RUC Referrals to CPT Editoral Panel - Outstanding Issues

		Screen	RUC Meeting	Specialty Society:	CPT Meeting
37220	**Revascularization, endovascular, open or percutaneous, iliac artery, unilateral, initial vessel; with transluminal angioplasty**	High Volume Growth1	January 2019	SVS, ACS, SIR, ACR, ACC	September 2021

Background: In October 2018, 37225, 37227 and 37229 services were identified by the PE High Cost Supplies screen for services with non-facility Medicare utilization over 10,000, not reviewed in the last five years and include a supply item greater than $500. The RUC requests an action plan for the January 2019 on how to address these services. The Workgroup reviewed the action plan for these services, noting that CMS repriced these supply items for 2019. The specialty societies indicated that they agreed these supply items were essential to perform CPT codes 37225, 37227 and 37229 and that the current repricing was appropriate. The Workgroup noted that CPT code 37229 was identified on the High Volume Growth screen at this meeting and the Workgroup agreed with the specialty societies to refer this entire family of services to CPT for revision to accommodate new technologies.

		Screen	RUC Meeting	Specialty Society:	CPT Meeting
37221	**Revascularization, endovascular, open or percutaneous, iliac artery, unilateral, initial vessel; with transluminal stent placement(s), includes angioplasty within the same vessel, when performed**	High Volume Growth1	January 2019	SVS, ACS, SIR, ACR, ACC	September 2021

Background: In October 2018, 37225, 37227 and 37229 services were identified by the PE High Cost Supplies screen for services with non-facility Medicare utilization over 10,000, not reviewed in the last five years and include a supply item greater than $500. 37226	**Revascularization, endovascular, open or percutaneous, femoral, popliteal artery(s), unilateral; with transluminal stent placement(s), includes angioplasty within the same vessel, when performed**	High Volume Growth1	January 2019	SVS, ACS, SIR, ACR, ACC	September 2021

Background: In October 2018, 37225, 37227 and 37229 services were identified by the PE High Cost Supplies screen for services with non-facility Medicare utilization over 10,000, not reviewed in the last five years and include a supply item greater than $500. The RUC requests an action plan for the January 2019 on how to address these services. The Workgroup reviewed the action plan for these services, noting that CMS repriced these supply items for 2019. The specialty societies indicated that they agreed these supply items were essential to perform CPT codes 37225, 37227 and 37229 and that the current repricing was appropriate. The Workgroup noted that CPT code 37229 was identified on the High Volume Growth screen at this meeting and the Workgroup agreed with the specialty societies to refer this entire family of services to CPT for revision to accommodate new technologies.

63030	**Laminotomy (hemilaminectomy), with decompression of nerve root(s), including partial facetectomy, foraminotomy and/or excision of herniated intervertebral disc; 1 interspace, lumbar**	Pre-Time Analysis / Site of Service Anomaly - 2018	January 2021	AANS, AAOS, NASS	September 2021

Background: CPT code 63030 was identified via the site of service anomaly screent. In December 2020, the Relativity Assessment Workgroup noted that CPT code 63030 continues to be primarily reported in the outpatient setting yet still includes inpatient hospital visits. The specialty society indicated that there is still confusion, and 63030 is inappropriately being reporting in the outpatient setting. The RUC recommends that CPT code 63030 be referred to CPT (May 2021) to revise the descriptor to exclude the types of procedures that are thought to be causing the incorrect reporting in the outpatient setting, such as explicitly stating the types of situations for which CPT code 63030 should not be used. The RUC understands that this service will be surveyed after the CPT revisions and reviewed by the RUC.

		Screen	RUC Meeting	Specialty Society:	CPT Meeting
76998	**Ultrasonic guidance, intraoperative**	CMS-Other - Utilization over 20,000 Part1	October 2019	STS, AATS, ACS, ASBrS, AUA, AVLS, SCAI, SIR, SVS	September 2021

Background: In October 2018, the Workgroup discussed future screens and recommends lowering the threshold and examining the list of CMS/Other source codes with Medicare utilization over 20,000. In October 2019, the RUC refers this issued to CPT Editorial Panel (May 2020) to more accurately differentiate physician work as multiple specialties currently use this code and to clarify correct coding.

		Screen	RUC Meeting	Specialty Society:	CPT Meeting
99415	**Prolonged clinical staff service (the service beyond the typical service time) during an evaluation and management service in the office or outpatient setting, direct patient contact with physician supervision; first hour (List separately in addition to code for outpatient Evaluation and Management service)**	CMS Request - Final Rule for 2020	April 2021	AAHPM, AAP, CHEST, ACP, AGS, ANA, ASCO, ATS, SVS	September 2021, February 2021

Background: In October 2020, the RUC recommends that CPT codes 99358 and 99459 be referred to the CPT Editorial Panel for February 2021, to be examined and surveyed along with the other E/M services for the CPT 2023 and the 2023 Medicare Physician Payment Schedule (February 2021, CPT Tab 11). At the April 2021 review, there was discussion at both the PE Subcommittee meeting and the RUC regarding discrepancies between the long descriptors for these codes and the introductory CPT language. The descriptors for 99415 and 99416 state “direct patient contact with physician supervision;” while the preparatory paragraph for these codes describes “face-to-face time.” Given these inconsistencies, there was confusion as to whether the two codes could be used for non-face-to-face (asynchronous) patient encounters. The CPT representative stated that the CPT Editorial Panel is working to reconcile the language. Regardless, the PE Subcommittee agreed that the practice expense inputs for CPT codes 99415 and 99416 were appropriate and that the recommended clinical staff times are correctly valued.

		Screen	RUC Meeting	Specialty Society:	CPT Meeting
99416	**Prolonged clinical staff service (the service beyond the typical service time) during an evaluation and management service in the office or outpatient setting, direct patient contact with physician supervision; each additional 30 minutes (List separately in addition to code for outpatient Evaluation and Management service)**	CMS Request - Final Rule for 2020	April 2021	AAHPM, AAP, CHEST, ACP, AGS, ANA, ASCO, ATS, SVS	September 2021, February 2021

Background: In October 2020, the RUC recommends that CPT codes 99358 and 99459 be referred to the CPT Editorial Panel for February 2021, to be examined and surveyed along with the other E/M services for the CPT 2023 and the 2023 Medicare Physician Payment Schedule (February 2021, CPT Tab 11). At the April 2021 review, there was discussion at both the PE Subcommittee meeting and the RUC regarding discrepancies between the long descriptors for these codes and the introductory CPT language. The descriptors for 99415 and 99416 state “direct patient contact with physician supervision;” while the preparatory paragraph for these codes describes “face-to-face time.” Given these inconsistencies, there was confusion as to whether the two codes could be used for non-face-to-face (asynchronous) patient encounters. The CPT representative stated that the CPT Editorial Panel is working to reconcile the language. 		Screen	RUC Meeting	Specialty Society:	CPT Meeting
G0396	**Alcohol and/or substance (other than tobacco) abuse structured assessment (e.g., audit, dast), and brief intervention 15 to 30 minutes**	CMS-Other - Utilization over 30,000	January 2018	AAFP, ASA, ASAM	Time Uncertain

Background: In October 2017, the RAW requested that AMA staff compile a list of CMS/Other codes with Medicare utilization of 30,000 or more. This list resulted in 34 services and the RAW requested action plans to be reviewed at the January 2018 meeting. In January 2018, the RUC recommended to maintain the physician work and refer to CPT to editorially remove "screening" from 99408 and 99409 to "assessment" to mirror G0396. At the February 2018 CPT meeting, the Panel postponed until time uncertain this request to revise codes 99408-99409 to identify assessment of alcohol and/or substance abuse. As a rationale for postponement, the Panel said that the service described in this application did not meet the General Criteria for Category I because the proposed service is not unique or well defined, and does not describe a service that is clearly identified and distinguished from existing services already described in CPT by other codes. The Panel's additional rationale for postponement of this item was to allow the relevant specialty societies an opportunity to submit a new code change application to address the differences between assessment and screening services.

		Screen	RUC Meeting	Specialty Society:	CPT Meeting
G6001	**Ultrasonic guidance for placement of radiation therapy fields**	CMS-Other - Utilization over 20,000 Part2	January 2021	AADA, ASTRO	September 2021

Background: The RUC identified G6001 via the CMS/Other Source Utilization over 20,000 screen. In January 2021, the RUC recommended to refer to CPT to develop new code(s) that reflect the different process of care between the two specialties (dermatology and radiation oncology).

RUC Recommendations to Develop CPT Assistant Articles - Outstanding Issues

		Screen:	RUC Meeting:	RUC Rec:	Specialty Society:	CPT Asst Status:
63685	**Insertion or replacement of spinal neurostimulator pulse generator or receiver, direct or inductive coupling**	Site of Service Anomaly / CMS Fastest Growing/ High Volume Growth7	January 2021	Review action plan in 2 years after CPT article published. 6.05	AAPM, AANS/CNS, ASA, ISIS, NASS	

Background: Oct 2010 re-reviewed site of service issue. In October 2020, the RUC identified six codes with Medicare utilization of 10,000 or more that have increased by at least 100% from 2014 through 2019e. CPT codes 00918, 63685, 75561, 75572, 75574 and 93655. The Workgroup requested that the specialty societies submit an action plan for codes CPT codes 00918, 63685, 75561, 75572, 75574 and 93655 for January 2021. In January 2021, the RUC recommended to refer to CPT Assistant. A CPT Assistant article has already been submitted. The RUC will reeview after 2 years of data are available after article is published.

		Screen:	RUC Meeting:	RUC Rec:	Specialty Society:	CPT Asst Status:
75710	**Angiography, extremity, unilateral, radiological supervision and interpretation**	CMS High Expenditure Procedural Codes2	January 2021	Refer to CPT Assistant and review after 2 years of data after publication available. 1.75	ACR, ACC, RPA, SCAI, SIR, SVS	July 2021

Background: In the NPRM for 2016 CMS re-ran the high expenditure services across specialties with Medicare allowed charges of $10 million or more. CMS identified the top 20 codes by specialty in terms of allowed charges, excluding 010 and 090-day global services, anesthesia and Evaluation and Management services and services reviewed since CY 2010. In October 2016 the RUC noted that with the newly bundled dialysis access maintenance codes that were approved in January 2016 as part of Dialysis Circuit code family 36901-36909, the specialties project that a significant portion of the nephrology volume for 75710 will instead be reported with applicable Dialysis Circuit codes. Nephrology represented 17.8 percent of the 2015 Medicare claims for 75710. The RUC will add a flag for review to confirm that nephrology utilization volume has decreased once 2017 Medicare utilization data is available for review. The RUC noted the nephrology utilization is slightly decreasing. The RUC recommended to review utilization again in 2 years (Oct 2020). In October 2020, the Workgroup reviewed the history of this code and the action plan submitted by SVS, SIR, ACR and ACC. Noting that the 2019e utilization by nephrologists was gradually decreasing (13%) (global & -26 modifier). The Workgroup questioned if the gradual decrease in utilization by nephrologists is appropriate or if nephrologists should not be performing this service at all. The Workgroup noted that RPA was not involved in the development of this action plan. The Workgroup requested the input from Nephrology regarding the reporting of CPT code 75710 and review at the January 2021 meeting. In January 2021, the Relativity Assessment Workgroup noted that the utilization of nephrology continues to decrease but not at the rate the specialty societies thought it would. The specialty societies indicated that they would submit a CPT Assistant article to address the appropriate reporting of this service. The Workgroup recommends that this service be referred to CPT Assistant and reviewed after 2 years of data is available after the publication of the article. The specialty societies noted that the expected utilization for Nephrology would be under 10%.

		Screen:	RUC Meeting:	RUC Rec:	Specialty Society:	CPT Asst Status:
G0407	**Follow-up inpatient consultation, intermediate, physicians typically spend 25 minutes communicating with the patient via telehealth**	CMS-Other - Utilization over 20,000 Part2	April 2021	Review action plan	AAN, ANA, APA (psychiatry)	

Background: In October 2020, the RUC identified 11 codes with 2019 estimated Medicare utilization over 20,000. Codes G0407, G0408, G0422, G0423, G0500, G0506, G6001, G6012, G6013, G6015 and G6017. The Workgroup requests that action plans be reviewed for these services at the January 2021 meeting to determine if current CPT codes exist to report these services, new CPT codes should be created, or the G code should be surveyed. At the December 2020 RAW meeting, the Workgroup recommended to postpone until April 2021 RAW for input from ANA and APA. In April 2021, the RUC the recommended these services be reviewed in 2 years (April 2023) after additional data are available. Second, there should be a CPT Assistant article, if appropriate, or other CMS education regarding who should be reporting these services. The RAW also would like to inform CMS of possible misreporting of these services. Based on the Medicare Provider Utilization and Payment Data Physician and Other Supplier PUF CY 2018 data, seven to eight individual Nurse Practitioners account for approximately 50% of G0407 and G0408 services provided.

Detailed Description of Pre-Service Time Packages (Minutes)

		FACILITY				NON-FAC	
		1	2	3	4	5**	6
	Total Pre-Service Time	**20**	**25**	**51**	**63**	**8**	**23**
	CATEGORY SUBTOTALS						
A	Pre-Service Evaluation (IWPUT =0.0224)	13	18	33	40	7	17
B	Pre-Service Positioning (IWPUT = 0.0224)	1	1	3	3	0	1
C	Pre-Service Scrub, Dress and Wait (IWPUT =0.0081)	6	6	15	20	1	5
	DETAILS						
A	History and Exam (Performance and review of appropriate Pre-Tests)	5	10	10	15	4	9
A	Prepare for Procedure (Check labs, plan, assess risks, review procedure)	2	2	2	4	1	1
A	Communicate with patient and/or family (Discuss procedure/ obtain consent)	3	3	5	5	2	3
A	Communicate with other professionals	0	0	5	5	0	2
A	Check/set-up room, supplies and equipment	1	1	5	5	0	1
A	Check/ prepare patient readiness (Gown, drape, prep, mark)	1	1	5	5	0	1
A	Prepare/ review/ confirm procedure	1	1	1	1	0	0
B	Perform/ supervise patient positioning	1	1	3	3	0	1
C	Administer local/topical anesthesia	1	1	0	0	1	5
C	Observe (wait anesthesia care)	0	0	10	15	0	0
C	Dress and scrub for procedure	5	5	5	5	0	0

**If the procedure does not require local anesthesia, 1 minute should be removed from pre-service time

1 Straightforward Patient/Straightforward Procedure (No anesthesia care)
2 Difficult Patient/Straightforward Procedure (No anesthesia care)
3 Straightforward Patient/Difficult Procedure
4 Difficult Patient/Difficult Procedure
5 Procedure with minimal anesthesia care (If no anesthesia care deduct 1 minute)
6 Procedure with local/topical anesthesia care requiring wait time for anesthesia to take effect

Additional Positioning Times for Spinal Surgical Procedures

SS1	Anterior Neck Surgery (Supine) (eg ACDF)	15 Minutes
SS2	Posterior Neck Surgery (Prone) (eg laminectomy)	25 Minutes
SS3	Posterior Thoracic/Lumbar (Prone) (eg laminectomy)	15 Minutes
SS4	Lateral Thoracic/Lumbar (Lateral) (eg corpectomy)	25 Minutes
SS5	Anterior Lumbar (Supine) (eg ALIF)	15 Minutes

Additional Positioning Times for Spinal Injection Procedures

SI1	Anterior Neck Injection (Supine) (eg discogram)	7 Minutes
SI2	Posterior Neck Injection (Prone) (eg facet)	5 Minutes
SI3	Posterior Thoracic/Lumbar (Prone) (eg epidural)	5 Minutes
SI4	Lateral Thoracic/Lumbar (Lateral) (eg discogram)	7 Minutes

Additional Positioning Times for Urological Procedures

U1	Dorsal Lithotomy	5 Minutes

Notes:

- Roll-over cells for additional detail where available
- Straightforward procedure: Integumentary, Non-incisional endoscopy, natural orifice

Detailed Description of Facility Based Post-Service Time Packages (Minutes)						
	7A Local Anesthesia/ Straightforward Procedure	**7B Local Anesthesia/ Complex Procedure**	**8A IV Sedation/ Straightforward Procedure**	**8B IV Sedation/ Complex Procedure**	**9A General Anesthesia or Complex Regional Block/ Straightforward Procedure**	**9B General Anesthesia or Complex Regional Block/Complex Procedure**
Total Post-Service Time	**18**	**21**	**25**	**28**	**30**	**33**
Details:						
Application of Dressing[1]	2	2	2	2	2	2
Transfer of supine patient off table	1	1	1	1	1	1
Operative Note	5	5	5	5	5	5
Monitor patient recovery/stabilization	1	1	5	5	10	10
Communication with patient and/or family	5	5	5	5	5	5
Written post-operative note	2	5	2	5	2	5
Post-Operative Orders and Order Entry	2	2	5	5	5	5

Advisors may request additional time for circumstances that require additional work beyond the type of work described

1 This represents a simple dressing

New Technology/New Services List

CPT Code	Long Descriptor	RUC Meeting	Issue	Tab	CPT Year	Date to Re-Review	RUC Rec	Complete
0001A	Immunization administration by intramuscular injection of severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) (Coronavirus disease [COVID-19]) vaccine, mRNA-LNP, spike protein, preservative free, 30 mcg/0.3mL dosage, diluent reconstituted; first dose	Dec 2020	Pfizer-SARS-CoV-2-IA		CPT 2020	January 2025		☐
0002A	Immunization administration by intramuscular injection of severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) (Coronavirus disease [COVID-19]) vaccine, mRNA-LNP, spike protein, preservative free, 30 mcg/0.3mL dosage, diluent reconstituted; second dose	Dec 2020	Pfizer-SARS-CoV-2-IA		CPT 2020	January 2025		☐
0011A	Immunization administration by intramuscular injection of severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) (Coronavirus disease [COVID-19]) vaccine, mRNA-LNP, spike protein, preservative free, 100 mcg/0.5mL dosage; first dose	Dec 2020	Moderna-SARS-CoV-2-IA		CPT 2020	January 2025		☐
0012A	Immunization administration by intramuscular injection of severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) (Coronavirus disease [COVID-19]) vaccine, mRNA-LNP, spike protein, preservative free, 100 mcg/0.5mL dosage; second dose	Dec 2020	Moderna-SARS-CoV-2-IA		CPT 2020	January 2025		☐
0021A	Immunization administration by intramuscular injection of severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) (coronavirus disease [COVID-19]) vaccine, DNA, spike protein, chimpanzee adenovirus Oxford 1 (ChAdOx1) vector, preservative free, 5x1010 viral particles/0.5mL dosage; first dose	Jan 2021	AstraZeneca-SARS-CoV-2-IA	34	CPT 2021	January 2025		☐

CPT Code	Long Descriptor	RUC Meeting	Issue	Tab	CPT Year	Date to Re-Review	RUC Rec	Complete
0022A	Immunization administration by intramuscular injection of severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) (coronavirus disease [COVID-19]) vaccine, DNA, spike protein, chimpanzee adenovirus Oxford 1 (ChAdOx1) vector, preservative free, 5x1010 viral particles/0.5mL dosage; second dose	Jan 2021	AstraZeneca-SARS-CoV-2-IA	34	CPT 2021	January 2025		☐
0031A	Immunization administration by intramuscular injection of severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) (coronavirus disease [COVID-19]) vaccine, DNA, spike protein, adenovirus type 26 (Ad26) vector, preservative free, 5x1010 viral particles/0.5mL dosage, single dose	Jan 2021	Janssen-SARS-CoV-2-IA	34	CPT 2021	January 2025		☐
0041A	Immunization administration by intramuscular injection of severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) (coronavirus disease [COVID-19]) vaccine, recombinant spike protein nanoparticle, saponin-based adjuvant, preservative free, 5 mcg/0.5mL dosage; first dose	Apr 2021	Novavax-SARS-CoV-2-IA	27	CPT 2021	January 2025		☐
0042A	Immunization administration by intramuscular injection of severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) (coronavirus disease [COVID-19]) vaccine, recombinant spike protein nanoparticle, saponin-based adjuvant, preservative free, 5 mcg/0.5mL dosage; second dose	Apr 2021	Novavax-SARS-CoV-2-IA	27	CPT 2021	January 2025		☐
10011	Fine needle aspiration biopsy, including MR guidance; first lesion	Jan 2018	Fine Needle Aspiration	04	CPT 2019	January 2023		☐
10012	Fine needle aspiration biopsy, including MR guidance; each additional lesion (List separately in addition to code for primary procedure)	Jan 2018	Fine Needle Aspiration	04	CPT 2019	January 2023		☐
14302	Adjacent tissue transfer or rearrangement, any area; each additional 30.0 sq cm, or part thereof (List separately in addition to code for primary procedure)	Apr 2009	Adjacent Tissue Transfer	4	CPT 2010	October 2015	Remove from list , no demonstrated technology diffusion that impacts work or practice expense.	☑

CPT Code	Long Descriptor	RUC Meeting	Issue	Tab	CPT Year	Date to Re-Review	RUC Rec	Complete
15271	Application of skin substitute graft to trunk, arms, legs, total wound surface area up to 100 sq cm; first 25 sq cm or less wound surface area	Apr 2011	Chronic Wound Dermal Substitute	4	CPT 2012	October 2015	Remove from list, no demonstrated technology diffusion that impacts work or practice expense.	☑
15272	Application of skin substitute graft to trunk, arms, legs, total wound surface area up to 100 sq cm; each additional 25 sq cm wound surface area, or part thereof (List separately in addition to code for primary procedure)	Apr 2011	Chronic Wound Dermal Substitute	4	CPT 2012	October 2015	Remove from list, no demonstrated technology diffusion that impacts work or practice expense.	☑
15273	Application of skin substitute graft to trunk, arms, legs, total wound surface area greater than or equal to 100 sq cm; first 100 sq cm wound surface area, or 1% of body area of infants and children	Apr 2011	Chronic Wound Dermal Substitute	4	CPT 2012	October 2015	Remove from list, no demonstrated technology diffusion that impacts work or practice expense.	☑
15274	Application of skin substitute graft to trunk, arms, legs, total wound surface area greater than or equal to 100 sq cm; each additional 100 sq cm wound surface area, or part thereof, or each additional 1% of body area of infants and children, or part thereof (List separately in addition to code for primary procedure)	Apr 2011	Chronic Wound Dermal Substitute	4	CPT 2012	October 2015	Remove from list, no demonstrated technology diffusion that impacts work or practice expense.	☑
15275	Application of skin substitute graft to face, scalp, eyelids, mouth, neck, ears, orbits, genitalia, hands, feet, and/or multiple digits, total wound surface area up to 100 sq cm; first 25 sq cm or less wound surface area	Apr 2011	Chronic Wound Dermal Substitute	4	CPT 2012	October 2015	Remove from list, no demonstrated technology diffusion that impacts work or practice expense.	☑
15276	Application of skin substitute graft to face, scalp, eyelids, mouth, neck, ears, orbits, genitalia, hands, feet, and/or multiple digits, total wound surface area up to 100 sq cm; each additional 25 sq cm wound surface area, or part thereof (List separately in addition to code for primary procedure)	Apr 2011	Chronic Wound Dermal Substitute	4	CPT 2012	October 2015	Remove from list, no demonstrated technology diffusion that impacts work or practice expense.	☑

15277	Application of skin substitute graft to face, scalp, eyelids, mouth, neck, ears, orbits, genitalia, hands, feet, and/or multiple digits, total wound surface area greater than or equal to 100 sq cm; first 100 sq cm wound surface area, or 1% of body area of infants and children	Apr 2011	Chronic Wound Dermal Substitute	4	CPT 2012	October 2015	Remove from list, no demonstrated technology diffusion that impacts work or practice expense.	☑
15278	Application of skin substitute graft to face, scalp, eyelids, mouth, neck, ears, orbits, genitalia, hands, feet, and/or multiple digits, total wound surface area greater than or equal to 100 sq cm; each additional 100 sq cm wound surface area, or part thereof, or each additional 1% of body area of infants and children, or part thereof (List separately in addition to code for primary procedure)	Apr 2011	Chronic Wound Dermal Substitute	4	CPT 2012	October 2015	Remove from list, no demonstrated technology diffusion that impacts work or practice expense.	☑
15769	Grafting of autologous soft tissue, other, harvested by direct excision (eg, fat, dermis, fascia)	Oct 2018	Tissue Grafting Procedures	04	CPT 2020	January 2024		☐
15771	Grafting of autologous fat harvested by liposuction technique to trunk, breasts, scalp, arms, and/or legs; 50 cc or less injectate	Oct 2018	Tissue Grafting Procedures	04	CPT 2020	January 2024		☐
15772	Grafting of autologous fat harvested by liposuction technique to trunk, breasts, scalp, arms, and/or legs; each additional 50 cc injectate, or part thereof (List separately in addition to code for primary procedure)	Oct 2018	Tissue Grafting Procedures	04	CPT 2020	January 2024		☐
15773	Grafting of autologous fat harvested by liposuction technique to face, eyelids, mouth, neck, ears, orbits, genitalia, hands, and/or feet; 25 cc or less injectate	Oct 2018	Tissue Grafting Procedures	04	CPT 2020	January 2024		☐
15774	Grafting of autologous fat harvested by liposuction technique to face, eyelids, mouth, neck, ears, orbits, genitalia, hands, and/or feet; each additional 25 cc injectate, or part thereof (List separately in addition to code for primary procedure)	Oct 2018	Tissue Grafting Procedures	04	CPT 2020	January 2024		☐

CPT Code	Long Descriptor	RUC Meeting	Issue	Tab	CPT Year	Date to Re-Review	RUC Rec	Complete
15777	Implantation of biologic implant (eg, acellular dermal matrix) for soft tissue reinforcement (ie, breast, trunk) (List separately in addition to code for primary procedure)	Apr 2011	Chronic Wound Dermal Substitute	4	CPT 2012	October 2015	Remove from list, no demonstrated technology diffusion that impacts work or practice expense.	☑
17106	Destruction of cutaneous vascular proliferative lesions (eg, laser technique); less than 10 sq cm	Oct 2008	Destruction of Skin Lesions	11	CPT 2009	September 2013	Remove from list, no demonstrated technology diffusion that impacts work or practice expense.	☑
17107	Destruction of cutaneous vascular proliferative lesions (eg, laser technique); 10.0 to 50.0 sq cm	Oct 2008	Destruction of Skin Lesions	11	CPT 2009	September 2013	Remove from list, no demonstrated technology diffusion that impacts work or practice expense.	☑
17108	Destruction of cutaneous vascular proliferative lesions (eg, laser technique); over 50.0 sq cm	Oct 2008	Destruction of Skin Lesions	11	CPT 2009	September 2013	Remove from list, no demonstrated technology diffusion that impacts work or practice expense.	☑
19105	Ablation, cryosurgical, of fibroadenoma, including ultrasound guidance, each fibroadenoma	Apr 2006	Fibroadenoma Cryoablation	11	CPT 2007	September 2011	Remove, code does not need to be re-evaluated	☑
19294	Preparation of tumor cavity, with placement of a radiation therapy applicator for intraoperative radiation therapy (IORT) concurrent with partial mastectomy (List separately in addition to code for primary procedure)	Oct 2016	Intraoperative Radiation Therapy Applicator Procedures	07	CPT 2018	January 2022		☐
20560	Needle insertion(s) without injection(s); 1 or 2 muscle(s)	Jan 2019	Trigger Point Dry Needling	41	CPT 2020	January 2024		☐
20561	Needle insertion(s) without injection(s); 3 or more muscles	Jan 2019	Trigger Point Dry Needling	41	CPT 2020	January 2024		☐

CPT Code	Long Descriptor	RUC Meeting	Issue	Tab	CPT Year	Date to Re-Review	RUC Rec	Complete
20696	Application of multiplane (pins or wires in more than 1 plane), unilateral, external fixation with stereotactic computer-assisted adjustment (eg, spatial frame), including imaging; initial and subsequent alignment(s), assessment(s), and computation(s) of adjustment schedule(s)	Apr 2008	Computer Dependent External Fixation	6	CPT 2009	September 2012	Remove, code does not need to be re-evaluated	☑
20697	Application of multiplane (pins or wires in more than 1 plane), unilateral, external fixation with stereotactic computer-assisted adjustment (eg, spatial frame), including imaging; exchange (ie, removal and replacement) of strut, each	Apr 2008	Computer Dependent External Fixation	6	CPT 2009	September 2012	Remove, code does not need to be re-evaluated	☑
20700	Manual preparation and insertion of drug-delivery device(s), deep (eg, subfascial) (List separately in addition to code for primary procedure)	Oct 2018	Drug Delivery Implant Procedures	05	CPT 2020	January 2024		☐
20701	Removal of drug-delivery device(s), deep (eg, subfascial) (List separately in addition to code for primary procedure)	Oct 2018	Drug Delivery Implant Procedures	05	CPT 2020	January 2024		☐
20702	Manual preparation and insertion of drug-delivery device(s), intramedullary (List separately in addition to code for primary procedure)	Oct 2018	Drug Delivery Implant Procedures	05	CPT 2020	January 2024		☐
20703	Removal of drug-delivery device(s), intramedullary (List separately in addition to code for primary procedure)	Oct 2018	Drug Delivery Implant Procedures	05	CPT 2020	January 2024		☐
20704	Manual preparation and insertion of drug-delivery device(s), intra-articular (List separately in addition to code for primary procedure)	Oct 2018	Drug Delivery Implant Procedures	05	CPT 2020	January 2024		☐
20705	Removal of drug-delivery device(s), intra-articular (List separately in addition to code for primary procedure)	Oct 2018	Drug Delivery Implant Procedures	05	CPT 2020	January 2024		☐
20983	Ablation therapy for reduction or eradication of 1 or more bone tumors (eg, metastasis) including adjacent soft tissue when involved by tumor extension, percutaneous, including imaging guidance when performed; cryoablation	Apr 2014	Cryoablation Treatment of the Bone Tumors	04	CPT 2015	October 2018	Remove from list , no demonstrated technology diffusion that impacts work or practice expense.	☑

99492	Initial psychiatric collaborative care management, first 70 minutes in the first calendar month of behavioral health care manager activities, in consultation with a psychiatric consultant, and directed by the treating physician or other qualified health care professional, with the following required elements: outreach to and engagement in treatment of a patient directed by the treating physician or other qualified health care professional; initial assessment of the patient, including administration of validated rating scales, with the development of an individualized treatment plan; review by the psychiatric consultant with modifications of the plan if recommended; entering patient in a registry and tracking patient follow-up and progress using the registry, with appropriate documentation, and participation in weekly caseload consultation with the psychiatric consultant; and provision of brief interventions using evidence-based techniques such as behavioral activation, motivational interviewing, and other focused treatment strategies.	Jan 2017	Psychiatric Collaborative Care Management Services	20	CPT 2018	January 2023	In January 2020, the RUC identified Psychiatric Collaborative Care Management Services (CPT codes 99492, 99493 and 99494) via the work neutrality process. These codes show a 468% increase in work RVUs for 2018. In reviewing the utilization data for these services, it appears one independent clinic is performing most of these services in the pediatric population. The Workgroup recommends that CMS investigate the reporting of services by this specific independent clinic. The specialty society indicated, and the Workgroup agreed, that a new CPT Assistant article on the appropriate usage of these codes be developed in 2020. This family is also scheduled on the new technology/new services list for review at the January 2023 Relativity Assessment Workgroup meeting. The Workgroup recommends postponing the new	☐

New Technology/Services Timeline

1. Code is identified as a new technology/service at the RUC meeting in which it is initially reviewed.
2. Code is flagged in the next version of the RUC database with date to be reviewed
3. Code will be reviewed in 5 years (depending on what meeting in the CPT/RUC cycle it is initially reviewed) after at least three years of data are available.

AMA/Specialty Society RVS Update Committee Summary of Recommendations

April 2021

Arthrodesis Decompression – Tab 4

In October 2020, the CPT Editorial Panel approved the revision of four codes describing arthrodesis, addition of two codes to report laminectomy, facetectomy, or foraminotomy during posterior interbody arthrodesis, lumbar to more appropriately identify the decompression that may be separately reported. A CPT coding change application (CCA) was created to assist with coding confusion for reporting additional decompression performed at the same interspace as a lumbar interbody fusion procedure. The coding confusion stemmed from language ("other than for decompression") included in the descriptors for CPT codes 22630-22634. To clarify correct coding, the CCA created two new add-on codes (63052 and 63053) to report decompression when performed in conjunction with posterior interbody arthrodesis at the same interspace, and revised definitions, guidelines, and parenthetical instructions. The terms corpectomy, facetectomy, foraminotomy, hemilaminectomy, lamina, laminectomy, and laminotomy were defined and editorial changes were made to several codes to consistently use the term "interspace" instead of "level" or "segment." In January 2021, the specialty societies surveyed the two new add-on codes and indicated that the revisions to existing codes were editorial precluding survey. The RUC disagreed and recommended that the entire family (CPT codes 22630, 22632, 22633, 22634, 63052 and 63053) be surveyed together for review at the April 2021 RUC meeting and interim values were established for CPT codes 63052 and 63053 until these two new codes could be reviewed again with the entire family in April.

22630 ***Arthrodesis, posterior interbody technique, including laminectomy and/or discectomy to prepare interspace (other than for decompression), single interspace; lumbar***

The RUC reviewed the survey results from 111 neurosurgeons, orthopaedic surgeons and spine surgeons and determined that maintaining the current work RVU of 22.09, which falls well below the survey 25th percentile, appropriately accounts for the physician work involved in this service. The RUC recommends the following physician time components as supported by the survey: 40 minutes pre-service evaluation, 20 minutes pre-service positioning, 15 minutes pre-service scrub/dress/wait time, 150 minutes intra-service time, and 30 minutes immediate post-service time, 1-99238 discharge visit, 1-99231 and 2-99232 post-operative visits and 2-99213 and 1-99214 office visits, 479 minutes total time. The scrub/dress/wait time was reduced from Pre-time Package 4 so as not to exceed survey median data. The positioning time was increased from the pre-time package to account for the additional work related to prone positioning.

The RUC noted that the total recommended time of 479 minutes is nearly identical to the total time of both the survey and the current code (487 minutes) which was initially valued in 1995. The post-operative visits have decreased by one, but the level of the visits has changed, practically resulting in a net change of zero in overall physician time despite the decrease of one visit. The RUC discussed the significant decrease in intra-service time of 30 minutes and considered crosswalk code alternatives; however, none of the crosswalk code options were deemed clinically comparable or sufficiently matched to the difficulty of the procedure. The change in time for the survey code, since it was valued in 1995, is attributed intra-operatively to the use of more effective drills, better X-rays, and several steps that streamline the procedure and make it more efficient. However, the RUC noted that while the procedure may be more efficient, it is not safer or less difficult. The elements that remain are

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

intense, such that the risk of the procedure, remains the same as it was originally; therefore, the RUC agreed that the current value should be maintained.

To justify the current work RVU of 22.09, the RUC compared the survey code to the top key reference service codes 22533 *Arthrodesis, lateral extracavitary technique, including minimal discectomy to prepare interspace (other than for decompression); lumbar* (work RVU = 24.79, 180 minutes intra-service time and 549 minutes total time) and 22612 *Arthrodesis, posterior or posterolateral technique, single level; lumbar (with lateral transverse technique, when performed)* (work RVU = 23.53, 150 minutes intra-service time and 482 minutes total time) and noted that the majority of respondents who chose 22533 as a key reference service indicated that the intensity/complexity of 22630 is similar to or somewhat more than 22533. Also, the respondents who chose 22612 as a key reference service indicated the intensity/complexity of 22630 is more than 22612.

The RUC also compared CPT code 22630 to MPC codes 35301 *Thromboendarterectomy, including patch graft, if performed; carotid, vertebral, subclavian, by neck incision* (work RVU = 21.16, 120 minutes intra-service time and 404 minutes total time) and 32669 *Thoracoscopy, surgical; with removal of a single lung segment (segmentectomy)* (work RVU = 23.53, 150 minutes intra-service time and 502 minutes total time) and noted that the multi-specialty points of comparison code values appropriately bracket the survey code recommendation. For additional support, the RUC noted that the survey code is further bracketed by comparator codes 38720 *Cervical lymphadenectomy (complete)* (work RVU = 21.95, 150 minutes intra-service time and 482 minutes total time) and 44140 *Colectomy, partial; with anastomosis* (work RVU = 22.59, 150 minutes intra-service time and 480 minutes total time). The RUC concluded that the value of CPT code 22630 should be maintained at 22.09 work RVUs, which is below the 25th percentile of the survey. **The RUC recommends a work RVU of 22.09 for CPT code 22630.**

22632 ***Arthrodesis, posterior interbody technique, including laminectomy and/or discectomy to prepare interspace (other than for decompression), single interspace; each additional interspace (List separately in addition to code for primary procedure)***
The RUC reviewed the survey results from 111 neurosurgeons, orthopaedic surgeons and spine surgeons and determined that maintaining the current work RVU of 5.22, which falls well below the survey 25th percentile, appropriately accounts for the physician work involved in this add-on service. The RUC recommends 60 minutes of intra-service time and noted that the intraoperative time has not changed since the code was initially valued in 1995. At that time, the value of this code was calculated based on 25% of the base code.

The specialties noted that a comparison to the key reference service codes 22614 *Arthrodesis, posterior or posterolateral technique, single level; each additional vertebral segment (List separately in addition to code for primary procedure)* (work RVU = 6.43, 40 minutes intra-service and total time) and 22552 *Arthrodesis, anterior interbody, including disc space preparation, discectomy, osteophytectomy and decompression of spinal cord and/or nerve roots; cervical below C2, each additional interspace (List separately in addition to code for primary procedure)* (work RVU = 6.50, 45 minutes intra-service time and 50 minutes total time) might support a higher work RVU, however, there was no compelling evidence that the work had changed. The RUC agreed that work had not changed.

The RUC also compared CPT code 22632 to MPC code 34812 *Open femoral artery exposure for delivery of endovascular prosthesis, by groin incision, unilateral (List separately in addition to code for primary procedure)* (work RVU = 4.13, 40 minutes intra-service and total time) and

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

noted that the comparator code has less intra-service and total time and is appropriately valued lower than the survey code. The specialties noted that the MPC code involves open femoral artery exposure by groin incision and closure of the wound, typically for separately reported percutaneous delivery of an endovascular prosthesis for an asymptomatic infrarenal abdominal aortic aneurysm (AAA) while, in comparison, the lower intensity exposure and closure for the survey code are performed as part of the primary arthrodesis code.

For additional support, the RUC noted that the survey code is appropriately bracketed by comparator codes with the same time and similar intensity: 11008 *Removal of prosthetic material or mesh, abdominal wall for infection (eg, for chronic or recurrent mesh infection or necrotizing soft tissue infection) (List separately in addition to code for primary procedure)* (work RVU = 5.00, 60 minutes intra-service and total time) and 22854 *Insertion of intervertebral biomechanical device(s) (eg, synthetic cage, mesh) with integral anterior instrumentation for device anchoring (eg, screws, flanges), when performed, to vertebral corpectomy(ies) (vertebral body resection, partial or complete) defect, in conjunction with interbody arthrodesis, each contiguous defect (List separately in addition to code for primary procedure)* (work RVU = 5.50, 60 minutes intra-service and total time). The RUC concluded that the value of CPT code 22632 should be maintained at 5.22 work RVUs which is below the 25th percentile of the survey. **The RUC recommends a work RVU of 5.22 for CPT code 22632.**

22633 ***Arthrodesis, combined posterior or posterolateral technique with posterior interbody technique including laminectomy and/or discectomy sufficient to prepare interspace (other than for decompression), single interspace; lumbar***
The RUC reviewed the survey results from 111 neurosurgeons, orthopaedic surgeons and spine surgeons and concurred that the survey respondents overvalued the physician work involved in performing this service. The RUC determined that changes in intra-service and total time for the procedure warranted a direct work RVU crosswalk to MPC code 55866 *Laparoscopy, surgical prostatectomy, retropubic radical, including nerve sparing, includes robotic assistance, when performed* (work RVU= 26.80, 180 minutes intra-service and 442 minutes total time) which falls below the survey 25th percentile and has identical intra-service time that appropriately accounts for the total physician work involved in this service.

The RUC recommends the following physician time components as supported by the survey: 40 minutes pre-service evaluation, 20 minutes pre-service positioning, 15 minutes pre-service scrub/dress/wait time, 180 minutes intra-service time, and 30 minutes immediate post-service time, 1-99238 discharge visit, 1-99231 and 2-99232 post-operative visits and 2-99213 and 1-99214 office visits, 509 minutes total time. The scrub/dress/wait time was reduced from Pre-time Package 4 so as not to exceed survey median data. The positioning time was increased from the pre-time package to account for the additional work related to prone positioning. The RUC used a crosswalk due to the changes in visits that caused a decrease in total time, primarily due to a change in inpatient care. Previously, there were two level-3 hospital visits and one level-2 hospital visit, this has been decreased to two level-2 and one level-1 inpatient visit along with a discharge day visit causing a substantial decrease in total time for the procedure, greater than the decrease in intra-service time; thus, a crosswalk was selected rather than recommending maintaining current value. The RUC discussed the recommended crosswalk code 55866 and noted that it is recently reviewed and performed 20,000/year and places the intraoperative intensity appropriately within this family of codes.

To justify the crosswalk value of 26.80 work RVUs, the RUC compared the survey code to the top key reference service code 22612 *Arthrodesis, posterior or posterolateral technique, single level; lumbar (with lateral transverse technique, when performed)* (work RVU = 23.53, 150 minutes

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

intra-service time and 482 minutes total time) and 2nd key reference code 22857 *Total disc arthroplasty (artificial disc), anterior approach, including discectomy to prepare interspace (other than for decompression), single interspace, lumbar* (work RVU = 27.13, 180 minutes intra-service time and 550 minutes total time) and noted that the physician work and total time of the survey code is appropriately bracketed between the two reference services using magnitude estimation.

For additional support, the RUC noted that the survey code is appropriately bracketed by comparator codes with the same intraoperative time and similar intensity: 43281 *Laparoscopy, surgical, repair of paraesophageal hernia, includes fundoplasty, when performed; without implantation of mesh (complete)* (work RVU = 26.60, 180 minutes intra-service time and 424 minutes total time). The RUC concluded that, given changes in intra-service and total time for the procedure, CPT code 22633 should be valued based on a direct work RVU crosswalk to CPT code 55866 which falls below the survey 25th percentile and preserves rank order within the family. **The RUC recommends a work RVU of 26.80 for CPT code 22633.**

22634 ***Arthrodesis, combined posterior or posterolateral technique with posterior interbody technique including laminectomy and/or discectomy sufficient to prepare interspace (other than for decompression), single interspace; each additional interspace and segment (List separately in addition to code for primary procedure)***
The RUC reviewed the survey results from 111 neurosurgeons, orthopaedic surgeons and spine surgeons and determined that the survey 25th percentile work RVU of 7.96 appropriately accounts for the physician work involved in this add-on service and is less than the current value. The RUC noted that the current value for 22634 is based on a calculation in 2011 that estimated the new add-on code was 70% of the survey 25th percentile work RVU. Although the current survey median work RVU would suggest an increase is warranted, the specialty did not present compelling evidence for an increase and the RUC recommends a decrease in the work RVU to account for the five minute decrease in median intra-service time. The RUC recommends 65 minutes of intra-service time as supported by the survey. The RUC noted that this service is more difficult and complex than CPT code 22632 due to the more complex patient undergoing this procedure and considerable additional steps that are not included in 22630 and 22632.

To justify a work RVU of 7.96, the RUC compared the survey code to the top key reference service code 22614 *Arthrodesis, posterior or posterolateral technique, single level; each additional vertebral segment (List separately in addition to code for primary procedure)* (work RVU = 6.43, 40 minutes intra-service and total time) and noted that the survey code has greater intra-service and total time and involves more physician work than the reference service. It was also rated as more intense/complex overall than the key reference service by 88% of survey respondents who selected the KRS. The RUC also compared CPT code 22634 to MPC code 34812 *Open femoral artery exposure for delivery of endovascular prosthesis, by groin incision, unilateral (List separately in addition to code for primary procedure)* (work RVU = 4.13, 40 minutes intra-service and total time) and noted that the MPC code has much less intra-service and total time and is appropriately valued lower than the survey code.

For additional support, the RUC noted that the survey code is bracketed by comparator codes 34820 *Open iliac artery exposure for delivery of endovascular prosthesis or iliac occlusion during endovascular therapy, by abdominal or retroperitoneal incision, unilateral (List separately in addition to code for primary procedure)* (work RVU = 7.00, 60 minutes intra-service and total time) and 33746 *Transcatheter intracardiac shunt (TIS) creation by stent placement for congenital cardiac anomalies to establish effective intracardiac flow, including all imaging guidance by the proceduralist, when performed, left and right heart diagnostic cardiac catherization for congenital cardiac anomalies, and target zone*

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

angioplasty, when performed (eg, atrial septum, Fontan fenestration, right ventricular outflow tract, Mustard/Senning/Warden baffles); each additional intracardiac shunt location (List separately in addition to code for primary procedure) (work RVU = 8.00, 60 minutes intra-service and total time). The RUC concluded that CPT code 22634 should be valued at the 25th percentile work RVU as supported by the survey and comparator codes. **The RUC recommends a work RVU of 7.96 for CPT code 22634.**

63052 ***Laminectomy, facetectomy, or foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s] [eg, spinal or lateral recess stenosis]), during posterior interbody arthrodesis, lumbar; single vertebral segment (List separately in addition to code for primary procedure)***

The RUC reviewed the survey results from 111 neurosurgeons, orthopaedic surgeons and spine surgeons and determined that the survey 25th percentile work RVU of 5.70 appropriately accounts for the physician work involved in this add-on service. The RUC recommends 45 minutes intra-service time and noted that the time has increased by five minutes compared to the previous survey and that the recommendation is slightly higher than the interim recommendation. This code was initially surveyed in January of 2021. At that time, the RUC concluded that the survey was flawed because the add-on codes were not surveyed in conjunction with the base codes. The RUC was concerned that without the base codes and add-on codes being surveyed together, that the survey for the add-on codes may have included work from the primary codes. For this reason, an interim value was assigned with guidance to the specialties to perform a new survey to include the add-on codes and the base codes. The current survey included all six codes on one survey instrument. Additionally, the overall experience of the survey respondents is greater for the new survey of six codes when compared to the prior survey of only the new add-on codes. The RUC determined that the value of 5.70 is more accurate as it is based on the survey of the entire code family and further noted that compelling evidence is not necessary for increases over interim values since interim values are, by definition, temporary. The RUC also noted that the time included in this add-on service is essentially all high-risk. The lower intensity surgical exposure activities have already been completed with the base code, so the physician work of 63052 involves is the actual higher intensity decompression as clarified by CPT.

To justify a work RVU of 5.70, the RUC compared the survey code to the top key reference service code 22840 *Posterior non-segmental instrumentation (eg, Harrington rod technique, pedicle fixation across 1 interspace, atlantoaxial transarticular screw fixation, sublaminar wiring at C1, facet screw fixation) (List separately in addition to code for primary procedure)* (work RVU = 12.52, 60 minutes intra-service and total time) and noted that the reference code has both more physician work and intra-service time and is therefore valued higher.

The RUC also compared the survey code to MPC code 34812 *Open femoral artery exposure for delivery of endovascular prosthesis, by groin incision, unilateral (List separately in addition to code for primary procedure)* (work RVU = 4.13, 40 minutes intra-service and total time) and noted that the MPC code involves open femoral artery exposure by groin incision and closure of the wound, typically for separately reported delivery of an endovascular prosthesis for an asymptomatic infrarenal abdominal aortic aneurysm (AAA). In comparison, exposure and closure for the survey code are performed as part of the primary arthrodesis code and the intra-service time includes bony and soft tissue resection (typically pathologic and not normal in nature) and decompression of neural elements in immediate high-risk proximity of the pathologic anatomy. Therefore, the physician work, time, and intensity of 63052 is greater than 34812.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

For additional support, the RUC noted that the survey code is appropriately bracketed by comparator codes with the same intraoperative time and similar intensity: 22552 *Arthrodesis, anterior interbody, including disc space preparation, discectomy, osteophytectomy and decompression of spinal cord and/or nerve roots; cervical below C2, each additional interspace (List separately in addition to code for primary procedure)* (work RVU = 6.50, 45 minutes intra-service time and 50 minutes total time) and code 22585 *Arthrodesis, anterior interbody technique, including minimal discectomy to prepare interspace (other than for decompression); each additional interspace (List separately in addition to code for primary procedure)* (work RVU = 5.52, 45 minutes intra-service and total time). The RUC concluded that CPT code 63052 should be valued at the 25th percentile work RVU as supported by the survey and comparator codes using magnitude estimation. **The RUC recommends a work RVU of 5.70 for CPT code 63052.**

63053 ***Laminectomy, facetectomy, or foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s] [eg, spinal or lateral recess stenosis]), during posterior interbody arthrodesis, lumbar; each additional segment (List separately in addition to code for primary procedure)***

The RUC reviewed the survey results from 111 neurosurgeons, orthopaedic and spine surgeons and determined that the survey 25th percentile work RVU of 5.00 appropriately accounts for the physician work involved in this add-on service. The RUC recommends 40 minutes intra-service time and noted that the time has increased by ten minutes compared to the previous survey. This code was initially surveyed in January of 2021. At that time, the RUC concluded that the survey was flawed because the add-on codes were not surveyed in conjunction with the base codes. For this reason, an interim value was assigned with guidance to the specialties to perform a new survey to include the add-on codes and the base codes. The new survey, which included all six codes, elicited a time that is only five minutes less than the work related to 63052 and is believed to be a more accurate reflection of the difference in work between laminectomy/facetectomy/foraminotomy with decompression of the first segment and of an additional segment. The RUC determined that the new value is more accurate as it is based on the survey of the entire code family and further noted that compelling evidence is not necessary for increases over interim values since interim values are, by definition, temporary.

To justify a work RVU of 5.00, the RUC compared the survey code to the top key reference service code 22614 *Arthrodesis, posterior or posterolateral technique, single level; each additional vertebral segment (List separately in addition to code for primary procedure)* (work RVU = 6.43, 40 minutes intra-service and total time) and noted that the codes have the same intra-service time, but the reference code is more intense and is appropriately valued higher than the survey code using magnitude estimate. The RUC also compared the survey code to the second key reference service code 22840 *Posterior non-segmental instrumentation (eg, Harrington rod technique, pedicle fixation across 1 interspace, atlantoaxial transarticular screw fixation, sublaminar wiring at C1, facet screw fixation) (List separately in addition to code for primary procedure)* (work RVU = 12.52, 60 minutes intra-service and total time) and noted that this reference code has more physician work and intra-service time and is therefore valued higher than the survey code.

The RUC also compared the survey code to MPC code 34812 *Open femoral artery exposure for delivery of endovascular prosthesis, by groin incision, unilateral (List separately in addition to code for primary procedure)* (work RVU = 4.13, 40 minutes intra-service and total time) and noted that the MPC code involves open femoral artery exposure by groin incision and closure of the wound, typically for separately reported delivery of an endovascular prosthesis for an asymptomatic infrarenal abdominal aortic aneurysm (AAA). In comparison, exposure and closure for the survey code are performed as part of the primary arthrodesis code and the intra-service time for 63053 includes bony and soft tissue resection

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

(typically pathologic and not normal in nature) and decompression of neural elements in immediate high-risk proximity of the pathologic anatomy. Therefore, the physician work and intensity of 63053 is appropriately greater than 34812.

For additional support, the RUC noted that the survey code is appropriately bracketed by comparator codes with the similar intraoperative time and similar intensity: 44128 *Enterectomy, resection of small intestine for congenital atresia, single resection and anastomosis of proximal segment of intestine; each additional resection and anastomosis (List separately in addition to code for primary procedure)* (work RVU = 4.44, 40 minutes intra-service and total time) and 22585 *Arthrodesis, anterior interbody technique, including minimal discectomy to prepare interspace (other than for decompression); each additional interspace (List separately in addition to code for primary procedure)* (work RVU = 5.52, 45 minutes intra-service and total time). The RUC concluded that CPT code 63053 should be valued at the 25th percentile work RVU as supported by the survey and comparator codes using magnitude estimation. **The RUC recommends a work RVU of 5.00 for CPT code 63053.**

Practice Expense
The Practice Expense Subcommittee removed the EQ168 *light, exam* for CPT codes 22630 and 22633. No direct practice expense inputs were recommended for the facility-only add-on codes 22632, 22634, 63052 and 63053. **The RUC recommends the direct practice expense inputs as modified by the Practice Expense Subcommittee.**

CPT Code	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
Arthrodesis **Posterior, Posterolateral or Lateral Transverse Process Technique** *To report instrumentation procedures, see 22840-22855, 22859. (Report in addition to code[s] for the definitive procedure[s].) Do not append modifier 62 to spinal instrumentation codes 22840-22848, 22850, 22852, 22853, 22854, 22859.* *To report bone graft procedures, see 20930-20938. (Report in addition to code[s] for the definitive procedure[s].) Do not append modifier 62 to bone graft codes 20900-20938.* **Corpectomy** identifies removal of a vertebral body during spinal surgery. **Facetectomy** is the excision of the facet joint between two vertebral bodies. There are two facet joints at each vertebral segment (see below) **Foraminotomy** is the excision of bone to widen the intervertebral foramen. The intervertebral foramen is bordered by the superior notch of the adjacent vertebra, the inferior notch of the vertebra, the facet joint and the intervertebral disc.				

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Hemilaminectomy is removal of a portion of a vertebral lamina, usually performed for exploration of, access to, or decompression of the intraspinal contents.

Lamina pertains to the vertebral arch, the flattened posterior portion of the vertebral arch extending between the pedicles and the midline, forming the dorsal wall of the vertebral foramen, and from the midline junction of which the spinous process extends.

Laminectomy is excision of a vertebral lamina; commonly used to denote removal of the posterior arch.

Laminotomy is excision of a portion of the vertebral lamina, resulting in enlargement of the intervertebral foramen for the purpose of relieving pressure ~~in~~ on a spinal nerve root.

A vertebral segment describes the basic constituent part into which the spine may be divided. It represents a single complete vertebral bone with its associated articular processes and laminae. A vertebral interspace is the nonbony compartment between two adjacent vertebral bodies which contains the intervertebral disc, and includes the nucleus pulposus, annulus fibrosus, and two cartilaginous endplates.

Decompression performed on the same vertebral segment(s) and/or interspace[s] as posterior lumbar interbody fusion that includes laminectomy, facetectomy, and/or foraminotomy may be separately reported using 63052, 63053.

Decompression solely to prepare the interspace for fusion is not separately reported.

When performing a posterior or posterolateral technique for fusion/arthrodesis at an additional ~~level~~ interspace, use 22614. When performing a posterior interbody fusion arthrodesis at an additional ~~level~~ interspace,	ZZZ	6.43 (No change)

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

		use 22632. When performing a combined posterior or posterolateral technique with posterior interbody arthrodesis at an additional ~~level~~ interspace, use 22634) (For facet joint fusion, see 0219T-0222T) (For placement of a posterior intrafacet implant, see 0219T-0222T)		
(f)22630	J1	Arthrodesis, posterior interbody technique, including laminectomy and/or discectomy to prepare interspace (other than for decompression), single interspace; lumbar (Do not report 22630 in conjunction with 22612 for the same interspace and segment, use 22633)	090	22.09 (No change)
(f)+22632	J2	each additional interspace (List separately in addition to code for primary procedure) (Use 22632 in conjunction with 22612, 22630, or 22633 when performed at a different ~~level~~ interspace. When performing a posterior interbody fusion arthrodesis at an additional ~~level~~ interspace, use 22632. When performing a posterior or posterolateral technique for fusion/arthrodesis at an additional ~~level~~ interspace, use 22614. When performing a combined posterior or posterolateral technique with posterior interbody arthrodesis at an additional ~~level~~ interspace, use 22634)	ZZZ	5.22 (No change)
▲22633	J3	Arthrodesis, combined posterior or posterolateral technique with posterior interbody technique including laminectomy and/or discectomy sufficient to prepare interspace (other than for decompression), single interspace ~~and segment~~; lumbar (Do not report with 22612 or 22630 ~~at the~~ for the same ~~level~~ interspace)	090	26.80
+▲22634	J4	each additional interspace and segment (List separately in addition to code for primary procedure) (Use 22634 in conjunction with 22633)	ZZZ	7.96

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

		(Do not report 22630, 22632, 22633, 22634 in conjunction with 63030, 63040, 63042, 63047, 63056, 63052, 63053, for laminectomy performed to prepare the interspace on the same spinal interspace[s]) (To report decompression performed on the same interspace as posterior interbody fusion that includes laminectomy, removal of facets, and/or opening/widening of the foramen for decompression of nerves or spinal components such as spinal cord, cauda equina, or nerve roots, see 63052, 63053)		

Nervous System
Posterior Extradural Laminotomy or Laminectomy for Exploration/Decompression of Neural Elements or Excision of Herniated Intervertebral Discs

Definitions

For purposes of CPT coding . . .

63020 *Laminotomy (hemilaminectomy), with decompression of nerve root(s), including partial facetectomy, foraminotomy and/or excision of herniated intervertebral disc; 1 interspace, cervical*

(For bilateral procedure, report 63020 with modifier 50)

63030 *1 interspace, lumbar*
(For bilateral procedure, report 63030 with modifier 50)

+63035 *each additional interspace, cervical or lumbar (List separately in addition to code for primary procedure)*

(Use 63035 in conjunction with 63020-63030)

(Do not report 63030, 63035 in conjunction with 22630, 22632, 22633, 22634 for laminotomy performed to prepare the interspace for fusion on the same spinal interspace)

(To report decompression performed on the same interspace and vertebral segment[s] as posterior interbody fusion that includes laminectomy, removal of facets, and/or opening/widening of the foramen for decompression of nerves or spinal components such as spinal cord, cauda equina, or nerve roots, see 63052, 63053)

(For bilateral procedure, report 63035 twice. Do not report modifier 50 in conjunction with 63035)

(For percutaneous endoscopic approach, see 0274T, 0275T)

63040 *Laminotomy (hemilaminectomy), with decompression of nerve root(s), including partial facetectomy, foraminotomy and/or excision of herniated intervertebral disc, reexploration, single interspace; cervical*

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

63042 *lumbar*
(For bilateral procedure, report 63042 with modifier 50)

+63043 *each additional cervical interspace (List separately in addition to code for primary procedure)*
(Use 63043 in conjunction with 63040)
(For bilateral procedure, report 63043 twice. Do not report modifier 50 in conjunction with 63043)

✚*63044* *each additional lumbar interspace (List separately in addition to code for primary procedure)*

(Use 63044 in conjunction with 63042)

(Do not report 63040, 63042, 63043, 63044, in conjunction with 22630, 22632, 22633, 22634 for laminotomy to prepare the interspace for fusion on the same interspace and vertebral segment[s])

(To report decompression performed on the same vertebral segments and/or interspace[s] as posterior interbody fusion that includes laminectomy, removal of facets, and/or opening/widening of the foramen for decompression of nerves or spinal components such as spinal cord, cauda equina, or nerve roots, see 63052, 63053)

(For bilateral procedure, report 63044 twice. Do not report modifier 50 in conjunction with 63044)

Decompression performed on the same vertebral segments and/or interspace[s] as posterior interbody fusion that includes laminectomy, facetectomy, or foraminotomy may be separately reported using 63052.

Codes 63052, 63053 may only be reported for decompression at the same anatomic site(s) when posterior interbody fusion (eg, 22630) requires decompression beyond preparation of the interspace(s) for fusion.

63045 *Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; cervical*

63046 *thoracic*

63047 *lumbar*

✚▲63048 each additional vertebral segment, cervical, thoracic or lumbar (List separately in addition to code for primary procedure

(Use 63048 in conjunction with 63045-63047)

(Do not report 63047, 63048 in conjunction with 22630, 22632, 22633, 22634 for laminectomy performed to prepare the interspace for fusion on the same vertebral segments and/or interspace[s])

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

		(To report decompression performed on the same vertebral segments and/or interspace[s] as posterior interbody fusion that includes laminectomy, removal of facets, and/or opening/widening of the foramen for decompression of nerves or spinal components such as spinal cord, cauda equina, or nerve roots, see 63052, 63053)		
+●63052	J5	Laminectomy, facetectomy, or foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s] [eg, spinal or lateral recess stenosis]), during posterior interbody arthrodesis, lumbar; single vertebral segment (List separately in addition to code for primary procedure)	ZZZ	5.70
+●63053	J6	each additional segment (List separately in addition to code for primary procedure) (Use 63053 in conjunction with 63052) (Use 63052, 63053 in conjunction with 22630, 22632, 22633, 22634)	ZZZ	5.00

63050 *Laminoplasty, cervical, with decompression of the spinal cord, 2 or more vertebral segments;*

63051 *with reconstruction of the posterior bony elements (including the application of bridging bone graft and non-segmental fixation devices [eg, wire, suture, mini-plates], when performed)*

Transpedicular or Costovertebral Approach for Posterolateral Extradural Exploration/Decompression

63055 *Transpedicular approach with decompression of spinal cord, equine and/or nerve root(s) (eg, herniated intervertebral disc), single segment; thoracic*

63056 *lumbar (including transfacet, or lateral extraforaminal approach) (eg, far lateral herniated intervertebral disc)*

+63057 *each additional segment, thoracic or lumbar (List separately in addition to code for primary procedure*

(Use 63057 in conjunction with 63055, 63056)

(Do not report 63056, 63057 for a herniated disc, in conjunction with 22630, 22632, 22633, 22634 for decompression-to prepare the interspace on the same interspace[s])

(To report decompression performed on the same interspace[s] as posterior interbody fusion that includes laminectomy, removal of facets, or opening/widening of the foramen for decompression of nerves or spinal components such as spinal cord, cauda equina, or nerve roots, see 63052, 63053)

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:22630 Tracking Number J1 Original Specialty Recommended RVU: **22.09**
Presented Recommended RVU: **22.09**
Global Period: 090 Current Work RVU: **22.09** RUC Recommended RVU: **22.09**

CPT Descriptor: Arthrodesis, posterior interbody technique, including laminectomy and/or discectomy to prepare interspace (other than for decompression), single interspace; lumbar

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 48-year-old male with a history of previous discectomy at L4-L5 presents with a spondylolisthesis and intractable back pain that improves with recumbency or back bracing. Non-operative treatments have failed to control his symptoms. Arthrodesis via a unilateral or bilateral approach of L4-L5 is performed using a posterior interbody technique. (Note: Decompression, instrumentation and/or bone preparation or harvesting, when performed, is separately reported.)

Percentage of Survey Respondents who found Vignette to be Typical: 85%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 99% , In the ASC 1%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 13% , Overnight stay-more than 24 hours 88%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 94%

Description of Pre-Service Work: Review preoperative laboratory workup. Write preoperative orders for perioperative medications. Review MRI and/or other spinal imaging studies. Review planned incisions and procedure. Update H&P, review current medications, review surgical procedure, postoperative recovery in and out of the hospital, and the expected outcome(s) with patient and family. Sign and mark operative site. Obtain informed consent. Verify all necessary surgical instruments, supplies, and devices are available in the operative suite. Review length and type of anesthesia with the anesthesiologist. Perform preoperative time out, confirming patient identity, surgical site, procedure, indicated intraoperative medications, and antibiotic and DVT prophylaxis, as necessary. Monitor initial patient positioning for induction of anesthesia. Monitor initial patient positioning for placement of neuromonitoring electrodes. Following induction of anesthesia, assist with positioning of the patient prone. Verify and/or assist with padding of the patient to prevent pressure on neurovascular structures and placement of any traction devices to facilitate intraoperative imaging. Scrub and gown. Supervise preparing and draping of the patient. Perform surgical time out.

Description of Intra-Service Work: Following skin incision, dissection is carried out through the subcutaneous tissue and fascia to the posterior spinal elements. The subcutaneous and muscular tissues are reflected to expose the posterior surface of the lamina and over the facet(s) and/or transverse processes of the segment to be fused. Verification of the levels is confirmed with imaging. Bone cutting tools are used to remove as much of the lamina above and below the facets and to remove as much of the medial edges of the facets as is necessary for adequate exposure of the disc space. The nerve root is carefully mobilized from adhesions and/or peridural membrane. Epidural veins are cauterized and cut. The nerve root(s) and thecal sac are protected by packing and retraction. The annulus is incised, and an ample section of it is removed by sharp dissection. The nucleus is removed within the disc space with rongeurs and curettes. Bone cutting instruments are used to remove cartilaginous and subchondral end-plates of the vertebrae above and below the disc to be fused. The bone dissection is fashioned to accept the graft in a way that will provide for contact, maintenance of disc space height, and stability. The spacer (graft and/or device with graft) is impacted into the recipient site. When appropriate, the entire exposure, bone preparation, and spacer insertion and impaction are repeated from the other side of the table. The neural elements are inspected to confirm that they are free of any impingement from the implants in the canal and neuroforamen. An

interposition membrane, as by free fat graft, may be used to cover the exposed dura and nerve root. Muscles and fascia are sutured. A drain is inserted through a separate stab wound and secured. The subcutaneous tissues and skin are closed. (Note: Decompression of neural elements, instrumentation, and/or bone preparation or harvesting, when performed, are separately reported.)

Description of Post-Service Work:
Facility: Apply sterile dressings. Assist with repositioning patient supine. When anesthesia has been reversed, transfer the patient to the recovery room. Write an operative note in the patient's record. Monitor patient for abnormal neurological findings prior to discharge from recovery to the surgical floor. Sign the OR forms, including pre- and postoperative diagnosis and operations performed. Discuss procedure outcome with family. Dictate postoperative report. Dictate procedure outcome and expected recovery letter for referring physician and/or insurance company. Order and review films to check the alignment of the lumbar spine. Later the same day, review nursing and other provider chart notes, assess patient neurovascular status and pain. Write orders or update orders, as necessary, for medications, diet, and patient activity. Chart patient progress notes. On subsequent days, examine the patient, check wounds and neurovascular status. Review nursing and other provider chart notes. Chart patient progress notes. Discuss (oral/written) patient progress with referring physician. Answer (oral/written) questions from patient and/or family, nursing and other staff, and insurance staff. When safe to discharge patient to home, conduct final exam, including neurovascular and pain status, write orders for follow-up visits, post-discharge laboratory tests, imaging, home care, and physical therapy. Order medications needed post-discharge. Discuss home restrictions and activity levels (ie, diet, bathing, driving, exercise) and follow-up planning with patient/family. Complete all appropriate medical records, including day of discharge progress notes, discharge summary, discharge instructions, and insurance forms.

Office: Examine patient and perform neurological exam and pain assessment. Write orders for medications. Order and review periodic imaging, as appropriate. Monitor wounds and remove sutures and staples when appropriate. Review physical therapy progress and revise orders as needed. Dictate patient progress notes for the medical chart. Answer patient and/or family questions and insurance staff questions. Discuss (oral/written) patient progress with referring physician.

INTENSITY/COMPLEXITY MEASURES

(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	7%	38%	43%	13%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	7%	53%	40%

Technical Skill/Physical Effort	**Less**	**Identical**	**More**
Technical skill required	7%	50%	43%

Physical effort required	3%	43%	53%

Psychological Stress	**Less**	**Identical**	**More**
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	17%	47%	37%

Survey Code Compared to 2nd Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	0%	20%	52%	28%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	24%	76%

Technical Skill/Physical Effort	**Less**	**Identical**	**More**
Technical skill required	0%	20%	80%
Physical effort required	4%	24%	72%

Psychological Stress	**Less**	**Identical**	**More**
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	36%	64%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

In October 2020, the CPT Editorial Panel approved the revision of four codes describing arthrodesis, addition of two codes to report laminectomy, facetectomy, or foraminotomy during posterior interbody arthrodesis, lumbar to more appropriately identify the decompression that may be separately reported. A coding change application was created to assist with coding confusion for reporting additional decompression performed at the same interspace as a lumbar interbody fusion procedure. The coding confusion stemmed from language ("other than for decompression") included in the descriptors for codes 22630-22634. To clarify correct coding, the CCA created two new add-on codes (63052 and 63053) to report decompression when performed in conjunction with posterior interbody arthrodesis at the same interspace, along with definitions, guidelines, and parenthetical instructions. The terms corpectomy, facetectomy, foraminotomy, hemilaminectomy, lamina, laminectomy, and laminotomy were defined and editorial changes were made to several codes to consistently use the term "interspace" instead of "level" or "segment."

In January 2021, the specialty societies surveyed the two new codes and indicated the existing code changes were editorial. The RUC expressed concern that the base codes were not surveyed with the two new add-on codes. Two of the codes (22630 and 22632) are from 1995 and the other two codes were last RUC reviewed in 2011 (22633 and 22634). The RUC could not accept the specialties' justification for only surveying the new codes. They questioned how, without the base codes being surveyed, there would be assurance the respondents followed instruction to only consider the work of the add-on codes. Moreover, CMS has made it clear that the Agency expects the base codes and add-on codes to be reviewed at the same time. The RUC recommends that the entire family (CPT codes 22630, 22632, 22633, 22634, 63052 , 63053) be resurveyed for review at the April 2021 RUC meeting and that interim values be established for CPT codes 63052 and 63053 for CY 2022.

Recommendation – 22630

We recommend maintaining the current work RVU of 22.09. Although the intraoperative time decreased, the postoperative work increased and the total time is nearly identical.

Positioning time

Additional time was added to the package time of 3 minutes for supine positioning. These patients will typically be positioned prone.

Key Reference Code Comparison

KRS1: The respondents who chose 22533 as a reference indicated the intensity/complexity of 22630 is similar to somewhat more than 22533.

KRS2: The respondents who chose 22612 as a reference indicated the intensity/complexity of 22630 is more than 22612.

CPT	DESCRIPTOR	RVW	IWPUT	TOTAL TIME	PRE	INTRA	POST

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. Decompression, instrumentation and/or bone preparation or harvesting, when performed, is separately reported.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 22630

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:22632 Tracking Number J2 Original Specialty Recommended RVU: **5.22**
Presented Recommended RVU: **5.22**
Global Period: ZZZ Current Work RVU: **5.22** RUC Recommended RVU: **5.22**

CPT Descriptor: Arthrodesis, posterior interbody technique, including laminectomy and/or discectomy to prepare interspace (other than for decompression), single interspace; each additional interspace (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 70-year-old male with a history of previous discectomy and posterolateral fusion of L4-L5, presents with pseudarthrosis of L4-L5, progressive spondylolisthesis of L5-S1, minimal signs of nerve root dysfunction, and intractable back pain that improves with recumbency or back bracing. Non-operative treatments have failed to control his symptoms. During (separately reported) posterior lumbar interbody arthrodesis of L4-L5, he undergoes additional interspace arthrodesis of L5-S1 via a unilateral or bilateral approach using a posterior interbody technique. (Note: This is an add-on procedure. Decompression, instrumentation and/or bone preparation or harvesting, when performed, is separately reported. Only consider the additional work related to the posterior interbody arthrodesis of the additional L5-S1 interspace.)

Percentage of Survey Respondents who found Vignette to be Typical: 81%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: n/a

Description of Intra-Service Work: Skin, muscle, and fascia incisions are extended to provide for enough retraction to safely expose the additional interspace. The ligamentum flavum and/or scar is removed from between the laminae of the additional interspace. The laminae and medial edges of the facets are removed with bone cutting instruments to a degree sufficient to allow safe exposure of the disc space. The nerve root is carefully mobilized from adhesions and/or peridural membrane. Epidural veins are cauterized and cut. The nerve root(s) and thecal sac are protected by packing and retraction. The annulus is incised, and an ample section of it is removed by sharp dissection. The nucleus is removed within the disc space with rongeurs and curettes. Bone cutting instruments are used to remove cartilaginous and subchondral end-plates of the vertebrae above and below the disc to be fused. The bone dissection is fashioned to accept the graft in a way that will provide for contact, maintenance of disc space height, and stability. The spacer (graft and/or device) is impacted into the recipient site. When appropriate, the entire exposure, bone preparation, and spacer insertion and impaction are repeated from the other side of the table. The neural elements are inspected to confirm that they are free of any impingement from the implant(s) in the canal and neuroforamen. An interposition membrane, as by fat graft, is applied over the exposed dura and nerve roots of the additional space. (Note: Decompression of neural elements, instrumentation, and/or bone preparation or harvesting, when performed, are separately reported.)

Psychological Stress	**Less**	**Identical**	**More**
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	9%	48%	43%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

In October 2020, the CPT Editorial Panel approved the revision of four codes describing arthrodesis, addition of two codes to report laminectomy, facetectomy, or foraminotomy during posterior interbody arthrodesis, lumbar to more

appropriately identify the decompression that may be separately reported. A coding change application was created to assist with coding confusion for reporting additional decompression performed at the same interspace as a lumbar interbody fusion procedure. The coding confusion stemmed from language ("other than for decompression") included in the descriptors for codes 22630-22634. To clarify correct coding, the CCA created two new add-on codes (63052 and 63053) to report decompression when performed in conjunction with posterior interbody arthrodesis at the same interspace, along with definitions, guidelines, and parenthetical instructions. The terms corpectomy, facetectomy, foraminotomy, hemilaminectomy, lamina, laminectomy, and laminotomy were defined and editorial changes were made to several codes to consistently use the term "interspace" instead of "level" or "segment."

In January 2021, the specialty societies surveyed the two new codes and indicated the existing code changes were editorial. The RUC expressed concern that the base codes were not surveyed with the two new add-on codes. Two of the codes (22630 and 22632) are from 1995 and the other two codes were last RUC reviewed in 2011 (22633 and 22634). The RUC could not accept the specialties' justification for only surveying the new codes. They questioned how, without the base codes being surveyed, there would be assurance the respondents followed instruction to only consider the work of the add-on codes. Moreover, CMS has made it clear that the Agency expects the base codes and add-on codes to be reviewed at the same time. The RUC recommends that the entire family (CPT codes 22630, 22632, 22633, 22634, 63052 , 63053) be resurveyed for review at the April 2021 RUC meeting and that interim values be established for CPT codes 63052 and 63053 for CY 2022.

Recommendation – 22632

The current value for 22632 is based on a calculation in 1995 that estimated the add-on code was 25% of the primary procedure for an additional interspace. Although the current survey would suggest an increase is warranted in comparison to other similar codes, we do not have compelling evidence for an increase. Therefore, we recommend maintaining the current work RVU of 5.22. Intraoperative time has not changed.

Key Reference Code Comparison

KRS1: The respondents who chose 22614 as a reference indicated the intensity/complexity of 22632 is more/much more than 22614.

KRS2: The respondents who chose 22552 as a reference indicated the intensity/complexity of 22632 is similar/more than 22552.

CPT	DESCRIPTOR	RVW	IWPUT	TOTAL TIME	PRE	INTRA	POST
22632	Arthrodesis, posterior interbody technique, including laminectomy and/or discectomy to prepare interspace (other than for decompression), single interspace; each additional interspace (List separately in addition to code for primary procedure)	5.22	0.087	60	0	60	0
22614	Arthrodesis, posterior or posterolateral technique, single level; each additional vertebral segment (List separately in addition to code for primary procedure)	6.43	0.161	40	0	40	0
22552	Arthrodesis, anterior interbody, including disc space preparation, discectomy, osteophytectomy and decompression of spinal cord and/or nerve roots; cervical below C2, each additional interspace (List separately in addition to code for primary procedure)	6.50	0.142	50	5	45	0

MPC Code Comparison

There are few MPC codes with a ZZZ global assignment which makes finding appropriate MPC codes with similar intensity/complexity difficult. MPC code 34812 (with the highest wRVU) involves open femoral artery exposure by groin incision and closure of the wound, typically for separately reported percutaneous delivery of an endovascular prosthesis for an asymptomatic infrarenal AAA. In comparison, the lower intensity exposure and closure for the survey code are performed as part of the primary arthrodesis code.

CPT	DESCRIPTOR	RVW	IWPUT	TOTAL TIME	PRE	INTRA	POST
34812	Open femoral artery exposure for delivery of endovascular prosthesis, by groin incision, unilateral (List separately in addition to code for primary	4.13	0.103	40	0	40	0

	procedure)						
22632	Arthrodesis, posterior interbody technique, including laminectomy and/or discectomy to prepare interspace (other than for decompression), single interspace; each additional interspace (List separately in addition to code for primary procedure)	5.22	0.087	60	0	60	0

Other Code Comparison

Codes 11008 and 22854 bracket and offer further support of the recommended wRVU of 5.22 for 22632.

CPT	DESCRIPTOR	RVW	IWPUT	TOTAL TIME	PRE	INTRA	POST
11008	Removal of prosthetic material or mesh, abdominal wall for infection (eg, for chronic or recurrent mesh infection or necrotizing soft tissue infection) (List separately in addition to code for primary procedure)	5.00	0.087	60	0	60	0
22632	Arthrodesis, posterior interbody technique, including laminectomy and/or discectomy to prepare interspace (other than for decompression), single interspace; each additional interspace (List separately in addition to code for primary procedure)	5.22	0.087	60	0	60	0
22854	Insertion of intervertebral biomechanical device(s) (eg, synthetic cage, mesh) with integral anterior instrumentation for device anchoring (eg, screws, flanges), when performed, to vertebral corpectomy(ies) (vertebral body resection, partial or complete) defect, in conjunction with interbody arthrodesis, each contiguous defect (List separately in addition to code for primary procedure)	5.50	0.092	60	0	60	0

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

Description of Pre-Service Work: Review preoperative laboratory workup. Write preoperative orders for perioperative medications. Review MRI and/or other spinal imaging studies. Review planned incisions and procedure. Update H&P, review current medications, review surgical procedure, postoperative recovery in and out of the hospital, and the expected outcome(s) with patient and family. Sign and mark operative site. Obtain informed consent. Verify all necessary surgical instruments, supplies, and devices are available in the operative suite. Review length and type of anesthesia with the anesthesiologist. Perform preoperative time out, confirming patient identity, surgical site, procedure, indicated intraoperative medications, and antibiotic and DVT prophylaxis, as necessary. Monitor initial patient positioning for induction of anesthesia. Monitor initial patient positioning for placement of neuromonitoring electrodes. Following induction of anesthesia, assist with positioning of the patient prone. Verify and/or assist with padding of the patient to prevent pressure on neurovascular structures and placement of any traction devices to facilitate intraoperative imaging. Scrub and gown. Supervise preparing and draping of the patient. Perform surgical time out.

Description of Intra-Service Work: Following skin incision, dissection is undertaken through the subcutaneous tissue and fascia to the posterior spinal elements. The subcutaneous and muscular tissues are reflected to expose the posterior surface of the lamina and out over the facet(s) and/or transverse processes of the segment to be fused. Verification of the levels is undertaken with imaging. Bone cutting tools are used to remove as much of the lamina above and below and as much of the medial edges of the facets as is necessary for adequate exposure of the disc space. The nerve root is carefully mobilized from adhesions and/or peridural membrane. Epidural veins are cauterized and cut. The nerve root(s) and thecal sac are protected by packing and retraction. The annulus is incised, and an ample section of it is removed by sharp dissection. The nucleus is removed within the disc space with rongeurs and curettes. Bone cutting instruments are used to remove cartilaginous and subchondral end-plates of the vertebrae above and below the disc to be fused. The bone dissection is fashioned to accept the graft in a way that will provide for contact, maintenance of disc space height, and stability. The spacer (graft and/or device) is impacted into the recipient site. When appropriate, the entire exposure, bone preparation, and spacer insertion and impaction are repeated from the other side of the table. Decortication of the posterolateral elements (transverse process, any remaining lamina, and/or facets) is undertaken, and graft material is packed posterolaterally to complete the arthrodesis preparations for the fusion. The neural elements are inspected to confirm that they are free of any

impingement from the implants in the canal and neuroforamen. An interposition membrane, as by free fat graft, may be used to cover the exposed dura and nerve root. Muscles and fascia are sutured. A drain is inserted through a separate stab wound and secured. The subcutaneous tissues and skin are closed. (Note: Decompression of neural elements, instrumentation, and/or bone preparation or harvesting, when performed, are separately reported.)

Description of Post-Service Work:
Facility: Apply sterile dressings. Assist with repositioning patient supine. When anesthesia has been reversed, transfer the patient to the recovery room. Write an operative note in the patient's record. Monitor patient for abnormal neurological findings prior to discharge from recovery to the surgical floor. Sign the OR forms, including pre- and postoperative diagnosis and operations performed. Discuss procedure outcome with family. Dictate postoperative report. Dictate procedure outcome and expected recovery letter for referring physician and/or insurance company. Order and review films to check the alignment of the cervical spine. Later the same day, review nursing and other provider chart notes, assess patient neurovascular status and pain. Write orders or update orders, as necessary, for medications, diet, and patient activity. Chart patient progress notes. On subsequent days, examine the patient, check wounds and neurovascular status. Review nursing and other provider chart notes. Chart patient progress notes. Discuss (oral/written) patient progress with referring physician. Answer (oral/written) questions from patient and/or family, nursing and other staff, and insurance staff. When safe to discharge patient to home, conduct final exam, including neurovascular and pain status, write orders for follow-up visits, post-discharge laboratory tests, imaging, home care, and physical therapy. Order medications needed post-discharge. Discuss home restrictions and activity levels (ie, diet, bathing, driving, exercise) with patient/family. Complete all appropriate medical records, including day of discharge progress notes, discharge summary, discharge instructions, and insurance forms.

Office: Examine patient and perform neurological exam and pain assessment. Write orders for medications. Order and review periodic imaging, as appropriate. Monitor wounds and remove sutures and staples when appropriate. Review physical therapy progress and revise orders as needed. Dictate patient progress notes for the medical chart. Answer patient and/or family questions and insurance staff questions. Discuss (oral/written) patient progress with referring physician.

INTENSITY/COMPLEXITY MEASURES

(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	23%	41%	36%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	5%	23%	73%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	23%	77%

Physical effort required	0%	23%	77%

Psychological Stress	**Less**	**Identical**	**More**
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	5%	36%	59%

Survey Code Compared to 2nd Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	0%	38%	52%	10%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	5%	38%	57%

Technical Skill/Physical Effort	**Less**	**Identical**	**More**
Technical skill required	0%	38%	62%
Physical effort required	0%	33%	67%

Psychological Stress	**Less**	**Identical**	**More**
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	10%	38%	52%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

In October 2020, the CPT Editorial Panel approved the revision of four codes describing arthrodesis, addition of two codes to report laminectomy, facetectomy, or foraminotomy during posterior interbody arthrodesis, lumbar to more appropriately identify the decompression that may be separately reported. A coding change application was created to assist with coding confusion for reporting additional decompression performed at the same interspace as a lumbar interbody fusion procedure. The coding confusion stemmed from language ("other than for decompression") included in the descriptors for codes 22630-22634. To clarify correct coding, the CCA created two new add-on codes (63052 and 63053) to report decompression when performed in conjunction with posterior interbody arthrodesis at the same interspace, along with definitions, guidelines, and parenthetical instructions. The terms corpectomy, facetectomy, foraminotomy, hemilaminectomy, lamina, laminectomy, and laminotomy were defined and editorial changes were made to several codes to consistently use the term "interspace" instead of "level" or "segment."

In January 2021, the specialty societies surveyed the two new codes and indicated the existing code changes were editorial. The RUC expressed concern that the base codes were not surveyed with the two new add-on codes. Two of the codes (22630 and 22632) are from 1995 and the other two codes were last RUC reviewed in 2011 (22633 and 22634). The RUC could not accept the specialties' justification for only surveying the new codes. They questioned how, without the base codes being surveyed, there would be assurance the respondents followed instruction to only consider the work of the add-on codes. Moreover, CMS has made it clear that the Agency expects the base codes and add-on codes to be reviewed at the same time. The RUC recommends that the entire family (CPT codes 22630, 22632, 22633, 22634, 63052 , 63053) be resurveyed for review at the April 2021 RUC meeting and that interim values be established for CPT codes 63052 and 63053 for CY 2022.

Recommendation – 22633

We recommend crosswalking the work RVU of 26.80 for MPC code 55866 to 22633 to account for the slight decrease in intraoperative and total time. This value is less than the 25th percentile.

Positioning time

Additional time was added to the package time of 3 minutes for supine positioning. These patients will typically be positioned prone.

Key Reference Code Comparison

KRS1: The respondents who chose 22612 as a reference indicated the intensity/complexity of 22633 is more than 22612.

KRS2: The respondents who chose 22857 as a reference indicated the intensity/complexity of 22633 is similar to somewhat more than 22857.

CPT	DESCRIPTOR	RVW	IWPUT	TOTAL TIME	PRE	INTRA	POST
22612	Arthrodesis, posterior or posterolateral technique, single level; lumbar (with lateral transverse technique, when performed)	23.53	0.088	482	95	150	237
22633	Arthrodesis, combined posterior or posterolateral technique with posterior interbody technique including laminectomy and/or discectomy sufficient to prepare interspace (other than for decompression), single interspace; lumbar	26.80	0.091	509	75	180	254
22857	Total disc arthroplasty (artificial disc), anterior approach, including discectomy to prepare interspace (other than for decompression), single interspace, lumbar	27.13	0.086	550	95	180	275

MPC Code Comparison

CPT	DESCRIPTOR	RVW	IWPUT	TOTAL TIME	PRE	INTRA	POST
55866	Laparoscopy, surgical prostatectomy, retropubic radical, including nerve sparing, includes robotic assistance, when performed	26.80	0.104	442	68	180	194
22633	Arthrodesis, combined posterior or posterolateral technique with posterior interbody technique including	26.80	0.091	509	75	180	254

	laminectomy and/or discectomy sufficient to prepare interspace (other than for decompression), single interspace; lumbar						
33641	Repair atrial septal defect, secundum, with cardiopulmonary bypass, with or without patch	29.58	0.094	562	95	164	303

Other Code Comparison

Codes 43281 and 33255 bracket and offer further support of the recommended wRVU of 26.80 for 22633.

CPT	DESCRIPTOR	RVW	IWPUT	TOTAL TIME	PRE	INTRA	POST
43281	Laparoscopy, surgical, repair of paraesophageal hernia, includes fundoplasty, when performed; without implantation of mesh	26.60	0.107	424	70	180	174
22633	Arthrodesis, combined posterior or posterolateral technique with posterior interbody technique including laminectomy and/or discectomy sufficient to prepare interspace (other than for decompression), single interspace; lumbar	26.80	0.091	509	75	180	254
33255	Operative tissue ablation and reconstruction of atria, extensive (eg, maze procedure); without cardiopulmonary bypass	29.04	0.106	516	95	180	241

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. Decompression, instrumentation and/or bone preparation or harvesting, when performed, is separately reported.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 22633

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty neurosurgery How often? Commonly

Specialty orthopaedic surgery How often? Commonly

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. national data not available

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 38,096
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. RUC database

Specialty neurosurgery Frequency 19800 Percentage 51.97 %

Specialty orthopaedic surgery Frequency 18286 Percentage 47.99 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Explor/Decompr/Excis disc

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 22633

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

SUMMARY OF RECOMMENDATION

CPT Code:22634 Tracking Number J4 Original Specialty Recommended RVU: **7.96**
Presented Recommended RVU: **7.96**
Global Period: ZZZ Current Work RVU: **8.16** RUC Recommended RVU: **7.96**

CPT Descriptor: Arthrodesis, combined posterior or posterolateral technique with posterior interbody technique including laminectomy and/or discectomy sufficient to prepare interspace (other than for decompression), single interspace; each additional interspace and segment (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 68-year-old female presents with severe disc degeneration with lateral listhesis of L4-L5 above a L5-S1 lytic or isthmic spondylolisthesis. She has significant low back pain that has not responded to non-operative treatment. During (separately reported) interbody arthrodesis of L4-L5, she undergoes additional interspace arthrodesis of L5-S1 via a unilateral or bilateral approach using a posterolateral technique with posterior interbody technique. (Note: This is an add-on service. Decompression, instrumentation, and/or bone preparation or harvesting, when performed, is separately reported. Only consider the additional work related to the arthrodesis of the additional L5-S1 interspace.)

Percentage of Survey Respondents who found Vignette to be Typical: 90%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: n/a

Description of Intra-Service Work: Skin, muscle, and fascia incisions are extended to provide for enough retraction to safely expose the additional interspace. The ligamentum flavum and/or scar is removed from between the laminae of the additional interspace. The laminae and medial edges of the facets are removed with bone cutting instruments to a degree sufficient to allow safe exposure of the disc space. The nerve root is carefully mobilized from adhesions and/or peridural membrane. Epidural veins are cauterized and cut. The nerve root(s) and thecal sac are protected by packing and retraction. The annulus is incised, and an ample section of it is removed by sharp dissection. The nucleus is removed within the disc space with rongeurs and curettes. Bone cutting instruments are used to remove cartilaginous and subchondral end-plates of the vertebrae above and below the disc to be fused. The bone dissection is fashioned to accept the graft in a way that will provide for contact, maintenance of disc space height, and stability. The spacer (graft and/or device) is impacted into the recipient site. When appropriate, the entire exposure, bone preparation, and spacer insertion and impaction are repeated from the other side of the table. Decortication of the posterolateral elements (transverse process, any remaining lamina, and/or facets) is undertaken, and graft material is packed posterolaterally to complete the arthrodesis preparations for the fusion. The neural elements are inspected to confirm that they are free of any impingement from the implant(s) in the canal and neuroforamen. An interposition membrane, as by fat graft, is applied over the exposed dura and nerve roots of the additional space. (Note: Decompression of neural elements instrumentation, and/or bone preparation or harvesting, when performed, are separately reported.)

Description of Post-Service Work: n/a

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	4%	12%	40%	44%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	4%	20%	76%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	4%	24%	72%
Physical effort required	4%	16%	80%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	4%	32%	64%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	9%	22%	70%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	4%	13%	83%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	4%	17%	78%
Physical effort required	0%	9%	91%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	9%	4%	87%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

In October 2020, the CPT Editorial Panel approved the revision of four codes describing arthrodesis, addition of two codes to report laminectomy, facetectomy, or foraminotomy during posterior interbody arthrodesis, lumbar to more appropriately identify the decompression that may be separately reported. A coding change application was created to assist with coding confusion for reporting additional decompression performed at the same interspace as a lumbar interbody fusion procedure. The coding confusion stemmed from language ("other than for decompression") included in the descriptors for codes 22630-22634. To clarify correct coding, the CCA created two new add-on codes (63052 and 63053) to report decompression when performed in conjunction with posterior interbody arthrodesis at the same interspace, along with definitions, guidelines, and parenthetical instructions. The terms corpectomy, facetectomy, foraminotomy, hemilaminectomy, lamina, laminectomy, and laminotomy were defined and editorial changes were made to several codes to consistently use the term "interspace" instead of "level" or "segment."

In January 2021, the specialty societies surveyed the two new codes and indicated the existing code changes were editorial. The RUC expressed concern that the base codes were not surveyed with the two new add-on codes. Two of the codes (22630 and 22632) are from 1995 and the other two codes were last RUC reviewed in 2011 (22633 and 22634). The RUC could not accept the specialties' justification for only surveying the new codes. They questioned how, without the base codes being surveyed, there would be assurance the respondents followed instruction to only consider the work of the add-on codes. Moreover, CMS has made it clear that the Agency expects the base codes and add-on codes to be reviewed at the same time. The RUC recommends that the entire family (CPT codes 22630, 22632, 22633, 22634, 63052 , 63053) be resurveyed for review at the April 2021 RUC meeting and that interim values be established for CPT codes 63052 and 63053 for CY 2022.

Recommendation – 22634

The current value for 22634 is based on a calculation in 2011 that estimated the new add-on code was 70% of the survey 25th percentile work RVU. Although the current survey median work RVU would suggest an increase is warranted, we do not have compelling evidence for an increase. We recommend the survey 25th percentile work RVU of 7.96 to account for the slight 5 minute decrease in median intraoperative time.

Key Reference Code Comparison

KRS1: The respondents who chose 22614 as a reference indicated the intensity/complexity of 22634 is more/much more than 22614.

KRS2: The respondents who chose 22840 as a reference indicated the intensity/complexity of 22634 is more than 22840.

CPT	DESCRIPTOR	RVW	IWPUT	TOTAL TIME	PRE	INTRA	POST
22614	Arthrodesis, posterior or posterolateral technique, single level; each additional vertebral segment (List separately in addition to code for primary procedure)	6.43	0.161	40	0	40	0
22634	Arthrodesis, combined posterior or posterolateral technique with posterior interbody technique including laminectomy and/or discectomy sufficient to prepare interspace (other than for decompression), single interspace; each additional interspace and segment (List separately in addition to code for primary procedure)	7.96	0.122	65	0	65	0
22840	Posterior non-segmental instrumentation (eg, Harrington rod technique, pedicle fixation across 1 interspace, atlantoaxial transarticular screw fixation, sublaminar wiring at C1, facet screw fixation) (List separately in addition to code for primary procedure)	12.52	0.209	60	0	60	0

MPC Code Comparison

There are few MPC codes with a ZZZ global assignment which makes finding appropriate MPC codes with similar intensity/complexity difficult. MPC code 34812 (with the highest wRVU) involves open femoral artery exposure by groin incision and closure of the wound, typically for separately reported percutaneous delivery of an endovascular

prosthesis for an asymptomatic infrarenal AAA. In comparison, the lower intensity exposure and closure for the survey code are performed as part of the primary arthrodesis code.

CPT	DESCRIPTOR	RVW	IWPUT	TOTAL TIME	PRE	INTRA	POST
34812	Open femoral artery exposure for delivery of endovascular prosthesis, by groin incision, unilateral (List separately in addition to code for primary procedure)	4.13	0.103	40	0	40	0
22634	Arthrodesis, combined posterior or posterolateral technique with posterior interbody technique including laminectomy and/or discectomy sufficient to prepare interspace (other than for decompression), single interspace; each additional interspace and segment (List separately in addition to code for primary procedure)	7.96	0.122	65	0	65	0

Other Code Comparison

The codes below bracket and offer further support of the recommended wRVU of 7.96 for 22634.

CPT	DESCRIPTOR	RVW	IWPUT	TOTAL TIME	PRE	INTRA	POST
34820	Open iliac artery exposure for delivery of endovascular prosthesis or iliac occlusion during endovascular therapy, by abdominal or retroperitoneal incision, unilateral (List separately in addition to code for primary procedure)	7.00	0.117	60	0	60	0
22634	Arthrodesis, combined posterior or posterolateral technique with posterior interbody technique including laminectomy and/or discectomy sufficient to prepare interspace (other than for decompression), single interspace; each additional interspace and segment (List separately in addition to code for primary procedure)	7.96	0.122	65	0	65	0
33746	Transcatheter intracardiac shunt (TIS) creation by stent placement for congenital cardiac anomalies to establish effective intracardiac flow, including all imaging guidance by the proceduralist, when performed, left and right heart diagnostic cardiac catheterization for congenital cardiac anomalies, and target zone angioplasty, when performed (eg, atrial septum, Fontan fenestration, right ventricular outflow tract, Mustard/Senning/Warden baffles); each additional intracardiac shunt location (List separately in addition to code for primary procedure)	8.00	0.133	60	0	60	0
93592	Percutaneous transcatheter closure of paravalvular leak; each additional occlusion device (List separately in addition to code for primary procedure)	8.00	0.133	60	0	60	0
33884	Placement of proximal extension prosthesis for endovascular repair of descending thoracic aorta (eg, aneurysm, pseudoaneurysm, dissection, penetrating ulcer, intramural hematoma, or traumatic disruption); each additional proximal extension (List separately in addition to code for primary procedure)	8.20	0.137	60	0	60	0

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.

- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 22634

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty neurosurgery How often? Commonly

Specialty orthopaedic surgery How often? Commonly

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. national data not available

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 14,338
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. RUC database

Specialty neurosurgery Frequency 7900 Percentage 55.09 %

Specialty orthopaedic surgery Frequency 6438 Percentage 44.90 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:

Major procedure

BETOS Sub-classification Level II:
Explor/Decompr/Excis disc

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 22634

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:63052 Tracking Number J5 Original Specialty Recommended RVU: **5.70**
Presented Recommended RVU: **5.70**
Global Period: ZZZ Current Work RVU: RUC Recommended RVU: **5.70**

CPT Descriptor: Laminectomy, facetectomy, or foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s] [eg, spinal or lateral recess stenosis]), during posterior interbody arthrodesis, lumbar; single vertebral segment (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: During (separately reported) posterior lumbar interbody arthrodesis for L4-5 spondylolisthesis with axial mechanical back pain and worsening neurogenic claudication and/or radiculopathy (extremity symptoms), refractory to nonoperative treatment, a 63-year-old female with advanced imaging that demonstrated central canal and bilateral lateral recess and foraminal stenosis at the L4-5 level, requires bilateral laminectomy with extensive decompression of the cauda equina and/or nerve root[s]. This more extensive decompression is beyond the typical dissection needed to complete the interbody arthrodesis approach and intervention. (Note: This is an add-on service. Only consider the additional work related to bilateral laminectomy with decompression of the cauda equina and/or nerve root[s].)

Percentage of Survey Respondents who found Vignette to be Typical: 99%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: n/a

Description of Intra-Service Work: Following bony and soft tissue resection and exposure of the L4-5 disc space for the interbody access and preparation for interbody arthrodesis, attention is turned to the additional bone and nervous system work required for decompression beyond what is required to access the disc space for the interbody arthrodesis. Additional portions of the laminae at the L4 and L5 vertebral segments are removed with a drill or bone biting instruments, and the inferior and superior facets are resected. The neural foraminae are expanded with bone biting instruments. The ligamentum flavum is dissected off the dura and completely removed, decompressing and mobilizing the neural elements. The neural elements are confirmed to be mobilized and decompressed. The additional intraoperative work is documented in the medical record.

Description of Post-Service Work: n/a

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	0%	30%	33%	37%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	26%	74%

Technical Skill/Physical Effort	**Less**	**Identical**	**More**
Technical skill required	4%	26%	70%

Physical effort required	11%	26%	63%

Psychological Stress	**Less**	**Identical**	**More**
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	4%	22%	74%

Survey Code Compared to 2nd Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	33%	17%	22%	28%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	39%	11%	50%

Technical Skill/Physical Effort	**Less**	**Identical**	**More**
Technical skill required	28%	17%	56%
Physical effort required	22%	22%	56%

Psychological Stress	**Less**	**Identical**	**More**
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	33%	17%	50%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

In October 2020, the CPT Editorial Panel approved the revision of four codes describing arthrodesis, addition of two codes to report laminectomy, facetectomy, or foraminotomy during posterior interbody arthrodesis, lumbar to more

appropriately identify the decompression that may be separately reported. A coding change application was created to assist with coding confusion for reporting additional decompression performed at the same interspace as a lumbar interbody fusion procedure. The coding confusion stemmed from language ("other than for decompression") included in the descriptors for codes 22630-22634. To clarify correct coding, the CCA created two new add-on codes (63052 and 63053) to report decompression when performed in conjunction with posterior interbody arthrodesis at the same interspace, along with definitions, guidelines, and parenthetical instructions. The terms corpectomy, facetectomy, foraminotomy, hemilaminectomy, lamina, laminectomy, and laminotomy were defined and editorial changes were made to several codes to consistently use the term "interspace" instead of "level" or "segment."

In January 2021, the specialty societies surveyed the two new codes and indicated the existing code changes were editorial. The RUC expressed concern that the base codes were not surveyed with the two new add-on codes. Two of the codes (22630 and 22632) are from 1995 and the other two codes were last RUC reviewed in 2011 (22633 and 22634). The RUC could not accept the specialties' justification for only surveying the new codes. They questioned how, without the base codes being surveyed, there would be assurance the respondents followed instruction to only consider the work of the add-on codes. Moreover, CMS has made it clear that the Agency expects the base codes and add-on codes to be reviewed at the same time. The RUC recommends that the entire family (CPT codes 22630, 22632, 22633, 22634, 63052 , 63053) be resurveyed for review at the April 2021 RUC meeting and that interim values be established for CPT codes 63052 and 63053 for CY 2022.

Recommendation – 63052

We recommend a work RVU of 5.70 (survey 25th percentile) and total time of 45 minutes. This RVW is higher than the interim recommendation of 5.55 which was the prior survey 25th percentile for a total time of 40 minutes.
Rationale: The RUC previously accepted the survey 25th percentile as interim, but believed the survey was flawed because the add-on codes were not surveyed in conjunction with the base codes. This new survey included all six codes. In addition, the overall experience of the survey respondents is greater for the new survey of 6 codes when compared to the prior survey of the add on codes (ie, although the median is still 50, there is a shift to the right).

Key Reference Code Comparison

KRS1: The respondents who chose 22840 as a reference indicated the intensity/complexity of 63052 is more/much more than 22840.

KRS2: The respondents who chose 22208 as a reference indicated the intensity/complexity of 63052 is overall similar to 22208.

CPT	DESCRIPTOR	RVW	IWPUT	TOTAL TIME	PRE	INTRA	POST
22840	Posterior non-segmental instrumentation (eg, Harrington rod technique, pedicle fixation across 1 interspace, atlantoaxial transarticular screw fixation, sublaminar wiring at C1, facet screw fixation) (List separately in addition to code for primary procedure)	12.52	0.209	60	0	60	0
63052	Laminectomy, facetectomy, or foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s] [eg, spinal or lateral recess stenosis]), during posterior interbody arthrodesis, lumbar; single vertebral segment (List separately in addition to code for primary procedure)	5.70	0.127	45	0	45	0
22208	Osteotomy of spine, posterior or posterolateral approach, 3 columns, 1 vertebral segment (eg, pedicle/vertebral body subtraction); each additional vertebral segment (List separately in addition to code for primary procedure)	9.66	0.78	135	0	120	15

MPC Code Comparison

There are few MPC codes with a ZZZ global assignment which makes finding appropriate MPC codes with similar intensity/complexity difficult. MPC code 34812 (with the highest wRVU) involves open femoral artery exposure by groin incision and closure of the wound, typically for separately reported percutaneous delivery of an endovascular prosthesis for an asymptomatic infrarenal AAA. In comparison, the lower intensity exposure and closure for the survey code are performed as part of the primary arthrodesis code.

CPT	DESCRIPTOR	RVW	IWPUT	TOTAL TIME	PRE	INTRA	POST
34812	Open femoral artery exposure for delivery of endovascular prosthesis, by groin incision, unilateral (List separately in addition to code for primary procedure)	4.13	0.103	40	0	40	0
63052	Laminectomy, facetectomy, or foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s] [eg, spinal or lateral recess stenosis]), during posterior interbody arthrodesis, lumbar; single vertebral segment (List separately in addition to code for primary procedure)	5.70	0.127	45	0	45	0

Other Code Comparison

Codes 22585 and 22552 bracket and offer further support of the recommended wRVU of 5.70 for 63052.

CPT	DESCRIPTOR	RVW	IWPUT	TOTAL TIME	PRE	INTRA	POST
22585	Arthrodesis, anterior interbody technique, including minimal discectomy to prepare interspace (other than for decompression); each additional interspace (List separately in addition to code for primary procedure)	5.52	0.123	45	0	45	0
63052	Laminectomy, facetectomy, or foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s] [eg, spinal or lateral recess stenosis]), during posterior interbody arthrodesis, lumbar; single vertebral segment (List separately in addition to code for primary procedure)	5.70	0.127	45	0	45	0
22552	Arthrodesis, anterior interbody, including disc space preparation, discectomy, osteophytectomy and decompression of spinal cord and/or nerve roots; cervical below C2, each additional interspace (List separately in addition to code for primary procedure)	6.50	0.142	50	5	45	0

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) There has been no reporting mechanism for this work since 2015. Please see supplemental file with an historical reporting overview.

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty neurosurgery How often? Sometimes

Specialty orthopaedic surgery How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. national data not available

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 11,000
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. specialty estimate

Specialty neurosurgery Frequency 5830 Percentage 53.00 %

Specialty orthopaedic surgery Frequency 5170 Percentage 47.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Explor/Decompr/Excis disc

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 63066

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:63053 Tracking Number J6 Original Specialty Recommended RVU: **5.00**
Presented Recommended RVU: **5.00**
Global Period: ZZZ Current Work RVU: RUC Recommended RVU: **5.00**

CPT Descriptor: Laminectomy, facetectomy, or foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s] [eg, spinal or lateral recess stenosis]), during posterior interbody arthrodesis, lumbar; each additional segment (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: During (separately reported) posterior lumbar interbody arthrodesis for L4-5 and L5-S1 spondylolisthesis with axial mechanical back pain and worsening neurogenic claudication and/or radiculopathy (extremity symptoms), refractory to nonoperative treatment, a 68-year-old male with advanced imaging that demonstrated central canal and bilateral lateral recess and foraminal stenosis at the L4-5 and L5-S1 levels requires bilateral laminectomy with extensive decompression of the cauda equina and/or nerve root[s]. This more extensive decompression is beyond the typical dissection needed to complete the interbody arthrodesis approach and intervention at each level. The first segment laminectomy has been completed (separately reported) and now the additional segment is addressed. (Note: This is an add-on service. Only consider the additional work related to bilateral laminectomy with decompression of the cauda equina and/or nerve root[s] of the additional segment.)

Percentage of Survey Respondents who found Vignette to be Typical: 97%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: n/a

Description of Intra-Service Work: After (separately reported) bony and soft tissue resection and exposure of the L4-L5 and L5-S1 disc spaces for the interbody access and preparation for arthrodesis is completed, along with the (separately reported) decompression of neural elements at the L4-L5 interspace, attention is turned to the additional bone and nervous system work required for decompression of the L5-S1 interspace beyond what is required to access the disc space for the interbody arthrodesis. Additional portions of the laminae at the L5 and S1 vertebral segments are removed with the drill or bone biting instruments, and the inferior and superior facets are resected. The neural foraminae are expanded with bone biting instruments. The ligamentum flavum is dissected off the dura and completely removed, allowing for decompression and mobilization of the neural elements are mobilized. The neural elements are confirmed to be mobilized and decompressed. The additional intraoperative work is documented in the medical record.

Description of Post-Service Work: n/a

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

In October 2020, the CPT Editorial Panel approved the revision of four codes describing arthrodesis, addition of two codes to report laminectomy, facetectomy, or foraminotomy during posterior interbody arthrodesis, lumbar to more appropriately identify the decompression that may be separately reported. A coding change application was created to assist with coding confusion for reporting additional decompression performed at the same interspace as a lumbar interbody fusion procedure. The coding confusion stemmed from language ("other than for decompression") included in the descriptors for codes 22630-22634. To clarify correct coding, the CCA created two new add-on codes (63052 and 63053) to report decompression when performed in conjunction with posterior interbody arthrodesis at the same interspace, along with definitions, guidelines, and parenthetical instructions. The terms corpectomy, facetectomy, foraminotomy, hemilaminectomy, lamina, laminectomy, and laminotomy were defined and editorial changes were made to several codes to consistently use the term "interspace" instead of "level" or "segment."

In January 2021, the specialty societies surveyed the two new codes and indicated the existing code changes were editorial. The RUC expressed concern that the base codes were not surveyed with the two new add-on codes. Two of the codes (22630 and 22632) are from 1995 and the other two codes were last RUC reviewed in 2011 (22633 and 22634). The RUC could not accept the specialties' justification for only surveying the new codes. They questioned how, without the base codes being surveyed, there would be assurance the respondents followed instruction to only consider the work of the add-on codes. Moreover, CMS has made it clear that the Agency expects the base codes and add-on codes to be reviewed at the same time. The RUC recommends that the entire family (CPT codes 22630, 22632, 22633, 22634, 63052 , 63053) be resurveyed for review at the April 2021 RUC meeting and that interim values be established for CPT codes 63052 and 63053 for CY 2022.

Recommendation – 63053

We recommend a work RVU of 5.00 (survey 25th percentile) and total time of 40 minutes. This RVW is higher than the interim recommendation of 4.44 which was crosswalked to code 33572 with total time = 30 minutes).
Rationale: The RUC previously crosswalked a value that was less than the survey 25th percentile based on total time as interim, but believed the survey was flawed because the add-on codes were not surveyed in conjunction with the base codes. This new survey included all six codes. In addition, the overall experience of the survey respondents is greater for the new survey of 6 codes when compared to the prior survey of the add on codes (ie, the 25th pctl, median, 75th pctl, and max 12-month experience is all greater). The new survey, which included all codes, elicited a time that is only 5 minutes less than the work related to 63052 and that we believe is a more accurate reflection of the difference in work between laminectomy/facetectomy/foraminotomy with decompression of the first segment and of an additional segment.

Key Reference Code Comparison

KRS1: The respondents who chose 22614 as a reference indicated the intensity/complexity of 63053 is more than 22614.

KRS2: The respondents who chose 22840 as a reference indicated the intensity/complexity of 63053 is more/much more than 22840.

CPT	DESCRIPTOR	RVW	IWPUT	TOTAL TIME	PRE	INTRA	POST
22614	Arthrodesis, posterior or posterolateral technique, single level; each additional vertebral segment (List separately in addition to code for primary procedure)	6.43	0.161	40	0	40	0
63053	Laminectomy, facetectomy, or foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s] [eg, spinal or lateral recess stenosis]), during posterior interbody arthrodesis, lumbar; each additional segment (List separately in addition to code for primary procedure)	5.00	0.125	40	0	40	0
22840	Posterior non-segmental instrumentation (eg, Harrington rod technique, pedicle fixation across 1 interspace, atlantoaxial transarticular screw fixation, sublaminar wiring at C1, facet screw fixation) (List separately in addition to code for primary procedure)	12.52	0.209	60	0	60	0

MPC Code Comparison

There are few MPC codes with a ZZZ global assignment which makes finding appropriate MPC codes with similar intensity/complexity difficult. MPC code 34812 (with the highest wRVU) involves open femoral artery exposure by groin incision and closure of the wound, typically for separately reported percutaneous delivery of an endovascular prosthesis for an asymptomatic infrarenal AAA. In comparison, the lower intensity exposure and closure for the survey code are performed as part of the primary arthrodesis code.

CPT	DESCRIPTOR	RVW	IWPUT	TOTAL TIME	PRE	INTRA	POST
34812	Open femoral artery exposure for delivery of endovascular prosthesis, by groin incision, unilateral (List separately in addition to code for primary procedure)	4.13	0.103	40	0	40	0
63053	Laminectomy, facetectomy, or foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s] [eg, spinal or lateral recess stenosis]), during posterior interbody arthrodesis, lumbar; each additional segment (List separately in addition to code for primary procedure)	5.00	0.125	40	0	40	0

Other Code Comparison

Codes 44128 and 22585 bracket and offer further support of the recommended wRVU of 5.00 for 63053.

CPT	DESCRIPTOR	RVW	IWPUT	TOTAL TIME	PRE	INTRA	POST
44128	Enterectomy, resection of small intestine for congenital atresia, single resection and anastomosis of proximal segment of intestine; each additional resection and anastomosis (List separately in addition to code for primary procedure)	4.44	0.106	40	0	40	0
63053	Laminectomy, facetectomy, or foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s] [eg, spinal or lateral recess stenosis]), during posterior interbody arthrodesis, lumbar; each additional segment (List separately in addition to code for primary procedure)	5.00	0.125	40	0	40	0
22585	Arthrodesis, anterior interbody technique, including minimal discectomy to prepare interspace (other than for decompression); each additional interspace (List separately in addition to code for primary procedure)	5.52	0.123	45	0	45	0

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the

provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) There has been no reporting mechanism for this work since 2015. Please see supplemental file with an historical reporting overview.

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty neurosurgery How often? Sometimes

Specialty orthopaedic surgery How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. national data not available

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 4,000
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. specialty estimate

Specialty neurosurgery Frequency 2120 Percentage 53.00 %

Specialty orthopaedic surgery Frequency 1880 Percentage 47.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Explor/Decompr/Excis disc

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 63066

+63052 and +63053: Historical Reporting Overview

Coding History

In the 1990's, the work for arthrodesis and decompression was typically performed jointly by an orthopedic surgeon who would perform the arthrodesis and a neurosurgeon who would perform the decompression. Perhaps the single most important aspect of this coding was that the decompression and arthrodesis was being coded at the same spinal level. The codes were surveyed in that manner, and wRVUs were based on each surgeon's work.

In 1998, an AMA CPT workgroup that convened to discuss reporting correct coding for spine procedures via an anterior approach, also reviewed the lumbar interbody fusion code (22630) and decompression code (63047) and determined that each code may be separately and discretely performed and that there was no overlap in intra-service work. The workgroup also agreed that each code was valued based on the specific work of each code (ie, interbody fusion versus decompression). For CPT 2000, the CPT Panel introduced language into code 22630 which made this point clear: “minimal laminectomy and/or discectomy to prepare the interspace.” The spirit of that language continues to this day in the parenthetical “other than for decompression.” That particular position was reinforced in the January 2001 *CPT Assistant* where a case illustration of a patient requiring a decompression and an interbody fusion was presented and the statement made, “63047-51 should be reported in addition to the code 22630.”

In 2012, in recognition that posterolateral fusions were commonly performed along with interbody fusions, a new bundled code (22633) was established to include the work of interbody fusions (22630) and posterolateral fusions (22612) being bundled together into 22633. It is important to note that the decompression element of the operation (63047) remained a separate entity as intended by the initial valuation of that code and the inclusion of ("other than for decompression") in the code descriptor.

In 2014, confusion, both at education seminars and in print, about correct coding of the additional work of laminectomy persisted, with societies not agreeing on appropriate coding for the additional work of decompression performed concurrently with interbody fusion.

In January 2015, due to misinformed educational materials, CMS took a drastic departure from the application of the CPT codes that had been in place for decades; specifically, the evolution of the codes, the validated surveys for each of the separate codes, and valuation of separate work, by establishing NCCI edits: *"CMS payment policy does not allow separate payment for CPT codes 63042 (laminotomy…; lumbar) or 63047 (laminectomy…; lumbar) with CPT codes 22630 or 22633 (arthrodesis; lumbar) when performed at the same interspace. If the two procedures are performed at different interspaces, the two codes of an edit pair may be reported with modifier 59 appended to CPT code 63042 or 63047."* [Chapter 4 of the NCCI manual]

In September 2015, the stakeholder societies conducted discussions with NCCI (CMS) about the history and valuation of codes 22630-22634. NCCI staff communicated that CMS had no intention to modify its position on these code pairs and instead recommended proposing an add-on code for use with arthrodesis codes that would describe additional decompression when performed.

Overview of CPT Assistant

After the coding changes for CPT 2000, the following CPT Assistant article was published that describes correct reporting of 22630 and 63047 for the same interspace.

January 2001 page 12
Coding Consultation
Musculoskeletal System, Surgery, 22554, 22630, 63001-63048, 63075-63078 (Q&A)

Question: The descriptors of codes 22554 and 22630 describe anterior (22554) or posterior (22630) interbody technique arthrodeses to include laminectomy, and/or diskectomy to prepare the interspace (other than for decompression). In what procedural circumstance would the 63001-63048 code(s) be reported in addition to code 22630? Similarly, in what procedural circumstance would code(s) 63075-63078 be reported in addition to code 22554?

AMA Comment
For both codes 22554 and 22630…

To report code 22554…

To report code 22630, *Arthrodesis, posterior interbody technique, including laminectomy and/or diskectomy to prepare interspace (other than for decompression), single interspace; lumbar*, in addition to code 63047-51, *Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; lumbar*, again additional procedure(s) must have been performed. For example, in spinal procedures performed on patients having lateral lumbar stenosis, the surgeon may need to perform additional work above and beyond that described by the PLIF, including facetectomy(ies) and/or foraminotomy(ies), to adequately decompress the nerve roots. For the purpose of this example, code 63047-51 should be reported in addition to code 22630.

Regarding the issue of laterality…

To further clarify, code 22630 may also require the additional performance of a posterior fusion, which involves bone grafting and placement of posterior instrumentation. These procedures should be additionally reported. If the surgeon uses a threaded bone dowel or prosthetic device in the disk space, then code +22851 should be reported. If any other type of bone graft is performed, the appropriate bone graft code should be reported.

The anterior fusion procedure described by code 22554…

In 2016, AMA CPTA staff drafted a FAQ based on the NCCI edit that was established. The stakeholder societies were not contacted about this FAQ. If we had been contacted, we would have informed AMA staff that we were in the process of discussions with CMS about coding misinformation.

October 2016 page 11
Frequently Asked Questions: Surgery: Nervous System

Question: The procedures described in code 63047 was performed for decompression, which was documented in the operative note. In addition, the procedure described in code 22633 was also performed at the same interspace. How should this be reported?

Answer: Codes 63047 and 22633 cannot be reported for the same interspace. However, it is appropriate to report codes 63047, Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; lumbar, and 22633, Arthrodesis, combined posterior or posterolateral technique with posterior interbody technique including laminectomy and/or discectomy sufficient to prepare interspace (other than for decompression), single interspace and segment; lumbar, if the two procedures are performed at different interspaces. Modifier 59, Distinct Procedural Service, should be appended to indicate that these are two distinct procedures.

The October 2016 FAQ added considerable coding confusion and after much effort by the stakeholder societies, including presentation of the historical information in this document, CPTA published a coding correction.

> **May 2018 page 9**
> **Coding Correction: Reporting Codes 22633 and 63047**
>
> In the Frequently Asked Questions (FAQ) section (page 11) of the October 2016 issue of CPT® Assistant, the Surgery: Nervous System answer incorrectly stated that codes 22633, Arthrodesis, combined posterior or posterolateral technique with posterior interbody technique including laminectomy and/or discectomy sufficient to prepare interspace (other than for decompression), single interspace and segment; lumbar, and 63047, Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; lumbar, may not be reported for the same interspace. On further analysis of this issue, it was demonstrated that this recommendation was inconsistent with previously published CPT® Assistant advice, which is that codes 22633 and 63047 may be reported for the same interspace when additional work is required to complete a decompression at a single spinal level. It is also appropriate to report codes 22633 and 63047, if the two procedures are performed at different interspaces. Modifier 59, Distinct Procedural Service, should then be appended to indicate that these are two distinct procedures.
>
> This correction aligns the coding advice with historical precedent published prior to the incorrect revisions in advice given in the October 2016 FAQ.
>
> The following is the corrected coding advice:
>
> *Surgery: Nervous System*
> Question: The procedure described in code 63047 was performed for decompression, which was documented in the operative note. In addition, the procedure described in code 22633 was also performed at the same interspace. How should this be reported?
>
> Answer: Codes 22633 and 63047 may be reported for the same interspace when additional work is required to complete a decompression at a single spinal level. It is also appropriate to report codes 22633 and 63047, if the two procedures are performed at different interspaces. Modifier 59, Distinct Procedural Service, should then be appended to indicate that these are two distinct procedures.

We appreciate that CPT recognized and corrected an errant FAQ.

Summary

Since the establishment of the CCI edits in 2015, surgeons have not been allowed to report 63047 with 22630-22634 for the same interspace. **This document is meant to explain why the current utilization for decompression at the same interspace is "zero."**

The new add-on codes respond to CMS's direction (via NCCI correspondence) that recommends establishing an add-on code for use with arthrodesis codes that would describe additional decompression when performed.

In addition to creation of the add-on codes, numerous new definitions and two instructional guidelines specify when 63052 and 63053 correctly apply:

> Decompression performed on the same vertebral segment(s) and/or interspace[s] as posterior lumbar interbody fusion that includes laminectomy, facetectomy, and/or foraminotomy may be separately reported using 630XX, 630X1.
>
> Decompression solely to prepare the interspace for fusion is not separately reported.

	back bracing. Non-operative treatments have failed to control his symptoms. During (separately reported) posterior lumbar interbody arthrodesis of L4-L5, he undergoes additional interspace arthrodesis of L5-S1 via a unilateral or bilateral approach using a posterior interbody technique. (Note: This is an add-on procedure. Decompression, instrumentation and/or bone preparation or harvesting, when performed, is separately reported. Only consider the additional work related to the posterior interbody arthrodesis of the additional L5-S1 interspace.)
22634	A 68-year-old female presents with severe disc degeneration with lateral listhesis of L4-L5 above a L5-S1 lytic or isthmic spondylolisthesis. She has significant low back pain that has not responded to non-operative treatment. During (separately reported) interbody arthrodesis of L4-L5, she undergoes additional interspace arthrodesis of L5-S1 via a unilateral or bilateral approach using a posterolateral technique with posterior interbody technique. (**Note**: This is an add-on service. Decompression, instrumentation, and/or bone preparation or harvesting, when performed, is separately reported. Only consider the additional work related to the arthrodesis of the additional L5-S1 interspace.)
63052	During (separately reported) posterior lumbar interbody arthrodesis for L4-5 spondylolisthesis with axial mechanical back pain and worsening neurogenic claudication and/or radiculopathy (extremity symptoms), refractory to nonoperative treatment, a 63-year-old female with advanced imaging that demonstrated central canal and bilateral lateral recess and foraminal stenosis at the L4-5 level, requires bilateral laminectomy with extensive decompression of the cauda equina and/or nerve root[s]. This more extensive decompression is beyond the typical dissection needed to complete the interbody arthrodesis approach and intervention. (**Note**: This is an add-on service. Only consider the additional work related to bilateral laminectomy with decompression of the cauda equina and/or nerve root[s].)
63053	During (separately reported) posterior lumbar interbody arthrodesis for L4-5 and L5-S1 spondylolisthesis with axial mechanical back pain and worsening neurogenic claudication and/or radiculopathy (extremity symptoms), refractory to nonoperative treatment, a 68-year-old male with advanced imaging that demonstrated central canal and bilateral lateral recess and foraminal stenosis at the L4-5 and L5-S1 levels requires bilateral laminectomy with extensive decompression of the cauda equina and/or nerve root[s]. This more extensive decompression is beyond the typical dissection needed to complete the interbody arthrodesis approach and intervention at each level. The first segment laminectomy has been completed (separately reported) and now the additional segment is addressed. (Note: This is an add-on service. Only consider the additional work related to bilateral laminectomy with decompression of the cauda equina and/or nerve root[s] of the additional segment.)

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

AANS, CNS, AAOS, NASS, ISASS Advisors reviewed the current PE details and adjusted as appropriate,

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code, but may provide an additional reference code for support. Provide an explanation for

CPT CODE(S): 22630, 22632, 22633, 22634, 63052, 63053
SPECIALTY SOCIETY(IES): AANS, CNS, AAOS, NASS, ISASS
PRESENTER(S): John Ratliff MD, Clemens Schirmer MD, William Creevy MD, Hussein Elkousy MD, Karin Swartz MD, Morgan Lorio MD

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

the selection of reference code(s) here (*for service reviewed prior to the implementation of clinical activity codes, detail is not provided in the RUC database, please contact Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org for PE spreadsheets for your reference codes*):

Current codes were used as references

3. Is this code(s) typically reported with an E/M service?

no

4. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time:

n/a

5. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies for the **code family**, please provide compelling evidence (please see *PE compelling evidence guidelines*) Please explain if the increase can be entirely accounted for because of an increase in physician time:

For code 22630, an exam light has been added for one visit at which the surgical wounds will be assessed and drain and suture/staple removal will occur.

6. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (*please see second worksheet in PE spreadsheet workbook*), please explain the difference here:

n/a

7. Please provide a brief description of the clinical staff work for the following:
   a. Pre-Service period:

Complete pre-service diagnostic and referral forms	Staff reviews all forms with patient and family to ensure all relevant history and diagnostic information is included.
Coordinate pre-surgery services (including test results)	Staff coordinates collection and documentation of imaging/lab results, patient specific information and other relevant patient information for surgical procedure including conducting requisite pre-surgery assessment with anesthesiologist. Enter and record all clinical updates in EHR.
Schedule space and equipment in facility	Staff interacts with facility to schedule space, supplies, equipment, and review checklists.
Provide pre-service education/obtain consent	Staff reviews procedure, complication risk, process of recovery, and answers patient/family questions.
Complete pre-procedure phone calls and prescription	Staff reviews preoperative medication changes, reviews patient medical status and answers final pre-admission questions.

   b. Service period (includes pre, intra and post):

Prior to discharge, office clinical staff will assist with necessary post-discharge care coordination, such as: Responding to patient/family questions about home activity restrictions and care of drains. Confirmation of discharge antibiotics if needed, and pain medication. Coordination with other physicians and QHPs involved in the care of the patient for transfer of records. Transitioning discharge information to the surgeon's office medical record, including medication list, correspondence and imaging or lab results pending at discharge.

   c. Post-service period:

The clinical staff work includes the standard activities involved in any E/M visit including ensuring the appropriate

supplies are available in the room, ensuring imaging and lab reports are available, rooming the patient, gowning, reviewing current medications/allergies in EHR, obtaining vital signs, assisting with wound care, coordination of care, and cleaning of the room.

8. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (*please see second worksheet in PE spreadsheet workbook*):

n/a

9. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov.

n/a

INVOICES

10. ☐ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

11. ☐ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

12. If you wish to include a supply that is not on the list (*please see fourth worksheet in PE spreadsheet workbook*) please provide a paid invoice. Identify and explain the invoice here:

n/a

13. Are you recommending a PE supply pack for this recommendation? Yes or No.
If Yes, please indicate if the pack is an established package of supplies as defined by CMS (eg, SA047 *pack, E/M visit*) or a pack that is commercially available?

yes, SA048 and SA053

14. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation. Please include the description, CMS supply code, unit, item quantity and unit price (if available). See documents two and three under PE reference materials on the RUC Collaboration Website for information on the contents of kits, packs and trays.

DESCRIPTION	Code	Unit	Item Qty	Unit price

ITEMIZED LIST OF CHANGES (FOLLOWING THE PE SUBCOMMITTEE MEETING

During and immediately following the review of this tab at the PE Subcommittee meeting please revise the summary of recommendation (PE SOR) based on modifications made during the meeting. Please submit the revised form electronically to Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org immediately following the close of business the same day that the tab is reviewed. On the PE spreadsheet, please highlight the cells and/or use red font to show the changes made during the PE Subcommittee meeting (if you have provided any of this highlighting based on changes from the reference code prior to the PE Subcommittee meeting please remove it, so not to be confused with changes made during the meeting). In addition to those revisions please also provide an itemized list of the modifications made to the PE spreadsheet during the PE Subcommittee meeting in the space below (e.g. clinical activity CA010 *obtain vital signs* was reduced from 5 minutes to 3 minutes).

NOTE: The virtual meetings have provided for real-time updates to the PE spreadsheets. PE SORs must still be updated and resubmitted asap.

AMA/Specialty Society RVS Update Committee Summary of Recommendations

April 2021

Drug Induced Sleep Endoscopy (DISE) – Tab 5

In October 2020, the CPT Editorial Panel created a new code to report drug induced sleep endoscopy (DISE) flexible, diagnostic. At the January 2021 RUC Meeting, the RUC requested that this service be resurveyed for the April 2021 RUC Meeting using a standard 000-day survey template.

42975 ***Drug induced sleep endoscopy, with dynamic evaluation of velum, pharynx, tongue base, and larynx for evaluation of sleep disordered breathing, flexible, diagnostic***

The RUC reviewed the survey results from 89 otolaryngologists for CPT code 42975 and determined that the survey 25th percentile work RVU of 1.95 appropriately accounts for the physician work required to perform this service. The RUC recommends 18 minutes of pre-service evaluation time, 1 minute of pre-service positioning time, 6 minutes of pre-service scrub/dress/wait time, 15 minutes of intra-service time, and 10 minutes of immediate post-service time, and 50 minutes of total time for CPT code 42975. The specialty society noted that this procedure involves endoscopic evaluation of the upper airway for sleep apnea from the tip of the nose down to the larynx to identify the type and location of the airway obstruction and to determine specific maneuvers that would alleviate the obstruction and the effect that interventions have on the collapse. The specialty society noted that the sedation involved in this procedure mimics the conditions of sleep and that the accompanying muscle and tissue collapse of the airway make endoscopic visualization more difficult.

The RUC compared CPT code 42975 to the top key reference service CPT code 31579 *Laryngoscopy, flexible or rigid telescopic, with stroboscopy* (work RVU = 1.88, 10 minutes intra-service and 34 minutes of total time) and noted that 80 percent of survey respondents determined 42975 to be more complex than key reference service 31579 and that the recommended intra-service time and total time for 42975 support a work RVU of 1.95 in appropriate rank order compared with 31579.

The RUC also compared the survey code with CPT code 62321 *Injection(s), of diagnostic or therapeutic substance(s) (eg, anesthetic, antispasmodic, opioid, steroid, other solution), not including neurolytic substances, including needle or catheter placement, interlaminar epidural or subarachnoid, cervical or thoracic; with imaging guidance (ie, fluoroscopy or CT)* (work RVU = 1.95, 15 minutes of intra-service and 45 minutes of total time), MPC code 64483 *Injection(s), anesthetic agent(s) and/or steroid; transforaminal epidural, with imaging guidance (fluoroscopy or CT), lumbar or sacral, single level* (work RVU = 1.90, 15 minutes of intra-service and 49 minutes of total time), and CPT code 36555 *Insertion of non-tunneled centrally inserted central venous catheter; younger than 5 years of age* (work RVU = 1.93, 15 minutes of intra-service and 48 minutes of total time) and noted that the recommended total time and work RVU fits appropriately within this range of codes. **The RUC recommends a work RVU of 1.95 for CPT code 42975.**

Practice Expense

The Practice Expense Subcommittee affirmed the practice expense inputs from the January 2021 RUC meeting. **The RUC recommends the direct practice expense inputs as submitted by the specialty society.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Global Period: 000 Current Work RVU: RUC Recommended RVU: **1.95**

CPT Descriptor: Drug induced sleep endoscopy; with dynamic evaluation of velum, pharynx, tongue base, and largynx for evaluation of sleep disordered breathing; flexible, diagnostic

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 45-year old male with moderate to severe obstructive sleep apnea has been unable to tolerate positive airway pressure therapy, sleep endoscopy is performed to identify anatomic and physiologic factors contributing to his obstructive sleep apnea and the selection of non-continuous positive airway pressure (cpap) treatment options

Percentage of Survey Respondents who found Vignette to be Typical: 87%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Meet with patients and family to describe and discuss in detail the planned procedure. Review and update the medical history. Perform a current physical exam. Reconcile medications and allergies. Address NPO status and timing. Discuss the patient's expected convalescence and educate the patient and caregivers regarding the signs and symptoms of the most common complications. Discussion with the anesthesiologist regarding the level of sedation required and the approximate length of the case. Review and obtain informed consent. The availability of all required instruments and supplies is verified. A timeout is performed with entire surgical team, including confirmation of the procedure, locations, allergies, antibiotic prophylaxis, anesthesia and fire risks, expected duration, and any concerns related to the procedure. The patient is positioned. The surgeon scrubs, gowns and preps the patient for the procedure.

Description of Intra-Service Work: The nasal passages are prepared with application of a decongestant and/or topical anesthesia. Light intravenous sedation is given, which typically is provided by a separate provider, to a point where the patient is non-responsive to verbal stimuli, has snoring or partial upper airway flow limitation, and observed oxygen desaturations. The performing physician then places a flexible endoscope through the nose and advances it to the pharynx. Endoscopic evaluation of the nasopharynx, oropharynx, hypopharynx, and larynx is performed during sleep or sedation over multiple cycles of airway narrowing and/or obstruction. The velopharynx is the term for the distal (no muscular) component of the soft palate and uvula. This is the predominant site of upper pharyngeal collapse. The physician will note the anatomic site of obstruction (velopharynx, oropharynx, tongue, epiglottis), the severity of the obstruction (non, partial, complete), and pattern of obstruction (anteroposterior, circular, lateral).The physician then repositions the patient and/or performs manipulation of the head and neck and repeat endoscopy to determine effect of body position (supine versus lateral); jaw lift, tongue protrusion, or hyoid lift on airway obstruction. A patient’s existing oral appliance (mandibular advancement device) is placed and titrated to optimal effect. In certain cases, a continuous positive airway pressure (CPAP) mask may be applied to determine sites on ongoing obstruction in regular CPAP users who fail to improve with CPAP therapy.

Description of Post-Service Work: The patient is observed during emergence from anesthesia. The procedure is dictated. Discharge medications are reconciled. The prescription drug monitoring database is reviewed. Postoperative orders,

medications and instructions are written. There is a discussion with the family and patient regarding the procedure and findings. There is reiteration of the convalescence, precautions, follow up appointments, expected postoperative course, signs and symptoms of complications, and review of the written postoperative instructions. Instructions, appropriate discharge timing, follow up, and precautions are discussed with the postoperative nursing team.

Modifier -51 Exempt Status
Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? No

TOP KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
31579	000	1.88	**RUC Time**

CPT Descriptor Laryngoscopy, flexible or rigid telescopic, with stroboscopy

SECOND HIGHEST KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
31575	000	0.94	**RUC Time**

CPT Descriptor Laryngoscopy, flexible; diagnostic

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
54150	000	1.90	**RUC Time**	250

CPT Descriptor 1 Circumcision, using clamp or other device with regional dorsal penile or ring block

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
64483	000	1.90	**RUC Time**	1,044,547

CPT Descriptor 2 Injection(s), anesthetic agent and/or steroid, transforaminal epidural, with imaging guidance (fluoroscopy or CT); lumbar or sacral, single level

Other Reference CPT Code	Global	Work RVU	Time Source
62321	000	1.95	**RUC Time**

CPT Descriptor Injection(s), of diagnostic or therapeutic substance(s) (eg, anesthetic, antispasmodic, opioid, steroid, other solution), not including neurolytic substances, including needle or catheter placement, interlaminar epidural or subarachnoid, cervical or thoracic; with imaging guidance (ie, fluoroscopy or CT)

RELATIONSHIP OF CODE BEING REVIEWED TO TOP TWO KEY REFERENCE SERVICES:

Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by percent distribution) of the service you are rating to the top two chosen key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Top Key Reference Code: 30 **% of respondents:** 33.7 **%**

Number of respondents who choose 2nd Key Reference Code: 12 **% of respondents:** 13.4 **%**

TIME ESTIMATES (Median)

INTENSITY/COMPLEXITY MEASURES

(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Top Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	0%	20%	57%	23%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	3%	20%	77%

Technical Skill/Physical Effort	**Less**	**Identical**	**More**
Technical skill required	3%	63%	33%

Physical effort required	0%	55%	45%

Psychological Stress	**Less**	**Identical**	**More**
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	27%	73%

2nd Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	0%	25%	58%	17%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	17%	83%

Technical Skill/Physical Effort	**Less**	**Identical**	**More**
Technical skill required	0%	33%	67%
Physical effort required	0%	8%	82%

Psychological Stress	**Less**	**Identical**	**More**
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	8%	17%	75%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background:

In October 2020, the Academy brought forward a Code Change Application requesting new code 42975. The Panel approved the CCA and the code is now being valued by the RUC. The new code will be published in the 2022 edition of the CPT Book. The new code was then surveyed for the January 2021 RUC meeting using the 000 global template with a visit. During the January RUC meeting, it was noted that the specialty should not have been able to use the 000 template with a visit, and the RUC voted to require AAO-HNS to resurvey the code for the April 2021 meeting.

Survey Sample and Process:

A survey request was sent to a targeted, random selection of 3963 members from the American Academy of Otolaryngology – Head and Neck Surgery who self-designated as one or more of the following sub-specialties: General Otolaryngology, Sleep Medicine, or Pediatric Otolaryngology.

Recommendation (Work and Intra Time):

We are recommending a work RVU of **1.95 and 15 minutes of intra service time**, based on our survey's 25th percentile RVW.

Time package selection: We have selected pre-time package 2 and post-time package 8B due to this procedure currently being done predominantly in the hospital outpatient setting using conscious sedation.

Pre-time Package 2 Difficult Patient / Straightforward Procedure (No anesthesia care)

Evaluation Time – We are recommending 18 minutes of evaluation time which is one minute less than our median survey time, but identical to the pre-service package time.

Positioning Time – We are recommending 1 minute of positioning time which is a decrease of 4 minutes from the median survey time, but consistent with the pre-service package time for this activity.

Scrub, Dress, Wait Time – We are recommending 6 minutes of scrub, dress and wait time which is a decrease of one minute from the median survey time, but consistent with the pre-service package time for this activity.

This results in a total recommended pre time of 25 minutes, taking the lesser of surveyed time or the pre-service package time.

Post-time Package 8B IV Sedation/ Complex Procedure

Our recommended post time is 10 minutes consistent with the survey's immediate post time of 10 minutes indicated by respondents. This is 18 minutes less than the post-package time, but consistent with our survey results for post work.

Supporting Reference Codes for the Recommended Value

CPT Code	Long Desc	Global	Work RVU	Intra Time	Total Time	Most Recent RUC Review	IWPUT	2019 Medicare Utilization
62320	Injection(s), of diagnostic or therapeutic substance(s) (eg, anesthetic, antispasmodic, opioid, steroid, other solution), not including neurolytic substances, including needle or catheter placement, interlaminar epidural or subarachnoid, cervical or thoracic; without imaging guidance	000	1.80	15	43	2015-10	0.083	5631

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. N/A

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 31599

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Otolaryngology How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 106858
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This is three times the Medicare volume predicted below, using the percentages of the three prior codes that were used to report the service.

Specialty Otolaryngology Frequency 106858 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 35,619
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. This takes the percentage estimates of the three codes above which were previously used to report the service and adds the volume together that is anticipated in the new code.

Specialty Otolaryngology Frequency 35619 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Endoscopy

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 31573

SPECIALTY SOCIETY(IES): AAO-HNS

PRESENTER(S): R. Peter Manes, MD

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC) PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

Meeting Date: April 2021

CPT Code	Long Descriptor	Global Period
42975	Drug induced sleep endoscopy, with dynamic evaluation of velum, pharynx, tongue base, and larynx for evaluation of sleep disordered breathing, flexible, diagnostic	000

Vignette(s) (*vignette required even if PE only code(s)***):**

CPT Code	Vignette
42975	A 45-year old male with moderate to severe obstructive sleep apnea has been unable to tolerate positive airway pressure therapy, sleep endoscopy is performed to identify anatomic and physiologic factors contributing to his obstructive sleep apnea and the selection of non-continuous positive airway pressure (cpap) treatment options

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

   Our specialty formed a panel of experts to develop practice expense recommendations for this family of codes. The panel was comprised of our RUC Advisor and multiple clinical experts who practice in the areas of general otolaryngology, sleep medicine and pediatric otolaryngology. The expert panel members also practice across in settings that vary by size, geography, and represent both private and academic settings.

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code, but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here (*for service reviewed prior to the implementation of clinical activity codes, detail is not provided in the RUC database, please contact Samantha Ashley at samantha.ashley@ama-assn.org for PE spreadsheets for your reference codes*):

   42975 is a new CPT code, therefore, reference code 31576 was selected. The reference code was chosen based on the fact that it was recently valued by the RUC by our specialty, and is also a 000 global service that is typically performed in the hospital outpatient setting.

3. Is this code(s) typically reported with an E/M service?

   No, however, a discharge management visit is typical based on the typical site of service being the hospital.

4. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time:

   We are recommending clinical staff pre-time above the standard for 000 globals of 0 minutes. This represents extensive use of clinical staff per the PE Subcommittee standards and is consistent with the PE approved in the January 2017 and January 2020 for otolaryngology services typically performed in the hospital setting. The rationale for this time is that staff are essential to scheduling, and completing paperwork necessary, to schedule these procedures in the facility setting. The recommendation for the new code is consistent with these recommendations and includes the standard time for clinical staff activities for endoscopy procedures time in the pre-service.

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC) PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

5. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies for the **code family**, please provide compelling evidence (please see *PE compelling evidence guidelines*) Please explain if the increase can be entirely accounted for because of an increase in physician time:

N/A, this is a new code. No new inputs are being requested / invoices provided.

6. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (*please see second worksheet in PE spreadsheet workbook*), please explain the difference here:

N/A

7. Please provide a brief description of the clinical staff work for the following:
   a. Pre-Service period:

During the pre-service period the clinical staff are conducting the typical activities for endoscopy procedures, when performed in the facility setting. Those include: Completing pre-service diagnostic and referral forms Coordinating pre-surgery services (including test results, medical evaluations) Scheduling the space and equipment in the facility Providing pre-service education and obtaining consent Completing pre-procedure phone calls and prescriptions

   b. Service period (includes pre, intra and post):

There are no clinical staff activities during the service period.

   c. Post-service period:

During the post-service period the clinical staff call the patient to check in and see how they're doing post-procedure. They also inquire about use of CPAP post procedure.

8. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (*please see second worksheet in PE spreadsheet workbook*):

N/A

9. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov.

N/A

INVOICES

10. ☐ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

11. ☐ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

12. If you wish to include a supply that is not on the list (*please see fourth worksheet in PE spreadsheet workbook*) please provide a paid invoice. Identify and explain the invoice here:

No supplies, only making facility recommendations at this time.

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC) PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

13. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation. Please include the description, CMS supply code, unit, item quantity and unit price (if available). See documents two and three under PE reference materials on the RUC Collaboration Website for information on the contents of kits, packs and trays.

No supplies, only making facility recommendations at this time.

14. If you wish to include an equipment item that is not on the list (*please see fifth worksheet in PE spreadsheet workbook*) please provide a paid invoice. Identify and explain the invoice here:

No equipment, only making facility recommendations at this time.

15. Have you recommended equipment minutes for a computer or equivalent laptop/integrated computer, equipment item computer, desktop, w-monitor, ED021 or notebook (Dell Latitute D600), ED038?
    a. If yes, please explain how the computer is used for this service(s).
    b. Is the computer used exclusively as an integral component of the service or is it also used for other purposes not specific to the code?
    c. Does the computer include code specific software that is typically used to provide the service(s)?

N/A

16. List all the equipment included in your recommendation and the equipment formula chosen *(*please see document titled *Calculating equipment time).* If you have selected "other formula" for any of the equipment please explain here:

No equipment, only making facility recommendations at this time.

17. If there is any other item(s) on your spreadsheet not covered in the categories above that require greater detail/explanation, please include here:

N/A

PROFESSIONAL LIABILITY INSURANCE (PLI) INFORMATION

18. If this is a PE only code please select a crosswalk based on a similar specialty mix:

N/A

ITEMIZED LIST OF CHANGES (FOLLOWING THE PE SUBCOMMITTEE MEETING

During and immediately following the review of this tab at the PE Subcommittee meeting please revise the PE spreadsheet and summary of recommendation (PE SOR) documents based on modifications made during the meeting. Please submit the revised documents electronically to Samantha Ashley at samantha.ashley@ama-assn.org immediately following the close of business the same day that the tab is reviewed. On the PE spreadsheet, please highlight the cells and/or use red font to show the changes made during the PE Subcommittee meeting (if you have provided any of this highlighting based on changes from the reference code prior to the PE Subcommittee meeting please remove it, so not to be confused with changes made during the meeting). In addition to those revisions please also provide an itemized list of the modifications made to the PE spreadsheet during the PE Subcommittee meeting in the space below (e.g. clinical activity CA010 *obtain vital signs* was reduced from 5 minutes to 3 minutes).

AMA/Specialty Society RVS Update Committee Summary of Recommendations

April 2021

Transcutaneous Passive Implant-Temporal Bone – Tab 6

In October 2020, the CPT Editorial Panel revised two codes to replace "temporal bone" with "skull" and delete "or transcutaneous" and "cochlear stimulator: without mastoidectomy" from the descriptors. The Panel also replaced two codes for mastoidectomy with new codes for magnetic transcutaneous attachment to external speech processor. Additional revisions and codes were added to differentiate implantation, removal, and replacement of the implants.

At the January 2021 RUC Meeting, the RUC reviewed these services and determined that they need to be resurveyed for the April 2021 RUC Meeting with a revised Reference Service List (RSL) to encompass a larger range of relative values, specifically the lower end of the RVU spectrum. The specialty society submitted a letter to the RUC requesting that this service be referred to CPT in May 2021 to clarify the percutaneous implant removal by describing the procedure as removal of the entire implant, add a parenthetical to report removal of the abutment alone to be an included component of the evaluation and management visit and to bifurcate the transcutaneous codes into placement within the mastoid and/or resulting in removal of less than 100 mm2 surface area of cranium beyond its outer cortex versus those that are placed outside of the mastoid and resulting in removal of greater than or equal to 100 mm2 surface area of cranium beyond its outer cortex. The specialty society will survey these codes for the October 2021 RUC Meeting.

The RUC recommends affirming the January 2021 interim RUC recommendations for work and practice expense inputs for CPT codes 69714, 69716, 69717, 69719, 69726, and 69727 and resurveying these codes for the October 2021 RUC meeting following revisions at the May 2021 CPT Editorial Panel meeting.

CPT Code	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
Auditory System **Middle Ear** **Osseointegrated Implants** The following codes are for implantation of an osseointegrated implant into the skull. These devices treat hearing loss through surgical placement of an abutment or device into the skull that facilitates transduction of acoustic energy to be received by the better-hearing inner ear or both inner ears when the implant is coupled to a speech processor and vibratory element. This coupling may occur in a percutaneous or a transcutaneous fashion. Other reparative middle ear and mastoid procedures (69501-69676) may be performed for different indications and may be reported separately when performed.				

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

▲69714	U1	Implantation, osseointegrated implant, ~~temporal bone~~ skull;~~,~~ with percutaneous attachment to external speech processor~~/cochlear stimulator; without mastoidectomy~~	090	Refer to CPT May 2021/ Survey October 2021 (Interim January 2021 RUC Recommendation affirmed for 2022 MFS = 8.69)
●69716	U2	with magnetic transcutaneous attachment to external speech processor	090	Refer to CPT May 2021/ Survey October 2021 (Interim January 2021 RUC Recommendation affirmed for 2022 MFS = 9.77)
~~69715~~	-	~~with mastoidectomy~~ (69715 has been deleted. To report mastoidectomy performed at the same operative session as osseointegrated implant placement, revision/replacement, or removal, see 69501-69676)	~~090~~	~~N/A~~
▲69717	U3	Revision/~~R~~replacement (including removal of existing device), osseointegrated implant, ~~temporal bone,~~ skull; with percutaneous attachment to external speech processor~~/ cochlear stimulator; without mastoidectomy~~	090	Refer to CPT May 2021/ Survey October 2021 (Interim January 2021 RUC Recommendation affirmed for 2022 MFS = 8.80)
●69719	U4	with magnetic transcutaneous attachment to external speech processor	090	Refer to CPT May 2021/ Survey October 2021 (Interim January 2021 RUC Recommendation affirmed for 2022 MFS = 9.77)

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

~~69718~~	-	~~with mastoidectomy~~ (69718 has been deleted. To report mastoidectomy performed at the same operative session as osseointegrated implant placement, revision/replacement, or removal, see 69501-69676)	~~090~~	~~N/A~~
●69726	U5	Removal, osseointegrated implant, skull; with percutaneous attachment to external speech processor	090	Refer to CPT May 2021/ Survey October 2021 (Interim January 2021 RUC Recommendation affirmed for 2022 MFS = 5.93)
●69727	U6	with magnetic transcutaneous attachment to external speech processor	090	Refer to CPT May 2021/ Survey October 2021 (Interim January 2021 RUC Recommendation affirmed for 2022 MFS = 7.13)

RE: Referral of Transcutaneous Passive Implant – Temporal Bone family of codes (CPT 69714, 69717, 69716, 69719, 69726, and 69727) to the CPT Editorial Panel

Dear Dr. Silva,

On behalf of the American Academy of Otolaryngology - Head and Neck Surgery (AAO-HNS), we would like to respectfully request that the Transcutaneous Passive Implant – Temporal Bone family of codes (CPT 69714, 69717, 69716, 69719, 69726, and 69727) be referred to the CPT Editorial Panel for the May 2021 meeting. As you know, these codes were surveyed and presented to the RUC for valuation at the January 2021 meeting. After a lengthy facilitation meeting, it was determined that there was an issue with the survey responses for at least one code in the family, due to resulting rank order anomalies in intra-service time. In response, the RUC assigned interim values for the codes, and requested that the family be resurveyed for the April 2021 RUC meeting.

The Academy agreed with this recommendation, and indicated our intent to resurvey for the April meeting in the recently released LOIs. After discussing the possible issues with the survey responses with Academy leadership, as well as our otology colleagues and sister-societies, we believe there may be problems with the way the code family was revised at CPT in October 2020, resulting in the anomalous survey responses. Specifically, the 69726 code survey, removal of the percutaneous device, created a rank order anomaly. We discussed this dilemma with representatives from American Otological Society (AOS)/American Neurotology Society (ANS) and determined that the variation in the removal of the percutaneous device, 69726, was likely due to misinterpretation of the descriptor.

A frequent clinical scenario that occurs in removing the percutaneous device is that the implant is not truly removed. Very commonly with percutaneous

T: 1-703-836-4444
F: 1-703-683-5100
W: www.entnet.org
A: 1650 Diagonal Road, Alexandria, VA 22314

implant wound problems, an appendage to the implant, known as the bone anchored implant abutment, which is the component that traverses the scalp, is simply uncoupled from the implant in the office setting. The resulting wound is subsequently left to heal by primary intention. The intent of CPT 69726 is for total removal of the implant and abutment which requires an operative environment and, most commonly, an otologic drill. Therefore, we are submitting a CCA that clarifies the percutaneous implant removal by describing the procedure as removal of the entire implant and have added a parenthetical to report removal of the abutment alone to be an included component of the evaluation and management visit.

Additionally, there is variation in the method of transcutaneous implant placement, and we noted problems with the distribution of the intraservice times in the 69716 code that is intended to report this procedure. Discussion with the AOS/ANS leadership revealed that there are different techniques that vary in time and intensity depending on the indication for the procedure, device chosen, and patient anatomy. A patient with chronic ear infection and resulting mixed or conductive hearing loss will often require placement of the device outside the mastoid to allow for adequate physical space for the device as well as mitigating infection risk. In these cases, some transcutaneous implants require removal of a significant amount of cranium down to or sometimes beyond the inner cortex in the retrosigmoid area or temporal squama. These cases are technically more difficult, time consuming, and risky. In other cases, such as single-sided deafness, conductive, or mixed hearing loss not resulting from chronic ear inflammatory disease, when the mastoid is well pneumatized, placement of a transcutaneous device in the mastoid is the preferred, less time consuming and less risky location for device placement. We have chosen to bifurcate the transcutaneous codes into placement within the mastoid and/or resulting in removal of less than 100 mm2 surface area of cranium beyond its outer cortex versus those that are placed outside of the mastoid and resulting in removal of greater than or equal to 100 mm2 surface area of cranium beyond its outer cortex as an effort to clarify the intraservice work for CPT
69716. Mirroring replacement and removal codes are also being proposed.

Given this additional information, we think it best to refer the family back to the CPT Editorial Panel for further clarification prior to resurvey. ***We therefore, request that the RUC approve referral of the family to CPT at the next opportunity in May 2021, and allow resurvey of the revised code set at the October 2021 RUC meeting.***

AMERICAN ACADEMY OF OTOLARYNGOLOGY–HEAD AND NECK SURGERY

Thank you in advance for your consideration of this request. If you have any questions, please contact Jenna Minton, AAO-HNS RUC staff, at jenna@proactivestrategies.net or 517.927.8696.

Sincerely,

R. Peter Manes, MD
AAO-HNS RUC Advisor

AMA/Specialty Society RVS Update Committee Summary of Recommendations

January 2021

Transcutaneous Passive Implant-Temporal Bone – Tab 18

In October 2020, the CPT Editorial replaced two codes for mastoidectomy with new codes for magnetic transcutaneous attachment to external speech processor. Additional revisions and codes were added to differentiate implantation, removal, and replacement of the implants.

69714 ***Implantation, osseointegrated implant, skull; with percutaneous attachment to external speech processor***
The RUC reviewed the survey results from 73 physicians and determined that a work RVU of 8.69 accurately reflects the typical physician work necessary to perform this service. The RUC recommends 33 minutes of pre-service evaluation time, 3 minutes of pre-service positioning time, 10 minutes of pre-service scrub/dress/wait time, 40 minutes of intra-service time, 15 minutes of immediate post-service time, ½ discharge day management (99238), one office visit(s) (1x 99212), and two office visit(s) (2x 99213).

The RUC recommends a direct work RVU crosswalk to CPT code 52400 *Cystourethroscopy with incision, fulguration, or resection of congenital posterior urethral valves, or congenital obstructive hypertrophic mucosal folds* (work RVU= 8.69, intra-service time of 40 minutes and 197.5 minutes of total time) and noted that both codes have identical intra-service time, similar total time, and should be valued identically. The RUC agreed that due to the lack of 090-day global codes with 40 minutes of intra-service time, CPT code 52400 is an appropriate crosswalk for the work value, resulting in a work intensity that closely aligns with the revision/replacement of implant code 69717 (0.110 and 0.100 IWPUT respectively). The RUC agreed that code 52400 and the survey code have similar intra-service and total times and should be valued identically, below the survey's 25th percentile. **The RUC recommends an interim work RVU of 8.69 for CPT code 69714.**

69716 ***Implantation, osseointegrated implant, skull; with magnetic transcutaneous attachment to external speech processor***
The RUC reviewed the survey results from 67 physicians and determined that a work RVU of 9.77 accurately reflects the typical physician work necessary to perform this service. The RUC recommends 32 minutes of pre-service evaluation time, 3 minutes of pre-service positioning time, 10 minutes of pre-service scrub/dress/wait time, 60 minutes of intra-service time, 15 minutes of immediate post-service time, ½ discharge day management (99238), and two office visit(s) (2x 99213).

After thorough discussion, the RUC recommends a direct work RVU crosswalk to MPC code 50590 *Lithotripsy, extracorporeal shock wave* (work RVU= 9.77, intra-service time of 60, immediate post service time of 15 minutes and total time of 207 minutes) and noted that both codes have identical intra-service time, identical post-service time and similar total time, and should be valued identically. The RUC agreed that an IWPUT of 0.100 is appropriate and that the recommended work value of 9.77 places the survey code well within the relativity of the family.

Additionally, the RUC agreed that the work value of 9.77 for code 69716 is appropriately bracketed by codes 43180 *Esophagoscopy, rigid, transoral with diverticulectomy of hypopharynx or cervical esophagus (eg, Zenker's diverticulum), with cricopharyngeal myotomy, includes use of telescope or operating microscope and repair, when performed* (work RVU = 9.03 and total time of 201 minutes) and 57240 *Anterior*

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

colporrhaphy, repair of cystocele with or without repair of urethrocele, including cystourethroscopy, when performed (work RVU = 10.08 and total time of 211 minutes), further supporting a recommended work RVU of 9.77 for code 69716. **The RUC recommends an interim work RVU of 9.77 for CPT code 69716.**

69717 ***Revision/replacement (including removal of existing device), osseointegrated implant, skull; with percutaneous attachment to external speech processor***
The RUC reviewed the survey results from 64 physicians and determined that a work RVU of 8.80 accurately reflects the typical physician work necessary to perform this service. The RUC recommends 33 minutes of pre-service evaluation time, 3 minutes of pre-service positioning time, 10 minutes of pre-service scrub/dress/wait time, 45 minutes of intra-service time, 15 minutes of immediate post-service time, ½ discharge day management (99238), one office visit(s) (1x 99212), and two office visit(s) (2x 99213).

The RUC recommends a direct work RVU crosswalk to CPT code 27829 *Open treatment of distal tibiofibular joint (syndesmosis) disruption, includes internal fixation, when performed* (work RVU= 8.80 and intra-service time of 45 minutes) to appropriately account for the physician work involved in this service. The RUC agreed that code 27829 is an appropriate crosswalk, the recommended work value of 8.80 for the survey code results in an IWPUT of 0.100. Additionally, the RUC agreed that the survey code should be valued identically to code 27829 because both services have identical intra-service time. **The RUC recommends an interim work RVU of 8.80 for CPT code 69717.**

69719 ***Revision/replacement (including removal of existing device), osseointegrated implant, skull; with magnetic transcutaneous attachment to external speech processor***
The RUC reviewed the survey results from 59 physicians and determined that the work RVU of 9.77 accurately reflects the typical physician work necessary to perform this service. The RUC recommends 33 minutes of pre-service evaluation time, 3 minutes of pre-service positioning time, 10 minutes of pre-service scrub/dress/wait time, 60 minutes of intra-service time, 15 minutes of immediate post-service time, ½ discharge day management (99238), and two office visit(s) (2x 99213).

After thorough discussion, the RUC recommends a direct work RVU crosswalk to MPC code 50590 *Lithotripsy, extracorporeal shock wave* (work RVU = 9.77, intra-service time of 60 minutes and total time of 207 minutes). The RUC agreed that the crosswalk to MPC code 50590 and recommended work value of 9.77 appropriately accounts for the physician work involved in this service because both codes have identical intra-service time, identical post-service time and similar total time. The RUC agreed that an IWPUT of 0.099 is appropriate and that the recommended work value of 9.77 places the survey code well within the relativity of the family.

Additionally, the RUC agreed that the work value of 9.77 for code 69719 is appropriately bracketed by codes 43180 *Esophagoscopy, rigid, transoral with diverticulectomy of hypopharynx or cervical esophagus (eg, Zenker's diverticulum), with cricopharyngeal myotomy, includes use of telescope or operating microscope and repair, when performed* (work RVU = 9.03 and total time of 201 minutes) and 57240 *Anterior colporrhaphy, repair of cystocele with or without repair of urethrocele, including cystourethroscopy, when performed* (work RVU = 10.08 and total time of 211 minutes), further warranting a recommended work RVU of 9.77 for code 69719. **The RUC recommends an interim work RVU of 9.77 for CPT code 69719.**

69726 ***Removal, osseointegrated implant, skull; with percutaneous attachment to external speech processor***
CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The RUC reviewed the survey results from 66 physicians and determined that the work RVU of 5.93 accurately reflects the typical physician work necessary to perform this service. The RUC recommends 32 minutes of pre-service evaluation time, 3 minutes of pre-service positioning time, 10 minutes of pre-service scrub/dress/wait time, 30 minutes of intra-service time, and 15 minutes of immediate post-service time, ½ discharge day management (99238), one office visit(s) (1x 99212), and one office visit(s) (1x 99213).

After thorough discussion, the RUC recommends a direct work RVU crosswalk to code 53852 *Transurethral destruction of prostate tissue; by radiofrequency thermotherapy* (work RVU = 5.93, intra-service time of 30 minutes and total time of 142 minutes). The RUC agreed that the work value of 5.93 appropriately accounts for the physician work involved in this service. The RUC noted that the survey code and crosswalk code 53852 have identical intra-service time and similar total time. The RUC agreed that an IWPUT of 0.088 is appropriate and that the recommended work value of 5.93 places the survey code well within the relativity of the entire family. Additionally, the RUC agreed that the recommended work value of 5.93 is appropriate because this (removal) service has a lower intensity, in comparison to the implantation and revision/replacement services in the family. **The RUC recommends an interim work RVU of 5.93 for CPT code 69726.**

69727 ***Removal, osseointegrated implant, skull; with magnetic transcutaneous attachment to external speech processor***
The RUC reviewed the survey results from 59 physicians and determined that the work RVU of 7.13 accurately reflects the typical physician work necessary to perform this service. The RUC recommends 33 minutes of pre-service evaluation time, 3 minutes of pre-service positioning time, 10 minutes of pre-service scrub/dress/wait time, 45 minutes of intra-service time, 15 minutes of immediate post-service time, ½ discharge day management (99238), one office visit(s) (1x 99212), and one office visit(s) (1x 99213).

After thorough discussion, the RUC recommends a direct work RVU crosswalk to code 37718 *Ligation, division, and stripping, short saphenous vein* (work RVU = 7.13, intra-service time of 45 minutes and total time of 178 minutes). The RUC agreed that the crosswalk to code 37718 and recommended value of 7.13 appropriately accounts for the physician work involved in this service because the survey code and crosswalk code have identical intra-service time and similar total time. The RUC agreed that an IWPUT of 0.085 is appropriate and is like (removal) code 69726 (IWPUT = 0.088) in the family, therefore the recommended work value of 7.13 places the survey code well within the relativity of the entire family. Additionally, the RUC agreed that the recommended work value of 7.13 is appropriate because this (removal) service has a lower intensity, in comparison to the implantation and revision/replacement services in the family.

The RUC agreed that the recommended work value of 7.13 is appropriately bracketed by codes 15823 *Blepharoplasty, upper eyelid; with excessive skin weighting down lid* (work RVU = 6.81, intra-service time of 45 minutes and total time of 161 minutes) and 67904 *Repair of blepharoptosis; (tarso) levator resection or advancement, external approach* (work RVU = 7.97, intra-service time of 45 minutes and total time of 185 minutes). **The RUC recommends an interim work RVU of 7.13 for CPT code 69727.**

Resurvey for April 2021 RUC Meeting
In January 2021, the RUC reviewed these services and determined that they need to be interim and resurveyed for the April 2021 RUC meeting with a revised Reference Service List (RSL) to encompass a larger range of relative values, specifically relative values on the lower end of the spectrum. Additionally, there was concern from the specialty that survey respondents may not have fully understood the new removal codes based on the anomalous intra-service time response for code 69726 which was less than all other codes in the family.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Practice Expense
The Practice Expense Subcommittee replaced one SA053 *pack, post-op incision care (suture and staple)* with one SA054 *pack, post-op incision care (suture)*. **The RUC recommends the direct practice expense inputs as modified by the Practice Expense Subcommittee.**

Work Neutrality
The RUC's recommendation for this family of codes will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

CPT Code	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
Surgery **Auditory System** **Middle Ear** **Osseointegrated Implants** The following codes are for implantation of an osseointegrated implant into the skull. These devices treat hearing loss through surgical placement of an abutment or device into the skull that facilitates transduction of acoustic energy to be received by the better-hearing inner ear or both inner ears when the implant is coupled to a speech processor and vibratory element. This coupling may occur in a percutaneous or a transcutaneous fashion. Other reparative middle ear and mastoid procedures (69501-69676) may be performed for different indications and may be reported separately when performed.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:69714 Tracking Number Original Specialty Recommended RVU: **11.00**
Presented Recommended RVU: **8.69**
Global Period: 090 Current Work RVU: **14.45** RUC Recommended RVU: **8.69**

CPT Descriptor: Implantation, osseointegrated implant, skull; with percutaneous attachment to external speech processor

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 56-year-old male suffers from chronic otitis media resulting in otorrhea and mixed hearing loss. He is unalbe to wear traditional hearing aids. Implantation of an osseointegrated bone anchored device with a percutaneous attachment to an external speech processor is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 96%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 49% , In the ASC 49%, In the office 1%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 100% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Meet with patient and family to describe and discuss in detail the planned procedure. Review and update the medical history. Review the CT scan to ensure that there is adequate bone quality and quantity in the area of implantation to support a successful implantation. Perform a current physical exam paying special attention to the patient's skin condition and skin thickness in the area of the actuator and coil to avoid potential post-surgical skin breakdown and implant extrusion. Reconcile medications and allergies. Address NPO status and timing. Discuss preoperative home medications and postoperative prescriptions and check the prescription drug monitoring database, discuss. Plan the patient's expected convalescence and educate the patient and caregivers regarding the signs and symptoms of the most common and serious complications. There is confirmation of site of proposed insertion site, and a detailed description is given of the postoperative changes in wound and incision and the expected cosmetic and functional results. Review and obtain informed consent. Verify that all required instruments and supplies are available. Following induction of anesthesia, the patient is positioned and prepped for the procedure. A timeout is performed with entire surgical team, including confirmation of the procedure, locations, allergies, antibiotic prophylaxis, anesthesia and fire risks, expected duration, and any concerns related to the procedure. The postauricular hair is shaved and the proposed implant recipient site is precisely measured and then marked using the implant template. The location of the implant transducer is marked using a hypodermic needle inserted down to the bone with marking ink, such as Methylene blue. The incision is injected with local anesthetic.

Description of Intra-Service Work: An incision is performed followed by a meticulous dissection to the pericranium. A dissection is performed and the pericranium is incised and dissected away from the cranial bone to expose an area for implant placement. A pilot guide hole through the cranium is drilled, and the deep portion of the guide hole is instrumented to ascertain the possible presence of dural contact and lack of sigmoid sinus exposure. Depending on this deep instrumentation, the pilot hole is possibly deepened. The final guide hole is then widened with spiral drilling to achieve a larger opening to receive the implant. The implanted fixture is installed in the cranial bone to very specific torque settings. This implanted fixture is then secured to the transcutaneous abutment. The overlying flap and surrounding soft tissues are thinned to a maximal thickness to allow for transcutaneous attachment to the processor. A separate incision is made in the overlying skin of the flap to allow the percutaneous abutment to extend through the soft tissue flap. The wound is irrigated and hemostasis is obtained. The wound is closed in a layered fashion. A small bolster is created immediately surrounding the abutment and a locking cap is fixed to the abutment to keep the bolster in place and with appropriate pressure.

Description of Post-Service Work: The prepped area of the recipient site is cleaned. A compression dressing is fashioned and is wrapped around the head to compress the recipient site. The patient is observed during emergence from anesthesia. Dictation and postoperative orders are performed. Discharge medications are reconciled and prescriptions are written. Instructions, appropriate discharge timing, follow up, and precautions are discussed with the postoperative nursing team. Communication with the referring physician is then performed. There is a discussion with the family regarding the procedure and findings. The patient is then seen after emergence from general anesthesia to check the patient's neurologic status, wound for signs of hematoma, or other complications. There is reiteration of the convalescence, precautions, follow up appointments, expected postoperative course, signs and symptoms of complications, and review the written postoperative instructions.

Post op visit 1: 99213
The mastoid dressing is removed. The patient's convalescence to that point is reviewed and discussed. The neurological status is assessed. The wound is inspected and palpated. Flap viability is assessed. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Patient and family questions and concerns are addressed. Ongoing care is reiterated. Antibiotic ointment is placed on the surgical wound.

Post op visit 2: 99213
The patient's convalescence to that point is reviewed. The small abutment bolster and associated locking cap device are removed. The sutures are removed. The area around the percutaneous abutment is vigorously cleaned and possibly debrided. The wound is again inspected and palpated. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Patient and family questions and concerns are addressed. Ongoing care is reiterated.

Post op visit 3: 99212
The patient's convalescence to that point is reviewed. The wounds are inspected and palpated for full incisional healing prior to fitting the sound processor. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Patient and family questions and concerns are addressed. Long term care, strategies to maximize function, and expected outcomes are discussed in detail. Counseling regarding the device, its function, and signs and symptoms of trouble with the device are discussed with the patient and family.

Modifier -51 Exempt Status
Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? No

TOP KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
15120	090	10.15	**RUC Time**

CPT Descriptor Split-thickness autograft, face, scalp, eyelids, mouth, neck, ears, orbits, genitalia, hands, feet, and/or multiple digits; first 100 sq cm or less, or 1% of body area of infants and children (except 15050)

SECOND HIGHEST KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
31610	090	12.00	**RUC Time**

CPT Descriptor Tracheostomy, fenestration procedure with skin flaps

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
67904	090	7.97	**RUC Time**	54,853

CPT Descriptor 1 Repair of blepharoptosis; (tarso) levator resection or advancement, external approach

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
26615	090	7.07	**RUC Time**	1,057,533

CPT Descriptor 2 Open treatment of metacarpal fracture, single, includes internal fixation, when performed, each bone

Other Reference CPT Code	Global	Work RVU	Time Source
66183	090	13.20	**RUC Time**

CPT Descriptor Insertion of anterior segment aqueous drainage device, without extraocular reservoir, external approach

RELATIONSHIP OF CODE BEING REVIEWED TO TOP TWO KEY REFERENCE SERVICES:
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by percent distribution) of the service you are rating to the top two chosen key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Top Key Reference Code: 14 **% of respondents:** 19.1 **%**

Number of respondents who choose 2nd Key Reference Code: 14 **% of respondents:** 19.1 **%**

TIME ESTIMATES (Median)

	CPT Code: 69714	Top Key Reference CPT Code: 15120	2nd Key Reference CPT Code: **31610**

INTENSITY/COMPLEXITY MEASURES

(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Top Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	14%	36%	36%	14%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	21%	29%	50%

Technical Skill/Physical Effort	**Less**	**Identical**	**More**
Technical skill required	21%	36%	43%
Physical effort required	29%	36%	36%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	24%	43%	36%

2nd Key Reference Code

	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	21%	50%	14%	14%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	14%	64%	21%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	21%	36%	43%
Physical effort required	31%	54%	16%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	42%	50%	8%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background:

In October 2020, the Academy brought forward a Code Change Application requesting the revision of two existing codes, 69714 and 69717, as well as the addition of four new codes 69716-727. These new codes represent implantation, revision/replacement, and removal of a transcutaneous and percutaneous osseointegrated implants, respectively. The

Panel approved the CCA and the code is now being valued by the RUC. The new codes will be published in the 2022 edition of the CPT Book.

Survey Sample and Process:

A survey request was sent to a targeted, random selection of 533 members from the AAO-HNS, the American Neurotology Society, and the AOS (American Otological Society).

Note re: Key Reference Code #2

We recognize that KRS code 2, 31610, was selected as a KRS for this code, and some others in this family of codes by survey respondents. That code is marked "Do not use to value physician work" in the RUC database. The RUC database further states the following rationale: "The RUC recommends to flag CPT codes 31605 and 31610 as do not use for validation of work as 31605 physician time and work recommendations are based on only the 20 survey respondents who performed this service in the past 12 months and 31610 recommendation was based on the survey 75th percentile work RVU." We do not agree that simply because the 75th percentile was approved in valuing this service, that it should be viewed as unreliable as a comparison to other services, and therefore, we included it in our RSL as a recently valued, and familiar service that our members would understand.

Recommendation (Work and Intra Time):

We are recommending a work RVU of **8.69 and 40 minutes of intra service time**, based on a crosswalk to CPT 52400. This is below the survey's 25th percentile.

Time package selection: We have selected pre-time package 3 and post-time package 9A due to this procedure currently being done predominantly in the hospital outpatient setting under general anesthesia.

Pre-time Package 3 Straightforward Patient/Difficult Procedure

Evaluation Time – We are recommending 33 minutes of evaluation time which is identical to the pre-service package time, based on our survey median.

Positioning Time – We are recommending 3 minutes of positioning time which is 7 minutes less than the survey median time, but consistent with the preservice package.

Scrub, Dress, Wait Time – We are recommending 10 minutes of scrub, dress and wait time which is 5 minutes less than the pre-service package time, based on our survey median.

This results in a total recommended pre time of 46 minutes, taking the lesser of surveyed time or the pre-service package time.

Post-time Package 9A General Anesthesia or Complex Regional Block/ Straightforward Procedure
Recommended time has been reduced to 15 minutes which is a decrease of 15 minutes from the post package time selected to match our survey time. ***This results in a total recommended post time of 15 minutes, taking the lesser of surveyed time or the pre-service package time.***

Discharge Management / Post-Operative Visits
Given that this procedure is almost exclusively performed in the hospital outpatient or ASC setting, and general anesthesia sedation is utilized, patients must be monitored closely following the procedure. This results in a discharge management visit being performed after the procedure, before the patient is discharged from the hospital. Our survey did not indicate that this was typical, however, it is the RUC standard for 090 global services when performed in the hospital, so we have included **.5 discharge management visit in our recommendations for this CPT code.**

Survey respondents also indicated that three post-operative office visits are typically conducted after the procedure. Two level three office visits, 99213; and one level two office visit, 99212.

Post op visit 1: 99213

The mastoid dressing is removed. The patient's convalescence to that point is reviewed and discussed. The neurological status is assessed. The wound is inspected and palpated. Flap viability is assessed. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Patient and family questions and concerns are addressed. Ongoing care is reiterated. Antibiotic ointment is placed on the surgical wound.

Post op visit 2: 99213
The patient's convalescence to that point is reviewed. The small abutment bolster and associated locking cap device are removed. The sutures are removed. The area around the percutaneous abutment is vigorously cleaned and possibly debrided. The wound is again inspected and palpated. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Patient and family questions and concerns are addressed. Ongoing care is reiterated.

Post op visit 3: 99212
The patient's convalescence to that point is reviewed. The wounds are inspected and palpated for full incisional healing prior to fitting the sound processor. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Patient and family questions and concerns are addressed. Long term care, strategies to maximize function, and expected outcomes are discussed in detail. Counseling regarding the device, its function, and signs and symptoms of trouble with the device are discussed with the patient and family.

Supporting Reference Codes for the Recommended Value

CPT Code	Long Desc	Global	IWPUT	Work RVU	Intra Time	Total Time	Most Recent RUC Review	Top_Specialty	2019 Medicare Utilization

	hypertrophic mucosal folds								

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 69714

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Otoloaryngology How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 279
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This is three times the Medicare volume estimated below.

Specialty Otolaryngology Frequency 279 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 93 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The current 2019 volume indicated by the RUC database for this code is 993 cases, however, we anticipate the majority of this volume (94% or so) will transfer to the new X codes.

Specialty Otolaryngology Frequency 93 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 69714

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:69716 Tracking Number Original Specialty Recommended RVU: **12.00**
Presented Recommended RVU: **9.77**
Global Period: 090 Current Work RVU: RUC Recommended RVU: **9.77**

CPT Descriptor: Implantation, osseointegrated implant, skull; with magnetic transcutaneous attachment to external speech processor

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 48-year-old male with left mixed hearing loss seeks intervention for improved quality of life at work and socially. Placement of a magnetic transcutaneous bone anchored heraing device is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 85%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 49% , In the ASC 49%, In the office 1%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 100% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Meet with patient and family to describe and discuss in detail the planned procedure. Review and update the medical history. Review the CT scan to ensure that there is adequate bone quality and quantity in the area of implantation to support a successful implantation. Perform a current physical exam paying special attention to the patient's skin condition and skin thickness in the area of the actuator and coil to avoid potential post-surgical skin breakdown and implant extrusion. Reconcile medications and allergies. Address NPO status and timing. Discuss preoperative home medications and postoperative prescriptions and check the prescription drug monitoring database, discuss. Plan the patient's expected convalescence and educate the patient and caregivers regarding the signs and symptoms of the most common and serious complications. There is confirmation of site of proposed insertion site, and a detailed description is given of the postoperative changes in wound and incision and the expected cosmetic and functional results. Review and obtain informed consent. Verify that all required instruments and supplies are available. Following induction of anesthesia, the patient is positioned and prepped for the procedure. A timeout is performed with entire surgical team, including confirmation of the procedure, locations, allergies, antibiotic prophylaxis, anesthesia and fire risks, expected duration, and any concerns related to the procedure. The postauricular hair is shaved and the proposed implant recipient site is precisely measured and then marked using the implant template. The location of the implant transducer is marked using a hypodermic needle inserted down to the bone with marking ink, such as Methylene blue. The incision is injected with local anesthetic.

Description of Intra-Service Work: An incision is performed followed by a meticulous dissection through the pericranium. A subpericranial dissection is performed and a subpericranial pocket for the implant coil and magnet are created. The area for the transducer is then identified using the template and marked on the outer table of the skull in the region of the sinodural angle. Surgical guide and fixation holes are then drilled taking care not to penetrate the sigmoid sinus or the dura overlying the temporal lobe of the brain. This area is measured for appropriate depth to accommodate the fixation screw. The skull overlying the sinodural angle is then drilled to create a well in the bone to accommodate the transducer device, again staying just superficial to the dura and sigmoid sinus. The entire device including the coil, magnet, and transducer portions are then placed. The device is then fixed to the skull using the fixation screw to a specific torque setting. The thickness of the flap overlying the magnet and coil portion of the device is then carefully measure and precisely trimmed to a specific thickness to allow for transcutaneous transmission. The wound is irrigated and hemostasis is obtained. The wound is closed in a layered fashion.

Description of Post-Service Work: The prepped areas of the respective donor and recipient sites are cleaned. A dressing is applied to the donor site. A compression dressing is fashioned and is wrapped around the head to compress the recipient site. The patient is observed during emergence from anesthesia. Dictation and postoperative orders are performed. Discharge medications are reconciled and prescriptions are written. Instructions, appropriate discharge timing, follow up, and precautions are discussed with the postoperative nursing team. Communication with the referring physician is then performed. There is a discussion with the family regarding the procedure and findings. The patient is then seen after emergence from general anesthesia to check the patient's neurologic status, wound for signs of hematoma, or other complications. There is reiteration of the convalescence, precautions, follow up appointments, expected postoperative course, signs and symptoms of complications, and review the written postoperative instructions.

Post op visit 1: 99213
The dressing is removed. The patient's convalescence to that point is reviewed and discussed. The neurological status is assessed. The wound is inspected and palpated. Flap viability overlying the coil is assessed. The sutures are removed. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Patient and family questions and concerns are addressed. Ongoing care is reiterated. Antibiotic ointment is placed on the surgical wound.

Post op visit 2: 99213
The patient's convalescence to that point is reviewed. The wound is inspected and palpated for full incisional healing prior to fitting the sound processor. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Patient and family questions and concerns are addressed. Long term care, strategies to maximize function, and expected outcomes are discussed in detail. Counseling regarding the device, its function, and signs and symptoms of trouble with the device are discussed with the patient and family.

INTENSITY/COMPLEXITY MEASURES

(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	8%	0%	58%	17%	17%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	8%	58%	34%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	8%	42%	50%
Physical effort required	0%	75%	25%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	42%	33%	25%

2nd Key Reference Code

	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	33%	33%	33%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	33%	67%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	17%	50%	33%
Physical effort required	0%	50%	50%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	17%	50%	33%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background:

In October 2020, the Academy brought forward a Code Change Application requesting the revision of two existing codes, 69714 and 69717, as well as the addition of four new codes 69716-727. These new codes represent implantation, revision/replacement, and removal of a transcutaneous and percutaneous osseointegrated implants, respectively. The

Panel approved the CCA and the code is now being valued by the RUC. The new codes will be published in the 2022 edition of the CPT Book.

Survey Sample and Process:

A survey request was sent to a targeted, random selection of 533 members from the AAO-HNS, the American Neurotology Society, and the AOS (American Otological Society).

Note re: Key Reference Code #2

We recognize that KRS code 2, 31610, was selected as a KRS for this code, and some others in this family of codes by survey respondents. That code is marked "Do not use to value physician work" in the RUC database. The RUC database further states the following rationale: "The RUC recommends to flag CPT codes 31605 and 31610 as do not use for validation of work as 31605 physician time and work recommendations are based on only the 20 survey respondents who performed this service in the past 12 months and 31610 recommendation was based on the survey 75th percentile work RVU." We do not agree that simply because the 75th percentile was approved in valuing this service that it should be viewed as unreliable as a comparison to other services, and therefore, we included it in our RSL as a recently valued, and familiar service that our members would understand.

Recommendation (Work and Intra Time):

We are recommending a work RVU of **9.77 and 60 minutes of intra service time**, based on a crosswalk to CPT 50590. This is below our survey's 25th percentile RVW.

Time package selection: We have selected pre-time package 3 and post-time package 9A due to this procedure currently being done predominantly in the hospital outpatient setting under general anesthesia.

Pre-time Package 3 Straightforward Patient/Difficult Procedure

Evaluation Time – We are recommending 32 minutes of evaluation time which is 1 minute less than the pre-service package time, based on our survey median.

Positioning Time – We are recommending 3 minutes of positioning time which is 7 minutes less than the survey median time, but consistent with the preservice package.

Scrub, Dress, Wait Time – We are recommending 10 minutes of scrub, dress and wait time which is 5 minutes less than the pre-service package time, based on our survey median.

This results in a total recommended pre time of 45 minutes, taking the lesser of surveyed time or the pre-service package time.

Post-time Package 9A General Anesthesia or Complex Regional Block/ Straightforward Procedure
Recommended time has been reduced to 15 minutes which is a decrease of 15 minutes from the post package time selected to match our survey time. ***This results in a total recommended post time of 15 minutes, taking the lesser of surveyed time or the pre-service package time.***

Discharge Management / Post-Operative Visits
Given that this procedure is almost exclusively performed in the hospital outpatient or ASC setting, and general anesthesia sedation is utilized, patients must be monitored closely following the procedure. This results in a discharge management visit being performed after the procedure, before the patient is discharged from the hospital. Our survey did not indicate that this was typical, however, it is the RUC standard for 090 global services when performed in the hospital, so we have included **.5 discharge management visit in our recommendations for this CPT code.**

Regarding post-operative visits, our survey respondents indicated that two post-operative visits were needed, two 99213 visits. Our expert panel agreed.

Post op visit 1: 99213

The dressing is removed. The patient's convalescence to that point is reviewed and discussed. The neurological status is assessed. The wound is inspected and palpated. Flap viability overlying the coil is assessed. The sutures are removed. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Patient and family questions and concerns are addressed. Ongoing care is reiterated. Antibiotic ointment is placed on the surgical wound.

Post op visit 2: 99213
The patient's convalescence to that point is reviewed. The wound is inspected and palpated for full incisional healing prior to fitting the sound processor. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Patient and family questions and concerns are addressed. Long term care, strategies to maximize function, and expected outcomes are discussed in detail. Counseling regarding the device, its function, and signs and symptoms of trouble with the device are discussed with the patient and family.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 69714

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Otoloaryngology How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 2979
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This is three times the 2019 volume for 69714 in the AMA RUC database

Specialty Otolaryngology Frequency 2979 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 900
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. We believe the majority (94% or so) of existing volume for the predecessor code 69714 will move to this new code. Volume for 69714 in 2019 was 993 cases.

Specialty Otolarngology Frequency 900 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 31070

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:69717 Tracking Number Original Specialty Recommended RVU: **11.48**
Presented Recommended RVU: **8.80**
Global Period: 090 Current Work RVU: **15.43** RUC Recommended RVU: **8.80**

CPT Descriptor: Revision/replacement (including removal of existing device), osseointegrated implant, skull; with percutaneous attachment to external speech processor

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 16-year-old female with chronic otitis media and conductive hearing loss who previously received a percutaneous bone anchored implant has chronic inflammation at the abutment site that has been unresponsive to medical therapy. The device is removed and a new device is placed at a different site.

Percentage of Survey Respondents who found Vignette to be Typical: 88%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 48% , In the ASC 50%, In the office 2%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 100% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Meet with patient and family to describe and discuss in detail the planned procedure. Review and update the medical history. Review the CT scan to ensure that there is adequate bone quality and quantity in the area of implantation to support a successful implantation. Perform a current physical exam paying special attention to the patient's skin condition and skin thickness in the area of the actuator and coil to avoid potential post-surgical skin breakdown and implant extrusion. Reconcile medications and allergies. Address NPO status and timing. Discuss preoperative home medications and postoperative prescriptions and check the prescription drug monitoring database, discuss. Plan the patient's expected convalescence and educate the patient and caregivers regarding the signs and symptoms of the most common and serious complications. There is confirmation of site of proposed insertion site, and a detailed description is given of the postoperative changes in wound and incision and the expected cosmetic and functional results. Review and obtain informed consent. Verify that all required instruments and supplies are available. Following induction of anesthesia, the patient is positioned and prepped for the procedure. A timeout is performed with entire surgical team, including confirmation of the procedure, locations, allergies, antibiotic prophylaxis, anesthesia and fire risks, expected duration, and any concerns related to the procedure. The postauricular hair is shaved and the proposed implant recipient site is precisely measured and then marked using the implant template. The location of the implant transducer is marked using a hypodermic needle inserted down to the bone with marking ink, such as Methylene blue. The incision is injected with local anesthetic.

Description of Intra-Service Work: An incision is performed followed by a meticulous dissection to the pericranium. A subpericranial dissection is performed and the previous implant abutment is removed. The cranial bone surrounding the osseointegrated titanium fixture in the patient's skull is drilled around the implant. The fixture is removed. The wound is thoroughly inspected for the cause of the patient's original complication related to the implant. The area for the new placement of the implant is then identified, templated, and marked on the outer table of the skull. A dissection is performed and the pericranium is incised and dissected away from the cranial bone to expose an area for implant placement. A new pilot guide hole through the cranium is drilled, and the deep portion of the guide hole is instrumented to ascertain the possible presence of dural contact and lack of sigmoid sinus exposure. Depending on this deep instrumentation, the pilot hole is possibly deepened. The final guide hole is then widened with spiral drilling to achieve a larger opening to receive the implant. The implanted fixture is installed in the cranial bone to very specific torque settings. This implanted fixture is then secured to the transcutaneous abutment. The overlying flap and surrounding soft tissues are thinned to a maximal

thickness to allow for transcutaneous attachment to the processor. A separate incision is made in the overlying skin of the flap to allow the percutaneous abutment to extend through the soft tissue flap. The wound is irrigated and hemostasis is obtained. The wound is closed in a layered fashion. A small bolster is created immediately surrounding the abutment and a locking cap is fixed to the abutment to keep the small abutment bolster in place and with appropriate pressure.

Description of Post-Service Work: he prepped area of the recipient site is cleaned. A compression dressing is fashioned and is wrapped around the head to compress the recipient site. The patient is observed during emergence from anesthesia. Dictation and postoperative orders are performed. Discharge medications are reconciled and prescriptions are written. Instructions, appropriate discharge timing, follow up, and precautions are discussed with the postoperative nursing team. Communication with the referring physician is then performed. There is a discussion with the family regarding the procedure and findings. The patient is then seen after emergence from general anesthesia to check the patient's neurologic status, wound for signs of hematoma, or other complications. There is reiteration of the convalescence, precautions, follow up appointments, expected postoperative course, signs and symptoms of complications, and review the written postoperative instructions.

Post op visit 1: 99213
The mastoid dressing is removed. The patient's convalescence to that point is reviewed and discussed. The neurological status is assessed. The wound is inspected and palpated. Flap viability is assessed. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Patient and family questions and concerns are addressed. Ongoing care is reiterated. Antibiotic ointment is placed on the surgical wound.

Post op visit 2: 99213
The patient's convalescence to that point is reviewed. The small abutment bolster and associated locking cap device are removed. The sutures are removed. The area around the percutaneous abutment is vigorously cleaned and possibly debrided. The wound is again inspected and palpated. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Patient and family questions and concerns are addressed. Ongoing care is reiterated.

Post op visit 3: 99212
The patient's convalescence to that point is reviewed. The wounds are inspected and palpated for full incisional healing prior to fitting the sound processor. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Patient and family questions and concerns are addressed. Long term care, strategies to maximize function, and expected outcomes are discussed in detail. Counseling regarding the device, its function, and signs and symptoms of trouble with the device are discussed with the patient and family.

Key CPT Code	Global	Work RVU	Time Source
15260	090	11.64	**RUC Time**

CPT Descriptor Full thickness graft, free, including direct closure of donor site, nose, ears, eyelids, and/or lips; 20 sq cm or less

SECOND HIGHEST KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
15120	090	10.15	**RUC Time**

CPT Descriptor Split-thickness autograft, face, scalp, eyelids, mouth, neck, ears, orbits, genitalia, hands, feet, and/or multiple digits; first 100 sq cm or less, or 1% of body area of infants and children (except 15050)

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
67904	090	7.97	**RUC Time**	54,853

CPT Descriptor 1 Repair of blepharoptosis; (tarso) levator resection or advancement, external approach

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
26615	090	7.07	**RUC Time**	1,057,533

CPT Descriptor 2 Open treatment of metacarpal fracture, single, includes internal fixation, when performed, each bone

Other Reference CPT Code	Global	Work RVU	Time Source
66183	090	13.20	**RUC Time**

CPT Descriptor Insertion of anterior segment aqueous drainage device, without extraocular reservoir, external approach

RELATIONSHIP OF CODE BEING REVIEWED TO TOP TWO KEY REFERENCE SERVICES:
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by percent distribution) of the service you are rating to the top two chosen key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Top Key Reference Code: 9 **% of respondents:** 14.0 **%**

Number of respondents who choose 2nd Key Reference Code: 9 **% of respondents:** 14.0 **%**

TIME ESTIMATES (Median)

	CPT Code: 69717	Top Key Reference CPT Code: 15260	2nd Key Reference CPT Code: **15120**

Other time if appropriate			

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Top Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	0%	22%	67%	11%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	33%	66%

Technical Skill/Physical Effort	**Less**	**Identical**	**More**
Technical skill required	11%	22%	67%
Physical effort required	0%	33%	67%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	56%	44%

2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	11%	0%	33%	44%	11%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	22%	33%	44%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	33%	22%	44%
Physical effort required	44%	33%	22%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	33%	33%	33%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background:

In October 2020, the Academy brought forward a Code Change Application requesting the revision of two existing codes, 69714 and 69717, as well as the addition of four new codes 69716-727. These new codes represent implantation, revision/replacement, and removal of a transcutaneous and percutaneous osseointegrated implants, respectively. The

Panel approved the CCA and the code is now being valued by the RUC. The new codes will be published in the 2022 edition of the CPT Book.

Survey Sample and Process:

A survey request was sent to a targeted, random selection of 533 members from the AAO-HNS, the American Neurotology Society, and the AOS (American Otological Society).

Recommendation (Work and Intra Time):

We are recommending a work RVU of **8.80 and 45 minutes of intra service time**, based on a crosswalk to CPT 27829. This is below our survey's 25th percentile RVW.

Time package selection: We have selected pre-time package 3 and post-time package 9A due to this procedure currently being done predominantly in the hospital outpatient setting under general anesthesia.

Pre-time Package 3 Straightforward Patient/Difficult Procedure

Evaluation Time – We are recommending 33 minutes of evaluation time which is identical to the pre-service package time, based on our survey median.

Positioning Time – We are recommending 3 minutes of positioning time which is 7 minutes less than the survey median time, but consistent with the preservice package.

Scrub, Dress, Wait Time – We are recommending 10 minutes of scrub, dress and wait time which is 5 minutes less than the pre-service package time, based on our survey median.

This results in a total recommended pre time of 46 minutes, taking the lesser of surveyed time or the pre-service package time.

Post-time Package 9A General Anesthesia or Complex Regional Block/ Straightforward Procedure
Recommended time has been reduced to 15 minutes which is a decrease of 15 minutes from the post package time selected to match our survey time. ***This results in a total recommended post time of 15 minutes, taking the lesser of surveyed time or the pre-service package time.***

Discharge Management / Post-Operative Visits
Given that this procedure is almost exclusively performed in the hospital outpatient or ASC setting, and general anesthesia sedation is utilized, patients must be monitored closely following the procedure. This results in a discharge management visit being performed after the procedure, before the patient is discharged from the hospital. Our survey did not indicate that this was typical, however, it is the RUC standard for 090 global services when performed in the hospital, so we have included **.5 discharge management visit in our recommendations for this CPT code.**

Survey respondents also indicated that three post-operative office visits are typically conducted after the procedure. Three level three office visits, 99213. Our expert panel agreed that three visits are necessary, but amended them to two level three visits (99213) and one level two office visit (99212) consistent with code 69714.

Post op visit 1: 99213
The mastoid dressing is removed. The patient's convalescence to that point is reviewed and discussed. The neurological status is assessed. The wound is inspected and palpated. Flap viability is assessed. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Patient and family questions and concerns are addressed. Ongoing care is reiterated. Antibiotic ointment is placed on the surgical wound.

Post op visit 2: 99213
The patient's convalescence to that point is reviewed. The small abutment bolster and associated locking cap device are removed. The sutures are removed. The area around the percutaneous abutment is vigorously cleaned and possibly debrided. The wound is again inspected and palpated. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Patient and family questions and concerns are addressed. Ongoing care is reiterated.

Post op visit 3: 99212
The patient's convalescence to that point is reviewed. The wounds are inspected and palpated for full incisional healing prior to fitting the sound processor. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Patient and family questions and concerns are addressed. Long term care, strategies to maximize function, and expected outcomes are discussed in detail. Counseling regarding the device, its function, and signs and symptoms of trouble with the device are discussed with the patient and family.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.

- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 69717

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Otoloaryngology How often? Rarely

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 18
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This is three times the Medicare volume estimated below.

Specialty Otolaryngology Frequency 18 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 6 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The current 2019 volume indicated by the RUC database for this code is 68, however, we esitmate that only about 7% of existing cases will be reported in the future by the percutaneous codes. We anticipate that the remainder of the volume will transition to the new transcutaneous codes.

Specialty Otolaryngology Frequency 6 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:

Major procedure

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 69717

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:69719 Tracking Number Original Specialty Recommended RVU: **12.00**
Presented Recommended RVU: **9.77**
Global Period: 090 Current Work RVU: RUC Recommended RVU: **9.77**

CPT Descriptor: Revision/replacement (including removal of existing device), osseointegrated implant, skull; with magnetic transcutaneous attachment to external speech processor

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 59-year-old female with right mixed hearing loss previously had placement of a magnetic transcutaneous bone anchored implant. It worked well, but she has developed discomfort at the device site. The device is removed and a new device is placed at a different site.

Percentage of Survey Respondents who found Vignette to be Typical: 83%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 47% , In the ASC 51%, In the office 2%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 100% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Meet with patient and family to describe and discuss in detail the planned procedure. Review and update the medical history. Review the CT scan to ensure that there is adequate bone quality and quantity in the area of implantation to support a successful implantation. Perform a current physical exam paying special attention to the patient's skin condition and skin thickness in the area of the actuator and coil to avoid potential repeat post-surgical skin breakdown, pain, and possible implant extrusion. Reconcile medications and allergies. Address NPO status and timing. Discuss preoperative home medications and postoperative prescriptions and check the prescription drug monitoring database, discuss. Plan the patient's expected convalescence and educate the patient and caregivers regarding the signs and symptoms of the most common and serious complications. There is confirmation of site of proposed insertion site, and a detailed description is given of the postoperative changes in wound and incision and the expected cosmetic and functional results. Review and obtain informed consent. Verify that all required instruments and supplies are available. Following induction of anesthesia, the patient is positioned and prepped for the procedure. A timeout is performed with entire surgical team, including confirmation of the procedure, locations, allergies, antibiotic prophylaxis, anesthesia and fire risks, expected duration, and any concerns related to the procedure. The postauricular hair is shaved and the proposed NEW implant recipient site is precisely measured and then marked using the implant template. The incision is injected with local anesthetic

Description of Intra-Service Work: An incision is performed followed by a meticulous dissection through the pericranium. A subpericranial dissection is performed and the previous implant is removed. The wound is thoroughly inspect for the cause of the patient's original complication related to the implant. A subpericranial pocket for the implant coil and magnet are created. The area for the new placement of the transducer is then identified using the template and marked on the outer table of the skull. Surgical guide and fixation holes are then drilled taking care not to penetrate the dura overlying the temporal lobe of the brain. This area is measured for appropriate depth to accommodate the fixation screw. The skull is then drilled to create a well in the bone to accommodate the transducer device, again staying just superficial to the dura. The entire device including the coil, magnet, and transducer portions are then placed. The device is then fixed to the skull using the fixation screw to a specific torque setting. The thickness of the flap overlying the magnet and coil portion of the device is then carefully measure and precisely trimmed to a specific thickness to allow for transcutaneous transmission. The wound is irrigated and hemostasis is obtained. The wound is closed in a layered fashion.

Description of Post-Service Work: The prepped areas of the respective donor and recipient sites are cleaned. A dressing is applied to the donor site. A compression dressing is fashioned and is wrapped around the head to compress the recipient site. The patient is observed during emergence from anesthesia. Dictation and postoperative orders are performed. Discharge medications are reconciled and prescriptions are written. Instructions, appropriate discharge timing, follow up, and precautions are discussed with the postoperative nursing team. Communication with the referring physician is then performed. There is a discussion with the family regarding the procedure and findings. The patient is then seen after emergence from general anesthesia to check the patient's neurologic status, wound for signs of hematoma, or other complications. There is reiteration of the convalescence, precautions, follow up appointments, expected postoperative course, signs and symptoms of complications, and review the written postoperative instructions.

Post op visit 1: 99213
The dressing is removed. The patient's convalescence to that point is reviewed and discussed. The neurological status is assessed. The wound is inspected and palpated. Flap viability overlying the coil is assessed. The sutures are removed. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Patient and family questions and concerns are addressed. Ongoing care is reiterated. Antibiotic ointment is placed on the surgical wound.

Post op visit 2: 99213
The patient's convalescence to that point is reviewed. The wound is inspected and palpated for full incisional healing prior to fitting the sound processor. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Patient and family questions and concerns are addressed. Long term care, strategies to maximize function, and expected outcomes are discussed in detail. Counseling regarding the device, its function, and signs and symptoms of trouble with the device are discussed with the patient and family.

INTENSITY/COMPLEXITY MEASURES

(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	50%	38%	12%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	63%	37%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	13%	88%
Physical effort required	0%	50%	50%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	13%	75%	13%

2nd Key Reference Code

	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	57%	14%	29%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	57%	43%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	57%	43%
Physical effort required	0%	71%	30%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	29%	43%	29%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background:

In October 2020, the Academy brought forward a Code Change Application requesting the revision of two existing codes, 69714 and 69717, as well as the addition of four new codes 69716-727. These new codes represent implantation, revision/replacement, and removal of a transcutaneous and percutaneous osseointegrated implants, respectively. The

Panel approved the CCA and the code is now being valued by the RUC. The new codes will be published in the 2022 edition of the CPT Book.

Survey Sample and Process:

A survey request was sent to a targeted, random selection of 533 members from the AAO-HNS, the American Neurotology Society, and the AOS (American Otological Society).

Note re: Key Reference Code #1

We recognize that KRS code 1, 31610, was selected as a KRS for this code, and some others in this family of codes by survey respondents. That code is marked "Do not use to value physician work" in the RUC database. The RUC database further states the following rationale: "The RUC recommends to flag CPT codes 31605 and 31610 as do not use for validation of work as 31605 physician time and work recommendations are based on only the 20 survey respondents who performed this service in the past 12 months and 31610 recommendation was based on the survey 75th percentile work RVU." We do not agree that simply because the 75th percentile was approved in valuing this service that it should be viewed as unreliable as a comparison to other services, and therefore, we included it in our RSL as a recently valued, and familiar service that our members would understand.

Recommendation (Work and Intra Time):

We are recommending a work RVU of 9.77 **and 60 minutes of intra service time**, based on a crosswalk to CPT 50590. This is below our survey's 25th percentile RVW.

Time package selection: We have selected pre-time package 3 and post-time package 9A due to this procedure currently being done predominantly in the hospital outpatient setting under general anesthesia.

Pre-time Package 3 Straightforward Patient/Difficult Procedure

Evaluation Time – We are recommending 33 minutes of evaluation time which is identical to the pre-service package time, based on our survey median.

Positioning Time – We are recommending 3 minutes of positioning time which is 7 minutes less than the survey median time, but consistent with the preservice package.

Scrub, Dress, Wait Time – We are recommending 10 minutes of scrub, dress and wait time which is 5 minutes less than the pre-service package time, based on our survey median.

This results in a total recommended pre time of 46 minutes, taking the lesser of surveyed time or the pre-service package time.

Post-time Package 9A General Anesthesia or Complex Regional Block/ Straightforward Procedure
Recommended time has been reduced to 15 minutes which is a decrease of 15 minutes from the post package time selected to match our survey time. ***This results in a total recommended post time of 15 minutes, taking the lesser of surveyed time or the pre-service package time.***

Discharge Management / Post-Operative Visits
Given that this procedure is almost exclusively performed in the hospital outpatient or ASC setting, and general anesthesia sedation is utilized, patients must be monitored closely following the procedure. This results in a discharge management visit being performed after the procedure, before the patient is discharged from the hospital. Our survey did not indicate that this was typical, however, it is the RUC standard for 090 global services when performed in the hospital, so we have included **.5 discharge management visit in our recommendations for this CPT code.**

Survey respondents also indicated that two post-operative office visits are typically conducted after the procedure. Two level three office visits, 99213.

Post op visit 1: 99213

The dressing is removed. The patient's convalescence to that point is reviewed and discussed. The neurological status is assessed. The wound is inspected and palpated. Flap viability overlying the coil is assessed. The sutures are removed. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Patient and family questions and concerns are addressed. Ongoing care is reiterated. Antibiotic ointment is placed on the surgical wound.

Post op visit 2: 99213
The patient's convalescence to that point is reviewed. The wound is inspected and palpated for full incisional healing prior to fitting the sound processor. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Patient and family questions and concerns are addressed. Long term care, strategies to maximize function, and expected outcomes are discussed in detail. Counseling regarding the device, its function, and signs and symptoms of trouble with the device are discussed with the patient and family.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 69714

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Otoloaryngology How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 27
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This is three times the estimated Medicare volume cited below

Specialty Otolaryngology Frequency 27 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 9 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Industry data indicates that approximately .5-1% of cases of 69716 will be revised, we estimate 900 cases per year of 69716, and 9 is 1% of that volume.

Specialty Otolaryngology Frequency 9 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 31070

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:69726 Tracking Number Original Specialty Recommended RVU: **10.00**
Presented Recommended RVU: **5.93**
Global Period: 090 Current Work RVU: RUC Recommended RVU: **5.93**

CPT Descriptor: Removal, osseointegrated implant, skull; with percutaneous attachment to external speech processor

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 59-year-old female with a right mixed hearing loss had previous placement of a percutaneous bone anchored implant. It worked well, but she has developed discomfort at the device site. The device is removed without replacement.

Percentage of Survey Respondents who found Vignette to be Typical: 95%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 33% , In the ASC 36%, In the office 30%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 100% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Meet with patient and family to describe and discuss in detail the planned procedure. Review and update the medical history. Perform a current physical exam paying special attention to the patient's skin condition adequacy for closure following implant removal. Reconcile medications and allergies. Address NPO status and timing. Discuss preoperative home medications and postoperative prescriptions and check the prescription drug monitoring database, discuss. Plan the patient's expected convalescence and educate the patient and caregivers regarding the signs and symptoms of the most common and serious complications. There is confirmation of site of proposed removal site, and a detailed description is given of the postoperative changes in wound and incision and the expected cosmetic and functional results. Review and obtain informed consent. Verify that all required instruments and supplies are available. Following induction of anesthesia, the patient is positioned and prepped for the procedure. A timeout is performed with entire surgical team, including confirmation of the procedure, locations, allergies, antibiotic prophylaxis, anesthesia and fire risks, expected duration, and any concerns related to the procedure. The postauricular hair is shaved and the incision is marked in the region of the previous incision. The incision is injected with local anesthetic.

Description of Intra-Service Work: An incision is performed followed by a meticulous dissection through the pericranium. A subpericranial dissection is performed and the previous implant is exposed. The cranial bone surrounding the osseo-integrated titanium fixture in the patient's skull is drilled around the implant. The wound is thoroughly inspected for the cause of the patient's original complication related to the implant. The wound is irrigated and hemostasis is obtained. The wound where the external abutment of the implant is debrided then closed followed by closure of the linear incision anterior to the implant site in a layered fashion.

Description of Post-Service Work: The prepped areas of the respective donor and recipient sites are cleaned. A dressing is applied to the donor site. A compression dressing is fashioned and is wrapped around the head to compress the recipient site. The patient is observed during emergence from anesthesia. Dictation and postoperative orders are performed. Discharge medications are reconciled and prescriptions are written. Instructions, appropriate discharge timing, follow up, and precautions are discussed with the postoperative nursing team. Communication with the referring physician is then performed. There is a discussion with the family regarding the procedure and findings. The patient is then seen after emergence from general anesthesia to check the patient's neurologic status, wound for signs of hematoma, or other

complications. There is reiteration of the convalescence, precautions, follow up appointments, expected postoperative course, signs and symptoms of complications, and review the written postoperative instructions.

Post op visit 1: 99213
The mastoid dressing is removed. The sutures are removed. The patient's convalescence to that point is reviewed and discussed. The neurological status is assessed. The incisions and wound are inspected and palpated. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Antibiotic ointment is placed on the wound. Patient and family questions and concerns are addressed. Ongoing care is reiterated.

Post op visit 2: 99212
The patient's convalescence to that point is reviewed. The wound is again inspected and palpated to insure full healing. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Patient and family questions and concerns are addressed. Ongoing care is reiterated. A discussion occurs regarding different hearing options now that the previous osseointegrated implant has been removed and not replaced.

• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	38%	62%	0%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background:

In October 2020, the Academy brought forward a Code Change Application requesting the revision of two existing codes, 69714 and 69717, as well as the addition of four new codes 69716-727. These new codes represent implantation, revision/replacement, and removal of a transcutaneous and percutaneous osseointegrated implants, respectively. The

Panel approved the CCA and the code is now being valued by the RUC. The new codes will be published in the 2022 edition of the CPT Book.

Survey Sample and Process:

A survey request was sent to a targeted, random selection of 533 members from the AAO-HNS, the American Neurotology Society, and the AOS (American Otological Society).

Recommendation (Work and Intra Time):

We are recommending a work RVU of **5.93 and 30 minutes of intra service time**, based on a crosswalk to CPT 53852. This is below our survey's 25th percentile RVW and utilizes our survey's median intra-service time.

Time package selection: We have selected pre-time package 3 and post-time package 9A due to this procedure currently being done predominantly in the hospital outpatient setting under general anesthesia.

Pre-time Package 3 Straightforward Patient/Difficult Procedure

Evaluation Time – We are recommending 32 minutes of evaluation time which is identical to the pre-service package time, based on our survey median.

Positioning Time – We are recommending 3 minutes of positioning time which is 7 minutes less than the survey median time, but consistent with the preservice package.

Scrub, Dress, Wait Time – We are recommending 10 minutes of scrub, dress and wait time which is 5 minutes less than the pre-service package time, based on our survey median.

This results in a total recommended pre time of 45 minutes, taking the lesser of surveyed time or the pre-service package time.

Post-time Package 9A General Anesthesia or Complex Regional Block/ Straightforward Procedure
Recommended time has been reduced to 15 minutes which is a decrease of 15 minutes from the post package time selected to match our survey time. ***This results in a total recommended post time of 15 minutes, taking the lesser of surveyed time or the pre-service package time.***

Discharge Management / Post-Operative Visits
Given that this procedure is almost exclusively performed in the hospital outpatient or ASC setting, and general anesthesia sedation is utilized, patients must be monitored closely following the procedure. This results in a discharge management visit being performed after the procedure, before the patient is discharged from the hospital. Our survey did not indicate that this was typical, however, it is the RUC standard for 090 global services when performed in the hospital, so we have included **.5 discharge management visit in our recommendations for this CPT code.**

Survey respondents also indicated that two post-operative office visits are typically conducted after the procedure. One level three office visit, 99213; and one level two office visit, 99212. Our expert panel agreed.

Post op visit 1: 99213
The mastoid dressing is removed. The sutures are removed. The patient's convalescence to that point is reviewed and discussed. The neurological status is assessed. The incisions and wound are inspected and palpated. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Antibiotic ointment is placed on the wound. Patient and family questions and concerns are addressed. Ongoing care is reiterated.

Post op visit 2: 99212
The patient's convalescence to that point is reviewed. The wound is again inspected and palpated to insure full healing. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Patient and family questions and concerns are addressed. Ongoing care is reiterated. A discussion occurs regarding different hearing options now that the previous osseointegrated implant has been removed and not replaced.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.

☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 69714

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Otolaryngology How often? Rarely

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 3
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This is three times the estimated Medicare data below.

Specialty Otolaryngology Frequency 3 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 1 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. We estimate that 1% of future 69714 volume will have to be removed. The 2019 volume of 69714 was 993 cases, which we anticipate will drop approximately 94% to 93 cases going forward. One percent of 93 is .93, or one case per year.

Specialty Otolaryngology Frequency 1 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 31070

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:69727 Tracking Number Original Specialty Recommended RVU: **10.98**
Presented Recommended RVU: **7.13**
Global Period: 090 Current Work RVU: RUC Recommended RVU: **7.13**

CPT Descriptor: Removal, osseointegrated implant, skull; with magnetic transcutaneous attachment to external speech processor

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 62-year-old male with right mixed hearing loss previously had placement of a magnetic transcutaneous bone anchored implant which worked well, but has now become infected. The device is removed without replacement.

Percentage of Survey Respondents who found Vignette to be Typical: 95%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 46% , In the ASC 51%, In the office 3%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 100% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Meet with patient and family to describe and discuss in detail the planned procedure. Review and update the medical history. Perform a current physical exam paying special attention to the patient's skin condition adequacy for closure following implant removal. Reconcile medications and allergies. Address NPO status and timing. Discuss preoperative home medications and postoperative prescriptions and check the prescription drug monitoring database, discuss. Plan the patient's expected convalescence and educate the patient and caregivers regarding the signs and symptoms of the most common and serious complications. There is confirmation of site of proposed removal site, and a detailed description is given of the postoperative changes in wound and incision and the expected cosmetic and functional results. Review and obtain informed consent. Verify that all required instruments and supplies are available. Following induction of anesthesia, the patient is positioned and prepped for the procedure. A timeout is performed with entire surgical team, including confirmation of the procedure, locations, allergies, antibiotic prophylaxis, anesthesia and fire risks, expected duration, and any concerns related to the procedure. The postauricular hair is shaved and the incision is marked

Description of Intra-Service Work: An incision is performed followed by a meticulous dissection through the pericranium. A subpericranial dissection is performed and the previous implant is exposed. The cranial bone surrounding the osseo-integrated titanium transducer and the respective fixture screws in the patient's skull is drilled out to free the implant. The wound is thoroughly inspected for the cause of the patient's original complication related to the implant. The wound is irrigated and hemostasis is obtained. The wound is closed in a layered fashion.

Description of Post-Service Work: The prepped areas of the respective donor and recipient sites are cleaned. A dressing is applied to the donor site. A compression dressing is fashioned and is wrapped around the head to compress the recipient site. The patient is observed during emergence from anesthesia. Dictation and postoperative orders are performed. Discharge medications are reconciled and prescriptions are written. Instructions, appropriate discharge timing, follow up, and precautions are discussed with the postoperative nursing team. Communication with the referring physician is then performed. There is a discussion with the family regarding the procedure and findings. The patient is then seen after emergence from general anesthesia to check the patient's neurologic status, wound for signs of hematoma, or other complications. There is reiteration of the convalescence, precautions, follow up appointments, expected postoperative course, signs and symptoms of complications, and review the written postoperative instructions.

Post op visit 1: 99213
The mastoid dressing is removed. The sutures are removed. The patient's convalescence to that point is reviewed and discussed. The neurological status is assessed. The wound is inspected and palpated. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Antibiotic ointment is placed on the wound. Patient and family questions and concerns are addressed. Ongoing care is reiterated.

Post op visit 2: 99212
The patient's convalescence to that point is reviewed. The wound is again inspected and palpated to insure full healing. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Patient and family questions and concerns are addressed. Ongoing care is reiterated. A discussion occurs regarding different hearing options now that the previous osseointegrated implant has been removed and not replaced.

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	63%	38%	0%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background:

In October 2020, the Academy brought forward a Code Change Application requesting the revision of two existing codes, 69714 and 69717, as well as the addition of four new codes 69716-727. These new codes represent implantation, revision/replacement, and removal of a transcutaneous and percutaneous osseointegrated implants, respectively. The

Panel approved the CCA and the code is now being valued by the RUC. The new codes will be published in the 2022 edition of the CPT Book.

Survey Sample and Process:

A survey request was sent to a targeted, random selection of 533 members from the AAO-HNS, the American Neurotology Society, and the AOS (American Otological Society).

Recommendation (Work and Intra Time):

We are recommending a work RVU of **7.13 and 45 minutes of intra service time**, based on a crosswalk to CPT 37718. This is below our survey's 25th percentile RVW.

Time package selection: We have selected pre-time package 3 and post-time package 9A due to this procedure currently being done predominantly in the hospital outpatient setting under general anesthesia.

Pre-time Package 3 Straightforward Patient/Difficult Procedure

Evaluation Time – We are recommending 33 minutes of evaluation time which is identical to the pre-service package time, based on our survey median.

Positioning Time – We are recommending 3 minutes of positioning time which is 7 minutes less than the survey median time, but consistent with the preservice package.

Scrub, Dress, Wait Time – We are recommending 10 minutes of scrub, dress and wait time which is 5 minutes less than the pre-service package time, based on our survey median.

This results in a total recommended pre time of 46 minutes, taking the lesser of surveyed time or the pre-service package time.

Post-time Package 9A General Anesthesia or Complex Regional Block/ Straightforward Procedure
Recommended time has been reduced to 15 minutes which is a decrease of 15 minutes from the post package time selected to match our survey time. ***This results in a total recommended post time of 15 minutes, taking the lesser of surveyed time or the pre-service package time.***

Discharge Management / Post-Operative Visits
Given that this procedure is almost exclusively performed in the hospital outpatient or ASC setting, and general anesthesia sedation is utilized, patients must be monitored closely following the procedure. This results in a discharge management visit being performed after the procedure, before the patient is discharged from the hospital. Our survey did not indicate that this was typical, however, it is the RUC standard for 090 global services when performed in the hospital, so we have included **.5 discharge management visit in our recommendations for this CPT code.**

Survey respondents also indicated that two post-operative office visits are typically conducted after the procedure. One level three office visit, 99213 and one level two office visit, 99212.Our expert panel agreed.

Post op visit 1: 99213
The mastoid dressing is removed. The sutures are removed. The patient's convalescence to that point is reviewed and discussed. The neurological status is assessed. The wound is inspected and palpated. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Antibiotic ointment is placed on the wound. Patient and family questions and concerns are addressed. Ongoing care is reiterated.

Post op visit 2: 99212
The patient's convalescence to that point is reviewed. The wound is again inspected and palpated to insure full healing. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Patient and family questions and concerns are addressed. Ongoing care is reiterated. A discussion occurs regarding different hearing options now that the previous osseointegrated implant has been removed and not replaced.

Supporting Reference Codes for the Recommended Value

CPT Code	Long Desc	Global	IWPUT	Work RVU	Intra Time	Total Time	Most Recent RUC Review	Top_Specialty	2019 Medicare Utilization
46262	Hemorrhoidectomy, internal and external, 2 or more columns/groups; with fistulectomy, including fissurectomy, when performed	090	0.0888	7.91	45	179	2000	General Surgery	106
67904	Repair of blepharoptosis; (tarso) levator resection or advancement, external approach	090	0.0892	7.97	45	185	2005	Ophthalmology	54853
45171	Excision of rectal tumor, transanal approach; not including muscularis propria (ie, partial thickness)	090	0.0761	8.13	45	209	2009-02	COLORECTAL SURGERY (PROCTOLOGY)	2516
52500	Transurethral resection of bladder neck (separate procedure)	090	0.0582	8.14	45	230.5	2008-04	UROLOGY	3173
25606	Percutaneous skeletal fixation of distal radial fracture or epiphyseal separation	090	0.0419	8.31	45	260	2006-02	ORTHOPEDIC SURGERY	2015
67255	Scleral reinforcement (separate procedure); with graft	090	0.0595	8.38	45	216	2014-01	OPHTHALMOLOGY	833

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.

☐ Historical precedents.
☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 69714

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Otoloaryngology How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 27
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This is three times the estimated Medicare volume cited below.

Specialty Otolaryngology Frequency 27 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 9 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Industry data estimates .5-1% of 69716 cases will have to be removed. We estimated 900 cases per year of 69716, and 1% of that is 9.

Specialty Otolaryngology Frequency 9 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 31070

69727	Removal, osseointegrated implant, skull; with magnetic transcutaneous attachment to external speech processor	090

Vignette(s) (*vignette required even if PE only code(s)***):**

CPT Code	Vignette
69714	A 56-year-old male suffers from chronic otitis media resulting in otorrhea and mixed hearing loss. He is unable to wear traditional hearing aids. Implantation of an osseointegrated bone anchored device with a percutaneous attachment to an external speech processor is performed.
CPT Code	**Vignette**
69716	A 48-year-old male with a left mixed hearing loss seeks intervention for improved quality of life at work and socially. Placement of a magnetic transcutaneous bone anchored hearing device is performed.
CPT Code	**Vignette**

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

69717	A 16-year-old female with chronic otitis media and conductive hearing loss who previously received a percutaneous bone anchored implant has chronic inflammation at the abutment site that has been unresponsive to medical therapy. The device is removed and a new device is placed at a different site.
CPT Code	**Vignette**
69719	A 59-year-old female with a right mixed hearing loss previously had placement of a magnetic transcutaneous bone anchored implant. It worked well, but she has developed discomfort at the device site. The device is removed and a new device is placed at a different site.
CPT Code	**Vignette**
69726	A 59-year-old female with a right mixed hearing loss had previous placement of a percutaneous bone anchored implant. It worked well, but she has developed discomfort at the device site. The device is removed without replacement.
CPT Code	**Vignette**
69727	A 62-year-old male with a right mixed hearing loss previously had placement of a magnetic transcutaneous bone anchored implant which worked well, but has now become infected. The device is removed without replacement.

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

   Our specialty formed a panel of experts to develop practice expense recommendations for this family of codes. The panel was comprised of our RUC Advisor and multiple clinical experts who practice in the areas of general otolaryngology, sleep medicine, and otology. The expert panel members also practice across in settings that vary by size, geography, and represent both private and academic settings.

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code, but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here (*for service reviewed prior to the implementation of clinical activity codes, detail is not provided in the RUC database, please contact Samantha Ashley at samantha.ashley@ama-assn.org for PE spreadsheets for your reference codes*):

   Existing codes 69714 and 69717 were utilized as comparison codes for all new codes in the family.

3. Is this code(s) typically reported with an E/M service?

   No

4. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time:

   N/A

5. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies for the **code family**, please provide compelling evidence (please see *PE compelling evidence*

guidelines) Please explain if the increase can be entirely accounted for because of an increase in physician time:

N/A

6. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (*please see second worksheet in PE spreadsheet workbook*), please explain the difference here:

N/A

7. Please provide a brief description of the clinical staff work for the following:
   a. Pre-Service period:

During the pre-service clinical staff are completing pre-service diagnostic and referral forms, coordinating pre-surgery services including test results, scheduling space and equipment in the facility, providing pre-service education and obtaining consent from the patient, and completing pre-procedure phone calls and prescriptions.

   b. Service period (includes pre, intra and post):

During the service period the clinical staff assist with a half discharge management visit for the patient. This includes post-procedure care instructions. They also clean the instruments used during each post operative visit.

   c. Post-service period:

During post operative visits the patient is checked in via front-desk staff. Clinical staff collects vitals from the patient. An exam chair/table and light are required with paper covering for the exam furniture. A postoperative wound kit for removal of sutures/staples is required. The clinical staff assists the physician with removal of the sutures.

8. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (*please see second worksheet in PE spreadsheet workbook*):

N/A

9. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov.

N/A

INVOICES

10. ☐ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

11. ☐ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

12. If you wish to include a supply that is not on the list (*please see fourth worksheet in PE spreadsheet workbook*) please provide a paid invoice. Identify and explain the invoice here:

N/A

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

13. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation. Please include the description, CMS supply code, unit, item quantity and unit price (if available). See documents two and three under PE reference materials on the RUC Collaboration Website for information on the contents of kits, packs and trays.

DESCRIPTION	Code	Unit	Item Qty	Unit price

gauze, sterile 4in x 4in		item
gloves, sterile		pair
steri-strip (6 strip uou)		item
swab-pad, alcohol		item
tape, surgical paper 1in (Micropore)		inch
tincture of benzoin, swab		item

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

14. If you wish to include an equipment item that is not on the list (*please see fifth worksheet in PE spreadsheet workbook*) please provide a paid invoice. Identify and explain the invoice here:

N/A

15. Have you recommended equipment minutes for a computer or equivalent laptop/integrated computer, equipment item computer, desktop, w-monitor, ED021 or notebook (Dell Latitute D600), ED038?
    a. If yes, please explain how the computer is used for this service(s).
    b. Is the computer used exclusively as an integral component of the service or is it also used for other purposes not specific to the code?
    c. Does the computer include code specific software that is typically used to provide the service(s)?

N/A

16. List all the equipment included in your recommendation and the equipment formula chosen *(*please see document titled *Calculating equipment time).* If you have selected "other formula" for any of the equipment please explain here:

EQ234 suction and pressure cabinet, ENT (SMR)
EQ183 microscope, operating
EQ170 light, fiberoptic headlight w-source
EF008 chair with headrest, exam, reclining

The office visit formula was used for all these pieces of equipment.

EQ137 basic instrument pack

The instrument pack formula was used for this item.

17. If there is any other item(s) on your spreadsheet not covered in the categories above that require greater detail/explanation, please include here:

N/A

PROFESSIONAL LIABILITY INSURANCE (PLI) INFORMATION

18. If this is a PE only code please select a crosswalk based on a similar specialty mix:

N/A

ITEMIZED LIST OF CHANGES (FOLLOWING THE PE SUBCOMMITTEE MEETING

During and immediately following the review of this tab at the PE Subcommittee meeting please revise the PE spreadsheet and summary of recommendation (PE SOR) documents based on modifications made during the meeting. Please submit the revised documents electronically to Samantha Ashley at samantha.ashley@ama-assn.org immediately following the close of business the same day that the tab is

reviewed. On the PE spreadsheet, please highlight the cells and/or use red font to show the changes made during the PE Subcommittee meeting (if you have provided any of this highlighting based on changes from the reference code prior to the PE Subcommittee meeting please remove it, so not to be confused with changes made during the meeting). In addition to those revisions please also provide an itemized list of the modifications made to the PE spreadsheet during the PE Subcommittee meeting in the space below (e.g. clinical activity CA010 *obtain vital signs* was reduced from 5 minutes to 3 minutes).

Clinical staff time in the preservice period remains unchanged for all codes in the family. All codes have cleaning time added in the intra service time period to allocate time to cleaning the instruments used at each post op visit. Post-operative time has changed, commensurate with the survey data and recommended post op visits. Two codes (64714/64717) have 3 post op visits and the rest of the family has 2 post op visits.

Some supplies were reduced commensurate with reducing the post-operative visits per our survey data. Additionally, we added a minimum multi-specialty pack for each post op visit and reduced individual, unnecessary line items. We also added a basic instrument pack and cleaning pack for the instruments which will be used at each post op visit. The items include a tuning fork, Frasier tip suctions, and ear curettes. We removed the suture/staple pack and replaced it with just a suture pack.

Equipment times were reduced based on less office visits and lower overall office visit post time. The instrument pack formula was used for the new instrument pack and cleaning time was accounted for.

AMA/Specialty Society RVS Update Committee Summary of Recommendations
Screen: High Volume Growth

April 2021

Cardiac Ablation – Tab 7

The RUC identified CPT code 93656 with Medicare utilization over 10,000 that have increased by at least 100% from 2014 through 2019e. In January 2020, the RUC recommended to refer this issue to the CPT Editorial Panel in May 2020 for revision and bundling. Technology and clinical practice have changed since these codes were developed in 2011. Based on the billed together data for these and related codes, the specialty societies recommended referral to CPT to update code descriptors and likely bundle services now commonly performed together, such as 3D mapping. In October 2020, the CPT Editorial Panel revised one code (93653) to bundle with 3D mapping and to include "induction or attempted induction of an arrhythmia with right atrial pacing and recording, and catheter ablation of arrhythmogenic focus," and another (93656) to add 3D mapping and "left atrial pacing and recording from coronary sinus or left atrium" and "intracardiac echocardiography including imaging supervision and interpretation" to their descriptors.

The surveying specialties had submitted a letter to the CPT Editorial Panel in December 2020 requesting that the coding changes for these services to be rescinded for CPT 2022 due to the specialty's concern that the RUC survey respondents may have been confused about the coding changes. In February 2021, the CPT Editorial Panel Executive Committee did not rescind their changes, which were among the coding changes for CPT 2022. Since the request to rescind the changes was not considered by CPT until after the January 2021 RUC meeting and January 2021 was the last RUC meeting of the CPT 2022 cycle, the RUC had recommended for these services to be valued as interim for CPT 2022 and that the codes would be resurveyed and reviewed at the April 2021 RUC meeting.

93653 ***Comprehensive electrophysiologic evaluation with insertion and repositioning of multiple electrode catheters, induction or attempted induction of an arrhythmia with right atrial pacing and recording, and catheter ablation of arrhythmogenic focus, including intracardiac electrophysiologic 3-dimensional mapping, right ventricular pacing and recording, left atrial pacing and recording from coronary sinus or left atrium, and His bundle recording, when performed; treatment of supraventricular tachycardia by ablation of fast or slow atrioventricular pathway, accessory atrioventricular connection, cavo-tricuspid isthmus or other single atrial focus or source of atrial re-entry***
The RUC reviewed the survey results from 62 cardiac electrophysiologists and recommends the survey 25th percentile work RVU of 15.00 for CPT code 93653. The RUC recommends 31 minutes of pre-service evaluation, 3 minutes of pre-service positioning, 15 minutes of pre-service scrub/dress/wait time, 120 minutes of intra-service time and 30 minutes of immediate post-service time. The RUC noted that CPT code 93653 was revised to now bundle the physician work of CPT codes 93613 *Intracardiac electrophysiologic 3-dimensional mapping (List separately in addition to code for primary procedure)* and 93621 *Comprehensive electrophysiologic evaluation including insertion and repositioning of multiple electrode catheters with induction or attempted induction of arrhythmia; with left atrial pacing and recording from coronary sinus or left atrium (List separately in addition to code for primary procedure)*, which previously were separately reported add-on services.

The specialties noted that the actual ablation portion of the procedure is more intense relative to when this procedure was last valued, since the cardiac electrophysiologist is now receiving much greater feedback from the catheter that is touching the heart and now knows exactly how many grams of force are being applied. When the base procedure was last reviewed, the physician would not have been certain that the tissue was

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

contacted well enough to be delivering energy, which resulted in the physician delivering repeated ablation on the same spots many times, to produce an effect. The physician now knows exactly how well the catheter is contacting the tissue and is also examining the different impedance and various electrical measurements during the ablation delivery. Due to these recent improvements in technology, the lesions are now much more efficient and effective, but also because of that, the risk of causing collateral injury during the ablation delivery is much higher with each lesion delivery. For instance, the ablation treatment is much more intense in terms of risk of heart block and esophageal injury. Furthermore, while the physician is obtaining many more data points to create the 3-dimensional map, the physician still needs to make sure every one of those points are accurate as review of points is not automated.

The specialties noted that 93653 is typically the most intense service to perform among the three base codes in this family (93653, 93654 and 93656). CPT code 93653 is typically performed on a young patient who does not have other conditions and the ablation site occurs very close to the patient's innate conduction system. There is an approximately 0.5 percent to 1 percent risk of causing heart block requiring a permanent pacemaker. The time when the physician is applying radiofrequency energy is extraordinarily intense as opposed to the other two ablation services, 93654 and 93656, which are longer procedures on generally sicker patients and the intensity is more spread out over time.

To justify a value of 15.00, the RUC compared the survey code to top key reference code 93580 *Percutaneous transcatheter closure of congenital interatrial communication (ie, Fontan fenestration, atrial septal defect) with implant* (work RVU= 17.97, intra-service time of 120 minutes, total time of 210 minutes) and noted that both services involve an identical amount of intra-service time and that 80 percent of the survey respondents who selected the top key reference code also indicated that the survey code is a more intense and complex procedure to perform. However, the reference code involves more total time. The RUC also compared the survey code to 2nd key reference code 33340 *Percutaneous transcatheter closure of the left atrial appendage with endocardial implant, including fluoroscopy, transseptal puncture, catheter placement(s), left atrial angiography, left atrial appendage angiography, when performed, and radiological supervision and interpretation* (work RVU= 14.00, intra-service time of 90 minutes, total time of 183 minutes) and noted that the survey code involves much more intra-service time and somewhat more total time. 75 percent of the survey respondents who selected this reference code indicated the survey code was more intense and complex, however, the RUC recommendation of 15.00 has a lower intensity than the reference code. The specialty noted and the RUC concurred that there are very few major surgical procedures that comprise 000-day or XXX global periods to use as reference codes to compare to the survey code. The RUC concluded that CPT code 93653 should be valued at the 25th percentile work RVU as supported by the resurvey. **The RUC recommends a work RVU of 15.00 for CPT code 93653.**

93654 ***Comprehensive electrophysiologic evaluation with insertion and repositioning of multiple electrode catheters, induction or attempted induction of an arrhythmia with right atrial pacing and recording, and catheter ablation of arrhythmogenic focus, including intracardiac electrophysiologic 3-dimensional mapping, right ventricular pacing and recording, left atrial pacing and recording from coronary sinus or left atrium, and His bundle recording, when performed; with treatment of ventricular tachycardia or focus of ventricular ectopy including left ventricular pacing and recording, when performed***

The RUC reviewed the survey results from 63 cardiac electrophysiologists and recommends the survey 25th percentile work RVU of 18.10 for CPT code 93654. The RUC recommends 40 minutes of pre-service evaluation, 3 minutes of pre-service positioning, 15 minutes of pre-service scrub/dress/wait time, 200 minutes of intra-service time and 33 minutes of immediate post-service time. The RUC noted that, unlike codes 93653 and 93655, the work of intracardiac electrophysiologic 3D mapping was already bundled into this service prior to the CPT revisions.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The specialties noted that the actual ablation portion of the procedure is more intense relative to when this procedure was last valued, since the cardiac electrophysiologist is now receiving much more feedback from the catheter that is touching the heart and now knows exactly how many grams of force are being applied. When the base procedure was last reviewed, the physician would not have been certain that the tissue was contacted well enough to be delivering energy, which resulted in the physician delivering repeated ablation on the same spots many times, to produce an effect. The physician now knows exactly how well the catheter is contacting the tissue and is also examining the different impedance and various electrical measurements during the ablation delivery. Due to these recent improvements in technology, the lesions are now much more efficient and effective, but also because of that, the risk of causing collateral injury during the ablation delivery is much higher with each lesion delivery. The ablation treatment is much more intense in terms of risk of heart block and esophageal injury. Furthermore, while the physician is obtaining many more points to create the 3-dimensional map, they still need to make sure every one of those points are accurate as review of points is not automated.

In addition, the specialties noted that ventricular tachycardia patients are the most complicated, often with recurrent heart failure admissions and these patients typically have with an implantable defibrillator. The defibrillator must be turned off prior to the procedure and the patient requires more pre-service evaluation time to make sure that they are hemodynamically stable prior to and throughout the procedure.

To justify a work value of 18.10, the RUC compared the survey code to CPT code 93581 *Percutaneous transcatheter closure of a congenital ventricular septal defect with implant* (work RVU= 24.39, intra-service time of 180 minutes, total time of 270 minutes) and noted that the survey code involves 20 more minutes of intra-service time and 21 more minutes of total time. The RUC also compared the survey code to CPT code 33978 *Removal of ventricular assist device; extracorporeal, biventricular* (work RVU= 25.00, intra-service time of 200 minutes, total time of 355 minutes) and noted that although both services involve an identical amount of intra-service time, it would be appropriate to value the survey code somewhat lower due to the disparity in total time. The specialty noted and the RUC concurred that there are very few major surgical procedures that comprise 000-day or XXX global periods to use as reference codes to compare to the survey code. The RUC concluded that CPT code 93654 should be valued at the 25th percentile work RVU as supported by the resurvey. **The RUC recommends a work RVU of 18.10 for CPT code 93654.**

93655 ***Intracardiac catheter ablation of a discrete mechanism of arrhythmia which is distinct from the primary ablated mechanism, including repeat diagnostic maneuvers, to treat a spontaneous or induced arrhythmia (List separately in addition to code for primary procedure)***
The RUC reviewed the survey results from 63 cardiac electrophysiologists and recommends the survey 25th percentile work RVU of 7.00 for CPT code 93655. The RUC recommends 60 minutes of intra-service time for this add-on service.

To support a work value of 7.00, the RUC compared the survey code to CPT code 93592 *Percutaneous transcatheter closure of paravalvular leak; each additional occlusion device (List separately in addition to code for primary procedure)* (work RVU= 8.00, intra-service and total time of 60 minutes) and noted that both add-on codes have identical times, whereas the reference code involves somewhat more intense physician work. The RUC also compared the survey code to CPT code 34820 *Open iliac artery exposure for delivery of endovascular prosthesis or iliac occlusion during endovascular therapy, by abdominal or retroperitoneal incision, unilateral (List separately in addition to code for primary procedure)* (work RVU= 7.00, intra-service and total time of 60 minutes) and noted that both services have identical times. The RUC concluded that CPT code 93655 should be valued at the 25th percentile work RVU as supported by the resurvey. **The RUC recommends a work RVU of 7.00 for CPT code 93655.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

93656 ***Comprehensive electrophysiologic evaluation including transseptal catheterizations, insertion and repositioning of multiple electrode catheters with intracardiac catheter ablation of atrial fibrillation by pulmonary vein isolation, including intracardiac electrophysiologic 3-dimensional mapping, intracardiac echocardiography including imaging supervision and interpretation, induction or attempted induction of an arrhythmia including left or right atrial pacing/recording, right ventricular pacing/recording, and His bundle recording, when performed***
The RUC reviewed the survey results from 61 cardiac electrophysiologists and recommends the survey 25th percentile work RVU of 17.00 for CPT code 93656. The RUC recommends 35 minutes of pre-service evaluation, 3 minutes of pre-service positioning, 15 minutes of pre-service scrub/dress/wait time, 180 minutes of intra-service time and 30 minutes of immediate post-service time. The RUC noted that CPT code 93656 was revised to now bundle the physician work of CPT codes 93613 *Intracardiac electrophysiologic 3-dimensional mapping (List separately in addition to code for primary procedure)* and 93662 *Intracardiac echocardiography during therapeutic/diagnostic intervention, including imaging supervision and interpretation (List separately in addition to code for primary procedure)*, which previously were separately reported add-on services.

The specialties noted that the actual ablation portion of the procedure is more intense relative to when this procedure was last valued, since the cardiac electrophysiologist is now receiving much more feedback from the catheter that is touching the heart and now knows exactly how many grams of force are being applied. When the base procedure was last reviewed, the physician would not have been certain that the tissue was contacted well enough to be delivering energy, which resulted in the physician delivering repeated ablation on the same spots many times, to produce an effect. The physician now knows exactly how well the catheter is contacting the tissue and is also examining the different impedance and various electrical measurements during the ablation delivery. Due to these recent improvements in technology, the lesions are now much more efficient and effective, but also because of that, the risk of causing collateral injury during the ablation delivery is much higher with each lesion delivery. The ablation treatment is much more intense in terms of risk of heart block and esophageal injury. Furthermore, while the physician is obtaining many more points to create the 3-dimensional map, they still need to make sure every one of those points are accurate as review of points is not automated.

To justify a value of 17.00, the RUC compared the survey code to CPT code 93581 *Percutaneous transcatheter closure of a congenital ventricular septal defect with implant* (work RVU= 24.39, intra-service time of 180 minutes, total time of 270 minutes) and noted that both services involve an identical amount of intra-service time, whereas the reference code involves slightly more total time and is also slightly more intense to perform. The RUC also compared the survey code to CPT code 33978 *Removal of ventricular assist device; extracorporeal, biventricular* (work RVU= 25.00, intra-service time of 200, total time of 355) and noted that the reference code involves 20 more minutes of intra-service time and 92 more minutes of total time, justifying a lower valuation for the survey code. The specialty noted and the RUC concurred that there are very few major surgical procedures that comprise 000-day or XXX global periods to use as reference codes to compare to this survey code. The RUC concluded that CPT code 93656 should be valued at the 25th percentile work RVU as supported by the resurvey. **The RUC recommends a work RVU of 17.00 for CPT code 93656.**

93657 ***Additional linear or focal intracardiac catheter ablation of the left or right atrium for treatment of atrial fibrillation remaining after completion of pulmonary vein isolation (List separately in addition to code for primary procedure)***
The RUC reviewed the survey results from 61 cardiac electrophysiologists and recommends the survey 25th percentile work RVU of 7.00 for CPT code 93657. The RUC recommends 60 minutes of intra-service time for this add-on service.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

To support a work value of 7.00, the RUC compared the survey code to CPT code 93592 *Percutaneous transcatheter closure of paravalvular leak; each additional occlusion device (List separately in addition to code for primary procedure)* (work RVU= 8.00, intra-service and total time of 60 minutes) and noted that both add-on codes have identical times, whereas the reference code involves somewhat more intense physician work. The RUC also compared the survey code to CPT code 34820 *Open iliac artery exposure for delivery of endovascular prosthesis or iliac occlusion during endovascular therapy, by abdominal or retroperitoneal incision, unilateral (List separately in addition to code for primary procedure)* (work RVU= 7.00, intra-service and total time of 60 minutes) and noted that both services have identical times. The RUC concluded that CPT code 93657 should be valued at the 25th percentile work RVU as supported by the resurvey. **The RUC recommends a work RVU of 7.00 for CPT code 93657.**

Affirmation of RUC Recommendations

The RUC reviewed the specialty societies' request to affirm the recent RUC valuations for CPT codes 93613, 93621 and 93662. The RUC noted that for 93613, this is also the code's current 2021 CMS value. For code 93621, this service was surveyed for the October 2020 RUC meeting for CY 2022 and represents a reduction compared to the current 2021 CMS value.

For code 93662, the RUC recommendation would represent an increase compared to the current 2021 CMS value. In the CY 2021 Medicare Physician Payment Schedule Final Rule, CMS' rationale for not accepting the RUC recommendation and instead implementing a lower value for 93662 was the 45 percent decrease in total time from when the service was previously surveyed in 2000. The Agency's 1.44 work value was derived from using a work value crosswalk to code 92979 *Endoluminal imaging of coronary vessel or graft using intravascular ultrasound (IVUS) or optical coherence tomography (OCT) during diagnostic evaluation and/or therapeutic intervention including imaging supervision, interpretation and report; each additional vessel (List separately in addition to code for primary procedure).* Unfortunately, the coronary IVUS crosswalk code (92979) that CMS had used to determine an alternate valuation was flawed because the nature of the services performed, intensity and work involved are different, with intracardiac echocardiography (ICE) and intravascular ultrasound (IVUS) performed in different parts of the heart for different reasons. Coronary IVUS is performed inside the coronary arteries to guide diagnostic catheterization and/or percutaneous coronary interventions. ICE is used to provide high-resolution real-time visualization of cardiac structures, continuous monitoring of a catheter location within the heart. It commonly guides trans-septal puncture where the operator creates a hole in the septum of the heart to gain access to the other cardiac chambers on the other side of the heart and is useful for early recognition of procedural complications, such as pericardial effusion or thrombus formation. ICE remains highly technical in nature and requires the patient to be anesthetized, which is not required in IVUS use. ICE is most used with atrial fibrillation ablations, a highly technical and challenging service, this reinforces the intensity of ICE.

The RUC recommendation for CPT code 93662 was based on the survey 25th percentile work RVU from robust survey results of 42 cardiologists as well as a favorable comparison to code 34713 *Percutaneous access and closure of femoral artery for delivery of endograft through a large sheath (12 French or larger), including ultrasound guidance, when performed, unilateral (List separately in addition to code for primary procedure)* (work RVU = 2.50 and intra-service time of 20 minutes) and MPC code 36476 *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; subsequent vein(s) treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)* (work RVU = 2.65 and intra-service time of 30 minutes). Both reference services bracket code 93662 in both physician work and time.

The RUC recommends affirming the recent RUC-recommended work RVU of 5.23 for CPT code 93613, 1.75 for CPT code 93621 and 2.53 for CPT code 93662.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Practice Expense
No direct practice expense inputs are recommended for CPT codes 93653-93657 as they are facility-only services.

Work Neutrality
The RUC's recommendation for this family of codes will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

CPT Code	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
Medicine **Cardiovasular** **Intracardiac Electrophysiological Procedures/Studies**

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:93653 Tracking Number Y1 Original Specialty Recommended RVU: **15.00**
Presented Recommended RVU: **15.00**
Global Period: 000 Current Work RVU: **14.75** RUC Recommended RVU: **15.00**

CPT Descriptor: Comprehensive electrophysiologic evaluation including with insertion and repositioning of multiple electrode catheters, induction or attempted induction of an arrhythmia with right atrial pacing and recording, and catheter ablation of arrhythmogenic focus, including intracardiac electrophysiologic 3-dimensional mapping, right ventricular pacing and recording, left atrial pacing and recording from coronary sinus or left atrium, and his bundle recording, when performed treatment of supraventricular tachycardia by ablation of fast or slow atrioventricular pathway, accessory atrioventricular connection, cavo-tricuspid isthmus or other single atrial focus or source of atrial re-entry
(Do not report 93653 in conjunction with 93600, 93602, 93603, 93610, 93612, 93613, 93618, 93619, 93620, 93621, 93642, 93654, 93656)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 64-year-old female has recurrent palpitations. an event monitor has documented supraventricular tachycardia (svt). a comprehensive electrophysiologic evaluation with catheter ablation is ordered.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: The procedure and the risks, benefits, and alternatives associated with electrophysiology testing and supraventricular tachycardia ablation are explained to the patient. Management of antiarrhythmic medications is communicated to the patient. Arrangements are made for the X-ray technician, electrophysiology laboratory technician, and nurse. Informed consent is obtained. The patient is evaluated on the day of the procedure with a history and physical examination. Preprocedure laboratory testing is reviewed as well as current medications and changes in health status.

Description of Intra-Service Work: Local analgesia is administered along with anesthesia appropriate to the patient including moderate sedation. Venous access is obtained. Arterial access to monitor blood pressure and to facilitate retrograde aortic access to the left ventricle may be obtained. Multi-electrode catheters are advanced from the access sheaths and into the respective cardiac chambers where they will be used to pace and record. Pacing and sensing is performed in the right atrium, left atrium, and right ventricle. His bundle recording is obtained. Refractory periods are measured. Attempts at arrhythmia induction are performed via maneuvers that include burst pacing and premature pacing using programmed electrical stimulation at multiple drive cycle lengths from multiple atrial and ventricular sites.

Once the SVT is induced, pacing maneuvers are performed to elucidate the mechanism of the tachycardia. A combination of diagnostic maneuvers is performed and a high definition anatomical map of the chamber(s) of interest is generated. Voltage and electrical activation in the arrhythmia and/or in sinus rhythm is performed to identify normal activation, location of scar, and mechanism of the arrhythmia. 3-dimensional mapping activation and voltage mapping may be performed to assist in identifying the arrhythmia mechanism, substrate, cardiac anatomy, and to guide catheter ablation. Catheter ablation may then be performed. An ablation catheter is maneuvered from the sites of vascular access to the appropriate cardiac location to facilitate delivery of ablative energy. Multiple lesions are delivered to ensure eradication of the arrhythmia focus and to provide consolidation lesions in the surrounding tissue.

During the course of an electrophysiology procedure, an arrhythmia is induced that requires use of advanced 3D computer mapping system to assist in identifying the arrhythmia circuit, localizing the origin (for focal arrhythmias) or the critical isthmus (reentrant arrhythmias). The 3D mapping system is calibrated, and recordings are made during sinus rhythm (to identify normal activation and location of scar) and during each distinct arrhythmia. The physician then analyzes the computer-generated map, ensuring that electrograms are annotated correctly and that the display parameters are correct for the specific arrhythmia being mapped. Based upon the data from the 3D mapping system, endocardial electrograms, surface ECG and the response of the SVT to pacing maneuvers, the ablation catheter is advanced to the point of earliest activation, localized by the mapping system, to identify a mid-diastolic potential, Kent potential, and/or similar paced maps. When a reentrant circuit is identified, entrainment mapping studies are performed and evaluated to confirm the catheter location is within the reentrant circuit. Radiofrequency (or cryo) ablation is then performed. If initial mapping in one chamber does not lead to complete identification of the essential arrhythmia circuit (either based on analysis of the map or based on incomplete ablation result, then the mapping catheter(s) is/are moved into another cardiac chamber and an additional 3D map is generated to aid in diagnosis; this is repeated until the arrhythmia mechanism is fully characterized and ablation is deemed completely successful. A final report that includes the mapping procedure and findings is prepared.

To record left atrial activity, femoral venous access site is already prepared for related procedure. Achieve central venous access, place a sheath in the femoral vein using standard percutaneous techniques, changing to subclavian or jugular access if that fails. Introduce the catheter into the sheath and advance into the right atrium where the ostium of the coronary sinus is engaged. Advance the catheter into the coronary sinus. Use the multielectrode catheter to record electrical activity from the left atrium and, at times, pace the left atrium to attempt arrhythmia induction. Reposition the catheter as necessary throughout the course of the cardiac electrophysiology procedure to optimize recordings and pacing thresholds. At the conclusion of the procedure, remove the catheter. Include a description of this additional work and catheter use and associated findings in the procedure report.

Throughout the ablation the patient is monitored for hemodynamic compromise due to cardiac perforation, - or tachyarrhythmias, embolic phenomena, or damage to cardiac or vascular structures. Following the ablation portion of the procedure, repeat electrophysiologic testing is performed to assess the outcome of ablation using decremental, burst, and premature pacing maneuvers. These are again repeated following a 30-minute waiting period following the conclusion of the final ablation lesion. If the tachycardia demonstrates recovery or incomplete suppression, then repeat mapping and ablation are performed as described above. These steps are repeated until the tachycardia is rendered durably suppressed. Sheaths are removed, appropriate hemostasis is achieved, and follow-up assessment of the patient for any complications is performed.

Description of Post-Service Work: The patient is monitored in the recovery unit for delayed complications. Results of the procedure are discussed with the patient and the patient's family, and postprocedure assessments are performed.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	20%	45%	35%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	25%	75%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	5%	10%	85%
Physical effort required	0%	40%	60%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	35%	65%

2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	6%	19%	50%	25%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	40%	60%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	47%	53%
Physical effort required	13%	34%	53%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	13%	62%	25%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

History Background

When the Relativity Assessment Workgroup identified CPT code 93656 (atrial fibrillation ablation) due to its rapid increase in growth, the ACC and HRS reviewed the code and determined that certain work should be bundled into the existing code due to their being billed together more than 75% of the time. With continued review of 93656 and the related the volume data, the societies also identified that CPT 93653 (SVT ablation) should have services bundled into it before the codes are

re-surveyed for upcoming RUC valuation. As a result, in October 2020, the ACC and HRS presented a code change application to the CPT Editorial Panel on codes: **93653**, 93654, 93655, 93656, 93657. As indicated in the summary spreadsheet, revised 93653 is now a more comprehensive, bundled service that includes the work of 3D mapping (93613) and left atrial pacing/recording (93621). The societies surveyed members late 2020 and presented data in January 2021. Due to inconsistencies in the survey data and in order to better convey the bundled services to respondents, the ACC and HRS resurveyed members March 2021.

The ACC and HRS randomly surveyed cardiac electrophysiologists, as designated by membership rolls, on the newly created codes and entire family. The 000- and ZZZ-global day survey was completed by physicians who have experience with the service. To remedy the above-described shortcomings, the societies work with the Research Subcommittee to deploy several tactics to obtain more consistent survey results. First, fake/dummy codes were used in the survey so that respondents would not presume to know the code descriptors. Second, additional language noting the bundling was included in the survey invitation. Third, respondents were required to attest they had read and understood the new language before completing the survey.

The key reference code is 93580 for percutaneous transcatheter closure of a congenital interatrial communication. It was selected by approximately 32% of respondents. 80% of the respondents indicated that 93653 was more complex. The second reference code was 33340 for percutaneous transcatheter closure of left atrial appendage with endocardial implant. It was selected by over 25% of respondents. About 75% of the respondents indicated that 93653 was more intense/complex overall.

Rationale

In reviewing the survey data to develop work recommendations, the expert panel believes the data accurate reflects the newly bundled services, 93653 and 93656. The societies believe the technological advances made in patient care indicate survey respondents understood that 3D mapping and left atrial pacing were now inherent to 93653. After nearly a decade and many changes in technology and broader service dispersion have clearly altered the way this service is provided. Over time, the mapping systems have improved, now providing much more detailed and accurate anatomical and electrical activation mapping, often removing the need for fluoroscopy completely. Catheter technology has advanced, providing real-time assessment of the quality of contact between the catheter tip and the endocardial tissue. Last, the 3D mapping systems in conjunction with new catheter technology are now able to provide real-time assessment of the quality of radiofrequency ablation lesion formation. This feature has allowed operators to significantly shorten the duration of each radiofrequency application while also improving the quality of the lesions delivered. The results indicate survey respondents understood that 3D mapping and left atrial pacing were now inherent to 93653. After nearly a decade and many changes in technology and broader service dispersion, a reduction in intraservice times is logical for performing this procedure. The societies support the resurvey data and stand behind the 25th survey value.

While we recognize that in some ways the resurvey may be viewed as a failure, we believe the general consistency with the initial survey—demonstrating reductions in intraservice time—provides insights and a foundation to develop final recommendations for this family. First, with the additional information and tactics taken in the resurvey, we have no reason to believe respondents failed to understand the bundling that has occurred. Rather, we now have confidence that in the survey and the survey-based recommendations we make. Second, in digesting the data from the two surveys, we believe the reductions in time can, in fact, be explained by evolutions in technology and service dispersion, as discussed above. We can speak to this in more detail if helpful. Finally, the resurvey does provide a viable path forward for valuation, as the survey 25th-percentile work RVUs proceed in a reasonable progression that align with other services in the fee schedule. We recognize these recommendations produce an increase in intensity as the drop in time is not 1:1 proportionate with the drop in RVU. We believe that increase is best explained by the fact that several separately reported services are now bundled together, with work being done more quickly and several services being combined in a way that makes meaningful comparison to the prior intensity unhelpful.

Recommendation

During the January meeting, several RUC members questioned whether codes 93613, 93621 and 93662 should also be addressed in the recommendations for cardiac ablation services. These codes are bundled into CPT codes 93653 and/or 93656. Each was recently surveyed by the specialties and the RUC in 2017, 2020, 2019, respectively. **As such, the societies recommend affirming the recent times and RVUs of these recently valued codes, as they remain separate in CPT for use in concert with other CPT codes.**

Therefore, for code 93653 the **societies recommend, the survey 25th of RVW of 15.00 with 49 minutes preservice time from package 4 with 14 minutes removed, 120 minutes intraservice time from the survey median, and 30 minutes postservice time with 3 minutes removed from package 9B**. This logically aligns with the KRS 93580 in terms of IWPUT, total time, and intraservice time. Survey respondents felt 93580 was less complex and had a shorter preservice time than 93653. This recommendation also produces a work RVU savings from the current, component-coded services. The survey 25th percentile recommendation is further supported, as results from the original RUC survey and comparison to other codes (37227, 33340) from the fee schedule, as shown in the summary spreadsheet.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 93653, 93613, 93621

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Cardiac Electrophysiology How often? Commonly

Specialty Cardiology How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 63642
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Figure is about twicethe Medicare-based claims volume.

Specialty Cardiac electrophysiology Frequency 50022 Percentage 78.59 %

Specialty Cardiology Frequency 11902 Percentage 18.70 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?
31,821 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Figure reflects 2019e Medicare-based claims.

Specialty Cardiac electrophysiology Frequency 25009 Percentage 78.59 %

Specialty Cardiology Frequency 5951 Percentage 18.70 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Cardiovascular-Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 93653

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:93654 Tracking Number Y2 Original Specialty Recommended RVU: **18.10**
Presented Recommended RVU: **18.10**
Global Period: 000 Current Work RVU: **19.75** RUC Recommended RVU: **18.10**

CPT Descriptor: Comprehensive electrophysiologic evaluation with insertion and repositioning of multiple electrode catheters, induction or attempted induction of an arrhythmia with right atrial pacing and recording, and catheter ablation of arrhythmogenic focus, including intracardiac electrophysiologic 3-dimensional mapping, right ventricular pacing and recording,left atrial pacing and recording from coronary sinus or left atrium, and His bundle recording, when performed; with treatment of ventricular tachycardia or focus of ventricular ectopy including left ventricular pacing and recording, when performed
(Do not report 93654 in conjunction with 93279-93284, 93286-93289, 93600-93603, 93609, 93610, 93612, 93613, 93618-93620, 93622, 93642, 93653, 93656)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 73-year-old male with a history of New York Heart Association Class III heart failure due to ischemic dilated cardiomyopathy (ef 25%) and prior myocardial infarction presents with recurrent implantable cardioverter-defibrillator (icd) therapies for drug-refractory ventricular tachycardia.

Percentage of Survey Respondents who found Vignette to be Typical: 94%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: The procedure and the risks, benefits, and alternatives associated with electrophysiology testing and ventricular tachycardia ablation are explained to the patient and the patient's family. Arrangements are made for the X-ray technician, electrophysiology laboratory technician, and nurse. The patient is evaluated on the day of the procedure with a history and physical examination and pre-procedure laboratory testing, medications, and changes in heath are reviewed. Informed consent is obtained. Direct current cardioversion/defibrillation, electrophysiology (EP), and ablation equipment is confirmed to be present and in proper working order. Fluoroscopic equipment that will be used to visualize catheter movements and location is tested. Three-dimensional mapping equipment is tested and confirmed to be functioning normally.

Description of Intra-Service Work: Local analgesia is administered. Patients with implantable cardioverter-defibrillators will have their devices reprogrammed and/or transiently deactivated at the start of the case so as to minimize adverse consequences resulting from electromagnetic interference from radiofrequency current application.

Venous access is obtained. Arterial access to monitor blood pressure and to facilitate retrograde aortic access to the left ventricle is obtained. Multi-electrode catheters are advanced from the access sheaths and into the respective cardiac chambers where they will be used to pace and record. Papillary muscles are also recorded in the three-dimensional anatomical ultrasound map. Pacing and sensing is performed in the right atrium and right ventricle. His bundle recording is obtained. Refractory periods are measured. Attempts at ventricular tachycardia induction are performed via burst pacing, decremental pacing, and premature pacing using programmed electrical stimulation at multiple drive cycle lengths from multiple ventricular sites.
To record left atrial activity, femoral venous access site is already prepared for related procedure. Achieve central venous access, place a sheath in the femoral vein using standard percutaneous techniques, changing to subclavian or jugular access

if that fails. Introduce the catheter into the sheath and advance into the right atrium where the ostium of the coronary sinus is engaged. Advance the catheter into the coronary sinus. Use the multielectrode catheter to record electrical activity from the left atrium and, at times, pace the left atrium to attempt arrhythmia induction. Reposition the catheter as necessary throughout the course of the cardiac electrophysiology procedure to optimize recordings and pacing thresholds. At the conclusion of the procedure, remove the catheter. Include a description of this additional work and catheter use and associated findings in the procedure report.

Once an arrhythmia is induced, pacing maneuvers are performed to elucidate the mechanism of the ventricular tachycardia. During the course of an electrophysiology procedure, an arrhythmia is induced that requires use of advanced 3D computer mapping system to assist in identifying the arrhythmia circuit, localizing the origin (for focal arrhythmias) or the critical isthmus (reentrant arrhythmias). The 3D mapping system is calibrated, and recordings are made during sinus rhythm (to identify normal activation and location of scar) and during each distinct arrhythmia. The physician then analyzes the computer-generated map, ensuring that electrograms are annotated correctly and that the display parameters are correct for the specific arrhythmia being mapped. Based upon the data from the 3D mapping system, endocardial electrograms, surface ECG and the response of the SVT to pacing maneuvers, the ablation catheter is advanced to the point of earliest activation, localized by the mapping system, to identify a mid-diastolic potential, Kent potential, and/or similar paced maps. When a reentrant circuit is identified, entrainment mapping studies are performed and evaluated to confirm the catheter location is within the reentrant circuit. Radiofrequency (or cryo) ablation is then performed. If initial mapping in one chamber does not lead to complete identification of the essential arrhythmia circuit (either based on analysis of the map or based on incomplete ablation result, then the mapping catheter(s) is/are moved into another cardiac chamber and an additional 3D map is generated to aid in diagnosis; this is repeated until the arrhythmia mechanism is fully characterized and ablation is deemed completely successful. Occasionally mapping of the epicardial surface of the heart is necessary. A final report that includes the mapping procedure and findings is prepared.

The electrical activation sequence is mapped with the three-dimensional electroanatomical mapping system and activation timing is superimposed upon the three-dimensional image previously obtained. Anticoagulation is administered once catheters have been placed on the left side of the heart. Once the ventricular tachycardia circuit is localized, a catheter is moved to the appropriate location or region of abnormal myocardium to deliver ablative energy. Multiple lesions are delivered to ensure eradication of the arrhythmia focus and to provide consolidation lesions in the surrounding tissue. Throughout the ablation the patient is monitored for hemodynamic compromise due to cardiac perforation, - or tachyarrhythmias, embolic phenomena, or damage to cardiac or vascular structures.

Following the ablation portion of the procedure, repeat electrophysiologic testing is performed to assess the outcome of ablation using decremental, burst, and premature pacing maneuvers. These are again repeated following a 30-minute waiting period following the conclusion of the final ablation lesion. If the tachycardia demonstrates recovery or incomplete suppression, then repeat mapping and ablation are performed as described above. These steps are repeated until the tachycardia is rendered durably suppressed. Following the ablation portion of the procedure, further electrophysiologic testing is performed to assess the outcome of ablation using decremental, burst, and premature pacing maneuvers. These are repeated following a 30-minute period following the conclusion of the final ablation lesion. Anticoagulation is reversed. Sheaths are removed, appropriate hemostasis is achieved, and follow-up assessment of the patient for any complications is performed. Patients with implantable cardioverter-defibrillators will have their devices reprogrammed to an active configuration with rates reprogrammed as necessary to treat any remaining arrhythmias.

Description of Post-Service Work: The patient is monitored in the recovery unit and then overnight in a telemetry unit for delayed complications. Results of the procedure are discussed with the patient and the patient's family, and postprocedure assessments are performed.

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	15%	85%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

History Background

When the Relativity Assessment Workgroup identified CPT code 93656 (atrial fibrillation ablation) due to its rapid increase in growth, the ACC and HRS reviewed the code and determined that certain work should be bundled into the existing code due to their being billed together more than 75% of the time. With continued review of 93656 and the related the volume data, the societies also identified that CPT 93653 (SVT ablation) should have services bundled into it before the codes are

re-surveyed for upcoming RUC valuation. As a result, in October 2020, the ACC and HRS presented a code change application to the CPT Editorial Panel on codes: 93653 and 93656, and were tasked in surveying the other codes in the family: 93654, 93655, and 93657. The societies surveyed members late 2020 and presented data in January 2021. Due to inconsistencies in the survey data and in order to better convey the bundled services to respondents, the ACC and HRS resurveyed members March 2021.

The ACC and HRS randomly surveyed cardiac electrophysiologists, as designated by membership rolls, on the newly created codes and entire family. The 000- and ZZZ-global day survey was completed by physicians who have experience with the service. To remedy the above-described shortcomings, the societies work with the Research Subcommittee to deploy several tactics to obtain more consistent survey results. First, fake/dummy codes were used in the survey so that respondents would not presume to know the code descriptors. Second, additional language noting the bundling was included in the survey invitation. Third, respondents were required to attest they had read and understood the new language before completing the survey.

The key reference code is 93580 for percutaneous transcatheter closure of a congenital interatrial communication. It was selected by approximately 33% of respondents. Approximately 95% of the respondents indicated that 93654 was more complex. The second reference code was 93590 for percutaneous transcatheter closure of paravalvular leak. It was selected by approximately 32% of respondents. About 85% of the respondents indicated that 93654 was more intense/complex overall.

Rationale

In reviewing the resurvey data to develop work recommendations, the expert panel believes the data does accurately reflect the newly bundled services, 93653 and 93656. The societies believe the technological advances made in patient care indicate survey respondents understood that 3D mapping and left atrial pacing were now inherent to 93653. After nearly a decade and many changes in technology and broader service dispersion have clearly altered the way this service is provided. Over time, the mapping systems have improved, now providing much more detailed and accurate anatomical and electrical activation mapping, often removing the need for fluoroscopy completely. Catheter technology has advanced, providing real-time assessment of the quality of contact between the catheter tip and the endocardial tissue. Last, the 3D mapping systems in conjunction with new catheter technology are now able to provide real-time assessment of the quality of radiofrequency ablation lesion formation. This feature has allowed operators to significantly shorten the duration of each radiofrequency application while also improving the quality of the lesions delivered. The results indicate survey respondents understood that 3D mapping and left atrial pacing were now inherent to 93653. After nearly a decade and many changes in technology and broader service dispersion, a reduction in intraservice times is logical for performing this procedure. The societies support the resurvey data and stand behind the 25th survey value.

While we recognize that in some ways the resurvey may be viewed as a failure, we believe the general consistency with the initial survey—demonstrating reductions in intraservice time—provides insights and a foundation to develop final recommendations for this family. First, with the additional information and tactics taken in the resurvey, we have no reason to believe respondents failed to understand the bundling that has occurred. Rather, we now have confidence that in the survey and the survey-based recommendations we make. Second, in digesting the data from the two surveys, we believe the reductions in time can, in fact, be explained by evolutions in technology and service dispersion, as discussed above. We can speak to this in more detail if helpful. Finally, the resurvey does provide a viable path forward for valuation, as the survey 25th-percentile work RVUs proceed in a reasonable progression that align with other services in the fee schedule. We recognize these recommendations produce an increase in intensity as the drop in time is not 1:1 proportionate with the drop in RVU. We believe that increase is best explained by the fact that several separately reported services are now bundled together, with work being done more quickly and several services being combined in a way that makes meaningful comparison to the prior intensity unhelpful.

Recommendation

During the January meeting, several RUC members questioned whether codes 93613, 93621 and 93662 should also be addressed in the recommendations for cardiac ablation services. These codes are bundled into CPT codes 93653 and/or 93656. Each was recently surveyed by the specialties and the RUC in 2017, 2020, 2019, respectively. **As such, the societies recommend affirming the recent times and RVUs of these recently valued codes, as they remain separate in CPT for use in concert with other CPT codes.**

Therefore, for code 93654 the **societies recommend the survey 25th RVU of 18.10 with 58 minutes preservice time from package 4 with five minutes removed, 200 minutes intraservice time from the survey median, and 33 minutes postservice time from Post Service Package 9B**. This value builds some increment from 93653 that accounts for longer time. The survey 25th percentile recommendation is further supported by results from the original RUC survey and comparison codes as shown in the summary spreadsheet.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

CPT Descriptor: Intracardiac catheter ablation of a discrete mechanism of arrhythmia which is distinct from the primary ablated mechanism, including repeat diagnostic maneuvers, to treat a spontaneous or induced arrhythmia
(List separately in addition to code for primary procedure)
(Use 93655 in conjunction with 93653, 93654, 93656)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 64-year-old female has undergone successful ablation of her atrial supraventricular tachycardia (SVT) focus (reported separately). Attempts to re-induce that arrhythmia reveal an additional atrial focus (also reported separately). A decision is made to ablate this additional focus following its discovery.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work:

Description of Intra-Service Work: A full electrophysiologic study and ablation procedure has been performed. Diagnostic and ablative electrophysiology (EP) catheters are in cardiac chambers. During the course of the post-ablation electrophysiologic evaluation, a second (or greater) arrhythmia is identified. For example, if the primary tachycardia ablated was atrioventricular (AV) nodal reentrant tachycardia and during post ablation testing, an atrial tachycardia, atrial flutter, or accessory pathway with orthotropic reentry tachycardia is identified, this would be considered a separate mechanism of tachycardia. Pacing maneuvers are performed to define the mechanism(s) of the new tachycardia(s). Mapping is performed to define the optimal ablation site or sites that are distinct from the initial ablation site(s). Catheter ablation of this distinct mechanism of tachycardia is performed at its origin. Multiple lesions are delivered to ensure eradication of the arrhythmia focus and to provide consolidation lesions in the surrounding tissue.

During the course of an electrophysiology procedure, an arrhythmia is induced that requires use of advanced 3D computer-assisted mapping system to localize the arrhythmia origin. The mapping system is placed in the cardiac chamber of interest using standard percutaneous techniques. The system is calibrated, and recordings are made during sinus rhythm to identify normal activation and location of scar during each distinct tachycardia. The computer-generated map is displayed, modifications are made in the computer parameters and display, and the tachycardia origin is identified. The ablation catheter is moved to the point of early activation, localized by the mapping system, to identify a mid-diastolic potential, Kent potential, and/or similar paced maps. When a reentrant circuit is identified, entrainment mapping studies are performed and evaluated to confirm the catheter location is within the reentrant circuit. Additional mappings are made to confirm arrhythmia origin and to study additional arrhythmias at the conclusion of the procedure. A final report that includes the mapping procedure and findings is prepared.

To record left atrial activity, femoral venous access site is already prepared for related procedure. Achieve central venous access, place a sheath in the femoral vein using standard percutaneous techniques, changing to subclavian or jugular access if that fails. Introduce the catheter into the sheath and advance into the right atrium where the ostium of the coronary sinus is

engaged. Advance the catheter into the coronary sinus. Use the multielectrode catheter to record electrical activity from the left atrium and, at times, pace the left atrium to attempt arrhythmia induction. Reposition the catheter as necessary throughout the course of the cardiac electrophysiology procedure to optimize recordings and pacing thresholds. At the conclusion of the procedure, remove the catheter. Include a description of this additional work and catheter use and associated findings in the procedure report.

Throughout the ablation the patient is monitored for hemodynamic compromise due to cardiac perforation, - or tachyarrhythmias, embolic phenomena, or damage to cardiac or vascular structures. Following the ablation portion of the procedure, repeat electrophysiologic testing is performed to assess the outcome of ablation using decremental, burst, and premature pacing maneuvers. These are again repeated following a 30-minute waiting period following the conclusion of the final ablation lesion. If the tachycardia demonstrates recovery or incomplete suppression, then repeat mapping and ablation are performed as described above. These steps are repeated until the tachycardia is rendered durably suppressed.

Description of Post-Service Work:

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	16%	31%	53%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

History Background

When the Relativity Assessment Workgroup identified CPT code 93656 (atrial fibrillation ablation) due to its rapid increase in growth, the ACC and HRS reviewed the code and determined that certain work should be bundled into the existing code due to their being billed together more than 75% of the time. With continued review of 93656 and the related the volume data, the societies also identified that CPT 93653 (SVT ablation) should have services bundled into it before the codes are

re-surveyed for upcoming RUC valuation. As a result, in October 2020, the ACC and HRS presented a code change application to the CPT Editorial Panel on codes: 93653 and 93656, and were tasked in surveying the other codes in the family: 93654, **93655,** and 93657. The societies surveyed members late 2020 and presented data in January 2021. Due to inconsistencies in the survey data and in order to better convey the bundled services to respondents, the ACC and HRS resurveyed members March 2021.

The ACC and HRS randomly surveyed cardiac electrophysiologists, as designated by membership rolls, on the newly created codes and entire family. The 000- and ZZZ-global day survey was completed by physicians who have experience with the service. To remedy the above-described shortcomings, the societies work with the Research Subcommittee to deploy several tactics to obtain more consistent survey results. First, fake/dummy codes were used in the survey so that respondents would not presume to know the code descriptors. Second, additional language noting the bundling was included in the survey invitation. Third, respondents were required to attest they had read and understood the new language before completing the survey.

The key reference code is 35306 for thromboendarterectomy. It was selected by approximately 24% of respondents. 60% of the respondents indicated that 93655 was more complex. The second reference code was 32737 for Transcatheter placement of an intravascular stent(s). It was selected by approximately 20% of respondents. About 46% of the respondents indicated that 93655 was more intense/complex overall.

Rationale

In reviewing the survey data to develop work recommendations, the expert panel believes the data accurate reflects the newly bundled services, 93653 and 93656. The societies believe the technological advances made in patient care indicate survey respondents understood that 3D mapping and left atrial pacing were now inherent to 93653. After nearly a decade and many changes in technology and broader service dispersion have clearly altered the way this service is provided. Over time, the mapping systems have improved, now providing much more detailed and accurate anatomical and electrical activation mapping, often removing the need for fluoroscopy completely. Catheter technology has advanced, providing real-time assessment of the quality of contact between the catheter tip and the endocardial tissue. Last, the 3D mapping systems in conjunction with new catheter technology are now able to provide real-time assessment of the quality of radiofrequency ablation lesion formation. This feature has allowed operators to significantly shorten the duration of each radiofrequency application while also improving the quality of the lesions delivered. The results indicate survey respondents understood that 3D mapping and left atrial pacing were now inherent to 93653. After nearly a decade and many changes in technology and broader service dispersion, a reduction in intraservice times is logical for performing this procedure. The societies support the resurvey data and stand behind the 25th survey value.

While we recognize that in some ways the resurvey may be viewed as a failure, we believe the general consistency with the initial survey—demonstrating reductions in intraservice time—provides insights and a foundation to develop final recommendations for this family. First, with the additional information and tactics taken in the resurvey, we have no reason to believe respondents failed to understand the bundling that has occurred. Rather, we now have confidence that in the survey and the survey-based recommendations we make. Second, in digesting the data from the two surveys, we believe the reductions in time can, in fact, be explained by evolutions in technology and service dispersion, as discussed above. We can speak to this in more detail if helpful. Finally, the resurvey does provide a viable path forward for valuation, as the survey 25th-percentile work RVUs proceed in a reasonable progression that align with other services in the fee schedule. We recognize these recommendations produce an increase in intensity as the drop in time is not 1:1 proportionate with the drop in RVU. We believe that increase is best explained by the fact that several separately reported services are now bundled together, with work being done more quickly and several services being combined in a way that makes meaningful comparison to the prior intensity unhelpful.

Recommendation

During the January meeting, several RUC members questioned whether codes 93613, 93621 and 93662 should also be addressed in the recommendations for cardiac ablation services. These codes are bundled into CPT codes 93653 and/or 93656. Each was recently surveyed by the specialties and the RUC in 2017, 2020, 2019, respectively. **As such, the societies recommend affirming the recent times and RVUs of these recently valued codes, as they remain separate in CPT for use in concert with other CPT codes.**

While this code descriptor did not change, its use as an additional ablation with a new base code that includes 3D mapping and left-atrial pacing, changing the service. The same 3D mapping and left-atrial pacing elements that were bundled into 93653 should now typically be considered to be included into this service, since those elements occur throughout the additional ablation. Therefore, for code 93655 the **societies recommend, the 25th survey value of 7.00 RVW with 60 minutes intraservice time**. This is sensibly below the KRS. This value also brings the IWPUT for 93655 in nearly identical alignment with that of 93653. This recommended value can also be supported by comparison to the percutaneous transcatheter closure of paravalvular leak, 93592; open iliac artery exposure, 34820; and transcatheter intracardiac shunt creation, 33746, as seen in the summary spreadsheet.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

CPT Descriptor: Comprehensive electrophysiologic evaluation including transseptal catheterizations, insertion and repositioning of multiple electrode catheters with intracardiac catheter ablation of atrial fibrillation by pulmonary vein isolation, including intracardiac electrophysiologic 3-dimensional mapping, intracardiac echocardiography including imaging supervision and interpretation, induction or attempted induction of an arrhythmia including left or right atrial pacing/recording, right ventricular pacing/recording, and his bundle recording, when performed
(Do not report 93656 in conjunction with 93279, 93280, 93281, 93282, 93283, 93284, 93286, 93287, 93288, 93289, 93462, 93600, 93602, 93603, 93610, 93612, 93613, 93618, 93619, 93620, 93621, 93653, 93654, 93662)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 62-year-old male with a history of hypertension has recurrent atrial fibrillation. despite rate and rhythm control with antiarrhythmic drugs, he remains symptomatic. a comprehensive electrophysiologic evaluation with transeptal catheterization and catheter ablation by pulmonary vein isolation for atrial fibrillation is ordered.

Percentage of Survey Respondents who found Vignette to be Typical: 95%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: A three-dimensional imaging study such as cardiac magnetic resonance imaging (MRI) or computed tomography (CT) scanning may be obtained prior to the procedure to assess atrial size and for pulmonary vein anatomic variants. The procedure and the risks, benefits, and alternatives associated with electrophysiology testing and atrial fibrillation ablation are explained to the patient and the patient's family. Management of antiarrhythmic medications is communicated to the patient. Arrangements are made for the X-ray technician, electrophysiology laboratory technician, and nurse. The patient is evaluated on the day of the procedure with a history and physical examination and pre-procedure laboratory, medications, and change in health status are reviewed with careful attention to the degree of anticoagulation. Informed consent is obtained. Direct current cardioversion/defibrillation, electrophysiology (EP), and ablative equipment is confirmed to be present and in proper working order. Fluoroscopic equipment that will be used to visualize catheter movements and location is tested.

Description of Intra-Service Work: Local analgesia is administered. Venous access is obtained. Arterial access to monitor blood pressure and to retrograde aortic access to the left ventricle may be obtained. By means of the venous access sites, multi-electrode catheters are positioned in specific cardiac chambers. An intracardiac echocardiographic probe is advanced into the heart and imaging of the heart and pericardium is performed: specific structures visualized include: right atrium, tricuspid valve, right ventricle, left atrium, aortic valve, left ventricle, pulmonary veins (left upper, left lower, right upper, right lower), pericardium, superior vena cava, coronary sinus. Intracardiac echocardiography may be used to guide catheter manipulation, guide transseptal puncture, provide visualization of catheter contact during mapping and ablation, and observe for complications throughout the procedure. The intracardiac echo catheter may be placed into the left atrium or right ventricle for additional imaging planes. One or two transseptal catheterizations are performed to achieve access and facilitate placement of both a circular mapping catheter and an ablation catheter in the left atrium.

Additional anticoagulation is administered. Level of anticoagulation is monitored throughout the procedure and additional anticoagulation is administered as needed. Conduction intervals and refractory periods are measured and arrhythmia induction attempted. His bundle recording and ventricular pacing and sensing are performed. A mapping catheter is passed into the left atrium and pulmonary vein conduction is assessed and recorded. Selective venography of the pulmonary veins may be performed to define anatomy. A high definition 3D anatomical map of the chamber(s) of interest is generated. Voltage and relative electrical activation in the arrhythmia and/or sinus may be performed to identify normal activation, location of scar, and mechanism of arrhythmia. Importation, segmentation, and/or registration to the three dimensional map of a MRI/CT scan may be performed. High output pacing is performed to prevent and/or monitor for phrenic nerve damage during ablation. Catheter ablation is then performed to achieve pulmonary vein isolation. Point lesions or balloon administered lesions encircling the pulmonary vein region are created that guided by anatomical mapping and electrical signals provided by a circular mapping catheter. Pulmonary vein isolation, as measured by the circular mapping catheter as well as loss of tissue voltage and tissue pacing capture are the measured endpoints.

During the course of an electrophysiology procedure, an arrhythmia is induced that requires use of advanced 3D computer-assisted mapping system to localize the arrhythmia origin. The mapping system is placed in the cardiac chamber of interest using standard percutaneous techniques. The system is calibrated, and recordings are made during sinus rhythm to identify normal activation and location of scar during each distinct tachycardia. The computer-generated map is displayed, modifications are made in the computer parameters and display, and the tachycardia origin is identified. The ablation catheter is moved to the point of early activation, localized by the mapping system, to identify a mid-diastolic potential, Kent potential, and/or similar paced maps. When a reentrant circuit is identified, entrainment mapping studies are performed and evaluated to confirm the catheter location is within the reentrant circuit. Additional mappings are made to confirm arrhythmia origin and to study additional arrhythmias at the conclusion of the procedure. A final report that includes the mapping procedure and findings is prepared.

Throughout the ablation the patient is monitored hemodynamic compromise due to cardiac perforation, - or tachyarrhythmias, embolic phenomena, thrombus formation, or damage to cardiac or vascular structures, including meticulous monitoring for lesion delivery within the pulmonary vein or close to the esophagus. Following the ablation portion of the procedure, further electrophysiologic testing is performed to assess the outcome of ablation. These are again repeated following a 30-minute waiting period following the conclusion of the final ablation lesion. If the pulmonary veins demonstrate recovery of conduction, then repeat mapping and ablation are performed as described above. These steps are repeated until the pulmonary veins are rendered durably isolated. Once electrophysiology testing and ablation are completed, anticoagulation is reversed. Post procedure, sheaths are removed, appropriate hemostasis is achieved, and follow-up assessment of the patient for any complications is performed.

Description of Post-Service Work: The patient is monitored in the recovery unit and then overnight in a telemetry unit for delayed complications. Results of the procedure are discussed with the patient and the patient's family and a postprocedure assessment is performed.

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	18%	82%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

History Background

When the Relativity Assessment Workgroup identified CPT code 93656 (atrial fibrillation ablation) due to its rapid increase in growth, the ACC and HRS reviewed the code and determined that certain work should be bundled into the existing code due to their being billed together more than 75% of the time. With continued review of 93656 and the related the volume data, the societies also identified that CPT 93653 (SVT ablation) should have services bundled into it before the

codes are re-surveyed for upcoming RUC valuation. As a result, in October 2020, the ACC and HRS presented a code change application to the CPT Editorial Panel on codes: 93653, 93654, 93655, 93656, 93657. As indicated in the summary spreadsheet, revised 93653 is now a more comprehensive, bundled service that includes the work of 3D mapping (93613) and left atrial pacing/recording (93621). The societies surveyed members late 2020 and presented data in January 2021. Due to inconsistencies in the survey data and in order to better convey the bundled services to respondents, the ACC and HRS resurveyed members March 2021.

The ACC and HRS randomly surveyed cardiac electrophysiologists, as designated by membership rolls, on the newly created codes and entire family. The 000- and ZZZ-global day survey was completed by physicians who have experience with the service. To remedy the above-described shortcomings, the societies work with the Research Subcommittee to deploy several tactics to obtain more consistent survey results. First, fake/dummy codes were used in the survey so that respondents would not presume to know the code descriptors. Second, additional language noting the bundling was included in the survey invitation. Third, respondents were required to attest they had read and understood the new language before completing the survey.

The key reference code is 93580 for percutaneous transcatheter closure of a congenital interatrial communication. It was selected by approximately 38% of respondents. 83% of the respondents indicated that 93656 was more complex. The second reference code was 93590 percutaneous transcatheter closure of paravalvular leak; initial occlusion device, mitral valve. It was selected by approximately 27% of respondents. About 88% of the respondents indicated that 93656 was more intense/complex overall.

Rationale

In reviewing the survey data to develop work recommendations, the expert panel believes the data accurate reflects the newly bundled services, 93653 and 93656. The societies believe the technological advances made in patient care indicate survey respondents understood that 3D mapping and left atrial pacing were now inherent to 93653. After nearly a decade and many changes in technology and broader service dispersion have clearly altered the way this service is provided. Over time, the mapping systems have improved, now providing much more detailed and accurate anatomical and electrical activation mapping, often removing the need for fluoroscopy completely. Catheter technology has advanced, providing real-time assessment of the quality of contact between the catheter tip and the endocardial tissue. Last, the 3D mapping systems in conjunction with new catheter technology are now able to provide real-time assessment of the quality of radiofrequency ablation lesion formation. This feature has allowed operators to significantly shorten the duration of each radiofrequency application while also improving the quality of the lesions delivered. The results indicate survey respondents understood that 3D mapping and left atrial pacing were now inherent to 93653. After nearly a decade and many changes in technology and broader service dispersion, a reduction in intraservice times is logical for performing this procedure. The societies support the resurvey data and stand behind the 25th survey value.

While we recognize that in some ways the resurvey may be viewed as a failure, we believe the general consistency with the initial survey—demonstrating reductions in intraservice time—provides insights and a foundation to develop final recommendations for this family. First, with the additional information and tactics taken in the resurvey, we have no reason to believe respondents failed to understand the bundling that has occurred. Rather, we now have confidence that in the survey and the survey-based recommendations we make. Second, in digesting the data from the two surveys, we believe the reductions in time can, in fact, be explained by evolutions in technology and service dispersion, as discussed above. We can speak to this in more detail if helpful. Finally, the resurvey does provide a viable path forward for valuation, as the survey 25th-percentile work RVUs proceed in a reasonable progression that align with other services in the fee schedule. We recognize these recommendations produce an increase in intensity as the drop in time is not 1:1 proportionate with the drop in RVU. We believe that increase is best explained by the fact that several separately reported services are now bundled together, with work being done more quickly and several services being combined in a way that makes meaningful comparison to the prior intensity unhelpful.

Recommendation

During the January meeting, several RUC members questioned whether codes 93613, 93621 and 93662 should also be addressed in the recommendations for cardiac ablation services. These codes are bundled into CPT codes 93653 and/or 93656. Each was recently surveyed by the specialties and the RUC in 2017, 2020, 2019, respectively. **As such, the societies recommend affirming the recent times and RVUs of these recently valued codes, as they remain separate in CPT for use in concert with other CPT codes.**

Therefore, for code 93656 the **societies recommend, survey 25th percentile of 17.00 RVW with 53 minutes preservice time from package 4 with 10 minutes removed, 180 minutes intraservice time from the survey median, and 30 minutes postservice time from package 9B with 3 minutes removed**. This recommendation produces a work RVU savings from the current, component-coded services. The survey 25th percentile recommendation is further supported summary spreadsheet and results from the original RUC survey support similar values.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 93656

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Cardiac Electrophysiology How often? Commonly

Specialty Cardiology How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 106654
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Figure is about twice as likely as Medicare based claims.

Specialty Cardiac electrophysiology Frequency 92256 Percentage 86.50 %

Specialty Cardiology Frequency 13972 Percentage 13.10 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 53,327 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Figure reflects Medicare based claims.

Specialty Cardiac electrophysiology Frequency 46128 Percentage 86.50 %

Specialty Cardiology Frequency 6986 Percentage 13.10 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

CPT Descriptor: Additional linear or focal intracardiac catheter ablation of the left or right atrium for treatment of atrial fibrillation remaining after completion of pulmonary vein isolation
(List separately in addition to code for primary procedure)
(Use 93657 in conjunction with 93656)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 72-year-old male has symptomatic atrial fibrillation refractory to medical therapy. An electrophysiology (EP) study and ablation are performed to achieve pulmonary vein isolation (reported separately). Despite demonstration of electrical isolation of the pulmonary veins, atrial fibrillation continues.

Percentage of Survey Respondents who found Vignette to be Typical: 95%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work:

Description of Intra-Service Work: A full electrophysiologic study and ablation procedure has been performed for atrial fibrillation. Diagnostic and ablation catheters are present in cardiac chambers. Pulmonary vein isolation has been accomplished. An intracardiac echocardiographic probe has been advanced into the heart and imaging of the heart and pericardium is performed. Intracardiac echocardiography may be used to guide catheter manipulation, guide transseptal puncture, guide catheter manipulation and observe for complications throughout the procedure. Due to the presence of non-pulmonary vein sources of atrial fibrillation, additional non-pulmonary vein ablation lesions are created. These additional ablation lesions may contain any or all of the following: 1) Regions of fractionated potentials are mapped and ablated outside the pulmonary vein area. 2) linear lesions are created along the roof, mitral isthmus, or septal aspect of the left atrium. 3) Non-pulmonary vein focal sources of atrial fibrillation induction are induced, localized, and ablated. These locations may include areas of the left atrium, right atrium, superior vena cava, or coronary sinus. During the delivery of ablation energy, continuous monitoring for hemodynamic instability, arrhythmias, embolic events, and injury to the esophagus is performed.

During the course of these additional ablation lesions, an advanced 3D computer-assisted mapping system is used to facilitate identification of sites to target for catheter ablation as well as to record sites of lesions to allow the operator to create linear lesions. The mapping system is placed in the cardiac chamber of interest using standard percutaneous techniques. The system is calibrated, and recordings are made during sinus rhythm to identify normal activation and location of scar during each distinct tachycardia. The computer-generated map is displayed, modifications are made in the computer parameters and display, and the tachycardia origin is identified. The ablation catheter is moved to the point of early activation, localized by the mapping system, to identify a mid-diastolic potential, Kent potential, and/or similar paced maps. When a reentrant circuit is identified, entrainment mapping studies are performed and evaluated to confirm the catheter location is within the reentrant circuit. Additional mappings are made to confirm arrhythmia origin and to study additional arrhythmias at the conclusion of the procedure. A final report that includes the mapping procedure and findings is prepared.

Appropriate post ablation attempts at reeducation and observation for 30-minutes are performed. Following restoration of sinus rhythm, conduction intervals are measured and arrhythmia induction is re-attempted over a 30-minute period following the last ablation lesion. If the target site demonstrates recovery or incomplete suppression, then repeat mapping and ablation are performed as described above. These steps are repeated until the target site is rendered durably suppressed or the line demonstrates durable conduction block.

Description of Post-Service Work:

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	17%	35%	48%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	27%	73%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	5%	95%
Physical effort required	10%	39%	61%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	4%	26%	70%

2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	12%	24%	64%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	18%	82%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	18%	82%
Physical effort required	0%	30%	70%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	18%	82%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

History Background

When the Relativity Assessment Workgroup identified CPT code 93656 (atrial fibrillation ablation) due to its rapid increase in growth, the ACC and HRS reviewed the code and determined that certain work should be bundled into the existing code due to their being billed together more than 75% of the time. With continued review of 93656 and the related the volume data, the societies also identified that CPT 93653 (SVT ablation) should have services bundled into it before the codes are

re-surveyed for upcoming RUC valuation. As a result, in October 2020, the ACC and HRS presented a code change application to the CPT Editorial Panel on codes: 93653, 93654, 93655, 93656, **93657.** The societies surveyed members late 2020 and presented data in January 2021. Due to inconsistencies in the survey data and in order to better convey the bundled services to respondents, the ACC and HRS resurveyed members March 2021.

The ACC and HRS randomly surveyed cardiac electrophysiologists, as designated by membership rolls, on the newly created codes and entire family. The 000- and ZZZ-global day survey was completed by physicians who have experience with the service. To remedy the above-described shortcomings, the societies work with the Research Subcommittee to deploy several tactics to obtain more consistent survey results. First, fake/dummy codes were used in the survey so that respondents would not presume to know the code descriptors. Second, additional language noting the bundling was included in the survey invitation. Third, respondents were required to attest they had read and understood the new language before completing the survey.

The key reference code is 35306 for thromboendarterectomy. It was selected by approximately 30% of respondents. About 66% of the respondents indicated that 93657 was more complex. The second reference code was 32737 for Transcatheter placement of an intravascular stent(s). It was selected by approximately 21% of respondents. About 53% of the respondents indicated that 93657 was more intense/complex overall.

Rationale

In reviewing the survey data to develop work recommendations, the expert panel believes the data accurate reflects the newly bundled services, 93653 and 93656. The societies believe the technological advances made in patient care indicate survey respondents understood that 3D mapping and left atrial pacing were now inherent to 93653. After nearly a decade and many changes in technology and broader service dispersion have clearly altered the way this service is provided. Over time, the mapping systems have improved, now providing much more detailed and accurate anatomical and electrical activation mapping, often removing the need for fluoroscopy completely. Catheter technology has advanced, providing real-time assessment of the quality of contact between the catheter tip and the endocardial tissue. Last, the 3D mapping systems in conjunction with new catheter technology are now able to provide real-time assessment of the quality of radiofrequency ablation lesion formation. This feature has allowed operators to significantly shorten the duration of each radiofrequency application while also improving the quality of the lesions delivered. The results indicate survey respondents understood that 3D mapping and left atrial pacing were now inherent to 93653. After nearly a decade and many changes in technology and broader service dispersion, a reduction in intraservice times is logical for performing this procedure. The societies support the resurvey data and stand behind the 25th survey value.

While we recognize that in some ways the resurvey may be viewed as a failure, we believe the general consistency with the initial survey—demonstrating reductions in intraservice time—provides insights and a foundation to develop final recommendations for this family. First, with the additional information and tactics taken in the resurvey, we have no reason to believe respondents failed to understand the bundling that has occurred. Rather, we now have confidence that in the survey and the survey-based recommendations we make. Second, in digesting the data from the two surveys, we believe the reductions in time can, in fact, be explained by evolutions in technology and service dispersion, as discussed above. We can speak to this in more detail if helpful. Finally, the resurvey does provide a viable path forward for valuation, as the survey 25th-percentile work RVUs proceed in a reasonable progression that align with other services in the fee schedule. We recognize these recommendations produce an increase in intensity as the drop in time is not 1:1 proportionate with the drop in RVU. We believe that increase is best explained by the fact that several separately reported services are now bundled together, with work being done more quickly and several services being combined in a way that makes meaningful comparison to the prior intensity unhelpful.

Recommendation
During the January meeting, several RUC members questioned whether codes 93613, 93621 and 93662 should also be addressed in the recommendations for cardiac ablation services. These codes are bundled into CPT codes 93653 and/or 93656. Each was recently surveyed by the specialties and the RUC in 2017, 2020, 2019, respectively. **As such, the societies recommend affirming the recent times and RVUs of these recently valued codes, as they remain separate in CPT for use in concert with other CPT codes.**

While this code descriptor did not change, its use as an additional ablation with a new base code that includes 3D mapping and intracardiac echo, changing the service. The same 3D mapping and intracardiac echo elements that were bundled into 93656 should now typically be considered to be included into this service, since those elements occur throughout the

additional ablation. Therefore, for code 93657 the **societies recommend the survey 25th percentile of 7.00 RVU with 60 minutes intraservice time**. This value fits well with comparators noted in the summary spreadsheet.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 93657, 93613, 93662

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Cardiac Electrophysiology How often? Commonly

Specialty Cardiology How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 43919
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Figure is twice much as Medicare based claims.

Specialty Cardiac electrophysiology Frequency 36000 Percentage 81.96 %

Specialty Cardiology Frequency 8000 Percentage 18.21 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 21,959 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Figure reflects 2019e Medicare based claims.

Specialty Cardiac electrophysiology Frequency 18000 Percentage 81.97 %

Specialty Cardiology Frequency 4000 Percentage 18.21 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Cardiovascular-Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 93657

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

Chicago, IL 60611

RE: Tab 7 Practice Expense

Dear Dr. Manaker:

Tab 7 on the April 2021 RUC agenda addresses five codes, SVT ablation, atrial fibrillation ablation, and the entire family of codes (93653-93657). Additionally, the Tab also includes three add-on codes 93613, 93621, and 93662. These services are provided exclusively in the facility setting. As such, we recommend no direct practice expense inputs for Tab 7.

Thank you for your consideration of this information as you prepare for the meeting. Please contact Claudia Vasquez at cvasquez@acc.org if you have any questions.

Sincerely,
Richard Wright, MD
ACC RUC Advisor
Mark Schoenfeld, MD
HRS RUC Advisor

AMA/Specialty Society RVS Update Committee Summary of Recommendations
CMS High Expenditure Procedures

January 2017

Intracardiac 3D Mapping Add-On

In the NPRM for 2016 CMS re-ran the high expenditure services across specialties with Medicare allowed charges of $10 million or more. CMS identified the top 20 codes by specialty in terms of allowed charges, excluding 010 and 090-day global services, anesthesia and Evaluation and Management services and services reviewed since CY 2010. In the comment letter the RUC noted that it was scheduled to review the utilization and collect data under new bundled codes in October 2016. However, in the Final Rule for 2016 CMS indicated that the work and practice expense for this service should be reviewed.

93613 ***Intracardiac electrophysiologic 3-dimensional mapping (List separately in addition to code for primary procedure)***
The RUC reviewed the survey results from 47 cardiologists and determined that the survey 25th percentile work RVU of 5.23 appropriately accounts for the work required to perform this service. The RUC recommends 90 minutes intra-service time. The RUC determined that the decrease in the recommended work RVU appropriately corresponds to the decrease in intra-service work. The RUC edited the description of work to delete "remove the catheter and obtaining hemostasis" as this is associated with the primary procedure. The RUC compared the surveyed code to the top key reference service 93609 *Intraventricular and/or intra-atrial mapping of tachycardia site(s) with catheter manipulation to record from multiple sites to identify origin of tachycardia (List separately in addition to code for primary procedure*) (PC work RVU = 4.99 and 90 minutes intra-service time) and determined that this service was slightly more intense and complex on all measures examined. The RUC also compared the surveyed code to the second top key reference code 93655 *Intracardiac catheter ablation of a discrete mechanism of arrhythmia which is distinct from the primary ablated mechanism, including repeat diagnostic maneuvers, to treat a spontaneous or induced arrhythmia (List separately in addition to code for primary procedure)* (work RVU = 7.50 and 90 minutes intra-service time) and determined that code 93655 is more intense than the surveyed code because it entails the initiation and prolonged observation (to allow for mapping, the surveyed code) of arrhythmias that are potentially dangerous and/or hemodynamically unstable with increased risk to the patient and thereafter requires ablation which in and of itself carries precision and risk- it requires greater intensity to perform the complex initiation of arrhythmias and to manage such patients while these arrhythmias are being mapped in order to allow for the subsequent ablation. In addition, any patient who has more than one arrhythmia focus becomes exponentially complex. The diagnostic maneuvers, mapping and ablation skills needed to successfully treat a second focus are significant. Not all arrhythmia foci are created equally. Patients who have more than one focus tend to have significant scar tissue. Mapping the circuit of the arrhythmia is particularly challenging because distinguishing between partly viable tissue and complete scare requires a very dense map (meaning many data points must be acquired and correctly interpreted and annotated on the map).

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

For additional support the RUC referenced MPC code 57267 *Insertion of mesh or other prosthesis for repair of pelvic floor defect, each site (anterior, posterior compartment), vaginal approach (List separately in addition to code for primary procedure)* (work RVU = 4.88 and 45 minutes intra-service time) and noted that the MPC code is much more intense and requires half the intra-service time. **The RUC recommends a work RVU of 5.23 for CPT code 93613.**

Practice Expense
There are no direct practice expense inputs for this service.

Work Neutrality
The RUC's recommendation for these codes will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

CPT Code	CPT Descriptor	Global Period	Work RVU Recommendation
93613	Intracardiac electrophysiologic 3-dimensional mapping (List separately in addition to code for primary procedure)	ZZZ	5.23

SUMMARY OF RECOMMENDATION

CPT Code:93613 Tracking Number Original Specialty Recommended RVU: **5.23**
Presented Recommended RVU: **5.23**
Global Period: ZZZ RUC Recommended RVU: **5.23**

CPT Descriptor: Intracardiac electrophysiologic 3-dimensional mapping (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 71-year-old female is undergoing radiofrequency ablation (reported separately) to treat atrial tachycardia. Atrial tachycardia is induced, with a morphology similar to the tachycardia that had been documented clinically. 3D mapping is indicated.

Percentage of Survey Respondents who found Vignette to be Typical: 96%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: n/a

Description of Intra-Service Work: During the course of an electrophysiology procedure, induce an arrhythmia that requires use of an advanced three-dimensional (3D) computer-assisted mapping system to localize the arrhythmia origin. Place the mapping system in the cardiac chamber of interest using standard percutaneous techniques. Calibrate the system and make recordings during sinus rhythm to identify normal activation and location of scar during each distinct tachycardia. Display the computer-generated map, make modifications in the computer parameters and display, and identify the tachycardia origin. Move the ablation catheter to the point of early activation localized by the mapping system to identify a mid-diastolic potential, Kent potential, and/or similar paced maps. When a re-entrant circuit is identified, perform entrainment mapping studies and evaluated them to confirm the catheter location is within the re-entrant circuit. Make additional mappings to confirm arrhythmia origin and study additional arrhythmias at the conclusion of the procedure. Prepare a final report and include the mapping procedure and findings.

Description of Post-Service Work: n/a

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.88	0.62
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.62	0.69
Urgency of medical decision making	0.42	0.15
Technical Skill/Physical Effort (Mean)		
Technical skill required	0.96	0.54

Physical effort required	0.62	0.23

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	0.19	0.00
Outcome depends on the skill and judgment of physician	0.69	0.62
Estimated risk of malpractice suit with poor outcome	0.27	0.15

INTENSITY/COMPLEXITY MEASURES	**Top Key Ref Code**	**2nd Key Ref Code**

Time Segment (Mean)

Overall intensity/complexity	0.96	0.77

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

93613 is an add-on code used with several cardiac electrophysiology evaluation and/or ablation services. It describes the work of placing the mapping system inside the heart and creating a map of the chamber to aid performance of the underlying service.

CMS identified 93613 in CY 2016 rulemaking as potentially misvalued through its high-expenditure screen. A random survey of 500 ACC and HRS members was executed with 47 completed surveys. The information obtained is used to develop the survey results in the SOR and the summary spreadsheet.

The key reference service was selected by 26 respondents. Respondents who selected atrial tachycardia mapping code 93609 as the key reference code found 93613 to be more intense/complex in every factor, as shown in the above table and the attached addendum. This comparison is reasonable, since the median survey time of 90 minutes equals the 90-minute survey time for 93609, yet respondents estimated 93613 to be more work.

At this RVU level, no comparable ZZZ MPC codes exist. The two highest MPC ZZZ codes—57267 for insertion of vaginal mesh or prosthesis for repair of pelvic floor defect and 63048 for vertebra laminectomy—are included on the SOR and summary spreadsheet. We note that both of those half as much intraservice time (45 minutes). We searched the RUC database for additional comparators and found only nine other RUC-reviewed ZZZ code with a time of 90 minutes. The lowest valued of those, 22851, describes application of intervertebral biomechanical devices and has a work RVU of 6.70.

Reflecting a robust survey, and given the reduction in intraservice time for 93613, we **recommend the survey 25th-percentile work RVU of 5.23 with times of 0 minutes preservice, 90 minutes intraservice, and 0 minutes postservice**. This value is 25% lower than the current value proportionately captures the 25% reduction in time, as demonstrated by the constant IWPUT.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 93613

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty cardiac electrophysiology How often? Commonly

Specialty cardiology How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 50,654 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2015 FFS utilization form RUC database.

Specialty cardiac electrophysiology Frequency 33654 Percentage 66.43 %

Specialty cardiology Frequency 15500 Percentage 30.59 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

AMA/Specialty Society RVS Update Committee Summary of Recommendations
High Volume Growth

April 2019

Intracardiac Echocardiography

In January 2019, the Relativity Assessment Workgroup (RAW) reviewed services with 2017e Medicare utilization of 10,000 or more that has increased by at least 100% from 2012 through 2017. CPT code 93662 was identified and the RUC recommended this service be surveyed for April 2019.

93662 ***Intracardiac echocardiography during therapeutic/diagnostic intervention, including imaging supervision and interpretation (List separately in addition to code for primary procedure)***
The RUC reviewed the survey results from 42 cardiologists and agreed on the following physician time component: 25 minutes of intra-service time.

The RUC reviewed the recommended survey 25th percentile work RVU of 2.53 and agreed that this value appropriately captures the amount of physician work involved. The recommended work value and time for this service reflects the change in technology from when it was last valued in 2000. Intracardiac echocardiography has become an essential tool for complex catheter ablation of many types of arrhythmias and it has also enabled operators to significantly reduce the use of fluoroscopy. Since this service was last valued, arrhythmia mapping systems have developed the ability to incorporate intracardiac echo images into 3-dimensional electroanatomical maps. This has improved the accuracy, safety and effectiveness of catheter ablation for a wide range of arrhythmias, most notably atrial fibrillation. To justify a work RVU of 2.53, the RUC compared the survey code to CPT code 34713 *Percutaneous access and closure of femoral artery for delivery of endograft through a large sheath (12 French or larger), including ultrasound guidance, when performed, unilateral (List separately in addition to code for primary procedure)* (work RVU = 2.50 and intra-service time of 20 minutes) and determined that the recommended work value for the survey code is supported by CPT code 34713 which has similar physician work and time. The RUC also compared the survey code to MPC code 36476 *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; subsequent vein(s) treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)* (work RVU = 2.65 and intra-service time of 30 minutes) and determined that the recommended work value is supported by MPC code 36476. The RUC agreed that both reference services bracket the survey code in both physician work and time, supporting the recommended work value for the survey code.

Additionally, survey respondents who selected coronary intravascular ultrasound (IVUS) code 92978 as the top key reference service (KRS), found the survey code to be more intense/complex overall. The RUC agreed that this comparison is reasonable, since the median survey time of 25 minutes for the survey code equals the 25-minute intra-service time for KRS code 92978, yet survey respondents estimated the survey code to be more work

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

and takes significantly more mental effort and judgment than KRS code 92978, further supporting the recommended survey 25th percentile work RVU of 2.53 for the survey code. **The RUC recommends a work RVU of 2.53 for CPT code 93662.**

Practice Expense
These services are facility-only and have no direct practice inputs.

Work Neutrality
The RUC's recommendation for this code will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: During the catheter ablation of a 57 year-old man with symptomatic paroxysmal atrial fibrillation, intracardiac ultrasound is used to guide the trans-septal puncture, evaluate left atrial and pulmonary vein anatomy, and monitor for intra-procedural complications.

Percentage of Survey Respondents who found Vignette to be Typical: 98%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work:

Description of Intra-Service Work: Femoral venous access is obtained using fluoroscopic and or ultrasound guidance, avoiding the femoral artery. A 9 French or 10 French sheath is inserted into the vein. The intracardiac echo probe is advanced through the sheath, up the inferior vena cava to the right atrium again using fluoroscopic and intracardiac echo guidance, avoiding the venous branches and Eustachian ridge. The following structures are imaged for baseline anatomy: The fossa ovalis, aortic root, left atrium including the left atrial appendage, pulmonary veins, esophagus and the pericardial space to evaluate for document if a baseline effusion is present. Next, preparations for transseptal puncture are made by rotating and flexing the intracardiac echo catheter in 3 dimensions to identify the ideal location of the atrial septum for puncture. Under intracardiac echo guidance the transseptal needle is positioned in the appropriate portion of the septum. Intracardiac echo is used to confirm tenting of the septum by the needle at the desired location, and the puncture is then performed. Saline is flushed through the transseptal needle and intracardiac echo is used to confirm that the needle tip is in the left atrium by visualizing bubbles on intracardiac echo within the left atrium. A sheath is then advanced over the transseptal needle into the left atrium and the needle is withdrawn from the body. Throughout the remainder of the procedure intracardiac echo is used to confirm the position of the ablation catheter in the left atrium and it is used to monitor for complications including pericardial effusion and intracardiac thrombus. At the end of the procedure the catheter and sheaths are removed and hemostasis achieved using either manual pressure, vascular closure device or superficial stitches. Details of the procedure and then documented.

Description of Post-Service Work:

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	10%	50%	40%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

93662 is an add-on code used with several cardiac electrophysiology evaluation and/or ablation services. It can also be used with certain transcatheter structural valve procedures.

The RAW identified 93662 through its high-growth screen. A random survey of 1000 ACC and HRS members was executed with 42 completed surveys. The information obtained is used to develop the survey results in the SOR and the summary spreadsheet.

While we are not making a compelling evidence argument because we are recommending a reduction, we do wish to explain the ways this service is different from when it was valued in 2000. Intracardiac echo has become unessential to tool for complex catheter ablation of many types of arrhythmias. It has also enabled operators to significantly reduce the use of fluoroscopy. Over the past 15 years, arrhythmia mapping systems have developed the ability to incorporate intracardiac echo images into 3-dimensional electroanatomical maps. This has improved the accuracy, safety and effectiveness of catheter ablation for a wide range of arrhythmias, most notably atrial fibrillation.

The key reference service was selected by 12 respondents. Respondents who selected coronary intravascular ultrasound (IVUS) code 92978 as the key reference code found 93662 to be more intense/complex overall. This comparison is reasonable, since the median survey time of 25 minutes equals the 25-minute intraservice time for 92978, yet respondents estimated 93662 to be more work.

The second key reference service was selected by 10 respondents. Respondents who selected intracardiac 3D mapping code 93613 as the key reference code found 93662 to be identical or somewhat more intense/complex overall. However, comparison between 93662 and 93613 is challenging, as the latter has a much longer service time and higher work RVU than under discussion here.

Reflecting a valid survey, and given the reduction in intraservice time for 93662, we **recommend the survey 25th-percentile work RVU of 2.53 work RVUs with times of 0 minutes preservice, 25 minutes intraservice, and 0 minutes postservice**. This somewhat higher value reflects the higher intensity/complexity estimated by respondents who selected the KRS.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. 93662 may be billed with 92987, 93453, 93460-96462, 93532, 93580, 93581, 93620, 93621, 93622, 93653, 93654, or 93656.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 93622

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty cardiac electrophysiology How often? Commonly

Specialty cardiology How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 130000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Twice the utilization estimated below for Medicare

Specialty cardiac electrophysiology Frequency 71000 Percentage 54.61 %

Specialty cardiology Frequency 59000 Percentage 45.38 %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 65,000 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. A continuation of recent growth trends of about 6,300 a year from 2015-2017 would lead to utilization of roughly 65,000 services in 2020.

Specialty cardiac electrophysiology Frequency 35500 Percentage 54.61 %

Specialty cardiology Frequency 29500 Percentage 45.38 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Cardiovascular-Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 93662

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

Chicago, IL 60611

RE: Tab 23 Practice Expense

Dear Dr. Manaker:

Tab 23 on the April 2019 RUC agenda addresses one add-on code for intracardiac echocardiography performed during other catheter procedures. This add-on service is provided exclusively in the facility setting. As such, we recommend no direct practice expense inputs for Tab 23.

Thank you for your consideration of this information as you prepare for the meeting. Please contact James Vavricek at jvavricek@acc.org if you have any questions.

Sincerely,

Richard Wright, MD
ACC RUC Advisor

Mark Schoenfeld, MD
HRS RUC Advisor

AMA/Specialty Society RVS Update Committee Summary of Recommendations
High Volume Growth

October 2020

Electrophysiologic Evaluation - REVISED

In October 2019, the RUC identified this service via the high-volume growth screen for services with Medicare utilization of 10,000 or more and have increased by at least 100% from 2013 through 2018. In January 2020, the RUC recommended this service be surveyed for April 2020. The code was surveyed individually, as it is not part of a specific family, because it is an add-on service that can be used with several different procedures - base codes or other add-on codes, diagnostic as well as therapeutic.

93621 ***Comprehensive electrophysiologic evaluation including insertion and repositioning of multiple electrode catheters with induction or attempted induction of arrhythmia; with left atrial pacing and recording from coronary sinus or left atrium (List separately in addition to code for primary procedure)***
The RUC reviewed the survey results from 53 cardiologists and cardiac electrophysiologists and determined that a direct work RVU crosswalk to CPT code 36483 *Endovenous ablation therapy of incompetent vein, extremity, by transcatheter delivery of a chemical adhesive (eg, cyanoacrylate) remote from the access site, inclusive of all imaging guidance and monitoring, percutaneous; subsequent vein(s) treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)* (work RVU = 1.75, 20 minutes intra-service and total time) would appropriately account for the physician work required to perform this service and falls below the survey 25th percentile.

The RUC discussed the decrease in intra-service time from 30 to 20 minutes and the accordant increase in intensity. Because the recommended work RVU is not an increase, a compelling evidence argument is not necessary. However, because of the change in calculated intensity that results from a decrease in intra-service time without an entirely commensurate decrease in work RVU, the specialty societies provided compelling evidence that there has been a change in technique that has changed physician work.

Since 2001, when this code was last surveyed, there have been several changes in technique that have contributed to an increase in the intensity and decrease in the total time of the procedure. In particular, the typical access technique has evolved to the femoral vein to insert the catheter, as opposed to the jugular or subclavian vein. Previously, a superior vena cava (SVC) approach via internal jugular (IJ) or subclavian vein access was the preferred route to access the coronary sinus. Anatomically, this provides an ideal angle from which to cannulate the coronary sinus which sits at the inferior posteroseptal region of the right atrium, just above the tricuspid valve. This angle makes it possible to use a simple fixed curve catheter and ensures that the catheter position will remain stable throughout the procedure. The downside of the superior approach is that it requires an additional access site (the internal jugular or subclavian vein) that would otherwise not be needed. This carries a small but real risk of pneumothorax and the IJ /

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

subclavian access site can be uncomfortable for patients during and after the procedure. For these reasons, most electrophysiologists have evolved their practice and now use a femoral vein approach to deploy the coronary sinus catheter.

The femoral approach avoids the need to prep and drape an additional access site since the other sheaths and catheters for EP studies are also placed from a femoral approach. However, a separate and additional sheath needs to be inserted into the femoral vein for placement of the coronary sinus catheter. Due to the need for multiple sheaths in the same femoral vein access region, care must be taken during venous access to space the access sites sufficiently to avoid interference between the catheters. In addition, a femoral venous approach introduces anatomical challenges for cannulating the coronary sinus and does not provide the natural stability of the catheter achieved from a subclavian approach. The primary anatomical obstacles are the height of the eustachian ridge/inferior vena cava junction and the abrupt reverse angle (usually greater than 135 degrees) that the catheter must traverse once it passes above the eustachian ridge in order to enter to coronary sinus ostium. With the advent of manually deflectable catheters, electrophysiologists are usually (but not always) able to cannulate the coronary sinus from a femoral approach despite the anatomical challenges. However, because the anatomy (eustachian ridge/IVC junction) intrinsically puts pressure on the catheter in a direction that pulls it away from the coronary sinus, the catheter is much less stable than it would be from a superior approach. As a result, it is typical for the coronary sinus catheter to become dislodged multiple times in a single case requiring the operator to reposition the catheter each time.

The RUC agreed that the minutes reduced from the change in access site are at the lower end of the intensity spectrum for the service, which naturally leads to an increase in calculated intensity that is compounded by the increased intensity of making the turn at the IVC/eustachian ridge and multiple re-positionings of the catheter.

Another difference from 2001 is that this service is typically added on to EP-studies performed in concert with ablation therapies, rather than with diagnostic-only EP studies as was predominant in 2001. Medicare reported together data show that these services are now typically performed as a combination of therapeutic and diagnostic interventions (e.g., EP ablation), as opposed to simply diagnostic procedures. The survey add-on code is most often reported with ablation code 93653 *Comprehensive electrophysiologic evaluation including insertion and repositioning of multiple electrode catheters with induction or attempted induction of an arrhythmia with right atrial pacing and recording, right ventricular pacing and recording (when necessary), and His bundle recording (when necessary) with intracardiac catheter ablation of arrhythmogenic focus; with treatment of supraventricular tachycardia by ablation of fast or slow atrioventricular pathway, accessory atrioventricular connection, cavo-tricuspid isthmus or other single atrial focus or source of atrial re-entry* (work RVU = 14.75, 180 minutes intra-service time) and diagnostic code 93613 *Intracardiac electrophysiologic 3-dimensional mapping (List separately in addition to code for primary procedure)* (work RVU = 5.23, 90 minutes intra-service time). Specifically, the data shows that approximately 80% of 93621 is reported with CPT code 93653. The placement of a catheter for pacing/recording in the left atrium and coronary sinus is more complex/intense in an ablation versus a diagnostic procedure. Patients who proceed to ablative therapies are more complex than those only receiving diagnostic catheterization.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Moreover, the RUC notes that while it is uncommon for an add-on code to be more intense than the underlying service, it does occur, and it is common in the electrophysiology space. A relevant example is trans-septal puncture CPT code 93462 *Left heart catheterization by transseptal puncture through intact septum or by transapical puncture (List separately in addition to code for primary procedure)* (work RVU = 3.73, 40 minutes intra-service and total time) that may be performed with SVT ablation CPT code 93653 *Comprehensive electrophysiologic evaluation including insertion and repositioning of multiple electrode catheters with induction or attempted induction of an arrhythmia with right atrial pacing and recording, right ventricular pacing and recording (when necessary), and His bundle recording (when necessary) with intracardiac catheter ablation of arrhythmogenic focus; with treatment of supraventricular tachycardia by ablation of fast or slow atrioventricular pathway, accessory atrioventricular connection, cavo-tricuspid isthmus or other single atrial focus or source of atrial re-entry* (work RVU = 14.75, 180 minutes intra-service and 239 minutes total time). The ablation procedure intensity is 0.075 while the puncture is more intense at 0.093. An intensity of 0.088 from the RVU recommendation for CPT code 93621 fits this model and is a reasonable intensity rank order.

The RUC compared CPT code 93621 to the second highest key reference service and MPC code 99292 *Critical care, evaluation and management of the critically ill or critically injured patient; each additional 30 minutes (List separately in addition to code for primary service)* (work RVU = 2.25, 30 minutes intra-service and total time) and noted the intra-service time is 10 minutes less for the survey code and all the survey respondents that selected the second key reference code rated the survey code as more intense and complex overall relative to the reference code.

The RUC also identified CPT code 37252 *Intravascular ultrasound (noncoronary vessel) during diagnostic evaluation and/or therapeutic intervention, including radiological supervision and interpretation; initial noncoronary vessel (List separately in addition to code for primary procedure)* (work RVU = 1.80, 20 minutes intra-service time and 22 minutes total time) for comparison purposes and noted that the comparator code has the same amount of intra-service time and intensity as the survey code.

For additional support, the RUC referenced key MPC codes 37253 *Intravascular ultrasound (noncoronary vessel) during diagnostic evaluation and/or therapeutic intervention, including radiological supervision and interpretation; each additional noncoronary vessel (List separately in addition to code for primary procedure)* (work RVU = 1.44, 20 minutes intra-service time and 1 minute immediate post-service time) and 36227 *Selective catheter placement, external carotid artery, unilateral, with angiography of the ipsilateral external carotid circulation and all associated radiological supervision and interpretation (List separately in addition to code for primary procedure)* (work RVU = 2.09, 15 minutes intra-service and total time) and noted that the multi-specialty points of comparison codes appropriately bracket the survey code. The RUC further noted that there are 12 RUC reviewed ZZZ codes with 20 minutes intra-service time and work values between 1.40 and 2.00.

The RUC concluded that, given changes in intensity and total time for the procedure, CPT code 93621 should be valued based on a direct work RVU crosswalk to CPT code 36483 with 20 minutes intra-service time as supported by the survey. **The RUC recommends a work RVU of 1.75 for CPT code 93621.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Practice Expense
CPT code 93621 is provided exclusively in the facility setting; thus, no direct practice expense inputs are recommended.

Work Neutrality
The RUC's recommendation for this code will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

CPT Code	CPT Descriptor	Global Period	Work RVU Recommendation
93621	Comprehensive electrophysiologic evaluation including insertion and repositioning of multiple electrode catheters with induction or attempted induction of arrhythmia; with left atrial pacing and recording from coronary sinus or left atrium (List separately in addition to code for primary procedure)	ZZZ	1.75

SUMMARY OF RECOMMENDATION

CPT Code:93621 Tracking Number Original Specialty Recommended RVU: **2.10**
Presented Recommended RVU: **1.75**
Global Period: ZZZ Current Work RVU: **2.10** RUC Recommended RVU: **1.75**

CPT Descriptor: Comprehensive electrophysiologic evaluation including insertion and repositioning of multiple electrode catheters with induction or attempted induction of arrhythmia; with left atrial pacing and recording from coronary sinus or left atrium (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: During a separately reported cardiac electrophysiology procedure, a 37 year-old man with recurrent palpitations is indicated, for diagnostic purposes, for the recording of electrical activity from the left atrium and ventricle and to pace the left atrium.

[Note: This is an add-on code. Only consider the additional work for left atrial pacing and recording from coronary sinus or left atrium. Do not include any work that is included in base codes 93620, 93653 or 93654.]

Percentage of Survey Respondents who found Vignette to be Typical: 88%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: N/A

Description of Intra-Service Work: The patient is undergoing a separately reported cardiac electrophysiology procedure, and it is necessary to place a catheter in the coronary sinus to record left atrial activity. Femoral venous access site is already prepared for related procedure. Achieve central venous access, place a sheath in the femoral vein using standard percutaneous techniques, changing to subclavian or jugular access if that fails. Introduce the catheter into the sheath and advance into the right atrium where the ostium of the coronary sinus is engaged. Advance the catheter into the coronary sinus. Use the multielectrode catheter to record electrical activity from the left atrium and, at times, pace the left atrium to attempt arrhythmia induction. Reposition the catheter as necessary throughout the course of the cardiac electrophysiology procedure to optimize recordings and pacing thresholds. At the conclusion of the procedure, remove the catheter. Include a description of this additional work and catheter use and associated findings in the procedure report

Description of Post-Service Work: N/A

Physical effort required	0%	17%	83%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	50%	50%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

History and Background

At the April 2020 virtual RUC meeting, the RUC recommended a value of 1.44, a crosswalk to CPT code 37253. The societies appealed that outcome after feeling limited by the virtual format, unable to adequately consult with one another or facilitate in the typical manner. That appeal was granted, and this SOR is a re-presentation of data from the April survey with reconfigured and enhanced recommendations the societies believe provide a satisfactory path forward.

In October 2019, the Relativity Assessment Workgroup identified services with Medicare utilization of 10,000 or more that have increased by at least 100% from 2013 through 2018, including CPT 93621 electrophysiologic evaluation.

For the April 2020 meeting, HRS and ACC randomly surveyed electrophysiologists, as designated by membership rolls. The survey was completed by physicians who have experience with the service. The key reference code is 93609 for intraventricular and/or intra-atrial mapping of tachycardia with catheter manipulation. It was selected by 33.9% of respondents. Nearly a third of these respondents indicate 93621 was virtually identical. The second reference code was 99292 for critical care evaluation. It was selected by 11.3% of respondents. All of these respondents indicated that 93621 was more intense/complex overall.

Since 2001, when this code was last surveyed, there have been a number of changes in technique that have contributed to change in intensity and total time of the procedure. In particular the typical access technique has evolved to the femoral vein to insert the catheter (as included in the updated description of service above), as opposed to the jugular or subclavian vein (as currently presented from the 2001 survey in the RUC database).

Compelling Evidence-Type Explanation for RVU Recommendation

Because the recommended work RVU is not an increase, a compelling evidence argument is not necessary. However, because of the change in calculated intensity that results from a decrease in intraservice time without an entirely commensurate decrease in work RVU, the societies make a compelling evidence-type presentation here. Specifically, there has been a change in technique that has changed physician work.

The technique used for coronary sinus catheter placement has evolved. Previously, a superior vena cava (SVC) approach via internal jugular (IJ) or subclavian vein access was the preferred route to access the coronary sinus. Anatomically, this provides an ideal angle from which to cannulate the coronary sinus which sits at the inferior posteroseptal region of the right atrium, just above the tricuspid valve. This angle makes it possible to use a simple fixed curve catheter and ensures that the catheter position will remain stable throughout the procedure. The downside of the superior approach is that it requires an additional access site (the internal jugular or subclavian vein) that would otherwise not be needed. This carries a small but real risk of pneumothorax and the IJ / subclavian access site can be uncomfortable for patients during and after the procedure. For these reasons, most electrophysiologists have evolved their practice and now use a femoral vein approach to deploy the coronary sinus catheter.

The femoral approach avoids the need to prep and drape an additional access site since the other sheaths and catheters for EP studies are also placed from a femoral approach. However, a separate and additional sheath does need to be inserted into the femoral vein for placement of the coronary sinus catheter. Due to the need for multiple sheaths in the same femoral vein access region, care must be taken during venous access to space the access sites sufficiently to avoid interference between the catheters. In addition, a femoral venous approach introduces anatomical challenges for cannulating the coronary sinus and does not provide the natural stability of the catheter achieved from a subclavian approach. The primary anatomical obstacles are the height of the eustachian ridge/inferior vena cava junction and the abrupt reverse angle (usually greater than 135 degrees) that the catheter must traverse once it passes above the eustachian ridge in order to enter to coronary sinus ostium. With the advent of manually deflectable catheters, electrophysiologists are usually (but not always) able to cannulate the coronary sinus from a femoral approach despite the anatomical challenges. However, because the anatomy (eustachian ridge/IVC junction) intrinsically puts pressure on the catheter in a direction that pulls it away from the coronary sinus, the catheter is much less stable than it would be from a superior approach. As a result, it is typical for the coronary sinus catheter to become dislodged multiple times in a single case requiring the operator to reposition the catheter each time.

We believe the minutes reduced from the change in access site are at the lower end of the intensity spectrum for the service, which naturally leads to an increase in calculated intensity that is compounded by the increased intensity of making the turn at the IVC/eustachian ridge and multiple re-positionings of the catheter.

Another difference from 2001 to now is that this service is typically added on to EP-studies performed in concert with ablation therapies, rather than with diagnostic-only EP studies as was predominant in 2001. Billed together data show that these services are now typically performed as a combination of therapeutic and diagnostic interventions (e.g., EP ablation), as opposed to simply diagnostic procedures, specifically the data shows that roughly 78% of 93621 is billed with 93653. This is another difference from the 2001 valuation. Patients who proceed to ablative therapies are more complex than those only receiving diagnostic catheterization.

For comparison purposes, the societies identified RVW comparator code 37252 for intravascular ultrasound (noncoronary vessel) during diagnostic evaluation and/or therapeutic intervention. This code has the same amount of intraservice time, 20 minutes and, correctly, a slightly lower IWPUT of 0.088 than results from our recommendation. The societies also identified two other comparator codes that bracket the recommendation: 36483 for endovenous ablation therapy at 1.75 RVW with a slightly higher intensity than the recommendation at 0.088. This code reflects a mostly 'technical' procedure. The second code, 36227 for selective catheter placement has an RVW of 2.09 and a higher intensity of 0.1393 IWPUT.

Finally, revisiting a topic that arose during the first presentation of this code, while it is uncommon for an add-on code to be more intense than the underlying service, it does occur and it is common in the electrophysiology space. A relevant example is trans-septal puncture (93462) that may be performed with SVT ablation (93653). The ablation procedure IWPUT is 0.075 while the puncture is more intense at 0.093. An IWPUT of 0.088 from the RVU recommended below fits this model, and is a reasonable IWPUT rank order to the expert panel.

Recommendation

Therefore, for code 93621 the societies **recommend a crosswalk to the RVW of 1.75 from code 36483 with 0 minutes preservice time, 20 minutes intraservice time from the survey median, and 0 minutes postservice time**.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 93621

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty ACC How often? Commonly

Specialty HRS How often? Commonly

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 59784
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on double the Medicare data estimation reported in 2018.

Specialty Cardiac Electrophysiology Frequency 48000 Percentage 80.28 %

Specialty Cardiology Frequency 11794 Percentage 19.72 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 29,892 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Fee for service utilization from RUC database from 2018 for 93621.

Specialty Cardiac Electrophysiology Frequency 24000 Percentage 80.28 %

Specialty Cardiology Frequency 5892 Percentage 19.71 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Cardiovascular-Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 93621

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

Chicago, IL 60611

RE: Tab 21 Practice Expense

Dear Dr. Manaker:

Tab 21 on the October 2020 RUC agenda addresses one add-on code for electrophysiologic services. This add-on service is provided exclusively in the facility setting. As such, we recommend no direct practice expense inputs for Tab 21.

Thank you for your consideration of this information as you prepare for the meeting. Please contact Claudia Vasquez at cvasquez@acc.org if you have any questions.

Sincerely,

Richard Wright, MD
ACC RUC Advisor

Mark Schoenfeld, MD
HRS RUC Advisor

AMA/Specialty Society RVS Update Committee Summary of Recommendations

April 2021

Endoscopic Bariatric Device Procedures – Tab 8

In February 2021, the CPT Editorial Panel approved the addition of two codes to report esophagogastroduodenoscopy, flexible, transoral with deployment and removal of intragastric bariatric balloon. CPT code 43235 was identified as being part of the same family of services.

43235 ***Esophagogastroduodenoscopy, flexible, transoral; diagnostic, including collection of specimen(s) by brushing or washing, when performed (separate procedure)***
The RUC reviewed the survey results from 54 gastrointestinal and endoscopic surgeons and bariatric surgeons and determined that maintaining the current work RVU of 2.09, which falls below the survey 25th percentile, appropriately accounts for the physician work involved in this service. The RUC recommends 14 minutes of pre-service evaluation, 3 minutes of pre-service positioning, 5 minutes of pre-service scrub/dress/wait time, 15 minutes intra-service time and 12 minutes immediate post-service time. Pre-service time package 1 (Straightforward Patient/Straightforward Procedure (No anesthesia care)) and post-service time package 8A (IV Sedation/ Straightforward Procedure) are recommended as adjusted. CPT code 43235 is typically performed with either moderate sedation or anesthesia. In 2017, when moderate sedation was removed from GI endoscopy codes and other codes where moderate sedation was considered inherent to the procedure, it became historical precedent that moderate sedation is separately reported. Therefore, moderate sedation CPT codes 99152 and 99153 or 00731 would be reported typically on the same date with 43235 (43290 or 43291). No multiple procedures reduction policies apply.

To justify a work RVU of 2.09, the RUC compared CPT code 43235 to the top key reference service code 43202 *Esophagoscopy, flexible, transoral; with biopsy, single or multiple* (work RVU = 1.72, 15 minutes intra-service time 47 minutes total time) and noted that the reference service has identical intra-service time but is less intense than the survey code and appropriately valued lower. The RUC also compared the survey code to the second key reference code 43216 *Esophagoscopy, flexible, transoral; with removal of tumor(s), polyp(s), or other lesion(s) by hot biopsy forceps* (work RVU = 2.30, 22 minutes intra-service time and 55 minutes total time) and noted that the reference service has more intra-service and total time and is appropriately valued higher than 43235.

For additional support, the RUC compared CPT code 43235 to MPC codes 64483 *Injection(s), anesthetic agent(s) and/or steroid; transforaminal epidural, with imaging guidance (fluoroscopy or CT), lumbar or sacral, single level* (work RVU = 1.90, 15 minutes intra-service time and 49 minutes total time) and 64479 *Injection(s), anesthetic agent(s) and/or steroid; transforaminal epidural, with imaging guidance (fluoroscopy or CT), cervical or thoracic, single level* (work RVU = 2.29, 15 minutes intra-service time and 49 minutes total time) and noted that the multi-specialty points of comparison values have the same intra-service time and appropriately bracket the survey code recommendation. The RUC concluded that the value of CPT code 43235 should be maintained at 2.09 work RVUs, below the 25th percentile of the survey. **The RUC recommends a work RVU of 2.09 for CPT code 43235.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

43290 ***Esophagogastroduodenoscopy, flexible, transoral; with deployment of intragastric bariatric balloon***
The RUC reviewed the survey results from 51 gastrointestinal and endoscopic surgeons and bariatric surgeons and concurred that the survey respondents overvalued the physician work involved in performing this service. The RUC determined that a direct work RVU crosswalk to CPT code 31256 *Nasal/sinus endoscopy, surgical, with maxillary antrostomy;* (work RVU = 3.11, 30 minutes intra-service time and 83 minutes total time), which falls below the survey 25th percentile and has identical intra-service time, appropriately accounts for the physician work involved in this service. The RUC believed that the survey 25th percentile work RVU was too high in comparison to other services and agreed with the crosswalk to 31256. Alternative crosswalks were considered; however, the nasal endoscopy code, 31256, was deemed most clinically comparable and the value fits within the context of the EGD family. The RUC noted that in a comparison of recently RUC-reviewed 000-day global codes with similar intra-service and total times, the crosswalk value of 3.11 falls in the middle range in terms of work RVUs.

The RUC recommends 18 minutes of pre-service evaluation, 3 minutes of pre-service positioning, 5 minutes of pre-service scrub/dress/wait time, 30 minutes intra-service time and 20 minutes immediate post-service time, 76 minutes total time. Pre-service time package 2 (Difficult Patient/Straightforward Procedure (No anesthesia care)) and post-service time package 8A are recommended as adjusted. The typical patient is considered difficult based on an elevated BMI of 30-40. The RUC noted that the requested pre-service physician time components differ slightly from the package and specifically align with the traditional GI endoscopy pre-times: 18 minutes evaluation time, 3 minutes positioning time, and 5 minutes scrub/dress/wait time.

To justify the crosswalk value of 3.11 work RVUs, the RUC compared CPT code 43290 to key reference code 43226 *Esophagoscopy, flexible, transoral; with insertion of guide wire followed by passage of dilator(s) over guide wire* (work RVU = 2.24, 25 minutes intra-service time and 57 minutes total time) and noted that the reference service has less intra-service and total time and is a less complex procedure than the survey code and appropriately valued lower.

For additional support, the RUC compared CPT code 43290 to MPC codes 10030 *Image-guided fluid collection drainage by catheter (eg, abscess, hematoma, seroma, lymphocele, cyst), soft tissue (eg, extremity, abdominal wall, neck), percutaneous* (work RVU = 2.75, 30 minutes intra-service time and 76 minutes total time) and 37191 *Insertion of intravascular vena cava filter, endovascular approach including vascular access, vessel selection, and radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance (ultrasound and fluoroscopy), when performed* (work RVU = 4.46, 30 minutes intra-service time and 73 minutes total time) and noted that the multi-specialty points of comparison values have the same intra-service time and appropriately bracket the survey code recommendation. The RUC concluded that CPT code 43290 should be valued based on a direct work RVU crosswalk to CPT code 31256 which falls below the survey 25th percentile. **The RUC recommends a work RVU of 3.11 for CPT code 43290.**

43291 ***Esophagogastroduodenoscopy, flexible, transoral; with removal of intragastric bariatric balloon(s)***
The RUC reviewed the survey results from 51 gastrointestinal and endoscopic surgeons and bariatric surgeons and determined that the survey 25th percentile work RVU of 2.80 appropriately accounts for the physician work involved in this service. The RUC recommends 18 minutes of pre-service evaluation, 3 minutes of pre-service positioning, 5 minutes of pre-service scrub/dress/wait time, 30 minutes intra-service time and 15 minutes immediate post-service time. The RUC noted that the requested pre-service physician time components specifically align with the rest of

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

the gastrointestinal endoscopy pre-times: 18 minutes evaluation time, 3 minutes positioning time, and 5 minutes scrub/dress/wait time. Pre-service time package 2 and post-service time package 9A (General Anesthesia or Complex Regional Block/ Straightforward Procedure) are recommended as adjusted. The RUC noted that typically the patient is intubated and concurred that post-time package 9A, as adjusted per the survey, is most appropriate.

To justify a work RVU of 2.80, the RUC compared CPT code 43291 to the top key reference service code 43215 *Esophagoscopy, flexible, transoral; with removal of foreign body(s)* (work RVU = 2.44, 20 minutes intra-service time and 53 minutes total time) and noted that the reference service has ten minutes less intra-service time than the survey code and is appropriately valued lower.

For additional support, the RUC compared CPT code 43291 to MPC codes 31622 *Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; diagnostic, with cell washing, when performed (separate procedure)* (work RVU = 2.53, 30 minutes intra-service time and 61 minutes total time) and 37191 *Insertion of intravascular vena cava filter, endovascular approach including vascular access, vessel selection, and radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance (ultrasound and fluoroscopy), when performed* (work RVU = 4.46, 30 minutes intra-service time and 73 minutes total time) and noted that the multi-specialty points of comparison values have the same intra-service time and appropriately bracket the survey code recommendation. The RUC concluded that CPT code 43291 should be valued at the 25th percentile work RVU as supported by the survey. **The RUC recommends a work RVU of 2.80 for CPT code 43291.**

Practice Expense
For CPT code 43290, the Practice Expense Subcommittee adjusted five minutes of clinical staff time between CA005 *Complete pre-procedure phone calls and prescription* (3 minutes) and CA035 *Complete pre-procedure phone calls and prescription* (2 minutes). The Subcommittee also verified that the new supply item, *Intragastric Balloon System,* is not reusable. When it is removed, the balloon is punctured so it cannot be reused in another patient. **The RUC recommends the direct practice expense inputs as modified by the Practice Expense Subcommittee.**

New Technology
CPT codes 43290 and 43291 will be placed on the New Technology list and will be re-reviewed by the RUC in three years to ensure correct valuation and utilization assumptions.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

SUMMARY OF RECOMMENDATION

CPT Code:43235 Tracking Number B1 Original Specialty Recommended RVU: **2.09**
Presented Recommended RVU: **2.09**
Global Period: 000 Current Work RVU: **2.09** RUC Recommended RVU: **2.09**

CPT Descriptor: Esophagogastroduodenoscopy, flexible, transoral; diagnostic, including collection of specimen(s) by brushing or washing, when performed (separate procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 67-year-old patient with dyspepsia and weight loss refractory to pharmacological therapy is referred for diagnostic esophagogastroduodenoscopy (EGD) and collection of specimens by brushings.

Percentage of Survey Respondents who found Vignette to be Typical: 87%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Review patient's gastrointestinal symptoms. Review the need for pre-procedure antibiotics or contrast allergy prophylaxis. Review patient's allergies and medications, specifically noting usage of antiplatelet or anticoagulation medications. Review patient's laboratory studies as they relate to coagulation status and platelet count. Review patient's X-rays and other diagnostic tests. Review the risks and benefits of the procedure with the patient. Obtain informed consent for the procedure. Verify all endoscopic equipment is available and operational and make appropriate computer entries as necessary. Position patient on the examination table. Position endoscopic equipment to provide access for the procedure. Perform a time out. Apply topical anesthesia to the throat. Place a bite-block in patient's mouth.

Description of Intra-Service Work: Assess level of sedation prior to inserting the endoscope. Insert a standard flexible upper endoscope through the mouth into the oropharynx and advance through the esophagus into the proximal stomach. Insufflate the stomach with air after suctioning liquid contents. Perform an examination of the entire stomach in the forward and retroflexed positions. Advance the endoscope through the pylorus into the duodenal bulb. Inspect the duodenum circumferentially after air insufflation. Slowly withdraw the endoscope and reinspect the stomach and duodenum. After suctioning air to deflate the stomach, withdraw the endoscope into the esophagus, allowing measurement of the squamocolumnar (SC) and gastroesophageal (GE) junction from the incisors. Assess for presence of a hiatal hernia and examine the esophageal mucosa. When indicated, obtain brushings or washings of suspicious abnormalities. Obtain photodocumentation of appropriate normal landmarks and abnormalities. Withdraw the endoscope at the conclusion of the procedure.

Description of Post-Service Work: Assess patient's condition including post-procedure vital signs. Complete post-procedure orders. Complete cytology forms as necessary. Complete post-procedure specimen verification and documentation and reporting for quality purposes. Review and label photographs. Order and review post-procedure radiographs. Generate a procedure report and forward to referral source and other appropriate parties. Enter data into the procedure registry. Assess patient for suitability to discharge from the recovery suite relative to established discharge criteria. When patient is stable for discharge, review findings and recommendations with the patient and pertinent others. Provide orders for necessary prescriptions, follow-up tests, and appointments to the patient.

SURVEY DATA

RUC Meeting Date (mm/yyyy)	04/2021		
Presenter(s):	R. Bruce Cameron, MD (ACG); Shivan Mehta, MD (AGA); Seth A. Gross, MD (ASGE); Ketan Sheth, MD (SAGES)		
Specialty Society(ies):	American College of Gastroenterology, American Gastroenterological Association, American Society for Gastrointestinal Endoscopy, Society of American Gastrointestinal and Endoscopic Surgeons		
CPT Code:	43235		
Sample Size:	2328	**Resp N:**	54
Description of Sample:	The ACG, AGA and ASGE surveyed a random sample of 1,000 members; with email bouncebacks, 974 surveys were successfully delivered. SAGES surveyed the 160 members of their metabolic and bariatric surgeon and advanced endoscopy members. ASGE surveyed the 260 members of its Association for Bariatric Endoscopy (ABE). We also surveyed the 992 physician list provided by industry; with email bouncebacks, 934 surveys were successfully delivered. 974 (random sample) + 160 (SAGES metabolic and bariatric surgeon and advanced endoscopy group) + 260 (ASGE ABE) + 934 (Industry list) = 2,328

CPT Descriptor Esophagoscopy, flexible, transoral; with removal of tumor(s), polyp(s), or other lesion(s) by hot biopsy forceps

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
64483	000	1.90	**RUC Time**	1,044,547

CPT Descriptor 1 Injection(s), anesthetic agent(s) and/or steroid; transforaminal epidural, with imaging guidance (fluoroscopy or CT), lumbar or sacral, single level

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
64479	000	2.29	**RUC Time**	44,367

CPT Descriptor 2 Injection(s), anesthetic agent(s) and/or steroid; transforaminal epidural, with imaging guidance (fluoroscopy or CT), cervical or thoracic, single level

Other Reference CPT Code	Global	Work RVU	Time Source
		0.00	

CPT Descriptor

RELATIONSHIP OF CODE BEING REVIEWED TO TOP TWO KEY REFERENCE SERVICES:
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by percent distribution) of the service you are rating to the top two chosen key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Top Key Reference Code: 26 **% of respondents:** 50.9 **%**

Number of respondents who choose 2nd Key Reference Code: 5 **% of respondents:** 9.8 **%**

TIME ESTIMATES (Median)

	CPT Code: 43235	**Top Key Reference CPT Code:** 43202	**2nd Key Reference CPT Code:** **43216**

Other time if appropriate			

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	4%	50%	46%	0%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	8%	54%	38%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	4%	54%	42%
Physical effort required	4%	62%	34%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	4%	73%	23%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	20%	80%	0%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	20%	20%	60%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	40%	40%	20%
Physical effort required	20%	60%	20%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	20%	60%	20%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

The CPT Editorial Panel accepted a proposal at the February 2021 CPT Editorial Panel meeting to add category I CPT codes for endoscopic bariatric device procedures to the esophagogastroduodenoscopy (EGD) code family. CPT code 43235 is the base code for the EGD family and was surveyed with the new endoscopic bariatric device procedures, 43290 and 43291.

43235 Esophagogastroduodenoscopy, flexible, transoral; diagnostic, including collection of specimen(s) by brushing or washing, when performed (separate procedure)

43290 with deployment of gastric bariatric device (eg, balloon) under endoscopic guidance

43291 with removal of intragastric bariatric balloon(s)

The Research Subcommittee approved our proposed survey methodology to survey codes 43235, 43290 and 43291 together using both a random sample of the GI societies' memberships and a targeted survey of the ASGE Association for Bariatric Endoscopy (ABE), a vendor list from Apollo Endosurgery Inc. and SAGES' metabolic and bariatric surgeon and advanced endoscopy members. The Research Subcommittee also provided input on our reference service list.

Our multi-specialty consensus panel reviewed the survey data for codes 43235, 43290 and 43291, comparing the data and work RVUs (wRVUs) to the current data for similar 000-day global codes that were recently approved by the RUC.

43235 – Discussion and Recommendation

Code 43235 is an existing code that was last reviewed by the RUC in January 2013. The ACG, AGA, ASGE and SAGES conducted a survey for the April 2021 RUC meeting and received 54 responses: 22 from the targeted survey of the industry list, 7 from SAGES' metabolic and bariatric surgeon and advanced endoscopy members, 15 from the ASGE ABE (labeled "GI-targeted" in the Survey Summary Spreadsheet) and 10 from the random sample of the GI societies' membership.

We recommend the existing **wRVU of 2.09**. This value is less than the 25th percentile of the combined survey data (2.10 wRVU).

Pre-time Package 1 (*Straightforward Patient/Straightforward Procedure (No anesthesia care)*) is appropriate with 14 minutes of evaluation time, reflecting the current pre-service time, 3 minutes positioning time and 5 minutes scrub, dress, wait time.

Pre-service evaluation time: 14 minutes
Pre-service positioning time: 3 minutes
Pre-service scrub, dress, wait time: 5 minutes

Post-time Package 8A (*IV Sedation/ Straightforward Procedure*) is appropriate with 12 minutes of immediate post-service time, reflecting the survey median.

Intra-service time of 15 minutes is appropriate, reflecting the survey median.

Key Reference Services

Two reference services were selected more often than others: 43202 and 43216. However, code 43202 (*Esophagoscopy, flexible, transoral; with biopsy, single or multiple*) was selected most often (26/54).

Comparison to recently RUC-reviewed 0-day global codes with 15 minutes intra-service time and similar total time:

The table below pertains to the next section on SERVICES REPORTED WITH MULTIPLE CPT CODES:

EGD (43235) with moderate sedation provided by same physician

Provider	CPT	Description	Global	wRVU	Pre-service time	Intra-service time	Post-service time	Overlapping procedure work?
GI or endoscopic surgeon	43X22	Esophagogastroduodenoscopy, flexible, transoral; with removal of intragastric bariatric balloon(s)	000	2.80	26	30	15	No
GI or endoscopic surgeon	99152	Moderate sedation services provided by the same physician or other qualified health care professional performing the diagnostic or therapeutic service that the sedation supports, requiring the presence of an independent trained observer to assist in the monitoring of the patient's level of consciousness and physiological status; initial 15 minutes of intraservice time, patient age 5 years or older	XXX	0.25	0	12	0	No
GI or endoscopic surgeon	99153	Moderate sedation services provided by the same physician or other qualified health care professional performing the diagnostic or therapeutic service that the sedation supports, requiring the presence of an independent trained observer to assist in the monitoring of the patient's level of consciousness and physiological status; each additional 15 minutes intraservice time (List separately in addition to code for primary service)	XXX	0.00	0	0	0	No

EGD (43235) with anesthesia

Provider	CPT	Description	Global	wRVU	Pre-service time	Intra-service time	Post-service time	Overlapping procedure work?
GI or endoscopic surgeon	43X22	Esophagogastroduodenoscopy, flexible, transoral; with removal of intragastric bariatric balloon(s)	000	2.80	26	30	15	No
Anesthesia professional	00731	Anesthesia for upper gastrointestinal endoscopic procedures, endoscope introduced proximal to duodenum; not otherwise specified	XXX	5.00	19	25	10	No

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☒ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. 43235 is typically performed with either moderate sedation or anesthesia. When moderate sedation was removed from GI endoscopy codes and other codes where moderate sedation was considered inherent to the procedure, it became historical precedent that moderate sedation is separately reported. Codes 99152 and 99153 or 00731 would be reported typically on the same date with 43235. No multiple procedures reduction policies apply. See section above for a table including CPT codes, global period, work RVUs, pre, intra and post-time and performing physician.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43235

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gastroenterology How often? Commonly

Specialty General Surgery How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 970863
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. 2019 CMS volume is 323,621. National volume is estimated to be three times Medicare. 323,621 x 3 = 970,863

Specialty Gastroenterology Frequency 813584 Percentage 83.80 %

Specialty General Surgery Frequency 94174 Percentage 9.70 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 323,621 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2019 CMS volume = 323,621

Specialty Gastroenterology Frequency 271195 Percentage 83.80 %

Specialty General Surgery Frequency 31392 Percentage 9.70 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Endoscopy

BETOS Sub-classification Level II:
Upper Gastrointestinal

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number
43235

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

CPT Descriptor: Esophagogastroduodenoscopy, flexible, transoral; with deployment of intragastric bariatric balloon

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 45-year-old female with a body mass index (BMI) of 33 who has failed to respond to dietary and pharmacologic interventions for weight loss undergoes endoscopically guided insertion of a gastric balloon.

Percentage of Survey Respondents who found Vignette to be Typical: 96%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Review patient's obesity criteria and associated comorbid conditions. Review patient's prior surgical history with specific attention to prior abdominal surgery. Review patient's allergies and medications, specifically noting usage of antiplatelet or anticoagulation medications. Discuss case planning with anesthesia team. Review patient's laboratory studies as they relate to coagulation status and platelet count. Review patient's other diagnostic tests. Review the risks and benefits of the procedure. Obtain informed consent. Verify all endoscopic equipment is available and operational and make appropriate computer entries as necessary. Position patient on the examination table. Position endoscopic equipment to provide access for the procedure. Perform a time out. Place a bite-block in patient's mouth.

Description of Intra-Service Work: Assess level of sedation prior to inserting the endoscope. Insert a standard flexible upper endoscope through the mouth into the oropharynx and advance through the esophagus into the proximal stomach. Insufflate the stomach with air after suctioning liquid contents. Perform an examination of the entire stomach in the forward and retroflexed positions. Advance the endoscope through the pylorus into the duodenal bulb. Inspect the duodenum circumferentially after air insufflation. Slowly withdraw the endoscope and reinspect the stomach and duodenum. After suctioning air to deflate the stomach, withdraw the endoscope into the esophagus, allowing measurement of the squamocolumnar (SC) and gastroesophageal (GE) junction from the incisors. Assess for presence of a hiatal hernia and examine the esophageal mucosa. When indicated, obtain brushings or washings of suspicious abnormalities. Obtain photodocumentation of appropriate normal landmarks and abnormalities. The endoscope is withdrawn. The intragastric balloon catheter is then advanced into the stomach based on the markings on the catheter and the prior noted location of the SCJ. The scope is reinserted to confirm and adjust the position of the collapsed intragastric balloon into the body of the stomach. The endoscope is then withdrawn to the level of GE junction at which point the stiffening wire is removed from the delivery catheter. The balloon is slowly inflated using saline with or without methylene blue dye. After the intragastric balloon is inflated to the desired volume, the catheter is disengaged from the intragastric balloon. The balloon and stomach are inspected to make sure there is no evidence of fluid leakage. The catheter is then completely removed. Photodocumentation is obtained confirming intragastric balloon placement in the stomach. The endoscope is then removed and procedure is complete.

Description of Post-Service Work: Assess patient's condition including post-procedure vital signs. Complete post-procedure orders. Review and label photographs. Generate a procedure report and forward to referral source and other appropriate parties. Assess patient for suitability to discharge from the recovery suite relative to established discharge

criteria. When patient is stable for discharge, review findings and recommendations for diet and managing nausea. Provide orders for necessary prescriptions, follow-up tests, and appointments to the patient.

SURVEY DATA

RUC Meeting Date (mm/yyyy)	04/2021		
Presenter(s):	R. Bruce Cameron, MD (ACG); Shivan Mehta, MD (AGA); Seth A. Gross, MD (ASGE); Ketan Sheth, MD (SAGES)		
Specialty Society(ies):	American College of Gastroenterology, American Gastroenterological Association, American Society for Gastrointestinal Endoscopy, Society of American Gastrointestinal and Endoscopic Surgeons		
CPT Code:	43290		
Sample Size:	2328	**Resp N:**	51
Description of Sample:	The ACG, AGA and ASGE surveyed a random sample of 1,000 members; with email bouncebacks, 974 surveys were successfully delivered. SAGES surveyed the 160 members of their metabolic and bariatric surgeon and advanced endoscopy members. ASGE surveyed the 260 members of its Association for Bariatric Endoscopy (ABE). We also surveyed the 992 physician list provided by industry; with email bouncebacks, 934 surveys were successfully delivered. 974 (random sample) + 160 (SAGES metabolic and bariatric surgeon and advanced endoscopy group) + 260 (ASGE ABE) + 934 (Industry list) = 2,328

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	760	0%	19%	28%	53%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	3%	19%	78%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	34%	66%
Physical effort required	0%	31%	69%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	3%	16%	81%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	0%	83%	17%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	0%	100%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	33%	67%
Physical effort required	0%	0%	100%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	16%	84%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

The CPT Editorial Panel accepted a proposal at the February 2021 CPT Editorial Panel meeting to add category I CPT codes for endoscopic bariatric device procedures to the esophagogastroduodenoscopy (EGD) code family. CPT code 43235 is the base code for the EGD family and was surveyed with the new endoscopic bariatric device procedures, 43290 and 43291.

43235 Esophagogastroduodenoscopy, flexible, transoral; diagnostic, including collection of specimen(s) by brushing or washing, when performed (separate procedure)

43290 with deployment of intragastric bariatric balloon

43291 with removal of intragastric bariatric balloon(s)

The Research Subcommittee approved our proposed survey methodology to survey codes 43235, 43290 and 43291 together using both a random sample of the GI societies' memberships and a targeted survey of the ASGE Association for Bariatric Endoscopy (ABE), a vendor list from Apollo Endosurgery Inc. and SAGES' metabolic and bariatric surgeon and advanced endoscopy members. The Research Subcommittee also provided input on our reference service list.

Our multi-specialty consensus panel reviewed the survey data for codes 43235, 43290 and 43291, comparing the data and work RVUs (wRVUs) to the current data for similar 000-day global codes that were recently approved by the RUC.

43290 – Discussion and Recommendation

Code 43290 is a new code for deployment of gastric bariatric device under endoscopic guidance that was approved by the CPT Editorial Panel at its February 2021 meeting. The ACG, AGA, ASGE and SAGES conducted a survey for the April 2021 RUC meeting and received 51 responses: 22 from the targeted survey of the industry list, 6 from SAGES' metabolic and bariatric surgeon and advanced endoscopy members, 15 from the ASGE ABE (labeled "GI-targeted" in the Survey Summary Spreadsheet) and 8 from the random sample of the GI societies' membership.

43290 physician time recommendations:

Pre-time Package 2 (*Difficult Patient/Straightforward Procedure (No anesthesia care)*) is appropriate with 18 minutes of evaluation time, reflecting the current pre-service time, 3 minutes positioning time and 5 minutes scrub, dress, wait time.

Pre-service evaluation time: 18 minutes
Pre-service positioning time: 3 minutes
Pre-service scrub, dress, wait time: 5 minutes

A breakdown of the pre-service time is provided in the table below.

Detailed Description of Pre-Service Time Packages (Minutes)		
		FACILITY
		2
	Total Pre-Service Time	**26**
	CATEGORY SUBTOTALS	
A	Pre-Service Evaluation (IWPUT =0.0224)	18
B	Pre-Service Positioning (IWPUT = 0.0224)	3
C	Pre-Service Scrub, Dress and Wait (IWPUT =0.0081)	5
	DETAILS	
A	History and Exam (Performance and review of appropriate Pre-Tests)	10
A	Prepare for Procedure (Check labs, plan, assess risks, review procedure)	2
A	Communicate with patient and/or family (Discuss procedure/ obtain consent)	3
A	Communicate with other professionals	0
A	Check/set-up room, supplies and equipment	1
A	Check/ prepare patient readiness (Gown, drape, prep, mark)	1
A	Prepare/ review/ confirm procedure	1
B	Perform/ supervise patient positioning	3
C	Administer local/topical anesthesia	0
C	Observe (wait anesthesia care)	0
C	Dress and scrub for procedure	5

Post-time Package 8A (*IV Sedation/ Straightforward Procedure*) is appropriate with 20 minutes of immediate post-service time, reflecting the survey median.

Intra-service time of 30 minutes is appropriate, reflecting the survey median.

Key Reference Services:
Two reference services were selected more often than others: 43212 and 43226. However, code 43212 (*Esophagoscopy, flexible, transoral; with placement of endoscopic stent (includes pre- and post-dilation and guide wire passage, when performed)*) was selected most often (32/51).

43290 wRVU recommendation:
We originally recommended a wRVU of 3.40. This value is the 25th percentile of the combined survey data. The survey is robust and, thus, the 25th percentile is valid based on the amount of physician work and complexity involved. We felt the survey 25th percentile wRVU and median times fit well both within the EGD family and with other procedures and we provided tables showing its position both within the EGD family and within other recently valued 000-day global codes of similar intra-service and total time.

We note that in a comparison of recently RUC-reviewed 0-day global codes with similar intra-service and total times (see the table below), *code 43290 falls near the middle in terms of wRVUs with 29 codes above and 38 codes below 3.40 wRVUs*. There are many endoscopy codes that have similar intra-service time and higher wRVUs. We believe this supports the survey 25th percentile value.

CPT Code: 43290

We also note that the 3.40 wRVU recommendation for 43290 fits appropriately within the EGD family, which additionally validates the survey 25th percentile wRVU (see the table below).

We appreciate the time and effort our pre-facilitation reviewers took in helping us with this tab and explaining their concerns. Ultimately, they felt that the 25th percentile wRVU was too high in comparison to other services and recommended a crosswalk to 31256 (*Nasal/sinus endoscopy, surgical, with maxillary antrostomy;*) with 3.11 wRVUs, Pre-time Package #3 with 15 minutes of pre-service time, 30 minutes of intra-service time, 20 minutes post-service time and a total time of 83 minutes.

While we continue believe the survey 25th percentile wRVU accurately reflects the physician work involved and did our best to convey that in the materials we provided, we understand and respect the reviewers' advice that 3.40 wRVUs felt too high. We then turned our focus to crosswalks for codes with less than 3.40 wRVUs with 30 minutes of intra-service time and similar total times (see the table below).

Search criteria: 000 day global; wRVU<3.40; IS = 30 min; total time b/t 67-85 min; Most recent RUC review > 2007

Codes19081 and 52334 are candidates for potential crosswalk if the RUC is uncomfortable with the 43290 survey 25th percentile of 3.40 wRVUs. The reviewers specifically recommended 31256 with 3.11 wRVUs. Code 32557 is not an

ideal candidate because CMS did not accept the RUC's time recommendation. Codes below this wRVU would cause an anomaly with balloon removal code 43291 and within the EGD family.

The table below shows the crosswalk identified by the RUC reviewers (31256) and the two other potential crosswalk codes identified (19081 and 52334) highlighted in light orange and the original recommendation for 43290 to demonstrate how each would fit within the context of the EGD family.

While we continue believe the survey 25th percentile wRVU accurately reflects the physician work involved and did our best to convey that in the materials we provided, **we will move forward with the RUC reviewers' recommendation to crosswalk the value of 43290 to code 31256 at 3.11 wRVUs**.

The table below pertains to the next section on SERVICES REPORTED WITH MULTIPLE CPT CODES:

Balloon placement (43X21) with moderate sedation provided by same physician

Provider	CPT	Description	Global	wRVU / Base Unit	Pre-service time	Intra-service time	Post-service time	Overlapping procedure work?
GI or endoscopic surgeon	43X21	Esophagogastroduodenoscopy, flexible, transoral; with deployment of gastric bariatric device (eg, balloon) under endoscopic guidance	000	3.40 wRVU (proposed)	26	30	20	No
GI or endoscopic surgeon	99152	Moderate sedation services provided by the same physician or other qualified health care professional performing the diagnostic or therapeutic service that the sedation supports, requiring the presence of an independent trained observer to assist in the monitoring of the patient's level of consciousness and physiological status; initial 15 minutes of intraservice time, patient age 5 years or older	XXX	0.25 wRVU	0	12	0	No
GI or endoscopic surgeon	99153	Moderate sedation services provided by the same physician or other qualified health care professional performing the diagnostic or therapeutic service that the sedation supports, requiring the presence of an independent trained observer to assist in the monitoring of the patient's level of consciousness and physiological status; each additional 15 minutes intraservice time (List separately in addition to code for primary service)	XXX	0.00 wRVU	0	0	0	No

Balloon placement (43X21) with anesthesia

Provider	CPT	Description	Global	wRVU / Base Unit	Pre-service time	Intra-service time	Post-service time	Overlapping procedure work?
GI or endoscopic surgeon	43X21	Esophagogastroduodenoscopy, flexible, transoral; with deployment of gastric bariatric device (eg, balloon) under endoscopic guidance	000	3.40 wRVU (proposed)	26	30	20	No
Anesthesia professional	00731	Anesthesia for upper gastrointestinal endoscopic procedures, endoscope introduced proximal to duodenum; not otherwise specified	XXX	5 base units	19	25	10	No

---

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☒ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. 43290 is typically performed with either moderate sedation or anesthesia. When moderate sedation was removed from GI endoscopy codes and other codes where moderate sedation was considered inherent to the procedure, it became historical precedent that moderate sedation is separately reported. Codes 99152 and 99153 or 00731 would be reported typically on the same date with 43290. No multiple procedures reduction policies apply. See section above for a table including CPT codes, global period, work RVUs, pre, intra and post-time and performing physician.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) The CPT application indicates 15% of endoscopic bariatric balloon placement was reported with 43999.

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gastroenterology How often? Sometimes

Specialty General Surgery How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 7571
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Apollo Endosurgery estimates 7,571 devices were placed in 2018

Specialty Gastroenterology Frequency 5300 Percentage 70.00 %

Specialty General Surgery Frequency 2272 Percentage 30.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 2,523
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. CMS volume is estimated to be 1/3 of national volume (7,571/3 = 2,523)

Specialty Gastroenterology Frequency 1767 Percentage 70.03 %

Specialty General Surgery Frequency 757 Percentage 30.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Endoscopy

BETOS Sub-classification Level II:
Upper Gastrointestinal

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 43215

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:43291 Tracking Number B3 Original Specialty Recommended RVU: **2.80**
Presented Recommended RVU: **2.80**
Global Period: 000 Current Work RVU: RUC Recommended RVU: **2.80**

CPT Descriptor: Esophagogastroduodenoscopy, flexible, transoral; with removal of intragastric bariatric balloon(s)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 45-year-old female presented who is six months post placement of an intragastric balloon presents for removal of the balloon.

Percentage of Survey Respondents who found Vignette to be Typical: 98%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Review procedural history of balloon placement and symptoms since balloon placement. Confirm the amount of fluid (in ccs/mls) that was used to inflate the balloon. Review patient's allergies and medications, specifically noting usage of antiplatelet or anticoagulation medications. Discuss case planning with anesthesia team. Review patient's laboratory studies as they relate to coagulation status and platelet count. Review patient's other diagnostic tests. Review the risks and benefits of the procedure. Obtain informed consent. Verify all endoscopic equipment is available and operational and make appropriate computer entries as necessary. Position patient on the examination table. Position endoscopic equipment to provide access for the procedure. Perform a time out. Place a bite-block in patient's mouth.

Description of Intra-Service Work: Assess level of sedation prior to inserting the endoscope. Insert a standard flexible upper endoscope through the mouth into the oropharynx and advance through the esophagus into the proximal stomach. Insufflate the stomach with air after suctioning liquid contents. Perform an examination of the entire stomach in the forward and retroflexed positions. Inspect the duodenum circumferentially after air insufflation. Slowly withdraw the endoscope and reinspect the stomach and duodenum. Visualize the previously placed balloon. Insert a needle instrument through the working channel of the endoscope. Use the needle instrument to puncture the balloon. Attach the external portion of the needle catheter to suction and remove the fluid from the balloon. The volume of the fluid is measured to ensure it approximates the same amount that was used to fill the balloon. After careful inspection to ensure the balloon is fully deflated, the needle catheter is removed. The device specific retrieval instrument is used to grasp the deflated balloon. The balloon is brought in apposition to the endoscope. The endoscope and balloon are carefully removed perorally using direct endoscopic guidance. The endoscope is then reinserted to make sure there is no mucosal trauma in the upper gastrointestinal tract. The endoscope is advanced through the pylorus into the duodenal bulb. The stomach is reinsuflated. The remaining fluid is removed. The stomach and esophagus are carefully evaluated, allowing measurement of the squamocolumnar (SC) and gastroesophageal (GE) junction from the incisors. Assess for presence of a hiatal hernia and examine the esophageal mucosa. When indicated, obtain brushings or washings of suspicious abnormalities. Obtain photodocumentation of appropriate normal landmarks and abnormalities. The endoscope is then removed and the procedure is complete.

Description of Post-Service Work: Assess patient's condition including post-procedure vital signs. Complete post-procedure orders. Review and label photographs. Generate a procedure report and forward to referral source and other appropriate parties. Assess patient for suitability to discharge from the recovery suite relative to established discharge

criteria. When patient is stable for discharge, review findings and recommendations with the patient and pertinent others. Provide orders for necessary prescriptions, follow-up tests, and appointments to the patient.

SURVEY DATA

RUC Meeting Date (mm/yyyy)	04/2021		
Presenter(s):	R. Bruce Cameron, MD (ACG); Shivan Mehta, MD (AGA); Seth A. Gross, MD (ASGE); Ketan Sheth, MD (SAGES)		
Specialty Society(ies):	American College of Gastroenterology, American Gastroenterological Association, American Society for Gastrointestinal Endoscopy, Society of American Gastrointestinal and Endoscopic Surgeons		
CPT Code:	43291		
Sample Size:	2328	**Resp N:**	51
Description of Sample:	The ACG, AGA and ASGE surveyed a random sample of 1,000 members; with email bouncebacks, 974 surveys were successfully delivered. SAGES surveyed the 160 members of their metabolic and bariatric surgeon and advanced endoscopy members. ASGE surveyed the 260 members of its Association for Bariatric Endoscopy (ABE). We also surveyed the 992 physician list provided by industry; with email bouncebacks, 934 surveys were successfully delivered. 974 (random sample) + 160 (SAGES metabolic and bariatric surgeon and advanced endoscopy group) + 260 (ASGE ABE) + 934 (Industry list) = 2,328

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	0%	11%	46%	43%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	18%	82%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	18%	82%
Physical effort required	4%	11%	85%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	14%	86%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	8%	17%	42%	33%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	8%	17%	75%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	33%	67%
Physical effort required	0%	33%	67%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	8%	8%	84%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

The CPT Editorial Panel accepted a proposal at the February 2021 CPT Editorial Panel meeting to add category I CPT codes for endoscopic bariatric device procedures to the esophagogastroduodenoscopy (EGD) code family. CPT code 43235 is the base code for the EGD family and was surveyed with the new endoscopic bariatric device procedures, 43290 and 43291.

43235 Esophagogastroduodenoscopy, flexible, transoral; diagnostic, including collection of specimen(s) by brushing or washing, when performed (separate procedure)

43290 with deployment of intragastric bariatric balloon

43291 with removal of intragastric bariatric balloon(s)

The Research Subcommittee approved our proposed survey methodology to survey codes 43235, 43290 and 43291 together using both a random sample of the GI societies' memberships and a targeted survey of the ASGE Association for Bariatric Endoscopy (ABE), a vendor list from Apollo Endosurgery Inc. and SAGES' metabolic and bariatric surgeon and advanced endoscopy members. The Research Subcommittee also provided input on our reference service list.

Our multi-specialty consensus panel reviewed the survey data for codes 43235, 43290 and 43291, comparing the data and work RVUs (wRVUs) to the current data for similar 000-day global codes that were recently approved by the RUC.

43291 – Discussion and Recommendation

Code 43291 is a new code for removal of intragastric bariatric balloon(s) that was approved by the CPT Editorial Panel at its February 2021 meeting. The ACG, AGA, ASGE and SAGES conducted a survey for the April 2021 RUC meeting and received 51 responses: 22 from the targeted survey of the industry list, 6 from SAGES' metabolic and bariatric surgeon and advanced endoscopy members, 15 from the ASGE ABE (labeled "GI-targeted" in the Survey Summary Spreadsheet) and 8 from the random sample of the GI societies' membership.

We recommend the existing **wRVU of 2.80**. This value is the 25th percentile of the combined survey data.

Pre-time Package 2 (*Difficult Patient/Straightforward Procedure (No anesthesia care)*) is appropriate with 18 minutes of evaluation time, reflecting the current pre-service time, 3 minutes positioning time and 5 minutes scrub, dress, wait time.

Pre-service evaluation time: 18 minutes
Pre-service positioning time: 3 minutes
Pre-service scrub, dress, wait time: 5 minutes

Please see the breakdown of pre-service minutes in the table below.

Detailed Description of Pre-Service Time Packages (Minutes)		
		FACILITY
		2
	Total Pre-Service Time	**26**
	CATEGORY SUBTOTALS	
A	Pre-Service Evaluation (IWPUT =0.0224)	18
B	Pre-Service Positioning (IWPUT = 0.0224)	3
C	Pre-Service Scrub, Dress and Wait (IWPUT =0.0081)	5
	DETAILS	
A	History and Exam (Performance and review of appropriate Pre-Tests)	10
A	Prepare for Procedure (Check labs, plan, assess risks, review procedure)	2
A	Communicate with patient and/or family (Discuss procedure/ obtain consent)	3
A	Communicate with other professionals	0
A	Check/set-up room, supplies and equipment	1
A	Check/ prepare patient readiness (Gown, drape, prep, mark)	1
A	Prepare/ review/ confirm procedure	1
B	Perform/ supervise patient positioning	3
C	Administer local/topical anesthesia	0
C	Observe (wait anesthesia care)	0
C	Dress and scrub for procedure	5

Post-time Package 9A (*General Anesthesia or Complex Regional Block/ Straightforward Procedure*) is appropriate with 15 minutes of immediate post-service time, reflecting the survey median post-service time.

Intra-service time of 30 minutes is appropriate, reflecting the survey median.

Key Reference Services
Two reference services were selected more often than others: 43215 and 43212. However, code 43215 (*Esophagoscopy, flexible, transoral; with removal of foreign body(s)*) was selected most often (28/51).

Comparison to recently RUC-reviewed 0-day global codes with 30 minutes intra-service time and similar total time:

This table is for the "Services Reported with Multiple CPT Codes" section below.

Balloon removal (43X22) with moderate sedation provided by same physician

Provider	CPT	Description	Global	wRVU	Pre-service time	Intra-service time	Post-service time	Overlapping procedure work?
GI or endoscopic surgeon	43X22	Esophagogastroduodenoscopy, flexible, transoral; with removal of intragastric bariatric balloon(s)	000	2.80	26	30	15	No
GI or endoscopic surgeon	99152	Moderate sedation services provided by the same physician or other qualified health care professional performing the diagnostic or therapeutic service that the sedation supports, requiring the presence of an independent trained observer to assist in the monitoring of the patient's level of consciousness and physiological status; initial 15 minutes of intraservice time, patient age 5 years or older	XXX	0.25	0	12	0	No
GI or endoscopic surgeon	99153	Moderate sedation services provided by the same physician or other qualified health care professional performing the diagnostic or therapeutic service that the sedation supports, requiring the presence of an independent trained observer to assist in the monitoring of the patient's level of consciousness and physiological status; each additional 15 minutes intraservice time (List separately in addition to code for primary service)	XXX	0.00	0	0	0	No

Balloon removal (43X22) with anesthesia

Provider	CPT	Description	Global	wRVU	Pre-service time	Intra-service time	Post-service time	Overlapping procedure work?
GI or endoscopic surgeon	43X22	Esophagogastroduodenoscopy, flexible, transoral; with removal of intragastric bariatric balloon(s)	000	2.80	26	30	15	No
Anesthesia professional	00731	Anesthesia for upper gastrointestinal endoscopic procedures, endoscope introduced proximal to duodenum; not otherwise specified	XXX	5.00	19	25	10	No

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☒ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. 43291 is typically performed with either moderate sedation or anesthesia. When moderate sedation was removed from GI endoscopy codes and other codes where moderate sedation was considered inherent to the procedure, it became historical precedent that moderate sedation is separately reported. Codes 99152 and 99153 or 00731 would be reported typically on the same date with 43291. No multiple procedures reduction policies apply. See SOR 43291 Attachment for a table including CPT codes, global period, work RVUs, pre, intra and post-time and performing physician.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) CPT code 43247 was previously used to report removal of bariatric balloon devices.

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gastroenterology How often? Sometimes

Specialty General Surgery How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 7571
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Apollo Endosurgery estimates 7,571 devices were placed in 2018; therefore, 7,571 devices were removed

Specialty Gastroenterology Frequency 5300 Percentage 70.00 %

Specialty General Surgery Frequency 2272 Percentage 30.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 2,523
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. CMS volume is estimated to be 1/3 of national volume (7,571/3 = 2,523)

Specialty Gastroenterology Frequency 1767 Percentage 70.03 %

Specialty General Surgery Frequency 757 Percentage 30.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Endoscopy

BETOS Sub-classification Level II:
Upper Gastrointestinal

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 43215

FACILITY DIRECT PE INPUTS **CPT CODE(S):**43235, 43290, 43291

SPECIALTY SOCIETY(IES): ACG, AGA, ASGE, SAGES

PRESENTER(S): R. Bruce Cameron, MD (ACG), Shivan Mehta, MD (AGA), Patricia Garcia, MD (AGA), Seth Gross, MD (ASGE), Vivek Kaul, MD (ASGE), Sheth Ketan, MD (SAGES), Dmitry Nepomnayshy, MD (SAGES)

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC) PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

Meeting Date: April 2021

CPT Code	Long Descriptor	Global Period
43235	Esophagogastroduodenoscopy, flexible, transoral; diagnostic, including collection of specimen(s) by brushing or washing, when performed (separate procedure)	000
43290	Esophagogastroduodenoscopy, flexible, transoral; with deployment of intragastric bariatric balloon	000
43291	Esophagogastroduodenoscopy, flexible, transoral; with removal of intragastric bariatric balloon(s)	000

Vignette(s) (*vignette required even if PE only code(s)***):**

CPT Code	Vignette
43235	A 67-year-old patient with dyspepsia and weight loss refractory to pharmacological therapy is referred for diagnostic esophagogastroduodenoscopy (EGD) and collection of specimens by brushings.
43290	A 45-year-old female with a body mass index (BMI) of 33 who has failed to respond to dietary and pharmacologic interventions for weight loss undergoes endoscopically guided insertion of a gastric balloon.
43291	A 45-year-old female who is six months post placement of an intragastric balloon presents for removal of the balloon.

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

   The ACG, AGA, ASGE and SAGES convened an RVS expert panel of the surveying specialty societies to review practice expense data for codes 43235, 43290 and 43291. The panel included both sub-specialists and generalists from within the specialties of a variety of settings across the United States. They also received input from practice managers and clinical staff familiar with the direct expense inputs.

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code, but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here (*for service reviewed prior to the implementation of clinical activity codes, detail is not provided in the RUC database, please contact Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org for PE spreadsheets for your reference codes*):

   The reference code for comparison of 43235 is 43235 with current PE inputs.

   The reference code for comparison of 43290 is 43226 (Esophagoscopy, flexible, transoral; with insertion of guide wire followed by passage of dilator(s) over guide wire). Code 43215 was selected because it is most similar to removal of intragastric bariatric balloon(s).
   The reference code for comparison of 43291 is 43215 (Esophagoscopy, flexible, transoral; with removal of foreign body(s)). Code 43215 was selected because it is most similar to removal of intragastric bariatric balloon(s).

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

3. Is this code(s) typically reported with an E/M service?

43235 is not typically reported with an E/M service. According to the RUC database, 43235 was billed 1.0% of the time with office E/M. It is not typically reported with an E/M service in the non-facility. According to the RUC database, 43235 was billed 7.0% of the time with non-facility office E/M.

Codes 43290 and 43291 are new CPT codes, so there is no data available for them in the RUC database. However, we do not expect these codes to be typically reported with an E/M service or with an E/M service in the non-facility.

4. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time:

Not applicable. We are not requesting more minutes that the PE Subcommittee standards.

		Approved by PE Subcmte Oct 2012	GI/SAGES Recommendation		
		Facility	43235	43X21	43X22
Activity Code	Description of Clinical Actvities	Use of Clinical Staff for Endoscopy	EGD base code	Balloon placement	Balloon removal
CA001	Complete pre-service diagnostic and referral forms	3	3	3	3
CA002	Coordinate pre-surgery services (including test results)	5	5	5	5
CA003	Schedule space and equipment in facility	3	3	3	3
CA004	Provide pre-service education/obtain consent	5	5	5	5
CA005	Complete pre-procedure phone calls and prescription	3	3	3	3
	Other Clinical Activity	0	0	0	0
	TOTAL	**19**	**19**	**19**	**19**

5. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies for the **code family**, please provide compelling evidence (please see *PE compelling evidence guidelines*) Please explain if the increase can be entirely accounted for because of an increase in physician time:

N/A

6. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (*please see second worksheet in PE spreadsheet workbook*), please explain the difference here:

N/A

7. Please provide a brief description of the clinical staff work for the following:
   a. Pre-Service period:

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

43235, 43290 and 43291 Pre-Service Clinical Labor Activities = RN/LPN/MTA
- 3 minutes to complete pre-service diagnostic and referral forms (CA001)
- 5 minutes to coordinate pre-surgery services (including test results) (CA002)
- 3 minutes to schedule space and equipment in facility (CA003)
- 5 minutes to provide pre-service education/obtain consent (CA004)
- 3 minutes to complete pre-procedure phone calls and prescription (CA005)

b. Service period (includes pre, intra and post):

N/A

c. Post-service period:

43235, 43290 and 43291 Post-Service Clinical Labor Activities = RN/LPN/MTA
- 3 minutes to conduct patient communications (CA037)

8. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (*please see second worksheet in PE spreadsheet workbook*):

N/A

9. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov.

N/A

INVOICES

10. ☒ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

11. ☒ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

12. If you wish to include a supply that is not on the list (*please see fourth worksheet in PE spreadsheet workbook*) please provide a paid invoice. Identify and explain the invoice here:

N/A

13. Are you recommending a PE supply pack for this recommendation? Yes or No.
If Yes, please indicate if the pack is an established package of supplies as defined by CMS (eg, SA047 *pack, E/M visit*) or a pack that is commercially available?

N/A

14. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation. Please include the description, CMS supply code, unit, item quantity and unit price (if available). See documents two and three under PE reference materials on the RUC Collaboration Website for information on the contents of kits, packs and trays.

N/A

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC) PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

15. If you wish to include an equipment item that is not on the list (*please see fifth worksheet in PE spreadsheet workbook*) please provide a paid invoice and the useful life. Identify and explain the invoice here:

N/A

16. Have you recommended equipment minutes for a computer or equivalent laptop/integrated computer, equipment item computer, desktop, w-monitor, ED021 or notebook (Dell Latitute D600), ED038?
    a. If yes, please explain how the computer is used for this service(s).
    b. Is the computer used exclusively as an integral component of the service or is it also used for other purposes not specific to the code?
    c. Does the computer include code specific software that is typically used to provide the service(s)?

N/A

17. List all the equipment included in your recommendation and the equipment formula chosen *(*please see document titled *Calculating equipment time).* If you have selected "other formula" for any of the equipment please explain here:

N/A

18. If there is any other item(s) on your spreadsheet not covered in the categories above that require greater detail/explanation, please include here:

N/A

PROFESSIONAL LIABILITY INSURANCE (PLI) INFORMATION

19. If this is a PE only code please select a crosswalk based on a similar specialty mix:

43235 = 43235 43290 and 43291 = 43215 (*Esophagoscopy, flexible, transoral; with removal of foreign body(s)*)

ITEMIZED LIST OF CHANGES (FOLLOWING THE PE SUBCOMMITTEE MEETING

During and immediately following the review of this tab at the PE Subcommittee meeting please revise the summary of recommendation (PE SOR) based on modifications made during the meeting. Please submit the revised form electronically to Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org immediately following the close of business the same day that the tab is reviewed. On the PE spreadsheet, please highlight the cells and/or use red font to show the changes made during the PE Subcommittee meeting (if you have provided any of this highlighting based on changes from the reference code prior to the PE Subcommittee meeting please remove it, so not to be confused with changes made during the meeting). In addition to those revisions please also provide an itemized list of the modifications made to the PE spreadsheet during the PE Subcommittee meeting in the space below (e.g. clinical activity CA010 *obtain vital signs* was reduced from 5 minutes to 3 minutes).

FACILITY DIRECT PE INPUTS **CPT CODE(S):**43235, 43290, 43291

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC) PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

Meeting Date: April 2021

CPT Code	Long Descriptor	Global Period
43235	Esophagogastroduodenoscopy, flexible, transoral; diagnostic, including collection of specimen(s) by brushing or washing, when performed (separate procedure)	000
43290	Esophagogastroduodenoscopy, flexible, transoral; with deployment of intragastric bariatric balloon	000
43291	Esophagogastroduodenoscopy, flexible, transoral; with removal of intragastric bariatric balloon(s)	000

Vignette(s) (*vignette required even if PE only code(s)***):**

CPT Code	Vignette
43235	A 67-year-old patient with dyspepsia and weight loss refractory to pharmacological therapy is referred for diagnostic esophagogastroduodenoscopy (EGD) and collection of specimens by brushings.
43290	A 45-year-old female with a body mass index (BMI) of 33 who has failed to respond to dietary and pharmacologic interventions for weight loss undergoes endoscopically guided insertion of a gastric balloon.
43291	A 45-year-old female who is six months post placement of an intragastric balloon presents for removal of the balloon.

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

   The ACG, AGA, ASGE and SAGES convened an RVS expert panel of the surveying specialty societies to review practice expense data for codes 43235, 43290 and 43291. The panel included both sub-specialists and generalists from within the specialties of a variety of settings across the United States. They also received input from practice managers and clinical staff familiar with the direct expense inputs.

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code, but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here (*for service reviewed prior to the implementation of clinical activity codes, detail is not provided in the RUC database, please contact Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org for PE spreadsheets for your reference codes*):

   The reference code for comparison of 43235 is 43235 with current PE inputs.

   The reference code for comparison of 43290 is 43226 (*Esophagoscopy, flexible, transoral; with insertion of guide wire followed by passage of dilator(s) over guide wire*). Code 43226 was selected because it includes an upper endoscopy and passage of the intra-gastric balloon is similar to passing a bougie (43226) with similar clinical staff activities.

   As noted in the Tab 8 PE Excel spreadsheet, CMS recorded 93 minutes of total service period clinical staff time for CPT code 43226, but all materials from the original submission indicate it should be 83

minutes. Neither we nor RUC staff could locate where the extra ten minutes were allocated. They were not in our original recommendations or the RUC's recommendations to CMS. We believe the 93 minutes was a typo in the CMS database when it was originally updated in 2014. We were advised by RUC staff that we must use the 93 minutes currently reflected in the CMS database and that we should use standards to fill in and/or whatever makes sense to the specialty in allocation. We wanted to note this as the PE Subcommittee and the RUC review the time inputs in column M for comparison code 43226 in the PE spreadsheet. Please see the notes in cells M10, M33, M35, M37, and M40 of the RUC Practice Expense Spreadsheet excel file for Tab 8. They are also listed below:

Cell M10 (Total Service Period Clinical Staff Time) note: CMS has 93 min, but all materials from the original submission indicate it should be 83 minutes. Neither we nor RUC staff could locate where the extra ten minutes were allocated. They were not in our original recommendations or the RUC's recommendations to CMS. We believe the 93 minutes was a typo in the CMS database when it was originally updated in 2014. We were advised by RUC staff to use standards to fill in and/or whatever makes sense to the specialty in allocation, which is what is reflected here in column M.

Cell M33 (CA009) note: The recommendation from the RUC to CMS listed 3 minutes, but we increased it to 5 minutes to count toward the 93 minutes of total service period clinical staff time recorded by CMS.

Cell M35 (CA011) note: The recommendation from the RUC to CMS listed 3 minutes, but we increased it to 5 minutes to count toward the 93 minutes of total service period clinical staff time recorded by CMS.

Cell M37 (CA013) note: The recommendation from the RUC to CMS listed 2 minutes, but we increased it to 5 minutes to count toward the 93 minutes of total service period clinical staff time recorded by CMS.

Cell M40 (CA016) note: The recommendation from the RUC to CMS listed 2 minutes, but we increased it to 5 minutes to count toward the 93 minutes of total service period clinical staff time recorded by CMS.

The reference code for comparison of 43291 is 43215 (*Esophagoscopy, flexible, transoral; with removal of foreign body(s)*). Code 43215 was selected because it is most similar to removal of intragastric bariatric balloon(s).

3. Is this code(s) typically reported with an E/M service?
   Is this code(s) typically reported with the E/M service in the nonfacility?
   (Please see provided data titled *Medicare Same Day NF EM Billed Together - NF Dom Spec* in the RUC Review Resource Materials)

43235 is not typically reported with an E/M service. According to the RUC database, 43235 was billed 1.0% of the time with office E/M. It is not typically reported with an E/M service in the non-facility. According to the RUC database, 43235 was billed 7.0% of the time with non-facility office E/M.

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

Codes 43290 and 43291 are new CPT codes, so there is no data available for them in the RUC database. However, we do not expect these codes to be typically reported with an E/M service or with an E/M service in the non-facility.

4. What specialty is the dominant provider in the nonfacility?
What percent of the time does the dominant provider provide the service(s) in the nonfacility?
Is the dominant provider in the nonfacility different than for the global?
(Please see provided data titled *Medicare Same Day NF EM Billed Together - NF Dom Spec* in the RUC Review Resource Materials)

For 43235, the dominant provider in the non-facility is Gastroenterology. The percentage of the time gastroenterologists provide 43235 in the non-facility is 77%. The dominant provider in the non-facility is the same as for the global.

Codes 43290 and 43291 are new CPT codes and do not have data available in the RUC database. However, we expect that gastroenterologists will be the dominant provider in the non-facility.

5. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time:

Below is a table showing the current **pre-service** standards and our recommendations for reference.

		Approved by PE Subcmte in Oct. 2012		GI/SAGES Recommendations		
		Non Facility	Non Facility	43235	43X21	43X22
Activity Code	Description of Pre-service Clinical Activities - 000 and 010	Use of clinical staff	Extensive use of clinical staff	EGD base code	Balloon insertion	Balloon removal
CA001	Complete pre-service diagnostic and referral forms	0	5	3	5	3
CA002	Coordinate pre-surgery services (including test results)	0	3	3	3	3
CA003	Schedule space and equipment in facility	0	0	0	0	0
CA004	Provide pre-service education/obtain consent	0	7	0	0	0
CA005	Complete pre-procedure phone calls and prescription	0	3	3	3	3
	Other clinical activity	0	0	0	0	0
	TOTAL	**0**	**18**	**9**	**11**	**9**

43235 Pre-Service Clinical Labor Activities = RN/LPN/MTA
We are not recommending any additional minutes beyond the PE Subcommittee Standards for codes requiring "Extensive use of clinical staff" in the Non-Facility setting.

43235 Intra-Service Clinical Labor Activities = RN/LPN/MTA
We recommend 2 additional minutes above the standards for **CA029** (*Check dressings, catheters, wounds*). Upper GI endoscopy procedures require 3 minutes to perform the following activities: Remove mouthpiece. Retrieve dentures from denture cup and return to patient. Clean patient with towel, place new chux pads (upper and lower) under patient, adjust gown, place patient in a safe position on the endoscopy stretcher, and adjust blanket and/or obtain a new one. Inspect IV sites and IV and supply new bag as needed. Inspect blood pressure cuff for proper position, inspect pulse oximeter on finger to make sure in the right position. Assist anesthesia in patient transport.

CA029 = 3 minutes

43235 Post-Service Clinical Labor Activities = RN/LPN/MTA
We are not recommending any additional minutes beyond the standard for CA037 (*Conduct patient communications*)

***

43290 Pre-Service Clinical Labor Activities = RN/LPN/MTA
We are not recommending any additional minutes beyond the PE Subcommittee Standards for codes requiring "Extensive use of clinical staff" in the Non-Facility setting.

43290 Intra-Service Clinical Labor Activities = RN/LPN/MTA
We recommend 4 additional minutes above the standard for CA011 (*Provide education/obtain consent*). In addition to obtaining consent, staff instructs the patient about the six medications they will take after the procedure to address nausea, vomiting, and pain (i.e., narcotic pain medication, antispasmotic, Scopolamine Patch, Zofran, Phenergan, Ativan) and the schedule for taking the medications to prevent interactions as well as NARCAN and answers the patient's questions about the medications. Staff reviews instructions for NARCAN with the patient and provides counseling for interaction of benzodiazepines and narcotics, which is required by most states. Staff also reviews with patient what to do and avoid doing during the first 24-hours, first 3 days and first week following the procedure (e.g., drink at least 8 cups of liquid per day. Take small sips. Wait a minute or two between sips. Slowly take more with each sip. Drink only 1/3 cup at a time. Sit upright for 3 to 4 hours after drinking.) See p. 13-14 of "Orbera Patient Booklet" https://www.orbera.com/resource/us_orbera_pdfs/pdfs/GRF-00345-00R08.pdf. Staff counsels the patient on expectations for side effects (e.g., side effects to expect, timing of side effects, how long they should last, how to manage them, when to call the office and when to go to the emergency department). Staff also provides counseling on dietary recommendations. Please note that we have not included any minutes for education/consent activities in CA004 so there is no overlap or duplication. **CA011 = 15 minutes**

We recommend 3 minutes above the standard for CA013 (*Prepare room, equipment and supplies*). Staff must verify the implant is not expired and all required components are in the kit. Staff must assemble the kit prior to beginning the procedure, including preparing the syringes, IV line tubing, saline bag, etc.
CA013 = 5 minutes

We recommend 2 additional minutes above the standards for **CA029** (*Check dressings, catheters, wounds*). Upper GI endoscopy procedures require 3 minutes to perform the following activities: Remove mouthpiece. Retrieve dentures from denture cup and return to patient. Clean patient with towel, place new chux pads (upper and lower) under patient, adjust gown, place patient in a safe position on the endoscopy stretcher, and adjust blanket and/or obtain a new one. Inspect IV sites and IV and supply new bag as needed. Inspect blood pressure cuff for proper position, inspect pulse oximeter on finger to make sure in the right position. Assist anesthesia in patient transport.
CA029 = 3 minutes

43290 Post-Service Clinical Labor Activities = RN/LPN/MTA

We are not recommending any additional minutes beyond the standard for CA037 (*Conduct patient communications*).

***

43291 Pre-Service Clinical Labor Activities = RN/LPN/MTA
We are not recommending any additional minutes beyond the PE Subcommittee Standards for codes requiring "Extensive use of clinical staff" in the Non-Facility setting.

43291 Intra-Service Clinical Labor Activities = RN/LPN/MTA
We recommend 3 minutes above the standard for CA013 (*Prepare room, equipment and supplies*). Staff must assemble and set up the tubing and the equipment to extract the fluids from the balloon(s) and prepare multiple syringes for extraction.
CA013 = 5 minutes

We recommend 2 additional minutes above the standard for CA011 (*Provide education/obtain consent*). In addition to obtaining consent, staff must provide post procedure dietary recommendations and counseling, including information on change of patient's sense of satiety and appropriate diet to manage those changes. Please note that we have not included any minutes for education/consent activities in CA004 so there is no overlap or duplication. **CA011 = 5 minutes**

We recommend 8 minutes above the standard for CA016 (*Prepare, set-up and start IV, initial positioning and monitoring of patient*). Patient is intubated while supine and staff must move the patient into left lateral position. Positioning the patient for balloon removal is identical to ERCP (43260 family) which has 10 minutes for positioning the patient. **CA016 = 10 minutes**

We recommend 2 additional minutes above the standards for **CA029** (*Check dressings, catheters, wounds*). Upper GI endoscopy procedures require 3 minutes to perform the following activities: Remove mouthpiece. Retrieve dentures from denture cup and return to patient. Clean patient with towel, place new chux pads (upper and lower) under patient, adjust gown, place patient in a safe position on the endoscopy stretcher, and adjust blanket and/or obtain a new one. Inspect IV sites and IV and supply new bag as needed. Inspect blood pressure cuff for proper position, inspect pulse oximeter on finger to make sure in the right position. Assist anesthesia in patient transport.
CA029 = 3 minutes

43291 Post-Service Clinical Labor Activities = RN/LPN/MTA
We are not recommending any additional minutes beyond the standard for CA037 (*Conduct patient communications*).

6. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies for the **code family**, please provide compelling evidence (please see *PE compelling evidence guidelines*) Please explain if the increase can be entirely accounted for because of an increase in physician time:

N/A

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

7. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (*please see second worksheet in PE spreadsheet workbook*), please explain the difference here:

N/A

8. How much time was allocated to clinical activity, *obtain vital signs* (CA010) prior to CMS increasing the clinical activity to 5 minutes for calendar year 2018? The standard for clinical activity, obtains vital signs remains 0, 3 and 5 based on the number of vital signs taken. Please provide a rationale for the clinical staff time that you are requesting for obtain vital signs here:

CMS allocated 5 minutes to clinical activity CA010 (*obtain vital signs*) for code 43235 prior to CMS increasing the clinical activity to 5 minutes for CY 2018.

For codes 43235, 43290 and 43291, at least 4 vital signs are taken prior to beginning the procedure to ensure the patient is healthy enough to undergo the procedures. Vital signs taken prior to the procedure include patient's temperature, heart rate, respiratory rate, and blood pressure and may include additional vital signs.

9. Please provide a brief description of the clinical staff work for the following:
   a. Pre-Service period:

43235 and 43291 Pre-Service Clinical Labor Activities = RN/LPN/MTA
- 3 minutes to complete pre-service diagnostic and referral forms (CA001)
- 3 minutes to coordinate pre-surgery services (including test results) (CA002)
- 3 minutes to complete pre-procedure phone calls and prescription (CA005)

43290 Pre-Service Clinical Labor Activities = RN/LPN/MTA
- 5 minutes to complete pre-service diagnostic and referral forms (CA001)
- 3 minutes to coordinate pre-surgery services (including test results) (CA002)
- 3 minutes to complete pre-procedure phone calls and prescriptions (CA005)

   b. Service period (includes pre, intra and post):

43235 Intra-Service Clinical Labor Activities = RN/LPN/MTA
- 3 minutes to greet patient, provide gowning, ensure appropriate medical records are available (CA009)
- 5 minutes to obtain vital signs (CA010)
- 3 minutes to provide education/obtain consent (CA011)
- 2 minutes to prepare room, equipment and supplies (CA013)
- 5 minutes to setup scope (nonfacility setting only) (CA015)
- 2 minutes to prepare, set-up and start IV, initial positioning and monitoring of patient (CA016)
- 15 minutes to assist physician or other qualified healthcare professional---directly related to physician work time (100%) (CA018)
- 3 minutes to clean room/equipment by clinical staff (CA024)
- 30 minutes to clean scope (CA025)
- 2 minutes to complete post-procedure diagnostic forms, lab and x-ray requisitions (CA027)
- 3 minutes to check dressings, catheters, wounds (CA029)

43290 Intra-Service Clinical Labor Activities = RN/LPN/MTA
- 3 minutes to greet patient, provide gowning, ensure appropriate medical records are available (CA009)

- 5 minutes to obtain vital signs (CA010)
- 15 minutes to provide education/obtain consent (CA011)
- 5 minutes to prepare room, equipment and supplies (CA013)
- 5 minutes to setup scope (nonfacility setting only) (CA015)
- 2 minutes to prepare, set-up and start IV, initial positioning and monitoring of patient (CA016)
- 30 minutes to assist physician or other qualified healthcare professional---directly related to physician work time (100%) (CA018)
- 3 minutes to clean room/equipment by clinical staff (CA024)
- 30 minutes to clean scope (CA025)
- 2 minutes to complete post-procedure diagnostic forms, lab and x-ray requisitions (CA027)
- 3 minutes to check dressings, catheters, wounds (CA029)
- 2 minutes to review home care instructions, coordinate visits/prescriptions (CA035)

43291 Intra-Service Clinical Labor Activities = RN/LPN/MTA
- 3 minutes to greet patient, provide gowning, ensure appropriate medical records are available (CA009)
- 5 minutes to obtain vital signs (CA010)
- 5 minutes to provide education/obtain consent (CA011)
- 5 minutes to prepare room, equipment and supplies (CA013)
- 5 minutes to setup scope (nonfacility setting only) (CA015)
- 10 minutes to prepare, set-up and start IV, initial positioning and monitoring of patient (CA016)
- 30 minutes to assist physician or other qualified healthcare professional---directly related to physician work time (100%) (CA018)
- 3 minutes to clean room/equipment by clinical staff (CA024)
- 30 minutes to clean scope (CA025)
- 2 minutes to complete post-procedure diagnostic forms, lab and x-ray requisitions (CA027)
- 3 minutes to check dressings, catheters, wounds (CA029)

c. Post-service period:

43235, 43290 and 43291 Post-Service Clinical Labor Activities = RN/LPN/MTA
- 3 minutes to conduct patient communications (CA037)

10. Please provide granular detail regarding what the clinical staff is doing during the intra-service (of service period) clinical activity, *assist physician or other qualified healthcare professional---directly related to physician work time* or *Perform procedure/service---NOT directly related to physician work time:*

43235 Intra-service (of service period) = RN/LPN/MTA
Clinical staff assists the physician with the procedure for 100% of the intra-service procedure time. The clinical staff assists with technical procedural-related activities such as collecting specimens.

43290 Intra-service (of service period) = RN/LPN/MTA
Clinical staff assists the physician with the procedure for 100% of the intra-service procedure time. Staff assist with technical procedural-related activities during balloon placement such as adding methylene blue to the saline and drawing the fluid up into syringes in preparation for the physician to fill the balloon.

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

43291 Intra-service (of service period) = RN/LPN/MTA
Clinical staff assists the physician with the procedure for 100% of the intra-service procedure time. Staff assist with technical procedural-related activities during balloon deflation and removal such as assisting in attaching the needle to suction the fluid to deflate the balloon.

11. If you have used a percentage of the physician intra-service work time other than 100 or 67 percent for the intra-service (of service period) clinical activity, please indicate the percentage and explain why the alternate percentage is needed and how it was derived.
N/A

12. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (*please see second worksheet in PE spreadsheet workbook*):
N/A

13. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov.
N/A

INVOICES

14. ☒ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

15. ☒ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

16. If you wish to include a supply that is not on the list (*please see fourth worksheet in PE spreadsheet workbook*) please provide a paid invoice. Identify and explain the invoice here:
We have submitted 8 paid invoices provided by Apollo which have been catalogued in the Excel file titled "Tab 8 – invoice summary_43290_43291." These invoices contain prices for the ORBERA Intragastric Balloon System (balloon, placement catheter and connection tube with 3-way valve and saline bag spike) to place the device and the needle aspirator & grasper to remove the device.

17. Are you recommending a PE supply pack for this recommendation? **Yes** or No.
If Yes, please indicate if the pack is an established package of supplies as defined by CMS (eg, SA047 *pack, E/M visit*) or a pack that is commercially available?
We are recommending SA042 (*pack, cleaning and disinfecting, endoscope*) and SA048 (*pack, minimum multi-specialty visit*) which are defined by CMS and commercially available.

18. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation. Please include the description, CMS supply code, unit, item quantity and unit price (if

available). See documents two and three under PE reference materials on the RUC Collaboration Website for information on the contents of kits, packs and trays.

Pack, cleaning and disinfecting, endoscope (SA042) item, 1 ($18.838)
gloves, non-sterile (SB022) pair, 4 ($0.246)
gown, staff, impervious (SB027) item, 1 ($1.186)
face shield, splash protection (SB034) item, 1 ($3.40)
biohazard bag (SM008) item, 1 ($0.0688)
gauze, sterile 4in x 4in (10 pack uou) (SG056) item, 1 ($1.0995)
alcohol isopropyl 70% (SJ001) ml, 60 ($0.023)
cleaning brush, endoscope (SM010) item, 1 ($3.6105)
glutaraldehyde 3.4% (Cidex, Maxicide, Wavicide) (SM018) oz, 32 ($2.6212)
glutaraldehyde test strips (Cidex, Metrex) (SM019) item, 1 ($0.883)

Pack, minimum multi-specialty visit (SA048) item, 1 ($4.0507)
Patient gown, disposable (SB026) item, 1
Exam table paper (SB036) feet, 7
Pillowcase, disposable (SB037) item, 1
Gloves, non-sterile (SB022) pair, 2
Thermometer probe cover, disposable (SB004) item, 1

19. If you wish to include an equipment item that is not on the list (*please see fifth worksheet in PE spreadsheet workbook*) please provide a paid invoice and the useful life. Identify and explain the invoice here:

N/A

20. Have you recommended equipment minutes for a computer or equivalent laptop/integrated computer, equipment item computer, desktop, w-monitor, ED021 or notebook (Dell Latitute D600), ED038?
    a. If yes, please explain how the computer is used for this service(s).
    b. Is the computer used exclusively as an integral component of the service or is it also used for other purposes not specific to the code?
    c. Does the computer include code specific software that is typically used to provide the service(s)?

N/A

21. List all the equipment included in your recommendation and the equipment formula chosen *(*please see document titled *Calculating equipment time).* If you have selected "other formula" for any of the equipment please explain here:

EQ235 (Suction machine, Gomco) = Scope systems formula
CA013 + CA014 + CA015 + CA016 + CA017 + CA018 + CA019 + CA020 + CA024

ES031 (scope video system (monitor, processor, digital capture, cart, printer, LED light)) = scope systems formula
CA013 + CA014 + CA015 + CA016 + CA017 + CA018 + CA019 + CA020 + CA024

ES087 (multi-channeled flexible digital scope, esophagoscopy gastroscopy duodenoscopy (EGD)) = Scope formula
CA013 + CA014 + CA015 + CA016 + CA017 + CA018 + CA019 + CA020 + CA025

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

ES005 (endoscope disinfector, rigid or fiberoptic, w-cart) = Other formula*
CA025
*The time for the endoscope disinfector equals CA025 (Clean scope)

22. If there is any other item(s) on your spreadsheet not covered in the categories above that require greater detail/explanation, please include here:

NA

PROFESSIONAL LIABILITY INSURANCE (PLI) INFORMATION

23. If this is a PE only code please select a crosswalk based on a similar specialty mix:

N/A – Codes 43235, 43290 and 43291 are not PE only codes.

ITEMIZED LIST OF CHANGES (FOLLOWING THE PE SUBCOMMITTEE MEETING

During and immediately following the review of this tab at the PE Subcommittee meeting, please revise the summary of recommendation (PE SOR) based on modifications made during the meeting. Please submit the revised form electronically to Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org immediately following the close of business the same day that the tab is reviewed. On the PE spreadsheet, please highlight the cells and/or use red font to show the changes made during the PE Subcommittee meeting (if you have provided any of this highlighting based on changes from the reference code prior to the PE Subcommittee meeting please remove it, so not to be confused with changes made during the meeting). In addition to those revisions please also provide an itemized list of the modifications made to the PE spreadsheet during the PE Subcommittee meeting in the space below (e.g. clinical activity CA010 *obtain vital signs* was reduced from 5 minutes to 3 minutes).

NOTE: The virtual meetings have provided for real-time updates to the PE spreadsheets. PE SORs must still be updated and resubmitted asap.

AMA/Specialty Society RVS Update Committee Summary of Recommendations
Site of Service Anomaly*

April 2021

Anterior Abdominal Hernia Repair – Tab 9

CPT Code 49565, *Repair recurrent incisional or ventral hernia; reducible*, was identified by the RUC as a service performed less than 50% of the time in the inpatient setting, included inpatient hospital E/M service codes and had Medicare utilization over 5,000. The stakeholder societies requested referral to CPT to update the descriptor of 49565 and other abdominal hernia codes to better describe these procedures as performed in current practice. As a result of the disparate site of service for anterior abdominal hernia repair codes, new codes were established and a 000-day global period was recommended. In addition, new codes for parastomal hernia repair, an add-on code to report removal of total or near total mesh, and a new code for placement of delayed mesh closure were established. The specialty societies collected data on typical site-of-service, hospital stays and associated Evaluation and Management (E/M) visits for the new codes through the survey process.

The specialty societies described the differences between the services included in this code family and explained that these CPT codes are generally differentiated by three factors: 1) whether the hernia is initial or recurrent; 2) whether the hernia is reducible or incarcerated/ strangulated; and 3) the total length of the hernia defect (< 3cm, 3-10cm, or > 10cm in length). Furthermore, two new codes were established to report parastomal hernia repair, which involves the repair of a hernia proximal to a pre-existing stoma. The specialty societies noted that each of these three factors impacts the work involved in a hernia repair. The repair of an incarcerated/strangulated hernia involves more work than that of a reducible hernia; the repair of a larger hernia involves more work than that of a smaller hernia; and the repair of a recurrent hernia requires more work than repair of an initial hernia. This is illustrated by the fact that CPT code 49591 *Repair of anterior abdominal hernia(s) (ie, epigastric, incisional, ventral, umbilical, spigelian), any approach (ie, open, laparoscopic, robotic), initial including placement of mesh or other prosthesis, when performed total length of defect(s); less than 3 cm, reducible* (recommended work RVU = 6.27, 45 minutes of intra-service time, 108 minutes of total time) has the lowest recommended work RVU of this code family and CPT code 49618 *Repair of anterior abdominal hernia(s) (ie, epigastric, incisional, ventral, umbilical, spigelian), any approach (ie, open, laparoscopic, robotic), recurrent, including placement of mesh or other prosthesis, when performed total length of defect(s); greater than 10 cm, incarcerated or strangulated* (recommended work RVU = 24.00, 180 minutes of intra-service time, 335 minutes of total time) has the highest recommended work RVU of this code family. In reviewing this code family, the RUC noted the importance of work RVU recommendations for individual codes and maintaining relativity across the entire code family (as shown in Table 1 below). The specialty societies noted – and the RUC concurred – that there is a dearth of available comparator codes for 000-day global codes with similar work RVUs and intra-service and total times for such major procedures and that this makes it particularly important to consider and maintain relativity within this code family.

The RUC acknowledged that the construction of the CPT codes in this family appropriately address the reporting of incarcerated/strangulated hernias. The introductory language for this code family states, "When both reducible and incarcerated/strangulated anterior abdominal hernias are repaired at the same operative session, all hernias are reported as incarcerated/strangulated. For example, one 2 cm reducible initial incisional hernia and one 4 cm incarcerated initial incisional hernias separated by 2 cm would be reported as an initial incarcerated hernia repair with a maximum craniocaudad distance of 8 cm (49594)." As stated by the specialties, hernias of this sort are all generally the same piece of bowel

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

herniating through the midline anterior abdominal wall defect and are not repaired separately; they are all the same hernia and if the interspace of the fascia were not intact (even for 1 cm), the entire single bulge would be considered incarcerated/strangulated. According to the specialty societies, it is also rare that if there are multiple hernias in the same proximity, there would be a separate hernia that is reducible and a separate hernia that is incarcerated/strangulated; it is most common that all the hernias would be incarcerated/strangulated as part of the same segment of bowel. Furthermore, in the scenario outlined in the CPT introductory language, if the 2 cm initial hernia (reducible) and the 4 cm initial hernia (incarcerated/strangulated) were separated and reported as 49591 and 49594 with April 2021 RUC recommended work RVUs, the total work RVU value would be **greater** (total work RVUs recommended = 20.27 for 49591 **and** 49594) than for just reporting the service as 49594 (recommended work RVU = 14.00). This would also be the case if the incarcerated/strangulated hernia were less than 3 cm in length and reported as 49592 (total work RVUs recommended = 15.27 for 49591 **and** 49592).

Table 1: Anterior Abdominal Hernia Repair: Work RVU Recommendations

CPT Code	DESC	Recommended Work RVU
49591	**Initial,** Reduc, < 3cm	**6.27**
49613	**Recurrent,** Reduc, < 3cm	**7.75**
49592	**Initial, I/S,** < 3cm	**9.00**

49593	**Initial,** Reduc, 3-10cm	**10.80**
49615	**Recurrent,** Reduc, 3-10cm	**12.00**
49621	**Parastomal**, Reduc	**14.24**
49594	**Initial, I/S,** 3-10cm	**14.00**
49595	**Initial,** Reduc, > 10cm	**14.88**
49616	**Recurrent, I/S,** 3-10cm	**16.50**
49617	**Recurrent,** Reduc, > 10cm	**16.97**
49622	**Parastomal**, **I/S**	**18.00**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

49596	**Initial, I/S,** > 10cm	**20.00**
49618	**Recurrent, I/S, > 10cm**	**24.00**
+49623	Removal of total or near-total non-infected mesh	**5.00**

Table 2: Mesh for Delayed Closure of Defect(s): Work RVU Recommendations		
CPT Code	**DESC**	**Recommended Work RVU**
15778	Implantation of absorbable mesh or other prosthesis	**8.00**

Initial Abdominal Hernia Repair

49591 ***Repair of anterior abdominal hernia(s) (ie, epigastric, incisional, ventral, umbilical, spigelian), any approach (ie, open, laparoscopic, robotic), initial, including placement of mesh or other prosthesis, when performed, total length of defect(s); less than 3 cm, reducible***
The RUC reviewed the survey results from 39 surgeons for CPT code 49591 and determined that the survey 25th percentile work RVU of 6.27 appropriately accounts for the work required to perform this service. The RUC recommends 25 minutes of pre-service evaluation time, 3 minutes of pre-service positioning time, 15 minutes of pre-service scrub/dress/wait time, 45 minutes of intra-service time, 20 minutes of immediate post-service time, and 108 minutes of total time. The specialty societies noted that this service involves the repair of the smallest type of an initial reducible hernia.

The typical patient is discharged on the same day and therefore there are no post-operative same day visits associated with 49591. The insertion of mesh or other prosthesis is now bundled into this service; the work associated with the placement of mesh or other prosthesis was previously reported separately with deleted CPT add-on code 49568 *Implantation of mesh or other prosthesis for open incisional or ventral hernia repair or mesh for closure of debridement for necrotizing soft tissue infection (List separately in addition to code for the incisional or ventral hernia repair)* (work RVU = 4.88).

To support a work RVU of 6.27, the RUC compared CPT code 49591 to top key reference service CPT code 31600 *Tracheostomy, planned (separate procedure)* (work RVU = 5.56, 30 minutes of intra-service and 120 minutes of total time) and second key reference service CPT code 43210 *Esophagogastroduodenoscopy, flexible, transoral; with esophagogastric fundoplasty, partial or complete, includes duodenoscopy when performed* (work RVU = 7.75, 60 minutes of intra-service time and 148 minutes of total time) and noted that the surveyed code is appropriately bracketed by these two services based on the complexity of physician work and intra-service time required to perform these services. The RUC also compared CPT code 49591 to MPC code 52352 *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with removal or manipulation of*

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

calculus (ureteral catheterization is included) (work RVU = 6.75, 45 minutes of intra-service and 118 minutes of total time). The RUC determined that these values support the recommended work RVU and noted that CPT code 49591 requires the same 45 minutes of intra-service time as MPC code 52352 but slightly less total time and support the slightly lower work RVU recommendation. **The RUC recommends a work RVU of 6.27 for CPT code 49591**.

49592 ***Repair of anterior abdominal hernia(s) (ie, epigastric, incisional, ventral, umbilical, spigelian), any approach (ie, open, laparoscopic, robotic), initial, including placement of mesh or other prosthesis, when performed, total length of defect(s); less than 3 cm, incarcerated or strangulated***

The RUC reviewed the survey results from 39 surgeons for CPT code 49592 and determined that the survey 25th percentile work RVU of 9.00 appropriately accounts for the work required to perform this service. The RUC recommends 35 minutes of pre-service evaluation time, 3 minutes of pre-service positioning time, 15 minutes of pre-service scrub/dress/wait time, 60 minutes of intra-service time, 30 minutes of immediate post-service time, and 143 minutes of total time. The specialty societies noted that the repair of an incarcerated/strangulated hernia requires more intra-service time and is more complex than the repair of a reducible hernia of the same or similar size. In addition, the specialties indicated that the repair of an incarcerated/strangulated hernia is typically performed laparoscopically and typically involves a loop of bowel which must be pulled down through the hernia and could potentially bleed. The high intensity of this service necessitates an overnight stay to monitor the abdomen and particularly the bowel that has been drawn through the hernia. Pain and bowel function is also a significant concern that requires close monitoring.

The RUC noted that the typical patient will stay overnight or longer and there will typically be a visit later the same date of the procedure at the level of 99224/99231 to monitor for problems such as ileus, intestinal ischemia, urinary retention and pain control; review data (eg, diagnostic and imaging studies) not available at the unit; communicate with other health care professionals and with patient and/or family; review medical records and data available on the unit; perform a medically appropriate examination; consider relevant data, options, and risks; formulate and/or revise diagnosis and treatment plan(s) (low complexity MDM); discuss diagnosis and treatment options with the patient and/or family; communicate with other health care professionals as necessary; write and/or review orders, complete medical record documentation; address interval data obtained and reported changes in condition; communicate results and additional care plans to other health care professionals and to the patient and/or family. Per CMS policy for reporting postoperative work for 23-hour stay procedures, the intra-service time of 10 minutes for 99224/99231 has been added to the survey immediate post-service time (total of 30 minutes). The insertion of mesh or other prosthesis is now bundled into this service; the work associated with the placement of mesh or other prosthesis was previously reported separately with deleted add-on CPT code 49568 *Implantation of mesh or other prosthesis for open incisional or ventral hernia repair or mesh for closure of debridement for necrotizing soft tissue infection (List separately in addition to code for the incisional or ventral hernia repair)* (work RVU = 4.88).

To support a work RVU of 9.00, the RUC compared CPT code 49592 to CPT code 43276 *Endoscopic retrograde cholangiopancreatography (ERCP); with removal and exchange of stent(s), biliary or pancreatic duct, including pre- and post-dilation and guide wire passage, when performed, including sphincterotomy, when performed, each stent exchanged* (work RVU = 8.84, 60 minutes of intra-service and 123 minutes of total time) and CPT code 33954 *Extracorporeal membrane oxygenation (ECMO)/extracorporeal life support (ECLS) provided by physician; insertion of peripheral (arterial and/or venous) cannula(e), open, 6 years and older* (work RVU = 9.11, 60 minutes intra-service and 178 minutes of total time). The RUC determined that these services include the same intra-service time as the surveyed code and appropriately bracket the recommend work RVU of CPT code 49592. **The RUC recommends a work RVU of 9.00 for CPT code 49592**.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

49593 ***Repair of anterior abdominal hernia(s) (ie, epigastric, incisional, ventral, umbilical, spigelian), any approach (ie, open, laparoscopic, robotic), initial, including placement of mesh or other prosthesis, when performed, total length of defect(s); 3 cm to 10 cm, reducible***
The RUC reviewed the survey results from 41 surgeons for CPT code 49593 and determined that the survey 25th percentile work RVU of 10.80 appropriately accounts for the work required to perform this service. The RUC recommends 30 minutes of pre-service evaluation time, 10 minutes of pre-service positioning time, 15 minutes of pre-service scrub/dress/wait time, 90 minutes of intra-service time, 30 minutes of immediate post-service time, and 175 minutes of total time. The specialty societies noted that this service is typically performed laparoscopically along the midline of the abdomen and that there may be multiple defects involved in a hernia of this size. The evaluation time was reduced from Pre-time Package 3 so as to not exceed survey median data. The positioning time was increased from the pre-time package to account for laparoscopic/robotic anterior abdominal hernia repair positioning: The patient will initially be positioned supine and upper extremity intravenous and arterial access points are dressed, padded and secured. The arms are padded and tucked at the patient's sides. The patient must be secured to the table, including a soft chest and thigh strap, as it may be necessary to roll the table during the procedure to use gravity to assist with shifting the abdominal contents. There is also consideration of positioning the patient relative to: laparoscopy equipment, including lines and video equipment and anesthesia lines relative to the rest of the equipment.

The RUC noted that the typical patient will stay overnight or longer and there will typically be a visit later the same date of the procedure at the level of 99224/99231 to monitor for problems such as ileus, intestinal ischemia, urinary retention and pain control; review data (eg, diagnostic and imaging studies) not available at the unit; communicate with other health care professionals and with patient and/or family; review medical records and data available on the unit; perform a medically appropriate examination; consider relevant data, options, and risks; formulate and/or revise diagnosis and treatment plan(s) (low complexity MDM); discuss diagnosis and treatment options with the patient and/or family; communicate with other health care professionals as necessary; write and/or review orders, complete medical record documentation; address interval data obtained and reported changes in condition; communicate results and additional care plans to other health care professionals and to the patient and/or family. Per CMS policy for reporting postoperative work for 23-hour stay procedures, the intra-service time of 10 minutes for 99224/99231 has been added to the survey immediate post-service time (total of 30 minutes). The insertion of mesh or other prosthesis is now bundled into this service; the work associated with the placement of mesh or other prosthesis was previously reported separately with deleted add-on CPT code 49568 *Implantation of mesh or other prosthesis for open incisional or ventral hernia repair or mesh for closure of debridement for necrotizing soft tissue infection (List separately in addition to code for the incisional or ventral hernia repair)* (work RVU = 4.88).

To support a work RVU of 10.80, the RUC compared CPT code 49593 to top key reference service 11006 *Debridement of skin, subcutaneous tissue, muscle and fascia for necrotizing soft tissue infection; external genitalia, perineum and abdominal wall, with or without fascial closure* (work RVU = 13.10, 120 minutes of intra-service and 270 minutes of total time) as well as MPC code 36906 *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit* (work RVU = 10.42, 90 minutes intra-service and 141 minutes of total time) and noted that the recommended work RVU of 10.80 is appropriately higher than that of MPC code 36906 given 49593's higher total time and is appropriately lower than that of top key reference service 11006 given 49593's lower intra-service and total time. **The RUC recommends a work RVU of 10.80 for CPT code 49593**.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

49594 ***Repair of anterior abdominal hernia(s) (ie, epigastric, incisional, ventral, umbilical, spigelian), any approach (ie, open, laparoscopic, robotic), initial, including placement of mesh or other prosthesis, when performed, total length of defect(s); 3 cm to 10 cm, incarcerated or strangulated***

The RUC reviewed the survey results from 41 surgeons for CPT code 49594 and determined that the survey 25th percentile work RVU of 14.00 appropriately accounts for the work required to perform this service. The RUC recommends 35 minutes of pre-service evaluation time, 15 minutes of pre-service positioning time, 15 minutes of pre-service scrub/dress/wait time, 120 minutes of intra-service time, 40 minutes of immediate post-service time, and 225 minutes of total time. The specialty societies noted that this service is typically performed laparoscopically along the midline of the abdomen and that there may be multiple defects involved in a hernia this size. The evaluation and scrub/dress/wait times were reduced from Pre-time Package 4 so as to not exceed survey median data. The positioning time was increased from the pre-time package to account for laparoscopic/robotic anterior abdominal hernia repair positioning: The patient will initially be positioned supine and upper extremity intravenous and arterial access points are dressed, padded and secured. The arms are padded and tucked at the patient's sides. The patient must be secured to the table, including a soft chest and thigh strap, as it may be necessary to roll the table during the procedure to use gravity to assist with shifting the abdominal contents. There is also consideration of positioning the patient relative to: laparoscopy equipment, including lines and video equipment and anesthesia lines relative to the rest of the equipment.

The RUC noted that the typical patient will stay overnight or longer and there will typically be a visit later the same date of the procedure at the level of 99225/99232 to monitor for problems such as ileus, intestinal ischemia, urinary retention and pain control; review data (eg, diagnostic and imaging studies) not available at the unit; communicate with other health care professionals and with patient and/or family; review medical records and data available on the unit; perform a medically appropriate examination; consider relevant data, options, and risks; formulate and/or revise diagnosis and treatment plan(s) (moderate complexity MDM); discuss diagnosis and treatment options with the patient and/or family; communicate with other health care professionals as necessary; write and/or review orders, complete medical record documentation; address interval data obtained and reported changes in condition; communicate results and additional care plans to other health care professionals and to the patient and/or family. Per CMS policy for reporting postoperative work for 23-hour stay procedures, the intra-service time of 20 minutes for 99225/99232 has been added to the immediate post-service time (total of 40 minutes). The insertion of mesh or other prosthesis is now bundled into this service; the work associated with the placement of mesh or other prosthesis was previously reported separately with deleted add-on CPT code 49568 *Implantation of mesh or other prosthesis for open incisional or ventral hernia repair or mesh for closure of debridement for necrotizing soft tissue infection (List separately in addition to code for the incisional or ventral hernia repair)* (work RVU = 4.88).

To support a work RVU of 14.00, the RUC compared CPT code 49594 to top key reference service CPT code 11005 *Debridement of skin, subcutaneous tissue, muscle and fascia for necrotizing soft tissue infection; abdominal wall, with or without fascial closure* (work RVU = 14.24, 120 minutes of intra-service and 265 minutes of total time) and MPC code 37244 *Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; for arterial or venous hemorrhage or lymphatic extravasation* (work RVU = 13.75, 90 minutes of intra-service and 166 minutes of total time) and noted that these codes bracket CPT code 49594 with appropriate work RVUs and noted that the recommended work RVU of 14.00 is appropriately higher than that of MPC code 37244 given 49594's higher intra-service and total time and is appropriately lower than that of top key reference service 11005 given 49594's lower total time. **The RUC recommends a work RVU of 14.00 for CPT code 49594**.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

49595 ***Repair of anterior abdominal hernia(s) (ie, epigastric, incisional, ventral, umbilical, spigelian), any approach (ie, open, laparoscopic, robotic), initial, including placement of mesh or other prosthesis, when performed, total length of defect(s); greater than 10 cm, reducible***
The RUC reviewed the survey results from 40 surgeons for CPT code 49595 and determined that the survey 25th percentile work RVU of 14.88 appropriately accounts for the work required to perform this service. The RUC recommends 40 minutes of pre-service evaluation time, 15 minutes of pre-service positioning time, 15 minutes of pre-service scrub/dress/wait time, 120 minutes of intra-service time, 40 minutes of immediate post-service time, and 230 minutes of total time. The specialty societies noted that this service is typically performed laparoscopically along the midline of the abdomen and that there may be multiple defects involved in a hernia this size. The scrub/dress/wait time was reduced from Pre-time Package 4 so as to not exceed survey median data. The positioning time was increased from the pre-time package to account for laparoscopic/robotic anterior abdominal hernia repair positioning: The patient will initially be positioned supine and upper extremity intravenous and arterial access points are dressed, padded and secured. The arms are padded and tucked at the patient's sides. The patient must be secured to the table, including a soft chest and thigh strap, as it may be necessary to roll the table during the procedure to use gravity to assist with shifting the abdominal contents. There is also consideration of positioning the patient relative to: laparoscopy equipment, including lines and video equipment and anesthesia lines relative to the rest of the equipment.

The RUC noted that the typical patient will stay overnight or longer and there will typically be a visit later the same date of the procedure at the level of 99225/99232 to monitor for problems such as ileus, intestinal ischemia, urinary retention and pain control; review data (eg, diagnostic and imaging studies) not available at the unit; communicate with other health care professionals and with patient and/or family; review medical records and data available on the unit; perform a medically appropriate examination; consider relevant data, options, and risks; formulate and/or revise diagnosis and treatment plan(s) (moderate complexity MDM); discuss diagnosis and treatment options with the patient and/or family; communicate with other health care professionals as necessary; write and/or review orders, complete medical record documentation; address interval data obtained and reported changes in condition; communicate results and additional care plans to other health care professionals and to the patient and/or family. Per CMS policy for reporting postoperative work for 23-hour stay procedures, the intra-service time of 20 minutes for 99225/99232 has been added to the immediate post-service time (total of 40 minutes). The insertion of mesh or other prosthesis is now bundled into this service; the work associated with the placement of mesh or other prosthesis was previously reported separately with deleted add-on CPT code 49568 *Implantation of mesh or other prosthesis for open incisional or ventral hernia repair or mesh for closure of debridement for necrotizing soft tissue infection (List separately in addition to code for the incisional or ventral hernia repair)* (work RVU = 4.88).

To support a work RVU of 14.88, the RUC compared CPT code 49595 to second key reference service 11005 *Debridement of skin, subcutaneous tissue, muscle and fascia for necrotizing soft tissue infection; abdominal wall, with or without fascial closure* (work RVU = 14.24, 120 minutes of intra-service and 265 minutes of total time) and noted that both services require similar physician work and time to perform. The RUC also referenced MPC code 37244 *Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; for arterial or venous hemorrhage or lymphatic extravasation* (work RVU = 13.75, 90 minutes of intra-service and 166 minutes total time) and noted that 20 percent of survey respondents determined that 49595 is much more complex than second key reference service 11005 and 60 percent of survey respondents determined that 49595 is somewhat more complex than 11005, which supports a slightly higher work RVU value for 49595. The higher recommended intra-service and total time for 49595 supports a higher work RVU value than 37244. **The RUC recommends a work RVU of 14.88 for CPT code 49595**.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

49596 ***Repair of anterior abdominal hernia(s) (ie, epigastric, incisional, ventral, umbilical, spigelian), any approach (ie, open, laparoscopic, robotic), initial, including placement of mesh or other prosthesis, when performed, total length of defect(s); greater than 10 cm, incarcerated or strangulated***

The RUC reviewed the survey results from 40 surgeons for CPT code 49596 and determined that the survey median work RVU of 20.00 appropriately accounts for the work required to perform this service. The RUC recommends 40 minutes of pre-service evaluation time, 15 minutes of pre-service positioning time, 15 minutes of pre-service scrub/dress/wait time, 160 minutes of intra-service time, 25 minutes of immediate post-service time, 1-99233 post-operative observation visit, and 310 minutes of total time. The specialty societies noted that this service is typically performed laparoscopically along the midline of the abdomen and that there may be multiple defects involved in a hernia this size. The scrub/dress/wait time was reduced from Pre-time Package 4 so as to not exceed survey median data. The positioning time was increased from the pre-time package to account for laparoscopic/robotic anterior abdominal hernia repair positioning: The patient will initially be positioned supine and upper extremity intravenous and arterial access points are dressed, padded and secured. The arms are padded and tucked at the patient's sides. The patient must be secured to the table, including a soft chest and thigh strap, as it may be necessary to roll the table during the procedure to use gravity to assist with shifting the abdominal contents. There is also consideration of positioning the patient relative to: laparoscopy equipment, including lines and video equipment and anesthesia lines relative to the rest of the equipment.

The RUC noted that the typical patient will be admitted as inpatient and there will typically be a visit later the same date of the procedure at the at the level of 99233 to monitor for problems such as ileus, intestinal ischemia, urinary retention and pain control; review data (eg, diagnostic and imaging studies) not available at the unit; communicate with other health care professionals and with patient and/or family; review medical records and data available on the unit; perform a medically appropriate examination; consider relevant data, options, and risks; formulate and/or revise diagnosis and treatment plan(s) (high complexity MDM); discuss diagnosis and treatment options with the patient and/or family; communicate with other health care professionals as necessary; write and/or review orders, complete medical record documentation; address interval data obtained and reported changes in condition; communicate results and additional care plans to other health care professionals and to the patient and/or family. Patients undergoing the repair of this size of hernia will require significant postoperative care on the same day to address pain control, review vital signs and fluid status commonly affected by repair of larger hernias, and eliminate concerns for bleeding and infection more common with larger or more numerous incisions. The insertion of mesh or other prosthesis is now bundled into this service; the work associated with the placement of mesh or other prosthesis was previously reported separately with deleted add-on CPT code 49568 *Implantation of mesh or other prosthesis for open incisional or ventral hernia repair or mesh for closure of debridement for necrotizing soft tissue infection (List separately in addition to code for the incisional or ventral hernia repair)* (work RVU = 4.88).

To support a work RVU of 20.00, the RUC compared CPT code 49596 to top key reference service 11005 *Debridement of skin, subcutaneous tissue, muscle and fascia for necrotizing soft tissue infection; abdominal wall, with or without fascial closure* (work RVU = 14.24, 120 minutes of intra-service and 265 minutes of total time) and second key reference service 61624 *Transcatheter permanent occlusion or embolization (eg, for tumor destruction, to achieve hemostasis, to occlude a vascular malformation), percutaneous, any method; central nervous system (intracranial, spinal cord)* (work RVU = 20.12, 232 minutes of intra-service and 362 minutes of total time) and noted that the recommended intra-service and total times support a work RVU higher than that of top key reference service 11005. The RUC also noted that 44 percent of survey respondents determined that 49596 is much more complex than second key reference service 61624 and 44 percent of survey respondents determined that 49596 is somewhat more complex than 61624, supporting a slightly lower work RVU despite the differences in intra-service and total time. **The RUC recommends a work RVU of 20.00 for CPT code 49596.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Recurrent Abdominal Hernia Repair

49613 ***Repair of anterior abdominal hernia(s) (ie, epigastric, incisional, ventral, umbilical, spigelian), any approach (ie, open, laparoscopic, robotic), recurrent, including placement of mesh or other prosthesis, when performed, total length of defect(s); less than 3 cm, reducible***
The RUC reviewed the survey results from 41 surgeons for CPT code 49613 and determined that the survey 25th percentile work RVU of 7.75 appropriately accounts for the work required to perform this service. The RUC recommends 30 minutes of pre-service evaluation time, 10 minutes of pre-service positioning time, 15 minutes of pre-service scrub/dress/wait time, 60 minutes of intra-service time, 20 minutes of immediate post-service time, and 135 minutes of total time. The RUC noted that this service involves the repair of the smallest size of a *recurrent* hernia and that there would be additional time and intensity associated with this service over CPT code 49591 because of the previous procedure. The specialty societies noted that this service is typically performed laparoscopically along the midline of the abdomen. The evaluation time was reduced from Pre-time Package 3 so as to not exceed survey median data. The positioning time was increased from the pre-time package to account for laparoscopic/robotic anterior abdominal hernia repair positioning: The patient will initially be positioned supine and upper extremity intravenous and arterial access points are dressed, padded and secured. The arms are padded and tucked at the patient's sides. The patient must be secured to the table, including a soft chest and thigh strap, as it may be necessary to roll the table during the procedure to use gravity to assist with shifting the abdominal contents. There is also consideration of positioning the patient relative to: laparoscopy equipment, including lines and video equipment and anesthesia lines relative to the rest of the equipment.

The typical patient is discharged on the same day and therefore there are no post-operative visits associated with 49613. The insertion of mesh or other prosthesis is now bundled into this service; the work associated with the placement of mesh or other prosthesis was previously reported separately with deleted add-on CPT code 49568 *Implantation of mesh or other prosthesis for open incisional or ventral hernia repair or mesh for closure of debridement for necrotizing soft tissue infection (List separately in addition to code for the incisional or ventral hernia repair)* (work RVU = 4.88).

To support a work RVU of 7.75, the RUC compared CPT code 49613 to CPT code 52345 *Cystourethroscopy with ureteroscopy; with treatment of ureteropelvic junction stricture (eg, balloon dilation, laser, electrocautery, and incision)* (work RVU = 7.55, 45 minutes of intra-service and 135 minutes of total time), CPT code 52240 *Cystourethroscopy, with fulguration (including cryosurgery or laser surgery) and/or resection of; large bladder tumor(s)* (work RVU = 7.50, 60 minutes of intra-service and 133 minutes of total time) and MPC code 52353 *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy (ureteral catheterization is included)* (work RVU = 7.50, 60 minutes of intra-service and 133 minutes of total time) and noted that the work RVUs, intra-service times and total times in this range of codes supports the work RVU recommendation for CPT code 49613 and that the added work associated with a recurrent hernia with respect to a reducible hernia places the recommended work RVU within appropriate rank order in this code family. **The RUC recommends a work RVU of 7.75 for CPT code 49613**.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

49614 ***Repair of anterior abdominal hernia(s) (ie, epigastric, incisional, ventral, umbilical, spigelian), any approach (ie, open, laparoscopic, robotic), recurrent, including placement of mesh or other prosthesis, when performed, total length of defect(s); less than 3 cm, incarcerated or strangulated***

The RUC reviewed the survey results from 41 surgeons for CPT code 49614 and determined that the survey 25th percentile work RVU of 10.79 appropriately accounts for the work required to perform this service. The RUC recommends 35 minutes of pre-service evaluation time, 10 minutes of pre-service positioning time, 15 minutes of pre-service scrub/dress/wait time, 75 minutes of intra-service time, 30 minutes of immediate post-service time, and 165 minutes of total time. The specialty societies specified that this service involves a recurrent hernia (as opposed to an initial hernia) and that involves another opening adjacent to the previously placed mesh and scar tissue and that the service is typically performed laparoscopically and involves working around a piece of incarcerated/strangulated bowel. These factors increase the time and intensity involved in performing the service. The evaluation and scrub/dress/wait times were reduced from Pre-time Package 4 so as to not exceed survey median data. The positioning time was increased from the pre-time package to account for laparoscopic/robotic anterior abdominal hernia repair positioning: The patient will initially be positioned supine and upper extremity intravenous and arterial access points are dressed, padded and secured. The arms are padded and tucked at the patient's sides. The patient must be secured to the table, including a soft chest and thigh strap, as it may be necessary to roll the table during the procedure to use gravity to assist with shifting the abdominal contents. There is also consideration of positioning the patient relative to: laparoscopy equipment, including lines and video equipment and anesthesia lines relative to the rest of the equipment.

The RUC noted that the typical patient will stay overnight or longer and there will typically be a visit later the same date of the procedure at the level of 99224/99231 to monitor for problems such as ileus, intestinal ischemia, urinary retention and pain control; review data (eg, diagnostic and imaging studies) not available at the unit; communicate with other health care professionals and with patient and/or family; review medical records and data available on the unit; perform a medically appropriate examination; consider relevant data, options, and risks; formulate and/or revise diagnosis and treatment plan(s) (low complexity MDM); discuss diagnosis and treatment options with the patient and/or family; communicate with other health care professionals as necessary; write and/or review orders, complete medical record documentation; address interval data obtained and reported changes in condition; communicate results and additional care plans to other health care professionals and to the patient and/or family. Per CMS policy for reporting postoperative work for 23-hour stay procedures, the intra-service time of 10 minutes for 99224/99231 has been added to the immediate post-service time (total of 30 minutes). The RUC noted that the recommended work RVU of 10.79 places this code in appropriate rank order within this code family with respect to overall intensity. The insertion of mesh or other prosthesis is now bundled into this service; the work associated with the placement of mesh or other prosthesis was previously reported separately with deleted add-on CPT code 49568 *Implantation of mesh or other prosthesis for open incisional or ventral hernia repair or mesh for closure of debridement for necrotizing soft tissue infection(List separately in addition to code for the incisional or ventral hernia repair)* (work RVU = 4.88).

To support a work RVU of 10.79, the RUC compared CPT code 49614 to top key reference service CPT code 21811 *Open treatment of rib fracture(s) with internal fixation, includes thoracoscopic visualization when performed, unilateral; 1-3 ribs* (work RVU = 10.79, 120 minutes of intra-service and 220 minutes of total time) and noted that the surveyed code requires less intra-service time but is much more intense, thus appropriate to be valued the same. Of the respondents who chose 21811 as the key reference service, 67% indicated CPT code 49614 requires more mental effort, technical skill and physician stress than CPT code 21811.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

For additional support, the RUC referenced MPC code 36906 *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit* (work RVU = 10.42, 90 minutes of intra-service and 141 minutes of total time). **The RUC recommends a work RVU of 10.79 for CPT code 49614**.

49615 ***Repair of anterior abdominal hernia(s) (ie, epigastric, incisional, ventral, umbilical, spigelian), any approach (ie, open, laparoscopic, robotic), recurrent, including placement of mesh or other prosthesis, when performed, total length of defect(s); 3 cm to 10 cm, reducible***
The RUC reviewed the survey results from 43 surgeons for CPT code 49615 and determined that the survey 25th percentile work RVU of 12.00 appropriately accounts for the work required to perform this service. The RUC recommends 35 minutes of pre-service evaluation time, 10 minutes of pre-service positioning time, 15 minutes of pre-service scrub/dress/wait time, 100 minutes of intra-service time, 30 minutes of immediate post-service time, and 190 minutes of total time. The specialty societies noted that this service is typically performed laparoscopically. The evaluation and scrub/dress/wait times were reduced from Pre-time Package 4 so as to not exceed survey median data. The positioning time was increased from the pre-time package to account for laparoscopic/robotic anterior abdominal hernia repair positioning: The patient will initially be positioned supine and upper extremity intravenous and arterial access points are dressed, padded and secured. The arms are padded and tucked at the patient's sides. The patient must be secured to the table, including a soft chest and thigh strap, as it may be necessary to roll the table during the procedure to use gravity to assist with shifting the abdominal contents. There is also consideration of positioning the patient relative to: laparoscopy equipment, including lines and video equipment and anesthesia lines relative to the rest of the equipment.

The RUC noted that the typical patient will stay overnight or longer and there will typically be a visit later the same date of the procedure at the level of 99224/99231 to monitor for problems such as ileus, intestinal ischemia, urinary retention and pain control; review data (eg, diagnostic and imaging studies) not available at the unit; communicate with other health care professionals and with patient and/or family; review medical records and data available on the unit; perform a medically appropriate examination; consider relevant data, options, and risks; formulate and/or revise diagnosis and treatment plan(s) (moderate complexity MDM); discuss diagnosis and treatment options with the patient and/or family; communicate with other health care professionals as necessary; write and/or review orders, complete medical record documentation; address interval data obtained and reported changes in condition; communicate results and additional care plans to other health care professionals and to the patient and/or family. Per CMS policy for reporting postoperative work for 23-hour stay procedures, the intra-service time of 10 minutes for 99224/99231 has been added to the immediate post-service time (total of 30 minutes). The insertion of mesh or other prosthesis is now bundled into this service; the work associated with the placement of mesh or other prosthesis was previously reported separately with deleted add-on CPT code 49568 *Implantation of mesh or other prosthesis for open incisional or ventral hernia repair or mesh for closure of debridement for necrotizing soft tissue infection (List separately in addition to code for the incisional or ventral hernia repair)* (work RVU = 4.88).

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

To support a work RVU of 12.00, the RUC compared CPT code 49615 to top key reference service 11006 *Debridement of skin, subcutaneous tissue, muscle and fascia for necrotizing soft tissue infection; external genitalia, perineum and abdominal wall, with or without fascial closure* (work RVU = 13.10, 120 minutes of intra-service and 270 minutes of total time) and second key reference service 11005 *Debridement of skin, subcutaneous tissue, muscle and fascia for necrotizing soft tissue infection; abdominal wall, with or without fascial closure* (work RVU = 14.24, 120 minutes of intra-service and 265 minutes of total time), both which require more physician work and time than 49615; thus it is appropriately valued slightly lower. **The RUC recommends a work RVU of 12.00 for CPT code 49615**.

49616 ***Repair of anterior abdominal hernia(s) (ie, epigastric, incisional, ventral, umbilical, spigelian), any approach (ie, open, laparoscopic, robotic), recurrent, including placement of mesh or other prosthesis, when performed, total length of defect(s); 3 cm to 10 cm, incarcerated or strangulated***

The RUC reviewed the survey results from 43 surgeons for CPT code 49616 and determined that the survey 25th percentile work RVU of 16.50 appropriately accounts for the work required to perform this service. The RUC recommends 40 minutes of pre-service evaluation time, 15 minutes of pre-service positioning time, 15 minutes of pre-service scrub/dress/wait time, 140 minutes of intra-service time, 25 minutes of immediate post-service time, 1-99232 post-operative observation visit, and 275 minutes of total time. The specialty societies noted that this service is typically performed laparoscopically. The scrub/dress/wait time was reduced from Pre-time Package 4 so as to not exceed survey median data. The positioning time was increased from the pre-time package to account for laparoscopic/robotic anterior abdominal hernia repair positioning: The patient will initially be positioned supine and upper extremity intravenous and arterial access points are dressed, padded and secured. The arms are padded and tucked at the patient's sides. The patient must be secured to the table, including a soft chest and thigh strap, as it may be necessary to roll the table during the procedure to use gravity to assist with shifting the abdominal contents. There is also consideration of positioning the patient relative to: laparoscopy equipment, including lines and video equipment and anesthesia lines relative to the rest of the equipment.

The RUC noted that the typical patient will be admitted as inpatient and there will typically be a visit later the same date of the procedure at the level of 99232 to monitor for problems such as ileus, intestinal ischemia, urinary retention and pain control; review data (eg, diagnostic and imaging studies) not available at the unit; communicate with other health care professionals and with patient and/or family; review medical records and data available on the unit; perform a medically appropriate examination; consider relevant data, options, and risks; formulate and/or revise diagnosis and treatment plan(s) (moderate complexity MDM); discuss diagnosis and treatment options with the patient and/or family; communicate with other health care professionals as necessary; write and/or review orders, complete medical record documentation; address interval data obtained and reported changes in condition; communicate results and additional care plans to other health care professionals and to the patient and/or family. The insertion of mesh or other prosthesis is now bundled into this service; the work associated with the placement of mesh or other prosthesis was previously reported separately with deleted add-on CPT code 49568 *Implantation of mesh or other prosthesis for open incisional or ventral hernia repair or mesh for closure of debridement for necrotizing soft tissue infection (List separately in addition to code for the incisional or ventral hernia repair)* (work RVU = 4.88).

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

To support a work RVU of 16.50, the RUC compared CPT code 49616 to top key reference service 33891 *Bypass graft, with other than vein, transcervical retropharyngeal carotid-carotid, performed in conjunction with endovascular repair of descending thoracic aorta, by neck incision* (work RVU = 20.00, 173 minutes of intra-service time and 323 minutes of total time) and the second key reference service 21813 *Open treatment of rib fracture(s) with internal fixation, includes thoracoscopic visualization when performed, unilateral; 7 or more ribs* (work RVU = 17.61, 210 minutes of intra-service and 310 minutes of total time) and noted that the surveyed code requires less physician time and work; thus it is appropriately valued lower.

For additional support, the RUC referenced MPC code 37244 *Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; for arterial or venous hemorrhage or lymphatic extravasation* (work RVU = 13.75, 90 minutes of intra-service and 166 minutes of total time) and noted that the surveyed code requires more physician work and time to perform, thus is valued higher. **The RUC recommends a work RVU of 16.50 for CPT code 49616**.

49617 ***Repair of anterior abdominal hernia(s) (ie, epigastric, incisional, ventral, umbilical, spigelian), any approach (ie, open, laparoscopic, robotic), recurrent, including placement of mesh or other prosthesis, when performed, total length of defect(s); greater than 10 cm, reducible***
The RUC reviewed the survey results from 42 surgeons for CPT code 49617 and noted that the survey 25th percentile work RVU recommendation would have created a rank order anomaly within the recommended work RVU values across this code family. The specialty societies noted that while the hernia repair associated with CPT code 49616 involves an incarcerated/strangulated hernia, the hernia repair associated with CPT code 49617 involves a significantly larger area of repair and involves multiple hernias in a line. However, the RUC determined that the survey median work RVU value of 18.53 overvalues the work associated with performing this procedure. The specialty societies noted that this service is typically performed laparoscopically. The scrub/dress/wait time was reduced from Pre-time Package 4 so as to not exceed survey median data. The positioning time was increased from the pre-time package to account for laparoscopic/robotic anterior abdominal hernia repair positioning: The patient will initially be positioned supine and upper extremity intravenous and arterial access points are dressed, padded and secured. The arms are padded and tucked at the patient's sides. The patient must be secured to the table, including a soft chest and thigh strap, as it may be necessary to roll the table during the procedure to use gravity to assist with shifting the abdominal contents. There is also consideration of positioning the patient relative to: laparoscopy equipment, including lines and video equipment and anesthesia lines relative to the rest of the equipment.

The RUC determined that a direct work RVU crosswalk to CPT code 37182 *Insertion of transvenous intrahepatic portosystemic shunt(s) (TIPS) (includes venous access, hepatic and portal vein catheterization, portography with hemodynamic evaluation, intrahepatic tract formation/dilatation, stent placement and all associated imaging guidance and documentation)* (work RVU = 16.97, 150 minutes of intra-service and 210 minutes of total time) appropriately accounts for the work required to perform this service. The RUC recommends 40 minutes of pre-service evaluation time, 15 minutes of pre-service positioning time, 15 minutes of pre-service scrub/dress/wait time, 150 minutes of intra-service time, 28 minutes of immediate post-service time, 1-99232 post-operative observation visit, and 288 minutes of total time for CPT code 49617.

The RUC noted that the typical patient will be admitted as inpatient and there will typically be a visit later the same date of the procedure at the level of 99232 to monitor for problems such as ileus, intestinal ischemia, urinary retention and pain control; review data (eg, diagnostic and imaging studies) not available at the unit; communicate with other health care professionals and with patient and/or family; review medical records and data available on the unit; perform a medically appropriate examination; consider relevant data, options, and risks; formulate and/or revise diagnosis and treatment plan(s) (moderate complexity MDM); discuss diagnosis and treatment options with the patient and/or family;
CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

communicate with other health care professionals as necessary; write and/or review orders, complete medical record documentation; address interval data obtained and reported changes in condition; communicate results and additional care plans to other health care professionals and to the patient and/or family. The insertion of mesh or other prosthesis is bundled into this service; the work associated with the placement of mesh or other prosthesis was previously reported separately with deleted add-on CPT code 49568 *Implantation of mesh or other prosthesis for open incisional or ventral hernia repair or mesh for closure of debridement for necrotizing soft tissue infection (List separately in addition to code for the incisional or ventral hernia repair)* (work RVU = 4.88).

To support a work RVU of 16.97, the RUC compared CPT code 49617 to second key reference service 11006 *Debridement of skin, subcutaneous tissue, muscle and fascia for necrotizing soft tissue infection; external genitalia, perineum and abdominal wall, with or without fascial closure* (work RVU = 13.10, 120 minutes of intra-service and 270 minutes of total time) and top key reference service 11005 *Debridement of skin, subcutaneous tissue, muscle and fascia for necrotizing soft tissue infection; abdominal wall, with or without fascial closure* (work RVU = 14.24, 120 minutes of intra-service and 265 minutes of total time) and noted that the higher intra-service time and the complexity associated with the repair of a recurrent abdominal hernia greater than 10 cm in length supports a higher work RVU than the key reference services. **The RUC recommends a work RVU of 16.97 for CPT code 49617**.

49618 ***Repair of anterior abdominal hernia(s) (ie, epigastric, incisional, ventral, umbilical, spigelian), any approach (ie, open, laparoscopic, robotic), recurrent, including placement of mesh or other prosthesis, when performed, total length of defect(s); greater than 10 cm, incarcerated or strangulated***

The RUC reviewed the survey results from 42 surgeons for CPT code 49618 and determined that the survey median work RVU of 24.00 appropriately accounts for the work required to perform this service. The RUC recommends 40 minutes of pre-service evaluation time, 15 minutes of pre-service positioning time, 15 minutes of pre-service scrub/dress/wait time, 180 minutes of intra-service time, 30 minutes of immediate post-service time, 1-99232 post-operative observation visit, and 335 minutes of total time. The specialty noted that the hernia repair associated with this service involves a large and recurrent hernia which presents several challenges, including navigating previous repairs (including scar tissue and previously placed mesh) and addressing the piece of bowel that is incarcerated or strangulated.

The RUC noted that the typical patient will be admitted as inpatient and there will typically be a visit later the same date of the procedure at the level of 99233 to monitor for problems such as ileus, intestinal ischemia, urinary retention and pain control; review data (eg, diagnostic and imaging studies) not available at the unit; communicate with other health care professionals and with patient and/or family; review medical records and data available on the unit; perform a medically appropriate examination; consider relevant data, options, and risks; formulate and/or revise diagnosis and treatment plan(s) (high complexity MDM); discuss diagnosis and treatment options with the patient and/or family; communicate with other health care professionals as necessary; write and/or review orders, complete medical record documentation; address interval data obtained and reported changes in condition; communicate results and additional care plans to other health care professionals and to the patient and/or family. Patients undergoing the repair of this size of hernia will require significant postoperative care on the same day to address pain control, review vital signs and fluid status commonly affected by repair of larger hernias, and eliminate concerns for bleeding and infection more common with larger or more numerous incisions. The insertion of mesh or other prosthesis is bundled into this service; the work associated with the placement of mesh or other prosthesis was previously reported separately with deleted add-on CPT code 49568 *Implantation of mesh or other prosthesis for open incisional or ventral hernia repair or mesh for closure of debridement for necrotizing soft tissue infection (List separately in addition to code for the incisional or ventral hernia repair)* (work RVU = 4.88).

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

To support a work RVU of 24.00, the RUC compared CPT code 49618 to top key reference service CPT code 61624 *Transcatheter permanent occlusion or embolization (eg, for tumor destruction, to achieve hemostasis, to occlude a vascular malformation), percutaneous, any method; central nervous system (intracranial, spinal cord)* (work RVU = 20.12, 232 minutes of intra-service and 362 minutes of total time) and second key reference service CPT code 21813 *Open treatment of rib fracture(s) with internal fixation, includes thoracoscopic visualization when performed, unilateral; 7 or more ribs* (work RVU = 17.61, 210 minutes of intra-service and 310 minutes of total time) and noted that the work associated with 49618 is significantly more complex given the size, recurrence, and incarceration/strangulation and that this service is the most complex in the rank order of this code family. **The RUC recommends a work RVU of 24.00 for CPT code 49618.**

Parastomal Hernia Repair

49621 ***Repair of parastomal hernia, any approach (ie, open, laparoscopic, robotic), initial or recurrent, including placement of mesh or other prosthesis, when performed; reducible***

The RUC reviewed the survey results from 39 surgeons for CPT code 49621 and determined that the specialty recommended survey median work RVU of 15.50 overvalues the work associated with this service. However, the RUC determined that the survey 25th percentile work RVU of 13.50 undervalues the work associated with this service and would create a rank order anomaly within this code family.

The RUC determined that a direct work RVU crosswalk to CPT code 11005 *Debridement of skin, subcutaneous tissue, muscle and fascia for necrotizing soft tissue infection; abdominal wall, with or without fascial closure* (work RVU = 14.24, 120 minutes of intra-service and 265 minutes of total time) appropriately reflects the relative work required to perform this service and places CPT code 49621 in appropriate rank order within this family of anterior abdominal hernia repair codes. The RUC recommends 40 minutes of pre-service evaluation time, 15 minutes of pre-service positioning time, 15 minutes of pre-service scrub/dress/wait time, 120 minutes of intra-service time, 25 minutes of immediate post-service time, 1-99231 post-operative observation visit, and 235 minutes of total time. The specialty societies noted that this service is typically performed laparoscopically. The scrub/dress/wait time was reduced from Pre-time Package 4 so as to not exceed survey median data. The positioning time was increased from the pre-time package to account for laparoscopic/robotic anterior abdominal hernia repair positioning: The patient will initially be positioned supine and upper extremity intravenous and arterial access points are dressed, padded and secured. The arms are padded and tucked at the patient's sides. The patient must be secured to the table, including a soft chest and thigh strap, as it may be necessary to roll the table during the procedure to use gravity to assist with shifting the abdominal contents. There is also consideration of positioning the patient relative to: laparoscopy equipment, including lines and video equipment and anesthesia lines relative to the rest of the equipment.

The RUC noted that the typical patient will be admitted as inpatient and there will typically be a visit later of the same date at the level of 99231 to monitor for problems such as ileus, intestinal ischemia, urinary retention and pain control; review data (eg, diagnostic and imaging studies) not available at the unit; communicate with other health care professionals and with patient and/or family; review medical records and data available on the unit; perform a medically appropriate examination; consider relevant data, options, and risks; formulate and/or revise diagnosis and treatment plan(s) (low complexity MDM); discuss diagnosis and treatment options with the patient and/or family; communicate with other health care professionals as necessary; write and/or review orders, complete medical record documentation; address interval data obtained and reported

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

changes in condition; communicate results and additional care plans to other health care professionals and to the patient and/or family.. The RUC noted that the parastomal abdominal hernia occurs proximal to a pre-existing stoma and colostomy and requires the maintenance of an abdominal defect to maintain the colostomy and that these factors make it a more complex service than a typical reducible abdominal hernia repair.

To support a work RVU of 14.24, the RUC compared CPT code 49621 to CPT code 37231 *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with transluminal stent placement(s) and atherectomy, includes angioplasty within the same vessel, when performed* (work RVU = 14.75, 135 minutes intra-service time and 203 minutes of total time) and determined that the work RVU of 14.75 is appropriately higher than the recommended work RVU of 14.24 for 49621. **The RUC recommends a work RVU of 14.24 for CPT code 49621**.

49622 ***Repair of parastomal hernia, any approach (ie, open, laparoscopic, robotic), initial or recurrent, including placement of mesh or other prosthesis, when performed; incarcerated or strangulated***

The RUC reviewed the survey results from 39 surgeons for CPT code 49622 and determined that the survey median work RVU of 18.00 appropriately accounts for the work required to perform this service. The RUC recommends 40 minutes of pre-service evaluation time, 15 minutes of pre-service positioning time, 15 minutes of pre-service scrub/dress/wait time, 150 minutes of intra-service time, 25 minutes of immediate post-service time, 1-99232 post-operative observation visit, and 285 minutes of total time. The specialty societies noted that this service is typically performed laparoscopically. The scrub/dress/wait time was reduced from Pre-time Package 4 so as to not exceed survey median data. The positioning time was increased from the pre-time package to account for laparoscopic/robotic anterior abdominal hernia repair positioning: The patient will initially be positioned supine and upper extremity intravenous and arterial access points are dressed, padded and secured. The arms are padded and tucked at the patient's sides. The patient must be secured to the table, including a soft chest and thigh strap, as it may be necessary to roll the table during the procedure to use gravity to assist with shifting the abdominal contents. There is also consideration of positioning the patient relative to: laparoscopy equipment, including lines and video equipment and anesthesia lines relative to the rest of the equipment.

The RUC noted that the typical patient will be admitted as inpatient and there will typically be a visit later on the same date at the level of 99232 to monitor for problems such as ileus, intestinal ischemia, urinary retention and pain control; review data (eg, diagnostic and imaging studies) not available at the unit; communicate with other health care professionals and with patient and/or family; review medical records and data available on the unit; perform a medically appropriate examination; consider relevant data, options, and risks; formulate and/or revise diagnosis and treatment plan(s) (moderate complexity MDM); discuss diagnosis and treatment options with the patient and/or family; communicate with other health care professionals as necessary; write and/or review orders, complete medical record documentation; address interval data obtained and reported changes in condition; communicate results and additional care plans to other health care professionals and to the patient and/or family.. The RUC noted that the parastomal abdominal hernia occurs proximal to a pre-existing stoma and colostomy and requires the maintenance of an abdominal defect to maintain the colostomy and that these factors make it a more complex service than a typical reducible abdominal hernia repair. The incarcerated/strangulated piece of bowel necessarily requires more work for 49622 than that associated with repair of a reducible parastomal hernia for 49621.

To support a work RVU of 18.00, the RUC compared CPT code 49622 to top key reference service CPT code 21813 *Open treatment of rib fracture(s) with internal fixation, includes thoracoscopic visualization when performed, unilateral; 7 or more ribs* (work RVU = 17.61, 210 minutes of intra-service and 310 minutes of total time) and noted that of the survey respondents who chose 21813 as the key reference service,

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

100% indicated that the surveyed code was more intense and complex on all measures. Therefore, although the surveyed code requires slightly less intra-service time than CPT code 21813, it is appropriate that it is valued slightly higher since it is more intense and complex. The RUC compared 49622 to the second key reference service CPT code 33891 *Bypass graft, with other than vein, transcervical retropharyngeal carotid-carotid, performed in conjunction with endovascular repair of descending thoracic aorta, by neck incision* (work RVU = 20.00, 173 minutes of intra-service and 323 minutes of total time) and noted that 49622 requires less physician work and time, thus is valued appropriately slightly lower than 33891. The RUC noted that 49622 is valued appropriately higher than 49621 given the piece of incarcerated/strangulated bowel associated with 49622. **The RUC recommends a work RVU of 18.00 for CPT code 49622**.

Removal of Mesh or Other Prosthesis

49623 ***Removal of total or near-total non-infected mesh or other prosthesis at the time of initial or recurrent anterior abdominal hernia repair or parastomal hernia repair, any approach (ie, open, laparoscopic, robotic) (List separately in addition to code for primary procedure)***The RUC discussed the subject of mesh implantation and removal at length. The specialties indicated that when add-on CPT code 49568 was created in 1993, mesh implantation with hernia repairs was not typical. This is supported by the typical patient described in 1993 as having a 10 cm midline incisional hernia – a very large hernia. With research on the causes of hernia recurrence, changes in technology and development of new types of mesh or other prosthesis, implantation of mesh is now typical for all types of hernias and all sizes to reduce the incidence of recurrence. This was supported by the literature submitted with the February 2021 CCA. However, the specialties also informed the RUC that mesh removal is not always required and is not typical. Technology and research have developed types of mesh that are now being implanted which are incorporated into the abdominal wall, reducing the risk of infection, complications, and recurrence. When mesh removal is indicated, it is typically due to hardening and fracturing of aged mesh, or when gross contamination and infection has occurred (eg, enterocutaneous fistula involving the mesh). For example, a recurrent hernia repair may require removal of fractured, brittle (old technology) mesh many years after an open repair following a colectomy. This work is typically significant, in that the mesh is often integrated with the abdominal wall or adhered to intestine, and involves removal of all of the mesh, not just a small portion. An add-on code to report mesh removal prior to hernia repair, when required, allows for accurate reporting of this work only when performed. The RUC was concerned that the code descriptor may be reported no matter how much mesh is removed, including minimal trimming. The specialty societies explained that the purpose of CPT code 49623 is not to report mesh trimming or adjustment but the total or near total removal of mesh. The specialty society noted that this code should be rarely used as the total or near total removal of mesh is extremely invasive and damaging. **The specialty societies recommended - and the RUC agreed - to refer this issue to the CPT Panel to editorially revise the CPT guidelines for the Anterior Abdominal Hernia Repair subsection to specify "total or near total" mesh removal and revise the code descriptor for CPT code 49623 to specify "total or near total non-infected" mesh removal.**

The RUC reviewed the survey results from 150 surgeons for CPT code 49623 and determined that the survey median and 25th percentile work RVU of 5.00 appropriately accounts for the work required to perform this service. The RUC recommends 45 minutes of intra-service and total time.

To support a work RVU of 5.00, the RUC compared CPT code 49623 to the top key reference service 11008 *Removal of prosthetic material or mesh, abdominal wall for infection (eg, for chronic or recurrent mesh infection or necrotizing soft tissue infection)* (work RVU = 5.00, 60 minutes of intra-service and total time), the second key reference service CPT code 35572 *Harvest of femoropopliteal vein, 1 segment, for vascular reconstruction procedure (eg, aortic, vena caval, coronary, peripheral artery)* (work RVU = 6.81, 60 minutes of intra-service and total time) and

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

noted that the survey respondents indicated the intensity and complexity of CPT code 49623 was greater that both CPT code 11008 and CPT code 35572. Both of the reference codes are performed via an open approach with direct visualization, while 49623 will typically be performed via a laparoscopic or robotic approach internally. The RUC also compared CPT code 49623 to MPC code 34812 *Open femoral artery exposure for delivery of endovascular prosthesis, by groin incision, unilateral* (work RVU = 4.13, 40 minutes of intra-service and total time) and noted that a recommended work RVU of 5.00 is appropriately higher than that of 34812 given the higher intra-service time and relative work.

As additional support, the RUC considered CPT code 57267, *Insertion of mesh or other prosthesis for repair of pelvic floor defect, each site (anterior, posterior compartment), vaginal approach (List separately in addition to code for primary procedure)* (work RVU = 4.88, 45 minutes of intra-service and total time) and CPT code 63295, *Osteoplastic reconstruction of dorsal spinal elements, following primary intraspinal procedure (List separately in addition to code for primary procedure)* (work RVU = 5.25, 45 minutes of intra-service time and 55 minutes total time) which bracket the work included in CPT code 49623. **The RUC recommends a work RVU of 5.00 for CPT code 49623.**

Implantation of Absorbable Mesh or Other Prothesis for Delayed Closure

15778 ***Implantation of absorbable mesh or other prosthesis for delayed closure of defect(s) (ie, external genitalia, perineum, abdominal wall) due to soft tissue infection or trauma***
The RUC reviewed the survey results from 36 surgeons for CPT code 15778 and determined that the survey 25th percentile work RVU of 8.00 appropriately accounts for the work required to perform this service. The RUC recommends 40 minutes of pre-service evaluation time, 3 minutes of pre-service positioning time, 15 minutes of pre-service scrub/dress/wait time, 90 minutes of intra-service time, 25 minutes of immediate post-service time, 1-99232 post-operative observation visit, and 213 minutes of total time. The scrub/dress/wait time was reduced from Pre-time Package 4 so as to not exceed survey median data.

The RUC agreed with the specialties that the typical patient requiring this procedure will have a large abdominal wall defect as a result of necrotizing infection and extensive debridement of all involved skin, subcutaneous tissue, fascia and muscle. For some patients, the external genitalia and perineum may also be involved. These patients will all have inpatient status and will require a visit later on the same date at the level of 99232 to monitor the sutured wound edges of skin/mesh for swelling and pulling and to monitor for pain control. Intake/output and vital signs are evaluated, including fluid and electrolyte status and renal function. Orders for prophylaxis for DVT and beta-blockers are reviewed and adjusted as needed. The surgeon will communicate with other health care professionals and with patient and/or family; review medical records and data available on the unit; perform a medically appropriate examination; consider relevant data, options, and risks; formulate and/or revise treatment plan(s) (moderate complexity MDM); and complete medical record documentation.

The RUC reviewed the top survey key reference services and agreed they were poor comparators because the intra-times and total times were much lower. To support a work RVU of 8.00, the RUC compared CPT code 15778 to MPC code 52353 *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy (ureteral catheterization is included)* (work RVU = 7.50, 60 minutes of intra-service and 133 minutes of total time) and agreed that 15778 was appropriately bracketed by these two codes using magnitude estimation. **The RUC recommends a work RVU of 8.00 for CPT code 15778**.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

RUC Referral to CPT
The RUC recommends CPT code 49623 be referred to CPT to editorially revise the guidelines to specify "total or near total non-infected" mesh removal and revise the descriptor for CPT code 49623 to specify "total or near total non-infected" mesh removal. *The CPT Editorial Panel incorporated these changes at their May 2021 meeting.*

Work Neutrality
The RUC's recommendation for this code family will result in an overall work savings that should be redistributed back to the Medicare conversion factor. The specialty society survey was conducted for all the base codes as 000-day global. This contrasts with the former code structure for this family where all the hernia repair codes had a 090-day global period, and as a result, post-operative visits after the date of the procedure will now be separately reported, when performed. When evaluating work neutrality, AMA staff performed several analyses, including an analysis assuming all bundled visits other than discharge services would continue to be separately reported, to determine whether the RUC recommendation was work neutral. Under all scenarios, including assumptions that all E/M visits will be separately reported using the current CMS values, the RUC recommendation for this code family would be work neutral.

Practice Expense
The Practice Expense (PE) Subcommittee agreed with the special society submitted standard 090-day global period clinical staff inputs as the conversion of this code family from 090-day to 000-day global period does not impact the fact that these are major surgical procedures. The PE Subcommittee removed medical supply item SA054 *Post-Operative Incision Care Suture Pack* from the submitted practice expense inputs because SA054 must be allocable to the service period; this would not be possible as this code family consists of 000-day global codes and one ZZZ code. The PE Subcommittee recommended that the specialties address post-operative work and practice expense needs such as suture removal through the CPT process. **The RUC recommends the direct practice expense inputs as modified by the Practice Expense Subcommittee.**

CPT Code	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
Surgery **Integumentary System** **Skin, Subcutaneous, and Accessory Structures** **Debridement**				
11004		*Debridement of skin, subcutaneous tissue, muscle and fascia for necrotizing soft tissue infection; external genitalia and perineum*		
11005		*abdominal wall, with or without fascial closure*		
11006		*external genitalia, perineum and abdominal wall, with or without fascial closure*		
		(If orchiectomy is performed, use 54520)

(If testicular transplantation is performed, use 54680)

+11008 *Removal of prosthetic material or mesh, abdominal wall for infection (eg, for chronic or recurrent mesh infection or necrotizing soft tissue infection) (List separately in addition to code for primary procedure)*

(Use 11008 in conjunction with 10180, 11004-11006)

(Report skin grafts or flaps separately when performed for closure at the same session as

11004-11008)

~~(When insertion of mesh is used for closure, use 49568)~~

(For implantation of absorbable mesh or other prosthesis for delayed closure of external genitalia, perineum and/or abdominal wall defect[s] due to soft tissue infection or trauma, use 15778)

Repair (Closure)
Other Flaps and Grafts

+15777 *Implantation of biologic implant (eg, acellular dermal matrix) for soft tissue reinforcement (ie, breast, trunk) (List separately in addition to code for primary procedure)*

(For implantation of biologic implants for soft tissue reinforcement in tissues other than breast and trunk, use 17999)

(For bilateral breast procedure, report 15777 twice. Do not report modifier 50 in conjunction with 15777)

~~(For implantation of mesh or other prosthesis for open incisional or ventral hernia repair, use 49568 in conjunction with 49560-49566)~~

~~(For insertion of mesh or other prosthesis for closure of a necrotizing soft tissue infection wound, use 49568 in conjunction with 11004-11006)~~

(For topical application of skin substitute graft to a wound surface, see 15271-15278)

~~(For repair of anorectal fistula with plug (eg, porcine small intestine submucosa [SIS]), use 46707)~~

~~(For insertion of mesh or other prosthesis for repair of pelvic floor defect, use 57267)~~

~~(For implantation of non-biologic or synthetic implant for fascial reinforcement of the abdominal wall, use 0437T)~~

(The supply of biologic implant should be reported separately in conjunction with 15777)

●15778	C1	Implantation of absorbable mesh or other prosthesis for delayed closure of defect(s) (ie, external genitalia, perineum, abdominal wall) due to soft tissue infection or trauma	000	8.00

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

		(For repair of anorectal fistula with plug [eg, porcine small intestine submucosa {SIS}], use 46707) (For implantation of mesh or other prosthesis for anterior abdominal hernia repair or parastomal hernia repair, see 49591-49622) (For insertion of mesh or other prosthesis for repair of pelvic floor defect, use 57267) (For implantation of non-biologic or synthetic implant for fascial reinforcement of the abdominal wall, use 0437T)		

Other Procedures

+15847 *Excision, excessive skin and subcutaneous tissue (includes lipectomy), abdomen (eg, abdominoplasty) (includes umbilical transposition and fascial plication) (List separately in addition to code for primary procedure)*

(Use 15847 in conjunction with 15830)

(For ~~abdominal wall~~ inguinal hernia repair, see 49491-4952~~549587~~)

(For anterior abdominal hernia[s] repair, see 49591-49618)

(To report other abdominoplasty, use 17999)

Digestive System
Abdomen, Peritoneum, and Omentum
Repair
Hernioplasty, Herniorrhaphy, Herniotomy

The hernia repair codes in this section are categorized primarily by the type of hernia (inguinal, femoral, lumbar, omphalocele, anterior abdominal, parastomal~~incisional, etc~~).

Some types of hernias are further categorized as "initial" or "recurrent" based on whether or not the hernia has required previous repair(s).

Additional variables accounted for by some of the codes include patient age and clinical presentation (reducible vs. incarcerated or strangulated).

~~With the exception of the incisional hernia repairs (see 49560-49566) the use of mesh or other prostheses is not separately reported.~~

The excision/repair of strangulated organs or structures such as testicle(s), intestine, ovaries are reported by using the appropriate code for the excision/repair (eg, 44120, 54520, and 58940) in addition to the appropriate code for the repair of the strangulated hernia.

(For reduction and repair of intra-abdominal hernia, use 44050)

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

	(For debridement of abdominal wall, see 11042, 11043)
	~~(Codes 49491-49651 are unilateral procedures. For bilateral procedure, report 49491-49566, 49570-49651 with modifier 50. Report add-on code 49568 twice, when performed bilaterally. Do not report modifier 50 in conjunction with 49568)~~
	(49491-49557, 49600, 49605, 49606, 49610, 49611, 49650, 49651 are unilateral procedures. For bilateral procedure, use modifier 50)
	(Do not report modifier 50 in conjunction with 49591-49622)
49491	*Repair, initial inguinal hernia, preterm infant (younger than 37 weeks gestation at birth), performed from birth up to 50 weeks postconception age, with or without hydrocelectomy; reducible*
49492	*incarcerated or strangulated*
	(Do not report modifier 63 in conjunction with 49491, 49492)
	(Postconception age equals gestational age at birth plus age of infant in weeks at the time of the hernia repair. Initial inguinal hernia repairs that are performed on preterm infants who are older than 50 weeks postconception age and younger than age 6 months at the time of surgery, should be reported using codes 49495, 49496)
49495	*Repair, initial inguinal hernia, full term infant younger than age 6 months, or preterm infant older than 50 weeks postconception age and younger than age 6 months at the time of surgery, with or without hydrocelectomy; reducible*
49496	*incarcerated or strangulated*
	(Do not report modifier 63 in conjunction with 49495, 49496)
	(Postconception age equals gestational age at birth plus age in weeks at the time of the hernia repair. Initial inguinal hernia repairs that are performed on preterm infants who are younger than or up to 50 weeks postconception age but younger than 6 months of age since birth, should be reported using codes 49491, 49492. Inguinal hernia repairs on infants age 6 months to younger than 5 years should be reported using codes 49500-49501)
49500	*Repair initial inguinal hernia, age 6 months to younger than 5 years, with or without hydrocelectomy; reducible*
49501	*incarcerated or strangulated*
49505	*Repair initial inguinal hernia, age 5 years or older; reducible*
49507	*incarcerated or strangulated*
	(For inguinal hernia repair, with simple orchiectomy, see 49505 or 49507 and 54520)
	(For inguinal hernia repair, with excision of hydrocele or spermatocele, see 49505 or 49507 and 54840 or 55040)
49520	*Repair recurrent inguinal hernia, any age; reducible*

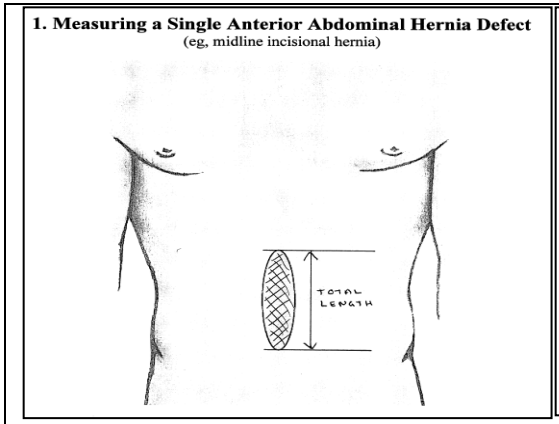
~~(D)49590~~	-	~~Repair spigelian hernia~~ (49590 has been deleted. For spigelian hernia repair, see 49591-49618)	~~090~~	~~N/A~~ ~~(2021 work RVU = 8.90)~~

Codes 49591-49618 describe repair of an anterior abdominal hernia(s) (ie, epigastric, incisional, ventral, umbilical, spigelian) by any approach (ie, open, laparoscopic, robotic). Codes 49591-49618 are reported only once, based on the total defect size for one or more anterior abdominal hernia(s), measured as the maximal craniocaudal or transverse distance between the outer margins of all defects repaired. For example, "Swiss cheese" defects (ie, multiple separate defects) would be measured from the superior most aspect of the upper defect to the inferior most aspect of the lowest defect. In addition, the hernia defect size should be measured prior to opening the hernia defect(s) (ie, during repair the fascia will typically retract creating a falsely elevated measurement).

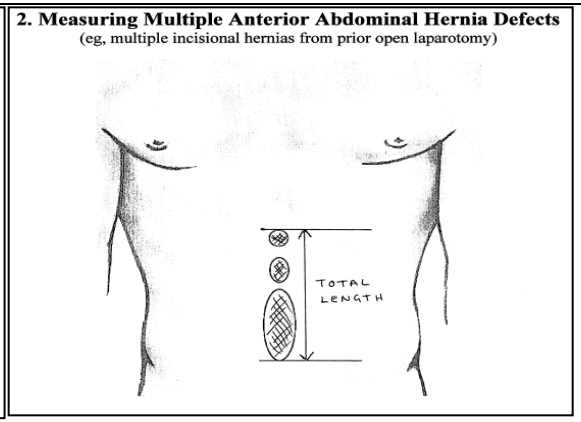
When both reducible and incarcerated/strangulated anterior abdominal hernias are repaired at the same operative session, all hernias are reported as incarcerated/strangulated. For example, one 2 cm reducible initial incisional hernia and one 4 cm incarcerated initial incisional hernia~~s~~ separated by 2 cm would be reported as an initial incarcerated hernia repair with a maximum craniocaudad distance of 8 cm (49594).

Inguinal, femoral, lumbar, omphalocele and/or parastomal hernia repair may be separately reported when performed at the same operative session as anterior abdominal hernia repair by appending modifier 59 as appropriate.

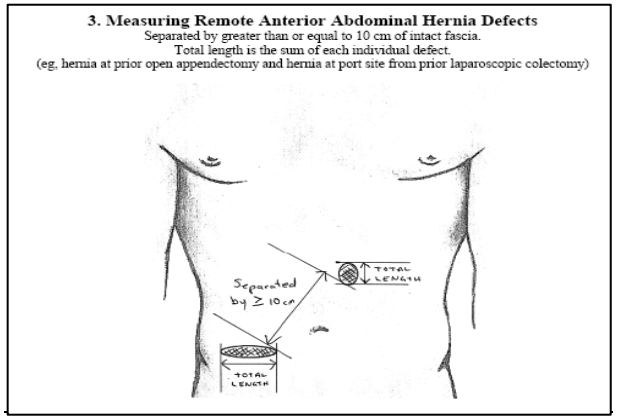
Codes 49621, 49622 describe repair of a parastomal hernia (initial or recurrent) by any approach (ie, open, laparoscopic, robotic). Code 49621 is reported for repair of a reducible parastomal hernia and code 49622 is reported for an incarcerated or strangulated parastomal hernia.



Implantation of mesh or other prosthesis, when performed, is included in 49591-49622 and may not be separately reported. For total or near-total removal of non-infected mesh when performed, use 49623 in conjunction with 49591-49622. For removal of infected mesh, see 11004, 11005, 11006, 11008.



Measuring Total Length of Anterior Abdominal Hernia Defect(s)



Hernia measurements are performed either in the transverse or craniocaudal dimension. The total length of the defect(s) corresponds to the maximum width or height of an oval drawn to encircle the outer perimeter of all repaired defects. If the defects are not contiguous and are separated by greater than or equal to 10 cm of intact fascia, total defect size is the sum of each defect measured individually.

Codes 49591-49618 are reported only once, based on the total defect size for one or more anterior abdominal hernia(s), measured as the maximal craniocaudal or transverse distance between the outer margins of all defects repaired.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:49591 Tracking Number C2 Original Specialty Recommended RVU: **6.27**
Presented Recommended RVU: **6.27**
Global Period: 000 Current Work RVU: RUC Recommended RVU: **6.27**

CPT Descriptor: Repair of anterior abdominal hernia(s) (ie, epigastric, incisional, ventral, umbilical, spigelian), any approach (ie, open, laparoscopic, robotic), initial including placement of mesh or other prosthesis, when performed total length of defect(s); less than 3 cm, reducible

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 55-year-old male presents with a painful mass through the umbilicus that disappears in supine position. He undergoes hernia repair of a defect that is less than 3 cm with placement of mesh.

Percentage of Survey Respondents who found Vignette to be Typical: 90%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 72% , In the ASC 28%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 82% , Overnight stay-less than 24 hours 18% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 80%

Description of Pre-Service Work: Results of preadmission testing (imaging, electrocardiogram and labs) are reviewed. Appropriate selection, timing, and administration of DVT prophylaxis are ensured. Appropriate selection, timing, and administration of antibiotics are ensured. The need for beta-blockers is assessed, and they are ordered as required. The patient is reexamined to confirm that physical findings have not changed, the patient's medication regimen has remained the same, the patient has no new allergies, and the patient has not undergone any recent procedures. The history and physical examination are then updated in the electronic health record. The planned procedure and postoperative management are reviewed with the patient and family. Informed consent is reviewed and obtained from the patient, including witness confirmation. The palpable edge of the hernia defect(s) and sites of the proposed skin incisions are marked with cooperation of patient. The length and type of anesthesia, including adjuncts to postoperative analgesia management, are reviewed with the anesthesiologist. Verify that all required instruments and supplies are available, including mesh. Assistance is provided in transfer of the patient from gurney to operating table. Assist anesthesia team with line placement and induction of anesthesia and intubation. The areas of skin to be prepared and draped are indicated by the surgeon to ensure that all of the potential operative field is included in the preparation. The surgeon scrubs and gowns. A surgical time-out is performed with operating surgical team.

Description of Intra-Service Work: An infraumbilical incision is made. Dissection of the subcutaneous tissues surrounding the hernia sac is performed. The overlying umbilical dermis is detached from the hernia sac. The fascia is circumferentially dissected surrounding the periphery of the hernia sac. The hernia sac is opened and adhesions to the hernia sac are divided. The hernia sac is excised. The hernia defect is measured at less than 3 cm in diameter. A mesh is selected to provide adequate overlap of the hernia defect. The mesh is inserted preperitoneal or intraperitoneal and sutured to the abdominal wall. The hernia defect is closed with interrupted sutures over the top the mesh. Redundant umbilical skin is excised. The umbilical dermis is sutured to the abdominal fascia. Layered closure is performed.

Description of Post-Service Work: Apply sterile dressings. Monitor patient during reversal of anesthesia. Assist in transfer of patient from operating table to gurney. Monitor transport of patient from operating room to recovery room. Discuss postoperative recovery care with anesthesia and nursing staff. Discontinue prophylactic antibiotic therapy, as appropriate. Discuss procedure and outcome with family in waiting area. Write brief operative note or complete final operative note and place in chart. Write postoperative note in the recovery room. When safe to discharge patient to home, conduct final exam.

Auscultate heart, lungs, and abdomen for bowel sounds. Assess for problems such as ileus, intestinal ischemia, and urinary retention. Assess pain status, write orders for follow-up visits, post-discharge laboratory tests, imaging, home care, and physical therapy. Order medications needed post-discharge. Discuss home restrictions and activity levels (ie, diet, bathing) with patient/family. Complete all appropriate medical records, including day of discharge progress notes, discharge summary, discharge instructions, and insurance forms.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

RAW Screen

Code 49565, *Repair recurrent incisional or ventral hernia; reducible*, was identified by the RUC/RAW with a site of service anomaly: less than 50% inpatient status; includes inpatient visit codes; greater than 5,000 utilization. Prior to submitting an Action Plan to the RAW, the societies reviewed the site of service data and found: almost even split of 48% between inpatient and outpatient – with a few percent in the ASC. At the January 2020 RUC meeting, the societies requested referral of code 49565 to CPT to update the descriptor to current standard of practice and typical patient presentation.

CPT Coding Changes

At the February 2021 CPT meeting the following changes were approved:

- Delete all the current open and laparoscopic codes for repair of anterior abdominal hernias.
- Delete add-on code 49568 for mesh for open ventral/incisional hernias and large defects as a result of necrotizing soft tissue infection.
- Add 12 new codes for anterior abdominal hernia repair by any approach (ie, open laparoscopic, robotic); by initial or recurrent; by total defect size; and by reducible or incarcerated/strangulated
- Add 2 codes for parastomal hernia repair - by reducible or incarcerated/strangulated
- Add 1 add-on code for removal of mesh/prosthesis – only with the new hernia repair codes
- Add 1 new code for mesh/prosthesis for delayed closure of external genitalia, perineum and/or abdominal wall defect(s) due to soft tissue infection or trauma.

Coding Structure

Hernia repair for epigastric, incisional, ventral, umbilical, spigelian were merged as they all appear on the anterior abdomen. The location--upper, lower, midline—does not impact the work. But instead, the size and number of defects is the driving factor for work. For example, with respect to the code that was tagged by the RAW, a recurrent, incisional, reducible hernia can be anywhere from a small hernia at a port site from a prior laparoscopic procedure to an extremely large hernia with multiple defects clustered in a midline incision.

Initial versus recurrent differentiation was maintained. Recurrent hernias are re-reoperations. An initial hernia can be the result of a prior procedure (this is not a recurrent hernia) or weak muscles and fascia. A recurrent hernia is typically at least the third time the same site is being operated on.
For example,

- operation 1 might be an open colectomy
- operation 2 would be an initial midline hernia repair
- operation 3 would be a recurrent midline hernia involving the initial midline repair and may include other multiple hernias occurring in the same old incision, all needing to be repaired.

There are many examples in CPT that differentiate between a primary and secondary procedure: disarticulation of shoulder (23920-23921); amputation of arm through humerus (24900-24930) and other similar amputation families; tendon repair (eg, 25260-25274); CABG reoperation (33530); and revision total joint (eg, 23473, 23474, 24370, 24371, 27134-27138).

The hernia size ranges were based on a review of literature and expert panel. For example, an article published in the Journal of the American College of Surgeons reviewed technique and outcomes of abdominal incisional hernia repair and showed that the range of defect size was from less than 1 cm to more than 25 cm with a mean of 6 cm and a median of less than 3 cm. Other similar articles were submitted with the code change application, supporting different work for different defect size. David A. Iannitti, et.al, *Technique and Outcomes of Abdominal Incisional Hernia Repair Using a Synthetic Composite Mesh: A Report of 455 Cases,* Journal of the American College of Surgeons, Volume 206, Issue 1, 2008, Pages 83-88, ISSN 1072-7515, https://doi.org/10.1016/j.jamcollsurg.2007.07.030.

Differentiating the work of a procedure in relationship to size or extent is not new for CPT. For example, 36 skin repair codes by length of repair; 44 lesion excision codes by excised diameter; 46 soft tissue tumor excision codes by size of tumor; 23 hysterectomy codes by size of uterus (58260-58573); 3 myomectomy codes are differentiated by total weight of the myomas (58140-58146); and 10 nerve graft codes are based on length of graft. (64885-64898)

The CPT guidelines and illustrations that describe how to measure the total defect size are well understood by surgeons. This is not a new concept – surgeons are very familiar with measuring a hernia defect, and in fact the size of the hernia defect was included in some of the patient vignettes in 1993. Furthermore, measurement of hernia size is a necessary step for selecting and preparing the appropriately sized mesh for implantation.

Hernia repair coding has been complicated by changes in (1) technology and technique and (2) the recent implementation of ICD-10-PCS codes. For these reasons, the stakeholder societies believed this set of codes should describe "any approach." The societies and the AMA Coding Network have received numerous coding questions about correct reporting for "hybrid" abdominal hernia repair procedures where parts of the procedure are performed via an open approach and parts of the procedure are performed via laparoscopy or with the use of a robot. These are not laparoscopic procedures converted to open procedures, but instead procedures that are more often begun open and then finished as laparoscopic/robotic under pneumoperitoneum.

Another issue that has recently caused confusion about coding has appeared on national coder websites and coder discussion boards referring to International Classification of Diseases Tenth Revision Procedure Coding System (ICD-10-PCS) codes which classifies procedures performed in the facility (ie, not CPT physician procedures). This, however, is important because facilities want the procedure codes reported to correspond with the descriptors of ICD-10-PCS codes that the facility is reporting. Unfortunately, the new ICD-10-PCS codes define various surgical approaches that do not correspond to CPT coding (open, closed, percutaneous, and laparoscopic). For example, the ICD-10-PCS "open endoscopic" approach is defined as "cutting through the skin or mucous membrane and any other body layers necessary to expose a body part, and introduction of instrumentation to reach and visualize the site of the procedure." A second example is the "open with percutaneous endoscopic assistance" approach defined as "cutting through the skin or mucous membrane and any other body layers necessary to expose the site of the procedure, and entry, by puncture or minor incision, of instrumentation through the skin or mucous membrane and any other body layers necessary to aid in the performance of the procedure." These new ICD-10-PCS codes have resulted in coders stating that a procedure should be reported as open because the ICD-10-PCS code indicates open and to report any procedure that includes extension of a port incision (eg, for delivery of a specimen) to be reported as an open procedure --instead of being correctly reported as a laparoscopic procedure.

Mesh

- **Implantation of mesh is now typical and therefore was bundled into the new codes.** When code 49568 was created in 1993, mesh implantation with hernia repairs was not typical. This is supported by the typical patient described in 1993 as having a 10 cm midline incisional hernia – a very large hernia. With research on the causes of hernia recurrence, changes in technology and development of new types of mesh or other prosthesis, implantation of mesh is now typical for all types of hernias and all sizes to reduce the incidence of recurrence. This was supported by the literature submitted with the CCA.

- **Mesh removal is not always required and is not typical.** Technology and research have developed types of mesh that are now being implanted which are incorporated into the abdominal wall, reducing the risk of infection, complications, and recurrence. When mesh removal is indicated, it is typically due to hardening and fracturing of aged mesh, or when gross contamination and infection has occurred (eg, enterocutaneous fistula involving the mesh). For example, a recurrent hernia repair may require removal of fractured, brittle (old technology) mesh many years after an open repair following a colectomy. This work is typically significant, in that the mesh is often integrated with the abdominal wall or adhered to intestine, and involves removal of all of the mesh, not just a small portion. An add-on code to report mesh removal prior to hernia repair, when required, allows for accurate reporting of this work only when performed, which our expert panel believes is not typical of most hernia repairs.

- **Deletion of code 49658 resulted in rare "left over" work for implantation of mesh related to closure for a large open wound after debridement for necrotizing fasciitis.** Add-on code 46958 was reported for mesh placement for both open hernia repair and in relation to closure of wounds from necrotizing soft tissue infection. This code will be deleted and the work of mesh placement will be included in the work for all of the anterior abdominal hernia repair codes. The remaining use of code 46958 was for mesh placement for delayed closure of external genitalia, perineum and/or abdominal wall defect(s) due to soft tissue infection or trauma. As described in the vignette for 15778, necrotizing soft tissue infections typically result in a large open wound that cannot be closed primarily. When the infection has resolved, absorbable mesh or other prosthesis is placed to allow healing by secondary intent until such time that a skin graft or skin closure can be accomplished. The literature submitted with the CCA supports this work.

Compelling Evidence - Flawed methodology of previous reviews, New technology

Flawed Methodology: Codes 49560, 49561, 49565, 49566, 49570, 49572, 49580, 49582, 49585, and 49590 were last reviewed in 2000 during the 2nd 5-year-review. During this review, the American College of Surgeons argued that there was compression of work values for big procedures and there were rank order issues within families of codes. We developed a methodology using NSQIP data that was approved by the Research Subcommittee. However, to validate the methodology, the 5YR Workgroup instructed the ACS to group the codes into families and survey one or two CPT codes as full surveys per family to act as anchors for each family and the rest of the codes to be surveyed as mini-surveys for only time and visits. After conducting all of the surveys, we believe we were able to validate the methodology that we proposed, however, the 5YR Workgroup did not agree. Instead, they decided that the value that they assigned to the anchor code (the full survey) would be extrapolated to all of the other codes grouped into the same survey. The hernia codes listed above were grouped with 49505 which was increased by 17% based on the survey data and compelling evidence. The 17% increase was applied to the other codes in the group without consideration of rank order, mini survey results or society recommendations. This resulted in continuation of compression and rank order issues. For example, although code 49572 was increased by 17%, the IWPUT for the code is negative. Other codes have near zero IWPUT. **We believe this was a flawed methodology of review of the codes and meets compelling evidence.**

Flawed Methodology: Codes 49587, 49652, 49653, 49654, and 49655 were last reviewed in 2011 based on a site of service anomaly screen. At that time, the RUC approved including a same day observation visit and full observation discharge on the subsequent day. The RUC noted that the typical patient requires close monitoring for problems such as ileus, intestinal ischemia and urinary retention. Additionally, there will be significant pain post-operatively requiring management before discharge. The specialty noted, and the RUC agreed, that the shift in patient facility status (in patient moving to outpatient—as determined by CMS) has little to do with healthier patients that require less physician work and everything to do with the recent OPPS changes related to facility reimbursement. This was substantiated by the survey data which showed that the typical patients stayed at least overnight and received a postoperative same-day E/M service. Given this data, the RUC enacted its (then current) policy to allocate the appropriate proxy for the postoperative visits which was categorized as either subsequent observation and/or observation discharge—both of which are outpatient codes. Importantly, the specialties argued and the RUC agreed that the work of providers who care for medical patients should not be discounted (eg, full observation E/M and full observation discharge E/M allowed for patient staying overnight for observation.)

CMS ignored the valid outpatient E/M visit code inputs that the RUC recommended and instead stated in the Rule that they have a policy of not allowing "inpatient" visits included in the details for outpatient services. These codes went through a Refinement Panel process [ie, a CMS convened group of Medical Officers and select physicians acting as a separate formal appeals process] that resulted in agreement with the RUC recommendations. Importantly, the Agency still maintained that inpatient visits would not be allowed (even though outpatient/observation visits were submitted by the RUC) and then used a reverse building block methodology to subtract work RVUs from the values. These values had been developed by magnitude estimation and approved by the RUC. The Agency deleted the observation visit code inputs and decreased discharge management by 50 percent even though it was performed on a subsequent date. **We believe this action by CMS resulted in a flawed methodology of review of these codes and meets compelling evidence.**

The rejection of equal value for equal work and rejection of the Refinement Panel results prompted the Executive Director of the American College of Surgeons to send a letter (see last page of SoR) to Kathleen Sebelius, then Secretary of the Department of Health and Human Services on November 29, 2011. This letter addressed the decision-making process for valuing procedure codes that have Medicare outpatient status, the use of refinement panels, and the arbitrary discount in physician work for the same work performed by any provider of a non-global service. Specifically, the letter included the following statement:

> *"CMS has now implemented a policy by which it is creating differential payments for the same work performed by different physicians as a backdoor mechanism for reducing the work RVUs for surgical procedures. They have valued the worth of a surgeon for post-operative evaluation and management work at about 30 percent of a non-surgeon. Non-surgeons are allowed to provide the same work to the same patient at 100 percent reimbursement. …we believe that this policy leads to a loss of validity and integrity of the current system."*

We continue to believe there is no valid justification for a 50% discount to discharge management services provided by a surgeon that is performed the day after a procedure when a non-surgical provider observing a medical patient who is kept overnight for any reason is allowed to bill a discharge management service at 100 percent for work on the next day.

We also believe there is no valid justification for discounting a postoperative visit later the same day of surgery to equal only the intra-service time of the visit multiplied by an intensity of 0.0224. No surgeon would round on a postoperative patient the same day and not review interval chart notes prior to the face-to-face with the patient and not followup with charting the visit and confirming or modifying the current orders.

CMS implemented a 23-hour policy for discounting surgical postoperative work based on the argument that the Agency could not include impatient work in their time/work file. However, the fact is that the Agency has also erroneously rejected RUC recommendations for outpatient / observation codes, stating "these inpatient codes" could not be included for procedure that are typically outpatient.

Change in Technology: Since the last review of the hernia repair codes (either in 2000 or in 2011), there has been introduction and application of new technology (ie, robotic assist) which adds work complexity and time with the goal of better patient outcomes. The diffusion of this new technology throughout this family of codes further meets compelling evidence.

Recommendation – 49591

We recommend a work RVU of 6.27, which is the survey 25th percentile. The typical patient will be discharged on the same day of the procedure.

Pre-service time

Package time has been reduced so as to not exceed survey median data.

Post-service time

Package time has been reduced so as to not exceed survey median data.

Key Reference Code Intensity/Complexity Comparison

Ref 1: The respondents indicated the intensity/complexity of survey code 49591 is somewhat less or similar than reference code 31600. Ref2: The respondents indicated the intensity/complexity of survey code 49591 is similar to somewhat more than reference code 43210.

MPC Code Comparison

49618	**Recurrent, I/S, > 10cm**	75th	**25.00**	**335**

Comparison of using the recommended RVW versus using the 25th percentile.

The first chart below shows reasonable correlation between the recommended RVW and WPUT—both trend lines have a similar slope. The second chart below shows no relationship of WPUT to the 25th percentile RVW—where WPUT decreases as work increases.

What if surgeon evaluation and management work were set equal to discrete E/M services?
As has been discussed by the RUC in the past, work intensities used for computation of IWPUT for time spent by physicians in the pre-service and immediate post-service period for surgical procedures have remained fixed since the early 1990s, while intensity of time for E/M values has received several increased values over several decades.

Recent increases for outpatient office E/M values were not allowed to be added to global codes by CMS. Because IWPUT is calculated by subtracting the pre- and post-work values from the RVW of a given CPT code, this has resulted in less value subtracted than would have occurred if the more appropriate pre- and post-work values were used for the IWPUT formula. This artificially increases the IWPUT and WPUT resulting in a decrease in relativity. This is especially true for codes that have a significant amount of pre-service and post-service work.

It has become difficult to compare IWPUT (and WPUT) for codes with different global periods because of the level of discounting of pre-service and post-service work. For example, for the top 34 high volume 10 and 90 day global codes, AMA staff recently calculated the difference in IWPUT if the office visit increases were used in the IWPUT equation. The AMA table, which is included in the Research Subcommittee agenda for this meeting, showed that the IWPUT would have decreased from -6% to -548% depending on the number of office visits included in the work/time file. To emphasize the importance of this information, the code which would have had the largest decrease (17000) has 3 minutes of intra-time and only one postop office visit (99212). In this table, it was also clear that relativity within a family of codes is lost, because each code within a family may have varying levels of post-service work. To summarize, IWPUT has become much less accurate when used as a comparator of intra-service work within and between families because of CMS actions (ie, not updating global RVW) and policy (ie, discounting postoperative work).

Using the discussion above, we have created the table below that presents the IWPUT and WPUT for the hernia set of codes using (1) the 2021 formulas, and (2) "full value" formulas. The note below the table describes each formula, but basically the full value formula sets pre- and post-service work equal to the same E/M work for non-surgical services. For comparison to facility non-surgical services, we have included codes 99283-99285 using the 2021 published RVW and time data. This table shows that most of the recommendations for 49591-49622 result in a WPUT that is less than an

ED visit requiring moderate MDM (99284). This table also shows that those codes with similar WPUT to high MDM are appropriately the bigger and more complex procedures. Last, this table provides evidence that discounting pre- and post-work distorts and artificially impacts fair IWPUT and WPUT relativity comparison. However, if undiscounted work is applied, the recommendations for this set of codes are appropriately ranked.

CPT	DESC	REC RVW	2021 formula*		2021 full value**		Total Time	PRE	Intra	Imm Post	-33 -26	-32 -25	-31 -24	Facility Status

* 2021 Formula: IWPUT calculation based on evaluation, positioning, immediate post intensity of 0.0224; scrub/dress/wait intensity of 0.0081; and discounted same-day outpatient postop visit (not shown in table) equal to intra-service time at 0.0224. WPUT calculation equal to total time (including discounted postop visit time not shown on table) divided by work.

**2021 Full Value Formula: IWPUT calculation based on pre-service and immediate post-service time intensity of 0.043 (equal to WPUT for 99213) and same-day post EM at full value instead of discounted time for outpatient procedure as shown on table (highlighted in red).

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed)
49560 Repair initial incisional or ventral hernia; reducible 090
49570 Repair epigastric hernia (eg, preperitoneal fat); reducible (separate procedure) 090
49585 Repair umbilical hernia, age 5 years or older; reducible 090
49590 Repair spigelian hernia 090
49652 Laparoscopy, surgical, repair, ventral, umbilical, spigelian or epigastric hernia (includes mesh insertion, when performed); reducible 090
49654 Laparoscopy, surgical, repair, incisional hernia (includes mesh insertion, when performed); reducible 090
49568 Implantation of mesh or other prosthesis for open incisional or ventral hernia repair or mesh for closure of debridement for necrotizing soft tissue infection (List separately in addition to code for the incisional or ventral hernia repair) ZZZ

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty general surgery How often? Commonly

Specialty colorectal surgery How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National frequency not available

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?
43,628 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Specialty estimate - See supplemental file with details

Specialty General Surgery Frequency 39265 Percentage 89 %

Specialty Colorectal Surgery Frequency 2181 Percentage 4.99 %

Specialty Other Surgery Frequency 2181 Percentage 4 %

Do many physicians perform this service across the United States? Yes

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Letter Referenced in Compelling Evidence Rationale

November 29, 2011

The Honorable Kathleen Sebelius
Secretary
Department of Health and Human Services
Hubert H. Humphrey Building
200 Independence Avenue SW
Washington, DC 20201

Re: CY 2012 Medicare Physician Fee Schedule Final Rule and CMS
Refinement Panels

Dear Secretary Sebelius:

On November 28, 2011, the Federal Register published the Centers for Medicare and Medicaid Services' (CMS) Calendar Year (CY) 2012 Medicare Physician Fee Schedule Final Rule. On behalf of the American College of Surgeons (ACS), I am writing to express concern regarding the decision making process and lack of transparency on the part of CMS related to the work relative value units (wRVUs) for 2012 reviewed under CMS' refinement panel process. The ACS, with over 78,000 members, is a scientific and educational organization of surgeons that was founded in 1913 to raise the standards of surgical practice and to improve the care of the surgical patient.

The ACS has participated in the efforts of the American Medical Association's Relative Value Scale Update Committee (AMA RUC) for years given the value we place on the AMA RUC process and our assumption that CMS will evaluate the RUC recommendations with fairness, transparency, and accuracy according to a process that has been set out via the Federal rulemaking process. As part of the work that led to the CY 2012 Medicare Physician Fee Schedule Final Rule, the ACS devoted significant resources to conducting AMA RUC surveys for over 100 new or existing codes at the request of CMS. The AMA RUC evaluated wRVU recommendations made by the ACS, based upon those surveys, and came to agreement on final recommended values to be submitted to CMS.

Fifty-seven of the aforementioned codes that the ACS surveyed were sent to the refinement panel. CMS accepted ***only 12 percent*** of those refinement panel recommendations.

For most of the 88 percent of refinement panel recommendations that CMS rejected, CMS lowered the wRVU by reducing the value of the post-operative evaluation and management work performed by surgeons in the hospital by 69 percent. However, if that same work is performed by any other physician other than the surgeon, that same service is paid at 100 percent. We believe that the refinement panel physicians completely rejected this concept as they agreed to a work RVU that did not discount post-surgical work in this fashion. We note that the multispecialty panel included physicians from primary care, contractor medical directors (CMDs), physicians in related specialties, and general surgeons. At no time did the Agency's Medical Officer in charge of the panel process disagree with the presenters or offer a contrary opinion to the discussion.

Our concerns were piqued when CMS issued the CY 2011 Medicare Physician Fee Schedule Final Rule in which CMS stated that it could change wRVU recommendations of the refinement panel convened by CMS if "policy concerns

warrant their modification," without providing additional clarification on what would trigger this ability of CMS to subvert the more transparent process of the refinement panel. However, we continued to participate in the process under the belief that CMS would operate fairly and transparently and that if there were indeed "policy concerns" that CMS had regarding the values of the codes under consideration that those concerns would be stated clearly so all parties could address them during the refinement panel reviews.

CMS has now implemented a policy by which it is creating differential payments for the same work performed by different physicians as a backdoor mechanism for reducing the work RVUs for surgical procedures. They have valued the worth of a surgeon for post-operative evaluation and management work at about 30 percent of a non-surgeon.. Non-surgeons are allowed to provide the same work to the same patient at 100 percent reimbursement. First, we believe that this policy leads to a loss of validity and integrity of the current system. In addition, this policy is prohibited by the Omnibus Budget Reconciliation Act of 1989, which states, "[t]he Secretary may not vary the conversion factor or the number of relative value units for a physicians' service based on whether the physician furnishing the service is a specialist or based on the type of specialty of the physician." (42 U.S.C. §1395w-4(c)(6)).

The ACS has been a vocal proponent of needed reforms in the delivery and payment of health care. We believe that the future of these reforms will be based on driving greater awareness of proven continuous quality improvement programs to achieve ongoing, tangible results for quality improvements. However, in order for these reforms to be effective, they must be built on a system that is consistent with previous Agency decisions, fair, and transparent, and it is our concern that many of the policy decisions made by CMS in the latest Medicare Physician Fee Schedule Final Rule move us away from those goals. The resource based relative value system (RBRVS) requires a resource basis for decisions on the valuation of physician services. We believe that the resource basis for the decision to reduce these values is not evident. We ask that under your authority as Secretary you will seek to have CMS define a more transparent process in the future for decisions that are not aligned with the RUC and refinement panel recommendations in order to help maintain the transparency and fairness of the current system and to restore the values of these services to the level that is supported by the RBRVS process.

Sincerely,
David B. Hoyt, MD, FACS
Executive Director

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:49592 Tracking Number C3 Original Specialty Recommended RVU: **9.00**
Presented Recommended RVU: **9.00**
Global Period: 000 Current Work RVU: RUC Recommended RVU: **9.00**

CPT Descriptor: Repair of anterior abdominal hernia(s) (ie, epigastric, incisional, ventral, umbilical, spigelian), any approach (ie, open, laparoscopic, robotic), initial including placement of mesh or other prosthesis, when performed total length of defect(s); less than 3 cm, incarcerated or strangulated

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 55-year-old male presents with a history of painful swelling in the umbilical region. Physical exam reveals an umbilical hernia that is tender and nonreducible by manual manipulation. He undergoes hernia repair of a defect that is less than 3 cm with placement of mesh.

Percentage of Survey Respondents who found Vignette to be Typical: 90%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 92% , In the ASC 8%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 39% , Overnight stay-less than 24 hours 39% , Overnight stay-more than 24 hours 22%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 91%

Description of Pre-Service Work: Results of preadmission testing (imaging, electrocardiogram and labs) are reviewed. Appropriate selection, timing, and administration of DVT prophylaxis are ensured. Appropriate selection, timing, and administration of antibiotics are ensured. The need for beta-blockers is assessed, and they are ordered as required. The patient is reexamined to confirm that physical findings have not changed, the patient's medication regimen has remained the same, the patient has no new allergies, and the patient has not undergone any recent procedures. The history and physical examination are then updated in the electronic health record. The planned procedure and postoperative management are reviewed with the patient and family. Informed consent is reviewed and obtained from the patient, including witness confirmation. The palpable mass of the hernia contents incarcerated in the subcutaneous tissue is easily identified , and sites of the proposed skin incisions are marked with cooperation of patient. The length and type of anesthesia, including adjuncts to postoperative analgesia management, are reviewed with the anesthesiologist. Verify that all required instruments and supplies are available, including mesh. Assistance is provided in transfer of the patient from gurney to operating table. Assist anesthesia team with line placement and induction of anesthesia and intubation. The areas of skin to be prepared and draped are indicated by the surgeon to ensure that all of the potential operative field is included in the preparation. The surgeon scrubs and gowns. A surgical time-out is performed with operating surgical team.

Description of Intra-Service Work: An infraumbilical skin incision is made. Dissection of the subcutaneous tissues surrounding the hernia sac is performed. The overlying umbilical dermis is detached from the hernia sac. This is exacerbated by the location of the incarcerated hernia contents occupying the central space of the operative field making the dissection more challenging. Separation is performed without damaging the intra-abdominal contents incarcerated in the hernia sac. The hernia sac is opened and the contents are inspected. Adhesiolysis is performed to free omentum and intestines incarcerated within the hernia sac. The reduced hernia contents are inspected for viability. The hernia sac is excised. The hernia defect is measured and found to span less than 3 cm. A mesh with adequate overlap of the abdominal wall is sutured to the abdominal wall circumferentially. The hernia defect is closed over the mesh. Redundant skin is excised as appropriate. The umbilical dermis is sutured to the abdominal fascia.

Description of Post-Service Work:

Immediate postoperative care [operative day through discharge from recovery room]: Apply sterile dressings. Monitor patient during reversal of anesthesia. Assist in transfer of patient from operating table to gurney. Monitor transport of patient from operating room to recovery room. Discuss postoperative recovery care with anesthesia and nursing staff, including need for patient-controlled analgesia. Discontinue prophylactic antibiotic therapy, as appropriate. Review postoperative labs. Discuss procedure and outcome with family in waiting area. Write brief operative note or complete final operative note and place in chart. Write postoperative note in the recovery room. Dictate operative report and copy referring physician(s). Call referring physician(s). Write orders for transferring to observation or general surgical floor and discuss ongoing care with nursing staff.

Later same day hospital observation care visit [operative day after discharge from recovery room]: Review interval nursing/other staff chart notes. Discuss ongoing care with nursing staff. Evaluate vital signs and intake/output. Auscultate heart, lungs, and abdomen for bowel sounds. Monitor fluid and electrolyte status and renal function; monitor for problems such as ileus, intestinal ischemia, and urinary retention. Examine patient, check wounds, and change dressings. Continue prophylaxis for DVT. Assess need for beta-blockers, order as required. Assess pain scores and adequacy of analgesia. Write orders for labs, films, medications, diet, and patient activity. Chart patient progress notes. Answer patient and family questions. Answer nursing/other staff questions. Advance diet, as appropriate.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

RAW Screen

Code 49565, *Repair recurrent incisional or ventral hernia; reducible*, was identified by the RUC/RAW with a site of service anomaly: less than 50% inpatient status; includes inpatient visit codes; greater than 5,000 utilization. Prior to submitting an Action Plan to the RAW, the societies reviewed the site of service data and found: almost even split of 48% between inpatient and outpatient – with a few percent in the ASC. At the January 2020 RUC meeting, the societies requested referral of code 49565 to CPT to update the descriptor to current standard of practice and typical patient presentation.

CPT Coding Changes

At the February 2021 CPT meeting the following changes were approved:

- Delete all the current open and laparoscopic codes for repair of anterior abdominal hernias.
- Delete add-on code 49568 for mesh for open ventral/incisional hernias and large defects as a result of necrotizing soft tissue infection.
- Add 12 new codes for anterior abdominal hernia repair by any approach (ie, open laparoscopic, robotic); by initial or recurrent; by total defect size; and by reducible or incarcerated/strangulated
- Add 2 codes for parastomal hernia repair - by reducible or incarcerated/strangulated
- Add 1 add-on code for removal of mesh/prosthesis – only with the new hernia repair codes
- Add 1 new code for mesh/prosthesis for delayed closure of external genitalia, perineum and/or abdominal wall defect(s) due to soft tissue infection or trauma.

Coding Structure

Hernia repair for epigastric, incisional, ventral, umbilical, spigelian were merged as they all appear on the anterior abdomen. The location--upper, lower, midline—does not impact the work. But instead, the size and number of defects is the driving factor for work. For example, with respect to the code that was tagged by the RAW, a recurrent, incisional, reducible hernia can be anywhere from a small hernia at a port site from a prior laparoscopic procedure to an extremely large hernia with multiple defects clustered in a midline incision.

Initial versus recurrent differentiation was maintained. Recurrent hernias are re-reoperations. An initial hernia can be the result of a prior procedure (this is not a recurrent hernia) or weak muscles and fascia. A recurrent hernia is typically at least the third time the same site is being operated on.
For example,

- operation 1 might be an open colectomy
- operation 2 would be an initial midline hernia repair
- operation 3 would be a recurrent midline hernia involving the initial midline repair and may include other multiple hernias occurring in the same old incision, all needing to be repaired.

There are many examples in CPT that differentiate between a primary and secondary procedure: disarticulation of shoulder (23920-23921); amputation of arm through humerus (24900-24930) and other similar amputation families; tendon repair (eg, 25260-25274); CABG reoperation (33530); and revision total joint (eg, 23473, 23474, 24370, 24371, 27134-27138).

The hernia size ranges were based on a review of literature and expert panel. For example, an article published in the Journal of the American College of Surgeons reviewed technique and outcomes of abdominal incisional hernia repair and showed that the range of defect size was from less than 1 cm to more than 25 cm with a mean of 6 cm and a median of less than 3 cm. Other similar articles were submitted with the code change application, supporting different work for different defect size. David A. Iannitti, et.al, *Technique and Outcomes of Abdominal Incisional Hernia Repair Using a Synthetic Composite Mesh: A Report of 455 Cases,* Journal of the American College of Surgeons, Volume 206, Issue 1, 2008, Pages 83-88, ISSN 1072-7515, https://doi.org/10.1016/j.jamcollsurg.2007.07.030.

Differentiating the work of a procedure in relationship to size or extent is not new for CPT. For example, 36 skin repair codes by length of repair; 44 lesion excision codes by excised diameter; 46 soft tissue tumor excision codes by size of tumor; 23 hysterectomy codes by size of uterus (58260-58573); 3 myomectomy codes are differentiated by total weight of the myomas (58140-58146); and 10 nerve graft codes are based on length of graft. (64885-64898)

The CPT guidelines and illustrations that describe how to measure the total defect size are well understood by surgeons. This is not a new concept – surgeons are very familiar with measuring a hernia defect, and in fact the size of the hernia defect was included in some of the patient vignettes in 1993. Furthermore, measurement of hernia size is a necessary step for selecting and preparing the appropriately sized mesh for implantation.

Hernia repair coding has been complicated by changes in (1) technology and technique and (2) the recent implementation of ICD-10-PCS codes. For these reasons, the stakeholder societies believed this set of codes should describe "any approach." The societies and the AMA Coding Network have received numerous coding questions about correct reporting for "hybrid" abdominal hernia repair procedures where parts of the procedure are performed via an open approach and parts of the procedure are performed via laparoscopy or with the use of a robot. These are not laparoscopic procedures converted to open procedures, but instead procedures that are more often begun open and then finished as laparoscopic/robotic under pneumoperitoneum.

Another issue that has recently caused confusion about coding has appeared on national coder websites and coder discussion boards referring to International Classification of Diseases Tenth Revision Procedure Coding System (ICD-10-PCS) codes which classifies procedures performed in the facility (ie, not CPT physician procedures). This, however, is important because facilities want the procedure codes reported to correspond with the descriptors of ICD-10-PCS codes that the facility is reporting. Unfortunately, the new ICD-10-PCS codes define various surgical approaches that do not correspond to CPT coding (open, closed, percutaneous, and laparoscopic). For example, the ICD-10-PCS "open endoscopic" approach is defined as "cutting through the skin or mucous membrane and any other body layers necessary to expose a body part, and introduction of instrumentation to reach and visualize the site of the procedure." A second example is the "open with percutaneous endoscopic assistance" approach defined as "cutting through the skin or mucous membrane and any other body layers necessary to expose the site of the procedure, and entry, by puncture or minor incision, of instrumentation through the skin or mucous membrane and any other body layers necessary to aid in the performance of the procedure." These new ICD-10-PCS codes have resulted in coders stating that a procedure should be reported as open because the ICD-10-PCS code indicates open and to report any procedure that includes extension of a port incision (eg, for delivery of a specimen) to be reported as an open procedure --instead of being correctly reported as a laparoscopic procedure.

Mesh

- **Implantation of mesh is now typical and therefore was bundled into the new codes.** When code 49568 was created in 1993, mesh implantation with hernia repairs was not typical. This is supported by the typical patient described in 1993 as having a 10 cm midline incisional hernia – a very large hernia. With research on the causes of hernia recurrence, changes in technology and development of new types of mesh or other prosthesis, implantation of mesh is now typical for all types of hernias and all sizes to reduce the incidence of recurrence. This was supported by the literature submitted with the CCA.

- **Mesh removal is not always required and is not typical.** Technology and research have developed types of mesh that are now being implanted which are incorporated into the abdominal wall, reducing the risk of infection, complications, and recurrence. When mesh removal is indicated, it is typically due to hardening and fracturing of aged mesh, or when gross contamination and infection has occurred (eg, enterocutaneous fistula involving the mesh). For example, a recurrent hernia repair may require removal of fractured, brittle (old technology) mesh many years after an open repair following a colectomy. This work is typically significant, in that the mesh is often integrated with the abdominal wall or adhered to intestine, and involves removal of all of the mesh, not just a small portion. An add-on code to report mesh removal prior to hernia repair, when required, allows for accurate reporting of this work only when performed, which our expert panel believes is not typical of most hernia repairs.

- **Deletion of code 49658 resulted in rare "left over" work for implantation of mesh related to closure for a large open wound after debridement for necrotizing fasciitis.** Add-on code 46958 was reported for mesh placement for both open hernia repair and in relation to closure of wounds from necrotizing soft tissue infection. This code will be deleted and the work of mesh placement will be included in the work for all of the anterior abdominal hernia repair codes. The remaining use of code 46958 was for mesh placement for delayed closure of external genitalia, perineum and/or abdominal wall defect(s) due to soft tissue infection or trauma. As described in the vignette for 15778, necrotizing soft tissue infections typically result in a large open wound that cannot be closed primarily. When the infection has resolved, absorbable mesh or other prosthesis is placed to allow healing by secondary intent until such time that a skin graft or skin closure can be accomplished. The literature submitted with the CCA supports this work.

Compelling Evidence - Flawed methodology of previous reviews, New technology

Flawed Methodology: Codes 49560, 49561, 49565, 49566, 49570, 49572, 49580, 49582, 49585, and 49590 were last reviewed in 2000 during the 2nd 5-year-review. During this review, the American College of Surgeons argued that there was compression of work values for big procedures and there were rank order issues within families of codes. We developed a methodology using NSQIP data that was approved by the Research Subcommittee. However, to validate the methodology, the 5YR Workgroup instructed the ACS to group the codes into families and survey one or two CPT codes as full surveys per family to act as anchors for each family and the rest of the codes to be surveyed as mini-surveys for only time and visits. After conducting all of the surveys, we believe we were able to validate the methodology that we proposed, however, the 5YR Workgroup did not agree. Instead, they decided that the value that they assigned to the anchor code (the full survey) would be extrapolated to all of the other codes grouped into the same survey. The hernia codes listed above were grouped with 49505 which was increased by 17% based on the survey data and compelling evidence. The 17% increase was applied to the other codes in the group without consideration of rank order, mini survey results or society recommendations. This resulted in continuation of compression and rank order issues. For example, although code 49572 was increased by 17%, the IWPUT for the code is negative. Other codes have near zero IWPUT. **We believe this was a flawed methodology of review of the codes and meets compelling evidence.**

Flawed Methodology: Codes 49587, 49652, 49653, 49654, and 49655 were last reviewed in 2011 based on a site of service anomaly screen. At that time, the RUC approved including a same day observation visit and full observation discharge on the subsequent day. The RUC noted that the typical patient requires close monitoring for problems such as ileus, intestinal ischemia and urinary retention. Additionally, there will be significant pain post-operatively requiring management before discharge. The specialty noted, and the RUC agreed, that the shift in patient facility status (in patient moving to outpatient—as determined by CMS) has little to do with healthier patients that require less physician work and everything to do with the recent OPPS changes related to facility reimbursement. This was substantiated by the survey data which showed that the typical patients stayed at least overnight and received a postoperative same-day E/M service. Given this data, the RUC enacted its (then current) policy to allocate the appropriate proxy for the postoperative visits which was categorized as either subsequent observation and/or observation discharge—both of which are outpatient codes. Importantly, the specialties argued and the RUC agreed that the work of providers who care for medical patients should not be discounted (eg, full observation E/M and full observation discharge E/M allowed for patient staying overnight for observation.)

CMS ignored the valid outpatient E/M visit code inputs that the RUC recommended and instead stated in the Rule that they have a policy of not allowing "inpatient" visits included in the details for outpatient services. These codes went through a Refinement Panel process [ie, a CMS convened group of Medical Officers and select physicians acting as a separate formal appeals process] that resulted in agreement with the RUC recommendations. Importantly, the Agency still maintained that inpatient visits would not be allowed (even though outpatient/observation visits were submitted by the RUC) and then used a reverse building block methodology to subtract work RVUs from the values. These values had been developed by magnitude estimation and approved by the RUC. The Agency deleted the observation visit code inputs and decreased discharge management by 50 percent even though it was performed on a subsequent date. **We believe this action by CMS resulted in a flawed methodology of review of these codes and meets compelling evidence.**

The rejection of equal value for equal work and rejection of the Refinement Panel results prompted the Executive Director of the American College of Surgeons to send a letter (see last page of SoR) to Kathleen Sebelius, then Secretary of the Department of Health and Human Services on November 29, 2011. This letter addressed the decision-making process for valuing procedure codes that have Medicare outpatient status, the use of refinement panels, and the arbitrary discount in physician work for the same work performed by any provider of a non-global service. Specifically, the letter included the following statement:

> *"CMS has now implemented a policy by which it is creating differential payments for the same work performed by different physicians as a backdoor mechanism for reducing the work RVUs for surgical procedures. They have valued the worth of a surgeon for post-operative evaluation and management work at about 30 percent of a non-surgeon. Non-surgeons are allowed to provide the same work to the same patient at 100 percent reimbursement. …we believe that this policy leads to a loss of validity and integrity of the current system."*

We continue to believe there is no valid justification for a 50% discount to discharge management services provided by a surgeon that is performed the day after a procedure when a non-surgical provider observing a medical patient who is kept overnight for any reason is allowed to bill a discharge management service at 100 percent for work on the next day.

We also believe there is no valid justification for discounting a postoperative visit later the same day of surgery to equal only the intra-service time of the visit multiplied by an intensity of 0.0224. No surgeon would round on a postoperative patient the same day and not review interval chart notes prior to the face-to-face with the patient and not followup with charting the visit and confirming or modifying the current orders.

CMS implemented a 23-hour policy for discounting surgical postoperative work based on the argument that the Agency could not include impatient work in their time/work file. However, the fact is that the Agency has also erroneously rejected RUC recommendations for outpatient / observation codes, stating "these inpatient codes" could not be included for procedure that are typically outpatient.

Change in Technology: Since the last review of the hernia repair codes (either in 2000 or in 2011), there has been introduction and application of new technology (ie, robotic assist) which adds work complexity and time with the goal of better patient outcomes. The diffusion of this new technology throughout this family of codes further meets compelling evidence.

Recommendation – 49592

We recommend a work RVU of 9.00, which is the survey 25th percentile.

Pre-service time

Package time has been reduced so as to not exceed survey median data.

Postoperative E/M visit later on the day of surgery

The typical patient will stay overnight or longer and there will typically be a visit later on the same day of the procedure at a level of 99231. Review data (eg, diagnostic and imaging studies) not available at the unit. Communicate with other health care professionals and with patient and/or family. Review medical records and data available on the unit. Perform a medically appropriate examination. Consider relevant data, options, and risks; formulate and/or revise diagnosis and treatment plan(s) (straightforward or low-complexity MDM). Discuss diagnosis and treatment options with the patient and/or family. Consider discharge needs of patient. Communicate with other health care professionals as necessary. Write and/or review orders, including arranging for necessary diagnostic testing, consultation(s), and therapeutic intervention(s). Complete medical record documentation. Address interval data obtained and reported changes in condition. Communicate results and additional care plans to other health care professionals and to the patient and/or family.

Per CMS policy for reporting postoperative work for 23-hour stay procedures, the intraservice time of 10 minutes for 99231 has been added to the survey immediate postoperative time (total = 30 min).

Key Reference Code Intensity/Complexity Comparison

Ref 1: The respondents indicated the intensity/complexity of survey code 49592 is somewhat more than reference code 11005. Ref 2: The respondents indicated the intensity/complexity of survey code 49592 is similar to reference code 33956.

MPC Code Comparison

49618	**Recurrent,** **I/S, > 10cm**	75th	**25.00**	**335**

Comparison of using the recommended RVW versus using the 25th percentile.

The first chart below shows reasonable correlation between the recommended RVW and WPUT—both trend lines have a similar slope. The second chart below shows no relationship of WPUT to the 25th percentile RVW—where WPUT decreases as work increases.

What if surgeon evaluation and management work were set equal to discrete E/M services?

As has been discussed by the RUC in the past, work intensities used for computation of IWPUT for time spent by physicians in the pre-service and immediate post-service period for surgical procedures have remained fixed since the early 1990s, while intensity of time for E/M values has received several increased values over several decades.

Recent increases for outpatient office E/M values were not allowed to be added to global codes by CMS. Because IWPUT is calculated by subtracting the pre- and post-work values from the RVW of a given CPT code, this has resulted in less value subtracted than would have occurred if the more appropriate pre- and post-work values were used for the

IWPUT formula. This artificially increases the IWPUT and WPUT resulting in a decrease in relativity. This is especially true for codes that have a significant amount of pre-service and post-service work.

It has become difficult to compare IWPUT (and WPUT) for codes with different global periods because of the level of discounting of pre-service and post-service work. For example, for the top 34 high volume 10 and 90 day global codes, AMA staff recently calculated the difference in IWPUT if the office visit increases were used in the IWPUT equation. The AMA table, which is included in the Research Subcommittee agenda for this meeting, showed that the IWPUT would have decreased from -6% to -548% depending on the number of office visits included in the work/time file. To emphasize the importance of this information, the code which would have had the largest decrease (17000) has 3 minutes of intra-time and only one postop office visit (99212). In this table, it was also clear that relativity within a family of codes is lost, because each code within a family may have varying levels of post-service work. To summarize, IWPUT has become much less accurate when used as a comparator of intra-service work within and between families because of CMS actions (ie, not updating global RVW) and policy (ie, discounting postoperative work).

Using the discussion above, we have created the table below that presents the IWPUT and WPUT for the hernia set of codes using (1) the 2021 formulas, and (2) "full value" formulas. The note below the table describes each formula, but basically the full value formula sets pre- and post-service work equal to the same E/M work for non-surgical services. For comparison to facility non-surgical services, we have included codes 99283-99285 using the 2021 published RVW and time data. This table shows that most of the recommendations for 49591-49622 result in a WPUT that is less than an ED visit requiring moderate MDM (99284). This table also shows that those codes with similar WPUT to high MDM are appropriately the bigger and more complex procedures. Last, this table provides evidence that discounting pre- and post-work distorts and artificially impacts fair IWPUT and WPUT relativity comparison. However, if undiscounted work is applied, the recommendations for this set of codes are appropriately ranked.

CPT	DESC	REC RVW	2021 formula*		2021 full value**		Total Time	PRE	Intra	Imm Post	-33 -26	-32 -25	-31 -24	Facility Status

* 2021 Formula: IWPUT calculation based on evaluation, positioning, immediate post intensity of 0.0224; scrub/dress/wait intensity of 0.0081; and discounted same-day outpatient postop visit (not shown in table) equal to intra-service time at 0.0224. WPUT calculation equal to total time (including discounted postop visit time not shown on table) divided by work.

**2021 Full Value Formula: IWPUT calculation based on pre-service and immediate post-service time intensity of 0.043 (equal to WPUT for 99213) and same-day post EM at full value instead of discounted time for outpatient procedure as shown on table (highlighted in red).

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed)
49561 Repair initial incisional or ventral hernia; incarcerated or strangulated 090
49572 Repair epigastric hernia (eg, preperitoneal fat); incarcerated or strangulated 090
49587 Repair umbilical hernia, age 5 years or older; incarcerated or strangulated 090
49590 Repair spigelian hernia 090
49653 Laparoscopy, surgical, repair, ventral, umbilical, spigelian or epigastric hernia (includes mesh insertion, when performed); incarcerated or strangulated 090
49655 Laparoscopy, surgical, repair, incisional hernia (includes mesh insertion, when performed); incarcerated or strangulated 090
49568 Implantation of mesh or other prosthesis for open incisional or ventral hernia repair or mesh for closure of debridement for necrotizing soft tissue infection (List separately in addition to code for the incisional or ventral hernia repair) ZZZ

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty general surgery How often? Commonly

Specialty colorectal surgery How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and <u>percentage</u> for each specialty. Please explain the rationale for this estimate. National frequency not available

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?
23,602 If this is a recommendation from multiple specialties please estimate frequency <u>and percentage</u> for each specialty. Please explain the rationale for this estimate. Specialty estimate - See supplemental file with details

Specialty General Surgery Frequency 21242 Percentage 90.00 %

Specialty Colorectal Surgery Frequency 1180 Percentage 4.99 %

Specialty Other Surgery Frequency 1180 Percentage 4.99 %

Do many physicians perform this service across the United States? Yes

Letter Referenced in Compelling Evidence Rationale

November 29, 2011

The Honorable Kathleen Sebelius
Secretary
Department of Health and Human Services
Hubert H. Humphrey Building
200 Independence Avenue SW
Washington, DC 20201

Re: CY 2012 Medicare Physician Fee Schedule Final Rule and CMS
Refinement Panels

Dear Secretary Sebelius:

On November 28, 2011, the Federal Register published the Centers for Medicare and Medicaid Services' (CMS) Calendar Year (CY) 2012 Medicare Physician Fee Schedule Final Rule. On behalf of the American College of Surgeons (ACS), I am writing to express concern regarding the decision making process and lack of transparency on the part of CMS related to the work relative value units (wRVUs) for 2012 reviewed under CMS' refinement panel process. The ACS, with over 78,000 members, is a scientific and educational organization of surgeons that was founded in 1913 to raise the standards of surgical practice and to improve the care of the surgical patient.

The ACS has participated in the efforts of the American Medical Association's Relative Value Scale Update Committee (AMA RUC) for years given the value we place on the AMA RUC process and our assumption that CMS will evaluate the RUC recommendations with fairness, transparency, and accuracy according to a process that has been set out via the Federal rulemaking process. As part of the work that led to the CY 2012 Medicare Physician Fee Schedule Final Rule, the ACS devoted significant resources to conducting AMA RUC surveys for over 100 new or existing codes at the request of CMS. The AMA RUC evaluated wRVU recommendations made by the ACS, based upon those surveys, and came to agreement on final recommended values to be submitted to CMS.

Fifty-seven of the aforementioned codes that the ACS surveyed were sent to the refinement panel. CMS accepted ***only 12 percent*** of those refinement panel recommendations.

For most of the 88 percent of refinement panel recommendations that CMS rejected, CMS lowered the wRVU by reducing the value of the post-operative evaluation and management work performed by surgeons in the hospital by 69 percent. However, if that same work is performed by any other physician other than the surgeon, that same service is paid at 100 percent. We believe that the refinement panel physicians completely rejected this concept as they agreed to a work RVU that did not discount post-surgical work in this fashion. We note that the multispecialty panel included physicians from primary care, contractor medical directors (CMDs), physicians in related specialties, and general surgeons. At no time did the Agency's Medical Officer in charge of the panel process disagree with the presenters or offer a contrary opinion to the discussion.

Our concerns were piqued when CMS issued the CY 2011 Medicare Physician Fee Schedule Final Rule in which CMS stated that it could change wRVU recommendations of the refinement panel convened by CMS if "policy concerns warrant their modification," without providing additional clarification on what would trigger this ability of CMS to subvert the more transparent process of the refinement panel. However, we continued to participate in the process under the belief that CMS would operate fairly and transparently and that if there were indeed "policy concerns" that CMS had regarding the values of the codes under consideration that those concerns would be stated clearly so all parties could address them during the refinement panel reviews.

CMS has now implemented a policy by which it is creating differential payments for the same work performed by different physicians as a backdoor mechanism for reducing the work RVUs for surgical procedures. They have valued the worth of a surgeon for post-operative evaluation and management work at about 30 percent of a non-surgeon.. Non-surgeons are allowed to provide the same work to the same patient at 100 percent reimbursement. First, we believe that this policy leads to a loss of validity and integrity of the current system. In addition, this policy is prohibited by the Omnibus Budget Reconciliation Act of 1989, which states, "[t]he Secretary may not vary the conversion factor or the number of relative value units for a physicians' service based on whether the physician furnishing the service is a specialist or based on the type of specialty of the physician." (42 U.S.C. §1395w-4(c)(6)).

The ACS has been a vocal proponent of needed reforms in the delivery and payment of health care. We believe that the future of these reforms will be based on driving greater awareness of proven continuous quality improvement programs to achieve ongoing, tangible results for quality improvements. However, in order for these reforms to be effective, they must be built on a system that is consistent with previous Agency decisions, fair, and transparent, and it is our concern that many of the policy decisions made by CMS in the latest Medicare Physician Fee Schedule Final Rule move us away from those goals. The resource based relative value system (RBRVS) requires a resource basis for decisions on the valuation of physician services. We believe that the resource basis for the decision to reduce these values is not evident. We ask that under your authority as Secretary you will seek to have CMS define a more transparent process in the future for decisions that are not aligned with the RUC and refinement panel recommendations in order to help maintain the transparency and fairness of the current system and to restore the values of these services to the level that is supported by the RBRVS process.

Sincerely,
David B. Hoyt, MD, FACS
Executive Director

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:49593 Tracking Number C4 Original Specialty Recommended RVU: **10.80**
Presented Recommended RVU: **10.80**
Global Period: 000 Current Work RVU: RUC Recommended RVU: **10.80**

CPT Descriptor: Repair of anterior abdominal hernia(s) (ie, epigastric, incisional, ventral, umbilical, spigelian), any approach (ie, open, laparoscopic, robotic), initial including placement of mesh or other prosthesis, when performed total length of defect(s); 3 cm to 10 cm, reducible

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 60-year-old obese male with a prior laparotomy has developed a bulge in the midline incision. The defect has been increasing in size during follow-up. He has symptoms of pain and local tenderness. He has had no history of incarceration or bowel obstruction. Physical exam reveals a reducible incisional hernia. He undergoes hernia repair of a defect that is 3 to 10 cm with placement of mesh.

Percentage of Survey Respondents who found Vignette to be Typical: 93%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 95% , In the ASC 5%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 31% , Overnight stay-less than 24 hours 59% , Overnight stay-more than 24 hours 10%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 85%

Description of Pre-Service Work: Results of preadmission testing (imaging, electrocardiogram and labs) are reviewed. Appropriate selection, timing, and administration of DVT prophylaxis are ensured. Appropriate selection, timing, and administration of antibiotics are ensured. The need for beta-blockers is assessed, and they are ordered as required. The patient is reexamined to confirm that physical findings have not changed, the patient's medication regimen has remained the same, the patient has no new allergies, and the patient has not undergone any recent procedures. The history and physical examination are then updated in the electronic health record. The planned procedure and postoperative management are reviewed with the patient and family. Informed consent is reviewed and obtained from the patient, including witness confirmation. The palpable edge of the hernia defect(s) and sites of the proposed skin incisions are marked with cooperation of patient. The length and type of anesthesia, including adjuncts to postoperative analgesia management, are reviewed with the anesthesiologist. Verify that all required instruments and supplies are available, including reusable and disposable laparoscopic/robotic equipment and mesh. Assistance is provided in transfer of the patient from gurney to operating table. Monitor/assist with positioning of patient, including padding and securing patient to table that will adjust throughout procedure (eg, reverse Trendelenburg). Assist anesthesia team with line placement and induction of anesthesia and intubation, relative to all laparoscopic/robotic equipment. The areas of skin to be prepared and draped are indicated by the surgeon to ensure that all of the potential operative field is included in the preparation. The surgeon scrubs and gowns. A surgical time-out is performed with operating surgical team.

Description of Intra-Service Work: Abdominal access is obtained and pneumoperitoneum is created with placement of a needle/trocar in the left upper quadrant. The camera is inserted and safe entry is verified. Additional trocars are placed in the lateral abdomen, under direct vision. A large field of adhesions occupies approximately half of the anterior abdominal wall correlating with the extent of the prior laparotomy. Adhesions to the abdominal wall are divided sharply to free the anterior abdominal wall adequately for subsequent mesh landing. The hernia defect is visualized. Great care is taken to avoid injury to the intestine or other intra-abdominal contents. Each separate defect within the overall hernia defect contains a separate component of adipose and intestine that requires safe reduction. The falciform ligament and preperitoneal fat are cleared from the abdominal wall fascia to expose the posterior fascia. All of the defects are measured and summed with a minimum length of 3 cm and maximum length of 10 cm. Peritoneal flaps are created for placement of

mesh. When appropriate, the fascial defect is approximated with sutures. A mesh is selected to provide adequate overlap of the hernia defect. the mesh is introduced into the peritoneal cavity through a trocar and is oriented. Insufflation is reduced to facilitate mesh conformity to the anterior abdominal wall. The mesh is secured to the abdominal wall utilizing multiple sutures and tacks.. Completion camera survey is performed of the abdomen and contents to inspect for bleeding and visceral injury. Irrigation is performed as necessary. Fascial incisions from laparoscopic ports larger than 1 cm in diameter are closed with a suture passer. Skin incisions are closed according to surgeon preference.

Description of Post-Service Work:
Immediate postoperative care [operative day through discharge from recovery room]: Apply sterile dressings. Monitor patient during reversal of anesthesia. Assist in transfer of patient from operating table to gurney. Monitor transport of patient from operating room to recovery room. Discuss postoperative recovery care with anesthesia and nursing staff, including need for patient-controlled analgesia. Discontinue prophylactic antibiotic therapy, as appropriate. Review postoperative labs. Discuss procedure and outcome with family in waiting area. Write brief operative note or complete final operative note and place in chart. Write postoperative note in the recovery room. Dictate operative report and copy referring physician(s). Call referring physician(s). Write orders for transferring to observation or general surgical floor and discuss ongoing care with nursing staff.

Later same day hospital observation care visit [operative day after discharge from recovery room]: Review interval nursing/other staff chart notes. Discuss ongoing care with nursing staff. Evaluate vital signs and intake/output. Auscultate heart, lungs, and abdomen for bowel sounds. Monitor fluid and electrolyte status and renal function; monitor for problems such as ileus, intestinal ischemia, and urinary retention. Examine patient, check wounds, and change dressings. Continue prophylaxis for DVT. Assess need for beta-blockers, order as required. Assess pain scores and adequacy of analgesia. Write orders for labs, films, medications, diet, and patient activity. Chart patient progress notes. Answer patient and family questions. Answer nursing/other staff questions. Advance diet, as appropriate.

• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	60%	20%	20%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

RAW Screen

Code 49565, *Repair recurrent incisional or ventral hernia; reducible*, was identified by the RUC/RAW with a site of service anomaly: less than 50% inpatient status; includes inpatient visit codes; greater than 5,000 utilization. Prior to submitting an Action Plan to the RAW, the societies reviewed the site of service data and found: almost even split of 48% between inpatient and outpatient – with a few percent in the ASC. At the January 2020 RUC meeting, the societies requested referral of code 49565 to CPT to update the descriptor to current standard of practice and typical patient presentation.

CPT Coding Changes

At the February 2021 CPT meeting the following changes were approved:

- Delete all the current open and laparoscopic codes for repair of anterior abdominal hernias.
- Delete add-on code 49568 for mesh for open ventral/incisional hernias and large defects as a result of necrotizing soft tissue infection.
- Add 12 new codes for anterior abdominal hernia repair by any approach (ie, open laparoscopic, robotic); by initial or recurrent; by total defect size; and by reducible or incarcerated/strangulated
- Add 2 codes for parastomal hernia repair - by reducible or incarcerated/strangulated
- Add 1 add-on code for removal of mesh/prosthesis – only with the new hernia repair codes
- Add 1 new code for mesh/prosthesis for delayed closure of external genitalia, perineum and/or abdominal wall defect(s) due to soft tissue infection or trauma.

Coding Structure

Hernia repair for epigastric, incisional, ventral, umbilical, spigelian were merged as they all appear on the anterior abdomen. The location--upper, lower, midline—does not impact the work. But instead, the size and number of defects is the driving factor for work. For example, with respect to the code that was tagged by the RAW, a recurrent, incisional, reducible hernia can be anywhere from a small hernia at a port site from a prior laparoscopic procedure to an extremely large hernia with multiple defects clustered in a midline incision.

Initial versus recurrent differentiation was maintained. Recurrent hernias are re-reoperations. An initial hernia can be the result of a prior procedure (this is not a recurrent hernia) or weak muscles and fascia. A recurrent hernia is typically at least the third time the same site is being operated on.
For example,

- operation 1 might be an open colectomy
- operation 2 would be an initial midline hernia repair
- operation 3 would be a recurrent midline hernia involving the initial midline repair and may include other multiple hernias occurring in the same old incision, all needing to be repaired.

There are many examples in CPT that differentiate between a primary and secondary procedure: disarticulation of shoulder (23920-23921); amputation of arm through humerus (24900-24930) and other similar amputation families; tendon repair (eg, 25260-25274); CABG reoperation (33530); and revision total joint (eg, 23473, 23474, 24370, 24371, 27134-27138).

The hernia size ranges were based on a review of literature and expert panel. For example, an article published in the Journal of the American College of Surgeons reviewed technique and outcomes of abdominal incisional hernia repair and showed that the range of defect size was from less than 1 cm to more than 25 cm with a mean of 6 cm and a median of less than 3 cm. Other similar articles were submitted with the code change application, supporting different work for different defect size. David A. Iannitti, et.al, *Technique and Outcomes of Abdominal Incisional Hernia Repair Using a Synthetic Composite Mesh: A Report of 455 Cases,* Journal of the American College of Surgeons, Volume 206, Issue 1, 2008, Pages 83-88, ISSN 1072-7515, https://doi.org/10.1016/j.jamcollsurg.2007.07.030.

Differentiating the work of a procedure in relationship to size or extent is not new for CPT. For example, 36 skin repair codes by length of repair; 44 lesion excision codes by excised diameter; 46 soft tissue tumor excision codes by size of tumor; 23 hysterectomy codes by size of uterus (58260-58573); 3 myomectomy codes are differentiated by total weight of the myomas (58140-58146); and 10 nerve graft codes are based on length of graft. (64885-64898)

The CPT guidelines and illustrations that describe how to measure the total defect size are well understood by surgeons. This is not a new concept – surgeons are very familiar with measuring a hernia defect, and in fact the size of the hernia

defect was included in some of the patient vignettes in 1993. Furthermore, measurement of hernia size is a necessary step for selecting and preparing the appropriately sized mesh for implantation.

Hernia repair coding has been complicated by changes in (1) technology and technique and (2) the recent implementation of ICD-10-PCS codes. For these reasons, the stakeholder societies believed this set of codes should describe "any approach." The societies and the AMA Coding Network have received numerous coding questions about correct reporting for "hybrid" abdominal hernia repair procedures where parts of the procedure are performed via an open approach and parts of the procedure are performed via laparoscopy or with the use of a robot. These are not laparoscopic procedures converted to open procedures, but instead procedures that are more often begun open and then finished as laparoscopic/robotic under pneumoperitoneum.

Another issue that has recently caused confusion about coding has appeared on national coder websites and coder discussion boards referring to International Classification of Diseases Tenth Revision Procedure Coding System (ICD-10-PCS) codes which classifies procedures performed in the facility (ie, not CPT physician procedures). This, however, is important because facilities want the procedure codes reported to correspond with the descriptors of ICD-10-PCS codes that the facility is reporting. Unfortunately, the new ICD-10-PCS codes define various surgical approaches that do not correspond to CPT coding (open, closed, percutaneous, and laparoscopic). For example, the ICD-10-PCS "open endoscopic" approach is defined as "cutting through the skin or mucous membrane and any other body layers necessary to expose a body part, and introduction of instrumentation to reach and visualize the site of the procedure." A second example is the "open with percutaneous endoscopic assistance" approach defined as "cutting through the skin or mucous membrane and any other body layers necessary to expose the site of the procedure, and entry, by puncture or minor incision, of instrumentation through the skin or mucous membrane and any other body layers necessary to aid in the performance of the procedure." These new ICD-10-PCS codes have resulted in coders stating that a procedure should be reported as open because the ICD-10-PCS code indicates open and to report any procedure that includes extension of a port incision (eg, for delivery of a specimen) to be reported as an open procedure --instead of being correctly reported as a laparoscopic procedure.

Mesh

- **Implantation of mesh is now typical and therefore was bundled into the new codes.** When code 49568 was created in 1993, mesh implantation with hernia repairs was not typical. This is supported by the typical patient described in 1993 as having a 10 cm midline incisional hernia – a very large hernia. With research on the causes of hernia recurrence, changes in technology and development of new types of mesh or other prosthesis, implantation of mesh is now typical for all types of hernias and all sizes to reduce the incidence of recurrence. This was supported by the literature submitted with the CCA.

- **Mesh removal is not always required and is not typical.** Technology and research have developed types of mesh that are now being implanted which are incorporated into the abdominal wall, reducing the risk of infection, complications, and recurrence. When mesh removal is indicated, it is typically due to hardening and fracturing of aged mesh, or when gross contamination and infection has occurred (eg, enterocutaneous fistula involving the mesh). For example, a recurrent hernia repair may require removal of fractured, brittle (old technology) mesh many years after an open repair following a colectomy. This work is typically significant, in that the mesh is often integrated with the abdominal wall or adhered to intestine, and involves removal of all of the mesh, not just a small portion. An add-on code to report mesh removal prior to hernia repair, when required, allows for accurate reporting of this work only when performed, which our expert panel believes is not typical of most hernia repairs.

- **Deletion of code 49658 resulted in rare "left over" work for implantation of mesh related to closure for a large open wound after debridement for necrotizing fasciitis.** Add-on code 46958 was reported for mesh placement for both open hernia repair and in relation to closure of wounds from necrotizing soft tissue infection. This code will be deleted and the work of mesh placement will be included in the work for all of the anterior abdominal hernia repair codes. The remaining use of code 46958 was for mesh placement for delayed closure of external genitalia, perineum and/or abdominal wall defect(s) due to soft tissue infection or trauma. As described in the vignette for 15778, necrotizing soft tissue infections typically result in a large open wound that cannot be closed primarily. When the infection has resolved, absorbable mesh or other prosthesis is placed to allow healing by secondary intent until such time that a skin graft or skin closure can be accomplished. The literature submitted with the CCA supports this work.

Compelling Evidence - Flawed methodology of previous reviews, New technology

Flawed Methodology: Codes 49560, 49561, 49565, 49566, 49570, 49572, 49580, 49582, 49585, and 49590 were last reviewed in 2000 during the 2nd 5-year-review. During this review, the American College of Surgeons argued that there was compression of work values for big procedures and there were rank order issues within families of codes. We developed a methodology using NSQIP data that was approved by the Research Subcommittee. However, to validate the methodology, the 5YR Workgroup instructed the ACS to group the codes into families and survey one or two CPT codes as full surveys per family to act as anchors for each family and the rest of the codes to be surveyed as mini-surveys for only time and visits. After conducting all of the surveys, we believe we were able to validate the methodology that we proposed, however, the 5YR Workgroup did not agree. Instead, they decided that the value that they assigned to the anchor code (the full survey) would be extrapolated to all of the other codes grouped into the same survey. The hernia codes listed above were grouped with 49505 which was increased by 17% based on the survey data and compelling evidence. The 17% increase was applied to the other codes in the group without consideration of rank order, mini survey results or society recommendations. This resulted in continuation of compression and rank order issues. For example, although code 49572 was increased by 17%, the IWPUT for the code is negative. Other codes have near zero IWPUT. **We believe this was a flawed methodology of review of the codes and meets compelling evidence.**

Flawed Methodology: Codes 49587, 49652, 49653, 49654, and 49655 were last reviewed in 2011 based on a site of service anomaly screen. At that time, the RUC approved including a same day observation visit and full observation discharge on the subsequent day. The RUC noted that the typical patient requires close monitoring for problems such as ileus, intestinal ischemia and urinary retention. Additionally, there will be significant pain post-operatively requiring management before discharge. The specialty noted, and the RUC agreed, that the shift in patient facility status (in patient moving to outpatient—as determined by CMS) has little to do with healthier patients that require less physician work and everything to do with the recent OPPS changes related to facility reimbursement. This was substantiated by the survey data which showed that the typical patients stayed at least overnight and received a postoperative same-day E/M service. Given this data, the RUC enacted its (then current) policy to allocate the appropriate proxy for the postoperative visits which was categorized as either subsequent observation and/or observation discharge—both of which are outpatient codes. Importantly, the specialties argued and the RUC agreed that the work of providers who care for medical patients should not be discounted (eg, full observation E/M and full observation discharge E/M allowed for patient staying overnight for observation.)

CMS ignored the valid outpatient E/M visit code inputs that the RUC recommended and instead stated in the Rule that they have a policy of not allowing "inpatient" visits included in the details for outpatient services. These codes went through a Refinement Panel process [ie, a CMS convened group of Medical Officers and select physicians acting as a separate formal appeals process] that resulted in agreement with the RUC recommendations. Importantly, the Agency still maintained that inpatient visits would not be allowed (even though outpatient/observation visits were submitted by the RUC) and then used a reverse building block methodology to subtract work RVUs from the values. These values had been developed by magnitude estimation and approved by the RUC. The Agency deleted the observation visit code inputs and decreased discharge management by 50 percent even though it was performed on a subsequent date. **We believe this action by CMS resulted in a flawed methodology of review of these codes and meets compelling evidence.**

The rejection of equal value for equal work and rejection of the Refinement Panel results prompted the Executive Director of the American College of Surgeons to send a letter (see last page of SoR) to Kathleen Sebelius, then Secretary of the Department of Health and Human Services on November 29, 2011. This letter addressed the decision-making process for valuing procedure codes that have Medicare outpatient status, the use of refinement panels, and the arbitrary discount in physician work for the same work performed by any provider of a non-global service. Specifically, the letter included the following statement:

> *"CMS has now implemented a policy by which it is creating differential payments for the same work performed by different physicians as a backdoor mechanism for reducing the work RVUs for surgical procedures. They have valued the worth of a surgeon for post-operative evaluation and management work at about 30 percent of a non-surgeon. Non-surgeons are allowed to provide the same work to the same patient at 100 percent reimbursement. …we believe that this policy leads to a loss of validity and integrity of the current system."*

We continue to believe there is no valid justification for a 50% discount to discharge management services provided by a surgeon that is performed the day after a procedure when a non-surgical provider observing a medical patient who is kept overnight for any reason is allowed to bill a discharge management service at 100 percent for work on the next day. We also believe there is no valid justification for discounting a postoperative visit later the same day of surgery to equal

only the intra-service time of the visit multiplied by an intensity of 0.0224. No surgeon would round on a postoperative patient the same day and not review interval chart notes prior to the face-to-face with the patient and not followup with charting the visit and confirming or modifying the current orders.

CMS implemented a 23-hour policy for discounting surgical postoperative work based on the argument that the Agency could not include impatient work in their time/work file. However, the fact is that the Agency has also erroneously rejected RUC recommendations for outpatient / observation codes, stating "these inpatient codes" could not be included for procedure that are typically outpatient.

Change in Technology: Since the last review of the hernia repair codes (either in 2000 or in 2011), there has been introduction and application of new technology (ie, robotic assist) which adds work complexity and time with the goal of better patient outcomes. The diffusion of this new technology throughout this family of codes further meets compelling evidence.

Recommendation – 49593

We recommend a work RVU of 10.80, which is the survey 25th percentile.

Pre-service time

Evaluation package time has been reduced so as to not exceed survey median data.
Laparoscopic/robotic anterior abdominal hernia repair positioning time: The patient will initially be positioned supine and upper extremity intravenous and arterial access points are dressed, padded and secured. The arms are padded and tucked at the patient's sides. The patient must be secured to the table, including a soft chest and thigh strap, as it may be necessary to roll the table during the procedure to use gravity to assist with shifting the abdominal contents.. There is also consideration of positioning the patient relative to: laparoscopy equipment, including lines and video equipment and anesthesia lines relative to the rest of the equipment. The survey median positioning time reflects the time for this procedure for these activities.

Postoperative E/M visit later on the day of surgery

The typical patient will stay overnight or longer and there will typically be a visit later on the same day of the procedure at a level of 99231. Review data (eg, diagnostic and imaging studies) not available at the unit. Communicate with other health care professionals and with patient and/or family. Review medical records and data available on the unit. Perform a medically appropriate examination. Consider relevant data, options, and risks; formulate and/or revise diagnosis and treatment plan(s) (straightforward or low-complexity MDM). Discuss diagnosis and treatment options with the patient and/or family. Consider discharge needs of patient. Communicate with other health care professionals as necessary. Write and/or review orders, including arranging for necessary diagnostic testing, consultation(s), and therapeutic intervention(s). Complete medical record documentation. Address interval data obtained and reported changes in condition. Communicate results and additional care plans to other health care professionals and to the patient and/or family.

Per CMS policy for reporting postoperative work for 23-hour stay procedures, the intraservice time of 10 minutes for 99231 has been added to the survey immediate postoperative time (total = 30 min).

Key Reference Code Intensity/Complexity Comparison

Ref 1: The respondents indicated the intensity/complexity of survey code 49593 is somewhat more than reference code 11006. Ref 2: The respondents indicated the intensity/complexity of survey code 49593 is similar to somewhat more than reference code 11004.

Comparison of using the recommended RVW versus using the 25th percentile.

The first chart below shows reasonable correlation between the recommended RVW and WPUT—both trend lines have a similar slope. The second chart below shows no relationship of WPUT to the 25th percentile RVW—where WPUT decreases as work increases.

What if surgeon evaluation and management work were set equal to discrete E/M services?

As has been discussed by the RUC in the past, work intensities used for computation of IWPUT for time spent by physicians in the pre-service and immediate post-service period for surgical procedures have remained fixed since the early 1990s, while intensity of time for E/M values has received several increased values over several decades.

Recent increases for outpatient office E/M values were not allowed to be added to global codes by CMS. Because IWPUT is calculated by subtracting the pre- and post-work values from the RVW of a given CPT code, this has resulted in less value subtracted than would have occurred if the more appropriate pre- and post-work values were used for the

IWPUT formula. This artificially increases the IWPUT and WPUT resulting in a decrease in relativity. This is especially true for codes that have a significant amount of pre-service and post-service work.

It has become difficult to compare IWPUT (and WPUT) for codes with different global periods because of the level of discounting of pre-service and post-service work. For example, for the top 34 high volume 10 and 90 day global codes, AMA staff recently calculated the difference in IWPUT if the office visit increases were used in the IWPUT equation. The AMA table, which is included in the Research Subcommittee agenda for this meeting, showed that the IWPUT would have decreased from -6% to -548% depending on the number of office visits included in the work/time file. To emphasize the importance of this information, the code which would have had the largest decrease (17000) has 3 minutes of intra-time and only one postop office visit (99212). In this table, it was also clear that relativity within a family of codes is lost, because each code within a family may have varying levels of post-service work. To summarize, IWPUT has become much less accurate when used as a comparator of intra-service work within and between families because of CMS actions (ie, not updating global RVW) and policy (ie, discounting postoperative work).

Using the discussion above, we have created the table below that presents the IWPUT and WPUT for the hernia set of codes using (1) the 2021 formulas, and (2) "full value" formulas. The note below the table describes each formula, but basically the full value formula sets pre- and post-service work equal to the same E/M work for non-surgical services. For comparison to facility non-surgical services, we have included codes 99283-99285 using the 2021 published RVW and time data. This table shows that most of the recommendations for 49591-49622 result in a WPUT that is less than an ED visit requiring moderate MDM (99284). This table also shows that those codes with similar WPUT to high MDM are appropriately the bigger and more complex procedures. Last, this table provides evidence that discounting pre- and post-work distorts and artificially impacts fair IWPUT and WPUT relativity comparison. However, if undiscounted work is applied, the recommendations for this set of codes are appropriately ranked.

CPT	DESC	REC RVW	2021 formula*		2021 full value**		Total Time	PRE	Intra	Imm Post	-33 -26	-32 -25	-31 -24	Facility Status

* 2021 Formula: IWPUT calculation based on evaluation, positioning, immediate post intensity of 0.0224; scrub/dress/wait intensity of 0.0081; and discounted same-day outpatient postop visit (not shown in table) equal to intra-service time at 0.0224. WPUT calculation equal to total time (including discounted postop visit time not shown on table) divided by work.

**2021 Full Value Formula: IWPUT calculation based on pre-service and immediate post-service time intensity of 0.043 (equal to WPUT for 99213) and same-day post EM at full value instead of discounted time for outpatient procedure as shown on table (highlighted in red).

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed)
49560 Repair initial incisional or ventral hernia; reducible 090
49570 Repair epigastric hernia (eg, preperitoneal fat); reducible (separate procedure) 090
49585 Repair umbilical hernia, age 5 years or older; reducible 090
49590 Repair spigelian hernia 090
49652 Laparoscopy, surgical, repair, ventral, umbilical, spigelian or epigastric hernia (includes mesh insertion, when performed); reducible 090
49654 Laparoscopy, surgical, repair, incisional hernia (includes mesh insertion, when performed); reducible 090
49568 Implantation of mesh or other prosthesis for open incisional or ventral hernia repair or mesh for closure of debridement for necrotizing soft tissue infection (List separately in addition to code for the incisional or ventral hernia repair) ZZZ

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty general surgery How often? Commonly

Specialty colorectal surgery How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and <u>percentage</u> for each specialty. Please explain the rationale for this estimate. National frequency not available

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?
12,662 If this is a recommendation from multiple specialties please estimate frequency <u>and percentage</u> for each specialty. Please explain the rationale for this estimate.

Specialty General Surgery Frequency 11396 Percentage 90.00 %

Specialty Colorectal Surgery Frequency 633 Percentage 4.99 %

Specialty Other Surgery Frequency 633 Percentage 4.99 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 11008

Letter Referenced in Compelling Evidence Rationale

November 29, 2011

The Honorable Kathleen Sebelius
Secretary
Department of Health and Human Services
Hubert H. Humphrey Building
200 Independence Avenue SW
Washington, DC 20201

Re: CY 2012 Medicare Physician Fee Schedule Final Rule and CMS
Refinement Panels

Dear Secretary Sebelius:

On November 28, 2011, the Federal Register published the Centers for Medicare and Medicaid Services' (CMS) Calendar Year (CY) 2012 Medicare Physician Fee Schedule Final Rule. On behalf of the American College of Surgeons (ACS), I am writing to express concern regarding the decision making process and lack of transparency on the part of CMS related to the work relative value units (wRVUs) for 2012 reviewed under CMS' refinement panel process. The ACS, with over 78,000 members, is a scientific and educational organization of surgeons that was founded in 1913 to raise the standards of surgical practice and to improve the care of the surgical patient.

The ACS has participated in the efforts of the American Medical Association's Relative Value Scale Update Committee (AMA RUC) for years given the value we place on the AMA RUC process and our assumption that CMS will evaluate

the RUC recommendations with fairness, transparency, and accuracy according to a process that has been set out via the Federal rulemaking process. As part of the work that led to the CY 2012 Medicare Physician Fee Schedule Final Rule, the ACS devoted significant resources to conducting AMA RUC surveys for over 100 new or existing codes at the request of CMS. The AMA RUC evaluated wRVU recommendations made by the ACS, based upon those surveys, and came to agreement on final recommended values to be submitted to CMS.

Fifty-seven of the aforementioned codes that the ACS surveyed were sent to the refinement panel. CMS accepted ***only 12 percent*** of those refinement panel recommendations.

For most of the 88 percent of refinement panel recommendations that CMS rejected, CMS lowered the wRVU by reducing the value of the post-operative evaluation and management work performed by surgeons in the hospital by 69 percent. However, if that same work is performed by any other physician other than the surgeon, that same service is paid at 100 percent. We believe that the refinement panel physicians completely rejected this concept as they agreed to a work RVU that did not discount post-surgical work in this fashion. We note that the multispecialty panel included physicians from primary care, contractor medical directors (CMDs), physicians in related specialties, and general surgeons. At no time did the Agency's Medical Officer in charge of the panel process disagree with the presenters or offer a contrary opinion to the discussion.

Our concerns were piqued when CMS issued the CY 2011 Medicare Physician Fee Schedule Final Rule in which CMS stated that it could change wRVU recommendations of the refinement panel convened by CMS if "policy concerns warrant their modification," without providing additional clarification on what would trigger this ability of CMS to subvert the more transparent process of the refinement panel. However, we continued to participate in the process under the belief that CMS would operate fairly and transparently and that if there were indeed "policy concerns" that CMS had regarding the values of the codes under consideration that those concerns would be stated clearly so all parties could address them during the refinement panel reviews.

CMS has now implemented a policy by which it is creating differential payments for the same work performed by different physicians as a backdoor mechanism for reducing the work RVUs for surgical procedures. They have valued the worth of a surgeon for post-operative evaluation and management work at about 30 percent of a non-surgeon.. Non-surgeons are allowed to provide the same work to the same patient at 100 percent reimbursement. First, we believe that this policy leads to a loss of validity and integrity of the current system. In addition, this policy is prohibited by the Omnibus Budget Reconciliation Act of 1989, which states, "[t]he Secretary may not vary the conversion factor or the number of relative value units for a physicians' service based on whether the physician furnishing the service is a specialist or based on the type of specialty of the physician." (42 U.S.C. §1395w-4(c)(6)).

The ACS has been a vocal proponent of needed reforms in the delivery and payment of health care. We believe that the future of these reforms will be based on driving greater awareness of proven continuous quality improvement programs to achieve ongoing, tangible results for quality improvements. However, in order for these reforms to be effective, they must be built on a system that is consistent with previous Agency decisions, fair, and transparent, and it is our concern that many of the policy decisions made by CMS in the latest Medicare Physician Fee Schedule Final Rule move us away from those goals. The resource based relative value system (RBRVS) requires a resource basis for decisions on the valuation of physician services. We believe that the resource basis for the decision to reduce these values is not evident. We ask that under your authority as Secretary you will seek to have CMS define a more transparent process in the future for decisions that are not aligned with the RUC and refinement panel recommendations in order to help maintain the transparency and fairness of the current system and to restore the values of these services to the level that is supported by the RBRVS process.

Sincerely,
David B. Hoyt, MD, FACS
Executive Director

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:49594 Tracking Number C5 Original Specialty Recommended RVU: **16.65**
Presented Recommended RVU: **16.65**
Global Period: 000 Current Work RVU: RUC Recommended RVU: **14.00**

CPT Descriptor: Repair of anterior abdominal hernia(s) (ie, epigastric, incisional, ventral, umbilical, spigelian), any approach (ie, open, laparoscopic, robotic), initial including placement of mesh or other prosthesis, when performed total length of defect(s); 3 cm to 10 cm, incarcerated or strangulated

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 60-year-old obese male with a prior laparotomy has developed an incisional hernia in the midline incision. Over the past few months, the defect has become chronically protuberant. He reports increasing pain and discomfort. Physical exam reveals a hernia that is tender and nonreducible by manual manipulation. He undergoes hernia repair of a defect that is 3 to 10 cm with placement of mesh.

Percentage of Survey Respondents who found Vignette to be Typical: 85%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 12% , Overnight stay-less than 24 hours 32% , Overnight stay-more than 24 hours 56%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 94%

Description of Pre-Service Work: Results of preadmission testing (imaging, electrocardiogram and labs) are reviewed. Appropriate selection, timing, and administration of DVT prophylaxis are ensured. Appropriate selection, timing, and administration of antibiotics are ensured. The need for beta-blockers is assessed, and they are ordered as required. The patient is reexamined to confirm that physical findings have not changed, the patient's medication regimen has remained the same, the patient has no new allergies, and the patient has not undergone any recent procedures. The history and physical examination are then updated in the electronic health record. The planned procedure and postoperative management are reviewed with the patient and family. Informed consent is reviewed and obtained from the patient, including witness confirmation. The masses of the incarcerated hernia contents are palpated obscuring the edge of the hernia defect(s). The sites of the proposed skin incisions are marked with cooperation of patient. The length and type of anesthesia, including adjuncts to postoperative analgesia management, are reviewed with the anesthesiologist. Verify that all required instruments and supplies are available, including reusable and disposable laparoscopic/robotic equipment and mesh. Assistance is provided in transfer of the patient from gurney to operating table. Monitor/assist with positioning of patient, including padding and securing patient to table that will adjust throughout procedure (eg, reverse Trendelenburg). Assist anesthesia team with line placement and induction of anesthesia and intubation, relative to all laparoscopic/robotic equipment. The areas of skin to be prepared and draped are indicated by the surgeon to ensure that all of the potential operative field is included in the preparation. The surgeon scrubs and gowns. A surgical time-out is performed with operating surgical team.

Description of Intra-Service Work: Abdominal access is obtained and a safe pneumoperitoneum is created with placement of a needle/trocar in the left upper quadrant. The camera is inserted and safe entry is verified. Additional trocars are placed in the lateral abdomen, under direct vision. A large field of adhesions occupies approximately half of the abdominal wall correlating with the extent of the prior laparotomy. Adhesions to the abdominal wall are divided sharply to free the anterior abdominal wall adequately for subsequent mesh landing. The incarcerated/strangulated bowel, mesentery and omentum are carefully reduced with dissection of the adhesions and sac to clear the defects for repair. Care is taken to avoid injury to the incarcerated intestine and omentum. Each separate defect within the overall hernia defect contains a separate component of adipose and intestine that requires safe reduction. This requires manipulation both intra-abdominally with minimally

invasive instrumentation and extra-abdominally with palpation and pressure applied to the abdominal wall to reduce the incarcerated contents. The reduced tissue is examined for viability and any inadvertent injury. The hernia sac is reduced and resected as needed to expose the fascial edges of the defect(s). The hernia defect is visualized. The falciform ligament and preperitoneal fat are cleared from the abdominal wall fascia to expose the posterior fascia. All of the defects are measured and summed with a minimum of 3 cm and maximum of 10 cm. Peritoneal flaps are created for placement of mesh. When appropriate, the fascial defect is approximated with sutures. A mesh is selected to provide adequate overlap of the hernia defect. The mesh is introduced into the peritoneal cavity through a trocar and is oriented. Insufflation is reduced to facilitate mesh conformity to the anterior abdominal wall. The mesh is secured to the abdominal wall utilizing multiple sutures and tacks. Completion camera survey is performed of the abdomen and contents to inspect for bleeding and visceral injury and perform a final viability assessment of the material once incarcerated in the hernia sac. Irrigation is performed as necessary. Fascial incisions from laparoscopic ports larger than 1 cm are closed with a suture passer. Skin incisions are closed according to surgeon preference.

Description of Post-Service Work:
Immediate postoperative care [operative day through discharge from recovery room]: Apply sterile dressings. Monitor patient during reversal of anesthesia. Assist in transfer of patient from operating table to gurney. Monitor transport of patient from operating room to recovery room. Discuss postoperative recovery care with anesthesia and nursing staff, including need for patient-controlled analgesia. Discontinue prophylactic antibiotic therapy, as appropriate. Review postoperative labs. Discuss procedure and outcome with family in waiting area. Write brief operative note or complete final operative note and place in chart. Write postoperative note in the recovery room. Dictate operative report and copy referring physician(s). Call referring physician(s). Write orders for transferring to observation or general surgical floor and discuss ongoing care with nursing staff.

Later same day hospital observation care visit [operative day after discharge from recovery room]: Review interval nursing/other staff chart notes. Discuss ongoing care with nursing staff. Evaluate vital signs and intake/output. Auscultate heart, lungs, and abdomen for bowel sounds. Monitor fluid and electrolyte status and renal function; monitor for problems such as ileus, intestinal ischemia, and urinary retention. Examine patient, check wounds, and change dressings. Continue prophylaxis for DVT. Assess need for beta-blockers, order as required. Assess pain scores and adequacy of analgesia. Write orders for labs, films, medications, diet, and patient activity. Chart patient progress notes. Answer patient and family questions. Answer nursing/other staff questions. Advance diet, as appropriate.

• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	17%	33%	50%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

RAW Screen

Code 49565, *Repair recurrent incisional or ventral hernia; reducible*, was identified by the RUC/RAW with a site of service anomaly: less than 50% inpatient status; includes inpatient visit codes; greater than 5,000 utilization. Prior to

submitting an Action Plan to the RAW, the societies reviewed the site of service data and found: almost even split of 48% between inpatient and outpatient – with a few percent in the ASC. At the January 2020 RUC meeting, the societies requested referral of code 49565 to CPT to update the descriptor to current standard of practice and typical patient presentation.

CPT Coding Changes

At the February 2021 CPT meeting the following changes were approved:

- Delete all the current open and laparoscopic codes for repair of anterior abdominal hernias.
- Delete add-on code 49568 for mesh for open ventral/incisional hernias and large defects as a result of necrotizing soft tissue infection.
- Add 12 new codes for anterior abdominal hernia repair by any approach (ie, open laparoscopic, robotic); by initial or recurrent; by total defect size; and by reducible or incarcerated/strangulated
- Add 2 codes for parastomal hernia repair - by reducible or incarcerated/strangulated
- Add 1 add-on code for removal of mesh/prosthesis – only with the new hernia repair codes
- Add 1 new code for mesh/prosthesis for delayed closure of external genitalia, perineum and/or abdominal wall defect(s) due to soft tissue infection or trauma.

Coding Structure

Hernia repair for epigastric, incisional, ventral, umbilical, spigelian were merged as they all appear on the anterior abdomen. The location--upper, lower, midline—does not impact the work. But instead, the size and number of defects is the driving factor for work. For example, with respect to the code that was tagged by the RAW, a recurrent, incisional, reducible hernia can be anywhere from a small hernia at a port site from a prior laparoscopic procedure to an extremely large hernia with multiple defects clustered in a midline incision.

Initial versus recurrent differentiation was maintained. Recurrent hernias are re-reoperations. An initial hernia can be the result of a prior procedure (this is not a recurrent hernia) or weak muscles and fascia. A recurrent hernia is typically at least the third time the same site is being operated on.
For example,

- operation 1 might be an open colectomy
- operation 2 would be an initial midline hernia repair
- operation 3 would be a recurrent midline hernia involving the initial midline repair and may include other multiple hernias occurring in the same old incision, all needing to be repaired.

There are many examples in CPT that differentiate between a primary and secondary procedure: disarticulation of shoulder (23920-23921); amputation of arm through humerus (24900-24930) and other similar amputation families; tendon repair (eg, 25260-25274); CABG reoperation (33530); and revision total joint (eg, 23473, 23474, 24370, 24371, 27134-27138).

The hernia size ranges were based on a review of literature and expert panel. For example, an article published in the Journal of the American College of Surgeons reviewed technique and outcomes of abdominal incisional hernia repair and showed that the range of defect size was from less than 1 cm to more than 25 cm with a mean of 6 cm and a median of less than 3 cm. Other similar articles were submitted with the code change application, supporting different work for different defect size. David A. Iannitti, et.al, *Technique and Outcomes of Abdominal Incisional Hernia Repair Using a Synthetic Composite Mesh: A Report of 455 Cases,* Journal of the American College of Surgeons, Volume 206, Issue 1, 2008, Pages 83-88, ISSN 1072-7515, https://doi.org/10.1016/j.jamcollsurg.2007.07.030.

Differentiating the work of a procedure in relationship to size or extent is not new for CPT. For example, 36 skin repair codes by length of repair; 44 lesion excision codes by excised diameter; 46 soft tissue tumor excision codes by size of tumor; 23 hysterectomy codes by size of uterus (58260-58573); 3 myomectomy codes are differentiated by total weight of the myomas (58140-58146); and 10 nerve graft codes are based on length of graft. (64885-64898)

The CPT guidelines and illustrations that describe how to measure the total defect size are well understood by surgeons. This is not a new concept – surgeons are very familiar with measuring a hernia defect, and in fact the size of the hernia defect was included in some of the patient vignettes in 1993. Furthermore, measurement of hernia size is a necessary step for selecting and preparing the appropriately sized mesh for implantation.

Hernia repair coding has been complicated by changes in (1) technology and technique and (2) the recent implementation of ICD-10-PCS codes. For these reasons, the stakeholder societies believed this set of codes should

describe "any approach." The societies and the AMA Coding Network have received numerous coding questions about correct reporting for "hybrid" abdominal hernia repair procedures where parts of the procedure are performed via an open approach and parts of the procedure are performed via laparoscopy or with the use of a robot. These are not laparoscopic procedures converted to open procedures, but instead procedures that are more often begun open and then finished as laparoscopic/robotic under pneumoperitoneum.

Another issue that has recently caused confusion about coding has appeared on national coder websites and coder discussion boards referring to International Classification of Diseases Tenth Revision Procedure Coding System (ICD-10-PCS) codes which classifies procedures performed in the facility (ie, not CPT physician procedures). This, however, is important because facilities want the procedure codes reported to correspond with the descriptors of ICD-10-PCS codes that the facility is reporting. Unfortunately, the new ICD-10-PCS codes define various surgical approaches that do not correspond to CPT coding (open, closed, percutaneous, and laparoscopic). For example, the ICD-10-PCS "open endoscopic" approach is defined as "cutting through the skin or mucous membrane and any other body layers necessary to expose a body part, and introduction of instrumentation to reach and visualize the site of the procedure." A second example is the "open with percutaneous endoscopic assistance" approach defined as "cutting through the skin or mucous membrane and any other body layers necessary to expose the site of the procedure, and entry, by puncture or minor incision, of instrumentation through the skin or mucous membrane and any other body layers necessary to aid in the performance of the procedure." These new ICD-10-PCS codes have resulted in coders stating that a procedure should be reported as open because the ICD-10-PCS code indicates open and to report any procedure that includes extension of a port incision (eg, for delivery of a specimen) to be reported as an open procedure --instead of being correctly reported as a laparoscopic procedure.

Mesh

- **Implantation of mesh is now typical and therefore was bundled into the new codes.** When code 49568 was created in 1993, mesh implantation with hernia repairs was not typical. This is supported by the typical patient described in 1993 as having a 10 cm midline incisional hernia – a very large hernia. With research on the causes of hernia recurrence, changes in technology and development of new types of mesh or other prosthesis, implantation of mesh is now typical for all types of hernias and all sizes to reduce the incidence of recurrence. This was supported by the literature submitted with the CCA.

- **Mesh removal is not always required and is not typical.** Technology and research have developed types of mesh that are now being implanted which are incorporated into the abdominal wall, reducing the risk of infection, complications, and recurrence. When mesh removal is indicated, it is typically due to hardening and fracturing of aged mesh, or when gross contamination and infection has occurred (eg, enterocutaneous fistula involving the mesh). For example, a recurrent hernia repair may require removal of fractured, brittle (old technology) mesh many years after an open repair following a colectomy. This work is typically significant, in that the mesh is often integrated with the abdominal wall or adhered to intestine, and involves removal of all of the mesh, not just a small portion. An add-on code to report mesh removal prior to hernia repair, when required, allows for accurate reporting of this work only when performed, which our expert panel believes is not typical of most hernia repairs.

- **Deletion of code 49658 resulted in rare "left over" work for implantation of mesh related to closure for a large open wound after debridement for necrotizing fasciitis.** Add-on code 46958 was reported for mesh placement for both open hernia repair and in relation to closure of wounds from necrotizing soft tissue infection. This code will be deleted and the work of mesh placement will be included in the work for all of the anterior abdominal hernia repair codes. The remaining use of code 46958 was for mesh placement for delayed closure of external genitalia, perineum and/or abdominal wall defect(s) due to soft tissue infection or trauma. As described in the vignette for 15778, necrotizing soft tissue infections typically result in a large open wound that cannot be closed primarily. When the infection has resolved, absorbable mesh or other prosthesis is placed to allow healing by secondary intent until such time that a skin graft or skin closure can be accomplished. The literature submitted with the CCA supports this work.

Compelling Evidence - Flawed methodology of previous reviews, New technology

Flawed Methodology: Codes 49560, 49561, 49565, 49566, 49570, 49572, 49580, 49582, 49585, and 49590 were last reviewed in 2000 during the 2nd 5-year-review. During this review, the American College of Surgeons argued that there was compression of work values for big procedures and there were rank order issues within families of codes. We developed a methodology using NSQIP data that was approved by the Research Subcommittee. However, to validate the methodology, the 5YR Workgroup instructed the ACS to group the codes into families and survey one or two CPT codes as full surveys per family to act as anchors for each family and the rest of the codes to be surveyed as mini-

surveys for only time and visits. After conducting all of the surveys, we believe we were able to validate the methodology that we proposed, however, the 5YR Workgroup did not agree. Instead, they decided that the value that they assigned to the anchor code (the full survey) would be extrapolated to all of the other codes grouped into the same survey. The hernia codes listed above were grouped with 49505 which was increased by 17% based on the survey data and compelling evidence. The 17% increase was applied to the other codes in the group without consideration of rank order, mini survey results or society recommendations. This resulted in continuation of compression and rank order issues. For example, although code 49572 was increased by 17%, the IWPUT for the code is negative. Other codes have near zero IWPUT. **We believe this was a flawed methodology of review of the codes and meets compelling evidence.**

Flawed Methodology: Codes 49587, 49652, 49653, 49654, and 49655 were last reviewed in 2011 based on a site of service anomaly screen. At that time, the RUC approved including a same day observation visit and full observation discharge on the subsequent day. The RUC noted that the typical patient requires close monitoring for problems such as ileus, intestinal ischemia and urinary retention. Additionally, there will be significant pain post-operatively requiring management before discharge. The specialty noted, and the RUC agreed, that the shift in patient facility status (in patient moving to outpatient—as determined by CMS) has little to do with healthier patients that require less physician work and everything to do with the recent OPPS changes related to facility reimbursement. This was substantiated by the survey data which showed that the typical patients stayed at least overnight and received a postoperative same-day E/M service. Given this data, the RUC enacted its (then current) policy to allocate the appropriate proxy for the postoperative visits which was categorized as either subsequent observation and/or observation discharge—both of which are outpatient codes. Importantly, the specialties argued and the RUC agreed that the work of providers who care for medical patients should not be discounted (eg, full observation E/M and full observation discharge E/M allowed for patient staying overnight for observation.)

CMS ignored the valid outpatient E/M visit code inputs that the RUC recommended and instead stated in the Rule that they have a policy of not allowing "inpatient" visits included in the details for outpatient services. These codes went through a Refinement Panel process [ie, a CMS convened group of Medical Officers and select physicians acting as a separate formal appeals process] that resulted in agreement with the RUC recommendations. Importantly, the Agency still maintained that inpatient visits would not be allowed (even though outpatient/observation visits were submitted by the RUC) and then used a reverse building block methodology to subtract work RVUs from the values. These values had been developed by magnitude estimation and approved by the RUC. The Agency deleted the observation visit code inputs and decreased discharge management by 50 percent even though it was performed on a subsequent date. **We believe this action by CMS resulted in a flawed methodology of review of these codes and meets compelling evidence.**

The rejection of equal value for equal work and rejection of the Refinement Panel results prompted the Executive Director of the American College of Surgeons to send a letter (see last page of SoR) to Kathleen Sebelius, then Secretary of the Department of Health and Human Services on November 29, 2011. This letter addressed the decision-making process for valuing procedure codes that have Medicare outpatient status, the use of refinement panels, and the arbitrary discount in physician work for the same work performed by any provider of a non-global service. Specifically, the letter included the following statement:

> *"CMS has now implemented a policy by which it is creating differential payments for the same work performed by different physicians as a backdoor mechanism for reducing the work RVUs for surgical procedures. They have valued the worth of a surgeon for post-operative evaluation and management work at about 30 percent of a non-surgeon. Non-surgeons are allowed to provide the same work to the same patient at 100 percent reimbursement. …we believe that this policy leads to a loss of validity and integrity of the current system."*

We continue to believe there is no valid justification for a 50% discount to discharge management services provided by a surgeon that is performed the day after a procedure when a non-surgical provider observing a medical patient who is kept overnight for any reason is allowed to bill a discharge management service at 100 percent for work on the next day. We also believe there is no valid justification for discounting a postoperative visit later the same day of surgery to equal only the intra-service time of the visit multiplied by an intensity of 0.0224. No surgeon would round on a postoperative patient the same day and not review interval chart notes prior to the face-to-face with the patient and not followup with charting the visit and confirming or modifying the current orders.

CMS implemented a 23-hour policy for discounting surgical postoperative work based on the argument that the Agency could not include impatient work in their time/work file. However, the fact is that the Agency has also erroneously

rejected RUC recommendations for outpatient / observation codes, stating "these inpatient codes" could not be included for procedure that are typically outpatient.

Change in Technology: Since the last review of the hernia repair codes (either in 2000 or in 2011), there has been introduction and application of new technology (ie, robotic assist) which adds work complexity and time with the goal of better patient outcomes. The diffusion of this new technology throughout this family of codes further meets compelling evidence.

Recommendation – 49594

We recommend a work RVU of 16.65, which is the survey median.

Pre-service time

Evaluation and scrub, dress, wait package time has been reduced so as to not exceed survey median data. Laparoscopic/robotic anterior abdominal hernia repair positioning time: The patient will initially be positioned supine and upper extremity intravenous and arterial access points are dressed, padded and secured. The arms are padded and tucked at the patient's sides. The patient must be secured to the table, including a soft chest and thigh strap, as it may be necessary to roll the table during the procedure to use gravity to assist with shifting the abdominal contents.. There is also consideration of positioning the patient relative to: laparoscopy equipment, including lines and video equipment and anesthesia lines relative to the rest of the equipment. The survey median positioning time reflects the time for this procedure for these activities.

Postoperative E/M visit later on the day of surgery

The typical patient will stay overnight or longer and there will typically be a visit later on the same day of the procedure at a level of 99232. Review data (eg, diagnostic and imaging studies) not available at the unit. Communicate with other health care professionals and with patient and/or family. Review medical records and data available on the unit. Perform a medically appropriate examination. Consider relevant data, options, and risks; formulate and/or revise diagnosis and treatment plan(s) (moderate complexity MDM). Discuss diagnosis and treatment options with the patient and/or family. Consider discharge needs of patient. Communicate with other health care professionals as necessary. Write and/or review orders, including arranging for necessary diagnostic testing, consultation(s), and therapeutic intervention(s). Complete medical record documentation. Address interval data obtained and reported changes in condition. Communicate results and additional care plans to other health care professionals and to the patient and/or family.

Per CMS policy for reporting postoperative work for 23-hour stay procedures, the intraservice time of 20 minutes for 99232 has been added to the survey immediate postoperative time (total = 40 min).

Key Reference Code Intensity/Complexity Comparison

Ref 1: The respondents indicated the intensity/complexity of survey code 49594 is somewhat more than reference code 11005. Ref 2: The respondents indicated the intensity/complexity of survey code 49594 is similar to somewhat more than reference code 33889.

MPC Code Comparison

MPC code 37244 has the highest RVW for the set of 0-day global codes.

CPT	DESCRIPTOR	RVW	IWPUT	WPUT	TOTAL TIME	PRE	INTRA	POST	SD E/M
37244	Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; for arterial or venous hemorrhage or lymphatic extravasation	**13.75**	0.135	0.083	166	31	90	45

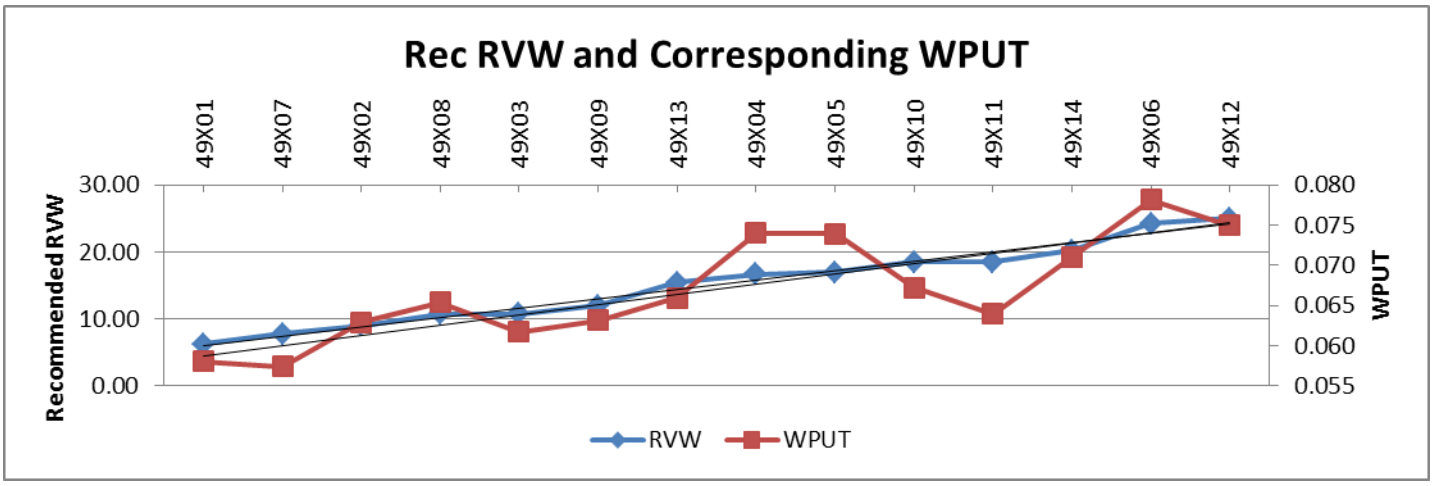
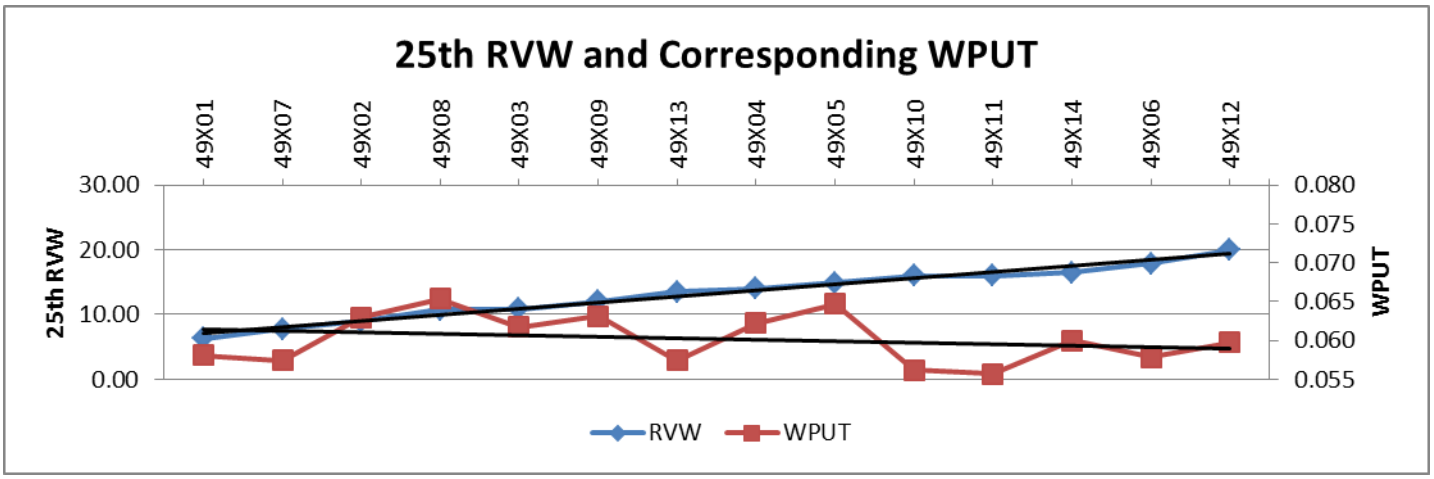
Relativity Assessment

Recommended RVW vs Total Time

The chart below that compares the recommended RVW and total time shows good correlation.



The data below that were used to create the chart above show appropriate relative rank order for work for this new set of hernia repair codes.



CPT	DESC		REC RVW	Total Time
49591	Initial, Reduc, < 3cm	25th	6.27	108
49613	Recurrent, Reduc, < 3cm	25th	7.75	135
49592	Initial, I/S, < 3cm	25th	9.00	143
49614	Recurrent, I/S, < 3cm	25th	10.79	165
49593	Initial, Reduc, 3-10cm	25th	10.80	175
49615	Recurrent, Reduc, 3-10cm	25th	12.00	190
49621	Parastomal, Reduc	median	15.50	235
49594	Initial, I/S, 3-10cm	median	16.65	225
49595	Initial, Reduc, > 10cm	median	17.00	230
49616	Recurrent, I/S, 3-10cm	median	18.50	275
49617	Recurrent, Reduc, > 10cm	median	18.53	288
49622	Parastomal, I/S	75th	20.25	285

49596	**Initial, I/S,** > 10cm	75th	**24.24**	**310**
49618	**Recurrent, I/S, > 10cm**	75th	**25.00**	**335**

Comparison of using the recommended RVW versus using the 25th percentile.

The first chart below shows reasonable correlation between the recommended RVW and WPUT—both trend lines have a similar slope. The second chart below shows no relationship of WPUT to the 25th percentile RVW—where WPUT decreases as work increases.

What if surgeon evaluation and management work were set equal to discrete E/M services?

As has been discussed by the RUC in the past, work intensities used for computation of IWPUT for time spent by physicians in the pre-service and immediate post-service period for surgical procedures have remained fixed since the early 1990s, while intensity of time for E/M values has received several increased values over several decades.

Recent increases for outpatient office E/M values were not allowed to be added to global codes by CMS. Because IWPUT is calculated by subtracting the pre- and post-work values from the RVW of a given CPT code, this has resulted in less value subtracted than would have occurred if the more appropriate pre- and post-work values were used for the IWPUT formula. This artificially increases the IWPUT and WPUT resulting in a decrease in relativity. This is especially true for codes that have a significant amount of pre-service and post-service work.

It has become difficult to compare IWPUT (and WPUT) for codes with different global periods because of the level of discounting of pre-service and post-service work. For example, for the top 34 high volume 10 and 90 day global codes, AMA staff recently calculated the difference in IWPUT if the office visit increases were used in the IWPUT equation. The AMA table, which is included in the Research Subcommittee agenda for this meeting, showed that the IWPUT would have decreased from -6% to -548% depending on the number of office visits included in the work/time file. To emphasize the importance of this information, the code which would have had the largest decrease (17000) has 3

minutes of intra-time and only one postop office visit (99212). In this table, it was also clear that relativity within a family of codes is lost, because each code within a family may have varying levels of post-service work. To summarize, IWPUT has become much less accurate when used as a comparator of intra-service work within and between families because of CMS actions (ie, not updating global RVW) and policy (ie, discounting postoperative work).

Using the discussion above, we have created the table below that presents the IWPUT and WPUT for the hernia set of codes using (1) the 2021 formulas, and (2) "full value" formulas. The note below the table describes each formula, but basically the full value formula sets pre- and post-service work equal to the same E/M work for non-surgical services. For comparison to facility non-surgical services, we have included codes 99283-99285 using the 2021 published RVW and time data. This table shows that most of the recommendations for 49591-49622 result in a WPUT that is less than an ED visit requiring moderate MDM (99284). This table also shows that those codes with similar WPUT to high MDM are appropriately the bigger and more complex procedures. Last, this table provides evidence that discounting pre- and post-work distorts and artificially impacts fair IWPUT and WPUT relativity comparison. However, if undiscounted work is applied, the recommendations for this set of codes are appropriately ranked.

* 2021 Formula: IWPUT calculation based on evaluation, positioning, immediate post intensity of 0.0224; scrub/dress/wait intensity of 0.0081; and discounted same-day outpatient postop visit (not shown in table) equal to intra-service time at 0.0224. WPUT calculation equal to total time (including discounted postop visit time not shown on table) divided by work.

**2021 Full Value Formula: IWPUT calculation based on pre-service and immediate post-service time intensity of 0.043 (equal to WPUT for 99213) and same-day post EM at full value instead of discounted time for outpatient procedure as shown on table (highlighted in red).

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.

- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed)
49561 Repair initial incisional or ventral hernia; incarcerated or strangulated 090
49572 Repair epigastric hernia (eg, preperitoneal fat); incarcerated or strangulated090
49587 Repair umbilical hernia, age 5 years or older; incarcerated or strangulated 090
49590 Repair spigelian hernia 090
49653 Laparoscopy, surgical, repair, ventral, umbilical, spigelian or epigastric hernia (includes mesh insertion, when performed); incarcerated or strangulated 090
49655 Laparoscopy, surgical, repair, incisional hernia (includes mesh insertion, when performed); incarcerated or strangulated 090
49568 Implantation of mesh or other prosthesis for open incisional or ventral hernia repair or mesh for closure of debridement for necrotizing soft tissue infection (List separately in addition to code for the incisional or ventral hernia repair) ZZZ

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty general surgery How often? Sometimes

Specialty colorectal surgery How often? Rarely

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National frequency not available

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 7,231
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Specialty estimate - See supplemental file with details

Specialty General Surgery Frequency 6508 Percentage 90.00 %

Specialty Colorectal Surgery Frequency 362 Percentage 5.00 %

Specialty Other Surgery Frequency 362 Percentage 5.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 11008

Letter Referenced in Compelling Evidence Rationale

November 29, 2011

The Honorable Kathleen Sebelius
Secretary
Department of Health and Human Services
Hubert H. Humphrey Building
200 Independence Avenue SW
Washington, DC 20201

Re: CY 2012 Medicare Physician Fee Schedule Final Rule and CMS
Refinement Panels

Dear Secretary Sebelius:

On November 28, 2011, the Federal Register published the Centers for Medicare and Medicaid Services' (CMS) Calendar Year (CY) 2012 Medicare Physician Fee Schedule Final Rule. On behalf of the American College of Surgeons (ACS), I am writing to express concern regarding the decision making process and lack of transparency on the part of CMS related to the work relative value units (wRVUs) for 2012 reviewed under CMS' refinement panel process. The ACS, with over 78,000 members, is a scientific and educational organization of surgeons that was founded in 1913 to raise the standards of surgical practice and to improve the care of the surgical patient.

The ACS has participated in the efforts of the American Medical Association's Relative Value Scale Update Committee (AMA RUC) for years given the value we place on the AMA RUC process and our assumption that CMS will evaluate the RUC recommendations with fairness, transparency, and accuracy according to a process that has been set out via the Federal rulemaking process. As part of the work that led to the CY 2012 Medicare Physician Fee Schedule Final Rule, the ACS devoted significant resources to conducting AMA RUC surveys for over 100 new or existing codes at the request of CMS. The AMA RUC evaluated wRVU recommendations made by the ACS, based upon those surveys, and came to agreement on final recommended values to be submitted to CMS.

Fifty-seven of the aforementioned codes that the ACS surveyed were sent to the refinement panel. CMS accepted ***only 12 percent*** of those refinement panel recommendations.

For most of the 88 percent of refinement panel recommendations that CMS rejected, CMS lowered the wRVU by reducing the value of the post-operative evaluation and management work performed by surgeons in the hospital by 69 percent. However, if that same work is performed by any other physician other than the surgeon, that same service is paid at 100 percent. We believe that the refinement panel physicians completely rejected this concept as they agreed to a work RVU that did not discount post-surgical work in this fashion. We note that the multispecialty panel included physicians from primary care, contractor medical directors (CMDs), physicians in related specialties, and general surgeons. At no time did the Agency's Medical Officer in charge of the panel process disagree with the presenters or offer a contrary opinion to the discussion.

Our concerns were piqued when CMS issued the CY 2011 Medicare Physician Fee Schedule Final Rule in which CMS stated that it could change wRVU recommendations of the refinement panel convened by CMS if "policy concerns warrant their modification," without providing additional clarification on what would trigger this ability of CMS to subvert the more transparent process of the refinement panel. However, we continued to participate in the process under the belief that CMS would operate fairly and transparently and that if there were indeed "policy concerns" that CMS had regarding the values of the codes under consideration that those concerns would be stated clearly so all parties could address them during the refinement panel reviews.

CMS has now implemented a policy by which it is creating differential payments for the same work performed by different physicians as a backdoor mechanism for reducing the work RVUs for surgical procedures. They have valued the worth of a surgeon for post-operative evaluation and management work at about 30 percent of a non-surgeon.. Non-surgeons are allowed to provide the same work to the same patient at 100 percent reimbursement. First, we believe that this policy leads to a loss of validity and integrity of the current system. In addition, this policy is prohibited by the Omnibus Budget Reconciliation Act of 1989, which states, "[t]he Secretary may not vary the conversion factor or the number of relative value units for a physicians' service based on whether the physician furnishing the service is a specialist or based on the type of specialty of the physician." (42 U.S.C. §1395w-4(c)(6)).

The ACS has been a vocal proponent of needed reforms in the delivery and payment of health care. We believe that the future of these reforms will be based on driving greater awareness of proven continuous quality improvement programs to achieve ongoing, tangible results for quality improvements. However, in order for these reforms to be effective, they must be built on a system that is consistent with previous Agency decisions, fair, and transparent, and it is our concern that many of the policy decisions made by CMS in the latest Medicare Physician Fee Schedule Final Rule move us away from those goals. The resource based relative value system (RBRVS) requires a resource basis for decisions on the valuation of physician services. We believe that the resource basis for the decision to reduce these values is not evident. We ask that under your authority as Secretary you will seek to have CMS define a more transparent process in the future for decisions that are not aligned with the RUC and refinement panel recommendations in order to help maintain the transparency and fairness of the current system and to restore the values of these services to the level that is supported by the RBRVS process.

Sincerely,
David B. Hoyt, MD, FACS
Executive Director

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:49595 Tracking Number C6 Original Specialty Recommended RVU: **17.00**
Presented Recommended RVU: **17.00**
Global Period: 000 Current Work RVU: RUC Recommended RVU: **14.88**

CPT Descriptor: Repair of anterior abdominal hernia(s) (ie, epigastric, incisional, ventral, umbilical, spigelian), any approach (ie, open, laparoscopic, robotic), initial including placement of mesh or other prosthesis, when performed total length of defect(s); greater than 10 cm, reducible

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 64-year-old obese male with a prior laparotomy has developed incisional hernias with defects of varying sizes at multiple points. He has symptoms of pain and tenderness at the sites. Physical exam reveals multiple reducible incisional hernias. He undergoes hernia repair of a defect that totals more than 10 cm with placement of mesh.

Percentage of Survey Respondents who found Vignette to be Typical: 90%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 3% , Overnight stay-less than 24 hours 48% , Overnight stay-more than 24 hours 50%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 87%

Description of Pre-Service Work: Results of preadmission testing (imaging, electrocardiogram and labs) are reviewed. Appropriate selection, timing, and administration of DVT prophylaxis are ensured. Appropriate selection, timing, and administration of antibiotics are ensured. The need for beta-blockers is assessed, and they are ordered as required. The patient is reexamined to confirm that physical findings have not changed, the patient's medication regimen has remained the same, the patient has no new allergies, and the patient has not undergone any recent procedures. The history and physical examination are then updated in the electronic health record. The planned procedure and postoperative management are reviewed with the patient and family. Informed consent is reviewed and obtained from the patient, including witness confirmation. The palpable edge of the hernia defect(s) and sites of the proposed skin incisions are marked with cooperation of patient. The length and type of anesthesia, including adjuncts to postoperative analgesia management, are reviewed with the anesthesiologist. Verify that all required instruments and supplies are available, including reusable and disposable laparoscopic/robotic equipment and mesh. Assistance is provided in transfer of the patient from gurney to operating table. Monitor/assist with positioning of patient, including padding and securing patient to table that will adjust throughout procedure (eg, reverse Trendelenburg). Assist anesthesia team with line placement and induction of anesthesia and intubation, relative to all laparoscopic/robotic equipment. The areas of skin to be prepared and draped are indicated by the surgeon to ensure that all of the potential operative field is included in the preparation. The surgeon scrubs and gowns. A surgical time-out is performed with operating surgical team.

Description of Intra-Service Work: Abdominal access is obtained and a safe pneumoperitoneum is created with placement of a needle/trocar. As the hernia extends across the majority of the anterior abdominal wall, location for insertion of the needle/trocar is selected based on the prior surgical history and the safest location to avoid intra-abdominal injury. The camera is inserted and safe entry is verified. Additional trocars are placed in the lateral abdomen, and in additional areas as needed, all under direct vision. A field of adhesions occupies the entire anterior abdominal wall correlating with the extent of the prior laparotomy. The adhesions are divided sharply to free the anterior abdominal wall completely taking great care to avoid injury to the intestine. Each separate defect within the entire hernia defect contains adipose and intestinal components and requires a safe and effective clearance of tissue. The hernia defect is visualized. The falciform ligament and preperitoneal fat are cleared from the abdominal wall fascia to expose the posterior fascia to include wide lateral clearance for adequate later mesh coverage. Peritoneal flaps are created for placement of mesh . The fascial defect is

approximated with sutures placed along the entire length of the defect. The appropriate size mesh is calculated after total defect length is documented. Adequate overlap of at least 5 cm in all directions is included in the calculation. A trocar is removed from the abdominal wall and the track is dilated to allow insertion of the large mesh into the peritoneal cavity. The mesh is oriented intra-abdominally. Insufflation is reduced to facilitate mesh conformity to the anterior abdominal wall. The mesh is secured to the abdominal wall utilizing multiple sutures and numerous tacks. The peritoneal flaps are then sutured over the mesh to protect it from the abdominal viscera. Completion camera survey is performed of the abdomen and contents to inspect for bleeding and visceral injury. Irrigation is performed as necessary. Fascial incisions from laparoscopic ports larger than 1 cm are closed with a suture passer. Skin incisions are closed according to surgeon preference.

Description of Post-Service Work:
Immediate postoperative care [operative day through discharge from recovery room]: Apply sterile dressings. Monitor patient during reversal of anesthesia. Assist in transfer of patient from operating table to gurney. Monitor transport of patient from operating room to recovery room. Discuss postoperative recovery care with anesthesia and nursing staff, including need for patient-controlled analgesia. Discontinue prophylactic antibiotic therapy, as appropriate. Review postoperative labs. Discuss procedure and outcome with family in waiting area. Write brief operative note or complete final operative note and place in chart. Write postoperative note in the recovery room. Dictate operative report and copy referring physician(s). Call referring physician(s). Write orders for transferring to observation or general surgical floor and discuss ongoing care with nursing staff.

Later same day hospital observation care visit [operative day after discharge from recovery room]: Review interval nursing/other staff chart notes. Discuss ongoing care with nursing staff. Evaluate vital signs and intake/output. Auscultate heart, lungs, and abdomen for bowel sounds. Monitor fluid and electrolyte status and renal function; monitor for problems such as ileus, intestinal ischemia, and urinary retention. Examine patient, check wounds, and change dressings. Continue prophylaxis for DVT. Assess need for beta-blockers, order as required. Assess pain scores and adequacy of analgesia. Write orders for labs, films, medications, diet, and patient activity. Chart patient progress notes. Answer patient and family questions. Answer nursing/other staff questions. Advance diet, as appropriate.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	20%	20%	30%	30%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	10%	40%	50%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	40%	60%
Physical effort required	20%	30%	50%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	10%	20%	70%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	20%	60%	20%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	20%	80%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	20%	80%
Physical effort required	0%	40%	60%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	20%	40%	40%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

RAW Screen

Code 49565, *Repair recurrent incisional or ventral hernia; reducible*, was identified by the RUC/RAW with a site of service anomaly: less than 50% inpatient status; includes inpatient visit codes; greater than 5,000 utilization. Prior to

submitting an Action Plan to the RAW, the societies reviewed the site of service data and found: almost even split of 48% between inpatient and outpatient – with a few percent in the ASC. At the January 2020 RUC meeting, the societies requested referral of code 49565 to CPT to update the descriptor to current standard of practice and typical patient presentation.

CPT Coding Changes

At the February 2021 CPT meeting the following changes were approved:

- Delete all the current open and laparoscopic codes for repair of anterior abdominal hernias.
- Delete add-on code 49568 for mesh for open ventral/incisional hernias and large defects as a result of necrotizing soft tissue infection.
- Add 12 new codes for anterior abdominal hernia repair by any approach (ie, open laparoscopic, robotic); by initial or recurrent; by total defect size; and by reducible or incarcerated/strangulated
- Add 2 codes for parastomal hernia repair - by reducible or incarcerated/strangulated
- Add 1 add-on code for removal of mesh/prosthesis – only with the new hernia repair codes
- Add 1 new code for mesh/prosthesis for delayed closure of external genitalia, perineum and/or abdominal wall defect(s) due to soft tissue infection or trauma.

Coding Structure

Hernia repair for epigastric, incisional, ventral, umbilical, spigelian were merged as they all appear on the anterior abdomen. The location--upper, lower, midline—does not impact the work. But instead, the size and number of defects is the driving factor for work. For example, with respect to the code that was tagged by the RAW, a recurrent, incisional, reducible hernia can be anywhere from a small hernia at a port site from a prior laparoscopic procedure to an extremely large hernia with multiple defects clustered in a midline incision.

Initial versus recurrent differentiation was maintained. Recurrent hernias are re-reoperations. An initial hernia can be the result of a prior procedure (this is not a recurrent hernia) or weak muscles and fascia. A recurrent hernia is typically at least the third time the same site is being operated on.
For example,

- operation 1 might be an open colectomy
- operation 2 would be an initial midline hernia repair
- operation 3 would be a recurrent midline hernia involving the initial midline repair and may include other multiple hernias occurring in the same old incision, all needing to be repaired.

There are many examples in CPT that differentiate between a primary and secondary procedure: disarticulation of shoulder (23920-23921); amputation of arm through humerus (24900-24930) and other similar amputation families; tendon repair (eg, 25260-25274); CABG reoperation (33530); and revision total joint (eg, 23473, 23474, 24370, 24371, 27134-27138).

The hernia size ranges were based on a review of literature and expert panel. For example, an article published in the Journal of the American College of Surgeons reviewed technique and outcomes of abdominal incisional hernia repair and showed that the range of defect size was from less than 1 cm to more than 25 cm with a mean of 6 cm and a median of less than 3 cm. Other similar articles were submitted with the code change application, supporting different work for different defect size. David A. Iannitti, et.al, *Technique and Outcomes of Abdominal Incisional Hernia Repair Using a Synthetic Composite Mesh: A Report of 455 Cases,* Journal of the American College of Surgeons, Volume 206, Issue 1, 2008, Pages 83-88, ISSN 1072-7515, https://doi.org/10.1016/j.jamcollsurg.2007.07.030.

Differentiating the work of a procedure in relationship to size or extent is not new for CPT. For example, 36 skin repair codes by length of repair; 44 lesion excision codes by excised diameter; 46 soft tissue tumor excision codes by size of tumor; 23 hysterectomy codes by size of uterus (58260-58573); 3 myomectomy codes are differentiated by total weight of the myomas (58140-58146); and 10 nerve graft codes are based on length of graft. (64885-64898)

The CPT guidelines and illustrations that describe how to measure the total defect size are well understood by surgeons. This is not a new concept – surgeons are very familiar with measuring a hernia defect, and in fact the size of the hernia defect was included in some of the patient vignettes in 1993. Furthermore, measurement of hernia size is a necessary step for selecting and preparing the appropriately sized mesh for implantation.

Hernia repair coding has been complicated by changes in (1) technology and technique and (2) the recent implementation of ICD-10-PCS codes. For these reasons, the stakeholder societies believed this set of codes should

describe "any approach." The societies and the AMA Coding Network have received numerous coding questions about correct reporting for "hybrid" abdominal hernia repair procedures where parts of the procedure are performed via an open approach and parts of the procedure are performed via laparoscopy or with the use of a robot. These are not laparoscopic procedures converted to open procedures, but instead procedures that are more often begun open and then finished as laparoscopic/robotic under pneumoperitoneum.

Another issue that has recently caused confusion about coding has appeared on national coder websites and coder discussion boards referring to International Classification of Diseases Tenth Revision Procedure Coding System (ICD-10-PCS) codes which classifies procedures performed in the facility (ie, not CPT physician procedures). This, however, is important because facilities want the procedure codes reported to correspond with the descriptors of ICD-10-PCS codes that the facility is reporting. Unfortunately, the new ICD-10-PCS codes define various surgical approaches that do not correspond to CPT coding (open, closed, percutaneous, and laparoscopic). For example, the ICD-10-PCS "open endoscopic" approach is defined as "cutting through the skin or mucous membrane and any other body layers necessary to expose a body part, and introduction of instrumentation to reach and visualize the site of the procedure." A second example is the "open with percutaneous endoscopic assistance" approach defined as "cutting through the skin or mucous membrane and any other body layers necessary to expose the site of the procedure, and entry, by puncture or minor incision, of instrumentation through the skin or mucous membrane and any other body layers necessary to aid in the performance of the procedure." These new ICD-10-PCS codes have resulted in coders stating that a procedure should be reported as open because the ICD-10-PCS code indicates open and to report any procedure that includes extension of a port incision (eg, for delivery of a specimen) to be reported as an open procedure --instead of being correctly reported as a laparoscopic procedure.

Mesh

- **Implantation of mesh is now typical and therefore was bundled into the new codes.** When code 49568 was created in 1993, mesh implantation with hernia repairs was not typical. This is supported by the typical patient described in 1993 as having a 10 cm midline incisional hernia – a very large hernia. With research on the causes of hernia recurrence, changes in technology and development of new types of mesh or other prosthesis, implantation of mesh is now typical for all types of hernias and all sizes to reduce the incidence of recurrence. This was supported by the literature submitted with the CCA.

- **Mesh removal is not always required and is not typical.** Technology and research have developed types of mesh that are now being implanted which are incorporated into the abdominal wall, reducing the risk of infection, complications, and recurrence. When mesh removal is indicated, it is typically due to hardening and fracturing of aged mesh, or when gross contamination and infection has occurred (eg, enterocutaneous fistula involving the mesh). For example, a recurrent hernia repair may require removal of fractured, brittle (old technology) mesh many years after an open repair following a colectomy. This work is typically significant, in that the mesh is often integrated with the abdominal wall or adhered to intestine, and involves removal of all of the mesh, not just a small portion. An add-on code to report mesh removal prior to hernia repair, when required, allows for accurate reporting of this work only when performed, which our expert panel believes is not typical of most hernia repairs.

- **Deletion of code 49658 resulted in rare "left over" work for implantation of mesh related to closure for a large open wound after debridement for necrotizing fasciitis.** Add-on code 46958 was reported for mesh placement for both open hernia repair and in relation to closure of wounds from necrotizing soft tissue infection. This code will be deleted and the work of mesh placement will be included in the work for all of the anterior abdominal hernia repair codes. The remaining use of code 46958 was for mesh placement for delayed closure of external genitalia, perineum and/or abdominal wall defect(s) due to soft tissue infection or trauma. As described in the vignette for 15778, necrotizing soft tissue infections typically result in a large open wound that cannot be closed primarily. When the infection has resolved, absorbable mesh or other prosthesis is placed to allow healing by secondary intent until such time that a skin graft or skin closure can be accomplished. The literature submitted with the CCA supports this work.

Compelling Evidence - Flawed methodology of previous reviews, New technology

Flawed Methodology: Codes 49560, 49561, 49565, 49566, 49570, 49572, 49580, 49582, 49585, and 49590 were last reviewed in 2000 during the 2nd 5-year-review. During this review, the American College of Surgeons argued that there was compression of work values for big procedures and there were rank order issues within families of codes. We developed a methodology using NSQIP data that was approved by the Research Subcommittee. However, to validate the methodology, the 5YR Workgroup instructed the ACS to group the codes into families and survey one or two CPT codes as full surveys per family to act as anchors for each family and the rest of the codes to be surveyed as mini-

surveys for only time and visits. After conducting all of the surveys, we believe we were able to validate the methodology that we proposed, however, the 5YR Workgroup did not agree. Instead, they decided that the value that they assigned to the anchor code (the full survey) would be extrapolated to all of the other codes grouped into the same survey. The hernia codes listed above were grouped with 49505 which was increased by 17% based on the survey data and compelling evidence. The 17% increase was applied to the other codes in the group without consideration of rank order, mini survey results or society recommendations. This resulted in continuation of compression and rank order issues. For example, although code 49572 was increased by 17%, the IWPUT for the code is negative. Other codes have near zero IWPUT. **We believe this was a flawed methodology of review of the codes and meets compelling evidence.**

Flawed Methodology: Codes 49587, 49652, 49653, 49654, and 49655 were last reviewed in 2011 based on a site of service anomaly screen. At that time, the RUC approved including a same day observation visit and full observation discharge on the subsequent day. The RUC noted that the typical patient requires close monitoring for problems such as ileus, intestinal ischemia and urinary retention. Additionally, there will be significant pain post-operatively requiring management before discharge. The specialty noted, and the RUC agreed, that the shift in patient facility status (in patient moving to outpatient—as determined by CMS) has little to do with healthier patients that require less physician work and everything to do with the recent OPPS changes related to facility reimbursement. This was substantiated by the survey data which showed that the typical patients stayed at least overnight and received a postoperative same-day E/M service. Given this data, the RUC enacted its (then current) policy to allocate the appropriate proxy for the postoperative visits which was categorized as either subsequent observation and/or observation discharge—both of which are outpatient codes. Importantly, the specialties argued and the RUC agreed that the work of providers who care for medical patients should not be discounted (eg, full observation E/M and full observation discharge E/M allowed for patient staying overnight for observation.)

CMS ignored the valid outpatient E/M visit code inputs that the RUC recommended and instead stated in the Rule that they have a policy of not allowing "inpatient" visits included in the details for outpatient services. These codes went through a Refinement Panel process [ie, a CMS convened group of Medical Officers and select physicians acting as a separate formal appeals process] that resulted in agreement with the RUC recommendations. Importantly, the Agency still maintained that inpatient visits would not be allowed (even though outpatient/observation visits were submitted by the RUC) and then used a reverse building block methodology to subtract work RVUs from the values. These values had been developed by magnitude estimation and approved by the RUC. The Agency deleted the observation visit code inputs and decreased discharge management by 50 percent even though it was performed on a subsequent date. **We believe this action by CMS resulted in a flawed methodology of review of these codes and meets compelling evidence.**

The rejection of equal value for equal work and rejection of the Refinement Panel results prompted the Executive Director of the American College of Surgeons to send a letter (see last page of SoR) to Kathleen Sebelius, then Secretary of the Department of Health and Human Services on November 29, 2011. This letter addressed the decision-making process for valuing procedure codes that have Medicare outpatient status, the use of refinement panels, and the arbitrary discount in physician work for the same work performed by any provider of a non-global service. Specifically, the letter included the following statement:

> *"CMS has now implemented a policy by which it is creating differential payments for the same work performed by different physicians as a backdoor mechanism for reducing the work RVUs for surgical procedures. They have valued the worth of a surgeon for post-operative evaluation and management work at about 30 percent of a non-surgeon. Non-surgeons are allowed to provide the same work to the same patient at 100 percent reimbursement. …we believe that this policy leads to a loss of validity and integrity of the current system."*

We continue to believe there is no valid justification for a 50% discount to discharge management services provided by a surgeon that is performed the day after a procedure when a non-surgical provider observing a medical patient who is kept overnight for any reason is allowed to bill a discharge management service at 100 percent for work on the next day. We also believe there is no valid justification for discounting a postoperative visit later the same day of surgery to equal only the intra-service time of the visit multiplied by an intensity of 0.0224. No surgeon would round on a postoperative patient the same day and not review interval chart notes prior to the face-to-face with the patient and not followup with charting the visit and confirming or modifying the current orders.

CMS implemented a 23-hour policy for discounting surgical postoperative work based on the argument that the Agency could not include impatient work in their time/work file. However, the fact is that the Agency has also erroneously

rejected RUC recommendations for outpatient / observation codes, stating "these inpatient codes" could not be included for procedure that are typically outpatient.

Change in Technology: Since the last review of the hernia repair codes (either in 2000 or in 2011), there has been introduction and application of new technology (ie, robotic assist) which adds work complexity and time with the goal of better patient outcomes. The diffusion of this new technology throughout this family of codes further meets compelling evidence.

Recommendation – 49595

We recommend a work RVU of 17.00, which is the survey median.

Pre-service time

Scrub, dress, wait package time has been reduced so as to not exceed survey median data.
Laparoscopic/robotic anterior abdominal hernia repair positioning time: The patient will initially be positioned supine and upper extremity intravenous and arterial access points are dressed, padded and secured. The arms are padded and tucked at the patient's sides. The patient must be secured to the table, including a soft chest and thigh strap, as it may be necessary to roll the table during the procedure to use gravity to assist with shifting the abdominal contents.. There is also consideration of positioning the patient relative to: laparoscopy equipment, including lines and video equipment and anesthesia lines relative to the rest of the equipment. The survey median positioning time reflects the time for this procedure for these activities.

Postoperative E/M visit later on the day of surgery

The typical patient will stay overnight or longer and there will typically be a visit later on the same day of the procedure at a level of 99232. Review data (eg, diagnostic and imaging studies) not available at the unit. Communicate with other health care professionals and with patient and/or family. Review medical records and data available on the unit. Perform a medically appropriate examination. Consider relevant data, options, and risks; formulate and/or revise diagnosis and treatment plan(s) (moderate complexity MDM). Discuss diagnosis and treatment options with the patient and/or family. Consider discharge needs of patient. Communicate with other health care professionals as necessary. Write and/or review orders, including arranging for necessary diagnostic testing, consultation(s), and therapeutic intervention(s). Complete medical record documentation. Address interval data obtained and reported changes in condition. Communicate results and additional care plans to other health care professionals and to the patient and/or family.

Per CMS policy for reporting postoperative work for 23-hour stay procedures, the intraservice time of 20 minutes for 99232 has been added to the survey immediate postoperative time (total = 40 min).

Key Reference Code Intensity/Complexity Comparison

Ref 1: The respondents indicated the intensity/complexity of survey code 49595 is similar to somewhat more than reference code 21813. Ref 2: The respondents indicated the intensity/complexity of survey code 49595 is somewhat more than reference code 11005.

MPC Code Comparison

MPC code 37244 has the highest RVW for the set of 0-day global codes.

CPT	DESCRIPTOR	RVW	IWPUT	WPUT	TOTAL TIME	PRE	INTRA	POST	SD E/M
37244	Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; for arterial or venous hemorrhage or lymphatic extravasation	**13.75**	0.135	0.083	166	31	90	45

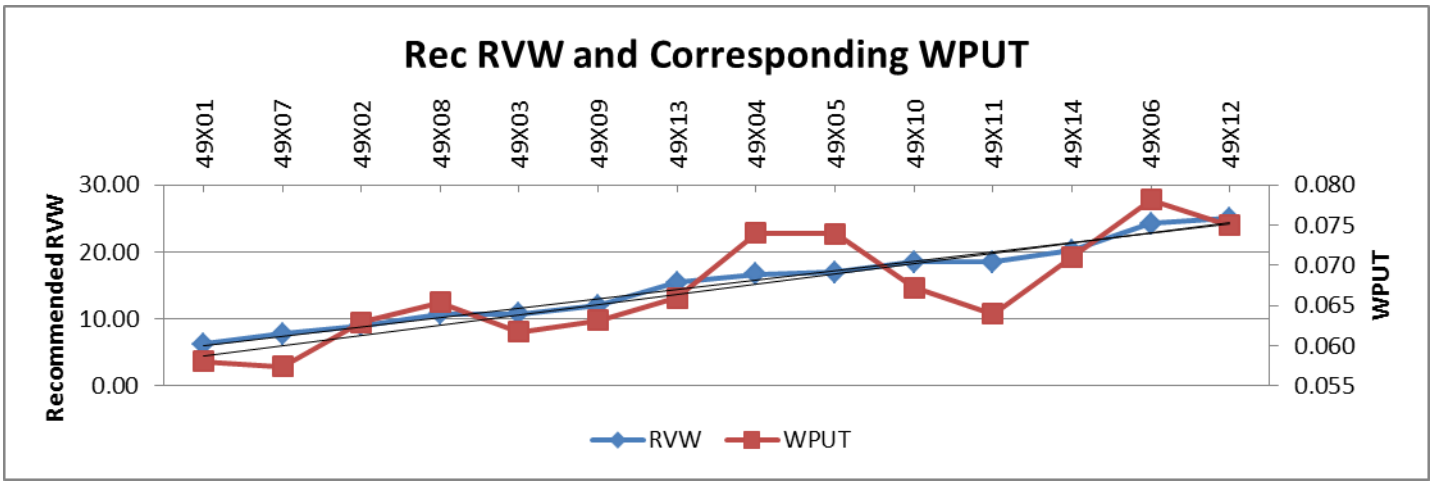
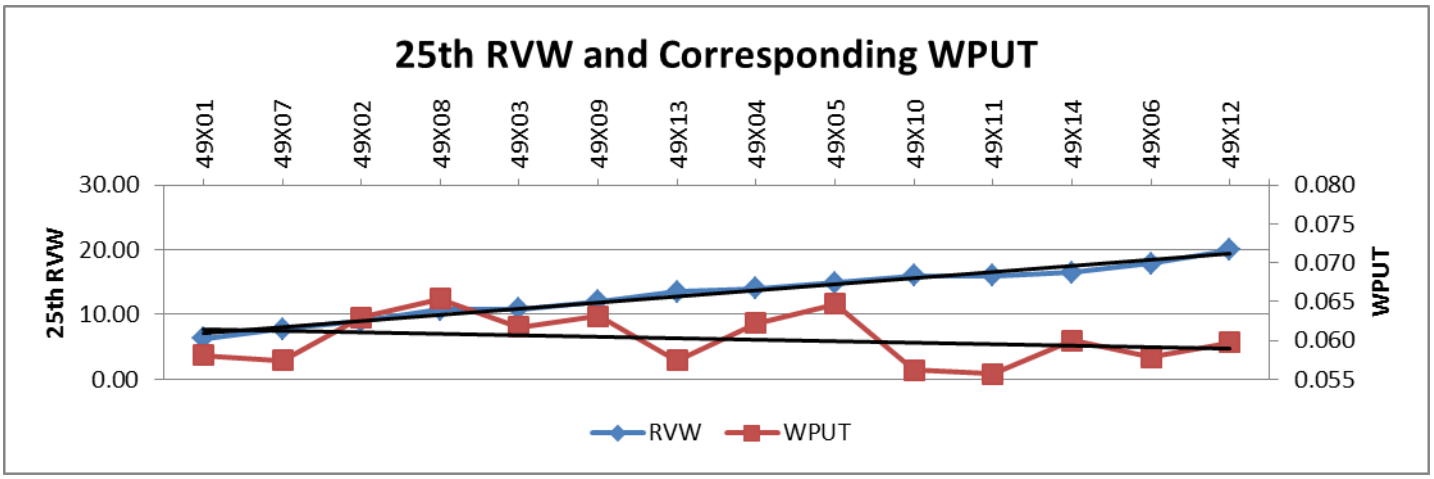
Relativity Assessment

Recommended RVW vs Total Time

The chart below that compares the recommended RVW and total time shows good correlation.



The data below that were used to create the chart above show appropriate relative rank order for work for this new set of hernia repair codes.



CPT	DESC		REC RVW	Total Time
49591	Initial, Reduc, < 3cm	25th	6.27	108
49613	Recurrent, Reduc, < 3cm	25th	7.75	135
49592	Initial, I/S, < 3cm	25th	9.00	143
49614	Recurrent, I/S, < 3cm	25th	10.79	165
49593	Initial, Reduc, 3-10cm	25th	10.80	175
49615	Recurrent, Reduc, 3-10cm	25th	12.00	190
49621	Parastomal, Reduc	median	15.50	235
49594	Initial, I/S, 3-10cm	median	16.65	225
49595	Initial, Reduc, > 10cm	median	17.00	230
49616	Recurrent, I/S, 3-10cm	median	18.50	275
49617	Recurrent, Reduc, > 10cm	median	18.53	288
49622	Parastomal, I/S	75th	20.25	285

49596	**Initial, I/S,** > 10cm	75th	**24.24**	**310**
49618	**Recurrent, I/S, > 10cm**	75th	**25.00**	**335**

Comparison of using the recommended RVW versus using the 25th percentile.

The first chart below shows reasonable correlation between the recommended RVW and WPUT—both trend lines have a similar slope. The second chart below shows no relationship of WPUT to the 25th percentile RVW—where WPUT decreases as work increases.

What if surgeon evaluation and management work were set equal to discrete E/M services?

As has been discussed by the RUC in the past, work intensities used for computation of IWPUT for time spent by physicians in the pre-service and immediate post-service period for surgical procedures have remained fixed since the early 1990s, while intensity of time for E/M values has received several increased values over several decades.

Recent increases for outpatient office E/M values were not allowed to be added to global codes by CMS. Because IWPUT is calculated by subtracting the pre- and post-work values from the RVW of a given CPT code, this has resulted in less value subtracted than would have occurred if the more appropriate pre- and post-work values were used for the IWPUT formula. This artificially increases the IWPUT and WPUT resulting in a decrease in relativity. This is especially true for codes that have a significant amount of pre-service and post-service work.

It has become difficult to compare IWPUT (and WPUT) for codes with different global periods because of the level of discounting of pre-service and post-service work. For example, for the top 34 high volume 10 and 90 day global codes, AMA staff recently calculated the difference in IWPUT if the office visit increases were used in the IWPUT equation. The AMA table, which is included in the Research Subcommittee agenda for this meeting, showed that the IWPUT would have decreased from -6% to -548% depending on the number of office visits included in the work/time file. To emphasize the importance of this information, the code which would have had the largest decrease (17000) has 3

minutes of intra-time and only one postop office visit (99212). In this table, it was also clear that relativity within a family of codes is lost, because each code within a family may have varying levels of post-service work. To summarize, IWPUT has become much less accurate when used as a comparator of intra-service work within and between families because of CMS actions (ie, not updating global RVW) and policy (ie, discounting postoperative work).

Using the discussion above, we have created the table below that presents the IWPUT and WPUT for the hernia set of codes using (1) the 2021 formulas, and (2) "full value" formulas. The note below the table describes each formula, but basically the full value formula sets pre- and post-service work equal to the same E/M work for non-surgical services. For comparison to facility non-surgical services, we have included codes 99283-99285 using the 2021 published RVW and time data. This table shows that most of the recommendations for 49591-49622 result in a WPUT that is less than an ED visit requiring moderate MDM (99284). This table also shows that those codes with similar WPUT to high MDM are appropriately the bigger and more complex procedures. Last, this table provides evidence that discounting pre- and post-work distorts and artificially impacts fair IWPUT and WPUT relativity comparison. However, if undiscounted work is applied, the recommendations for this set of codes are appropriately ranked.

CPT	DESC	REC RVW	2021 formula*		2021 full value**		Total Time	PRE	Intra	Imm Post	-33 -26	-32 -25	-31 -24	Facility Status

* 2021 Formula: IWPUT calculation based on evaluation, positioning, immediate post intensity of 0.0224; scrub/dress/wait intensity of 0.0081; and discounted same-day outpatient postop visit (not shown in table) equal to intra-service time at 0.0224. WPUT calculation equal to total time (including discounted postop visit time not shown on table) divided by work.

**2021 Full Value Formula: IWPUT calculation based on pre-service and immediate post-service time intensity of 0.043 (equal to WPUT for 99213) and same-day post EM at full value instead of discounted time for outpatient procedure as shown on table (highlighted in red).

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.

☐ Historical precedents.
☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed)
49560 Repair initial incisional or ventral hernia; reducible 090
49570 Repair epigastric hernia (eg, preperitoneal fat); reducible (separate procedure) 090
49585 Repair umbilical hernia, age 5 years or older; reducible 090
49590 Repair spigelian hernia 090
49652 Laparoscopy, surgical, repair, ventral, umbilical, spigelian or epigastric hernia (includes mesh insertion, when performed); reducible 090
49654 Laparoscopy, surgical, repair, incisional hernia (includes mesh insertion, when performed); reducible 090
49568 Implantation of mesh or other prosthesis for open incisional or ventral hernia repair or mesh for closure of debridement for necrotizing soft tissue infection (List separately in addition to code for the incisional or ventral hernia repair) ZZZ

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty general surgery How often? Sometimes

Specialty colorectal surgery How often? Rarely

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National frequency not available

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 2,191
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Specialty estimate - See supplemental file with details

Specialty General Surgery Frequency 1972 Percentage 90.00 %

Specialty Colorectal Surgery Frequency 110 Percentage 5.02 %

Specialty Other Surgery Frequency 110 Percentage 5.02 %

Do many physicians perform this service across the United States? Yes

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 11008

Letter Referenced in Compelling Evidence Rationale

November 29, 2011

The Honorable Kathleen Sebelius
Secretary
Department of Health and Human Services
Hubert H. Humphrey Building
200 Independence Avenue SW
Washington, DC 20201

Re: CY 2012 Medicare Physician Fee Schedule Final Rule and CMS
Refinement Panels

Dear Secretary Sebelius:

On November 28, 2011, the Federal Register published the Centers for Medicare and Medicaid Services' (CMS) Calendar Year (CY) 2012 Medicare Physician Fee Schedule Final Rule. On behalf of the American College of Surgeons (ACS), I am writing to express concern regarding the decision making process and lack of transparency on the part of CMS related to the work relative value units (wRVUs) for 2012 reviewed under CMS' refinement panel process. The ACS, with over 78,000 members, is a scientific and educational organization of surgeons that was founded in 1913 to raise the standards of surgical practice and to improve the care of the surgical patient.

The ACS has participated in the efforts of the American Medical Association's Relative Value Scale Update Committee (AMA RUC) for years given the value we place on the AMA RUC process and our assumption that CMS will evaluate the RUC recommendations with fairness, transparency, and accuracy according to a process that has been set out via the Federal rulemaking process. As part of the work that led to the CY 2012 Medicare Physician Fee Schedule Final Rule, the ACS devoted significant resources to conducting AMA RUC surveys for over 100 new or existing codes at the request of CMS. The AMA RUC evaluated wRVU recommendations made by the ACS, based upon those surveys, and came to agreement on final recommended values to be submitted to CMS.

Fifty-seven of the aforementioned codes that the ACS surveyed were sent to the refinement panel. CMS accepted ***only 12 percent*** of those refinement panel recommendations.

For most of the 88 percent of refinement panel recommendations that CMS rejected, CMS lowered the wRVU by reducing the value of the post-operative evaluation and management work performed by surgeons in the hospital by 69

percent. However, if that same work is performed by any other physician other than the surgeon, that same service is paid at 100 percent. We believe that the refinement panel physicians completely rejected this concept as they agreed to a work RVU that did not discount post-surgical work in this fashion. We note that the multispecialty panel included physicians from primary care, contractor medical directors (CMDs), physicians in related specialties, and general surgeons. At no time did the Agency's Medical Officer in charge of the panel process disagree with the presenters or offer a contrary opinion to the discussion.

Our concerns were piqued when CMS issued the CY 2011 Medicare Physician Fee Schedule Final Rule in which CMS stated that it could change wRVU recommendations of the refinement panel convened by CMS if "policy concerns warrant their modification," without providing additional clarification on what would trigger this ability of CMS to subvert the more transparent process of the refinement panel. However, we continued to participate in the process under the belief that CMS would operate fairly and transparently and that if there were indeed "policy concerns" that CMS had regarding the values of the codes under consideration that those concerns would be stated clearly so all parties could address them during the refinement panel reviews.

CMS has now implemented a policy by which it is creating differential payments for the same work performed by different physicians as a backdoor mechanism for reducing the work RVUs for surgical procedures. They have valued the worth of a surgeon for post-operative evaluation and management work at about 30 percent of a non-surgeon.. Non-surgeons are allowed to provide the same work to the same patient at 100 percent reimbursement. First, we believe that this policy leads to a loss of validity and integrity of the current system. In addition, this policy is prohibited by the Omnibus Budget Reconciliation Act of 1989, which states, "[t]he Secretary may not vary the conversion factor or the number of relative value units for a physicians' service based on whether the physician furnishing the service is a specialist or based on the type of specialty of the physician." (42 U.S.C. §1395w-4(c)(6)).

The ACS has been a vocal proponent of needed reforms in the delivery and payment of health care. We believe that the future of these reforms will be based on driving greater awareness of proven continuous quality improvement programs to achieve ongoing, tangible results for quality improvements. However, in order for these reforms to be effective, they must be built on a system that is consistent with previous Agency decisions, fair, and transparent, and it is our concern that many of the policy decisions made by CMS in the latest Medicare Physician Fee Schedule Final Rule move us away from those goals. The resource based relative value system (RBRVS) requires a resource basis for decisions on the valuation of physician services. We believe that the resource basis for the decision to reduce these values is not evident. We ask that under your authority as Secretary you will seek to have CMS define a more transparent process in the future for decisions that are not aligned with the RUC and refinement panel recommendations in order to help maintain the transparency and fairness of the current system and to restore the values of these services to the level that is supported by the RBRVS process.

Sincerely,
David B. Hoyt, MD, FACS
Executive Director

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:49596 Tracking Number C7 Original Specialty Recommended RVU: **24.24**
Presented Recommended RVU: **24.24**
Global Period: 000 Current Work RVU: RUC Recommended RVU: **20.00**

CPT Descriptor: Repair of anterior abdominal hernia(s) (ie, epigastric, incisional, ventral, umbilical, spigelian), any approach (ie, open, laparoscopic, robotic), initial including placement of mesh or other prosthesis, when performed total length of defect(s); greater than 10 cm, incarcerated or strangulated

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 64-year-old obese male with a prior laparotomy has developed incisional hernias with defects of varying sizes at multiple points. The defects have been increasing in size during follow-up with increasing symptoms. Physical exam reveals multiple tender and nonreducible incisional hernias. He undergoes hernia repair of a defect that totals more than 10 cm with placement of mesh.

Percentage of Survey Respondents who found Vignette to be Typical: 90%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 5% , Overnight stay-more than 24 hours 95%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 95%

Description of Pre-Service Work: Results of preadmission testing (imaging, electrocardiogram and labs) are reviewed. Appropriate selection, timing, and administration of DVT prophylaxis are ensured. Appropriate selection, timing, and administration of antibiotics are ensured. The need for beta-blockers is assessed, and they are ordered as required. The patient is reexamined to confirm that physical findings have not changed, the patient's medication regimen has remained the same, the patient has no new allergies, and the patient has not undergone any recent procedures. The history and physical examination are then updated in the electronic health record. The planned procedure and postoperative management are reviewed with the patient and family. Informed consent is reviewed and obtained from the patient, including witness confirmation. The masses of the material incarcerated in the hernia are palpated obscuring the edge of the hernia defect(s). The sites of the proposed skin incisions are marked with cooperation of patient. The length and type of anesthesia, including adjuncts to postoperative analgesia management, are reviewed with the anesthesiologist. Verify that all required instruments and supplies are available, including reusable and disposable laparoscopic/robotic equipment and mesh. Assistance is provided in transfer of the patient from gurney to operating table. Monitor/assist with positioning of patient, including padding and securing patient to table that will adjust throughout procedure (eg, reverse Trendelenburg). Assist anesthesia team with line placement and induction of anesthesia and intubation, relative to all laparoscopic/robotic equipment. The areas of skin to be prepared and draped are indicated by the surgeon to ensure that all of the potential operative field is included in the preparation. The surgeon scrubs and gowns. A surgical time-out is performed with operating surgical team.

Description of Intra-Service Work: Abdominal access is obtained and a safe pneumoperitoneum is created with placement of a needle/trocar. As the hernia extends across the majority of the anterior abdominal wall, location for insertion of the needle/trocar is selected based on the prior surgical history and the safest location to avoid intra-abdominal injury. The camera is inserted and safe entry is verified. Additional trocars are placed in the lateral abdomen, under direct vision. A large field of adhesions occupies the entire anterior abdominal wall correlating with the extent of the prior laparotomy. Adhesions are divided sharply to free the anterior abdominal wall completely taking great care to avoid injury to the intestine. Each separate defect within the entire hernia defect contains adipose and intestinal components and requires a safe and effective clearance of tissue. The incarcerated/strangulated bowel, mesentery and omentum are carefully reduced

with dissection of the adhesions and sac to clear all the defects for repair. Care is taken to avoid injury to the incarcerated tissue. This requires manipulation both intra-abdominally with minimally invasive instrumentation and extra-abdominally with palpation and pressure applied to the abdominal wall to reduce the incarcerated contents. The reduced tissue is examined for viability and any inadvertent injury. The falciform ligament and preperitoneal fat are cleared from the abdominal wall fascia to expose all defects and enough surface for mesh overlap. The hernia sac is reduced and resected as needed to expose the fascial edges of the defect(s). The hernia defect is visualized. The defects are measured with a minimum craniocaudal length greater than 10 cm. Peritoneal flaps are created for placement of mesh. The fascial defect is approximated with sutures placed along the entirety of the defect. The appropriate size mesh is calculated after total defect length is documented. Adequate overlap of at least 5 cm in all directions is included in the calculation. A trocar is removed from the abdominal wall and the track is dilated to allow insertion of the large mesh into the peritoneal cavity. The mesh is oriented intra-abdominally. Insufflation is reduced to facilitate mesh conformity to the anterior abdominal wall. The mesh is secured to the abdominal wall utilizing sutures and tacks. The peritoneal flaps are then sutured over the mesh to protect it from the abdominal viscera. Completion camera survey is performed of the abdomen and contents to inspect for bleeding and visceral injury and perform a final viability assessment of the material once incarcerated in the hernia sac. Irrigation is performed as necessary. Fascial incisions for laparoscopic ports larger than 1 cm are closed with a suture passer. Skin incisions are closed according to surgeon preference.

Description of Post-Service Work:
Immediate postoperative care [operative day through discharge from recovery room]: Apply sterile dressings. Monitor patient during reversal of anesthesia. Assist in transfer of patient from operating table to gurney. Monitor transport of patient from operating room to recovery room. Discuss postoperative recovery care with anesthesia and nursing staff, including need for patient-controlled analgesia. Discontinue prophylactic antibiotic therapy, as appropriate. Review postoperative labs. Discuss procedure and outcome with family in waiting area. Write brief operative note or complete final operative note and place in chart. Write postoperative note in the recovery room. Dictate operative report and copy referring physician(s). Call referring physician(s). Write orders for transferring to general surgical floor and discuss ongoing care with nursing staff.

Later same day hospital inpatient care visit [operative day after discharge from recovery room]: Review interval nursing/other staff chart notes. Discuss ongoing care with nursing staff. Evaluate vital signs and intake/output. Auscultate heart, lungs, and abdomen for bowel sounds. Monitor fluid and electrolyte status and renal function; monitor for problems such as ileus, intestinal ischemia, and urinary retention. Examine patient, check wounds, and change dressings. Continue prophylaxis for DVT. Assess need for beta-blockers, order as required. Assess pain scores and adequacy of analgesia. Write orders for labs, films, medications, diet, and patient activity. Chart patient progress notes. Answer patient and family questions. Answer nursing/other staff questions. Advance diet, as appropriate.

Technical skill required	11%	0%	89%
Physical effort required	0%	11%	89%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	33%	67%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

RAW Screen

Code 49565, *Repair recurrent incisional or ventral hernia; reducible*, was identified by the RUC/RAW with a site of service anomaly: less than 50% inpatient status; includes inpatient visit codes; greater than 5,000 utilization. Prior to

submitting an Action Plan to the RAW, the societies reviewed the site of service data and found: almost even split of 48% between inpatient and outpatient – with a few percent in the ASC. At the January 2020 RUC meeting, the societies requested referral of code 49565 to CPT to update the descriptor to current standard of practice and typical patient presentation.

CPT Coding Changes

At the February 2021 CPT meeting the following changes were approved:

- Delete all the current open and laparoscopic codes for repair of anterior abdominal hernias.
- Delete add-on code 49568 for mesh for open ventral/incisional hernias and large defects as a result of necrotizing soft tissue infection.
- Add 12 new codes for anterior abdominal hernia repair by any approach (ie, open laparoscopic, robotic); by initial or recurrent; by total defect size; and by reducible or incarcerated/strangulated
- Add 2 codes for parastomal hernia repair - by reducible or incarcerated/strangulated
- Add 1 add-on code for removal of mesh/prosthesis – only with the new hernia repair codes
- Add 1 new code for mesh/prosthesis for delayed closure of external genitalia, perineum and/or abdominal wall defect(s) due to soft tissue infection or trauma.

Coding Structure

Hernia repair for epigastric, incisional, ventral, umbilical, spigelian were merged as they all appear on the anterior abdomen. The location--upper, lower, midline—does not impact the work. But instead, the size and number of defects is the driving factor for work. For example, with respect to the code that was tagged by the RAW, a recurrent, incisional, reducible hernia can be anywhere from a small hernia at a port site from a prior laparoscopic procedure to an extremely large hernia with multiple defects clustered in a midline incision.

Initial versus recurrent differentiation was maintained. Recurrent hernias are re-reoperations. An initial hernia can be the result of a prior procedure (this is not a recurrent hernia) or weak muscles and fascia. A recurrent hernia is typically at least the third time the same site is being operated on.
For example,

- operation 1 might be an open colectomy
- operation 2 would be an initial midline hernia repair
- operation 3 would be a recurrent midline hernia involving the initial midline repair and may include other multiple hernias occurring in the same old incision, all needing to be repaired.

There are many examples in CPT that differentiate between a primary and secondary procedure: disarticulation of shoulder (23920-23921); amputation of arm through humerus (24900-24930) and other similar amputation families; tendon repair (eg, 25260-25274); CABG reoperation (33530); and revision total joint (eg, 23473, 23474, 24370, 24371, 27134-27138).

The hernia size ranges were based on a review of literature and expert panel. For example, an article published in the Journal of the American College of Surgeons reviewed technique and outcomes of abdominal incisional hernia repair and showed that the range of defect size was from less than 1 cm to more than 25 cm with a mean of 6 cm and a median of less than 3 cm. Other similar articles were submitted with the code change application, supporting different work for different defect size. David A. Iannitti, et.al, *Technique and Outcomes of Abdominal Incisional Hernia Repair Using a Synthetic Composite Mesh: A Report of 455 Cases,* Journal of the American College of Surgeons, Volume 206, Issue 1, 2008, Pages 83-88, ISSN 1072-7515, https://doi.org/10.1016/j.jamcollsurg.2007.07.030.

Differentiating the work of a procedure in relationship to size or extent is not new for CPT. For example, 36 skin repair codes by length of repair; 44 lesion excision codes by excised diameter; 46 soft tissue tumor excision codes by size of tumor; 23 hysterectomy codes by size of uterus (58260-58573); 3 myomectomy codes are differentiated by total weight of the myomas (58140-58146); and 10 nerve graft codes are based on length of graft. (64885-64898)

The CPT guidelines and illustrations that describe how to measure the total defect size are well understood by surgeons. This is not a new concept – surgeons are very familiar with measuring a hernia defect, and in fact the size of the hernia defect was included in some of the patient vignettes in 1993. Furthermore, measurement of hernia size is a necessary step for selecting and preparing the appropriately sized mesh for implantation.

Hernia repair coding has been complicated by changes in (1) technology and technique and (2) the recent implementation of ICD-10-PCS codes. For these reasons, the stakeholder societies believed this set of codes should

describe "any approach." The societies and the AMA Coding Network have received numerous coding questions about correct reporting for "hybrid" abdominal hernia repair procedures where parts of the procedure are performed via an open approach and parts of the procedure are performed via laparoscopy or with the use of a robot. These are not laparoscopic procedures converted to open procedures, but instead procedures that are more often begun open and then finished as laparoscopic/robotic under pneumoperitoneum.

Another issue that has recently caused confusion about coding has appeared on national coder websites and coder discussion boards referring to International Classification of Diseases Tenth Revision Procedure Coding System (ICD-10-PCS) codes which classifies procedures performed in the facility (ie, not CPT physician procedures). This, however, is important because facilities want the procedure codes reported to correspond with the descriptors of ICD-10-PCS codes that the facility is reporting. Unfortunately, the new ICD-10-PCS codes define various surgical approaches that do not correspond to CPT coding (open, closed, percutaneous, and laparoscopic). For example, the ICD-10-PCS "open endoscopic" approach is defined as "cutting through the skin or mucous membrane and any other body layers necessary to expose a body part, and introduction of instrumentation to reach and visualize the site of the procedure." A second example is the "open with percutaneous endoscopic assistance" approach defined as "cutting through the skin or mucous membrane and any other body layers necessary to expose the site of the procedure, and entry, by puncture or minor incision, of instrumentation through the skin or mucous membrane and any other body layers necessary to aid in the performance of the procedure." These new ICD-10-PCS codes have resulted in coders stating that a procedure should be reported as open because the ICD-10-PCS code indicates open and to report any procedure that includes extension of a port incision (eg, for delivery of a specimen) to be reported as an open procedure --instead of being correctly reported as a laparoscopic procedure.

Mesh

- **Implantation of mesh is now typical and therefore was bundled into the new codes.** When code 49568 was created in 1993, mesh implantation with hernia repairs was not typical. This is supported by the typical patient described in 1993 as having a 10 cm midline incisional hernia – a very large hernia. With research on the causes of hernia recurrence, changes in technology and development of new types of mesh or other prosthesis, implantation of mesh is now typical for all types of hernias and all sizes to reduce the incidence of recurrence. This was supported by the literature submitted with the CCA.

- **Mesh removal is not always required and is not typical.** Technology and research have developed types of mesh that are now being implanted which are incorporated into the abdominal wall, reducing the risk of infection, complications, and recurrence. When mesh removal is indicated, it is typically due to hardening and fracturing of aged mesh, or when gross contamination and infection has occurred (eg, enterocutaneous fistula involving the mesh). For example, a recurrent hernia repair may require removal of fractured, brittle (old technology) mesh many years after an open repair following a colectomy. This work is typically significant, in that the mesh is often integrated with the abdominal wall or adhered to intestine, and involves removal of all of the mesh, not just a small portion. An add-on code to report mesh removal prior to hernia repair, when required, allows for accurate reporting of this work only when performed, which our expert panel believes is not typical of most hernia repairs.

- **Deletion of code 49658 resulted in rare "left over" work for implantation of mesh related to closure for a large open wound after debridement for necrotizing fasciitis.** Add-on code 46958 was reported for mesh placement for both open hernia repair and in relation to closure of wounds from necrotizing soft tissue infection. This code will be deleted and the work of mesh placement will be included in the work for all of the anterior abdominal hernia repair codes. The remaining use of code 46958 was for mesh placement for delayed closure of external genitalia, perineum and/or abdominal wall defect(s) due to soft tissue infection or trauma. As described in the vignette for 15778, necrotizing soft tissue infections typically result in a large open wound that cannot be closed primarily. When the infection has resolved, absorbable mesh or other prosthesis is placed to allow healing by secondary intent until such time that a skin graft or skin closure can be accomplished. The literature submitted with the CCA supports this work.

Compelling Evidence - Flawed methodology of previous reviews, New technology

Flawed Methodology: Codes 49560, 49561, 49565, 49566, 49570, 49572, 49580, 49582, 49585, and 49590 were last reviewed in 2000 during the 2nd 5-year-review. During this review, the American College of Surgeons argued that there was compression of work values for big procedures and there were rank order issues within families of codes. We developed a methodology using NSQIP data that was approved by the Research Subcommittee. However, to validate the methodology, the 5YR Workgroup instructed the ACS to group the codes into families and survey one or two CPT codes as full surveys per family to act as anchors for each family and the rest of the codes to be surveyed as mini-

surveys for only time and visits. After conducting all of the surveys, we believe we were able to validate the methodology that we proposed, however, the 5YR Workgroup did not agree. Instead, they decided that the value that they assigned to the anchor code (the full survey) would be extrapolated to all of the other codes grouped into the same survey. The hernia codes listed above were grouped with 49505 which was increased by 17% based on the survey data and compelling evidence. The 17% increase was applied to the other codes in the group without consideration of rank order, mini survey results or society recommendations. This resulted in continuation of compression and rank order issues. For example, although code 49572 was increased by 17%, the IWPUT for the code is negative. Other codes have near zero IWPUT. **We believe this was a flawed methodology of review of the codes and meets compelling evidence.**

Flawed Methodology: Codes 49587, 49652, 49653, 49654, and 49655 were last reviewed in 2011 based on a site of service anomaly screen. At that time, the RUC approved including a same day observation visit and full observation discharge on the subsequent day. The RUC noted that the typical patient requires close monitoring for problems such as ileus, intestinal ischemia and urinary retention. Additionally, there will be significant pain post-operatively requiring management before discharge. The specialty noted, and the RUC agreed, that the shift in patient facility status (in patient moving to outpatient—as determined by CMS) has little to do with healthier patients that require less physician work and everything to do with the recent OPPS changes related to facility reimbursement. This was substantiated by the survey data which showed that the typical patients stayed at least overnight and received a postoperative same-day E/M service. Given this data, the RUC enacted its (then current) policy to allocate the appropriate proxy for the postoperative visits which was categorized as either subsequent observation and/or observation discharge—both of which are outpatient codes. Importantly, the specialties argued and the RUC agreed that the work of providers who care for medical patients should not be discounted (eg, full observation E/M and full observation discharge E/M allowed for patient staying overnight for observation.)

CMS ignored the valid outpatient E/M visit code inputs that the RUC recommended and instead stated in the Rule that they have a policy of not allowing "inpatient" visits included in the details for outpatient services. These codes went through a Refinement Panel process [ie, a CMS convened group of Medical Officers and select physicians acting as a separate formal appeals process] that resulted in agreement with the RUC recommendations. Importantly, the Agency still maintained that inpatient visits would not be allowed (even though outpatient/observation visits were submitted by the RUC) and then used a reverse building block methodology to subtract work RVUs from the values. These values had been developed by magnitude estimation and approved by the RUC. The Agency deleted the observation visit code inputs and decreased discharge management by 50 percent even though it was performed on a subsequent date. **We believe this action by CMS resulted in a flawed methodology of review of these codes and meets compelling evidence.**

The rejection of equal value for equal work and rejection of the Refinement Panel results prompted the Executive Director of the American College of Surgeons to send a letter (see last page of SoR) to Kathleen Sebelius, then Secretary of the Department of Health and Human Services on November 29, 2011. This letter addressed the decision-making process for valuing procedure codes that have Medicare outpatient status, the use of refinement panels, and the arbitrary discount in physician work for the same work performed by any provider of a non-global service. Specifically, the letter included the following statement:

> *"CMS has now implemented a policy by which it is creating differential payments for the same work performed by different physicians as a backdoor mechanism for reducing the work RVUs for surgical procedures. They have valued the worth of a surgeon for post-operative evaluation and management work at about 30 percent of a non-surgeon. Non-surgeons are allowed to provide the same work to the same patient at 100 percent reimbursement. …we believe that this policy leads to a loss of validity and integrity of the current system."*

We continue to believe there is no valid justification for a 50% discount to discharge management services provided by a surgeon that is performed the day after a procedure when a non-surgical provider observing a medical patient who is kept overnight for any reason is allowed to bill a discharge management service at 100 percent for work on the next day. We also believe there is no valid justification for discounting a postoperative visit later the same day of surgery to equal only the intra-service time of the visit multiplied by an intensity of 0.0224. No surgeon would round on a postoperative patient the same day and not review interval chart notes prior to the face-to-face with the patient and not followup with charting the visit and confirming or modifying the current orders.

CMS implemented a 23-hour policy for discounting surgical postoperative work based on the argument that the Agency could not include impatient work in their time/work file. However, the fact is that the Agency has also erroneously

rejected RUC recommendations for outpatient / observation codes, stating "these inpatient codes" could not be included for procedure that are typically outpatient.

Change in Technology: Since the last review of the hernia repair codes (either in 2000 or in 2011), there has been introduction and application of new technology (ie, robotic assist) which adds work complexity and time with the goal of better patient outcomes. The diffusion of this new technology throughout this family of codes further meets compelling evidence.

Recommendation – 49596

We recommend a work RVU of 24.24, which is the survey 75th percentile. We believe the limited number of 0-day global codes that are familiar to general surgeons to be used on a reference service list hindered the ability for survey respondents to provide an accurate magnitude estimation of work.

Pre-service time

Scrub, dress, wait package time has been reduced so as to not exceed survey median data.
Laparoscopic/robotic anterior abdominal hernia repair positioning time: The patient will initially be positioned supine and upper extremity intravenous and arterial access points are dressed, padded and secured. The arms are padded and tucked at the patient's sides. The patient must be secured to the table, including a soft chest and thigh strap, as it may be necessary to roll the table during the procedure to use gravity to assist with shifting the abdominal contents.. There is also consideration of positioning the patient relative to: laparoscopy equipment, including lines and video equipment and anesthesia lines relative to the rest of the equipment. The survey median positioning time reflects the time for this procedure for these activities.

Postoperative E/M visit later on the day of surgery

The typical patient will be admitted and a visit will occur later on the same day to monitor for postoperative complications including ileus, intestinal ischemia, and urinary retention. Review data (eg, diagnostic and imaging studies) not available at the unit. Communicate with other health care professionals and with patient and/or family. Review medical records and data available on the unit. Perform a medically appropriate examination. Consider relevant data, options, and risks; formulate and/or revise diagnosis and treatment plan(s) (high complexity MDM). Discuss diagnosis and treatment options with the patient and/or family. Communicate with other health care professionals as necessary. Write and/or review orders, including arranging for necessary diagnostic testing, consultation(s), and therapeutic intervention(s). Complete medical record documentation. Address interval data obtained and reported changes in condition. Communicate results and additional care plans to other health care professionals and to the patient and/or family. Patients undergoing the repair of this size of hernia will require significant postoperative care on the same day to address pain control, review vital signs and fluid status commonly affected by repair of larger hernias, and eliminate concerns for bleeding and infection more common with larger or more numerous incisions.

Key Reference Code Intensity/Complexity Comparison

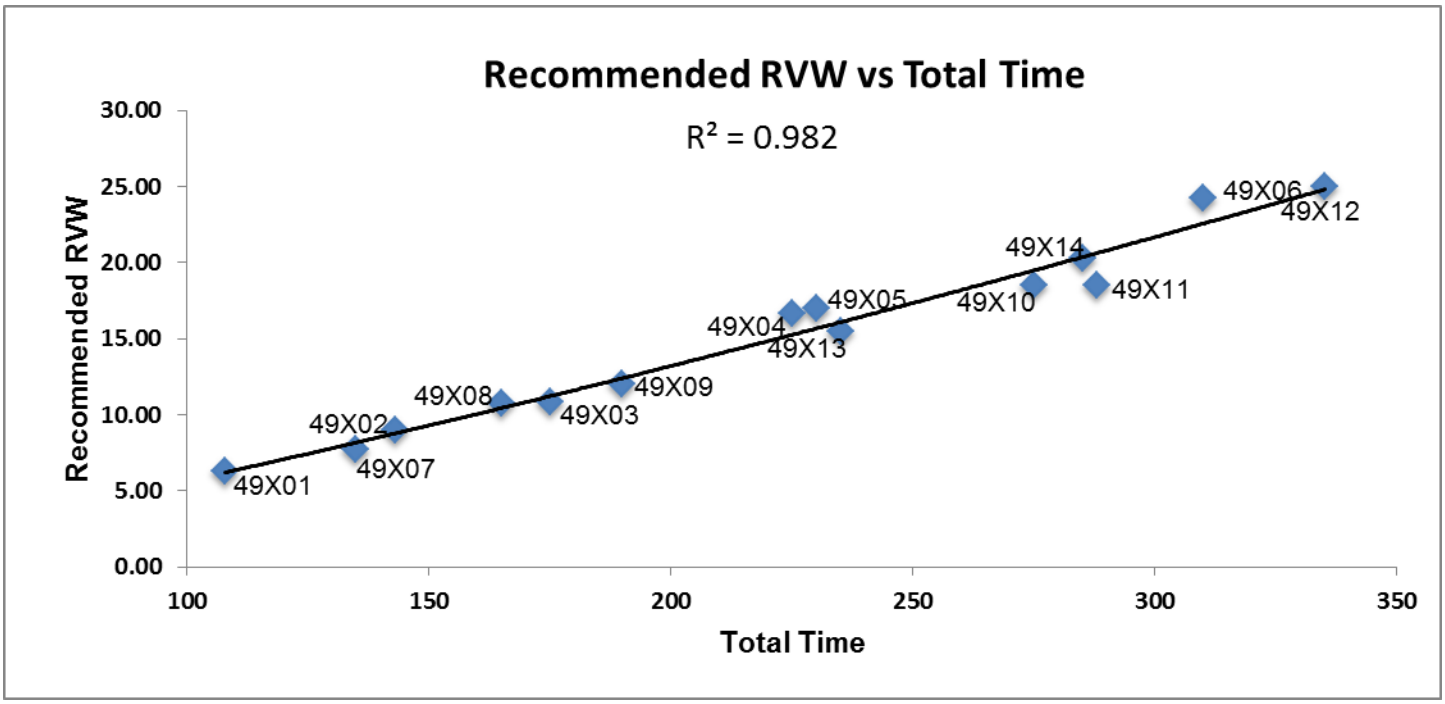
Ref 1: The respondents indicated the intensity/complexity of survey code 49596 is somewhat/much more than reference code 11005. Ref 2: The respondents indicated the intensity/complexity of survey code 49596 is somewhat/much more than reference code 61624.

MPC Code Comparison

MPC code 37244 has the highest RVW for the set of 0-day global codes.

CPT	DESCRIPTOR	RVW	IWPUT	WPUT	TOTAL TIME	PRE	INTRA	POST	SD E/M
37244	Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; for arterial or venous hemorrhage or lymphatic extravasation	**13.75**	0.135	0.083	166	31	90	45	
49596	**Initial, I/S, > 10cm**	**24.24**	**0.127**	**0.078**	**310**	**70**	**160**	**25**	**99233**

Other Code Comparison



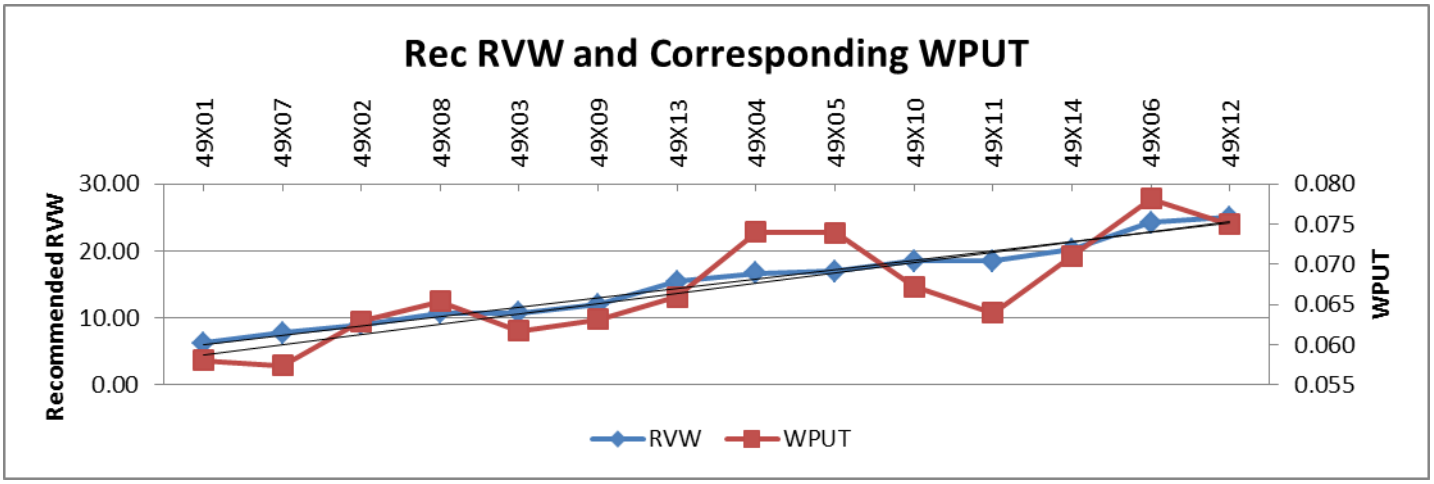
The codes in the table below that include extensive, complex and intense 0-day global procedures, bracket the recommendation for the survey code and offer further support for the recommended work RVU.

CPT	DESCRIPTOR	RVW	IWPUT	WPUT	TOTAL TIME	PRE	INTRA	POST	SD E/M
33745	Transcatheter intracardiac shunt (TIS) creation by stent placement for congenital cardiac anomalies to establish effective intracardiac flow, including all imaging guidance by the proceduralist, when performed, left and right heart diagnostic cardiac catheterization for congenital cardiac anomalies, and target zone angioplasty, when performed (eg, atrial septum, Fontan fenestration, right ventricular outflow tract, Mustard/Senning/Warden baffles); initial intracardiac shunt	**20.00**	0.192	0.097	207	55	92	60	
93590	Percutaneous transcatheter closure of paravalvular leak; initial occlusion device, mitral valve	**21.70**	0.148	0.097	223	58	135	30	
49596	**Initial, I/S, > 10cm**	**24.24**	**0.127**	**0.078**	**310**	**70**	**160**	**25**	**99233**
33477	Transcatheter pulmonary valve implantation, percutaneous approach, including pre-stenting of the valve delivery site, when performed	**25.00**	0.129	0.091	276	63	180	33	
33978	Removal of ventricular assist device; extracorporeal, biventricular	**25.00**	0.109	0.070	355	95	200	60	

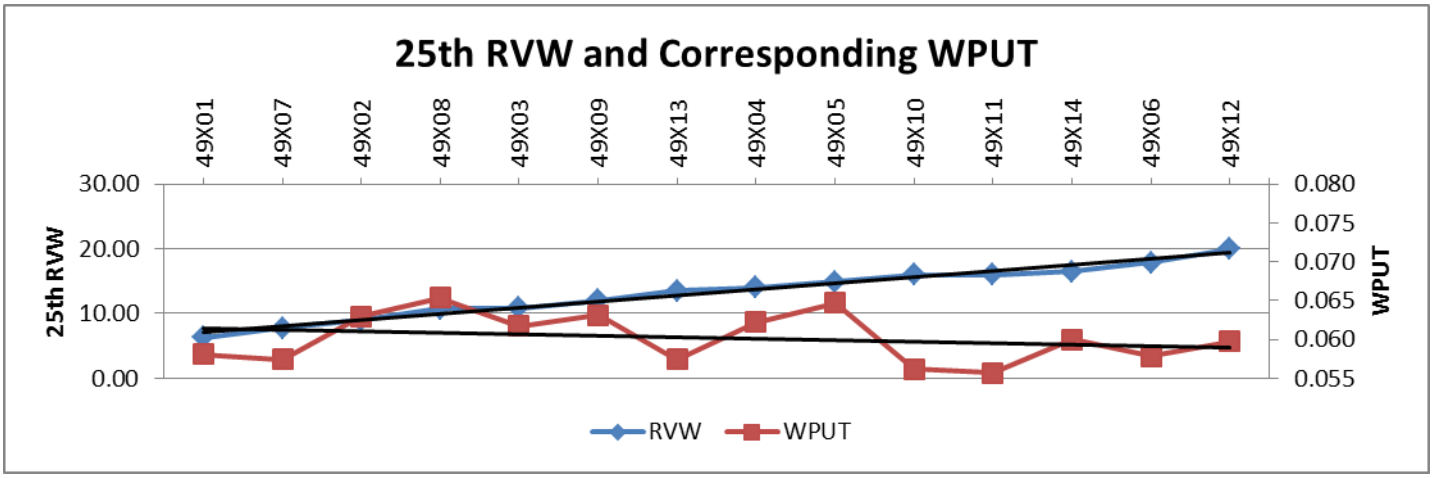
Relativity Assessment

Recommended RVW vs Total Time

The chart below that compares the recommended RVW and total time shows good correlation.



The data below that were used to create the chart above show appropriate relative rank order for work for this new set of hernia repair codes.



CPT	DESC		REC RVW	Total Time
49591	**Initial,** Reduc, < 3cm	25th	**6.27**	**108**
49613	**Recurrent,** Reduc, < 3cm	25th	**7.75**	**135**
49592	**Initial, I/S,** < 3cm	25th	**9.00**	**143**
49614	**Recurrent, I/S,** < 3cm	25th	**10.79**	**165**
49593	**Initial,** Reduc, 3-10cm	25th	**10.80**	**175**

49615	**Recurrent,** Reduc, 3-10cm	25th	**12.00**	**190**
49621	Parastomal, Reduc	median	**15.50**	**235**
49594	**Initial, I/S,** 3-10cm	median	**16.65**	**225**
49595	**Initial,** Reduc, > 10cm	median	**17.00**	**230**
49616	**Recurrent, I/S,** 3-10cm	median	**18.50**	**275**
49617	**Recurrent,** Reduc, > 10cm	median	**18.53**	**288**
49622	Parastomal, **I/S**	75th	**20.25**	**285**
49596	**Initial, I/S,** > 10cm	75th	**24.24**	**310**
49618	**Recurrent, I/S, > 10cm**	75th	**25.00**	**335**

Comparison of using the recommended RVW versus using the 25th percentile.

The first chart below shows reasonable correlation between the recommended RVW and WPUT—both trend lines have a similar slope. The second chart below shows no relationship of WPUT to the 25th percentile RVW—where WPUT decreases as work increases.

What if surgeon evaluation and management work were set equal to discrete E/M services?

As has been discussed by the RUC in the past, work intensities used for computation of IWPUT for time spent by physicians in the pre-service and immediate post-service period for surgical procedures have remained fixed since the early 1990s, while intensity of time for E/M values has received several increased values over several decades.

Recent increases for outpatient office E/M values were not allowed to be added to global codes by CMS. Because IWPUT is calculated by subtracting the pre- and post-work values from the RVW of a given CPT code, this has resulted in less value subtracted than would have occurred if the more appropriate pre- and post-work values were used for the

IWPUT formula. This artificially increases the IWPUT and WPUT resulting in a decrease in relativity. This is especially true for codes that have a significant amount of pre-service and post-service work.

It has become difficult to compare IWPUT (and WPUT) for codes with different global periods because of the level of discounting of pre-service and post-service work. For example, for the top 34 high volume 10 and 90 day global codes, AMA staff recently calculated the difference in IWPUT if the office visit increases were used in the IWPUT equation. The AMA table, which is included in the Research Subcommittee agenda for this meeting, showed that the IWPUT would have decreased from -6% to -548% depending on the number of office visits included in the work/time file. To emphasize the importance of this information, the code which would have had the largest decrease (17000) has 3 minutes of intra-time and only one postop office visit (99212). In this table, it was also clear that relativity within a family of codes is lost, because each code within a family may have varying levels of post-service work. To summarize, IWPUT has become much less accurate when used as a comparator of intra-service work within and between families because of CMS actions (ie, not updating global RVW) and policy (ie, discounting postoperative work).

Using the discussion above, we have created the table below that presents the IWPUT and WPUT for the hernia set of codes using (1) the 2021 formulas, and (2) "full value" formulas. The note below the table describes each formula, but basically the full value formula sets pre- and post-service work equal to the same E/M work for non-surgical services. For comparison to facility non-surgical services, we have included codes 99283-99285 using the 2021 published RVW and time data. This table shows that most of the recommendations for 49591-49622 result in a WPUT that is less than an ED visit requiring moderate MDM (99284). This table also shows that those codes with similar WPUT to high MDM are appropriately the bigger and more complex procedures. Last, this table provides evidence that discounting pre- and post-work distorts and artificially impacts fair IWPUT and WPUT relativity comparison. However, if undiscounted work is applied, the recommendations for this set of codes are appropriately ranked.

CPT	DESC	REC RVW	2021 formula*		2021 full value**		Total Time	PRE	Intra	Imm Post	-33 -26	-32 -25	-31 -24	Facility Status
			IWPUT	WPUT	IWPUT	WPUT

49618	Recurrent, I/S, > 10cm	25.00	0.117	0.075	0.104	0.075	335	70	180	30	1			inpatient

* 2021 Formula: IWPUT calculation based on evaluation, positioning, immediate post intensity of 0.0224; scrub/dress/wait intensity of 0.0081; and discounted same-day outpatient postop visit (not shown in table) equal to intra-service time at 0.0224. WPUT calculation equal to total time (including discounted postop visit time not shown on table) divided by work.

**2021 Full Value Formula: IWPUT calculation based on pre-service and immediate post-service time intensity of 0.043 (equal to WPUT for 99213) and same-day post EM at full value instead of discounted time for outpatient procedure as shown on table (highlighted in red).

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed)
49561 Repair initial incisional or ventral hernia; incarcerated or strangulated 090
49572 Repair epigastric hernia (eg, preperitoneal fat); incarcerated or strangulated 090
49587 Repair umbilical hernia, age 5 years or older; incarcerated or strangulated 090
49590 Repair spigelian hernia 090
49653 Laparoscopy, surgical, repair, ventral, umbilical, spigelian or epigastric hernia (includes mesh insertion, when performed); incarcerated or strangulated 090
49655 Laparoscopy, surgical, repair, incisional hernia (includes mesh insertion, when performed); incarcerated or strangulated 090
49568 Implantation of mesh or other prosthesis for open incisional or ventral hernia repair or mesh for closure of debridement for necrotizing soft tissue infection (List separately in addition to code for the incisional or ventral hernia repair) ZZZ

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty general surgery How often? Rarely

Specialty colorectal surgery How often? Rarely

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National frequency not available

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 839
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Specialty estimate - See supplemental file with details

Specialty General Surgery	Frequency 755	Percentage 89.98 %
Specialty Colorectal Surgery	Frequency 42	Percentage 5.00 %
Specialty Other Surgery	Frequency 42	Percentage 5.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:

Letter Referenced in Compelling Evidence Rationale

November 29, 2011

The Honorable Kathleen Sebelius
Secretary
Department of Health and Human Services
Hubert H. Humphrey Building
200 Independence Avenue SW
Washington, DC 20201

Re: CY 2012 Medicare Physician Fee Schedule Final Rule and CMS
Refinement Panels

Dear Secretary Sebelius:

On November 28, 2011, the Federal Register published the Centers for Medicare and Medicaid Services' (CMS) Calendar Year (CY) 2012 Medicare Physician Fee Schedule Final Rule. On behalf of the American College of Surgeons (ACS), I am writing to express concern regarding the decision making process and lack of transparency on the part of CMS related to the work relative value units (wRVUs) for 2012 reviewed under CMS' refinement panel process. The ACS, with over 78,000 members, is a scientific and educational organization of surgeons that was founded in 1913 to raise the standards of surgical practice and to improve the care of the surgical patient.

The ACS has participated in the efforts of the American Medical Association's Relative Value Scale Update Committee (AMA RUC) for years given the value we place on the AMA RUC process and our assumption that CMS will evaluate the RUC recommendations with fairness, transparency, and accuracy according to a process that has been set out via the Federal rulemaking process. As part of the work that led to the CY 2012 Medicare Physician Fee Schedule Final Rule, the ACS devoted significant resources to conducting AMA RUC surveys for over 100 new or existing codes at the request of CMS. The AMA RUC evaluated wRVU recommendations made by the ACS, based upon those surveys, and came to agreement on final recommended values to be submitted to CMS.

Fifty-seven of the aforementioned codes that the ACS surveyed were sent to the refinement panel. CMS accepted ***only 12 percent*** of those refinement panel recommendations.

For most of the 88 percent of refinement panel recommendations that CMS rejected, CMS lowered the wRVU by reducing the value of the post-operative evaluation and management work performed by surgeons in the hospital by 69 percent. However, if that same work is performed by any other physician other than the surgeon, that same service is paid at 100 percent. We believe that the refinement panel physicians completely rejected this concept as they agreed to a work RVU that did not discount post-surgical work in this fashion. We note that the multispecialty panel included physicians from primary care, contractor medical directors (CMDs), physicians in related specialties, and general surgeons. At no time did the Agency's Medical Officer in charge of the panel process disagree with the presenters or offer a contrary opinion to the discussion.

Our concerns were piqued when CMS issued the CY 2011 Medicare Physician Fee Schedule Final Rule in which CMS stated that it could change wRVU recommendations of the refinement panel convened by CMS if "policy concerns warrant their modification," without providing additional clarification on what would trigger this ability of CMS to subvert the more transparent process of the refinement panel. However, we continued to participate in the process under the belief that CMS would operate fairly and transparently and that if there were indeed "policy concerns" that CMS had regarding the values of the codes under consideration that those concerns would be stated clearly so all parties could address them during the refinement panel reviews.

CMS has now implemented a policy by which it is creating differential payments for the same work performed by different physicians as a backdoor mechanism for reducing the work RVUs for surgical procedures. They have valued the worth of a surgeon for post-operative evaluation and management work at about 30 percent of a non-surgeon.. Non-surgeons are allowed to provide the same work to the same patient at 100 percent reimbursement. First, we believe that this policy leads to a loss of validity and integrity of the current system. In addition, this policy is prohibited by the Omnibus Budget Reconciliation Act of 1989, which states, "[t]he Secretary may not vary the conversion factor or the number of relative value units for a physicians' service based on whether the physician furnishing the service is a specialist or based on the type of specialty of the physician." (42 U.S.C. §1395w-4(c)(6)).

The ACS has been a vocal proponent of needed reforms in the delivery and payment of health care. We believe that the future of these reforms will be based on driving greater awareness of proven continuous quality improvement programs to achieve ongoing, tangible results for quality improvements. However, in order for these reforms to be effective, they must be built on a system that is consistent with previous Agency decisions, fair, and transparent, and it is our concern that many of the policy decisions made by CMS in the latest Medicare Physician Fee Schedule Final Rule move us away from those goals. The resource based relative value system (RBRVS) requires a resource basis for decisions on the valuation of physician services. We believe that the resource basis for the decision to reduce these values is not evident. We ask that under your authority as Secretary you will seek to have CMS define a more transparent process in the future for decisions that are not aligned with the RUC and refinement panel recommendations in order to help maintain the transparency and fairness of the current system and to restore the values of these services to the level that is supported by the RBRVS process.

Sincerely,
David B. Hoyt, MD, FACS
Executive Director

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:49613 Tracking Number 49613 Original Specialty Recommended RVU: **7.75**
Presented Recommended RVU: **7.75**
Global Period: 000 Current Work RVU: RUC Recommended RVU: **7.75**

CPT Descriptor: Repair of anterior abdominal hernia(s) (ie, epigastric, incisional, ventral, umbilical, spigelian), any approach (ie, open, laparoscopic, robotic), recurrent, including placement of mesh or other prosthesis, when performed total length of defect(s); less than 3 cm, reducible

CLINICAL DESCRIPTION OF SERVICE:
