Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC’s rationale, please review the separate RUC recommendation document.

History Background

When the Relativity Assessment Workgroup identified CPT code 93656 (atrial fibrillation ablation) due to its rapid increase in growth, the ACC and HRS reviewed the code and determined that certain work should be bundled into the existing code due to their being billed together more than 75% of the time. With continued review of 93656 and the related volume data, the societies also identified that CPT 93653 (SVT ablation) should have services bundled into it before the...
codes are re-surveyed for upcoming RUC valuation. As a result, in October 2020, the ACC and HRS presented a code change application to the CPT Editorial Panel on codes: 93653, 93654, 93655, 93656, 93657. As indicated in the summary spreadsheet, revised 93653 is now a more comprehensive, bundled service that includes the work of 3D mapping (93613) and left atrial pacing/recording (93621). The societies surveyed members late 2020 and presented data in January 2021. Due to inconsistencies in the survey data and in order to better convey the bundled services to respondents, the ACC and HRS resurveyed members March 2021.

The ACC and HRS randomly surveyed cardiac electrophysiologists, as designated by membership rolls, on the newly created codes and entire family. The 000- and ZZZ-global day survey was completed by physicians who have experience with the service. To remedy the above-described shortcomings, the societies work with the Research Subcommittee to deploy several tactics to obtain more consistent survey results. First, fake dummy codes were used in the survey so that respondents would not presume to know the code descriptors. Second, additional language noting the bundling was included in the survey invitation. Third, respondents were required to attest they had read and understood the new language before completing the survey.

The key reference code is 93580 for percutaneous transcatheter closure of a congenital interatrial communication. It was selected by approximately 38% of respondents. 83% of the respondents indicated that 93656 was more complex. The second reference code was 93590 percutaneous transcatheter closure of paravalvular leak; initial occlusion device, mitral valve. It was selected by approximately 27% of respondents. About 88% of the respondents indicated that 93656 was more intense/complex overall.

Rationale

In reviewing the survey data to develop work recommendations, the expert panel believes the data accurate reflects the newly bundled services, 93653 and 93656. The societies believe the technological advances made in patient care indicate survey respondents understood that 3D mapping and left atrial pacing were now inherent to 93653. After nearly a decade and many changes in technology and broader service dispersion have clearly altered the way this service is provided. Over time, the mapping systems have improved, now providing much more detailed and accurate anatomical and electrical activation mapping, often removing the need for fluoroscopy completely. Catheter technology has advanced, providing real-time assessment of the quality of contact between the catheter tip and the endocardial tissue. Last, the 3D mapping systems in conjunction with new catheter technology are now able to provide real-time assessment of the quality of radiofrequency ablation lesion formation. This feature has allowed operators to significantly shorten the duration of each radiofrequency application while also improving the quality of the lesions delivered. The results indicate survey respondents understood that 3D mapping and left atrial pacing were now inherent to 93653. After nearly a decade and many changes in technology and broader service dispersion, a reduction in intraservice times is logical for performing this procedure. The societies support the resurvey data and stand behind the 25th survey value.

While we recognize that in some ways the resurvey may be viewed as a failure, we believe the general consistency with the initial survey—demonstrating reductions in intraservice time—provides insights and a foundation to develop final recommendations for this family. First, with the additional information and tactics taken in the resurvey, we have no reason to believe respondents failed to understand the bundling that has occurred. Rather, we now have confidence that in the survey and the survey-based recommendations we make. Second, in digesting the data from the two surveys, we believe the reductions in time can, in fact, be explained by evolutions in technology and service dispersion, as discussed above. We can speak to this in more detail if helpful. Finally, the resurvey does provide a viable path forward for valuation, as the survey 25th-percentile work RVUs proceed in a reasonable progression that align with other services in the fee schedule. We recognize these recommendations produce an increase in intensity as the drop in time is not 1:1 proportionate with the drop in RVU. We believe that increase is best explained by the fact that several separately reported services are now bundled together, with work being done more quickly and several services being combined in a way that makes meaningful comparison to the prior intensity unhelpful.

Recommendation

During the January meeting, several RUC members questioned whether codes 93613, 93621 and 93662 should also be addressed in the recommendations for cardiac ablation services. These codes are bundled into CPT codes 93653 and/or 93656. Each was recently surveyed by the specialties and the RUC in 2017, 2020, 2019, respectively. As such, the societies recommend affirming the recent times and RVUs of these recently valued codes, as they remain separate in CPT for use in concert with other CPT codes.
Therefore, for code 93656 the **societies recommend, survey 25th percentile of 17.00 RVW with 53 minutes preservice time from package 4 with 10 minutes removed, 180 minutes intraservice time from the survey median, and 30 minutes postservice time from package 9B with 3 minutes removed.** This recommendation produces a work RVU savings from the current, component-coded services. The survey 25th percentile recommendation is further supported summary spreadsheet and results from the original RUC survey support similar values.

**SERVICES REPORTED WITH MULTIPLE CPT CODES**

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No
   
   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)
   
   - The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - Multiple codes allow flexibility to describe exactly what components the procedure included.
   - Multiple codes are used to maintain consistency with similar codes.
   - Historical precedents.
   - Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

**FREQUENCY INFORMATION**

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 93656

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

<table>

CPT Code: 93657  Tracking Number   Y5  Original Specialty Recommended RVU: 7.00
Global Period: ZZZ  Current Work RVU: 7.50  Presented Recommended RVU: 7.00
RUC Recommended RVU: 7.00

CPT Descriptor: Additional linear or focal intracardiac catheter ablation of the left or right atrium for treatment of atrial fibrillation remaining after completion of pulmonary vein isolation
(List separately in addition to code for primary procedure)
(Use 93657 in conjunction with 93656)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 72-year-old male has symptomatic atrial fibrillation refractory to medical therapy. An electrophysiology (EP) study and ablation are performed to achieve pulmonary vein isolation (reported separately). Despite demonstration of electrical isolation of the pulmonary veins, atrial fibrillation continues.

Percentage of Survey Respondents who found Vignette to be Typical: 95%

Site of Service (Complete for 010 and 090 Globals Only)
Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0%, Overnight stay-less than 24 hours 0%, Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work:

Description of Intra-Service Work: A full electrophysiologic study and ablation procedure has been performed for atrial fibrillation. Diagnostic and ablation catheters are present in cardiac chambers. Pulmonary vein isolation has been accomplished. An intracardiac echocardiographic probe has been advanced into the heart and imaging of the heart and pericardium is performed. Intracardiac echocardiography may be used to guide catheter manipulation, guide transseptal puncture, guide catheter manipulation and observe for complications throughout the procedure. Due to the presence of non-pulmonary vein sources of atrial fibrillation, additional non-pulmonary vein ablation lesions are created. These additional ablation lesions may contain any or all of the following: 1) Regions of fractionated potentials are mapped and ablated outside the pulmonary vein area. 2) linear lesions are created along the roof, mitral isthmus, or septal aspect of the left atrium. 3) Non-pulmonary vein focal sources of atrial fibrillation induction are induced, localized, and ablated. These locations may include areas of the left atrium, right atrium, superior vena cava, or coronary sinus. During the delivery of ablation energy, continuous monitoring for hemodynamic instability, arrhythmias, embolic events, and injury to the esophagus is performed.

During the course of these additional ablation lesions, an advanced 3D computer-assisted mapping system is used to facilitate identification of sites to target for catheter ablation as well as to record sites of lesions to allow the operator to create linear lesions. The mapping system is placed in the cardiac chamber of interest using standard percutaneous techniques. The system is calibrated, and recordings are made during sinus rhythm to identify normal activation and location of scar during each distinct tachycardia. The computer-generated map is displayed, modifications are made in the computer parameters and display, and the tachycardia origin is identified. The ablation catheter is moved to the point of early activation, localized by the mapping system, to identify a mid-diastolic potential, Kent potential, and/or similar paced maps. When a reentrant circuit is identified, entrainment mapping studies are performed and evaluated to confirm the catheter location is within the reentrant circuit. Additional mappings are made to confirm arrhythmia origin and to study additional arrhythmias at the conclusion of the procedure. A final report that includes the mapping procedure and findings is prepared.
Appropriate post ablation attempts at reeducation and observation for 30-minutes are performed. Following restoration of sinus rhythm, conduction intervals are measured and arrhythmia induction is re-attempted over a 30-minute period following the last ablation lesion. If the target site demonstrates recovery or incomplete suppression, then repeat mapping and ablation are performed as described above. These steps are repeated until the target site is rendered durably suppressed or the line demonstrates durable conduction block.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUM analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC’s rationale, please review the separate RUC recommendation document.

History Background

When the Relativity Assessment Workgroup identified CPT code 93656 (atrial fibrillation ablation) due to its rapid increase in growth, the ACC and HRS reviewed the code and determined that certain work should be bundled into the existing code due to their being billed together more than 75% of the time. With continued review of 93656 and the related the volume data, the societies also identified that CPT 93653 (SVT ablation) should have services bundled into it before the codes are
re-surveyed for upcoming RUC valuation. As a result, in October 2020, the ACC and HRS presented a code change application to the CPT Editorial Panel on codes: 93653, 93654, 93655, 93656, 93657. The societies surveyed members late 2020 and presented data in January 2021. Due to inconsistencies in the survey data and in order to better convey the bundled services to respondents, the ACC and HRS resurveyed members March 2021.

The ACC and HRS randomly surveyed cardiac electrophysiologists, as designated by membership rolls, on the newly created codes and entire family. The 000- and ZZZ-global day survey was completed by physicians who have experience with the service. To remedy the above-described shortcomings, the societies work with the Research Subcommittee to deploy several tactics to obtain more consistent survey results. First, fake/dummy codes were used in the survey so that respondents would not presume to know the code descriptors. Second, additional language noting the bundling was included in the survey invitation. Third, respondents were required to attest they had read and understood the new language before completing the survey.

The key reference code is 35306 for thromboendarterectomy. It was selected by approximately 30% of respondents. About 66% of the respondents indicated that 93657 was more complex. The second reference code was 32737 for Transcatheter placement of an intravascular stent(s). It was selected by approximately 21% of respondents. About 53% of the respondents indicated that 93657 was more intense/complex overall.

Rationale

In reviewing the survey data to develop work recommendations, the expert panel believes the data accurate reflects the newly bundled services, 93653 and 93656. The societies believe the technological advances made in patient care indicate survey respondents understood that 3D mapping and left atrial pacing were now inherent to 93653. After nearly a decade and many changes in technology and broader service dispersion have clearly altered the way this service is provided. Over time, the mapping systems have improved, now providing much more detailed and accurate anatomical and electrical activation mapping, often removing the need for fluoroscopy completely. Catheter technology has advanced, providing real-time assessment of the quality of contact between the catheter tip and the endocardial tissue. Last, the 3D mapping systems in conjunction with new catheter technology are now able to provide real-time assessment of the quality of radiofrequency ablation lesion formation. This feature has allowed operators to significantly shorten the duration of each radiofrequency application while also improving the quality of the lesions delivered. The results indicate survey respondents understood that 3D mapping and left atrial pacing were now inherent to 93653. After nearly a decade and many changes in technology and broader service dispersion, a reduction in intraservice times is logical for performing this procedure. The societies support the resurvey data and stand behind the 25th survey value.

While we recognize that in some ways the resurvey may be viewed as a failure, we believe the general consistency with the initial survey—demonstrating reductions in intraservice time—provides insights and a foundation to develop final recommendations for this family. First, with the additional information and tactics taken in the resurvey, we have no reason to believe respondents failed to understand the bundling that has occurred. Rather, we now have confidence that in the survey and the survey-based recommendations we make. Second, in digesting the data from the two surveys, we believe the reductions in time can, in fact, be explained by evolutions in technology and service dispersion, as discussed above. We can speak to this in more detail if helpful. Finally, the resurvey does provide a viable path forward for valuation, as the survey 25th-percentile work RVUs proceed in a reasonable progression that align with other services in the fee schedule. We recognize these recommendations produce an increase in intensity as the drop in time is not 1:1 proportionate with the drop in RVU. We believe that increase is best explained by the fact that several separately reported services are now bundled together, with work being done more quickly and several services being combined in a way that makes meaningful comparison to the prior intensity unhelpful.

Recommendation

During the January meeting, several RUC members questioned whether codes 93613, 93621 and 93662 should also be addressed in the recommendations for cardiac ablation services. These codes are bundled into CPT codes 93653 and/or 93656. Each was recently surveyed by the specialties and the RUC in 2017, 2020, 2019, respectively. As such, the societies recommend affirming the recent times and RVUs of these recently valued codes, as they remain separate in CPT for use in concert with other CPT codes.

While this code descriptor did not change, its use as an additional ablation with a new base code that includes 3D mapping and intracardiac echo, changing the service. The same 3D mapping and intracardiac echo elements that were bundled into 93656 should now typically be considered to be included into this service, since those elements occur throughout the
additional ablation. Therefore, for code 93657 the societies recommend the survey 25th percentile of 7.00 RVU with 60 minutes intraservice time. This value fits well with comparators noted in the summary spreadsheet.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

☑️ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
☐ Multiple codes are used to maintain consistency with similar codes.
☐ Historical precedents.
☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 93657, 93613, 93662

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Cardiac Electrophysiology How often? Commonly
Specialty Cardiology How often? Sometimes
Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 43919
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Figure is twice much as Medicare based claims.

Specialty Cardiac electrophysiology Frequency 36000 Percentage 81.96 %
Specialty Cardiology Frequency 8000 Percentage 18.21 %
Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be provided to Medicare patients nationally in a one-year period? 21,959 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Figure reflects 2019e Medicare based claims.

Specialty Cardiac electrophysiology Frequency 18000 Percentage 81.97 %
Specialty Cardiology Frequency 4000 Percentage 18.21 %
Do many physicians perform this service across the United States? Yes

**Berenson-Eggers Type of Service (BETOS) Assignment**
Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Cardiovascular-Other

**Professional Liability Insurance Information (PLI)**

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 93657

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.
Intracardiac echocardiography

Additional linear or focal

Percutaneous transcatheter

Thromboendarterectomy, intravascular stent(s) (except patch graft if included in procedure performed)

Percutaneous transcatheter closure of paravalvular leak; placement of an intracardiac catheter; catheterization, insertion and repositioning of multiple catheters (List separately in addition to code for primary procedure)

Intracardiac electrophysiologic evaluation with 3-dimensional mapping (List separately in addition to code for primary procedure)

Intracardiac catheter ablation of a discrete mechanism of induction of arrhythmia; with electrophysiologic evaluation during therapeutic/diagnostic intervention, including imaging
Scott Manaker, MD  
AMA/RVS Update PE Subcommittee  
American Medical Association  
330 N. Wabash Ave.  
Chicago, IL 60611  

RE: Tab 7 Practice Expense  

Dear Dr. Manaker:  

Tab 7 on the April 2021 RUC agenda addresses five codes, SVT ablation, atrial fibrillation ablation, and the entire family of codes (93653-93657). Additionally, the Tab also includes three add-on codes 93613, 93621, and 93662. These services are provided exclusively in the facility setting. As such, we recommend no direct practice expense inputs for Tab 7.  

Thank you for your consideration of this information as you prepare for the meeting. Please contact Claudia Vasquez at cvasquez@acc.org if you have any questions.  

Sincerely,  
Richard Wright, MD  
ACC RUC Advisor  
Mark Schoenfeld, MD  
HRS RUC Advisor
In the NPRM for 2016 CMS re-ran the high expenditure services across specialties with Medicare allowed charges of $10 million or more. CMS identified the top 20 codes by specialty in terms of allowed charges, excluding 010 and 090-day global services, anesthesia and Evaluation and Management services and services reviewed since CY 2010. In the comment letter the RUC noted that it was scheduled to review the utilization and collect data under new bundled codes in October 2016. However, in the Final Rule for 2016 CMS indicated that the work and practice expense for this service should be reviewed.

**93613 Intracardiac electrophysiologic 3-dimensional mapping (List separately in addition to code for primary procedure)**

The RUC reviewed the survey results from 47 cardiologists and determined that the survey 25th percentile work RVU of 5.23 appropriately accounts for the work required to perform this service. The RUC recommends 90 minutes intra-service time. The RUC determined that the decrease in the recommended work RVU appropriately corresponds to the decrease in intra-service work. The RUC edited the description of work to delete “remove the catheter and obtaining hemostasis” as this is associated with the primary procedure. The RUC compared the surveyed code to the top key reference service 93609 Intraventricular and/or intra-atrial mapping of tachycardia site(s) with catheter manipulation to record from multiple sites to identify origin of tachycardia (List separately in addition to code for primary procedure) (PC work RVU = 4.99 and 90 minutes intra-service time) and determined that this service was slightly more intense and complex on all measures examined. The RUC also compared the surveyed code to the second top key reference code 93655 Intracardiac catheter ablation of a discrete mechanism of arrhythmia which is distinct from the primary ablated mechanism, including repeat diagnostic maneuvers, to treat a spontaneous or induced arrhythmia (List separately in addition to code for primary procedure) (work RVU = 7.50 and 90 minutes intra-service time) and determined that code 93655 is more intense than the surveyed code because it entails the initiation and prolonged observation (to allow for mapping, the surveyed code) of arrhythmias that are potentially dangerous and/or hemodynamically unstable with increased risk to the patient and thereafter requires ablation which in and of itself carries precision and risk- it requires greater intensity to perform the complex initiation of arrhythmias and to manage such patients while these arrhythmias are being mapped in order to allow for the subsequent ablation. In addition, any patient who has more than one arrhythmia focus becomes exponentially complex. The diagnostic maneuvers, mapping and ablation skills needed to successfully treat a second focus are significant. Not all arrhythmia foci are created equally. Patients who have more than one focus tend to have significant scar tissue. Mapping the circuit of the arrhythmia is particularly challenging because distinguishing between partly viable tissue and complete scare requires a very dense map (meaning many data points must be acquired and correctly interpreted and annotated on the map).
For additional support the RUC referenced MPC code 57267 *Insertion of mesh or other prosthesis for repair of pelvic floor defect, each site (anterior, posterior compartment), vaginal approach (List separately in addition to code for primary procedure)* (work RVU = 4.88 and 45 minutes intra-service time) and noted that the MPC code is much more intense and requires half the intra-service time. **The RUC recommends a work RVU of 5.23 for CPT code 93613.**

**Practice Expense**
There are no direct practice expense inputs for this service.

**Work Neutrality**
The RUC’s recommendation for these codes will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 71-year-old female is undergoing radiofrequency ablation (reported separately) to treat atrial tachycardia. Atrial tachycardia is induced, with a morphology similar to the tachycardia that had been documented clinically. 3D mapping is indicated.

Percentage of Survey Respondents who found Vignette to be Typical: 96%

Site of Service (Complete for 010 and 090 Globals Only)
Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is;
Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: n/a

Description of Intra-Service Work: During the course of an electrophysiology procedure, induce an arrhythmia that requires use of an advanced three-dimensional (3D) computer-assisted mapping system to localize the arrhythmia origin. Place the mapping system in the cardiac chamber of interest using standard percutaneous techniques. Calibrate the system and make recordings during sinus rhythm to identify normal activation and location of scar during each distinct tachycardia. Display the computer-generated map, make modifications in the computer parameters and display, and identify the tachycardia origin. Move the ablation catheter to the point of early activation localized by the mapping system to identify a mid-diastolic potential, Kent potential, and/or similar paced maps. When a re-entrant circuit is identified, perform entrainment mapping studies and evaluated them to confirm the catheter location is within the re-entrant circuit. Make additional mappings to confirm arrhythmia origin and study additional arrhythmias at the conclusion of the procedure. Prepare a final report and include the mapping procedure and findings.

Description of Post-Service Work: n/a

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

93613 is an add-on code used with several cardiac electrophysiology evaluation and/or ablation services. It describes the work of placing the mapping system inside the heart and creating a map of the chamber to aid performance of the underlying service.

CMS identified 93613 in CY 2016 rulemaking as potentially misvalued through its high-expenditure screen. A random survey of 500 ACC and HRS members was executed with 47 completed surveys. The information obtained is used to develop the survey results in the SOR and the summary spreadsheet.

The key reference service was selected by 26 respondents. Respondents who selected atrial tachycardia mapping code 93609 as the key reference code found 93613 to be more intense/complex in every factor, as shown in the above table and the attached addendum. This comparison is reasonable, since the median survey time of 90 minutes equals the 90-minute survey time for 93609, yet respondents estimated 93613 to be more work.

At this RVU level, no comparable ZZZ MPC codes exist. The two highest MPC ZZZ codes—57267 for insertion of vaginal mesh or prosthesis for repair of pelvic floor defect and 63048 for vertebra laminectomy—are included on the SOR and summary spreadsheet. We note that both of those half as much intraservice time (45 minutes). We searched the RUC database for additional comparators and found only nine other RUC-reviewed ZZZ code with a time of 90 minutes. The lowest valued of those, 22851, describes application of intervertebral biomechanical devices and has a work RVU of 6.70.

Reflecting a robust survey, and given the reduction in intraservice time for 93613, we **recommend the survey 25th-percentile work RVU of 5.23 with times of 0 minutes preservice, 90 minutes intraservice, and 0 minutes postservice.** This value is 25% lower than the current value proportionately captures the 25% reduction in time, as demonstrated by the constant IWPUT.

---

**SERVICES REPORTED WITH MULTIPLE CPT CODES**
CPT Code: 93613

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
☐ Multiple codes are used to maintain consistency with similar codes.
☐ Historical precedents.
☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 93613

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

<table>

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Facility Direct Inputs

CPT Long Descriptor: Intracardiac electrophysiologic 3-dimensional mapping (List separately in addition to code for primary procedure)

Global Period: ZZZ Meeting Date: January 2017

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee: The reviewer panel utilized a consensus panel process to develop recommended inputs. **No clinical staff time, supplies, or equipment are recommended for this facility-based ZZZ code.**

2. You must provide reference code(s) for comparison on your spreadsheet. **If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes. Reference Code Rationale: Existing 93613.

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time: n/a

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence: n/a

5. Please describe in detail the clinical activities of your staff: n/a

**Pre-Service** Clinical Labor Activities:

**Intra-Service** Clinical Labor Activities:

**Post-Service** Clinical Labor Activities:
In January 2019, the Relativity Assessment Workgroup (RAW) reviewed services with 2017e Medicare utilization of 10,000 or more that has increased by at least 100% from 2012 through 2017. CPT code 93662 was identified and the RUC recommended this service be surveyed for April 2019.

**93662 Intracardiac echocardiography during therapeutic/diagnostic intervention, including imaging supervision and interpretation (List separately in addition to code for primary procedure)**

The RUC reviewed the survey results from 42 cardiologists and agreed on the following physician time component: 25 minutes of intra-service time.

The RUC reviewed the recommended survey 25th percentile work RVU of 2.53 and agreed that this value appropriately captures the amount of physician work involved. The recommended work value and time for this service reflects the change in technology from when it was last valued in 2000. Intracardiac echocardiography has become an essential tool for complex catheter ablation of many types of arrhythmias and it has also enabled operators to significantly reduce the use of fluoroscopy. Since this service was last valued, arrhythmia mapping systems have developed the ability to incorporate intracardiac echo images into 3-dimensional electroanatomical maps. This has improved the accuracy, safety and effectiveness of catheter ablation for a wide range of arrhythmias, most notably atrial fibrillation. To justify a work RVU of 2.53, the RUC compared the survey code to CPT code 34713 *Percutaneous access and closure of femoral artery for delivery of endograft through a large sheath (12 French or larger), including ultrasound guidance, when performed, unilateral (List separately in addition to code for primary procedure)* (work RVU = 2.50 and intra-service time of 20 minutes) and determined that the recommended work value for the survey code is supported by CPT code 34713 which has similar physician work and time. The RUC also compared the survey code to MPC code 36476 *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; subsequent vein(s) treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)* (work RVU = 2.65 and intra-service time of 30 minutes) and determined that the recommended work value is supported by MPC code 36476. The RUC agreed that both reference services bracket the survey code in both physician work and time, supporting the recommended work value for the survey code.

Additionally, survey respondents who selected coronary intravascular ultrasound (IVUS) code 92978 as the top key reference service (KRS), found the survey code to be more intense/complex overall. The RUC agreed that this comparison is reasonable, since the median survey time of 25 minutes for the survey code equals the 25-minute intra-service time for KRS code 92978, yet survey respondents estimated the survey code to be more work

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.
and takes significantly more mental effort and judgment than KRS code 92978, further supporting the recommended survey 25\textsuperscript{th} percentile work RVU of 2.53 for the survey code. **The RUC recommends a work RVU of 2.53 for CPT code 93662.**

**Practice Expense**
These services are facility-only and have no direct practice inputs.

**Work Neutrality**
The RUC’s recommendation for this code will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

CPT Descriptor: Intracardiac echocardiography during therapeutic/diagnostic intervention, including imaging supervision and interpretation (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: During the catheter ablation of a 57 year-old man with symptomatic paroxysmal atrial fibrillation, intracardiac ultrasound is used to guide the trans-septal puncture, evaluate left atrial and pulmonary vein anatomy, and monitor for intra-procedural complications.

Percentage of Survey Respondents who found Vignette to be Typical: 98%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0%, Overnight stay-less than 24 hours 0%, Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work:

Description of Intra-Service Work: Femoral venous access is obtained using fluoroscopic and or ultrasound guidance, avoiding the femoral artery. A 9 French or 10 French sheath is inserted into the vein. The intracardiac echo probe is advanced through the sheath, up the inferior vena cava to the right atrium again using fluoroscopic and intracardiac echo guidance, avoiding the venous branches and Eustachian ridge. The following structures are imaged for baseline anatomy: The fossa ovalis, aortic root, left atrium including the left atrial appendage, pulmonary veins, esophagus and the pericardial space to evaluate for document if a baseline effusion is present. Next, preparations for transseptal puncture are made by rotating and flexing the intracardiac echo catheter in 3 dimensions to identify the ideal location of the atrial septum for puncture. Under intracardiac echo guidance the transseptal needle is positioned in the appropriate portion of the septum. Intracardiac echo is used to confirm tenting of the septum by the needle at the desired location, and the puncture is then performed. Saline is flushed through the transseptal needle and intracardiac echo is used to confirm that the needle tip is in the left atrium by visualizing bubbles on intracardiac echo within the left atrium. A sheath is then advanced over the transseptal needle into the left atrium and the needle is withdrawn from the body. Throughout the remainder of the procedure intracardiac echo is used to confirm the position of the ablation catheter in the left atrium and it is used to monitor for complications including pericardial effusion and intracardiac thrombus. At the end of the procedure the catheter and sheaths are removed and hemostasis achieved using either manual pressure, vascular closure device or superficial stitches. Details of the procedure and then documented.

Description of Post-Service Work:
### Survey Data

### Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC’s rationale, please review the separate RUC recommendation document.
93662 is an add-on code used with several cardiac electrophysiology evaluation and/or ablation services. It can also be used with certain transcatheter structural valve procedures.

The RAW identified 93662 through its high-growth screen. A random survey of 1000 ACC and HRS members was executed with 42 completed surveys. The information obtained is used to develop the survey results in the SOR and the summary spreadsheet.

While we are not making a compelling evidence argument because we are recommending a reduction, we do wish to explain the ways this service is different from when it was valued in 2000. Intracardiac echo has become unessential to tool for complex catheter ablation of many types of arrhythmias. It has also enabled operators to significantly reduce the use of fluoroscopy. Over the past 15 years, arrhythmia mapping systems have developed the ability to incorporate intracardiac echo images into 3-dimensional electroanatomical maps. This has improved the accuracy, safety and effectiveness of catheter ablation for a wide range of arrhythmias, most notably atrial fibrillation.

The key reference service was selected by 12 respondents. Respondents who selected coronary intravascular ultrasound (IVUS) code 92978 as the key reference code found 93662 to be more intense/complex overall. This comparison is reasonable, since the median survey time of 25 minutes equals the 25-minute intraservice time for 92978, yet respondents estimated 93662 to be more work.

The second key reference service was selected by 10 respondents. Respondents who selected intracardiac 3D mapping code 93613 as the key reference code found 93662 to be identical or somewhat more intense/complex overall. However, comparison between 93662 and 93613 is challenging, as the latter has a much longer service time and higher work RVU than under discussion here.

Reflecting a valid survey, and given the reduction in intraservice time for 93662, we recommend the survey 25th-percentile work RVU of 2.53 work RVUs with times of 0 minutes preservice, 25 minutes intraservice, and 0 minutes postservice. This somewhat higher value reflects the higher intensity/complexity estimated by respondents who selected the KRS.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☑ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. 93662 may be billed with 92987, 93453, 93460-96462, 93532, 93580, 93581, 93620, 93621, 93622, 93653, 93654, or 93656.
How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 93622

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty cardiac electrophysiology  How often? Commonly
Specialty cardiology  How often? Sometimes
Specialty  How often?

Estimate the number of times this service might be provided nationally in a one-year period? 130000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Twice the utilization estimated below for Medicare

Specialty cardiac electrophysiology  Frequency 71000  Percentage 54.61 %
Specialty cardiology  Frequency 59000  Percentage 45.38 %
Specialty  Frequency  Percentage %

Estimate the number of times this service might be provided to Medicare patients nationally in a one-year period? 65,000  If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. A continuation of recent growth trends of about 6,300 a year from 2015-2017 would lead to utilization of roughly 65,000 services in 2020.

Specialty cardiac electrophysiology  Frequency 35500  Percentage 54.61 %
Specialty cardiology  Frequency 29500  Percentage 45.38 %
Specialty  Frequency  Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

Berenson-Eggers Type of Service (BETOS) Assignment
Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Cardiovascular-Other

Professional Liability Insurance Information (PLI)
If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 93662

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.
### INSTRUCTIONS

1. Insert information and data into all applicable cells except IWPUT and TOTAL TIME. These cells will automatically calculate.
2. Hide columns and rows that do not contain data.
3. **1st REF** = Top Key Reference code data
4. **2nd REF** = Second Highest Key Reference code data
5. **CURRENT** = Current data (Harvard or RUC) for code being surveyed. If this is a new code, this row will be blank.
6. **SVY** = Survey data - as it appears on the Summary of Recommendation form.
7. **REC** = Specialty Society recommended data as it appears on the Summary of Recommendation form.

April 2, 2019

Scott Manaker, MD
AMA/RVS Update PE Subcommittee
American Medical Association
330 N. Wabash Ave.
Chicago, IL 60611

RE: Tab 23 Practice Expense

Dear Dr. Manaker:

Tab 23 on the April 2019 RUC agenda addresses one add-on code for intracardiac echocardiography performed during other catheter procedures. This add-on service is provided exclusively in the facility setting. As such, we recommend no direct practice expense inputs for Tab 23.

Thank you for your consideration of this information as you prepare for the meeting. Please contact James Vavricek at jvavricek@acc.org if you have any questions.

Sincerely,

Richard Wright, MD
ACC RUC Advisor

Mark Schoenfeld, MD
HRS RUC Advisor
In October 2019, the RUC identified this service via the high-volume growth screen for services with Medicare utilization of 10,000 or more and have increased by at least 100% from 2013 through 2018. In January 2020, the RUC recommended this service be surveyed for April 2020. The code was surveyed individually, as it is not part of a specific family, because it is an add-on service that can be used with several different procedures - base codes or other add-on codes, diagnostic as well as therapeutic.

**93621 Comprehensive electrophysiologic evaluation including insertion and repositioning of multiple electrode catheters with induction or attempted induction of arrhythmia; with left atrial pacing and recording from coronary sinus or left atrium (List separately in addition to code for primary procedure)**

The RUC reviewed the survey results from 53 cardiologists and cardiac electrophysiologists and determined that a direct work RVU crosswalk to CPT code 36483 Endovenous ablation therapy of incompetent vein, extremity, by transcatheter delivery of a chemical adhesive (eg, cyanoacrylate) remote from the access site, inclusive of all imaging guidance and monitoring, percutaneous; subsequent vein(s) treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure) (work RVU = 1.75, 20 minutes intra-service and total time) would appropriately account for the physician work required to perform this service and falls below the survey 25\textsuperscript{th} percentile.

The RUC discussed the decrease in intra-service time from 30 to 20 minutes and the accordant increase in intensity. Because the recommended work RVU is not an increase, a compelling evidence argument is not necessary. However, because of the change in calculated intensity that results from a decrease in intra-service time without an entirely commensurate decrease in work RVU, the specialty societies provided compelling evidence that there has been a change in technique that has changed physician work.

Since 2001, when this code was last surveyed, there have been several changes in technique that have contributed to an increase in the intensity and decrease in the total time of the procedure. In particular, the typical access technique has evolved to the femoral vein to insert the catheter, as opposed to the jugular or subclavian vein. Previously, a superior vena cava (SVC) approach via internal jugular (IJ) or subclavian vein access was the preferred route to access the coronary sinus. Anatomically, this provides an ideal angle from which to cannulate the coronary sinus which sits at the inferior posteroseptal region of the right atrium, just above the tricuspid valve. This angle makes it possible to use a simple fixed curve catheter and ensures that the catheter position will remain stable throughout the procedure. The downside of the superior approach is that it requires an additional access site (the internal jugular or subclavian vein) that would otherwise not be needed. This carries a small but real risk of pneumothorax and the IJ /
Subclavian access site can be uncomfortable for patients during and after the procedure. For these reasons, most electrophysiologists have evolved their practice and now use a femoral vein approach to deploy the coronary sinus catheter.

The femoral approach avoids the need to prep and drape an additional access site since the other sheaths and catheters for EP studies are also placed from a femoral approach. However, a separate and additional sheath needs to be inserted into the femoral vein for placement of the coronary sinus catheter. Due to the need for multiple sheaths in the same femoral vein access region, care must be taken during venous access to space the access sites sufficiently to avoid interference between the catheters. In addition, a femoral venous approach introduces anatomical challenges for cannulating the coronary sinus and does not provide the natural stability of the catheter achieved from a subclavian approach. The primary anatomical obstacles are the height of the eustachian ridge/inferior vena cava junction and the abrupt reverse angle (usually greater than 135 degrees) that the catheter must traverse once it passes above the eustachian ridge in order to enter to coronary sinus ostium. With the advent of manually deflectable catheters, electrophysiologists are usually (but not always) able to cannulate the coronary sinus from a femoral approach despite the anatomical challenges. However, because the anatomy (eustachian ridge/IVC junction) intrinsically puts pressure on the catheter in a direction that pulls it away from the coronary sinus, the catheter is much less stable than it would be from a superior approach. As a result, it is typical for the coronary sinus catheter to become dislodged multiple times in a single case requiring the operator to reposition the catheter each time.

The RUC agreed that the minutes reduced from the change in access site are at the lower end of the intensity spectrum for the service, which naturally leads to an increase in calculated intensity that is compounded by the increased intensity of making the turn at the IVC/eustachian ridge and multiple re-positionings of the catheter.

Another difference from 2001 is that this service is typically added on to EP-studies performed in concert with ablation therapies, rather than with diagnostic-only EP studies as was predominant in 2001. Medicare reported together data show that these services are now typically performed as a combination of therapeutic and diagnostic interventions (e.g., EP ablation), as opposed to simply diagnostic procedures. The survey add-on code is most often reported with ablation code 93653 Comprehensive electrophysiologic evaluation including insertion and repositioning of multiple electrode catheters with induction or attempted induction of an arrhythmia with right atrial pacing and recording, right ventricular pacing and recording (when necessary), and His bundle recording (when necessary) with intracardiac catheter ablation of arrhythmogenic focus; with treatment of supraventricular tachycardia by ablation of fast or slow atrioventricular pathway, accessory atrioventricular connection, cavo-tricuspid isthmus or other single atrial focus or source of atrial re-entry (work RVU = 14.75, 180 minutes intra-service time) and diagnostic code 93613 Intracardiac electrophysiologic 3-dimensional mapping (List separately in addition to code for primary procedure) (work RVU = 5.23, 90 minutes intra-service time). Specifically, the data shows that approximately 80% of 93621 is reported with CPT code 93653. The placement of a catheter for pacing/recording in the left atrium and coronary sinus is more complex/intense in an ablation versus a diagnostic procedure. Patients who proceed to ablative therapies are more complex than those only receiving diagnostic catheterization.
Moreover, the RUC notes that while it is uncommon for an add-on code to be more intense than the underlying service, it does occur, and it is common in the electrophysiology space. A relevant example is trans-septal puncture CPT code 93462 *Left heart catheterization by transseptal puncture through intact septum or by transapical puncture (List separately in addition to code for primary procedure)* (work RVU = 3.73, 40 minutes intra-service and total time) that may be performed with SVT ablation CPT code 93653 *Comprehensive electrophysiologic evaluation including insertion and repositioning of multiple electrode catheters with induction or attempted induction of an arrhythmia with right atrial pacing and recording, right ventricular pacing and recording (when necessary), and His bundle recording (when necessary) with intracardiac catheter ablation of arrhythmogenic focus; with treatment of supraventricular tachycardia by ablation of fast or slow atrioventricular pathway, accessory atrioventricular connection, cavo-tricuspid isthmus or other single atrial focus or source of atrial re-entry* (work RVU = 14.75, 180 minutes intra-service and 239 minutes total time). The ablation procedure intensity is 0.075 while the puncture is more intense at 0.093. An intensity of 0.088 from the RVU recommendation for CPT code 93621 fits this model and is a reasonable intensity rank order.

The RUC compared CPT code 93621 to the second highest key reference service and MPC code 99292 *Critical care, evaluation and management of the critically ill or critically injured patient; each additional 30 minutes (List separately in addition to code for primary service)* (work RVU = 2.25, 30 minutes intra-service and total time) and noted the intra-service time is 10 minutes less for the survey code and all the survey respondents that selected the second key reference code rated the survey code as more intense and complex overall relative to the reference code.

The RUC also identified CPT code 37252 *Intravascular ultrasound (noncoronary vessel) during diagnostic evaluation and/or therapeutic intervention, including radiological supervision and interpretation; initial noncoronary vessel (List separately in addition to code for primary procedure)* (work RVU = 1.80, 20 minutes intra-service time and 22 minutes total time) for comparison purposes and noted that the comparator code has the same amount of intra-service time and intensity as the survey code.

For additional support, the RUC referenced key MPC codes 37253 *Intravascular ultrasound (noncoronary vessel) during diagnostic evaluation and/or therapeutic intervention, including radiological supervision and interpretation; each additional noncoronary vessel (List separately in addition to code for primary procedure)* (work RVU = 1.44, 20 minutes intra-service time and 1 minute immediate post-service time) and 36227 *Selective catheter placement, external carotid artery, unilateral, with angiography of the ipsilateral external carotid circulation and all associated radiological supervision and interpretation (List separately in addition to code for primary procedure)* (work RVU = 2.09, 15 minutes intra-service and total time) and noted that the multi-specialty points of comparison codes appropriately bracket the survey code. The RUC further noted that there are 12 RUC reviewed ZZZ codes with 20 minutes intra-service time and work values between 1.40 and 2.00.

The RUC concluded that, given changes in intensity and total time for the procedure, CPT code 93621 should be valued based on a direct work RVU crosswalk to CPT code 36483 with 20 minutes intra-service time as supported by the survey. The RUC recommends a work RVU of 1.75 for CPT code 93621.
Practice Expense
CPT code 93621 is provided exclusively in the facility setting; thus, no direct practice expense inputs are recommended.

Work Neutrality
The RUC’s recommendation for this code will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

CPT Code: 93621

CPT Descriptor: Comprehensive electrophysiologic evaluation including insertion and repositioning of multiple electrode catheters with induction or attempted induction of arrhythmia; with left atrial pacing and recording from coronary sinus or left atrium (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: During a separately reported cardiac electrophysiology procedure, a 37 year-old man with recurrent palpitations is indicated, for diagnostic purposes, for the recording of electrical activity from the left atrium and ventricle and to pace the left atrium.

[Note: This is an add-on code. Only consider the additional work for left atrial pacing and recording from coronary sinus or left atrium. Do not include any work that is included in base codes 93620, 93653 or 93654.]

Percentage of Survey Respondents who found Vignette to be Typical: 88%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: N/A

Description of Intra-Service Work: The patient is undergoing a separately reported cardiac electrophysiology procedure, and it is necessary to place a catheter in the coronary sinus to record left atrial activity. Femoral venous access site is already prepared for related procedure. Achieve central venous access, place a sheath in the femoral vein using standard percutaneous techniques, changing to subclavian or jugular access if that fails. Introduce the catheter into the sheath and advance into the right atrium where the ostium of the coronary sinus is engaged. Advance the catheter into the coronary sinus. Use the multielectrode catheter to record electrical activity from the left atrium and, at times, pace the left atrium to attempt arrhythmia induction. Reposition the catheter as necessary throughout the course of the cardiac electrophysiology procedure to optimize recordings and pacing thresholds. At the conclusion of the procedure, remove the catheter. Include a description of this additional work and catheter use and associated findings in the procedure report

Description of Post-Service Work: N/A

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.
History and Background

At the April 2020 virtual RUC meeting, the RUC recommended a value of 1.44, a crosswalk to CPT code 37253. The societies appealed that outcome after feeling limited by the virtual format, unable to adequately consult with one another or facilitate in the typical manner. That appeal was granted, and this SOR is a re-presentation of data from the April survey with reconfigured and enhanced recommendations the societies believe provide a satisfactory path forward.

In October 2019, the Relativity Assessment Workgroup identified services with Medicare utilization of 10,000 or more that have increased by at least 100% from 2013 through 2018, including CPT 93621 electrophysiologic evaluation.

For the April 2020 meeting, HRS and ACC randomly surveyed electrophysiologists, as designated by membership rolls. The survey was completed by physicians who have experience with the service. The key reference code is 93609 for intraventricular and/or intra-atrial mapping of tachycardia with catheter manipulation. It was selected by 33.9% of respondents. Nearly a third of these respondents indicate 93621 was virtually identical. The second reference code was 99292 for critical care evaluation. It was selected by 11.3% of respondents. All of these respondents indicated that 93621 was more intense/complex overall.

Since 2001, when this code was last surveyed, there have been a number of changes in technique that have contributed to change in intensity and total time of the procedure. In particular the typical access technique has evolved to the femoral vein to insert the catheter (as included in the updated description of service above), as opposed to the jugular or subclavian vein (as currently presented from the 2001 survey in the RUC database).

Compelling Evidence-Type Explanation for RVU Recommendation

Because the recommended work RVU is not an increase, a compelling evidence argument is not necessary. However, because of the change in calculated intensity that results from a decrease in intraservice time without an entirely commensurate decrease in work RVU, the societies make a compelling evidence-type presentation here. Specifically, there has been a change in technique that has changed physician work.

The technique used for coronary sinus catheter placement has evolved. Previously, a superior vena cava (SVC) approach via internal jugular (IJ) or subclavian vein access was the preferred route to access the coronary sinus. Anatomically, this provides an ideal angle from which to cannulate the coronary sinus which sits at the inferior posteroseptal region of the right atrium, just above the tricuspid valve. This angle makes it possible to use a simple fixed curve catheter and ensures that the catheter position will remain stable throughout the procedure. The downside of the superior approach is that it requires an additional access site (the internal jugular or subclavian vein) that would otherwise not be needed. This carries a small but real risk of pneumothorax and the IJ / subclavian access site can be uncomfortable for patients during and after the procedure. For these reasons, most electrophysiologists have evolved their practice and now use a femoral vein approach to deploy the coronary sinus catheter.

The femoral approach avoids the need to prep and drape an additional access site since the other sheaths and catheters for EP studies are also placed from a femoral approach. However, a separate and additional sheath does need to be inserted into the femoral vein for placement of the coronary sinus catheter. Due to the need for multiple sheaths in the same femoral vein access region, care must be taken during venous access to space the access sites sufficiently to avoid interference between the catheters. In addition, a femoral venous approach introduces anatomical challenges for cannulating the coronary sinus and does not provide the natural stability of the catheter achieved from a subclavian approach. The primary anatomical obstacles are the height of the eustachian ridge/inferior vena cava junction and the abrupt reverse angle (usually greater than 135 degrees) that the catheter must traverse once it passes above the eustachian ridge in order to enter to coronary sinus ostium. With the advent of manually deflectable catheters, electrophysiologists are usually (but not always) able to cannulate the coronary sinus from a femoral approach despite the anatomical challenges. However, because the anatomy (eustachian ridge/IVC junction) intrinsically puts pressure on the catheter in a direction that pulls it away from the coronary sinus, the catheter is much less stable than it would be from a superior approach. As a result, it is typical for the coronary sinus catheter to become dislodged multiple times in a single case requiring the operator to reposition the catheter each time.
We believe the minutes reduced from the change in access site are at the lower end of the intensity spectrum for the service, which naturally leads to an increase in calculated intensity that is compounded by the increased intensity of making the turn at the IVC/eustachian ridge and multiple re-positionings of the catheter.

Another difference from 2001 to now is that this service is typically added on to EP-studies performed in concert with ablation therapies, rather than with diagnostic-only EP studies as was predominant in 2001. Billed together data show that these services are now typically performed as a combination of therapeutic and diagnostic interventions (e.g., EP ablation), as opposed to simply diagnostic procedures, specifically the data shows that roughly 78% of 93621 is billed with 93653. This is another difference from the 2001 valuation. Patients who proceed to ablative therapies are more complex than those only receiving diagnostic catheterization.

For comparison purposes, the societies identified RVW comparator code 37252 for intravascular ultrasound (noncoronary vessel) during diagnostic evaluation and/or therapeutic intervention. This code has the same amount of intraservice time, 20 minutes and, correctly, a slightly lower IWPUT of 0.088 than results from our recommendation. The societies also identified two other comparator codes that bracket the recommendation: 36483 for endovenous ablation therapy at 1.75 RVW with a slightly higher intensity than the recommendation at 0.088. This code reflects a mostly ‘technical’ procedure. The second code, 36227 for selective catheter placement has an RVW of 2.09 and a higher intensity of 0.1393 IWPUT.

Finally, revisiting a topic that arose during the first presentation of this code, while it is uncommon for an add-on code to be more intense than the underlying service, it does occur and it is common in the electrophysiology space. A relevant example is trans-septal puncture (93462) that may be performed with SVT ablation (93653). The ablation procedure IWPUT is 0.075 while the puncture is more intense at 0.093. An IWPUT of 0.088 from the RVU recommended below fits this model, and is a reasonable IWPUT rank order to the expert panel.

Recommendation

Therefore, for code 93621 the societies recommend a crosswalk to the RVW of 1.75 from code 36483 with 0 minutes preservice time, 20 minutes intraservice time from the survey median, and 0 minutes postservice time.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)
   
   - The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - Multiple codes allow flexibility to describe exactly what components the procedure included.
   - Multiple codes are used to maintain consistency with similar codes.
   - Historical precedents.
   - Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 93621
How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Scott Manaker, MD  
AMA/RVS Update PE Subcommittee  
American Medical Association  
330 N. Wabash Ave.  
Chicago, IL 60611

RE: Tab 21 Practice Expense

Dear Dr. Manaker:

Tab 21 on the October 2020 RUC agenda addresses one add-on code for electrophysiologic services. This add-on service is provided exclusively in the facility setting. As such, we recommend no direct practice expense inputs for Tab 21. Thank you for your consideration of this information as you prepare for the meeting. Please contact Claudia Vasquez at cvasquez@acc.org if you have any questions.

Sincerely,

Richard Wright, MD  
ACC RUC Advisor

Mark Schoenfeld, MD  
HRS RUC Advisor
In February 2021, the CPT Editorial Panel approved the addition of two codes to report esophagogastroduodenoscopy, flexible, transoral with deployment and removal of intragastric bariatric balloon. CPT code 43235 was identified as being part of the same family of services.

**43235 Esophagogastroduodenoscopy, flexible, transoral; diagnostic, including collection of specimen(s) by brushing or washing, when performed (separate procedure)**

The RUC reviewed the survey results from 54 gastrointestinal and endoscopic surgeons and bariatric surgeons and determined that maintaining the current work RVU of 2.09, which falls below the survey 25th percentile, appropriately accounts for the physician work involved in this service. The RUC recommends 14 minutes of pre-service evaluation, 3 minutes of pre-service positioning, 5 minutes of pre-service scrub/dress/wait time, 15 minutes intra-service time and 12 minutes immediate post-service time. Pre-service time package 1 (Straightforward Patient/Straightforward Procedure (No anesthesia care)) and post-service time package 8A (IV Sedation/ Straightforward Procedure) are recommended as adjusted. CPT code 43235 is typically performed with either moderate sedation or anesthesia. In 2017, when moderate sedation was removed from GI endoscopy codes and other codes where moderate sedation was considered inherent to the procedure, it became historical precedent that moderate sedation is separately reported. Therefore, moderate sedation CPT codes 99152 and 99153 or 00731 would be reported typically on the same date with 43235 (43X21 or 43X22). No multiple procedures reduction policies apply.

To justify a work RVU of 2.09, the RUC compared CPT code 43235 to the top key reference service code 43202 Esophagoscopy, flexible, transoral; with biopsy, single or multiple (work RVU = 1.72, 15 minutes intra-service time 47 minutes total time) and noted that the reference service has identical intra-service time but is less intense than the survey code and appropriately valued lower. The RUC also compared the survey code to the second key reference code 43216 Esophagoscopy, flexible, transoral; with removal of tumor(s), polyp(s), or other lesion(s) by hot biopsy forceps (work RVU = 2.30, 22 minutes intra-service time and 55 minutes total time) and noted that the reference service has more intra-service and total time and is appropriately valued higher than 43235.

For additional support, the RUC compared CPT code 43235 to MPC codes 64483 Injection(s), anesthetic agent(s) and/or steroid; transforaminal epidural, with imaging guidance (fluoroscopy or CT), lumbar or sacral, single level (work RVU = 1.90, 15 minutes intra-service time and 49 minutes total time) and 64479 Injection(s), anesthetic agent(s) and/or steroid; transforaminal epidural, with imaging guidance (fluoroscopy or CT), cervical or thoracic, single level (work RVU = 2.29, 15 minutes intra-service time and 49 minutes total time) and noted that the multi-specialty points of comparison values have the same intra-service time and appropriately bracket the survey code recommendation. The RUC concluded that the value of CPT code 43235 should be maintained at 2.09 work RVUs, below the 25th percentile of the survey. The RUC recommends a work RVU of 2.09 for CPT code 43235.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.
43X21 *Esophagogastroduodenoscopy, flexible, transoral; with deployment of intragastric bariatric balloon*

The RUC reviewed the survey results from 51 gastrointestinal and endoscopic surgeons and bariatric surgeons and concurred that the survey respondents overvalued the physician work involved in performing this service. The RUC determined that a direct work RVU crosswalk to CPT code 31256 *Nasal/sinus endoscopy, surgical, with maxillary antrostomy*; (work RVU = 3.11, 30 minutes intra-service time and 83 minutes total time), which falls below the survey 25th percentile and has identical intra-service time, appropriately accounts for the physician work involved in this service. The RUC believed that the survey 25th percentile work RVU was too high in comparison to other services and agreed with the crosswalk to 31256. Alternative crosswalks were considered; however, the nasal endoscopy code, 31256, was deemed most clinically comparable and the value fits within the context of the EGD family. The RUC noted that in a comparison of recently RUC-reviewed 000-day global codes with similar intra-service and total times, the crosswalk value of 3.11 falls in the middle range in terms of work RVUs.

The RUC recommends 18 minutes of pre-service evaluation, 3 minutes of pre-service positioning, 5 minutes of pre-service scrub/dress/wait time, 30 minutes intra-service time and 20 minutes immediate post-service time, 76 minutes total time. Pre-service time package 2 (Difficult Patient/Straightforward Procedure (No anesthesia care)) and post-service time package 8A are recommended as adjusted. The typical patient is considered difficult based on an elevated BMI of 30-40. The RUC noted that the requested pre-service physician time components differ slightly from the package and specifically align with the traditional GI endoscopy pre-times: 18 minutes evaluation time, 3 minutes positioning time, and 5 minutes scrub/dress/wait time.

To justify the crosswalk value of 3.11 work RVUs, the RUC compared CPT code 43X21 to key reference code 43226 *Esophagoscopy, flexible, transoral; with insertion of guide wire followed by passage of dilator(s) over guide wire* (work RVU = 2.24, 25 minutes intra-service time and 57 minutes total time) and noted that the reference service has less intra-service and total time and is a less complex procedure than the survey code and appropriately valued lower.

For additional support, the RUC compared CPT code 43X21 to MPC codes 10030 *Image-guided fluid collection drainage by catheter (eg, abscess, hematoma, seroma, lymphocele, cyst), soft tissue (eg, extremity, abdominal wall, neck), percutaneous (work RVU = 2.75, 30 minutes intra-service time and 76 minutes total time)* and 37191 *Insertion of intravascular vena cava filter, endovascular approach including vascular access, vessel selection, and radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance (ultrasound and fluoroscopy), when performed* (work RVU = 4.46, 30 minutes intra-service time and 73 minutes total time) and noted that the multi-specialty points of comparison values have the same intra-service time and appropriately bracket the survey code recommendation. The RUC concluded that CPT code 43X21 should be valued based on a direct work RVU crosswalk to CPT code 31256 which falls below the survey 25th percentile. **The RUC recommends a work RVU of 3.11 for CPT code 43X21.**

43X22 *Esophagogastroduodenoscopy, flexible, transoral; with removal of intragastric bariatric balloon(s)*

The RUC reviewed the survey results from 51 gastrointestinal and endoscopic surgeons and bariatric surgeons and determined that the survey 25th percentile work RVU of 2.80 appropriately accounts for the physician work involved in this service. The RUC recommends 18 minutes of pre-service evaluation, 3 minutes of pre-service positioning, 5 minutes of pre-service scrub/dress/wait time, 30 minutes intra-service time and 15 minutes immediate post-service time. The RUC noted that the requested pre-service physician time components specifically align with the rest of

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.
the gastrointestinal endoscopy pre-times: 18 minutes evaluation time, 3 minutes positioning time, and 5 minutes scrub/dress/wait time. Pre-service time package 2 and post-service time package 9A (General Anesthesia or Complex Regional Block/ Straightforward Procedure) are recommended as adjusted. The RUC noted that typically the patient is intubated and concurred that post-time package 9A, as adjusted per the survey, is most appropriate.

To justify a work RVU of 2.80, the RUC compared CPT code 43X22 to the top key reference service code 43215 *Esophagoscopy, flexible, transoral; with removal of foreign body(s)* (work RVU = 2.44, 20 minutes intra-service time and 53 minutes total time) and noted that the reference service has ten minutes less intra-service time than the survey code and is appropriately valued lower.

For additional support, the RUC compared CPT code 43X22 to MPC codes 31622 *Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; diagnostic, with cell washing, when performed (separate procedure)* (work RVU = 2.53, 30 minutes intra-service time and 61 minutes total time) and 37191 *Insertion of intravascular vena cava filter, endovascular approach including vascular access, vessel selection, and radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance (ultrasound and fluoroscopy), when performed* (work RVU = 4.46, 30 minutes intra-service time and 73 minutes total time) and noted that the multi-specialty points of comparison values have the same intra-service time and appropriately bracket the survey code recommendation. The RUC concluded that CPT code 43X22 should be valued at the 25th percentile work RVU as supported by the survey. **The RUC recommends a work RVU of 2.80 for CPT code 43X22.**

**Practice Expense**
For CPT code 43X21, the Practice Expense Subcommittee adjusted five minutes of clinical staff time between CA005 *Complete pre-procedure phone calls and prescription* (3 minutes) and CA035 *Complete pre-procedure phone calls and prescription* (2 minutes). The Subcommittee also verified that the new supply item, *Intragastric Balloon System*, is not reusable. When it is removed, the balloon is punctured so it cannot be reused in another patient. **The RUC recommends the direct practice expense inputs as modified by the Practice Expense Subcommittee.**

**New Technology**
CPT codes 43X21 and 43X22 will be placed on the New Technology list and will be re-reviewed by the RUC in three years to ensure correct valuation and utilization assumptions.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 43235  Tracking Number: B1  Original Specialty Recommended RVU: 2.09
Global Period: 000  Current Work RVU: 2.09  Presented Recommended RVU: 2.09
RUC Recommended RVU: 2.09

CPT Descriptor: Esophagogastroduodenoscopy, flexible, transoral; diagnostic, including collection of specimen(s) by brushing or washing, when performed (separate procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 67-year-old patient with dyspepsia and weight loss refractory to pharmacological therapy is referred for diagnostic esophagogastroduodenoscopy (EGD) and collection of specimens by brushings.

Percentage of Survey Respondents who found Vignette to be Typical: 87%

Site of Service (Complete for 010 and 090 Globals Only)
Percent of survey respondents who stated they perform the procedure; In the hospital 0%, In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0%, Overnight stay-less than 24 hours 0%, Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Review patient’s gastrointestinal symptoms. Review the need for pre-procedure antibiotics or contrast allergy prophylaxis. Review patient's allergies and medications, specifically noting usage of antiplatelet or anticoagulation medications. Review patient's laboratory studies as they relate to coagulation status and platelet count. Review patient's X-rays and other diagnostic tests. Review the risks and benefits of the procedure with the patient. Obtain informed consent for the procedure. Verify all endoscopic equipment is available and operational and make appropriate computer entries as necessary. Position patient on the examination table. Position endoscopic equipment to provide access for the procedure. Perform a time out. Apply topical anesthesia to the throat. Place a bite-block in patient's mouth.

Description of Intra-Service Work: Assess level of sedation prior to inserting the endoscope. Insert a standard flexible upper endoscope through the mouth into the oropharynx and advance through the esophagus into the proximal stomach. Insufflate the stomach with air after suctioning liquid contents. Perform an examination of the entire stomach in the forward and retroflexed positions. Advance the endoscope through the pylorus into the duodenal bulb. Inspect the duodenum circumferentially after air insufflation. Slowly withdraw the endoscope and reinspect the stomach and duodenum. After suctioning air to deflate the stomach, withdraw the endoscope into the esophagus, allowing measurement of the squamocolumnar (SC) and gastroesophageal (GE) junction from the incisors. Assess for presence of a hiatal hernia and examine the esophageal mucosa. When indicated, obtain brushings or washings of suspicious abnormalities. Obtain photodocumentation of appropriate normal landmarks and abnormalities. Withdraw the endoscope at the conclusion of the procedure.

Description of Post-Service Work: Assess patient's condition including post-procedure vital signs. Complete post-procedure orders. Complete cytology forms as necessary. Complete post-procedure specimen verification and documentation and reporting for quality purposes. Review and label photographs. Order and review post-procedure radiographs. Generate a procedure report and forward to referral source and other appropriate parties. Enter data into the procedure registry. Assess patient for suitability to discharge from the recovery suite relative to established discharge criteria. When patient is stable for discharge, review findings and recommendations with the patient and pertinent others. Provide orders for necessary prescriptions, follow-up tests, and appointments to the patient.

### Description of Sample:

The ACG, AGA and ASGE surveyed a random sample of 1,000 members; with email bouncebacks, 974 surveys were successfully delivered. SAGES surveyed the 160 members of their metabolic and bariatric surgeon and advanced endoscopy members. ASGE surveyed the 260 members of its Association for Bariatric Endoscopy (ABE). We also surveyed the 992 physician list provided by industry; with email bouncebacks, 934 surveys were successfully delivered.

974 (random sample) + 160 (SAGES metabolic and bariatric surgeon and advanced endoscopy group) + 260 (ASGE ABE) + 934 (Industry list) = 2,328

### Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. If your society has used an IPWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC’s rationale, please review the separate RUC recommendation document.
**Background**

The CPT Editorial Panel accepted a proposal at the February 2021 CPT Editorial Panel meeting to add category I CPT codes for endoscopic bariatric device procedures to the esophagogastroduodenoscopy (EGD) code family. CPT code 43235 is the base code for the EGD family and was surveyed with the new endoscopic bariatric device procedures, 43X21 and 43X22.

- **43235** Esophagogastroduodenoscopy, flexible, transoral; diagnostic, including collection of specimen(s) by brushing or washing, when performed (separate procedure)
- **43X21** with deployment of gastric bariatric device (eg, balloon) under endoscopic guidance
- **43X22** with removal of intragastric bariatric balloon(s)

The Research Subcommittee approved our proposed survey methodology to survey codes 43235, 43X21 and 43X22 together using both a random sample of the GI societies’ memberships and a targeted survey of the ASGE Association for Bariatric Endoscopy (ABE), a vendor list from Apollo Endosurgery Inc. and SAGES’ metabolic and bariatric surgeon and advanced endoscopy members. The Research Subcommittee also provided input on our reference service list.

Our multi-specialty consensus panel reviewed the survey data for codes 43235, 43X21 and 43X22, comparing the data and work RVUs (wRVUs) to the current data for similar 000-day global codes that were recently approved by the RUC.

**43235 – Discussion and Recommendation**

Code 43235 is an existing code that was last reviewed by the RUC in January 2013. The ACG, AGA, ASGE and SAGES conducted a survey for the April 2021 RUC meeting and received 54 responses: 22 from the targeted survey of the industry list, 7 from SAGES’ metabolic and bariatric surgeon and advanced endoscopy members, 15 from the ASGE ABE (labeled “GI-targeted” in the Survey Summary Spreadsheet) and 10 from the random sample of the GI societies’ membership.

We recommend the existing wRVU of **2.09**. This value is less than the 25th percentile of the combined survey data (2.10 wRVU).

**Pre-time Package 1** (*Straightforward Patient/Straightforward Procedure (No anesthesia care)*) is appropriate with 14 minutes of evaluation time, reflecting the current pre-service time, 3 minutes positioning time and 5 minutes scrub, dress, wait time.

- Pre-service evaluation time: 14 minutes
- Pre-service positioning time: 3 minutes
- Pre-service scrub, dress, wait time: 5 minutes

**Post-time Package 8A** (*IV Sedation/ Straightforward Procedure*) is appropriate with 12 minutes of immediate post-service time, reflecting the survey median.

**Intra-service time** of 15 minutes is appropriate, reflecting the survey median.

**Key Reference Services**

Two reference services were selected more often than others: 43202 and 43216. However, code 43202 (*Esophagoscopy, flexible, transoral; with biopsy, single or multiple*) was selected most often (26/54).

**Comparison to recently RUC-reviewed 0-day global codes with 15 minutes intra-service time and similar total time:**

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - [ ] The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - [x] Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - [ ] Multiple codes allow flexibility to describe exactly what components the procedure included.
   - [ ] Multiple codes are used to maintain consistency with similar codes.
   - [ ] Historical precedents.
   - [ ] Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. 43235 is typically performed with either moderate sedation or anesthesia. When moderate sedation was removed from GI endoscopy codes and other codes where moderate sedation was considered inherent to the procedure, it became historical precedent that moderate sedation is separately reported. Codes 99152 and 99153 or 00731 would be reported typically on the same date with 43235. No multiple procedures reduction policies apply. See section above for a table including CPT codes, global period, work RVUs, pre, intra and post-time and performing physician.
FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43235

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gastroenterology   How often?  Commonly
Specialty General Surgery   How often?  Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 970863
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. 2019 CMS volume is 323,621. National volume is estimated to be three times Medicare. 323,621 x 3 = 970,863

Specialty Gastroenterology  Frequency 813584  Percentage 83.80 %
Specialty General Surgery  Frequency 94174   Percentage 9.70 %
Specialty  Frequency 0   Percentage 0.00 %

Estimate the number of times this service might be provided to Medicare patients nationally in a one-year period? 323,621. If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2019 CMS volume = 323,621

Specialty Gastroenterology  Frequency 271195  Percentage 83.80 %
Specialty General Surgery  Frequency 31392  Percentage 9.70 %
Specialty  Frequency 0   Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

Berenson-Eggers Type of Service (BETOS) Assignment
Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification: Procedures
BETOS Sub-classification: Endoscopy
BETOS Sub-classification Level II: Upper Gastrointestinal

Professional Liability Insurance Information (PLI)
If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

43235

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

CPT Descriptor: Esophagogastroduodenoscopy, flexible, transoral; with deployment of intragastric bariatric balloon

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 45-year-old female with a body mass index (BMI) of 33 who has failed to respond to dietary and pharmacologic interventions for weight loss undergoes endoscopically guided insertion of a gastric balloon.

Percentage of Survey Respondents who found Vignette to be Typical: 96%

Site of Service (Complete for 010 and 090 Globals Only)
Percent of survey respondents who stated they perform the procedure; In the hospital 0%, In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0%, Overnight stay-less than 24 hours 0%, Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Review patient’s obesity criteria and associated comorbid conditions. Review patient’s prior surgical history with specific attention to prior abdominal surgery. Review patient's allergies and medications, specifically noting usage of antiplatelet or anticoagulation medications. Discuss case planning with anesthesia team. Review patient's laboratory studies as they relate to coagulation status and platelet count. Review patient’s other diagnostic tests. Review the risks and benefits of the procedure. Obtain informed consent. Verify all endoscopic equipment is available and operational and make appropriate computer entries as necessary. Position patient on the examination table. Position endoscopic equipment to provide access for the procedure. Perform a time out. Place a bite-block in patient's mouth.

Description of Intra-Service Work: Assess level of sedation prior to inserting the endoscope. Insert a standard flexible upper endoscope through the mouth into the oropharynx and advance through the esophagus into the proximal stomach. Insufflate the stomach with air after suctioning liquid contents. Perform an examination of the entire stomach in the forward and retroflexed positions. Advance the endoscope through the pylorus into the duodenal bulb. Inspect the duodenum circumferentially after air insufflation. Slowly withdraw the endoscope and reinspect the stomach and duodenum. After suctioning air to deflate the stomach, withdraw the endoscope into the esophagus, allowing measurement of the squamocolumnar (SC) and gastroesophageal (GE) junction from the incisors. Assess for presence of a hiatal hernia and examine the esophageal mucosa. When indicated, obtain brushings or washings of suspicious abnormalities. Obtain photodocumentation of appropriate normal landmarks and abnormalities. The endoscope is withdrawn. The intragastric balloon catheter is then advanced into the stomach based on the markings on the catheter and the prior noted location of the SCJ. The scope is reinserted to confirm and adjust the position of the collapsed intragastric balloon into the body of the stomach. The endoscope is then withdrawn to the level of GE junction at which point the stiffening wire is removed from the delivery catheter. The balloon is slowly inflated using saline with or without methylene blue dye. After the intragastric balloon is inflated to the desired volume, the catheter is disengaged from the intragastric balloon. The balloon and stomach are inspected to make sure there is no evidence of fluid leakage. The catheter is then completely removed. Photodocumentation is obtained confirming intragastric balloon placement in the stomach. The endoscope is then removed and procedure is complete.

Description of Post-Service Work: Assess patient's condition including post-procedure vital signs. Complete post-procedure orders. Review and label photographs. Generate a procedure report and forward to referral source and other appropriate
Assess patient for suitability to discharge from the recovery suite relative to established discharge criteria. When patient is stable for discharge, review findings and recommendations for diet and managing nausea. Provide orders for necessary prescriptions, follow-up tests, and appointments to the patient.
**SURVEY DATA**

**Description of Sample:**
The ACG, AGA and ASGE surveyed a random sample of 1,000 members; with email bouncebacks, 974 surveys were successfully delivered. SAGES surveyed the 160 members of its Association for Bariatric Endoscopy (ABE). We also surveyed the 992 physician list provided by industry; with email bouncebacks, 934 surveys were successfully delivered.

974 (random sample) + 160 (SAGES metabolic and bariatric surgeon and advanced endoscopy group) + 260 (ASGE ABE) + 934 (Industry list) = 2,328

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC’s rationale, please review the separate RUC recommendation document.

Background
The CPT Editorial Panel accepted a proposal at the February 2021 CPT Editorial Panel meeting to add category I CPT codes for endoscopic bariatric device procedures to the esophagogastroduodenoscopy (EGD) code family. CPT code 43235 is the base code for the EGD family and was surveyed with the new endoscopic bariatric device procedures, 43X21 and 43X22.

<table>
<thead>
<tr>
<th>Code</th>

<td>Esophagogastroduodenoscopy, flexible, transoral; diagnostic, including collection of specimen(s) by brushing or washing, when performed (separate procedure)</td>
</tr>
<tr>
<td>43X21</td>
<td>with deployment of intragastric bariatric balloon</td>
</tr>
<tr>
<td>43X22</td>
<td>with removal of intragastric bariatric balloon(s)</td>
</tr>
</tbody>
</table>

The Research Subcommittee approved our proposed survey methodology to survey codes 43235, 43X21 and 43X22 together using both a random sample of the GI societies’ memberships and a targeted survey of the ASGE Association for Bariatric Endoscopy (ABE), a vendor list from Apollo Endosurgery Inc. and SAGES’ metabolic and bariatric surgeon and advanced endoscopy members. The Research Subcommittee also provided input on our reference service list.

Our multi-specialty consensus panel reviewed the survey data for codes 43235, 43X21 and 43X22, comparing the data and work RVUs (wRVUs) to the current data for similar 000-day global codes that were recently approved by the RUC.

43X21 – Discussion and Recommendation
Code 43X21 is a new code for deployment of gastric bariatric device under endoscopic guidance that was approved by the CPT Editorial Panel at its February 2021 meeting. The ACG, AGA, ASGE and SAGES conducted a survey for the April 2021 RUC meeting and received 51 responses: 22 from the targeted survey of the industry list, 6 from SAGES’ metabolic and bariatric surgeon and advanced endoscopy members, 15 from the ASGE ABE (labeled “GI-targeted” in the Survey Summary Spreadsheet) and 8 from the random sample of the GI societies’ membership.

43X21 physician time recommendations:
Pre-time Package 2 (Difficult Patient/Straightforward Procedure (No anesthesia care)) is appropriate with 18 minutes of evaluation time, reflecting the current pre-service time, 3 minutes positioning time and 5 minutes scrub, dress, wait time.

Pre-service evaluation time: 18 minutes
Pre-service positioning time: 3 minutes
Pre-service scrub, dress, wait time: 5 minutes

A breakdown of the pre-service time is provided in the table below.
CPT Code: 43X21

### Detailed Description of Pre-Service Time Packages (Minutes)

<table>
<thead>
<tr>
<th>FACILITY</th>
<th>TIME</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td></td>
</tr>
</tbody>
</table>

Total Pre-Service Time 26

#### CATEGORY SUBTOTALS

A Pre-Service Evaluation (IWPUT = 0.0224) 18
B Pre-Service Positioning (IWPUT = 0.0224) 3
C Pre-Service Scrub, Dress and Wait (IWPUT = 0.0081) 5

#### DETAILS

A History and Exam (Performance and review of appropriate Pre-Tests) 10
A Prepare for Procedure (Check labs, plan, assess risks, review procedure) 2
A Communicate with patient and/or family (Discuss procedure/obtain consent) 3
A Communicate with other professionals 0
A Check/set-up room, supplies and equipment 1
A Check/prepare patient readiness (Gown, drape, prep, mark) 1
A Prepare/ review/ confirm procedure 1
B Perform/supervise patient positioning 3
C Administer local/topical anesthesia 0
C Observe (wait anesthesia care) 0
C Dress and scrub for procedure 5

Post-time Package 8A (*IV Sedation/ Straightforward Procedure*) is appropriate with 20 minutes of immediate post-service time, reflecting the survey median.

Intra-service time of 30 minutes is appropriate, reflecting the survey median.

**Key Reference Services:**
Two reference services were selected more often than others: 43212 and 43226. However, code 43212 (*Esophagoscopy, flexible, transoral; with placement of endoscopic stent (includes pre- and post-dilation and guide wire passage, when performed)*) was selected most often (32/51).

**43X21 wRVU recommendation:**
We originally recommended a wRVU of 3.40. This value is the 25th percentile of the combined survey data. The survey is robust and, thus, the 25th percentile is valid based on the amount of physician work and complexity involved. We felt the survey 25th percentile wRVU and median times fit well both within the EGD family and with other procedures and we provided tables showing its position both within the EGD family and within other recently valued 000-day global codes of similar intra-service and total time.

We note that in a comparison of recently RUC-reviewed 0-day global codes with similar intra-service and total times (see the table below), code 43X21 falls near the middle in terms of wRVUs with 29 codes above and 38 codes below 3.40 wRVUs. There are many endoscopy codes that have similar intra-service time and higher wRVUs. We believe this supports the survey 25th percentile value.
We also note that the 3.40 wRVU recommendation for 43X21 fits appropriately within the EGD family, which additionally validates the survey 25th percentile wRVU (see the table below).

---

We appreciate the time and effort our pre-facilitation reviewers took in helping us with this tab and explaining their concerns. Ultimately, they felt that the 25th percentile wRVU was too high in comparison to other services and recommended a crosswalk to 31256 (Nasal/sinus endoscopy, surgical, with maxillary antrostomy:) with 3.11 wRVUs, Pre-time Package #3 with 15 minutes of pre-service time, 30 minutes of intra-service time, 20 minutes post-service time and a total time of 83 minutes.

While we continue believe the survey 25th percentile wRVU accurately reflects the physician work involved and did our best to convey that in the materials we provided, we understand and respect the reviewers’ advice that 3.40 wRVUs felt too high. We then turned our focus to crosswalks for codes with less than 3.40 wRVUs with 30 minutes of intra-service time and similar total times (see the table below).

---

Search criteria: 000 day global; wRVU<3.40; IS = 30 min; total time b/t 67-85 min; Most recent RUC review > 2007

---

We then turned our focus to crosswalks for codes with less than 3.40 wRVUs with 30 minutes of intra-service time and similar total times (see the table below).

---

CPT Code 43X21

## Codes

Codes 19081 and 52334 are candidates for potential crosswalk if the RUC is uncomfortable with the 43X21 survey 25th percentile of 3.40 wRVUs. The reviewers specifically recommended 31256 with 3.11 wRVUs. Code 32557 is not an...
ideal candidate because CMS did not accept the RUC’s time recommendation. Codes below this wRVU would cause an anomaly with balloon removal code 43X22 and within the EGD family.

The table below shows the crosswalk identified by the RUC reviewers (31256) and the two other potential crosswalk codes identified (19081 and 52334) highlighted in light orange and the original recommendation for 43X21 to demonstrate how each would fit within the context of the EGD family.

### SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - [ ] The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - [x] Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - [ ] Multiple codes allow flexibility to describe exactly what components the procedure included.
   - [ ] Multiple codes are used to maintain consistency with similar codes.
   - [ ] Historical precedents.
   - [ ] Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. 43X21 is typically performed with either moderate sedation or anesthesia. When moderate sedation was removed from GI endoscopy codes and other codes where moderate sedation was considered inherent to the procedure, it became historical precedent that moderate sedation is separately reported. Codes 99152 and 99153 or 00731 would be reported typically on the same date with 43X21. No multiple procedures reduction policies
FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) The CPT application indicates 15% of endoscopic bariatric balloon placement was reported with 43999.

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gastroenterology  How often?  Sometimes
Specialty General Surgery  How often?  Sometimes
Specialty  How often?

Estimate the number of times this service might be provided nationally in a one-year period? 7571
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Apollo Endosurgery estimates 7,571 devices were placed in 2018

<table>

Description of Pre-Service Work: Review procedural history of balloon placement and symptoms since balloon placement. Confirm the amount of fluid (in ccs/mls) that was used to inflate the balloon. Review patient's allergies and medications, specifically noting usage of antiplatelet or anticoagulation medications. Discuss case planning with anesthesia team. Review patient's laboratory studies as they relate to coagulation status and platelet count. Review patient’s other diagnostic tests. Review the risks and benefits of the procedure. Obtain informed consent. Verify all endoscopic equipment is available and operational and make appropriate computer entries as necessary. Position patient on the examination table. Position endoscopic equipment to provide access for the procedure. Perform a time out. Place a bite-block in patient's mouth.

Description of Intra-Service Work: Assess level of sedation prior to inserting the endoscope. Insert a standard flexible upper endoscope through the mouth into the oropharynx and advance through the esophagus into the proximal stomach. Insufflate the stomach with air after suctioning liquid contents. Perform an examination of the entire stomach in the forward and retroflexed positions. Inspect the duodenum circumferentially after air insufflation. Slowly withdraw the endoscope and reinspect the stomach and duodenum. Visualize the previously placed balloon. Insert a needle instrument through the working channel of the endoscope. Use the needle instrument to puncture the balloon. Attach the external portion of the needle catheter to suction and remove the fluid from the balloon. The volume of the fluid is measured to ensure it approximates the same amount that was used to fill the balloon. After careful inspection to ensure the balloon is fully deflated, the needle catheter is removed. The device specific retrieval instrument is used to grasp the deflated balloon. The balloon is brought in apposition to the endoscope. The endoscope and balloon are carefully removed perorally using direct endoscopic guidance. The endoscope is then reinserted to make sure there is no mucosal trauma in the upper gastrointestinal tract. The endoscope is advanced through the pylorus into the duodenal bulb. The stomach is reinsufflated. The remaining fluid is removed. The stomach and esophagus are carefully evaluated, allowing measurement of the squamocolumnar (SC) and gastroesophageal (GE) junction from the incisors. Assess for presence of a hiatal hernia and examine the esophageal mucosa. When indicated, obtain brushings or washings of suspicious abnormalities. Obtain photodocumentation of appropriate normal landmarks and abnormalities. The endoscope is then removed and the procedure is complete.

Description of Post-Service Work: Assess patient's condition including post-procedure vital signs. Complete post-procedure orders. Review and label photographs. Generate a procedure report and forward to referral source and other appropriate parties. Assess patient for suitability to discharge from the recovery suite relative to established discharge criteria. When
patient is stable for discharge, review findings and recommendations with the patient and pertinent others. Provide orders for necessary prescriptions, follow-up tests, and appointments to the patient.
SURVEY DATA

<table>
<thead>

**Description of Sample:** The ACG, AGA and ASGE surveyed a random sample of 1,000 members; with email bouncesbacks, 974 surveys were successfully delivered. SAGES surveyed the 160 members of their metabolic and bariatric surgeon and advanced endoscopy members. ASGE surveyed the 260 members of its Association for Bariatric Endoscopy (ABE). We also surveyed the 992 physician list provided by industry; with email bouncesbacks, 934 surveys were successfully delivered.

974 (random sample) + 160 (SAGES metabolic and bariatric surgeon and advanced endoscopy group) + 260 (ASGE ABE) + 934 (Industry list) = 2,328

## Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC’s rationale, please review the separate RUC recommendation document.
Background
The CPT Editorial Panel accepted a proposal at the February 2021 CPT Editorial Panel meeting to add category I CPT codes for endoscopic bariatric device procedures to the esophagogastroduodenoscopy (EGD) code family. CPT code 43235 is the base code for the EGD family and was surveyed with the new endoscopic bariatric device procedures, 43X21 and 43X22.

- **43235**: Esophagogastroduodenoscopy, flexible, transoral; diagnostic, including collection of specimen(s) by brushing or washing, when performed (separate procedure)
- **43X21**: with deployment of intragastric bariatric balloon
- **43X22**: with removal of intragastric bariatric balloon(s)

The Research Subcommittee approved our proposed survey methodology to survey codes 43235, 43X21 and 43X22 together using both a random sample of the GI societies’ memberships and a targeted survey of the ASGE Association for Bariatric Endoscopy (ABE), a vendor list from Apollo Endosurgery Inc. and SAGES’ metabolic and bariatric surgeon and advanced endoscopy members. The Research Subcommittee also provided input on our reference service list.

Our multi-specialty consensus panel reviewed the survey data for codes 43235, 43X21 and 43X22, comparing the data and work RVUs (wRVUs) to the current data for similar 000-day global codes that were recently approved by the RUC.

**43X22 – Discussion and Recommendation**

Code 43X22 is a new code for removal of intragastric bariatric balloon(s) that was approved by the CPT Editorial Panel at its February 2021 meeting. The ACG, AGA, ASGE and SAGES conducted a survey for the April 2021 RUC meeting and received 51 responses: 22 from the targeted survey of the industry list, 6 from SAGES’ metabolic and bariatric surgeon and advanced endoscopy members, 15 from the ASGE ABE (labeled “GI-targeted” in the Survey Summary Spreadsheet) and 8 from the random sample of the GI societies’ membership.

We recommend the existing **wRVU of 2.80**. This value is the 25th percentile of the combined survey data.

**Pre-time Package 2 (Difficult Patient/Straightforward Procedure (No anesthesia care))** is appropriate with 18 minutes of evaluation time, reflecting the current pre-service time, 3 minutes positioning time and 5 minutes scrub, dress, wait time.

Pre-service evaluation time: 18 minutes
Pre-service positioning time: 3 minutes
Pre-service scrub, dress, wait time: 5 minutes

Please see the breakdown of pre-service minutes in the table below.
Detailed Description of Pre-Service Time Packages (Minutes)

<table>
<thead>

</tr>
</tbody>
</table>

Post-time Package 9A (General Anesthesia or Complex Regional Block/ Straightforward Procedure) is appropriate with 15 minutes of immediate post-service time, reflecting the survey median post-service time.

Intra-service time of 30 minutes is appropriate, reflecting the survey median.

Key Reference Services
Two reference services were selected more often than others: 43215 and 43212. However, code 43215 (Esophagoscopy, flexible, transoral; with removal of foreign body(s)) was selected most often (28/51).

Comparison to recently RUC-reviewed 0-day global codes with 30 minutes intra-service time and similar total time:

### Conclusion

The document contains a comprehensive list of procedures coded under CPT Code 43X22, which includes various endoscopic and interventional procedures. The table format provides detailed information on each procedure, including its description, global work, and associated RVUs and Medicare code numbers. This information is crucial for healthcare providers and administrators in understanding the scope and cost implications of these procedures in the context of the EGD family of codes. The inclusion of recent Medicare utilization data allows for a comparative analysis of how these services are utilized across different specialties and institutions.

---

**43X22 comparison to codes in the EGD family**

The document details the CPT Code 43X22 and its application to endoscopic procedures, providing a thorough comparison to the broader family of EGD codes. This comparison highlights the specific subset of procedures covered by 43X22, along with detailed RVU and Medicare code information. The table structure ensures clarity and ease of understanding, facilitating informed decision-making in healthcare settings.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
☒ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
☐ Multiple codes are used to maintain consistency with similar codes.
☐ Historical precedents.
☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. 43X22 is typically performed with either moderate sedation or anesthesia. When moderate sedation was removed from GI endoscopy codes and other codes where moderate sedation was considered inherent to the procedure, it became historical precedent that moderate sedation is separately reported. Codes 99152 and 99153 or 00731 would be reported typically on the same date with 43X22. No multiple procedures reduction policies apply. See SOR 43X22 Attachment for a table including CPT codes, global period, work RVUs, pre, intra and post-time and performing physician.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) CPT code 43247 was previously used to report removal of bariatric balloon devices.

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gastroenterology  How often? Sometimes
Specialty General Surgery  How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 7,571
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Apollo Endosurgery estimates 7,571 devices were placed in 2018; therefore, 7,571 devices were removed

<table>

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

   The ACG, AGA, ASGE and SAGES convened an RVS expert panel of the surveying specialty societies to review practice expense data for codes 43235, 43X21 and 43X22. The panel included both sub-specialists and generalists from within the specialties of a variety of settings across the United States. They also received input from practice managers and clinical staff familiar with the direct expense inputs.

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code, but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here (for service reviewed prior to the implementation of clinical activity codes, detail is not provided in the RUC database, please contact Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org for PE spreadsheets for your reference codes):

   The reference code for comparison of 43235 is 43235 with current PE inputs.

   The reference code for comparison of 43X21 is 43226 (Esophagoscopy, flexible, transoral; with insertion of guide wire followed by passage of dilator(s) over guide wire). Code 43215 was selected because it is most similar to removal of intragastric bariatric balloon(s).

   The reference code for comparison of 43X22 is 43215 (Esophagoscopy, flexible, transoral; with removal of foreign body(s)). Code 43215 was selected because it is most similar to removal of intragastric bariatric balloon(s).
3. Is this code(s) typically reported with an E/M service?

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

3. Is this code(s) typically reported with an E/M service?

43235 is not typically reported with an E/M service. According to the RUC database, 43235 was billed 1.0% of the time with office E/M. It is not typically reported with an E/M service in the non-facility. According to the RUC database, 43235 was billed 7.0% of the time with non-facility office E/M.

Codes 43X21 and 43X22 are new CPT codes, so there is no data available for them in the RUC database. However, we do not expect these codes to be typically reported with an E/M service or with an E/M service in the non-facility.

4. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time:

Not applicable. We are not requesting more minutes that the PE Subcommittee standards.

5. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies for the code family, please provide compelling evidence (please see PE compelling evidence guidelines) Please explain if the increase can be entirely accounted for because of an increase in physician time:

N/A

6. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (please see second worksheet in PE spreadsheet workbook), please explain the difference here:

N/A

7. Please provide a brief description of the clinical staff work for the following:
   a. Pre-Service period:
AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

43235, 43X21 and 43X22 Pre-Service Clinical Labor Activities = RN/LPN/MTA
- 3 minutes to complete pre-service diagnostic and referral forms (CA001)
- 5 minutes to coordinate pre-surgery services (including test results) (CA002)
- 3 minutes to schedule space and equipment in facility (CA003)
- 5 minutes to provide pre-service education/obtain consent (CA004)
- 3 minutes to complete pre-procedure phone calls and prescription (CA005)

b. Service period (includes pre, intra and post):
N/A

c. Post-service period:
43235, 43X21 and 43X22 Post-Service Clinical Labor Activities = RN/LPN/MTA
- 3 minutes to conduct patient communications (CA037)

8. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (please see second worksheet in PE spreadsheet workbook):
N/A

9. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov.
N/A

INVOICES

10. ☒ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

11. ☒ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

12. If you wish to include a supply that is not on the list (please see fourth worksheet in PE spreadsheet workbook) please provide a paid invoice. Identify and explain the invoice here:
N/A

13. Are you recommending a PE supply pack for this recommendation? Yes or No.
If Yes, please indicate if the pack is an established package of supplies as defined by CMS (eg, SA047 pack, E/M visit) or a pack that is commercially available?
N/A

14. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation. Please include the description, CMS supply code, unit, item quantity and unit price (if available). See documents two and three under PE reference materials on the RUC Collaboration Website for information on the contents of kits, packs and trays.
N/A
### AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC) PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

15. If you wish to include an equipment item that is not on the list (please see fifth worksheet in PE spreadsheet workbook) please provide a paid invoice and the useful life. Identify and explain the invoice here:

| N/A |

16. Have you recommended equipment minutes for a computer or equivalent laptop/integrated computer, equipment item computer, desktop, w-monitor, ED021 or notebook (Dell Latitide D600), ED038?
   a. If yes, please explain how the computer is used for this service(s).
   b. Is the computer used exclusively as an integral component of the service or is it also used for other purposes not specific to the code?
   c. Does the computer include code specific software that is typically used to provide the service(s)?

| N/A |

17. List all the equipment included in your recommendation and the equipment formula chosen (please see document titled Calculating equipment time). If you have selected “other formula” for any of the equipment please explain here:

| N/A |

18. If there is any other item(s) on your spreadsheet not covered in the categories above that require greater detail/explanation, please include here:

| N/A |

### PROFESSIONAL LIABILITY INSURANCE (PLI) INFORMATION

19. If this is a PE only code please select a crosswalk based on a similar specialty mix:

| 43235 = 43235 |
| 43X21 and 43X22 = 43215 (Esophagoscopy, flexible, transoral; with removal of foreign body(s)) |

### ITEMIZED LIST OF CHANGES (FOLLOWING THE PE SUBCOMMITTEE MEETING)

During and immediately following the review of this tab at the PE Subcommittee meeting please revise the summary of recommendation (PE SOR) based on modifications made during the meeting. Please submit the revised form electronically to Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org immediately following the close of business the same day that the tab is reviewed. On the PE spreadsheet, please highlight the cells and/or use red font to show the changes made during the PE Subcommittee meeting (if you have provided any of this highlighting based on changes from the reference code prior to the PE Subcommittee meeting please remove it, so not to be confused with changes made during the meeting). In addition to those revisions please also provide an itemized list of the modifications made to the PE spreadsheet during the PE Subcommittee meeting in the space below (e.g. clinical activity CA010 obtain vital signs was reduced from 5 minutes to 3 minutes).
NOTE: The virtual meetings have provided for real-time updates to the PE spreadsheets. PE SORs must still be updated and resubmitted asap.

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

The ACG, AGA, ASGE and SAGES convened an RVS expert panel of the surveying specialty societies to review practice expense data for codes 43235, 43X21 and 43X22. The panel included both sub-specialists and generalists from within the specialties of a variety of settings across the United States. They also received input from practice managers and clinical staff familiar with the direct expense inputs.

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code, but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here (for service reviewed prior to the implementation of clinical activity codes, detail is not provided in the RUC database, please contact Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org for PE spreadsheets for your reference codes):

The reference code for comparison of 43235 is 43235 with current PE inputs.

The reference code for comparison of 43X21 is 43226 (Esophagoscopy, flexible, transoral; with insertion of guide wire followed by passage of dilator(s) over guide wire). Code 43226 was selected because it includes an upper endoscopy and passage of the intra-gastric balloon is similar to passing a bougie (43226) with similar clinical staff activities.

As noted in the Tab 8 PE Excel spreadsheet, CMS recorded 93 minutes of total service period clinical staff time for CPT code 43226, but all materials from the original submission indicate it should be 83
Nonfacility Direct PE Inputs

CPT Code(s): 43235, 43X21, 43X22

Specialty Society(ies): ACG, AGA, ASGE, SAGES

Presenter(s): R. Bruce Cameron, MD (ACG), Shivan Mehta, MD (AGA), Patricia Garcia, MD (AGA), Seth Gross, MD (ASGE), Vivek Kaul, MD (ASGE), Sheeth Ketan, MD (SAGES), Dmitry Nepomnayshy, MD (SAGES)

AMA/Specialty Society Relative Value Update Committee (RUC) Practice Expense Summary of Recommendation (SOR)

2

Minutes. Neither we nor RUC staff could locate where the extra ten minutes were allocated. They were not in our original recommendations or the RUC's recommendations to CMS. We believe the 93 minutes was a typo in the CMS database when it was originally updated in 2014. We were advised by RUC staff that we must use the 93 minutes currently reflected in the CMS database and that we should use standards to fill in and/or whatever makes sense to the specialty in allocation. We wanted to note this as the PE Subcommittee and the RUC review the time inputs in column M for comparison code 43226 in the PE spreadsheet. Please see the notes in cells M10, M33, M35, M37, and M40 of the RUC Practice Expense Spreadsheet excel file for Tab 8. They are also listed below:

Cell M10 (Total Service Period Clinical Staff Time) note: CMS has 93 min, but all materials from the original submission indicate it should be 83 minutes. Neither we nor RUC staff could locate where the extra ten minutes were allocated. They were not in our original recommendations or the RUC's recommendations to CMS. We believe the 93 minutes was a typo in the CMS database when it was originally updated in 2014. We were advised by RUC staff to use standards to fill in and/or whatever makes sense to the specialty in allocation, which is what is reflected here in column M.

Cell M33 (CA009) note: The recommendation from the RUC to CMS listed 3 minutes, but we increased it to 5 minutes to count toward the 93 minutes of total service period clinical staff time recorded by CMS.

Cell M35 (CA011) note: The recommendation from the RUC to CMS listed 3 minutes, but we increased it to 5 minutes to count toward the 93 minutes of total service period clinical staff time recorded by CMS.

Cell M37 (CA013) note: The recommendation from the RUC to CMS listed 2 minutes, but we increased it to 5 minutes to count toward the 93 minutes of total service period clinical staff time recorded by CMS.

Cell M40 (CA016) note: The recommendation from the RUC to CMS listed 2 minutes, but we increased it to 5 minutes to count toward the 93 minutes of total service period clinical staff time recorded by CMS.

The reference code for comparison of 43X22 is 43215 (Esophagoscopy, flexible, transoral; with removal of foreign body(s)). Code 43215 was selected because it is most similar to removal of intragastric bariatric balloon(s).

3. Is this code(s) typically reported with an E/M service?
   Is this code(s) typically reported with the E/M service in the nonfacility?
   (Please see provided data titled Medicare Same Day NF EM Billed Together - NF Dom Spec in the RUC Review Resource Materials)

43235 is not typically reported with an E/M service. According to the RUC database, 43235 was billed 1.0% of the time with office E/M. It is not typically reported with an E/M service in the nonfacility. According to the RUC database, 43235 was billed 7.0% of the time with non-facility office E/M.
NONFACILITY DIRECT PE INPUTS

CPT CODE(S): 43235, 43X21, 43X22

SPECIALTY SOCIETY(IES): ACG, AGA, ASGE, SAGES

PRESENTER(S): R. Bruce Cameron, MD (ACG), Shivan Mehta, MD (AGA), Patricia Garcia, MD (AGA), Seth Gross, MD (ASGE), Vivek Kaul, MD (ASGE), Sheth Ketan, MD (SAGES), Dmitry Nepomnayshy, MD (SAGES)

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

Codes 43X21 and 43X22 are new CPT codes, so there is no data available for them in the RUC database. However, we do not expect these codes to be typically reported with an E/M service or with an E/M service in the non-facility.

---

4. What specialty is the dominant provider in the nonfacility?
What percent of the time does the dominant provider provide the service(s) in the nonfacility?
Is the dominant provider in the nonfacility different than for the global?
(Please see provided data titled Medicare Same Day NF EM Billed Together - NF Dom Spec in the RUC Review Resource Materials)

For 43235, the dominant provider in the non-facility is Gastroenterology. The percentage of the time gastroenterologists provide 43235 in the non-facility is 77%. The dominant provider in the non-facility is the same as for the global.

Codes 43X21 and 43X22 are new CPT codes and do not have data available in the RUC database. However, we expect that gastroenterologists will be the dominant provider in the non-facility.

---

5. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time:

**43235 Pre-Service Clinical Labor Activities = RN/LPN/MTA**

We are not recommending any additional minutes beyond the PE Subcommittee Standards for codes requiring “Extensive use of clinical staff” in the Non-Facility setting.

**43235 Intra-Service Clinical Labor Activities = RN/LPN/MTA**

We recommend 2 additional minutes above the standards for CA029 (Check dressings, catheters, wounds). Upper GI endoscopy procedures require 3 minutes to perform the following activities: Remove mouthpiece. Retrieve dentures from denture cup and return to patient. Clean patient with towel, place new chux pads (upper and lower) under patient, adjust gown, place patient in a safe position on the endoscopy stretcher, and adjust blanket and/or obtain a new one. Inspect IV sites and IV and supply new bag as needed. Inspect blood pressure cuff for proper position, inspect pulse oximeter on finger to make sure in the right position. Assist anesthesia in patient transport.
CA029 = 3 minutes

**43235 Post-Service Clinical Labor Activities = RN/LPN/MTA**

We are not recommending any additional minutes beyond the standard for CA037 *(Conduct patient communications)*

***

**43X21 Pre-Service Clinical Labor Activities = RN/LPN/MTA**

We are not recommending any additional minutes beyond the PE Subcommittee Standards for codes requiring “Extensive use of clinical staff” in the Non-Facility setting.

**43X21 Intra-Service Clinical Labor Activities = RN/LPN/MTA**

We recommend 4 additional minutes above the standard for CA011 *(Provide education/obtain consent)*. In addition to obtaining consent, staff instructs the patient about the six medications they will take after the procedure to address nausea, vomiting, and pain (i.e., narcotic pain medication, antispasmodic, Scopolamine Patch, Zofran, Phenergan, Ativan) and the schedule for taking the medications to prevent interactions as well as NARCAN and answers the patient’s questions about the medications. Staff reviews instructions for NARCAN with the patient and provides counseling for interaction of benzodiazepines and narcotics, which is required by most states. Staff also reviews with patient what to do and avoid doing during the first 24-hours, first 3 days and first week following the procedure (e.g., drink at least 8 cups of liquid per day. Take small sips. Wait a minute or two between sips. Slowly take more with each sip. Drink only 1/3 cup at a time. Sit upright for 3 to 4 hours after drinking.) See p. 13-14 of “Orbera Patient Booklet” [https://www.orbera.com/resource/us_orbera_pdfs/pdfs/GRF-00345-00R08.pdf](https://www.orbera.com/resource/us_orbera_pdfs/pdfs/GRF-00345-00R08.pdf). Staff counsels the patient on expectations for side effects (e.g., side effects to expect, timing of side effects, how long they should last, how to manage them, when to call the office and when to go to the emergency department). Staff also provides counseling on dietary recommendations. Please note that we have not included any minutes for education/consent activities in CA004 so there is no overlap or duplication. **CA011 = 15 minutes**

We recommend 3 minutes above the standard for CA013 *(Prepare room, equipment and supplies)*. Staff must verify the implant is not expired and all required components are in the kit. Staff must assemble the kit prior to beginning the procedure, including preparing the syringes, IV line tubing, saline bag, etc.

**CA013 = 5 minutes**

We recommend 2 additional minutes above the standards for **CA029 (Check dressings, catheters, wounds)**. Upper GI endoscopy procedures require 3 minutes to perform the following activities: Remove mouthpiece. Retrieve dentures from denture cup and return to patient. Clean patient with towel, place new chux pads (upper and lower) under patient, adjust gown, place patient in a safe position on the endoscopy stretcher, and adjust blanket and/or obtain a new one. Inspect IV sites and IV and supply new bag as needed. Inspect blood pressure cuff for proper position, inspect pulse oximeter on finger to make sure in the right position. Assist anesthesia in patient transport.

**CA029 = 3 minutes**

**43X21 Post-Service Clinical Labor Activities = RN/LPN/MTA**
We are not recommending any additional minutes beyond the standard for CA037 (Conduct patient communications).

***

**43X22 Pre-Service Clinical Labor Activities = RN/LPN/MTA**

We are not recommending any additional minutes beyond the PE Subcommittee Standards for codes requiring “Extensive use of clinical staff” in the Non-Facility setting.

**43X22 Intra-Service Clinical Labor Activities = RN/LPN/MTA**

We recommend 3 minutes above the standard for CA013 (Prepare room, equipment and supplies). Staff must assemble and set up the tubing and the equipment to extract the fluids from the balloon(s) and prepare multiple syringes for extraction.

**CA013 = 5 minutes**

We recommend 2 additional minutes above the standard for CA011 (Provide education/obtain consent). In addition to obtaining consent, staff must provide post procedure dietary recommendations and counseling, including information on change of patient’s sense of satiety and appropriate diet to manage those changes. Please note that we have not included any minutes for education/consent activities in CA004 so there is no overlap or duplication. **CA011 = 5 minutes**

We recommend 8 minutes above the standard for CA016 (Prepare, set-up and start IV, initial positioning and monitoring of patient). Patient is intubated while supine and staff must move the patient into left lateral position. Positioning the patient for balloon removal is identical to ERCP (43260 family) which has 10 minutes for positioning the patient. **CA016 = 10 minutes**

We recommend 2 additional minutes above the standards for CA029 (Check dressings, catheters, wounds). Upper GI endoscopy procedures require 3 minutes to perform the following activities: Remove mouthpiece. Retrieve dentures from denture cup and return to patient. Clean patient with towel, place new chux pads (upper and lower) under patient, adjust gown, place patient in a safe position on the endoscopy stretcher, and adjust blanket and/or obtain a new one. Inspect IV sites and IV and supply new bag as needed. Inspect blood pressure cuff for proper position, inspect pulse oximeter on finger to make sure in the right position. Assist anesthesia in patient transport. **CA029 = 3 minutes**

**43X22 Post-Service Clinical Labor Activities = RN/LPN/MTA**

We are not recommending any additional minutes beyond the standard for CA037 (Conduct patient communications).

6. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies for the **code family**, please provide compelling evidence (please see **PE compelling evidence guidelines**) Please explain if the increase can be entirely accounted for because of an increase in physician time:

**N/A**
7. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (please see second worksheet in PE spreadsheet workbook), please explain the difference here:

N/A

8. How much time was allocated to clinical activity, obtain vital signs (CA010) prior to CMS increasing the clinical activity to 5 minutes for calendar year 2018? The standard for clinical activity, obtains vital signs remains 0, 3 and 5 based on the number of vital signs taken. Please provide a rationale for the clinical staff time that you are requesting for obtain vital signs here:

| CMS allocated 5 minutes to clinical activity CA010 (obtain vital signs) for code 43235 prior to CMS increasing the clinical activity to 5 minutes for CY 2018. |

For codes 43235, 43X21 and 43X22, at least 4 vital signs are taken prior to beginning the procedure to ensure the patient is healthy enough to undergo the procedures. Vital signs taken prior to the procedure include patient’s temperature, heart rate, respiratory rate, and blood pressure and may include additional vital signs.

9. Please provide a brief description of the clinical staff work for the following:
   a. Pre-Service period:

   **43235 and 43X22 Pre-Service Clinical Labor Activities = RN/LPN/MTA**
   - 3 minutes to complete pre-service diagnostic and referral forms (CA001)
   - 3 minutes to coordinate pre-surgery services (including test results) (CA002)
   - 3 minutes to complete pre-procedure phone calls and prescription (CA005)

   **43X21 Pre-Service Clinical Labor Activities = RN/LPN/MTA**
   - 5 minutes to complete pre-service diagnostic and referral forms (CA001)
   - 3 minutes to coordinate pre-surgery services (including test results) (CA002)
   - 3 minutes to complete pre-procedure phone calls and prescriptions (CA005)

   b. Service period (includes pre, intra and post):

   **43235 Intra-Service Clinical Labor Activities = RN/LPN/MTA**
   - 3 minutes to greet patient, provide gowning, ensure appropriate medical records are available (CA009)
   - 5 minutes to obtain vital signs (CA010)
   - 3 minutes to provide education/obtain consent (CA011)
   - 2 minutes to prepare room, equipment and supplies (CA013)
   - 5 minutes to setup scope (nonfacility setting only) (CA015)
   - 2 minutes to prepare, set-up and start IV, initial positioning and monitoring of patient (CA016)
   - 15 minutes to assist physician or other qualified healthcare professional---directly related to physician work time (100%) (CA018)
   - 3 minutes to clean room/equipment by clinical staff (CA024)
   - 30 minutes to clean scope (CA025)
   - 2 minutes to complete post-procedure diagnostic forms, lab and x-ray requisitions (CA027)
   - 3 minutes to check dressings, catheters, wounds (CA029)

   **43X21 Intra-Service Clinical Labor Activities = RN/LPN/MTA**
   - 3 minutes to greet patient, provide gowning, ensure appropriate medical records are available (CA009)

- 3 minutes to clean room/equipment by clinical staff (CA024)
- 30 minutes to clean scope (CA025)
- 2 minutes to complete post-procedure diagnostic forms, lab and x-ray requisitions (CA027)
- 3 minutes to check dressings, catheters, wounds (CA029)

43235, 43X21 and 43X22 Post-Service Clinical Labor Activities = RN/LPN/MTA

- 3 minutes to conduct patient communications (CA037)

c. Post-service period:

10. Please provide granular detail regarding what the clinical staff is doing during the intra-service (of service period) clinical activity, assist physician or other qualified healthcare professional---directly related to physician work time or Perform procedure/service---NOT directly related to physician work time:

43235 Intra-service (of service period) = RN/LPN/MTA
Clinical staff assists the physician with the procedure for 100% of the intra-service procedure time. The clinical staff assists with technical procedural-related activities such as collecting specimens.

43X21 Intra-service (of service period) = RN/LPN/MTA
Clinical staff assists the physician with the procedure for 100% of the intra-service procedure time. Staff assist with technical procedural-related activities during balloon placement such as adding methylene blue to the saline and drawing the fluid up into syringes in preparation for the physician to fill the balloon.
43X22 Intra-service (of service period) = RN/LPN/MTA
Clinical staff assists the physician with the procedure for 100% of the intra-service procedure time. Staff assist with technical procedural-related activities during balloon deflation and removal such as assisting in attaching the needle to suction the fluid to deflate the balloon.

11. If you have used a percentage of the physician intra-service work time other than 100 or 67 percent for the intra-service (of service period) clinical activity, please indicate the percentage and explain why the alternate percentage is needed and how it was derived.
N/A

12. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (*please see second worksheet in PE spreadsheet workbook*):
N/A

13. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at [http://www.bls.gov](http://www.bls.gov).
N/A

INVOICES

14. ☒ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

15. ☒ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

16. If you wish to include a supply that is not on the list (*please see fourth worksheet in PE spreadsheet workbook*) please provide a paid invoice. Identify and explain the invoice here:

We have submitted 8 paid invoices provided by Apollo which have been catalogued in the Excel file titled “Tab 8 – invoice summary_43X21_43X22.” These invoices contain prices for the ORBERA Intragastic Balloon System (balloon, placement catheter and connection tube with 3-way valve and saline bag spike) to place the device and the needle aspirator & grasper to remove the device.

17. Are you recommending a PE supply pack for this recommendation? **Yes** or No.
If Yes, please indicate if the pack is an established package of supplies as defined by CMS (eg, SA047 pack, E/M visit) or a pack that is commercially available?

We are recommending SA042 (pack, cleaning and disinfecting, endoscope) and SA048 (pack, minimum multi-specialty visit) which are defined by CMS and commercially available.

18. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation. Please include the description, CMS supply code, unit, item quantity and unit price (if

Gloves, non-sterile (SB022) pair, 2  
Thermometer probe cover, disposable (SB004) item, 1

19. If you wish to include an equipment item that is not on the list (please see fifth worksheet in PE spreadsheet workbook) please provide a paid invoice and the useful life. Identify and explain the invoice here:

N/A

20. Have you recommended equipment minutes for a computer or equivalent laptop/integrated computer, equipment item computer, desktop, w-monitor, ED021 or notebook (Dell Latitude D600), ED038?
   a. If yes, please explain how the computer is used for this service(s).
   b. Is the computer used exclusively as an integral component of the service or is it also used for other purposes not specific to the code?
   c. Does the computer include code specific software that is typically used to provide the service(s)?

N/A

21. List all the equipment included in your recommendation and the equipment formula chosen (please see document titled Calculating equipment time). If you have selected “other formula” for any of the equipment please explain here:

EQ235 (Suction machine, Gomco) = Scope systems formula
CA013 + CA014 + CA015 + CA016 + CA017 + CA018 + CA019 + CA020 + CA024

ES031 (scope video system (monitor, processor, digital capture, cart, printer, LED light)) = scope systems formula
CA013 + CA014 + CA015 + CA016 + CA017 + CA018 + CA019 + CA020 + CA024

ES087 (multi-channeled flexible digital scope, esophagoscopy gastroscopy duodenoscopy (EGD)) = Scope formula
CA013 + CA014 + CA015 + CA016 + CA017 + CA018 + CA019 + CA020 + CA025

ITEMIZED LIST OF CHANGES (FOLLOWING THE PE SUBCOMMITTEE MEETING)

During and immediately following the review of this tab at the PE Subcommittee meeting, please revise the summary of recommendation (PE SOR) based on modifications made during the meeting. Please submit the revised form electronically to Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org immediately following the close of business the same day that the tab is reviewed. On the PE spreadsheet, please highlight the cells and/or use red font to show the changes made during the PE Subcommittee meeting (if you have provided any of this highlighting based on changes from the reference code prior to the PE Subcommittee meeting please remove it, so not to be confused with changes made during the meeting). In addition to those revisions please also provide an itemized list of the modifications made to the PE spreadsheet during the PE Subcommittee meeting in the space below (e.g. clinical activity CA010 obtain vital signs was reduced from 5 minutes to 3 minutes).

NOTE: The virtual meetings have provided for real-time updates to the PE spreadsheets. PE SORs must still be updated and resubmitted asap.

### RUC Practice Expense Spreadsheet

#### Meeting Date: April 2021

#### Revision Date (if applicable): 4/12/2021

#### Specialty: ACG, AGA, ASGE, SAGES

### Tab: 8 (Endoscopic Bariatric Device Procedures)

Anterior Abdominal Hernia Repair – Tab 9

CPT Code 49565, Repair recurrent incisional or ventral hernia; reducible, was identified by the RUC as a service performed less than 50% of the time in the inpatient setting, included inpatient hospital E/M service codes and had Medicare utilization over 5,000. The stakeholder societies requested referral to CPT to update the descriptor of 49565 and other abdominal hernia codes to better describe these procedures as performed in current practice. As a result of the disparate site of service for anterior abdominal hernia repair codes, new codes were established and a 000-day global period was recommended. In addition, new codes for parastomal hernia repair, an add-on code to report removal of total or near total mesh, and a new code for placement of delayed mesh closure were established. The specialty societies collected data on typical site-of-service, hospital stays and associated Evaluation and Management (E/M) visits for the new codes through the survey process.

The specialty societies described the differences between the services included in this code family and explained that these CPT codes are generally differentiated by three factors: 1) whether the hernia is initial or recurrent; 2) whether the hernia is reducible or incarcerated/strangulated; and 3) the total length of the hernia defect (< 3cm, 3-10cm, or > 10cm in length). Furthermore, two new codes were established to report parastomal hernia repair, which involves the repair of a hernia proximal to a pre-existing stoma. The specialty societies noted that each of these three factors impacts the work involved in a hernia repair. The repair of an incarcerated/strangulated hernia involves more work than that of a reducible hernia; the repair of a larger hernia involves more work than that of a smaller hernia; and the repair of a recurrent hernia requires more work than repair of an initial hernia. This is illustrated by the fact that CPT code 49X01 Repair of anterior abdominal hernia(s) (ie, epigastric, incisional, ventral, umbilical, spigelian), any approach (ie, open, laparoscopic, robotic), initial including placement of mesh or other prosthesis, when performed total length of defect(s); less than 3 cm, reducible (recommended work RVU = 6.27, 45 minutes of intra-service time, 108 minutes of total time) has the lowest recommended work RVU of this code family and CPT code 49X12 Repair of anterior abdominal hernia(s) (ie, epigastric, incisional, ventral, umbilical, spigelian), any approach (ie, open, laparoscopic, robotic), recurrent, including placement of mesh or other prosthesis, when performed total length of defect(s); greater than 10 cm, incarcerated or strangulated (recommended work RVU = 24.00, 180 minutes of intra-service time, 335 minutes of total time) has the highest recommended work RVU of this code family. In reviewing this code family, the RUC noted the importance of work RVU recommendations for individual codes and maintaining relativity across the entire code family (as shown in Table 1 below). The specialty societies noted – and the RUC concurred – that there is a dearth of available comparator codes for 000-day global codes with similar work RVUs and intra-service and total times for such major procedures and that this makes it particularly important to consider and maintain relativity within this code family.

The RUC acknowledged that the construction of the CPT codes in this family appropriately address the reporting of incarcerated/strangulated hernias. The introductory language for this code family states, “When both reducible and incarcerated/strangulated anterior abdominal hernias are repaired at the same operative session, all hernias are reported as incarcerated/strangulated. For example, one 2 cm reducible initial incisional hernia and one 4 cm incarcerated initial incisional hernias separated by 2 cm would be reported as an initial incarcerated hernia repair with a maximum cranio-caudal distance of 8 cm (49X04).” As stated by the specialties, hernias of this sort are all generally the same piece of bowel CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.
herniating through the midline anterior abdominal wall defect and are not repaired separately; they are all the same hernia and if the interspace of the fascia were not intact (even for 1 cm), the entire single bulge would be considered incarcerated/strangulated. According to the specialty societies, it is also rare that if there are multiple hernias in the same proximity, there would be a separate hernia that is reducible and a separate hernia that is incarcerated/strangulated; it is most common that all the hernias would be incarcerated/strangulated as part of the same segment of bowel. Furthermore, in the scenario outlined in the CPT introductory language, if the 2 cm initial hernia (reducible) and the 4 cm initial hernia (incarcerated/strangulated) were separated and reported as 49X01 and 49X04 with April 2021 RUC recommended work RVUs, the total work RVU value would be greater (total work RVUs recommended = 20.27 for 49X01 and 49X04) than for just reporting the service as 49X04 (recommended work RVU = 14.00). This would also be the case if the incarcerated/strangulated hernia were less than 3 cm in length and reported as 49X02 (total work RVUs recommended = 15.27 for 49X01 and 49X02).

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.
Initial Abdominal Hernia Repair

49X01 Repair of anterior abdominal hernia(s) (ie, epigastric, incisional, ventral, umbilical, spigelian), any approach (ie, open, laparoscopic, robotic), initial, including placement of mesh or other prosthesis, when performed, total length of defect(s); less than 3 cm, reducible

The RUC reviewed the survey results from 39 surgeons for CPT code 49X01 and determined that the survey 25th percentile work RVU of 6.27 appropriately accounts for the work required to perform this service. The RUC recommends 25 minutes of pre-service evaluation time, 3 minutes of pre-service positioning time, 15 minutes of pre-service scrub/dress/wait time, 45 minutes of intra-service time, 20 minutes of immediate post-service time, and 108 minutes of total time. The specialty societies noted that this service involves the repair of the smallest type of an initial reducible hernia.

The typical patient is discharged on the same day and therefore there are no post-operative same day visits associated with 49X01. The insertion of mesh or other prosthesis is now bundled into this service; the work associated with the placement of mesh or other prosthesis was previously reported separately with deleted CPT add-on code 49568 Implantation of mesh or other prosthesis for open incisional or ventral hernia repair or mesh for closure of debridement for necrotizing soft tissue infection (List separately in addition to code for the incisional or ventral hernia repair) (work RVU = 4.88).

To support a work RVU of 6.27, the RUC compared CPT code 49X01 to top key reference service CPT code 31600 Tracheostomy, planned (separate procedure) (work RVU = 5.56, 30 minutes of intra-service and 120 minutes of total time) and second key reference service CPT code 43210 Esophagogastroduodenoscopy; flexible, transoral; with esophagogastric fundoplasty, partial or complete, includes duodenoscopy when performed (work RVU = 7.75, 60 minutes of intra-service time and 148 minutes of total time) and noted that the surveyed code is appropriately bracketed by these two services based on the complexity of physician work and intra-service time required to perform these services. The RUC also compared CPT code 49X01 to MPC code 52352 Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with removal or manipulation of CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.
calculus (ureteral catheterization is included) (work RVU = 6.75, 45 minutes of intra-service and 118 minutes of total time). The RUC determined that these values support the recommended work RVU and noted that CPT code 49X01 requires the same 45 minutes of intra-service time as MPC code 52352 but slightly less total time and support the slightly lower work RVU recommendation. The RUC recommends a work RVU of 6.27 for CPT code 49X01.

49X02 Repair of anterior abdominal hernia(s) (ie, epigastric, incisional, ventral, umbilical, spigelian), any approach (ie, open, laparoscopic, robotic), initial, including placement of mesh or other prosthesis, when performed, total length of defect(s); less than 3 cm, incarcerated or strangulated

The RUC reviewed the survey results from 39 surgeons for CPT code 49X02 and determined that the survey 25th percentile work RVU of 9.00 appropriately accounts for the work required to perform this service. The RUC recommends 35 minutes of pre-service positioning time, 15 minutes of pre-service scrub/dress/wait time, 60 minutes of intra-service time, 30 minutes of immediate post-service time, and 143 minutes of total time. The specialty societies noted that the repair of an incarcerated/strangulated hernia requires more intra-service time and is more complex than the repair of a reducible hernia of the same or similar size. In addition, the specialties indicated that the repair of an incarcerated/strangulated hernia is typically performed laparoscopically and typically involves a loop of bowel which must be pulled down through the hernia and could potentially bleed. The high intensity of this service necessitates an overnight stay to monitor the abdomen and particularly the bowel that has been drawn through the hernia. Pain and bowel function is also a significant concern that requires close monitoring.

The RUC noted that the typical patient will stay overnight or longer and there will typically be a visit later the same day of the procedure at the level of 99224/99231 to monitor for problems such as ileus, intestinal ischemia, urinary retention and pain control; review data (eg, diagnostic and imaging studies) not available at the unit; communicate with other health care professionals and with patient and/or family; review medical records and data available on the unit; perform a medically appropriate examination; consider relevant data, options, and risks; formulate and/or revise diagnosis and treatment plan(s) (low complexity MDM); discuss diagnosis and treatment options with the patient and/or family; communicate with other health care professionals as necessary; write and/or review orders, complete medical record documentation; address interval data obtained and reported changes in condition; communicate results and additional care plans to other health care professionals and to the patient and/or family. Per CMS policy for reporting postoperative work for 23-hour stay procedures, the intra-service time of 10 minutes for 99224/99231 has been added to the survey immediate post-service time (total of 30 minutes). The insertion of mesh or other prosthesis is now bundled into this service; the work associated with the placement of mesh or other prosthesis was previously reported separately with deleted add-on CPT code 49568 Implantation of mesh or other prosthesis for open incisional or ventral hernia repair or mesh for closure of debridement for necrotizing soft tissue infection (List separately in addition to code for the incisional or ventral hernia repair) (work RVU = 4.88).

To support a work RVU of 9.00, the RUC compared CPT code 49X02 to CPT code 43276 Endoscopic retrograde cholangiopancreatography (ERCP); with removal and exchange of stent(s), biliary or pancreatic duct, including pre- and post-dilation and guide wire passage, when performed, including sphincterotomy, when performed, each stent exchanged (work RVU = 8.84, 60 minutes of intra-service and 123 minutes of total time) and CPT code 33954 Extracorporeal membrane oxygenation (ECMO)/extracorporeal life support (ECLS) provided by physician; insertion of peripheral (arterial and/or venous) cannula(e), open, 6 years and older (work RVU = 9.11, 60 minutes intra-service and 178 minutes of total time). The RUC determined that these services include the same intra-service time as the surveyed code and appropriately bracket the recommend work RVU of CPT code 49X02. The RUC recommends a work RVU of 9.00 for CPT code 49X02.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.
49X03 Repair of anterior abdominal hernia(s) (ie, epigastric, incisional, ventral, umbilical, spigelian), any approach (ie, open, laparoscopic, robotic), initial, including placement of mesh or other prosthesis, when performed, total length of defect(s); 3 cm to 10 cm, reducible

The RUC reviewed the survey results from 41 surgeons for CPT code 49X03 and determined that the survey 25th percentile work RVU of 10.80 appropriately accounts for the work required to perform this service. The RUC recommends 30 minutes of pre-service evaluation time, 10 minutes of pre-service positioning time, 15 minutes of pre-service scrub/dress/wait time, 90 minutes of intra-service time, 30 minutes of immediate post-service time, and 175 minutes of total time. The specialty societies noted that this service is typically performed laparoscopically along the midline of the abdomen and that there may be multiple defects involved in a hernia of this size. The evaluation time was reduced from Pre-time Package 3 so as to not exceed survey median data. The positioning time was increased from the pre-time package to account for laparoscopic/robotic anterior abdominal hernia repair positioning: The patient will initially be positioned supine and upper extremity intravenous and arterial access points are dressed, padded and secured. The arms are padded and tucked at the patient’s sides. The patient must be secured to the table, including a soft chest and thigh strap, as it may be necessary to roll the table during the procedure to use gravity to assist with shifting the abdominal contents. There is also consideration of positioning the patient relative to: laparoscopy equipment, including lines and video equipment and anesthesia lines relative to the rest of the equipment.

The RUC noted that the typical patient will stay overnight or longer and there will typically be a visit later the same date of the procedure at the level of 99224/99231 to monitor for problems such as ileus, intestinal ischemia, urinary retention and pain control; review data (eg, diagnostic and imaging studies) not available at the unit; communicate with other health care professionals and with patient and/or family; review medical records and data available on the unit; perform a medically appropriate examination; consider relevant data, options, and risks; formulate and/or revise diagnosis and treatment plan(s) (low complexity MDM); discuss diagnosis and treatment options with the patient and/or family; communicate with other health care professionals as necessary; write and/or review orders, complete medical record documentation; address interval data obtained and reported changes in condition; communicate results and additional care plans to other health care professionals and to the patient and/or family. Per CMS policy for reporting postoperative work for 23-hour stay procedures, the intra-service time of 10 minutes for 99224/99231 has been added to the survey immediate post-service time (total of 30 minutes). The insertion of mesh or other prosthesis is now bundled into this service; the work associated with the placement of mesh or other prosthesis was previously reported separately with deleted add-on CPT code 49568 Implantation of mesh or other prosthesis for open incisional or ventral hernia repair or mesh for closure of debridement for necrotizing soft tissue infection (List separately in addition to code for the incisional or ventral hernia repair) (work RVU = 4.88).

To support a work RVU of 10.80, the RUC compared CPT code 49X03 to top key reference service 11006 Debridement of skin, subcutaneous tissue, muscle and fascia for necrotizing soft tissue infection; external genitalia, perineum and abdominal wall, with or without fascial closure (work RVU = 13.10, 120 minutes of intra-service and 270 minutes of total time) as well as MPC code 36906 Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit (work RVU = 10.42, 90 minutes intra-service and 141 minutes of total time) and noted that the recommended work RVU of 10.80 is appropriately higher than that of MPC code 36906 given 49X03’s higher total time and is appropriately lower than that of top key reference service 11006 given 49X03’s lower intra-service and total time. **The RUC recommends a work RVU of 10.80 for CPT code 49X03.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.
49X04 Repair of anterior abdominal hernia(s) (ie, epigastric, incisional, ventral, umbilical, spigelian), any approach (ie, open, laparoscopic, robotic), initial, including placement of mesh or other prosthesis, when performed, total length of defect(s); 3 cm to 10 cm, incarcerated or strangulated

The RUC reviewed the survey results from 41 surgeons for CPT code 49X04 and determined that the survey 25th percentile work RVU of 14.00 appropriately accounts for the work required to perform this service. The RUC recommends 35 minutes of pre-service evaluation time, 15 minutes of pre-service positioning time, 15 minutes of pre-service scrub/dress/wait time, 120 minutes of intra-service time, 40 minutes of immediate post-service time, and 225 minutes of total time. The specialty societies noted that this service is typically performed laparoscopically along the midline of the abdomen and that there may be multiple defects involved in a hernia this size. The evaluation and scrub/dress/wait times were reduced from Pre-time Package 4 as to not exceed survey median data. The positioning time was increased from the pre-time package to account for laparoscopic/robotic anterior abdominal hernia repair positioning: The patient will initially be positioned supine and upper extremity intravenous and arterial access points are dressed, padded and secured. The arms are padded and tucked at the patient’s sides. The patient must be secured to the table, including a soft chest and thigh strap, as it may be necessary to roll the table during the procedure to use gravity to assist with shifting the abdominal contents. There is also consideration of positioning the patient relative to: laparoscopy equipment, including lines and video equipment and anesthesia lines relative to the rest of the equipment.

The RUC noted that the typical patient will stay overnight or longer and there will typically be a visit later the same date of the procedure at the level of 99225/99232 to monitor for problems such as ileus, intestinal ischemia, urinary retention and pain control; review data (eg, diagnostic and imaging studies) not available at the unit; communicate with other health care professionals and with patient and/or family; review medical records and data available on the unit; perform a medically appropriate examination; consider relevant data, options, and risks; formulate and/or revise diagnosis and treatment plan(s) (moderate complexity MDM); discuss diagnosis and treatment options with the patient and/or family; communicate with other health care professionals as necessary; write and/or review orders, complete medical record documentation; address interval data obtained and reported changes in condition; communicate results and additional care plans to other health care professionals and to the patient and/or family. Per CMS policy for reporting postoperative work for 23-hour stay procedures, the intra-service time of 20 minutes for 99225/99232 has been added to the immediate post-service time (total of 40 minutes). The insertion of mesh or other prosthesis is now bundled into this service; the work associated with the placement of mesh or other prosthesis was previously reported separately with deleted add-on CPT code 49568 Implantation of mesh or other prosthesis for open incisional or ventral hernia repair or mesh for closure of debridement for necrotizing soft tissue infection (List separately in addition to code for the incisional or ventral hernia repair) (work RVU = 4.88).

To support a work RVU of 14.00, the RUC compared CPT code 49X04 to top key reference service CPT code 11005 Debridement of skin, subcutaneous tissue, muscle and fascia for necrotizing soft tissue infection; abdominal wall, with or without fascial closure (work RVU = 14.24, 120 minutes of intra-service and 265 minutes of total time) and MPC code 37244 Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; for arterial or venous hemorrhage or lymphatic extravasation (work RVU = 13.75, 90 minutes of intra-service and 166 minutes of total time) and noted that these codes bracket CPT code 49X04 with appropriate work RVUs and noted that the recommended work RVU of 14.00 is appropriately higher than that of MPC code 37244 given 49X04’s higher intra-service and total time and is appropriately lower than that of top key reference service 11005 given 49X04’s lower total time. The RUC recommends a work RVU of 14.00 for CPT code 49X04.
49X05 *Repair of anterior abdominal hernia(s) (ie, epigastric, incisional, ventral, umbilical, spigelian), any approach (ie, open, laparoscopic, robotic), initial, including placement of mesh or other prosthesis, when performed, total length of defect(s); greater than 10 cm, reducible*

The RUC reviewed the survey results from 40 surgeons for CPT code 49X05 and determined that the survey 25th percentile work RVU of 14.88 appropriately accounts for the work required to perform this service. The RUC recommends 40 minutes of pre-service evaluation time, 15 minutes of pre-service positioning time, 15 minutes of pre-service scrub/dress/wait time, 120 minutes of intra-service time, 40 minutes of immediate post-service time, and 230 minutes of total time. The specialty societies noted that this service is typically performed laparoscopically along the midline of the abdomen and that there may be multiple defects involved in a hernia this size. The scrub/dress/wait time was reduced from Pre-time Package 4 so as to not exceed survey median data. The positioning time was increased from the pre-time package to account for laparoscopic/robotic anterior abdominal hernia repair positioning: The patient will initially be positioned supine and upper extremity intravenous and arterial access points are dressed, padded and secured. The arms are padded and tucked at the patient’s sides. The patient must be secured to the table, including a soft chest and thigh strap, as it may be necessary to roll the table during the procedure to use gravity to assist with shifting the abdominal contents. There is also consideration of positioning the patient relative to: laparoscopy equipment, including lines and video equipment and anesthesia lines relative to the rest of the equipment.

The RUC noted that the typical patient will stay overnight or longer and there will typically be a visit later the same date of the procedure at the level of 99225/99232 to monitor for problems such as ileus, intestinal ischemia, urinary retention and pain control; review data (eg, diagnostic and imaging studies) not available at the unit; communicate with other health care professionals and with patient and/or family; review medical records and data available on the unit; perform a medically appropriate examination; consider relevant data, options, and risks; formulate and/or revise diagnosis and treatment plan(s) (moderate complexity MDM); discuss diagnosis and treatment options with the patient and/or family; communicate with other health care professionals as necessary; write and/or review orders, complete medical record documentation; address interval data obtained and reported changes in condition; communicate results and additional care plans to other health care professionals and to the patient and/or family. Per CMS policy for reporting postoperative work for 23-hour stay procedures, the intra-service time of 20 minutes for 99225/99232 has been added to the immediate post-service time (total of 40 minutes). The insertion of mesh or other prosthesis is now bundled into this service; the work associated with the placement of mesh or other prosthesis was previously reported separately with deleted add-on CPT code 49568 *Implantation of mesh or other prosthesis for open incisional or ventral hernia repair or mesh for closure of debridement for necrotizing soft tissue infection (List separately in addition to code for the incisional or ventral hernia repair) (work RVU = 4.88).*

To support a work RVU of 14.88, the RUC compared CPT code 49X05 to second key reference service 11005 *Debridement of skin, subcutaneous tissue, muscle and fascia for necrotizing soft tissue infection; abdominal wall, with or without fascial closure* (work RVU = 14.24, 120 minutes of intra-service and 265 minutes of total time) and noted that both services require similar physician work and time to perform. The RUC also referenced MPC code 37244 *Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; for arterial or venous hemorrhage or lymphatic extravasation* (work RVU = 13.75, 90 minutes of intra-service and 166 minutes total time) and noted that 20 percent of survey respondents determined that 49X05 is much more complex than second key reference service 11005 and 60 percent of survey respondents determined that 49X05 is somewhat more complex than 11005, which supports a slightly higher work RVU value for 49X05. The higher recommended intra-service and total time for 49X05 supports a higher work RVU value than 37244. The RUC recommends a work RVU of 14.88 for CPT code 49X05.
49X06 Repair of anterior abdominal hernia(s) (ie, epigastric, incisional, ventral, umbilical, spigelian), any approach (ie, open, laparoscopic, robotic), initial, including placement of mesh or other prosthesis, when performed, total length of defect(s); greater than 10 cm, incarcerated or strangulated

The RUC reviewed the survey results from 40 surgeons for CPT code 49X06 and determined that the survey median work RVU of 20.00 appropriately accounts for the work required to perform this service. The RUC recommends 40 minutes of pre-service evaluation time, 15 minutes of pre-service positioning time, 15 minutes of pre-service scrub/dress/wait time, 160 minutes of intra-service time, 25 minutes of immediate post-service time, 1-99233 post-operative observation visit, and 310 minutes of total time. The specialty societies noted that this service is typically performed laparoscopically along the midline of the abdomen and that there may be multiple defects involved in a hernia this size. The scrub/dress/wait time was reduced from Pre-time Package 4 so as to not exceed survey median data. The positioning time was increased from the pre-time package to account for laparoscopic/robotic anterior abdominal hernia repair positioning: The patient will initially be positioned supine and upper extremity intravenous and arterial access points are dressed, padded and secured. The arms are padded and tucked at the patient’s sides. The patient must be secured to the table, including a soft chest and thigh strap, as it may be necessary to roll the table during the procedure to use gravity to assist with shifting the abdominal contents. There is also consideration of positioning the patient relative to: laparoscopy equipment, including lines and video equipment and anesthesia lines relative to the rest of the equipment.

The RUC noted that the typical patient will be admitted as inpatient and there will typically be a visit later the same date of the procedure at the at the level of 99233 to monitor for problems such as ileus, intestinal ischemia, urinary retention and pain control; review data (eg, diagnostic and imaging studies) not available at the unit; communicate with other health care professionals and with patient and/or family; review medical records and data available on the unit; perform a medically appropriate examination; consider relevant data, options, and risks; formulate and/or revise diagnosis and treatment plan(s) (high complexity MDM); discuss diagnosis and treatment options with the patient and/or family; communicate with other health care professionals as necessary; review orders, complete medical record documentation; address interval data obtained and reported changes in condition; communicate results and additional care plans to other health care professionals and to the patient and/or family. Patients undergoing the repair of this size of hernia will require significant postoperative care on the same day to address pain control, review vital signs and fluid status commonly affected by repair of larger hernias, and eliminate concerns for bleeding and infection more common with larger or more numerous incisions. The insertion of mesh or other prosthesis is now bundled into this service; the work associated with the placement of mesh or other prosthesis was previously reported separately with deleted add-on CPT code 49568 Implantation of mesh or other prosthesis for open incisional or ventral hernia repair or mesh for closure of debridement for necrotizing soft tissue infection (List separately in addition to code for the incisional or ventral hernia repair) (work RVU = 4.88).

To support a work RVU of 20.00, the RUC compared CPT code 49X06 to top key reference service 11005 Debridement of skin, subcutaneous tissue, muscle and fascia for necrotizing soft tissue infection; abdominal wall, with or without fascial closure (work RVU = 14.24, 120 minutes of intra-service and 265 minutes of total time) and second key reference service 61624 Transcatheter permanent occlusion or embolization (eg, for tumor destruction, to achieve hemostasis, to occlude a vascular malformation), percutaneous, any method; central nervous system (intracranial, spinal cord) (work RVU = 20.12, 232 minutes of intra-service and 362 minutes of total time) and noted that the recommended intra-service and total times support a work RVU higher than that of top key reference service 11005. The RUC also noted that 44 percent of survey respondents determined that 49X06 is much more complex than second key reference service 61624 and 44 percent of survey respondents determined that 49X06 is somewhat more complex than 61624, supporting a slightly lower work RVU despite the differences in intra-service and total time. **The RUC recommends a work RVU of 20.00 for CPT code 49X06.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.
Recurrent Abdominal Hernia Repair

49X07 Repair of anterior abdominal hernia(s) (ie, epigastric, incisional, ventral, umbilical, spigelian), any approach (ie, open, laparoscopic, robotic), recurrent, including placement of mesh or other prosthesis, when performed, total length of defect(s); less than 3 cm, reducible

The RUC reviewed the survey results from 41 surgeons for CPT code 49X07 and determined that the survey 25th percentile work RVU of 7.75 appropriately accounts for the work required to perform this service. The RUC recommends 30 minutes of pre-service evaluation time, 10 minutes of pre-service positioning time, 15 minutes of pre-service scrub/dress/wait time, 60 minutes of intra-service time, 20 minutes of immediate post-service time, and 135 minutes of total time. The RUC noted that this service involves the repair of the smallest size of a recurrent hernia and that there would be additional time and intensity associated with this service over CPT code 49X01 because of the previous procedure. The specialty societies noted that this service is typically performed laparoscopically along the midline of the abdomen. The evaluation time was reduced from Pre-time Package 3 so as to not exceed survey median data. The positioning time was increased from the pre-time package to account for laparoscopic/robotic anterior abdominal hernia repair positioning: The patient will initially be positioned supine and upper extremity intravenous and arterial access points are dressed, padded and secured. The arms are padded and tucked at the patient’s sides. The patient must be secured to the table, including a soft chest and thigh strap, as it may be necessary to roll the table during the procedure to use gravity to assist with shifting the abdominal contents. There is also consideration of positioning the patient relative to: laparoscopy equipment, including lines and video equipment and anesthesia lines relative to the rest of the equipment.

The typical patient is discharged on the same day and therefore there are no post-operative visits associated with 49X07. The insertion of mesh or other prosthesis is now bundled into this service; the work associated with the placement of mesh or other prosthesis was previously reported separately with deleted add-on CPT code 49568 Implantation of mesh or other prosthesis for open incisional or ventral hernia repair or mesh for closure of debridement for necrotizing soft tissue infection (List separately in addition to code for the incisional or ventral hernia repair) (work RVU = 4.88).

To support a work RVU of 7.75, the RUC compared CPT code 49X07 to CPT code 52345 Cystourethroscopy with ureteroscopy; with treatment of ureteropelvic junction stricture (eg, balloon dilation, laser, electrocautery, and incision) (work RVU = 7.55, 45 minutes of intra-service and 135 minutes of total time), CPT code 52240 Cystourethroscopy, with fulguration (including cryosurgery or laser surgery) and/or resection of; large bladder tumor(s) (work RVU = 7.50, 60 minutes of intra-service and 133 minutes of total time) and MPC code 52353 Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy (ureteral catheterization is included) (work RVU = 7.50, 60 minutes of intra-service and 133 minutes of total time) and noted that the work RVUs, intra-service times and total times in this range of codes supports the work RVU recommendation for CPT code 49X07 and that the added work associated with a recurrent hernia with respect to a reducible hernia places the recommended work RVU within appropriate rank order in this code family. The RUC recommends a work RVU of 7.75 for CPT code 49X07.
49X08 Repair of anterior abdominal hernia(s) (ie, epigastric, incisional, ventral, umbilical, spigelian), any approach (ie, open, laparoscopic, robotic), recurrent, including placement of mesh or other prosthesis, when performed, total length of defect(s); less than 3 cm, incarcerated or strangulated

The RUC reviewed the survey results from 41 surgeons for CPT code 49X08 and determined that the survey 25th percentile work RVU of 10.79 appropriately accounts for the work required to perform this service. The RUC recommends 35 minutes of pre-service evaluation time, 10 minutes of pre-service positioning time, 15 minutes of pre-service scrub/dress/wait time, 75 minutes of intra-service time, 30 minutes of immediate post-service time, and 165 minutes of total time. The specialty societies specified that this service involves a recurrent hernia (as opposed to an initial hernia) and that involves another opening adjacent to the previously placed mesh and scar tissue and that the service is typically performed laparoscopically and involves working around a piece of incarcerated/strangulated bowel. These factors increase the time and intensity involved in performing the service. The evaluation and scrub/dress/wait times were reduced from Pre-time Package 4 so as to not exceed survey median data. The positioning time was increased from the pre-time package to account for laparoscopic/robotic anterior abdominal hernia repair positioning: The patient will initially be positioned supine and upper extremity intravenous and arterial access points are dressed, padded and secured. The arms are padded and tucked at the patient’s sides. The patient must be secured to the table, including a soft chest and thigh strap, as it may be necessary to roll the table during the procedure to use gravity to assist with shifting the abdominal contents. There is also consideration of positioning the patient relative to: laparoscopy equipment, including lines and video equipment and anesthesia lines relative to the rest of the equipment.

The RUC noted that the typical patient will stay overnight or longer and there will typically be a visit later the same date of the procedure at the level of 99224/99231 to monitor for problems such as ileus, intestinal ischemia, urinary retention and pain control; review data (eg, diagnostic and imaging studies) not available at the unit; communicate with other health care professionals and with patient and/or family; review medical records and data available on the unit; perform a medically appropriate examination; consider relevant data, options, and risks; formulate and/or revise diagnosis and treatment plan(s) (low complexity MDM); discuss diagnosis and treatment options with the patient and/or family; communicate with other health care professionals as necessary; write and/or review orders, complete medical record documentation; address interval data obtained and reported changes in condition; communicate results and additional care plans to other health care professionals and to the patient and/or family. Per CMS policy for reporting postoperative work for 23-hour stay procedures, the intra-service time of 10 minutes for 99224/99231 has been added to the immediate post-service time (total of 30 minutes). The RUC noted that the recommended work RVU of 10.79 places this code in appropriate rank order with respect to overall intensity. The insertion of mesh or other prosthesis is now bundled into this service; the work associated with the placement of mesh or other prosthesis was previously reported separately with deleted add-on CPT code 49568 Implantation of mesh or other prosthesis for open incisional or ventral hernia repair or mesh for closure of debridement for necrotizing soft tissue infection(List separately in addition to code for the incisional or ventral hernia repair) (work RVU = 4.88).

To support a work RVU of 10.79, the RUC compared CPT code 49X08 to top key reference service CPT code 21811 Open treatment of rib fracture(s) with internal fixation, includes thoracoscopic visualization when performed, unilateral; 1-3 ribs (work RVU = 10.79, 120 minutes of intra-service and 220 minutes of total time) and noted that the surveyed code requires less intra-service time but is much more intense, thus appropriate to be valued the same. Of the respondents who chose 21811 as the key reference service, 67% indicated CPT code 48X08 requires more mental effort, technical skill and physician stress than CPT code 21811.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.
For additional support, the RUC referenced MPC code 36906 *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit* (work RVU = 10.42, 90 minutes of intra-service and 141 minutes of total time).

**The RUC recommends a work RVU of 10.79 for CPT code 49X08.**

49X09 *Repair of anterior abdominal hernia(s) (ie, epigastric, incisional, ventral, umbilical, spigelian), any approach (ie, open, laparoscopic, robotic), recurrent, including placement of mesh or other prosthesis, when performed, total length of defect(s); 3 cm to 10 cm, reducible*

The RUC reviewed the survey results from 43 surgeons for CPT code 49X09 and determined that the survey 25th percentile work RVU of 12.00 appropriately accounts for the work required to perform this service. The RUC recommends 35 minutes of pre-service evaluation time, 10 minutes of pre-service positioning time, 15 minutes of pre-service scrub/dress/wait time, 100 minutes of intra-service time, 30 minutes of immediate post-service time, and 190 minutes of total time. The specialty societies noted that this service is typically performed laparoscopically. The evaluation and scrub/dress/wait times were reduced from Pre-time Package 4 so as to not exceed survey median data. The positioning time was increased from the pre-time package to account for laparoscopic/robotic anterior abdominal hernia repair positioning: The patient will initially be positioned supine and upper extremity intravenous and arterial access points are dressed, padded and secured. The arms are padded and tucked at the patient’s sides. The patient must be secured to the table, including a soft chest and thigh strap, as it may be necessary to roll the table during the procedure to use gravity to assist with shifting the abdominal contents. There is also consideration of positioning the patient relative to: laparoscopy equipment, including lines and video equipment and anesthesia lines relative to the rest of the equipment.

The RUC noted that the typical patient will stay overnight or longer and there will typically be a visit later the same date of the procedure at the level of 99224/99231 to monitor for problems such as ileus, intestinal ischemia, urinary retention and pain control; review data (eg, diagnostic and imaging studies) not available at the unit; communicate with other health care professionals and with patient and/or family; review medical records and data available on the unit; perform a medically appropriate examination; consider relevant data, options, and risks; formulate and/or revise diagnosis and treatment plan(s) (moderate complexity MDM); discuss diagnosis and treatment options with the patient and/or family; communicate with other health care professionals as necessary; write and/or review orders, complete medical record documentation; address interval data obtained and reported changes in condition; communicate results and additional care plans to other health care professionals and to the patient and/or family. Per CMS policy for reporting postoperative work for 23-hour stay procedures, the intra-service time of 10 minutes for 99224/99231 has been added to the immediate post-service time (total of 30 minutes). The insertion of mesh or other prosthesis is now bundled into this service; the work associated with the placement of mesh or other prosthesis was previously reported separately with deleted add-on CPT code 49568 *Implantation of mesh or other prosthesis for open incisional or ventral hernia repair or mesh for closure of debridement for necrotizing soft tissue infection* (List separately in addition to code for the incisional or ventral hernia repair) (work RVU = 4.88).

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.
To support a work RVU of 12.00, the RUC compared CPT code 49X09 to top key reference service 11006 Debridement of skin, subcutaneous tissue, muscle and fascia for necrotizing soft tissue infection; external genitalia, perineum and abdominal wall, with or without fascial closure (work RVU = 13.10, 120 minutes of intra-service and 270 minutes of total time) and second key reference service 11005 Debridement of skin, subcutaneous tissue, muscle and fascia for necrotizing soft tissue infection; abdominal wall, with or without fascial closure (work RVU = 14.24, 120 minutes of intra-service and 265 minutes of total time), both of which require more physician work and time than 49X09; thus it is appropriately valued slightly lower. The RUC recommends a work RVU of 12.00 for CPT code 49X09.

49X10 Repair of anterior abdominal hernia(s) (ie, epigastric, incisional, ventral, umbilical, spigelian), any approach (ie, open, laparoscopic, robotic), recurrent, including placement of mesh or other prosthesis, when performed, total length of defect(s); 3 cm to 10 cm, incarcerated or strangulated

The RUC reviewed the survey results from 43 surgeons for CPT code 49X10 and determined that the survey 25th percentile work RVU of 16.50 appropriately accounts for the work required to perform this service. The RUC recommends 40 minutes of pre-service evaluation time, 15 minutes of pre-service positioning time, 15 minutes of pre-service scrub/dress/wait time, 140 minutes of intra-service time, 25 minutes of immediate post-service time, 1-99232 post-operative observation visit, and 275 minutes of total time. The specialty societies noted that this service is typically performed laparoscopically. The scrub/dress/wait time was reduced from Pre-time Package 4 so as to not exceed survey median data. The positioning time was increased from the pre-time package to account for laparoscopic/robotic anterior abdominal hernia repair positioning: The patient will initially be positioned supine and upper extremity intravenous and arterial access points are dressed, padded and secured. The arms are padded and tucked at the patient’s sides. The patient must be secured to the table, including a soft chest and thigh strap, as it may be necessary to roll the table during the procedure to use gravity to assist with shifting the abdominal contents. There is also consideration of positioning the patient relative to: laparoscopy equipment, including lines and video equipment and anesthesia lines relative to the rest of the equipment.

The RUC noted that the typical patient will be admitted as an inpatient and there will typically be a visit later the same date of the procedure at the level of 99232 to monitor for problems such as ileus, intestinal ischemia, urinary retention and pain control; review data (eg, diagnostic and imaging studies) not available at the unit; communicate with other health care professionals and with patient and/or family; review medical records and data available on the unit; perform a medically appropriate examination; consider relevant data, options, and risks; formulate and/or revise diagnosis and treatment plan(s) (moderate complexity MDM); discuss diagnosis and treatment options with the patient and/or family; communicate with other health care professionals as necessary; write and/or review orders, complete medical record documentation; address interval data obtained and reported changes in condition; communicate results and additional care plans to other health care professionals and to the patient and/or family. The insertion of mesh or other prosthesis is now bundled into this service; the work associated with the placement of mesh or other prosthesis was previously reported separately with deleted add-on CPT code 49568 Implantation of mesh or other prosthesis for open incisional or ventral hernia repair or mesh for closure of debridement for necrotizing soft tissue infection (List separately in addition to code for the incisional or ventral hernia repair) (work RVU = 4.88).
To support a work RVU of 16.50, the RUC compared CPT code 49X10 to top key reference service 33891 Bypass graft, with other than vein, transcervical retropharyngeal carotid-carotid, performed in conjunction with endovascular repair of descending thoracic aorta, by neck incision (work RVU = 20.00, 173 minutes of intra-service time and 323 minutes of total time) and the second key reference service 21813 Open treatment of rib fracture(s) with internal fixation, includes thorascoscopic visualization when performed, unilateral; 7 or more ribs (work RVU = 17.61, 210 minutes of intra-service and 310 minutes of total time) and noted that the surveyed code requires less physician time and work; thus it is appropriately valued lower.

For additional support, the RUC referenced MPC code 37244 Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; for arterial or venous hemorrhage or lymphatic extravasation (work RVU = 13.75, 90 minutes of intra-service and 166 minutes of total time) and noted that the surveyed code requires more physician work and time to perform, thus is valued higher. The RUC recommends a work RVU of 16.50 for CPT code 49X10.

49X11  Repair of anterior abdominal hernia(s) (ie, epigastric, incisional, ventral, umbilical, spigelian), any approach (ie, open, laparoscopic, robotic), recurrent, including placement of mesh or other prosthesis, when performed, total length of defect(s); greater than 10 cm, reducible

The RUC reviewed the survey results from 42 surgeons for CPT code 49X11 and noted that the survey 25th percentile work RVU recommendation would have created a rank order anomaly within the recommended work RVU values across this code family. The specialty societies noted that while the hernia repair associated with CPT code 49X10 involves an incarcerated/strangulated hernia, the hernia repair associated with CPT code 49X11 involves a significantly larger area of repair and involves multiple hernias in a line. However, the RUC determined that the survey median work RVU value of 18.53 overvalues the work associated with performing this procedure. The specialty societies noted that this service is typically performed laparoscopically. The scrub/dress/wait time was reduced from Pre-time Package 4 so as to not exceed survey median data. The positioning time was increased from the pre-time package to account for laparoscopic/robotic anterior abdominal hernia repair positioning: The patient will initially be positioned supine and upper extremity intravenous and arterial access points are dressed, padded and secured. The arms are padded and tucked at the patient’s sides. The patient must be secured to the table, including a soft chest and thigh strap, as it may be necessary to roll the table during the procedure to use gravity to assist with shifting the abdominal contents. There is also consideration of positioning the patient relative to: laparoscopy equipment, including lines and video equipment and anesthesia lines relative to the rest of the equipment.

The RUC determined that a direct work RVU crosswalk to CPT code 37182 Insertion of transvenous intrahepatic portosystemic shunt(s) (TIPS) (includes venous access, hepatic and portal vein catheterization, portography with hemodynamic evaluation, intrahepatic tract formation/dilatation, stent placement and all associated imaging guidance and documentation) (work RVU = 16.97, 150 minutes of intra-service and 210 minutes of total time) appropriately accounts for the work required to perform this service. The RUC recommends 40 minutes of pre-service evaluation time, 15 minutes of pre-service positioning time, 15 minutes of pre-service scrub/dress/wait time, 150 minutes of intra-service time, 28 minutes of immediate post-service time, 1-99232 post-operative observation visit, and 288 minutes of total time for CPT code 49X11.

The RUC noted that the typical patient will be admitted as inpatient and there will typically be a visit later the same date of the procedure at the level of 99232 to monitor for problems such as ileus, intestinal ischemia, urinary retention and pain control; review data (eg, diagnostic and imaging studies) not available at the unit; communicate with other health care professionals and with patient and/or family; review medical records and data available on the unit; perform a medically appropriate examination; consider relevant data, options, and risks; formulate and/or revise diagnosis and treatment plan(s) (moderate complexity MDM); discuss diagnosis and treatment options with the patient and/or family; CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.
communicate with other health care professionals as necessary; write and/or review orders, complete medical record documentation; address interval data obtained and reported changes in condition; communicate results and additional care plans to other health care professionals and to the patient and/or family. The insertion of mesh or other prosthesis is bundled into this service; the work associated with the placement of mesh or other prosthesis was previously reported separately with deleted add-on CPT code 49568 Implantation of mesh or other prosthesis for open incisional or ventral hernia repair or mesh for closure of debridement for necrotizing soft tissue infection (List separately in addition to code for the incisional or ventral hernia repair) (work RVU = 4.88).

To support a work RVU of 16.97, the RUC compared CPT code 49X11 to second key reference service 11006 Debridement of skin, subcutaneous tissue, muscle and fascia for necrotizing soft tissue infection; external genitalia, perineum and abdominal wall, with or without fascial closure (work RVU = 13.10, 120 minutes of intra-service and 270 minutes of total time) and top key reference service 11005 Debridement of skin, subcutaneous tissue, muscle and fascia for necrotizing soft tissue infection; abdominal wall, with or without fascial closure (work RVU = 14.24, 120 minutes of intra-service and 265 minutes of total time) and noted that the higher intra-service time and the complexity associated with the repair of a recurrent abdominal hernia greater than 10 cm in length supports a higher work RVU than the key reference services. The RUC recommends a work RVU of 16.97 for CPT code 49X11.

49X12 Repair of anterior abdominal hernia(s) (ie, epigastric, incisional, ventral, umbilical, spigelian), any approach (ie, open, laparoscopic, robotic), recurrent, including placement of mesh or other prosthesis, when performed, total length of defect(s); greater than 10 cm, incarcerated or strangulated

The RUC reviewed the survey results from 42 surgeons for CPT code 49X12 and determined that the survey median work RVU of 24.00 appropriately accounts for the work required to perform this service. The RUC recommends 40 minutes of pre-service evaluation time, 15 minutes of pre-service positioning time, 15 minutes of pre-service scrub/dress/wait time, 180 minutes of intra-service time, 30 minutes of immediate post-service time, 1-99232 post-operative observation visit, and 335 minutes of total time. The specialty noted that the hernia repair associated with this service involves a large and recurrent hernia which presents several challenges, including navigating previous repairs (including scar tissue and previously placed mesh) and addressing the piece of bowel that is incarcerated or strangulated.

The RUC noted that the typical patient will be admitted as inpatient and there will typically be a visit later the same date of the procedure at the level of 99233 to monitor for problems such as ileus, intestinal ischemia, urinary retention and pain control; review data (eg, diagnostic and imaging studies) not available at the unit; communicate with other health care professionals and with patient and/or family; review medical records and data available on the unit; perform a medically appropriate examination; consider relevant data, options, and risks; formulate and/or revise diagnosis and treatment plan(s) (high complexity MDM); discuss diagnosis and treatment options with the patient and/or family; communicate with other health care professionals as necessary; write and/or review orders, complete medical record documentation; address interval data obtained and reported changes in condition; communicate results and additional care plans to other health care professionals and to the patient and/or family. Patients undergoing the repair of this size of hernia will require significant postoperative care on the same day to address pain control, review vital signs and fluid status commonly affected by repair of larger hernias, and eliminate concerns for bleeding and infection more common with larger or more numerous incisions. The insertion of mesh or other prosthesis is bundled into this service; the work associated with the placement of mesh or other prosthesis was previously reported separately with deleted add-on CPT code 49568 Implantation of mesh or other prosthesis for open incisional or ventral hernia repair or mesh for closure of debridement for necrotizing soft tissue infection (List separately in addition to code for the incisional or ventral hernia repair) (work RVU = 4.88).

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.
To support a work RVU of 24.00, the RUC compared CPT code 49X12 to top key reference service CPT code 61624 Transcatheter permanent occlusion or embolization (eg, for tumor destruction, to achieve hemostasis, to occlude a vascular malformation), percutaneous, any method; central nervous system (intracranial, spinal cord) (work RVU = 20.12, 232 minutes of intra-service and 362 minutes of total time) and second key reference service CPT code 21813 Open treatment of rib fracture(s) with internal fixation, includes thoracoscopic visualization when performed, unilateral; 7 or more ribs (work RVU = 17.61, 210 minutes of intra-service and 310 minutes of total time) and noted that the work associated with 49X12 is significantly more complex given the size, recurrence, and incarceration/strangulation and that this service is the most complex in the rank order of this code family. The RUC recommends a work RVU of 24.00 for CPT code 49X12.

Parastomal Hernia Repair

49X13 Repair of parastomal hernia, any approach (ie, open, laparoscopic, robotic), initial or recurrent, including placement of mesh or other prosthesis, when performed; reducible

The RUC reviewed the survey results from 39 surgeons for CPT code 49X13 and determined that the specialty recommended survey median work RVU of 15.50 overvalues the work associated with this service. However, the RUC determined that the survey 25th percentile work RVU of 13.50 undervalues the work associated with this service and would create a rank order anomaly within this code family.

The RUC determined that a direct work RVU crosswalk to CPT code 11005 Debridement of skin, subcutaneous tissue, muscle and fascia for necrotizing soft tissue infection; abdominal wall, with or without fascial closure (work RVU = 14.24, 120 minutes of intra-service and 265 minutes of total time) appropriately reflects the relative work required to perform this service and places CPT code 49X13 in appropriate rank order within this family of anterior abdominal hernia repair codes. The RUC recommends 40 minutes of pre-service evaluation time, 15 minutes of pre-service positioning time, 15 minutes of pre-service scrub/dress/wait time, 120 minutes of intra-service time, 25 minutes of immediate post-service time, 1-99231 post-operative observation visit, and 235 minutes of total time. The specialty societies noted that this service is typically performed laparoscopically. The scrub/dress/wait time was reduced from Pre-time Package 4 so as to not exceed survey median data. The positioning time was increased from the pre-time package to account for laparoscopic/robotic anterior abdominal hernia repair positioning: The patient will initially be positioned supine and upper extremity intravenous and arterial access points are dressed, padded and secured. The arms are padded and tucked at the patient’s sides. The patient must be secured to the table, including a soft chest and thigh strap, as it may be necessary to roll the table during the procedure to use gravity to assist with shifting the abdominal contents. There is also consideration of positioning the patient relative to: laparoscopy equipment, including lines and video equipment and anesthesia lines relative to the rest of the equipment.

The RUC noted that the typical patient will be admitted as inpatient and there will typically be a visit later of the same date at the level of 99231 to monitor for problems such as ileus, intestinal ischemia, urinary retention and pain control; review data (eg, diagnostic and imaging studies) not available at the unit; communicate with other health care professionals and with patient and/or family; review medical records and data available on the unit; perform a medically appropriate examination; consider relevant data, options, and risks; formulate and/or revise diagnosis and treatment plan(s) (low complexity MDM); discuss diagnosis and treatment options with the patient and/or family; communicate with other health care professionals as necessary; write and/or review orders, complete medical record documentation; address interval data obtained and reported

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.
changes in condition; communicate results and additional care plans to other health care professionals and to the patient and/or family. The RUC noted that the parastomal abdominal hernia occurs proximal to a pre-existing stoma and colostomy and requires the maintenance of an abdominal defect to maintain the colostomy and that these factors make it a more complex service than a typical reducible abdominal hernia repair.

To support a work RVU of 14.24, the RUC compared CPT code 49X13 to CPT code 37231 Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with transluminal stent placement(s) and atherectomy, includes angioplasty within the same vessel, when performed (work RVU = 14.75, 135 minutes intra-service time and 203 minutes of total time) and determined that the work RVU of 14.75 is appropriately higher than the recommended work RVU of 14.24 for 49X13. The RUC recommends a work RVU of 14.24 for CPT code 49X13.

**49X14 Repair of parastomal hernia, any approach (ie, open, laparoscopic, robotic), initial or recurrent, including placement of mesh or other prosthesis, when performed; incarcerated or strangulated**

The RUC reviewed the survey results from 39 surgeons for CPT code 49X14 and determined that the survey median work RVU of 18.00 appropriately accounts for the work required to perform this service. The RUC recommends 40 minutes of pre-service evaluation time, 15 minutes of pre-service scrub/dress/wait time, 150 minutes of intra-service time, 25 minutes of immediate post-service time, 1-99232 post-operative observation visit, and 285 minutes of total time. The specialty societies noted that this service is typically performed laparoscopically. The scrub/dress/wait time was reduced from Pre-time Package 4 so as to not exceed survey median data. The positioning time was increased from the pre-time package to account for laparoscopic/robotic anterior abdominal hernia repair positioning: The patient will initially be positioned supine and upper extremity intravenous and arterial access points are dressed, padded and secured. The arms are padded and tucked at the patient’s sides. The patient must be secured to the table, including a soft chest and thigh strap, as it may be necessary to roll the table during the procedure to use gravity to assist with shifting the abdominal contents. There is also consideration of positioning the patient relative to: laparoscopy equipment, including lines and video equipment and anesthesia lines relative to the rest of the equipment.

The RUC noted that the typical patient will be admitted as inpatient and there will typically be a visit later on the same date at the level of 99232 to monitor for problems such as ileus, intestinal ischemia, urinary retention and pain control; review data (eg, diagnostic and imaging studies) not available at the unit; communicate with other health care professionals and with patient and/or family; review medical records and data available on the unit; perform a medically appropriate examination; consider relevant data, options, and risks; formulate and/or revise diagnosis and treatment plan(s) (moderate complexity MDM); discuss diagnosis and treatment options with the patient and/or family; communicate with other health care professionals as necessary; write and/or review orders, complete medical record documentation; address interval data obtained and reported changes in condition; communicate results and additional care plans to other health care professionals and to the patient and/or family.

The RUC noted that the parastomal abdominal hernia occurs proximal to a pre-existing stoma and colostomy and requires the maintenance of an abdominal defect to maintain the colostomy and that these factors make it a more complex service than a typical reducible abdominal hernia repair. The incarcerated/strangulated piece of bowel necessarily requires more work for 49X14 than that associated with repair of a reducible parastomal hernia for 49X13.

To support a work RVU of 18.00, the RUC compared CPT code 49X14 to top key reference service CPT code 21813 Open treatment of rib fracture(s) with internal fixation, includes thoracoscopic visualization when performed, unilateral; 7 or more ribs (work RVU = 17.61, 210 minutes of intra-service and 310 minutes of total time) and noted that of the survey respondents who chose 21813 as the key reference service, CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.
100% indicated that the surveyed code was more intense and complex on all measures. Therefore, although the surveyed code requires slightly less intra-service time than CPT code 21813, it is appropriate that it is valued slightly higher since it is more intense and complex. The RUC compared 49X14 to the second key reference service CPT code 33891 *Bypass graft, with other than vein, transcervical retropharyngeal carotid-carotid, performed in conjunction with endovascular repair of descending thoracic aorta, by neck incision* (work RVU = 20.00, 173 minutes of intra-service and 323 minutes of total time) and noted that 49X14 requires less physician work and time, thus is valued appropriately slightly lower than 33891. The RUC noted that 49X14 is valued appropriately higher than 49X13 given the piece of incarcerated/strangulated bowel associated with 49X14. **The RUC recommends a work RVU of 18.00 for CPT code 49X14.**

**Removal of Mesh or Other Prosthesis**

*49X15 Removal of total or near-total non-infected mesh or other prosthesis at the time of initial or recurrent anterior abdominal hernia repair or parastomal hernia repair, any approach (ie, open, laparoscopic, robotic) (List separately in addition to code for primary procedure)*

The RUC discussed the subject of mesh implantation and removal at length. The specialties indicated that when add-on CPT code 49568 was created in 1993, mesh implantation with hernia repairs was not typical. This is supported by the typical patient described in 1993 as having a 10 cm midline incisional hernia – a very large hernia. With research on the causes of hernia recurrence, changes in technology and development of new types of mesh or other prosthesis, implantation of mesh is now typical for all types of hernias and all sizes to reduce the incidence of recurrence. This was supported by the literature submitted with the February 2021 CCA. However, the specialties also informed the RUC that mesh removal is not always required and is not typical. Technology and research have developed types of mesh that are now being implanted which are incorporated into the abdominal wall, reducing the risk of infection, complications, and recurrence. When mesh removal is indicated, it is typically due to hardening and fracturing of aged mesh, or when gross contamination and infection has occurred (eg, enterocutaneous fistula involving the mesh). For example, a recurrent hernia repair may require removal of fractured, brittle (old technology) mesh many years after an open repair following a colectomy. This work is typically significant, in that the mesh is often integrated with the abdominal wall or adhered to intestine, and involves removal of all of the mesh, not just a small portion. An add-on code to report mesh removal prior to hernia repair, when required, allows for accurate reporting of this work only when performed. The RUC was concerned that the code descriptor may be reported no matter how much mesh is removed, including minimal trimming. The specialty societies explained that the purpose of CPT code 49X15 is not to report mesh trimming or adjustment but the total or near total removal of mesh. The specialty society noted that this code should be rarely used as the total or near total removal of mesh is extremely invasive and damaging. **The specialty societies recommended - and the RUC agreed - to refer this issue to the CPT Panel to editorially revise the CPT guidelines for the Anterior Abdominal Hernia Repair subsection to specify “total or near total” mesh removal and revise the code descriptor for CPT code 49X15 to specify “total or near total non-infected” mesh removal.**

The RUC reviewed the survey results from 150 surgeons for CPT code 49X15 and determined that the survey median and 25th percentile work RVU of 5.00 appropriately accounts for the work required to perform this service. The RUC recommends 45 minutes of intra-service and total time.

To support a work RVU of 5.00, the RUC compared CPT code 49X15 to the top key reference service 11008 *Removal of prosthetic material or mesh, abdominal wall for infection (eg, for chronic or recurrent mesh infection or necrotizing soft tissue infection)* (work RVU = 5.00, 60 minutes of intra-service and total time), the second key reference service CPT code 35572 *Harvest of femoropopliteal vein, 1 segment, for vascular reconstruction procedure (eg, aortic, vena caval, coronary, peripheral artery)* (work RVU = 6.81, 60 minutes of intra-service and total time) and CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.
noted that the survey respondents indicated the intensity and complexity of CPT code 49X15 was greater than both CPT code 11008 and CPT code 35572. Both of the reference codes are performed via an open approach with direct visualization, while 49X15 will typically be performed via a laparoscopic or robotic approach internally. The RUC also compared CPT code 49X15 to MPC code 34812 *Open femoral artery exposure for delivery of endovascular prosthesis, by groin incision, unilateral* (work RVU = 4.13, 40 minutes of intra-service and total time) and noted that a recommended work RVU of 5.00 is appropriately higher than that of 34812 given the higher intra-service time and relative work.

As additional support, the RUC considered CPT code 57267, *Insertion of mesh or other prosthesis for repair of pelvic floor defect, each site (anterior, posterior compartment), vaginal approach (List separately in addition to code for primary procedure)* (work RVU = 4.88, 45 minutes of intra-service and total time) and CPT code 63295, *Osteoplastic reconstruction of dorsal spinal elements, following primary intraspinal procedure (List separately in addition to code for primary procedure)* (work RVU = 5.25, 45 minutes of intra-service time and 55 minutes total time) which bracket the work included in CPT code 49X15. The RUC recommends a work RVU of 5.00 for CPT code 49X15.

**Implantation of Absorbable Mesh or Other Prosthesis for Delayed Closure**

157X1 *Implantation of absorbable mesh or other prosthesis for delayed closure of defect(s) (ie, external genitalia, perineum, abdominal wall) due to soft tissue infection or trauma*

The RUC reviewed the survey results from 36 surgeons for CPT code 157X1 and determined that the survey 25th percentile work RVU of 8.00 appropriately accounts for the work required to perform this service. The RUC recommends 40 minutes of pre-service evaluation time, 3 minutes of pre-service positioning time, 15 minutes of pre-service scrub/dress/wait time, 90 minutes of intra-service time, 25 minutes of immediate post-service time, 1-99232 post-operative observation visit, and 213 minutes of total time. The scrub/dress/wait time was reduced from Pre-time Package 4 so as to not exceed survey median data.

The RUC agreed with the specialties that the typical patient requiring this procedure will have a large abdominal wall defect as a result of necrotizing infection and extensive debridement of all involved skin, subcutaneous tissue, fascia and muscle. For some patients, the external genitalia and perineum may also be involved. These patients will all have inpatient status and will require a visit later on the same date at the level of 99232 to monitor the sutured wound edges of skin/mesh for swelling and pulling and to monitor for pain control. Intake/output and vital signs are evaluated, including fluid and electrolyte status and renal function. Orders for prophylaxis for DVT and beta-blockers are reviewed and adjusted as needed. The surgeon will communicate with other health care professionals and with patient and/or family; review medical records and data available on the unit; perform a medically appropriate examination; consider relevant data, options, and risks; formulate and/or revise treatment plan(s) (moderate complexity MDM); and complete medical record documentation.

The RUC reviewed the top survey key reference services and agreed they were poor comparators because the intra-times and total times were much lower. To support a work RVU of 8.00, the RUC compared CPT code 157X1 to MPC code 52353 *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy (ureteral catheterization is included)* (work RVU = 7.50, 60 minutes of intra-service and 133 minutes of total time) and agreed that 157X1 was appropriately bracketed by these two codes using magnitude estimation. The RUC recommends a work RVU of 8.00 for CPT code 157X1.
RUC Referral to CPT
The RUC recommends CPT code 49X15 be referred to CPT to editorially revise the guidelines to specify “total or near total non-infected” mesh removal and revise the descriptor for CPT code 49X15 to specify “total or near total non-infected” mesh removal. The CPT Editorial Panel incorporated these changes at their May 2021 meeting.

Work Neutrality
The RUC’s recommendation for this code family will result in an overall work savings that should be redistributed back to the Medicare conversion factor. The specialty society survey was conducted for all the base codes as 000-day global. This contrasts with the former code structure for this family where all the hernia repair codes had a 090-day global period, and as a result, post-operative visits after the date of the procedure will now be separately reported, when performed. When evaluating work neutrality, AMA staff performed several analyses, including an analysis assuming all bundled visits other than discharge services would continue to be separately reported, to determine whether the RUC recommendation was work neutral. Under all scenarios, including assumptions that all E/M visits will be separately reported using the current CMS values, the RUC recommendation for this code family would be work neutral.

Practice Expense
The Practice Expense (PE) Subcommittee agreed with the special society submitted standard 090-day global period clinical staff inputs as the conversion of this code family from 090-day to 000-day global period does not impact the fact that these are major surgical procedures. The PE Subcommittee removed medical supply item SA054 Post-Operative Incision Care Suture Pack from the submitted practice expense inputs because SA054 must be allocable to the service period; this would not be possible as this code family consists of 000-day global codes and one ZZZ code. The PE Subcommittee recommended that the specialties address post-operative work and practice expense needs such as suture removal through the CPT process. The RUC recommends the direct practice expense inputs as modified by the Practice Expense Subcommittee.

(For repair of anorectal fistula with plug [eg, porcine small intestine submucosa {SIS}], use 46707)

(For implantation of mesh or other prosthesis for anterior abdominal hernia repair or parastomal hernia repair, see 49X01-49X14)

(For insertion of mesh or other prosthesis for repair of pelvic floor defect, use 57267)

(For implantation of non-biologic or synthetic implant for fascial reinforcement of the abdominal wall, use 0437T)

Other Procedures

+15847  Excision, excessive skin and subcutaneous tissue (includes lipectomy), abdomen (eg, abdominoplasty) (includes umbilical transposition and fascial plication) (List separately in addition to code for primary procedure)

(Use 15847 in conjunction with 15830)

(For abdominal wall inguinal hernia repair, see 49491-4952549587)

(For anterior abdominal hernia(s) repair, see 49X01-49X12)

(To report other abdominoplasty, use 17999)

Digestive System
Abdomen, Peritoneum, and Omentum Repair
Hernioplasty, Herniorrhaphy, Herniotomy

The hernia repair codes in this section are categorized primarily by the type of hernia (inguinal, femoral, lumbar, omphalocele, anterior abdominal, parastomal/incisional, etc).

Some types of hernias are further categorized as “initial” or “recurrent” based on whether or not the hernia has required previous repair(s).

Additional variables accounted for by some of the codes include patient age and clinical presentation (reducible vs. incarcerated or strangulated).

With the exception of the incisional hernia repairs (see 49560-49566) the use of mesh or other prostheses is not separately reported.

The excision/repair of strangulated organs or structures such as testicle(s), intestine, ovaries are reported by using the appropriate code for the excision/repair (eg, 44120, 54520, and 58940) in addition to the appropriate code for the repair of the strangulated hernia.

(For reduction and repair of intra-abdominal hernia, use 44050)
CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

(For debridement of abdominal wall, see 11042, 11043)

(Codes 49491-49651 are unilateral procedures. For bilateral procedure, report 49491-49566, 49570-49651 with modifier 50. Report add-on code 49568 twice, when performed bilaterally. Do not report modifier 50 in conjunction with 49568)

(49491-49557, 49600, 49605, 49606, 49610, 49611, 49650, 49651 are unilateral procedures. For bilateral procedure, use modifier 50)

(Do not report modifier 50 in conjunction with 49X01-49X14)

49491  Repair, initial inguinal hernia, preterm infant (younger than 37 weeks gestation at birth), performed from birth up to 50 weeks postconception age, with or without hydrocelectomy; reducible

49492  incarcerated or strangulated

(Do not report modifier 63 in conjunction with 49491, 49492)

(For inguinal hernia repair, with simple orchiectomy, see 49505 or 49507 and 54520)

(For inguinal hernia repair, with excision of hydrocele or spermatocele, see 49505 or 49507 and 54840 or 55040)

49495  Repair, initial inguinal hernia, full term infant younger than age 6 months, or preterm infant older than 50 weeks postconception age and younger than age 6 months at the time of surgery, with or without hydrocelectomy; reducible

49496  incarcerated or strangulated

(Do not report modifier 63 in conjunction with 49495, 49496)

(For inguinal hernia repair, with simple orchiectomy, see 49505 or 49507 and 54520)

(For inguinal hernia repair, with excision of hydrocele or spermatocele, see 49505 or 49507 and 54840 or 55040)

49500  Repair initial inguinal hernia, age 6 months to younger than 5 years, with or without hydrocelectomy; reducible

49501  incarcerated or strangulated

49505  Repair initial inguinal hernia, age 5 years or older; reducible

49507  incarcerated or strangulated

(For inguinal hernia repair, with simple orchiectomy, see 49505 or 49507 and 54520)

(For inguinal hernia repair, with excision of hydrocele or spermatocele, see 49505 or 49507 and 54840 or 55040)

49520  Repair recurrent inguinal hernia, any age; reducible

</tbody>
</table>

Codes 49X01-49X12 describe repair of an anterior abdominal hernia(s) (ie, epigastric, incisional, ventral, umbilical, spigelian) by any approach (ie, open, laparoscopic, robotic). Codes 49X01-49X12 are reported only once, based on the total defect size for one or more anterior abdominal hernia(s), measured as the maximal craniocaudal or transverse distance between the outer margins of all defects repaired. For example, "Swiss cheese" defects (ie, multiple separate defects) would be measured from the superior most aspect of the upper defect to the inferior most aspect of the lowest defect. In addition, the hernia defect size should be measured prior to opening the hernia defect(s) (ie, during repair the fascia will typically retract creating a falsely elevated measurement).

When both reducible and incarcerated/strangulated anterior abdominal hernias are repaired at the same operative session, all hernias are reported as incarcerated/strangulated. For example, one 2 cm reducible initial incisional hernia and one 4 cm incarcerated initial incisional hernias separated by 2 cm would be reported as an initial incarcerated hernia repair with a maximum craniocaudal distance of 8 cm (49X04).

Inguinal, femoral, lumbar, omphalocele and/or parastomal hernia repair may be separately reported when performed at the same operative session as anterior abdominal hernia repair by appending modifier 59 as appropriate.

Codes 49X13, 49X14 describe repair of a parastomal hernia (initial or recurrent) by any approach (ie, open, laparoscopic, robotic). Code 49X13 is reported for repair of a reducible parastomal hernia and code 49X14 is reported for an incarcerated or strangulated parastomal hernia.

Implantation of mesh or other prosthesis, when performed, is included in 49X01-49X14 and may not be separately reported. For total or near-total removal of non-infected mesh when performed, use 49X15 in conjunction with 49X01-49X14. For removal of infected mesh, see 11004, 11005, 11006, 11008.

**Measuring Total Length of Anterior Abdominal Hernia Defect(s)**

Hernia measurements are performed either in the transverse or craniocaudal dimension. The total length of the defect(s) corresponds to the maximum width or height of an oval drawn to encircle the outer perimeter of all repaired defects. If the defects are not contiguous and are separated by greater than or equal to 10 cm of intact fascia, total defect size is the sum of each defect measured individually.
Codes 49X01-49X12 are reported only once, based on the total defect size for one or more anterior abdominal hernia(s), measured as the maximal craniocaudal or transverse distance between the outer margins of all defects repaired.

(For implantation of mesh or other prosthesis for open incisional or ventral hernia repair, use 49568 in conjunction with 49560, 49561, 49565, 49566)

(For insertion of mesh or other prosthesis for closure of a necrotizing soft tissue infection wound, use 49568 in conjunction with 11004, 11005, 11006)

(For implantation of mesh or other prosthesis for anterior abdominal hernia[s] repair or parastomal hernia repair, see 49X01-49X14)

(For implantation of absorbable mesh or other prosthesis for delayed closure of defect[s] [ie, external genitalia, perineum, abdominal wall] due to soft tissue infection or trauma, use 157X1)
CPT Code: 49X01

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 49X01 Tracking Number C2
Global Period: 000 Current Work RVU:

Original Specialty Recommended RVU: **6.27**
Presented Recommended RVU: **6.27**
RUC Recommended RVU: **6.27**

CPT Descriptor: Repair of anterior abdominal hernia(s) (ie, epigastric, incisional, ventral, umbilical, spigelian), any approach (ie, open, laparoscopic, robotic), initial including placement of mesh or other prosthesis, when performed total length of defect(s); less than 3 cm, reducible

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 55-year-old male presents with a painful mass through the umbilicus that disappears in supine position. He undergoes hernia repair of a defect that is less than 3 cm with placement of mesh.

Percentage of Survey Respondents who found Vignette to be Typical: 90%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 72%, In the ASC 28%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 82%, Overnight stay-less than 24 hours 18%, Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 80%

Description of Pre-Service Work: Results of preadmission testing (imaging, electrocardiogram and labs) are reviewed. Appropriate selection, timing, and administration of DVT prophylaxis are ensured. Appropriate selection, timing, and administration of antibiotics are ensured. The need for beta-blockers is assessed, and they are ordered as required. The patient is reexamined to confirm that physical findings have not changed, the patient’s medication regimen has remained the same, the patient has no new allergies, and the patient has not undergone any recent procedures. The history and physical examination are then updated in the electronic health record. The planned procedure and postoperative management are reviewed with the patient and family. Informed consent is reviewed and obtained from the patient, including witness confirmation. The palpable edge of the hernia defect(s) and sites of the proposed skin incisions are marked with cooperation of patient. The length and type of anesthesia, including adjuncts to postoperative analgesia management, are reviewed with the anesthesiologist. Verify that all required instruments and supplies are available, including mesh. Assistance is provided in transfer of the patient from gurney to operating table. Assist anesthesia team with line placement and induction of anesthesia and intubation. The areas of skin to be prepared and draped are indicated by the surgeon to ensure that all of the potential operative field is included in the preparation. The surgeon scrubs and gowns. A surgical time-out is performed with operating surgical team.

Description of Intra-Service Work: An infraumbilical incision is made. Dissection of the subcutaneous tissues surrounding the hernia sac is performed. The overlying umbilical dermis is detached from the hernia sac. The fascia is circumferentially dissected surrounding the periphery of the hernia sac. The hernia sac is opened and adhesions to the hernia sac are divided. The hernia sac is excised. The hernia defect is measured at less than 3 cm in diameter. A mesh is selected to provide adequate overlap of the hernia defect. The mesh is inserted preperitoneal or intraperitoneal and sutured to the abdominal wall. The hernia defect is closed with interrupted sutures over the top the mesh. Redundant umbilical skin is excised. The umbilical dermis is sutured to the abdominal fascia. Layered closure is performed.

Description of Post-Service Work: Apply sterile dressings. Monitor patient during reversal of anesthesia. Assist in transfer of patient from operating table to gurney. Monitor transport of patient from operating room to recovery room. Discuss postoperative recovery care with anesthesia and nursing staff. Discontinue prophylactic antibiotic therapy, as appropriate. Discuss procedure and outcome with family in waiting area. Write brief operative note or complete final operative note and...
place in chart. Write postoperative note in the recovery room. When safe to discharge patient to home, conduct final exam. Auscultate heart, lungs, and abdomen for bowel sounds. Assess for problems such as ileus, intestinal ischemia, and urinary retention. Assess pain status, write orders for follow-up visits, post-discharge laboratory tests, imaging, home care, and physical therapy. Order medications needed post-discharge. Discuss home restrictions and activity levels (ie, diet, bathing) with patient/family. Complete all appropriate medical records, including day of discharge progress notes, discharge summary, discharge instructions, and insurance forms.

### Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC’s rationale, please review the separate RUC recommendation document.
Background

RAW Screen
Code 49565, Repair recurrent incisional or ventral hernia; reducible, was identified by the RUC/RAW with a site of service anomaly: less than 50% inpatient status; includes inpatient visit codes; greater than 5,000 utilization. Prior to submitting an Action Plan to the RAW, the societies reviewed the site of service data and found: almost even split of 48% between inpatient and outpatient – with a few percent in the ASC. At the January 2020 RUC meeting, the societies requested referral of code 49565 to CPT to update the descriptor to current standard of practice and typical patient presentation.

CPT Coding Changes
At the February 2021 CPT meeting the following changes were approved:

- Delete all the current open and laparoscopic codes for repair of anterior abdominal hernias.
- Delete add-on code 49568 for mesh for open ventral/incisional hernias and large defects as a result of necrotizing soft tissue infection.
- Add 12 new codes for anterior abdominal hernia repair by any approach (ie, open laparoscopic, robotic); by initial or recurrent; by total defect size; and by reducible or incarcerated/strangulated
- Add 2 codes for parastomal hernia repair - by reducible or incarcerated/strangulated
- Add 1 add-on code for removal of mesh/prosthesis – only with the new hernia repair codes
- Add 1 new code for mesh/prosthesis for delayed closure of external genitalia, perineum and/or abdominal wall defect(s) due to soft tissue infection or trauma.

Coding Structure
Hernia repair for epigastric, incisional, ventral, umbilical, spigelian were merged as they all appear on the anterior abdomen. The location--upper, lower, midline—does not impact the work. But instead, the size and number of defects is the driving factor for work. For example, with respect to the code that was tagged by the RAW, a recurrent, incisional, reducible hernia can be anywhere from a small hernia at a port site from a prior laparoscopic procedure to an extremely large hernia with multiple defects clustered in a midline incision.

Initial versus recurrent differentiation was maintained. Recurrent hernias are re-reoperations. An initial hernia can be the result of a prior procedure (this is not a recurrent hernia) or weak muscles and fascia. A recurrent hernia is typically at least the third time the same site is being operated on.

For example,

- operation 1 might be an open colectomy
- operation 2 would be an initial midline hernia repair
- operation 3 would be a recurrent midline hernia involving the initial midline repair and may include other multiple hernias occurring in the same old incision, all needing to be repaired.

There are many examples in CPT that differentiate between a primary and secondary procedure: disarticulation of shoulder (23920-23921); amputation of arm through humerus (24900-24930) and other similar amputation families; tendon repair (eg, 25260-25274); CABG reoperation (33530); and revision total joint (eg, 23473, 23474, 24370, 24371, 27134-27138).

The hernia size ranges were based on a review of literature and expert panel. For example, an article published in the Journal of the American College of Surgeons reviewed technique and outcomes of abdominal incisional hernia repair and showed that the range of defect size was from less than 1 cm to more than 25 cm with a mean of 6 cm and a median of less than 3 cm. Other similar articles were submitted with the code change application, supporting different work for different defect size. David A. Iannitti, et.al, Technique and Outcomes of Abdominal Incisional Hernia Repair Using a Synthetic Composite Mesh: A Report of 455 Cases, Journal of the American College of Surgeons, Volume 206, Issue 1, 2008, Pages 83-88, ISSN 1072-7515, https://doi.org/10.1016/j.jamcollsurg.2007.07.030.

Differentiating the work of a procedure in relationship to size or extent is not new for CPT. For example, 36 skin repair codes by length of repair; 44 lesion excision codes by excised diameter; 46 soft tissue tumor excision codes by size of tumor; 23 hysterectomy codes by size of uterus (58260-58573); 3 myomectomy codes are differentiated by total weight of the myomas (58140-58146); and 10 nerve graft codes are based on length of graft. (64885-64898)
The CPT guidelines and illustrations that describe how to measure the total defect size are well understood by surgeons. This is not a new concept – surgeons are very familiar with measuring a hernia defect, and in fact the size of the hernia defect was included in some of the patient vignettes in 1993. Furthermore, measurement of hernia size is a necessary step for selecting and preparing the appropriately sized mesh for implantation.

Hernia repair coding has been complicated by changes in (1) technology and technique and (2) the recent implementation of ICD-10-PCS codes. For these reasons, the stakeholder societies believed this set of codes should describe "any approach." The societies and the AMA Coding Network have received numerous coding questions about correct reporting for "hybrid" abdominal hernia repair procedures where parts of the procedure are performed via an open approach and parts of the procedure are performed via laparoscopy or with the use of a robot. These are not laparoscopic procedures converted to open procedures, but instead procedures that are more often begun open and then finished as laparoscopic/robotic under pneumoperitoneum.

Another issue that has recently caused confusion about coding has appeared on national coder websites and coder discussion boards referring to International Classification of Diseases Tenth Revision Procedure Coding System (ICD-10-PCS) codes which classifies procedures performed in the facility (ie, not CPT physician procedures). This, however, is important because facilities want the procedure codes reported to correspond with the descriptors of ICD-10-PCS codes that the facility is reporting. Unfortunately, the new ICD-10-PCS codes define various surgical approaches that do not correspond to CPT coding (open, closed, percutaneous, and laparoscopic). For example, the ICD-10-PCS "open endoscopic" approach is defined as "cutting through the skin or mucous membrane and any other body layers necessary to expose the site of the procedure, and entry, by puncture or minor incision, of instrumentation through the skin or mucous membrane and any other body layers necessary to aid in the performance of the procedure." These new ICD-10-PCS codes have resulted in coders stating that a procedure should be reported as open because the ICD-10-PCS code indicates open and to report any procedure that includes extension of a port incision (eg, for delivery of a specimen) to be reported as an open procedure – instead of being correctly reported as laparoscopic/robotic under pneumoperitoneum.

Mesh

- **Implantation of mesh is now typical and therefore was bundled into the new codes.** When code 49568 was created in 1993, mesh implantation with hernia repairs was not typical. This is supported by the typical patient described in 1993 as having a 10 cm midline incisional hernia – a very large hernia. With research on the causes of hernia recurrence, changes in technology and development of new types of mesh or other prosthesis, implantation of mesh is now typical for all types of hernias and all sizes to reduce the incidence of recurrence. This was supported by the literature submitted with the CCA.

- **Mesh removal is not always required and is not typical.** Technology and research have developed types of mesh that are now being implanted which are incorporated into the abdominal wall, reducing the risk of infection, complications, and recurrence. When mesh removal is indicated, it is typically due to hardening and fracturing of aged mesh, or when gross contamination and infection has occurred (eg, enterocutaneous fistula involving the mesh). For example, a recurrent hernia repair may require removal of fractured, brittle (old technology) mesh many years after an open repair following a colectomy. This work is typically significant, in that the mesh is often integrated with the abdominal wall or adhered to intestine, and involves removal of all of the mesh, not just a small portion. An add-on code to report mesh removal prior to hernia repair, when required, allows for accurate reporting of this work only when performed, which our expert panel believes is not typical of most hernia repairs.

- **Deletion of code 49658 resulted in rare "left over" work for implantation of mesh related to closure for a large open wound after debridement for necrotizing fasciitis.** Add-on code 46958 was reported for mesh placement for both open hernia repair and in relation to closure of wounds from necrotizing soft tissue infection. This code will be deleted and the work of mesh placement will be included in the work for all of the anterior abdominal hernia repair codes. The remaining use of code 46958 was for mesh placement for delayed closure of external genitalia, perineum and/or abdominal wall defect(s) due to soft tissue infection or trauma. As described in the vignette for 157X1, necrotizing soft tissue infections typically result in a large open wound that cannot be closed primarily. When the infection has resolved, absorbable mesh or other prosthesis is placed to allow healing by secondary intent until such time that a skin graft or skin closure can be accomplished. The literature submitted with the CCA supports this work.
Compelling Evidence - Flawed methodology of previous reviews, New technology

**Flawed Methodology:** Codes 49560, 49561, 49565, 49566, 49570, 49572, 49580, 49582, 49585, and 49590 were last reviewed in 2000 during the 2nd 5-year-review. During this review, the American College of Surgeons argued that there was compression of work values for big procedures and there were rank order issues within families of codes. We developed a methodology using NSQIP data that was approved by the Research Subcommittee. However, to validate the methodology, the 5YR Workgroup instructed the ACS to group the codes into families and survey one or two CPT codes as full surveys per family to act as anchors for each family and the rest of the codes to be surveyed as mini-surveys for only time and visits. After conducting all of the surveys, we believe we were able to validate the methodology that we proposed, however, the 5YR Workgroup did not agree. Instead, they decided that the value that they assigned to the anchor code (the full survey) would be extrapolated to all of the other codes grouped into the same survey. The hernia codes listed above were grouped with 49505 which was increased by 17% based on the survey data and compelling evidence. The 17% increase was applied to the other codes in the group without consideration of rank order, mini survey results or society recommendations. This resulted in continuation of compression and rank order issues. For example, although code 49572 was increased by 17%, the IWPUT for the code is negative. Other codes have near zero IWPUT. **We believe this was a flawed methodology of review of the codes and meets compelling evidence.**

**Flawed Methodology:** Codes 49587, 49652, 49653, 49654, and 49655 were last reviewed in 2011 based on a site of service anomaly screen. At that time, the RUC approved including a same day observation visit and full observation discharge on the subsequent day. The RUC noted that the typical patient requires close monitoring for problems such as ileus, intestinal ischemia and urinary retention. Additionally, there will be significant pain post-operatively requiring management before discharge. The specialty noted, and the RUC agreed, that the shift in patient facility status (in patient moving to outpatient—as determined by CMS) has little to do with healthier patients that require less physician work and everything to do with the recent OPPS changes related to facility reimbursement. This was substantiated by the survey data which showed that the typical patients stayed at least overnight and received a postoperative same-day E/M service. Given this data, the RUC enacted its (then current) policy to allocate the appropriate proxy for the postoperative visits which was categorized as either subsequent observation and/or observation discharge—both of which are outpatient codes. Importantly, the specialties argued and the RUC agreed that the work of providers who care for medical patients should not be discounted (eg, full observation E/M and full observation discharge E/M allowed for patient staying overnight for observation.)

CMS ignored the valid outpatient E/M visit code inputs that the RUC recommended and instead stated in the Rule that they have a policy of not allowing "inpatient" visits included in the details for outpatient services. These codes went through a Refinement Panel process [ie, a CMS convened group of Medical Officers and select physicians acting as a separate formal appeals process] that resulted in agreement with the RUC recommendations. Importantly, the Agency still maintained that inpatient visits would not be allowed (even though outpatient/observation visits were submitted by the RUC) and then used a reverse building block methodology to subtract work RVUs from the values. These values had been developed by magnitude estimation and approved by the RUC. The Agency deleted the observation visit code inputs and decreased discharge management by 50 percent even though it was performed on a subsequent date. **We believe this action by CMS resulted in a flawed methodology of review of these codes and meets compelling evidence.**

The rejection of equal value for equal work and rejection of the Refinement Panel results prompted the Executive Director of the American College of Surgeons to send a letter (see last page of SoR) to Kathleen Sebelius, then Secretary of the Department of Health and Human Services on November 29, 2011. This letter addressed the decision-making process for valuing procedure codes that have Medicare outpatient status, the use of refinement panels, and the arbitrary discount in physician work for the same work performed by any provider of a non-global service. Specifically, the letter included the following statement:

"CMS has now implemented a policy by which it is creating differential payments for the same work performed by different physicians as a backdoor mechanism for reducing the work RVUs for surgical procedures. They have valued the worth of a surgeon for post-operative evaluation and management work at about 30 percent of a non-surgeon. Non-surgeons are allowed to provide the same work to the same patient at 100 percent reimbursement...we believe that this policy leads to a loss of validity and integrity of the current system."

We continue to believe there is no valid justification for a 50% discount to discharge management services provided by a surgeon that is performed the day after a procedure when a non-surgical provider observing a medical patient who is kept overnight for any reason is allowed to bill a discharge management service at 100 percent for work on the next day.
We also believe there is no valid justification for discounting a postoperative visit later the same day of surgery to equal only the intra-service time of the visit multiplied by an intensity of 0.0224. No surgeon would round on a postoperative patient the same day and not review interval chart notes prior to the face-to-face with the patient and not followup with charting the visit and confirming or modifying the current orders.

CMS implemented a 23-hour policy for discounting surgical postoperative work based on the argument that the Agency could not include inpatient work in their time/work file. However, the fact is that the Agency has also erroneously rejected RUC recommendations for outpatient / observation codes, stating "these inpatient codes" could not be included for procedure that are typically outpatient.

**Change in Technology:** Since the last review of the hernia repair codes (either in 2000 or in 2011), there has been introduction and application of new technology (ie, robotic assist) which adds work complexity and time with the goal of better patient outcomes. The diffusion of this new technology throughout this family of codes further meets compelling evidence.

**Recommendation – 49X01**
We recommend a work RVU of 6.27, which is the survey 25th percentile. The typical patient will be discharged on the same day of the procedure.

**Pre-service time**
Package time has been reduced so as to not exceed survey median data.

**Post-service time**
Package time has been reduced so as to not exceed survey median data.

**Key Reference Code Intensity/Complexity Comparison**
Ref 1: The respondents indicated the intensity/complexity of survey code 49X01 is somewhat less or similar than reference code 31600. Ref2: The respondents indicated the intensity/complexity of survey code 49X01 is similar to somewhat more than reference code 43210.

Comparison of using the recommended RVW versus using the 25th percentile.

The first chart below shows reasonable correlation between the recommended RVW and WPUT—both trend lines have a similar slope. The second chart below shows no relationship of WPUT to the 25th percentile RVW—where WPUT decreases as work increases.
What if surgeon evaluation and management work were set equal to discrete E/M services?

As has been discussed by the RUC in the past, work intensities used for computation of IWPUT for time spent by physicians in the pre-service and immediate post-service period for surgical procedures have remained fixed since the early 1990s, while intensity of time for E/M values has received several increased values over several decades.

Recent increases for outpatient office E/M values were not allowed to be added to global codes by CMS. Because IWPUT is calculated by subtracting the pre- and post-work values from the RVW of a given CPT code, this has resulted in less value subtracted than would have occurred if the more appropriate pre- and post-work values were used for the IWPUT formula. This artificially increases the IWPUT and WPUT resulting in a decrease in relativity. This is especially true for codes that have a significant amount of pre-service and post-service work.

It has become difficult to compare IWPUT (and WPUT) for codes with different global periods because of the level of discounting of pre-service and post-service work. For example, for the top 34 high volume 10 and 90 day global codes, AMA staff recently calculated the difference in IWPUT if the office visit increases were used in the IWPUT equation. The AMA table, which is included in the Research Subcommittee agenda for this meeting, showed that the IWPUT would have decreased from -6% to -548% depending on the number of office visits included in the work/time file. To emphasize the importance of this information, the code which would have had the largest decrease (17000) has 3 minutes of intra-time and only one postop office visit (99212). In this table, it was also clear that relativity within a family of codes is lost, because each code within a family may have varying levels of post-service work. To summarize, IWPUT has become much less accurate when used as a comparator of intra-service work within and between families because of CMS actions (ie, not updating global RVW) and policy (ie, discounting postoperative work).

Using the discussion above, we have created the table below that presents the IWPUT and WPUT for the hernia set of codes using (1) the 2021 formulas, and (2) "full value" formulas. The note below the table describes each formula, but basically the full value formula sets pre- and post-service work equal to the same E/M work for non-surgical services. For comparison to facility non-surgical services, we have included codes 99283-99285 using the 2021 published RVW
and time data. This table shows that most of the recommendations for 49X01-49X14 result in a WPUT that is less than an ED visit requiring moderate MDM (99284). This table also shows that those codes with similar WPUT to high MDM are appropriately the bigger and more complex procedures. Last, this table provides evidence that discounting pre- and post-work distorts and artificially impacts fair IWPUT and WPUT relativity comparison. However, if undiscounted work is applied, the recommendations for this set of codes are appropriately ranked.

* 2021 Formula: IWPUT calculation based on evaluation, positioning, immediate post intensity of 0.0224; scrub/dress/wait intensity of 0.0081; and discounted same-day outpatient postop visit (not shown in table) equal to intra-service time at 0.0224. WPUT calculation equal to total time (including discounted postop visit time not shown on table) divided by work.

**2021 Full Value Formula: IWPUT calculation based on pre-service and immediate post-service time intensity of 0.043 (equal to WPUT for 99213) and same-day post EM at full value instead of discounted time for outpatient procedure as shown on table (highlighted in red).

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - [ ] The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - [ ] Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - [ ] Multiple codes allow flexibility to describe exactly what components the procedure included.
   - [ ] Multiple codes are used to maintain consistency with similar codes.
   - [ ] Historical precedents.
   - [ ] Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.
FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed)

- 49560 Repair initial incisional or ventral hernia; reducible 090
- 49570 Repair epigastric hernia (eg, preperitoneal fat); reducible (separate procedure) 090
- 49585 Repair umbilical hernia, age 5 years or older; reducible 090
- 49590 Repair spigelian hernia 090
- 49652 Laparoscopy, surgical, repair, ventral, umbilical, spigelian or epigastric hernia (includes mesh insertion, when performed); reducible 090
- 49654 Laparoscopy, surgical, repair, incisional hernia (includes mesh insertion, when performed); reducible 090
- 49568 Implantation of mesh or other prosthesis for open incisional or ventral hernia repair or mesh for closure of debridement for necrotizing soft tissue infection (List separately in addition to code for the incisional or ventral hernia repair) ZZZ

Re: CY 2012 Medicare Physician Fee Schedule Final Rule and CMS Refinement Panels

Dear Secretary Sebelius:

On November 28, 2011, the Federal Register published the Centers for Medicare and Medicaid Services’ (CMS) Calendar Year (CY) 2012 Medicare Physician Fee Schedule Final Rule. On behalf of the American College of Surgeons (ACS), I am writing to express concern regarding the decision making process and lack of transparency on the part of CMS related to the work relative value units (wRVUs) for 2012 reviewed under CMS’ refinement panel process. The ACS, with over 78,000 members, is a scientific and educational organization of surgeons that was founded in 1913 to raise the standards of surgical practice and to improve the care of the surgical patient.

The ACS has participated in the efforts of the American Medical Association’s Relative Value Scale Update Committee (AMA RUC) for years given the value we place on the AMA RUC process and our assumption that CMS will evaluate the RUC recommendations with fairness, transparency, and accuracy according to a process that has been set out via the Federal rulemaking process. As part of the work that led to the CY 2012 Medicare Physician Fee Schedule Final Rule, the ACS devoted significant resources to conducting AMA RUC surveys for over 100 new or existing codes at the request of CMS. The ACS, with over 78,000 members, is a scientific and educational organization of surgeons that was founded in 1913 to raise the standards of surgical practice and to improve the care of the surgical patient.

Fifty-seven of the aforementioned codes that the ACS surveyed were sent to the refinement panel. CMS accepted only 12 percent of those refinement panel recommendations.

For most of the 88 percent of refinement panel recommendations that CMS rejected, CMS lowered the wRVU by reducing the value of the post-operative evaluation and management work performed by surgeons in the hospital by 69 percent. However, if that same work is performed by any other physician other than the surgeon, that same service is paid at 100 percent. We believe that the refinement panel physicians completely rejected this concept as they agreed to a work RVU that did not discount post-surgical work in this fashion. We note that the multispecialty panel included physicians from primary care, contractor medical directors (CMDs), physicians in related specialties, and general surgeons. At no time did the Agency’s Medical Officer in charge of the panel process disagree with the presenters or offer a contrary opinion to the discussion.
Our concerns were piqued when CMS issued the CY 2011 Medicare Physician Fee Schedule Final Rule in which CMS stated that it could change wRVU recommendations of the refinement panel convened by CMS if “policy concerns warrant their modification,” without providing additional clarification on what would trigger this ability of CMS to subvert the more transparent process of the refinement panel. However, we continued to participate in the process under the belief that CMS would operate fairly and transparently and that if there were indeed “policy concerns” that CMS had regarding the values of the codes under consideration that those concerns would be stated clearly so all parties could address them during the refinement panel reviews.

CMS has now implemented a policy by which it is creating differential payments for the same work performed by different physicians as a backdoor mechanism for reducing the work RVUs for surgical procedures. They have valued the worth of a surgeon for post-operative evaluation and management work at about 30 percent of a non-surgeon. Non-surgeons are allowed to provide the same work to the same patient at 100 percent reimbursement. First, we believe that this policy leads to a loss of validity and integrity of the current system. In addition, this policy is prohibited by the Omnibus Budget Reconciliation Act of 1989, which states, “[t]he Secretary may not vary the conversion factor or the number of relative value units for a physicians’ service based on whether the physician furnishing the service is a specialist or based on the type of specialty of the physician.” (42 U.S.C. §1395w-4(c)(6)).

The ACS has been a vocal proponent of needed reforms in the delivery and payment of health care. We believe that the future of these reforms will be based on driving greater awareness of proven continuous quality improvement programs to achieve ongoing, tangible results for quality improvements. However, in order for these reforms to be effective, they must be built on a system that is consistent with previous Agency decisions, fair, and transparent, and it is our concern that many of the policy decisions made by CMS in the latest Medicare Physician Fee Schedule Final Rule move us away from those goals. The resource based relative value system (RBRVS) requires a resource basis for decisions on the valuation of physician services. We believe that the resource basis for the decision to reduce these values is not evident. We ask that under your authority as Secretary you will seek to have CMS define a more transparent process in the future for decisions that are not aligned with the RUC and refinement panel recommendations in order to help maintain the transparency and fairness of the current system and to restore the values of these services to the level that is supported by the RBRVS process.

Sincerely,
David B. Hoyt, MD, FACS
Executive Director
CPT Code: 49X02

CSM/AMA SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 49X02
Tracking Number C3
Original Specialty Recommended RVU: 9.00
Presented Recommended RVU: 9.00
RUC Recommended RVU: 9.00

CPT Descriptor: Repair of anterior abdominal hernia(s) (ie, epigastric, incisional, ventral, umbilical, spigelian), any approach (ie, open, laparoscopic, robotic), initial including placement of mesh or other prosthesis, when performed total length of defect(s); less than 3 cm, incarcerated or strangulated

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 55-year-old male presents with a history of painful swelling in the umbilical region. Physical exam reveals an umbilical hernia that is tender and nonreducible by manual manipulation. He undergoes hernia repair of a defect that is less than 3 cm with placement of mesh.

Percentage of Survey Respondents who found Vignette to be Typical: 90%

Site of Service (Complete for 010 and 090 Globals Only)
Percent of survey respondents who stated they perform the procedure; In the hospital 92% , In the ASC 8%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 39% , Overnight stay-less than 24 hours 39% , Overnight stay-more than 24 hours 22%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 91%

Description of Pre-Service Work: Results of preadmission testing (imaging, electrocardiogram and labs) are reviewed. Appropriate selection, timing, and administration of DVT prophylaxis are ensured. Appropriate selection, timing, and administration of antibiotics are ensured. The need for beta-blockers is assessed, and they are ordered as required. The patient is reexamined to confirm that physical findings have not changed, the patient’s medication regimen has remained the same, the patient has no new allergies, and the patient has not undergone any recent procedures. The history and physical examination are then updated in the electronic health record. The planned procedure and postoperative management are reviewed with the patient and family. Informed consent is reviewed and obtained from the patient, including witness confirmation. The palpable mass of the hernia contents incarcerated in the subcutaneous tissue is easily identified, and sites of the proposed skin incisions are marked with cooperation of patient. The length and type of anesthesia, including adjuncts to postoperative analgesia management, are reviewed with the anesthesiologist. Verify that all required instruments and supplies are available, including mesh. Assistance is provided in transfer of the patient from gurney to operating table. Assist anesthesia team with line placement and induction of anesthesia and intubation. The areas of skin to be prepared and draped are indicated by the surgeon to ensure that all of the potential operative field is included in the preparation. The surgeon scrubs and gowns. A surgical time-out is performed with operating surgical team.

Description of Intra-Service Work: An infraumbilical skin incision is made. Dissection of the subcutaneous tissues surrounding the hernia sac is performed. The overlying umbilical dermis is detached from the hernia sac. This is exacerbated by the location of the incarcerated hernia contents occupying the central space of the operative field making the dissection more challenging. Separation is performed without damaging the intra-abdominal contents incarcerated in the hernia sac. The hernia sac is opened and the contents are inspected. Adhesiolysis is performed to free omentum and intestines incarcerated within the hernia sac. The reduced hernia contents are inspected for viability. The hernia sac is excised. The hernia defect is measured and found to span less than 3 cm. A mesh with adequate overlap of the abdominal wall is sutured to the abdominal wall circumferentially. The hernia defect is closed over the mesh. Redundant skin is excised as appropriate. The umbilical dermis is sutured to the abdominal fascia.

Description of Post-Service Work:
Immediate postoperative care [operative day through discharge from recovery room]: Apply sterile dressings. Monitor patient during reversal of anesthesia. Assist in transfer of patient from operating table to gurney. Monitor transport of patient from operating room to recovery room. Discuss postoperative recovery care with anesthesia and nursing staff, including need for patient-controlled analgesia. Discontinue prophylactic antibiotic therapy, as appropriate. Review postoperative labs. Discuss procedure and outcome with family in waiting area. Write brief operative note or complete final operative note and place in chart. Write postoperative note in the recovery room. Dictate operative report and copy referring physician(s). Call referring physician(s). Write orders for transferring to observation or general surgical floor and discuss ongoing care with nursing staff.

Later same day hospital observation care visit [operative day after discharge from recovery room]: Review interval nursing/other staff chart notes. Discuss ongoing care with nursing staff. Evaluate vital signs and intake/output. Auscultate heart, lungs, and abdomen for bowel sounds. Monitor fluid and electrolyte status and renal function; monitor for problems such as ileus, intestinal ischemia, and urinary retention. Examine patient, check wounds, and change dressings. Continue prophylaxis for DVT. Assess need for beta-blockers, order as required. Assess pain scores and adequacy of analgesia. Write orders for labs, films, medications, diet, and patient activity. Chart patient progress notes. Answer patient and family questions. Answer nursing/other staff questions. Advance diet, as appropriate.

## Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC’s rationale, please review the separate RUC recommendation document.
**Background**

**RAW Screen**
Code 49565, *Repair recurrent incisional or ventral hernia; reducible*, was identified by the RUC/RAW with a site of service anomaly: less than 50% inpatient status; includes inpatient visit codes; greater than 5,000 utilization. Prior to submitting an Action Plan to the RAW, the societies reviewed the site of service data and found: almost even split of 48% between inpatient and outpatient – with a few percent in the ASC. At the January 2020 RUC meeting, the societies requested referral of code 49565 to CPT to update the descriptor to current standard of practice and typical patient presentation.

**CPT Coding Changes**
At the February 2021 CPT meeting the following changes were approved:
- Delete all the current open and laparoscopic codes for repair of anterior abdominal hernias.
- Delete add-on code 49568 for mesh for open ventral/incisional hernias and large defects as a result of necrotizing soft tissue infection.
- Add 12 new codes for anterior abdominal hernia repair by any approach (ie, open laparoscopic, robotic); by initial or recurrent; by total defect size; and by reducible or incarcerated/strangulated.
- Add 2 codes for parastomal hernia repair - by reducible or incarcerated/strangulated.
- Add 1 add-on code for removal of mesh/prosthesis – only with the new hernia repair codes.
- Add 1 new code for mesh/prosthesis for delayed closure of external genitalia, perineum and/or abdominal wall defect(s) due to soft tissue infection or trauma.

**Coding Structure**
Hernia repair for epigastric, incisional, ventral, umbilical, spigelian were merged as they all appear on the anterior abdomen. The location--upper, lower, midline—does not impact the work. But instead, the size and number of defects is the driving factor for work. For example, with respect to the code that was tagged by the RAW, a recurrent, incisional, reducible hernia can be anywhere from a small hernia at a port site from a prior laparoscopic procedure to an extremely large hernia with multiple defects clustered in a midline incision.

Initial versus recurrent differentiation was maintained. Recurrent hernias are re-reoperations. An initial hernia can be the result of a prior procedure (this is not a recurrent hernia) or weak muscles and fascia. A recurrent hernia is typically at least the third time the same site is being operated on.

For example,
- operation 1 might be an open colectomy
- operation 2 would be an initial midline hernia repair
- operation 3 would be a recurrent midline hernia involving the initial midline repair and may include other multiple hernias occurring in the same old incision, all needing to be repaired.

There are many examples in CPT that differentiate between a primary and secondary procedure: disarticulation of shoulder (23920-23921); amputation of arm through humerus (24900-24930) and other similar amputation families; tendon repair (eg, 25260-25274); CABG reoperation (33530); and revision total joint (eg, 23473, 23474, 24370, 24371, 27134-27138).

The hernia size ranges were based on a review of literature and expert panel. For example, an article published in the Journal of the American College of Surgeons reviewed technique and outcomes of abdominal incisional hernia repair and showed that the range of defect size was from less than 1 cm to more than 25 cm with a mean of 6 cm and a median of less than 3 cm. Other similar articles were submitted with the code change application, supporting different work for different defect size. David A. Iannitti, et.al, *Technique and Outcomes of Abdominal Incisional Hernia Repair Using a Synthetic Composite Mesh: A Report of 455 Cases*, Journal of the American College of Surgeons, Volume 206, Issue 1, 2008, Pages 83-88, ISSN 1072-7515, https://doi.org/10.1016/j.jamcollsurg.2007.07.030.

Differentiating the work of a procedure in relationship to size or extent is not new for CPT. For example, 36 skin repair codes by length of repair; 44 lesion excision codes by excised diameter; 46 soft tissue tumor excision codes by size of tumor; 23 hysterectomy codes by size of uterus (58260-58573); 3 myomectomy codes are differentiated by total weight of the myomas (58140-58146); and 10 nerve graft codes are based on length of graft. (64885-64898)
The CPT guidelines and illustrations that describe how to measure the total defect size are well understood by surgeons. This is not a new concept—surgeons are very familiar with measuring a hernia defect, and in fact the size of the hernia defect was included in some of the patient vignettes in 1993. Furthermore, measurement of hernia size is a necessary step for selecting and preparing the appropriately sized mesh for implantation.

Hernia repair coding has been complicated by changes in (1) technology and technique and (2) the recent implementation of ICD-10-PCS codes. For these reasons, the stakeholder societies believed this set of codes should describe "any approach." The societies and the AMA Coding Network have received numerous coding questions about correct reporting for "hybrid" abdominal hernia repair procedures where parts of the procedure are performed via an open approach and parts of the procedure are performed via laparoscopy or with the use of a robot. These are not laparoscopic procedures converted to open procedures, but instead procedures that are more often begun open and then finished as laparoscopic/robotic under pneumoperitoneum.

Another issue that has recently caused confusion about coding has appeared on national coder websites and coder discussion boards referring to International Classification of Diseases Tenth Revision Procedure Coding System (ICD-10-PCS) codes which classify procedures performed in the facility (ie, not CPT physician procedures). Unfortunately, the new ICD-10-PCS codes define various surgical approaches that do not correspond to CPT coding (open, closed, percutaneous, and laparoscopic). For example, the ICD-10-PCS "open endoscopic" approach is defined as "cutting through the skin or mucous membrane and any other body layers necessary to expose the site of the procedure, and entry, by puncture or minor incision, of instrumentation through the skin or mucous membrane and any other body layers necessary to aid in the performance of the procedure." These new ICD-10-PCS codes have resulted in coders stating that a procedure should be reported as open because the ICD-10-PCS code indicates open and to report any procedure that includes extension of a port incision (eg, for delivery of a specimen) to be reported as an open procedure—instead of being correctly reported as open because the ICD-10-PCS code indicates open and to report any procedure that includes extension of a port incision (eg, for delivery of a specimen) to be reported as an open procedure—instead of being correctly reported as a laparoscopic procedure.

Mesh

- **Implantation of mesh is now typical and therefore was bundled into the new codes.** When code 49568 was created in 1993, mesh implantation with hernia repairs was not typical. This is supported by the typical patient described in 1993 as having a 10 cm midline incisional hernia—a very large hernia. With research on the causes of hernia recurrence, changes in technology and development of new types of mesh or other prosthesis, implantation of mesh is now typical for all types of hernias and all sizes to reduce the incidence of recurrence. This was supported by the literature submitted with the CCA.

- **Mesh removal is not always required and is not typical.** Technology and research have developed types of mesh that are now being implanted which are incorporated into the abdominal wall, reducing the risk of infection, complications, and recurrence. When mesh removal is indicated, it is typically due to hardening and fracturing of aged mesh, or when gross contamination and infection has occurred (eg, enterocutaneous fistula involving the mesh). For example, a recurrent hernia repair may require removal of fractured, brittle (old technology) mesh many years after an open repair following a colectomy. This work is typically significant, in that the mesh is often integrated with the abdominal wall or adhered to intestine, and involves removal of all of the mesh, not just a small portion. An add-on code to report mesh removal prior to hernia repair, when required, allows for accurate reporting of this work only when performed, which our expert panel believes is not typical of most hernia repairs.

- **Deletion of code 49658 resulted in rare "left over" work for implantation of mesh related to closure for a large open wound after debridement for necrotizing fasciitis.** Add-on code 46958 was reported for mesh placement for both open hernia repair and in relation to closure of wounds from necrotizing soft tissue infection. This code will be deleted and the work of mesh placement will be included in the work for all of the anterior abdominal hernia repair codes. The remaining use of code 46958 was for mesh placement for delayed closure of external genitalia, perineum and/or abdominal wall defect(s) due to soft tissue infection or trauma. As described in the vignette for 157X1, necrotizing soft tissue infections typically result in a large open wound that cannot be closed primarily. When the infection has resolved, absorbable mesh or other prosthesis is placed to allow healing by secondary intent until such time that a skin graft or skin closure can be accomplished. The literature submitted with the CCA supports this work.
Flawed Methodology: Codes 49560, 49561, 49565, 49566, 49570, 49572, 49580, 49582, 49585, and 49590 were last reviewed in 2000 during the 2nd 5-year-review. During this review, the American College of Surgeons argued that there was compression of work values for big procedures and there were rank order issues within families of codes. We developed a methodology using NSQIP data that was approved by the Research Subcommittee. However, to validate the methodology, the 5YR Workgroup instructed the ACS to group the codes into families and survey one or two CPT codes as full surveys per family to act as anchors for each family and the rest of the codes to be surveyed as mini-surveys for only time and visits. After conducting all of the surveys, we believe we were able to validate the methodology that we proposed, however, the 5YR Workgroup did not agree. Instead, they decided that the value that they assigned to the anchor code (the full survey) would be extrapolated to all of the other codes grouped into the same survey. The hernia codes listed above were grouped with 49505 which was increased by 17% based on the survey data and compelling evidence. The 17% increase was applied to the other codes in the group without consideration of rank order, mini survey results or society recommendations. This resulted in continuation of compression and rank order issues. For example, although code 49572 was increased by 17%, the IWPUT for the code is negative. Other codes have near zero IWPUT. We believe this was a flawed methodology of review of the codes and meets compelling evidence.

Flawed Methodology: Codes 49587, 49652, 49653, 49654, and 49655 were last reviewed in 2011 based on a site of service anomaly screen. At that time, the RUC approved including a same day observation visit and full observation discharge on the subsequent day. The RUC noted that the typical patient requires close monitoring for problems such as ileus, intestinal ischemia and urinary retention. Additionally, there will be significant pain post-operatively requiring management before discharge. The specialty noted, and the RUC agreed, that the shift in patient facility status (in patient moving to outpatient—as determined by CMS) has little to do with healthier patients that require less physician work and everything to do with the recent OPPS changes related to facility reimbursement. This was substantiated by the survey data which showed that the typical patients stayed at least overnight and received a postoperative same-day E/M service. Given this data, the RUC enacted its (then current) policy to allocate the appropriate proxy for the postoperative visits which was categorized as either subsequent observation and/or observation discharge—both of which are outpatient codes. Importantly, the specialties argued and the RUC agreed that the work of providers who care for medical patients should not be discounted (eg, full observation E/M and full observation discharge E/M allowed for patient staying overnight for observation.)

CMS ignored the valid outpatient E/M visit code inputs that the RUC recommended and instead stated in the Rule that they have a policy of not allowing "inpatient" visits included in the details for outpatient services. These codes went through a Refinement Panel process [ie, a CMS convened group of Medical Officers and select physicians acting as a separate formal appeals process] that resulted in agreement with the RUC recommendations. Importantly, the Agency still maintained that inpatient visits would not be allowed (even though outpatient/observation visits were submitted by the RUC) and then used a reverse building block methodology to subtract work RVUs from the values. These values had been developed by magnitude estimation and approved by the RUC. The Agency deleted the observation visit code inputs and decreased discharge management by 50 percent even though it was performed on a subsequent date. We believe this action by CMS resulted in a flawed methodology of review of these codes and meets compelling evidence.

The rejection of equal value for equal work and rejection of the Refinement Panel results prompted the Executive Director of the American College of Surgeons to send a letter (see last page of SoR) to Kathleen Sebelius, then Secretary of the Department of Health and Human Services on November 29, 2011. This letter addressed the decision-making process for valuing procedure codes that have Medicare outpatient status, the use of refinement panels, and the arbitrary discount in physician work for the same work performed by any provider of a non-global service. Specifically, the letter included the following statement:

"CMS has now implemented a policy by which it is creating differential payments for the same work performed by different physicians as a backdoor mechanism for reducing the work RVUs for surgical procedures. They have valued the worth of a surgeon for post-operative evaluation and management work at about 30 percent of a non-surgeon. Non-surgeons are allowed to provide the same work to the same patient at 100 percent reimbursement. ...we believe that this policy leads to a loss of validity and integrity of the current system."

We continue to believe there is no valid justification for a 50% discount to discharge management services provided by a surgeon that is performed the day after a procedure when a non-surgical provider observing a medical patient who is kept overnight for any reason is allowed to bill a discharge management service at 100 percent for work on the next day.
We also believe there is no valid justification for discounting a postoperative visit later the same day of surgery to equal only the intra-service time of the visit multiplied by an intensity of 0.0224. No surgeon would round on a postoperative patient the same day and not review interval chart notes prior to the face-to-face with the patient and not follow up with charting the visit and confirming or modifying the current orders.

CMS implemented a 23-hour policy for discounting surgical postoperative work based on the argument that the Agency could not include inpatient work in their time/work file. However, the fact is that the Agency has also erroneously rejected RUC recommendations for outpatient / observation codes, stating "these inpatient codes" could not be included for procedure that are typically outpatient.

Change in Technology: Since the last review of the hernia repair codes (either in 2000 or in 2011), there has been introduction and application of new technology (ie, robotic assist) which adds work complexity and time with the goal of better patient outcomes. The diffusion of this new technology throughout this family of codes further meets compelling evidence.

**Recommendation – 49X02**

We recommend a work RVU of 9.00, which is the survey 25th percentile.

**Pre-service time**

Package time has been reduced so as to not exceed survey median data.

**Postoperative E/M visit later on the day of surgery**

The typical patient will stay overnight or longer and there will typically be a visit later on the same day of the procedure at a level of 99231. Review data (eg, diagnostic and imaging studies) not available at the unit. Communicate with other health care professionals and with patient and/or family. Review medical records and data available on the unit. Perform a medically appropriate examination. Consider relevant data, options, and risks; formulate and/or revise diagnosis and treatment plan(s) (straightforward or low-complexity MDM). Discuss diagnosis and treatment options with the patient and/or family. Consider discharge needs of patient. Communicate with other health care professionals as necessary. Write and/or review orders, including arranging for necessary diagnostic testing, consultation(s), and therapeutic intervention(s). Complete medical record documentation. Address interval data obtained and reported changes in condition. Communicate results and additional care plans to other health care professionals and to the patient and/or family.

Per CMS policy for reporting postoperative work for 23-hour stay procedures, the intraservice time of 10 minutes for 99231 has been added to the survey immediate postoperative time (total = 30 min).

**Key Reference Code Intensity/Complexity Comparison**

Ref 1: The respondents indicated the intensity/complexity of survey code 49X02 is somewhat more than reference code 11005. Ref 2: The respondents indicated the intensity/complexity of survey code 49X02 is similar to reference code 33956.

Comparison of using the recommended RVW versus using the 25th percentile.

The first chart below shows reasonable correlation between the recommended RVW and WPUT—both trend lines have a similar slope. The second chart below shows no relationship of WPUT to the 25th percentile RVW—where WPUT decreases as work increases.

What if surgeon evaluation and management work were set equal to discrete E/M services?

As has been discussed by the RUC in the past, work intensities used for computation of IWPUT for time spent by physicians in the pre-service and immediate post-service period for surgical procedures have remained fixed since the early 1990s, while intensity of time for E/M values has received several increased values over several decades.

Recent increases for outpatient office E/M values were not allowed to be added to global codes by CMS. Because IWPUT is calculated by subtracting the pre- and post-work values from the RVW of a given CPT code, this has resulted in less value subtracted than would have occurred if the more appropriate pre- and post-work values were used for the
IWPUT formula. This artificially increases the IWPUT and WPUT resulting in a decrease in relativity. This is especially true for codes that have a significant amount of pre-service and post-service work.

It has become difficult to compare IWPUT (and WPUT) for codes with different global periods because of the level of discounting of pre-service and post-service work. For example, for the top 34 high volume 10 and 90 day global codes, AMA staff recently calculated the difference in IWPUT if the office visit increases were used in the IWPUT equation. The AMA table, which is included in the Research Subcommittee agenda for this meeting, showed that the IWPUT would have decreased from -6% to -548% depending on the number of office visits included in the work/time file. To emphasize the importance of this information, the code which would have had the largest decrease (17000) has 3 minutes of intra-time and only one postop office visit (99212). In this table, it was also clear that relativity within a family of codes is lost, because each code within a family may have varying levels of post-service work. To summarize, IWPUT has become much less accurate when used as a comparator of intra-service work within and between families because of CMS actions (ie, not updating global RVW) and policy (ie, discounting postoperative work).

Using the discussion above, we have created the table below that presents the IWPUT and WPUT for the hernia set of codes using (1) the 2021 formulas, and (2) "full value" formulas. The note below the table describes each formula, but basically the full value formula sets pre- and post-service work equal to the same E/M work for non-surgical services. For comparison to facility non-surgical services, we have included codes 99283-99285 using the 2021 published RVW and time data. This table shows that of the recommendations for 49X01-49X14 result in a WPUT that is less than an ED visit requiring moderate MDM (99284). This table also shows that those codes with similar WPUT to high MDM are appropriately ranked.

To summarize, the AMA table, which is included in the Research Subcommittee agenda for this meeting, showed that the IWPUT was calculated equal to total time (including discounted postop visit time not shown on table) divided by work.

**2021 Full Value Formula:** IWPUT calculation based on pre-service and immediate post-service time intensity of 0.043 (equal to WPUT for 99213) and same-day post EM at full value instead of discounted time for outpatient procedure as shown on table (highlighted in red).

**2021 Formula:** IWPUT calculation based on evaluation, positioning, immediate post intensity of 0.0224; scrub/dress/wait intensity of 0.0081; and discounted same-day outpatient postop visit (not shown in table) equal to intra-service time at 0.0224. WPUT calculation equal to total time (including discounted postop visit time not shown on table) divided by work.

*2021 Formula: IWPUT calculation based on evaluation, positioning, immediate post intensity of 0.0224; scrub/dress/wait intensity of 0.0081; and discounted same-day outpatient postop visit (not shown in table) equal to intra-service time at 0.0224. WPUT calculation equal to total time (including discounted postop visit time not shown on table) divided by work.

**2021 Full Value Formula:** IWPUT calculation based on pre-service and immediate post-service time intensity of 0.043 (equal to WPUT for 99213) and same-day post EM at full value instead of discounted time for outpatient procedure as shown on table (highlighted in red).
1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
☐ Multiple codes are used to maintain consistency with similar codes.
☐ Historical precedents.
☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

---

**Letter Referenced in Compelling Evidence Rationale**

November 29, 2011

The Honorable Kathleen Sebelius
Secretary
Department of Health and Human Services
Hubert H. Humphrey Building
200 Independence Avenue SW
Washington, DC 20201

Re: CY 2012 Medicare Physician Fee Schedule Final Rule and CMS Refinement Panels

Dear Secretary Sebelius:

On November 28, 2011, the Federal Register published the Centers for Medicare and Medicaid Services’ (CMS) Calendar Year (CY) 2012 Medicare Physician Fee Schedule Final Rule. On behalf of the American College of Surgeons (ACS), I am writing to express concern regarding the decision making process and lack of transparency on the part of CMS related to the work relative value units (wRVUs) for 2012 reviewed under CMS’ refinement panel process. The ACS, with over 78,000 members, is a scientific and educational organization of surgeons that was founded in 1913 to raise the standards of surgical practice and to improve the care of the surgical patient.
The ACS has participated in the efforts of the American Medical Association’s Relative Value Scale Update Committee (AMA RUC) for years given the value we place on the AMA RUC process and our assumption that CMS will evaluate the RUC recommendations with fairness, transparency, and accuracy according to a process that has been set out via the Federal rulemaking process. As part of the work that led to the CY 2012 Medicare Physician Fee Schedule Final Rule, the ACS devoted significant resources to conducting AMA RUC surveys for over 100 new or existing codes at the request of CMS. The AMA RUC evaluated wRVU recommendations made by the ACS, based upon those surveys, and came to agreement on final recommended values to be submitted to CMS.

Fifty-seven of the aforementioned codes that the ACS surveyed were sent to the refinement panel. CMS accepted only 12 percent of those refinement panel recommendations.

For most of the 88 percent of refinement panel recommendations that CMS rejected, CMS lowered the wRVU by reducing the value of the post-operative evaluation and management work performed by surgeons in the hospital by 69 percent. However, if that same work is performed by any other physician other than the surgeon, that same service is paid at 100 percent. We believe that the refinement panel physicians completely rejected this concept as they agreed to a work RVU that did not discount post-surgical work in this fashion. We note that the multispecialty panel included physicians from primary care, contractor medical directors (CMDs), physicians in related specialties, and general surgeons. At no time did the Agency’s Medical Officer in charge of the panel process disagree with the presenters or offer a contrary opinion to the discussion.

Our concerns were piqued when CMS issued the CY 2011 Medicare Physician Fee Schedule Final Rule in which CMS stated that it could change wRVU recommendations of the refinement panel convened by CMS if “policy concerns warrant their modification,” without providing additional clarification on what would trigger this ability of CMS to subvert the more transparent process of the refinement panel. However, we continued to participate in the process under the belief that CMS would operate fairly and transparently and that if there were indeed “policy concerns” that CMS had regarding the values of the codes under consideration that those concerns would be stated clearly so all parties could address them during the refinement panel reviews.

CMS has now implemented a policy by which it is creating differential payments for the same work performed by different physicians as a backdoor mechanism for reducing the work RVUs for surgical procedures. They have valued the worth of a surgeon for post-operative evaluation and management work at about 30 percent of a non-surgeon. Non-surgeons are allowed to provide the same work to the same patient at 100 percent reimbursement. First, we believe that this policy leads to a loss of validity and integrity of the current system. In addition, this policy is prohibited by the Omnibus Budget Reconciliation Act of 1989, which states, “[t]he Secretary may not vary the conversion factor or the number of relative value units for a physicians’ service based on whether the physician furnishing the service is a specialist or based on the type of specialty of the physician.” (42 U.S.C. §1395w-4(c)(6)).

The ACS has been a vocal proponent of needed reforms in the delivery and payment of health care. We believe that the future of these reforms will be based on driving greater awareness of proven continuous quality improvement programs to achieve ongoing, tangible results for quality improvements. However, in order for these reforms to be effective, they must be built on a system that is consistent with previous Agency decisions, fair, and transparent, and it is our concern that many of the policy decisions made by CMS in the latest Medicare Physician Fee Schedule Final Rule move us away from those goals. The resource based relative value system (RBRVS) requires a resource basis for decisions on the valuation of physician services. We believe that the resource basis for the decision to reduce these values is not evident. We ask that under your authority as Secretary you will seek to have CMS define a more transparent process in the future for decisions that are not aligned with the RUC and refinement panel recommendations in order to help maintain the transparency and fairness of the current system and to restore the values of these services to the level that is supported by the RBRVS process.

Sincerely,
David B. Hoyt, MD, FACS
Executive Director
CPT Code: 49X03

Summary of Recommendation

CPT Code: 49X03 Tracking Number C4
Global Period: 000

Original Specialty Recommended RVU: 10.80
Presented Recommended RVU: 10.80
RUC Recommended RVU: 10.80

CPT Descriptor: Repair of anterior abdominal hernia(s) (ie, epigastric, incisional, ventral, umbilical, spigelian), any approach (ie, open, laparoscopic, robotic), initial including placement of mesh or other prosthesis, when performed total length of defect(s); 3 cm to 10 cm, reducible

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 60-year-old obese male with a prior laparotomy has developed a bulge in the midline incision. The defect has been increasing in size during follow-up. He has symptoms of pain and local tenderness. He has had no history of incarceration or bowel obstruction. Physical exam reveals a reducible incisional hernia. He undergoes hernia repair of a defect that is 3 to 10 cm with placement of mesh.

Percentage of Survey Respondents who found Vignette to be Typical: 93%

Site of Service (Complete for 010 and 090 Globals Only)
Percent of survey respondents who stated they perform the procedure; In the hospital 95% , In the ASC 5%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 31% , Overnight stay-less than 24 hours 59% , Overnight stay-more than 24 hours 10%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 85%

Description of Pre-Service Work: Results of preadmission testing (imaging, electrocardiogram and labs) are reviewed. Appropriate selection, timing, and administration of DVT prophylaxis are ensured. Appropriate selection, timing, and administration of antibiotics are ensured. The need for beta-blockers is assessed, and they are ordered as required. The patient is reexamined to confirm that physical findings have not changed, the patient’s medication regimen has remained the same, the patient has no new allergies, and the patient has not undergone any recent procedures. The history and physical examination are then updated in the electronic health record. The planned procedure and postoperative management are reviewed with the patient and family. Informed consent is reviewed and obtained from the patient, including witness confirmation. The palpable edge of the hernia defect(s) and sites of the proposed skin incisions are marked with cooperation of patient. The length and type of anesthesia, including adjuncts to postoperative analgesia management, are reviewed with the anesthesiologist. Verify that all required instruments and supplies are available, including reusable and disposable laparoscopic/robotic equipment and mesh. Assistance is provided in transfer of the patient from gurney to operating table. Monitor/assist with positioning of patient, including padding and securing patient to table that will adjust throughout procedure (eg, reverse Trendelenburg). Assist anesthesia team with line placement and induction of anesthesia and intubation, relative to all laparoscopic/robotic equipment. The areas of skin to be prepared and draped are indicated by the surgeon to ensure that all of the potential operative field is included in the preparation. The surgeon scrubs and gowns. A surgical time-out is performed with operating surgical team.

Description of Intra-Service Work: Abdominal access is obtained and pneumoperitoneum is created with placement of a needle/trocar in the left upper quadrant. The camera is inserted and safe entry is verified. Additional trocars are placed in the lateral abdomen, under direct vision. A large field of adhesions occupies approximately half of the anterior abdominal wall correlating with the extent of the prior laparotomy. Adhesions to the abdominal wall are divided sharply to free the anterior abdominal wall adequately for subsequent mesh landing. The hernia defect is visualized. Great care is taken to avoid injury to the intestine or other intra-abdominal contents. Each separate defect within the overall hernia defect contains a separate component of adipose and intestine that requires safe reduction. The falciform ligament and preperitoneal fat are cleared from the abdominal wall fascia to expose the posterior fascia. All of the defects are measured and summed with a minimum
length of 3 cm and maximum length of 10 cm. Peritoneal flaps are created for placement of mesh. When appropriate, the fascial defect is approximated with sutures. A mesh is selected to provide adequate overlap of the hernia defect. The mesh is introduced into the peritoneal cavity through a trocar and is oriented. Insufflation is reduced to facilitate mesh conformity to the anterior abdominal wall. The mesh is secured to the abdominal wall utilizing multiple sutures and tacks. Completion camera survey is performed of the abdomen and contents to inspect for bleeding and visceral injury. Irrigation is performed as necessary. Fascial incisions from laparoscopic ports larger than 1 cm in diameter are closed with a suture passer. Skin incisions are closed according to surgeon preference.

Description of Post-Service Work:
Immediate postoperative care [operative day through discharge from recovery room]: Apply sterile dressings. Monitor patient during reversal of anesthesia. Assist in transfer of patient from operating table to gurney. Monitor transport of patient from operating room to recovery room. Discuss postoperative recovery care with anesthesia and nursing staff, including need for patient-controlled analgesia. Discontinue prophylactic antibiotic therapy, as appropriate. Review postoperative labs. Discuss procedure and outcome with family in waiting area. Write brief operative note or complete final operative note and place in chart. Write postoperative note in the recovery room. Dictate operative report and copy referring physician(s). Call referring physician(s). Write orders for transferring to observation or general surgical floor and discuss ongoing care with nursing staff.

Later same day hospital observation care visit [operative day after discharge from recovery room]: Review interval nursing/other staff chart notes. Discuss ongoing care with nursing staff. Evaluate vital signs and intake/output. Auscultate heart, lungs, and abdomen for bowel sounds. Monitor fluid and electrolyte status and renal function; monitor for problems such as ileus, intestinal ischemia, and urinary retention. Examine patient, check wounds, and change dressings. Continue prophylaxis for DVT. Assess need for beta-blockers, order as required. Assess pain scores and adequacy of analgesia. Write orders for labs, films, medications, diet, and patient activity. Chart patient progress notes. Answer patient and family questions. Answer nursing/other staff questions. Advance diet, as appropriate.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC’s rationale, please review the separate RUC recommendation document.
Background

RAW Screen
Code 49565, Repair recurrent incisional or ventral hernia; reducible, was identified by the RUC/RAW with a site of service anomaly: less than 50% inpatient status; includes inpatient visit codes; greater than 5,000 utilization. Prior to submitting an Action Plan to the RAW, the societies reviewed the site of service data and found: almost even split of 48% between inpatient and outpatient – with a few percent in the ASC. At the January 2020 RUC meeting, the societies requested referral of code 49565 to CPT to update the descriptor to current standard of practice and typical patient presentation.

CPT Coding Changes
At the February 2021 CPT meeting the following changes were approved:

- Delete all the current open and laparoscopic codes for repair of anterior abdominal hernias.
- Delete add-on code 49568 for mesh for open ventral/incisional hernias and large defects as a result of necrotizing soft tissue infection.
- Add 12 new codes for anterior abdominal hernia repair by any approach (ie, open laparoscopic, robotic); by initial or recurrent; by total defect size; and by reducible or incarcerated/strangulated
- Add 2 codes for parastomal hernia repair - by reducible or incarcerated/strangulated
- Add 1 add-on code for removal of mesh/prosthesis – only with the new hernia repair codes
- Add 1 new code for mesh/prosthesis for delayed closure of external genitalia, perineum and/or abdominal wall defect(s) due to soft tissue infection or trauma.

Coding Structure
Hernia repair for epigastric, incisional, ventral, umbilical, spigelian were merged as they all appear on the anterior abdomen. The location—upper, lower, midline—does not impact the work. But instead, the size and number of defects is the driving factor for work. For example, with respect to the code that was tagged by the RAW, a recurrent, incisional, reducible hernia can be anywhere from a small hernia at a port site from a prior laparoscopic procedure to an extremely large hernia with multiple defects clustered in a midline incision.

Initial versus recurrent differentiation was maintained. Recurrent hernias are re-reoperations. An initial hernia can be the result of a prior procedure (this is not a recurrent hernia) or weak muscles and fascia. A recurrent hernia is typically at least the third time the same site is being operated on.

For example,

- operation 1 might be an open colectomy
- operation 2 would be an initial midline hernia repair
- operation 3 would be a recurrent midline hernia involving the initial midline repair and may include other multiple hernias occurring in the same old incision, all needing to be repaired.

There are many examples in CPT that differentiate between a primary and secondary procedure: disarticulation of shoulder (23920-23921); amputation of arm through humerus (24900-24930) and other similar amputation families; tendon repair (eg, 25260-25274); CABG reoperation (33530); and revision total joint (eg, 23473, 23474, 24370, 24371, 27134-27138).

The hernia size ranges were based on a review of literature and expert panel. For example, an article published in the Journal of the American College of Surgeons reviewed technique and outcomes of abdominal incisional hernia repair and showed that the range of defect size was from less than 1 cm to more than 25 cm with a mean of 6 cm and a median of less than 3 cm. Other similar articles were submitted with the code change application, supporting different work for different defect size. David A. Iannitti, et.al, Technique and Outcomes of Abdominal Incisional Hernia Repair Using a Synthetic Composite Mesh: A Report of 455 Cases, Journal of the American College of Surgeons, Volume 206, Issue 1, 2008, Pages 83-88, ISSN 1072-7515, https://doi.org/10.1016/j.jamcollsurg.2007.07.030.

Differentiating the work of a procedure in relationship to size or extent is not new for CPT. For example, 36 skin repair codes by length of repair; 44 lesion excision codes by excised diameter; 46 soft tissue tumor excision codes by size of tumor; 23 hysterectomy codes by size of uterus (58260-58573); 3 myomectomy codes are differentiated by total weight of the myomas (58140-58146); and 10 nerve graft codes are based on length of graft. (64885-64898)

The CPT guidelines and illustrations that describe how to measure the total defect size are well understood by surgeons. This is not a new concept – surgeons are very familiar with measuring a hernia defect, and in fact the size of the hernia
defect was included in some of the patient vignettes in 1993. Furthermore, measurement of hernia size is a necessary step for selecting and preparing the appropriately sized mesh for implantation.

Hernia repair coding has been complicated by changes in (1) technology and technique and (2) the recent implementation of ICD-10-PCS codes. For these reasons, the stakeholder societies believed this set of codes should describe "any approach." The societies and the AMA Coding Network have received numerous coding questions about correct reporting for "hybrid" abdominal hernia repair procedures where parts of the procedure are performed via an open approach and parts of the procedure are performed via laparoscopy or with the use of a robot. These are not laparoscopic procedures converted to open procedures, but instead procedures that are more often begun open and then finished as laparoscopic/robotic under pneumoperitoneum.

Another issue that has recently caused confusion about coding has appeared on national coder websites and coder discussion boards referring to International Classification of Diseases Tenth Revision Procedure Coding System (ICD-10-PCS) codes which classifies procedures performed in the facility (ie, not CPT physician procedures). This, however, is important because facilities want the procedure codes reported to correspond with the descriptors of ICD-10-PCS codes that the facility is reporting. Unfortunately, the new ICD-10-PCS codes define various surgical approaches that do not correspond to CPT coding (open, closed, percutaneous, and laparoscopic). For example, the ICD-10-PCS "open endoscopic" approach is defined as "cutting through the skin or mucous membrane and any other body layers necessary to expose a body part, and introduction of instrumentation to reach and visualize the site of the procedure." A second example is the "open with percutaneous endoscopic assistance" approach defined as "cutting through the skin or mucous membrane and any other body layers necessary to expose the site of the procedure, and entry, by puncture or minor incision, of instrumentation through the skin or mucous membrane and any other body layers necessary to aid in the performance of the procedure." These new ICD-10-PCS codes have resulted in coders stating that a procedure should be reported as open because the ICD-10-PCS code indicates open and to report any procedure that includes extension of a port incision (eg, for delivery of a specimen) to be reported as an open procedure --instead of being correctly reported as a laparoscopic procedure.

Mesh
• Implantation of mesh is now typical and therefore was bundled into the new codes. When code 49568 was created in 1993, mesh implantation with hernia repairs was not typical. This is supported by the typical patient described in 1993 as having a 10 cm midline incisional hernia – a very large hernia. With research on the causes of hernia recurrence, changes in technology and development of new types of mesh or other prosthesis, implantation of mesh is now typical for all types of hernias and all sizes to reduce the incidence of recurrence. This was supported by the literature submitted with the CCA.

• Mesh removal is not always required and is not typical. Technology and research have developed types of mesh that are now being implanted which are incorporated into the abdominal wall, reducing the risk of infection, complications, and recurrence. When mesh removal is indicated, it is typically due to hardening and fracturing of aged mesh, or when gross contamination and infection has occurred (eg, enterocutaneous fistula involving the mesh). For example, a recurrent hernia repair may require removal of fractured, brittle (old technology) mesh many years after an open repair following a colectomy. This work is typically significant, in that the mesh is often integrated with the abdominal wall or adhered to intestine, and involves removal of all of the mesh, not just a small portion. An add-on code to report mesh removal prior to hernia repair, when required, allows for accurate reporting of this work only when performed, which our expert panel believes is not typical of most hernia repairs.

• Deletion of code 49658 resulted in rare "left over" work for implantation of mesh related to closure for a large open wound after debridement for necrotizing fasciitis. Add-on code 46958 was reported for mesh placement for both open hernia repair and in relation to closure of wounds from necrotizing soft tissue infection. This code will be deleted and the work of mesh placement will be included in the work for all of the anterior abdominal hernia repair codes. The remaining use of code 46958 was for mesh placement for delayed closure of external genitalia, perineum and/or abdominal wall defect(s) due to soft tissue infection or trauma. As described in the vignette for 157X1, necrotizing soft tissue infections typically result in a large open wound that cannot be closed primarily. When the infection has resolved, absorbable mesh or other prosthesis is placed to allow healing by secondary intent until such time that a skin graft or skin closure can be accomplished. The literature submitted with the CCA supports this work.
Flawed Methodology: Codes 49560, 49561, 49565, 49566, 49570, 49572, 49580, 49582, 49585, and 49590 were last reviewed in 2000 during the 2nd 5-year-review. During this review, the American College of Surgeons argued that there was compression of work values for big procedures and there were rank order issues within families of codes. We developed a methodology using NSQIP data that was approved by the Research Subcommittee. However, to validate the methodology, the 5YR Workgroup instructed the ACS to group the codes into families and survey one or two CPT codes as full surveys per family to act as anchors for each family and the rest of the codes to be surveyed as mini-surveys for only time and visits. After conducting all of the surveys, we believe we were able to validate the methodology that we proposed, however, the 5YR Workgroup did not agree. Instead, they decided that the value that they assigned to the anchor code (the full survey) would be extrapolated to all of the other codes grouped into the same survey. The hernia codes listed above were grouped with 49505 which was increased by 17% based on the survey data and compelling evidence. The 17% increase was applied to the other codes in the group without consideration of rank order, mini survey results or society recommendations. This resulted in continuation of compression and rank order issues. For example, although code 49572 was increased by 17%, the IWPUT for the code is negative. Other codes have near zero IWPUT. We believe this was a flawed methodology of review of the codes and meets compelling evidence.

Flawed Methodology: Codes 49587, 49652, 49653, 49654, and 49655 were last reviewed in 2011 based on a site of service anomaly screen. At that time, the RUC approved including a same day observation visit and full observation discharge on the subsequent day. The RUC noted that the typical patient requires close monitoring for problems such as ileus, intestinal ischemia and urinary retention. Additionally, there will be significant pain post-operatively requiring management before discharge. The specialty noted, and the RUC agreed, that the shift in patient facility status (in patient moving to outpatient—as determined by CMS) has little to do with healthier patients that require less physician work and everything to do with the recent OPPS changes related to facility reimbursement. This was substantiated by the survey data which showed that the typical patients stayed at least overnight and received a postoperative same-day E/M service. Given this data, the RUC enacted its (then current) policy to allocate the appropriate proxy for the postoperative visits which was categorized as either subsequent observation and/or observation discharge—both of which are outpatient codes. Importantly, the specialties argued and the RUC agreed that the work of providers who care for medical patients should not be discounted (eg, full observation E/M and full observation discharge E/M allowed for patient staying overnight for observation.) CMS ignored the valid outpatient E/M visit code inputs that the RUC recommended and instead stated in the Rule that they have a policy of not allowing "inpatient" visits included in the details for outpatient services. These codes went through a Refinement Panel process [ie, a CMS convened group of Medical Officers and select physicians acting as a separate formal appeals process] that resulted in agreement with the RUC recommendations. Importantly, the Agency still maintained that inpatient visits would not be allowed (even though outpatient/observation visits were submitted by the RUC) and then used a reverse building block methodology to subtract work RVUs from the values. These values had been developed by magnitude estimation and approved by the RUC. The Agency deleted the observation visit code inputs and decreased discharge management by 50 percent even though it was performed on a subsequent date. We believe this action by CMS resulted in a flawed methodology of review of these codes and meets compelling evidence.

The rejection of equal value for equal work and rejection of the Refinement Panel results prompted the Executive Director of the American College of Surgeons to send a letter (see last page of SoR) to Kathleen Sebelius, then Secretary of the Department of Health and Human Services on November 29, 2011. This letter addressed the decision-making process for valuing procedure codes that have Medicare outpatient status, the use of refinement panels, and the arbitrary discount in physician work for the same work performed by any provider of a non-global service. Specifically, the letter included the following statement:

"CMS has now implemented a policy by which it is creating differential payments for the same work performed by different physicians as a backdoor mechanism for reducing the work RVUs for surgical procedures. They have valued the worth of a surgeon for post-operative evaluation and management work at about 30 percent of a non-surgeon. Non-surgeons are allowed to provide the same work to the same patient at 100 percent reimbursement. ...we believe that this policy leads to a loss of validity and integrity of the current system."

We continue to believe there is no valid justification for a 50% discount to discharge management services provided by a surgeon that is performed the day after a procedure when a non-surgical provider observing a medical patient who is kept overnight for any reason is allowed to bill a discharge management service at 100 percent for work on the next day. We also believe there is no valid justification for discounting a postoperative visit later the same day of surgery to equal
CPT Code: 49X03

only the intra-service time of the visit multiplied by an intensity of 0.0224. No surgeon would round on a postoperative patient the same day and not review interval chart notes prior to the face-to-face with the patient and not follow up with charting the visit and confirming or modifying the current orders.

CMS implemented a 23-hour policy for discounting surgical postoperative work based on the argument that the Agency could not include inpatient work in their time/work file. However, the fact is that the Agency has also erroneously rejected RUC recommendations for outpatient / observation codes, stating “these inpatient codes” could not be included for procedure that are typically outpatient.

**Change in Technology:** Since the last review of the hernia repair codes (either in 2000 or in 2011), there has been introduction and application of new technology (ie, robotic assist) which adds work complexity and time with the goal of better patient outcomes. The diffusion of this new technology throughout this family of codes further meets compelling evidence.

**Recommendation – 49X03**

We recommend a work RVU of 10.80, which is the survey 25th percentile.

**Pre-service time**

Evaluation package time has been reduced so as to not exceed survey median data. Laparoscopic/robotic anterior abdominal hernia repair positioning time: The patient will initially be positioned supine and upper extremity intravenous and arterial access points are dressed, padded and secured. The arms are padded and tucked at the patient’s sides. The patient must be secured to the table, including a soft chest and thigh strap, as it may be necessary to roll the table during the procedure to use gravity to assist with shifting the abdominal contents. There is also consideration of positioning the patient relative to: laparoscopy equipment, including lines and video equipment and anesthesiology lines relative to the rest of the equipment. The survey median positioning time reflects the time for this procedure for these activities.

**Postoperative E/M visit later on the day of surgery**

The typical patient will stay overnight or longer and there will typically be a visit later on the same day of the procedure at a level of 99231. Review data (eg, diagnostic and imaging studies) not available at the unit. Communicate with other health care professionals and with patient and/or family. Review medical records and data available on the unit. Perform a medically appropriate examination. Consider relevant data, options, and risks; formulate and/or revise diagnosis and treatment plan(s) (straightforward or low-complexity MDM). Discuss diagnosis and treatment options with the patient and/or family. Consider discharge needs of patient. Communicate with other health care professionals as necessary. Write and/or review orders, including arranging for necessary diagnostic testing, consultation(s), and therapeutic intervention(s). Complete medical record documentation. Address interval data obtained and reported changes in condition. Communicate results and additional care plans to other health care professionals and to the patient and/or family.

Per CMS policy for reporting postoperative work for 23-hour stay procedures, the intraservice time of 10 minutes for 99231 has been added to the survey immediate postoperative time (total = 30 min).

**Key Reference Code Intensity/Complexity Comparison**

Ref 1: The respondents indicated the intensity/complexity of survey code 49X03 is somewhat more than reference code 11006. Ref 2: The respondents indicated the intensity/complexity of survey code 49X03 is similar to somewhat more than reference code 11004.

Relativity Assessment

Recommended RVW vs Total Time

The chart below that compares the recommended RVW and total time shows good correlation.

The data below that were used to create the chart above show appropriate relative rank order for work for this new set of hernia repair codes.

</table>
Comparison of using the recommended RVW versus using the 25th percentile.

The first chart below shows reasonable correlation between the recommended RVW and WPUT—both trend lines have a similar slope. The second chart below shows no relationship of WPUT to the 25th percentile RVW—where WPUT decreases as work increases.

What if surgeon evaluation and management work were set equal to discrete E/M services?
As has been discussed by the RUC in the past, work intensities used for computation of IWPUT for time spent by physicians in the pre-service and immediate post-service period for surgical procedures have remained fixed since the early 1990s, while intensity of time for E/M values has received several increased values over several decades.
Recent increases for outpatient office E/M values were not allowed to be added to global codes by CMS. Because IWPUT is calculated by subtracting the pre- and post-work values from the RVW of a given CPT code, this has resulted in less value subtracted than would have occurred if the more appropriate pre- and post-work values were used for the IWPUT formula. This artificially increases the IWPUT and WPUT resulting in a decrease in relativity. This is especially true for codes that have a significant amount of pre-service and post-service work.

It has become difficult to compare IWPUT (and WPUT) for codes with different global periods because of the level of discounting of pre-service and post-service work. For example, for the top 34 high volume 10 and 90 day global codes, AMA staff recently calculated the difference in IWPUT if the office visit increases were used in the IWPUT equation. The AMA table, which is included in the Research Subcommittee agenda for this meeting, showed that the IWPUT would have decreased from -6% to -548% depending on the number of office visits included in the work/time file. To emphasize the importance of this information, the code which would have had the largest decrease (17000) has 3 minutes of intra-time and only one post office visit (99212). In this table, it was also clear that relativity within a family of codes is lost, because each code within a family may have varying levels of post-service work. To summarize, IWPUT has become much less accurate when used as a comparator of intra-service work within and between families because of CMS actions (ie, not updating global RVW) and policy (ie, discounting postoperative work).

Using the discussion above, we have created the table below that presents the IWPUT and WPUT for the hernia set of codes using (1) the 2021 formulas, and (2) "full value" formulas. The note below the table describes each formula, but basically the full value formula sets pre- and post-service work equal to the same E/M work for non-surgical services. For comparison to facility non-surgical services, we have included codes 99283-99285 using the 2021 published RVW and time data. This table shows that most of the recommendations for 49X01-49X14 result in a WPUT that is less than an ED visit requiring moderate MDM (99284). This table also shows that those codes with similar WPUT to high MDM are appropriately the bigger and more complex procedures. Last, this table provides evidence that discounting pre- and post-work distorts and artificially impacts fair IWPUT and WPUT relativity comparison. However, if undiscounted work is applied, the recommendations for this set of codes are appropriately ranked.

* 2021 Formula: IWPUT calculation based on evaluation, positioning, immediate post intensity of 0.0224; scrub/dress/wait intensity of 0.0081; and discounted same-day outpatient postop visit (not shown in table) equal to intra-service time at 0.0224. WPUT calculation equal to total time (including discounted postop visit time not shown on table) divided by work.

**2021 Full Value Formula: IWPUT calculation based on pre-service and immediate post-service time intensity of 0.043 (equal to WPUT for 99213) and same-day post EM at full value instead of discounted time for outpatient procedure as shown on table (highlighted in red).
SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - Multiple codes allow flexibility to describe exactly what components the procedure included.
   - Multiple codes are used to maintain consistency with similar codes.
   - Historical precedents.
   - Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed)

**Berenson-Eggers Type of Service (BETOS) Assignment**

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
- Procedures

BETOS Sub-classification:
- Major procedure

BETOS Sub-classification Level II:
- Other

**Professional Liability Insurance Information (PLI)**

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 11008

**Letter Referenced in Compelling Evidence Rationale**

November 29, 2011

The Honorable Kathleen Sebelius  
Secretary  
Department of Health and Human Services  
Hubert H. Humphrey Building  
200 Independence Avenue SW  
Washington, DC 20201

Re: CY 2012 Medicare Physician Fee Schedule Final Rule and CMS Refinement Panels

Dear Secretary Sebelius:

On November 28, 2011, the Federal Register published the Centers for Medicare and Medicaid Services’ (CMS) Calendar Year (CY) 2012 Medicare Physician Fee Schedule Final Rule. On behalf of the American College of Surgeons (ACS), I am writing to express concern regarding the decision making process and lack of transparency on the part of CMS related to the work relative value units (wRVUs) for 2012 reviewed under CMS’ refinement panel process. The
ACS, with over 78,000 members, is a scientific and educational organization of surgeons that was founded in 1913 to raise the standards of surgical practice and to improve the care of the surgical patient.

The ACS has participated in the efforts of the American Medical Association’s Relative Value Scale Update Committee (AMA RUC) for years given the value we place on the AMA RUC process and our assumption that CMS will evaluate the RUC recommendations with fairness, transparency, and accuracy according to a process that has been set out via the Federal rulemaking process. As part of the work that led to the CY 2012 Medicare Physician Fee Schedule Final Rule, the ACS devoted significant resources to conducting AMA RUC surveys for over 100 new or existing codes at the request of CMS. The AMA RUC evaluated wRVU recommendations made by the ACS, based upon those surveys, and came to agreement on final recommended values to be submitted to CMS.

Fifty-seven of the aforementioned codes that the ACS surveyed were sent to the refinement panel. CMS accepted only 12 percent of those refinement panel recommendations.

For most of the 88 percent of refinement panel recommendations that CMS rejected, CMS lowered the wRVU by reducing the value of the post-operative evaluation and management work performed by surgeons in the hospital by 69 percent. However, if that same work is performed by any other physician other than the surgeon, that same service is paid at 100 percent. We believe that the refinement panel physicians completely rejected this concept as they agreed to a work RVU that did not discount post-surgical work in this fashion. We note that the multispecialty panel included physicians from primary care, contractor medical directors (CMDs), physicians in related specialties, and general surgeons. At no time did the Agency’s Medical Officer in charge of the panel process disagree with the presenters or offer a contrary opinion to the discussion.

Our concerns were piqued when CMS issued the CY 2011 Medicare Physician Fee Schedule Final Rule in which CMS stated that it could change wRVU recommendations of the refinement panel convened by CMS if “policy concerns warrant their modification,” without providing additional clarification on what would trigger this ability of CMS to subvert the more transparent process of the refinement panel. However, we continued to participate in the process under the belief that CMS would operate fairly and transparently and that if there were indeed “policy concerns” that CMS had regarding the values of the codes under consideration that those concerns would be stated clearly so all parties could address them during the refinement panel reviews.

CMS has now implemented a policy by which it is creating differential payments for the same work performed by different physicians as a backdoor mechanism for reducing the work RVUs for surgical procedures. They have valued the worth of a surgeon for post-operative evaluation and management work at about 30 percent of a non-surgeon.. Non-surgeons are allowed to provide the same work to the same patient at 100 percent reimbursement. First, we believe that this policy leads to a loss of validity and integrity of the current system. In addition, this policy is prohibited by the Omnibus Budget Reconciliation Act of 1989, which states, “[t]he Secretary may not vary the conversion factor or the number of relative value units for a physicians’ service based on whether the physician furnishing the service is a specialist or based on the type of specialty of the physician.” (42 U.S.C. §1395w-4(c)(6)).

The ACS has been a vocal proponent of needed reforms in the delivery and payment of health care. We believe that the future of these reforms will be based on driving greater awareness of proven continuous quality improvement programs to achieve ongoing, tangible results for quality improvements. However, in order for these reforms to be effective, they must be built on a system that is consistent with previous Agency decisions, fair, and transparent, and it is our concern that many of the policy decisions made by CMS in the latest Medicare Physician Fee Schedule Final Rule move us away from those goals. The resource based relative value system (RBRVS) requires a resource basis for decisions on the valuation of physician services. We believe that the resource basis for the decision to reduce these values is not evident. We ask that under your authority as Secretary you will seek to have CMS define a more transparent process in the future for decisions that are not aligned with the RUC and refinement panel recommendations in order to help maintain the transparency and fairness of the current system and to restore the values of these services to the level that is supported by the RBRVS process.

Sincerely,
David B. Hoyt, MD, FACS
Executive Director
CPT Code: 49X04

Summary of Recommendation

CPT Code: 49X04  Tracking Number: C5

Original Specialty Recommended RVU: 16.65
Presented Recommended RVU: 16.65
RUC Recommended RVU: 14.00

CPT Descriptor: Repair of anterior abdominal hernia(s) (ie, epigastric, incisional, ventral, umbilical, spigelian), any approach (ie, open, laparoscopic, robotic), initial including placement of mesh or other prosthesis, when performed total length of defect(s); 3 cm to 10 cm, incarcerated or strangulated

Clinical Description of Service:

Vignette Used in Survey: A 60-year-old obese male with a prior laparotomy has developed an incisional hernia in the midline incision. Over the past few months, the defect has become chronically protuberant. He reports increasing pain and discomfort. Physical exam reveals a hernia that is tender and nonreducible by manual manipulation. He undergoes hernia repair of a defect that is 3 to 10 cm with placement of mesh.

Percentage of Survey Respondents who found Vignette to be Typical: 85%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 100%, In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 12%, Overnight stay-less than 24 hours 32%, Overnight stay-more than 24 hours 56%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 94%

Description of Pre-Service Work: Results of preadmission testing (imaging, electrocardiogram and labs) are reviewed. Appropriate selection, timing, and administration of DVT prophylaxis are ensured. Appropriate selection, timing, and administration of antibiotics are ensured. The need for beta-blockers is assessed, and they are ordered as required. The patient is reexamined to confirm that physical findings have not changed, the patient’s medication regimen has remained the same, the patient has no new allergies, and the patient has not undergone any recent procedures. The history and physical examination are then updated in the electronic health record. The planned procedure and postoperative management are reviewed with the patient and family. Informed consent is reviewed and obtained from the patient, including witness confirmation. The masses of the incarcerated hernia contents are palpated obscuring the edge of the hernia defect(s). The sites of the proposed skin incisions are marked with cooperation of patient. The length and type of anesthesia, including adjuncts to postoperative analgesia management, are reviewed with the anesthesiologist. Verify that all required instruments and supplies are available, including reusable and disposable laparoscopic/robotic equipment and mesh. Assistance is provided in transfer of the patient from gurney to operating table. Monitor/assist with positioning of patient, including padding and securing patient to table that will adjust throughout procedure (eg, reverse Trendelenburg). Assist anesthesia team with line placement and induction of anesthesia and intubation, relative to all laparoscopic/robotic equipment. The areas of skin to be prepared and draped are indicated by the surgeon to ensure that all of the potential operative field is included in the preparation. The surgeon scrubs and gowns. A surgical time-out is performed with operating surgical team.

Description of Intra-Service Work: Abdominal access is obtained and a safe pneumoperitoneum is created with placement of a needle/trocar in the left upper quadrant. The camera is inserted and safe entry is verified. Additional trocars are placed in the lateral abdomen, under direct vision. A large field of adhesions occupies approximately half of the abdominal wall correlating with the extent of the prior laparotomy. Adhesions to the abdominal wall are divided sharply to free the anterior abdominal wall adequately for subsequent mesh landing. The incarcerated/strangulated bowel, mesentery and omentum are carefully reduced with dissection of the adhesions and sac to clear the defects for repair. Care is taken to avoid injury to the incarcerated intestine and omentum. Each separate defect within the overall hernia defect contains a separate component of
adipose and intestine that requires safe reduction. This requires manipulation both intra-abdominally with minimally invasive instrumentation and extra-abdominally with palpation and pressure applied to the abdominal wall to reduce the incarcerated contents. The reduced tissue is examined for viability and any inadvertent injury. The hernia sac is reduced and resected as needed to expose the fascial edges of the defect(s). The hernia defect is visualized. The falciform ligament and preperitoneal fat are cleared from the abdominal wall fascia to expose the posterior fascia. All of the defects are measured and summed with a minimum of 3 cm and maximum of 10 cm. Peritoneal flaps are created for placement of mesh. When appropriate, the fascial defect is approximated with sutures. A mesh is selected to provide adequate overlap of the hernia defect. The mesh is introduced into the peritoneal cavity through a trocar and is oriented. Insufflation is reduced to facilitate mesh conformity to the anterior abdominal wall. The mesh is secured to the abdominal wall utilizing multiple sutures and tacks. Completion camera survey is performed of the abdomen and contents to inspect for bleeding and visceral injury and perform a final viability assessment of the material once incarcerated in the hernia sac. Irrigation is performed as necessary. Fascial incisions from laparoscopic ports larger than 1 cm are closed with a suture passer. Skin incisions are closed according to surgeon preference.

Description of Post-Service Work:
Immediate postoperative care [operative day through discharge from recovery room]: Apply sterile dressings. Monitor patient during reversal of anesthesia. Assist in transfer of patient from operating table to gurney. Monitor transport of patient from operating room to recovery room. Discuss postoperative recovery care with anesthesia and nursing staff, including need for patient-controlled analgesia. Discontinue prophylactic antibiotic therapy, as appropriate. Review postoperative labs. Discuss procedure and outcome with family in waiting area. Write brief operative note or complete final operative note and place in chart. Write postoperative note in the recovery room. Dictate operative report and copy referring physician(s). Call referring physician(s). Write orders for transferring to observation or general surgical floor and discuss ongoing care with nursing staff.

Later same day hospital observation care visit [operative day after discharge from recovery room]: Review interval nursing/other staff chart notes. Discuss ongoing care with nursing staff. Evaluate vital signs and intake/output. Auscultate heart, lungs, and abdomen for bowel sounds. Monitor fluid and electrolyte status and renal function; monitor for problems such as ileus, intestinal ischemia, and urinary retention. Examine patient, check wounds, and change dressings. Continue prophylaxis for DVT. Assess need for beta-blockers, order as required. Assess pain scores and adequacy of analgesia. Write orders for labs, films, medications, diet, and patient activity. Chart patient progress notes. Answer patient and family questions. Answer nursing/other staff questions. Advance diet, as appropriate.

### Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

*The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC’s rationale, please review the separate RUC recommendation document.*
Background

**RAW Screen**
Code 49565, Repair recurrent incisional or ventral hernia; reducible, was identified by the RUC/RAW with a site of service anomaly: less than 50% inpatient status; includes inpatient visit codes; greater than 5,000 utilization. Prior to submitting an Action Plan to the RAW, the societies reviewed the site of service data and found: almost even split of 48% between inpatient and outpatient – with a few percent in the ASC. At the January 2020 RUC meeting, the societies requested referral of code 49565 to CPT to update the descriptor to current standard of practice and typical patient presentation.

**CPT Coding Changes**
At the February 2021 CPT meeting the following changes were approved:
- Delete all the current open and laparoscopic codes for repair of anterior abdominal hernias.
- Delete add-on code 49568 for mesh for open ventral/incisional hernias and large defects as a result of necrotizing soft tissue infection.
- Add 12 new codes for anterior abdominal hernia repair by any approach (ie, open laparoscopic, robotic); by initial or recurrent; by total defect size; and by reducible or incarcerated/strangulated
- Add 2 codes for parastomal hernia repair - by reducible or incarcerated/strangulated
- Add 1 add-on code for removal of mesh/prosthesis – only with the new hernia repair codes
- Add 1 new code for mesh/prosthesis for delayed closure of external genitalia, perineum and/or abdominal wall defect(s) due to soft tissue infection or trauma.

**Coding Structure**
Hernia repair for epigastric, incisional, ventral, umbilical, spigelian were merged as they all appear on the anterior abdomen. The location--upper, lower, midline—does not impact the work. But instead, the size and number of defects is the driving factor for work. For example, with respect to the code that was tagged by the RAW, a recurrent, incisional, reducible hernia can be anywhere from a small hernia at a port site from a prior laparoscopic procedure to an extremely large hernia with multiple defects clustered in a midline incision.

Initial versus recurrent differentiation was maintained. Recurrent hernias are re-reoperations. An initial hernia can be the result of a prior procedure (this is not a recurrent hernia) or weak muscles and fascia. A recurrent hernia is typically at least the third time the same site is being operated on.
For example,
- operation 1 might be an open colectomy
- operation 2 would be an initial midline hernia repair
- operation 3 would be a recurrent midline hernia involving the initial midline repair and may include other multiple hernias occurring in the same old incision, all needing to be repaired.

There are many examples in CPT that differentiate between a primary and secondary procedure: disarticulation of shoulder (23920-23921); amputation of arm through humerus (24900-24930) and other similar amputation families; tendon repair (eg, 25260-25274); CABG reoperation (33530); and revision total joint (eg, 23473, 23474, 24370, 24371, 27134-27138).

The hernia size ranges were based on a review of literature and expert panel. For example, an article published in the Journal of the American College of Surgeons reviewed technique and outcomes of abdominal incisional hernia repair and showed that the range of defect size was from less than 1 cm to more than 25 cm with a mean of 6 cm and a median of less than 3 cm. Other similar articles were submitted with the code change application, supporting different work for different defect size. David A. Iannitti, et.al, *Technique and Outcomes of Abdominal Incisional Hernia Repair Using a Synthetic Composite Mesh: A Report of 455 Cases*, Journal of the American College of Surgeons, Volume 206, Issue 1, 2008, Pages 83-88, ISSN 1072-7515, https://doi.org/10.1016/j.jamcollsurg.2007.07.030.

Differentiating the work of a procedure in relationship to size or extent is not new for CPT. For example, 36 skin repair codes by length of repair; 44 lesion excision codes by excised diameter; 46 soft tissue tumor excision codes by size of tumor; 23 hysterectomy codes by size of uterus (58260-58573); 3 myomectomy codes are differentiated by total weight of the myomas (58140-58146); and 10 nerve graft codes are based on length of graft. (64885-64898)
The CPT guidelines and illustrations that describe how to measure the total defect size are well understood by surgeons. This is not a new concept – surgeons are very familiar with measuring a hernia defect, and in fact the size of the hernia defect was included in some of the patient vignettes in 1993. Furthermore, measurement of hernia size is a necessary step for selecting and preparing the appropriately sized mesh for implantation.

Hernia repair coding has been complicated by changes in (1) technology and technique and (2) the recent implementation of ICD-10-PCS codes. For these reasons, the stakeholder societies believed this set of codes should describe "any approach." The societies and the AMA Coding Network have received numerous coding questions about correct reporting for "hybrid" abdominal hernia repair procedures where parts of the procedure are performed via an open approach and parts of the procedure are performed via laparoscopy or with the use of a robot. These are not laparoscopic procedures converted to open procedures, but instead procedures that are more often begun open and then finished as laparoscopic/robotic under pneumoperitoneum.

Another issue that has recently caused confusion about coding has appeared on national coder websites and coder discussion boards referring to International Classification of Diseases Tenth Revision Procedure Coding System (ICD-10-PCS) codes which classifies procedures performed in the facility (i.e., not CPT physician procedures). This, however, is important because facilities want the procedure codes reported to correspond with the descriptors of ICD-10-PCS codes that the facility is reporting. Unfortunately, the new ICD-10-PCS codes define various surgical approaches that do not correspond to CPT coding (open, closed, percutaneous, and laparoscopic). For example, the ICD-10-PCS "open endoscopic" approach is defined as "cutting through the skin or mucous membrane and any other body layers necessary to expose a body part, and introduction of instrumentation to reach and visualize the site of the procedure." A second example is the "open with percutaneous endoscopic assistance" approach defined as "cutting through the skin or mucous membrane and any other body layers necessary to expose the site of the procedure, and entry, by puncture or minor incision, of instrumentation through the skin or mucous membrane and any other body layers necessary to aid in the performance of the procedure." These new ICD-10-PCS codes have resulted in coders stating that a procedure should be reported as open because the ICD-10-PCS code indicates open and to report any procedure that includes extension of a port incision (e.g., for delivery of a specimen) to be reported as an open procedure -- instead of being correctly reported as a laparoscopic procedure.

Mesh

- **Implantation of mesh is now typical and therefore was bundled into the new codes.** When code 49568 was created in 1993, mesh implantation with hernia repairs was not typical. This is supported by the typical patient described in 1993 as having a 10 cm midline incisional hernia – a very large hernia. With research on the causes of hernia recurrence, changes in technology and development of new types of mesh or other prosthesis, implantation of mesh is now typical for all types of hernias and all sizes to reduce the incidence of recurrence. This was supported by the literature submitted with the CCA.

- **Mesh removal is not always required and is not typical.** Technology and research have developed types of mesh that are now being implanted which are incorporated into the abdominal wall, reducing the risk of infection, complications, and recurrence. When mesh removal is indicated, it is typically due to hardening and fracturing of aged mesh, or when gross contamination and infection has occurred (e.g., enterocutaneous fistula involving the mesh). For example, a recurrent hernia repair may require removal of fractured, brittle (old technology) mesh many years after an open repair following a colectomy. This work is typically significant, in that the mesh is often integrated with the abdominal wall or adhered to intestine, and involves removal of all of the mesh, not just a small portion. An add-on code to report mesh removal prior to hernia repair, when required, allows for accurate reporting of this work only when performed, which our expert panel believes is not typical of most hernia repairs.

- **Deletion of code 49658 resulted in rare "left over" work for implantation of mesh related to closure for a large open wound after debridement for necrotizing fasciitis.** Add-on code 46958 was reported for mesh placement for both open hernia repair and in relation to closure of wounds from necrotizing soft tissue infection. This code will be deleted and the work of mesh placement will be included in the work for all of the anterior abdominal hernia repair codes. The remaining use of code 46958 was for mesh placement for delayed closure of external genitalia, perineum and/or abdominal wall defect(s) due to soft tissue infection or trauma. As described in the vignette for 157X1, necrotizing soft tissue infections typically result in a large open wound that cannot be closed primarily. When the infection has resolved, absorbable mesh or other prosthesis is placed to allow healing by
Compelling Evidence - Flawed methodology of previous reviews, New technology

Flawed Methodology: Codes 49560, 49561, 49565, 49566, 49570, 49572, 49580, 49582, 49585, and 49590 were last reviewed in 2000 during the 2nd 5-year-review. During this review, the American College of Surgeons argued that there was compression of work values for big procedures and there were rank order issues within families of codes. We developed a methodology using NSQIP data that was approved by the Research Subcommittee. However, to validate the methodology, the 5YR Workgroup instructed the ACS to group the codes into families and survey one or two CPT codes as full surveys per family to act as anchors for each family and the rest of the codes to be surveyed as mini-surveys for only time and visits. After conducting all of the surveys, we believe we were able to validate the methodology that we proposed, however, the 5YR Workgroup did not agree. Instead, they decided that the value that they assigned to the anchor code (the full survey) would be extrapolated to all of the other codes grouped into the same survey. The hernia codes listed above were grouped with 49505 which was increased by 17% based on the survey data and compelling evidence. The 17% increase was applied to the other codes in the group without consideration of rank order, mini survey results or society recommendations. This resulted in continuation of compression and rank order issues. For example, although code 49572 was increased by 17%, the IWPUT for the code is negative. Other codes have near zero IWPUT. We believe this was a flawed methodology of review of the codes and meets compelling evidence.

Flawed Methodology: Codes 49587, 49652, 49653, 49654, and 49655 were last reviewed in 2011 based on a site of service anomaly screen. At that time, the RUC approved including a same day observation visit and full observation discharge on the subsequent day. The RUC noted that the typical patient requires close monitoring for problems such as ileus, intestinal ischemia and urinary retention. Additionally, there will be significant pain post-operatively requiring management before discharge. The specialty noted, and the RUC agreed, that the shift in patient facility status (in patient moving to outpatient—as determined by CMS) has little to do with healthier patients that require less physician work and everything to do with the recent OPPS changes related to facility reimbursement. This was substantiated by the survey data which showed that the typical patients stayed at least overnight and received a postoperative same-day E/M service. Given this data, the RUC enacted its (then current) policy to allocate the appropriate proxy for the postoperative visits which was categorized as either subsequent observation and/or observation discharge—both of which are outpatient codes. Importantly, the specialties argued and the RUC agreed that the work of providers who care for medical patients should not be discounted (eg, full observation E/M and full observation discharge E/M allowed for patient staying overnight for observation.)

CMS ignored the valid outpatient E/M visit code inputs that the RUC recommended and instead stated in the Rule that they have a policy of not allowing "inpatient" visits included in the details for outpatient services. These codes went through a Refinement Panel process [ie, a CMS convened group of Medical Officers and select physicians acting as a separate formal appeals process] that resulted in agreement with the RUC recommendations. Importantly, the Agency still maintained that inpatient visits would not be allowed (even though outpatient/observation visits were submitted by the RUC) and then used a reverse building block methodology to subtract work RVUs from the values. These values had been developed by magnitude estimation and approved by the RUC. The Agency deleted the observation visit code inputs and decreased discharge management by 50 percent even though it was performed on a subsequent date. We believe this action by CMS resulted in a flawed methodology of review of these codes and meets compelling evidence.

The rejection of equal value for equal work and rejection of the Refinement Panel results prompted the Executive Director of the American College of Surgeons to send a letter (see last page of SoR) to Kathleen Sebelius, then Secretary of the Department of Health and Human Services on November 29, 2011. This letter addressed the decision-making process for valuing procedure codes that have Medicare outpatient status, the use of refinement panels, and the arbitrary discount in physician work for the same work performed by any provider of a non-global service. Specifically, the letter included the following statement:

"CMS has now implemented a policy by which it is creating differential payments for the same work performed by different physicians as a backdoor mechanism for reducing the work RVUs for surgical procedures. They have valued the worth of a surgeon for post-operative evaluation and management work at about 30 percent of a non-surgeon. Non-surgeons are allowed to provide the same work to the same patient at 100 percent reimbursement. …We believe that this policy leads to a loss of validity and integrity of the current system."
We continue to believe there is no valid justification for a 50% discount to discharge management services provided by a surgeon that is performed the day after a procedure when a non-surgical provider observing a medical patient who is kept overnight for any reason is allowed to bill a discharge management service at 100 percent for work on the next day. We also believe there is no valid justification for discounting a postoperative visit later the same day of surgery to equal only the intra-service time of the visit multiplied by an intensity of 0.0224. No surgeon would round on a postoperative patient the same day and not review interval chart notes prior to the face-to-face with the patient and not follow up with charting the visit and confirming or modifying the current orders.

CMS implemented a 23-hour policy for discounting surgical postoperative work based on the argument that the Agency could not include inpatient work in their time/work file. However, the fact is that the Agency has also erroneously rejected RUC recommendations for outpatient/observation codes, stating "these inpatient codes" could not be included for procedure that are typically outpatient.

**Change in Technology:** Since the last review of the hernia repair codes (either in 2000 or in 2011), there has been introduction and application of new technology (ie, robotic assist) which adds work complexity and time with the goal of better patient outcomes. The diffusion of this new technology throughout this family of codes further meets compelling evidence.

**Recommendation – 49X04**

We recommend a work RVU of 16.65, which is the survey median.

**Pre-service time**

Evaluation and scrub, dress, wait package time has been reduced so as to not exceed survey median data. Laparoscopic/robotic anterior abdominal hernia repair positioning time: The patient will initially be positioned supine and upper extremity intravenous and arterial access points are dressed, padded and secured. The arms are padded and tucked at the patient’s sides. The patient must be secured to the table, including a soft chest and thigh strap, as it may be necessary to roll the table during the procedure to use gravity to assist with shifting the abdominal contents.. There is also consideration of positioning the patient relative to: laparoscopy equipment, including lines and video equipment and anesthesia lines relative to the rest of the equipment. The survey median positioning time reflects the time for this procedure for these activities.

**Postoperative E/M visit later on the day of surgery**

The typical patient will stay overnight or longer and there will typically be a visit later on the same day of the procedure at a level of 99232. Review data (eg, diagnostic and imaging studies) not available at the unit. Communicate with other health care professionals and with patient and/or family. Review medical records and data available on the unit. Perform a medically appropriate examination. Consider relevant data, options, and risks; formulate and/or revise diagnosis and treatment plan(s) (moderate complexity MDM). Discuss diagnosis and treatment options with the patient and/or family. Consider discharge needs of patient. Communicate with other health care professionals as necessary. Write and/or review orders, including arranging for necessary diagnostic testing, consultation(s), and therapeutic intervention(s). Complete medical record documentation. Address interval data obtained and reported changes in condition. Communicate results and additional care plans to other health care professionals and to the patient and/or family.

Per CMS policy for reporting postoperative work for 23-hour stay procedures, the intraservice time of 20 minutes for 99232 has been added to the survey immediate postoperative time (total = 40 min).

**Key Reference Code Intensity/Complexity Comparison**

Ref 1: The respondents indicated the intensity/complexity of survey code 49X04 is somewhat more than reference code 11005. Ref 2: The respondents indicated the intensity/complexity of survey code 49X04 is similar to somewhat more than reference code 33889.

**MPC Code Comparison**

MPC code 37244 has the highest RVW for the set of 0-day global codes.
CPT Code: 49X04

<td>108</td>
</tr>
</tbody>
</table>

\[ R^2 = 0.982 \]
Comparison of using the recommended RVW versus using the 25th percentile.

The first chart below shows reasonable correlation between the recommended RVW and WPUT—both trend lines have a similar slope. The second chart below shows no relationship of WPUT to the 25th percentile RVW—where WPUT decreases as work increases.

What if surgeon evaluation and management work were set equal to discrete E/M services?
As has been discussed by the RUC in the past, work intensities used for computation of IWPUT for time spent by physicians in the pre-service and immediate post-service period for surgical procedures have remained fixed since the early 1990s, while intensity of time for E/M values has received several increased values over several decades.

Recent increases for outpatient office E/M values were not allowed to be added to global codes by CMS. Because IWPUT is calculated by subtracting the pre- and post-work values from the RVW of a given CPT code, this has resulted in less value subtracted than would have occurred if the more appropriate pre- and post-work values were used for the IWPUT formula. This artificially increases the IWPUT and WPUT resulting in a decrease in relativity. This is especially true for codes that have a significant amount of pre-service and post-service work.

It has become difficult to compare IWPUT (and WPUT) for codes with different global periods because of the level of discounting of pre-service and post-service work. For example, for the top 34 high volume 10 and 90 day global codes, it has become difficult to compare IWPUT (and WPUT) for codes with different global periods because of the level of true for codes that have a significant amount of pre-service and post-service work.

IWPUT formula. This artificially increases the IWPUT and WPUT resulting in a decrease in relativity. This is especially true for codes that have a significant amount of pre-service and post-service work.

Using the discussion above, we have created the table below that presents the IWPUT and WPUT for the hernia set of codes using (1) the 2021 formulas, and (2) "full value" formulas. The note below the table describes each formula, but basically the full value formula sets pre- and post-service work equal to the same E/M work for non-surgical services. For comparison to facility non-surgical services, we have included codes 99283-99285 using the 2021 published RVW and time data. This table shows that most of the recommendations for 49X01-49X14 result in a WPUT that is less than an ED visit requiring moderate MDM (99284). This table also shows that those codes with similar WPUT to high MDM are appropriately the bigger and more complex procedures. Last, this table provides evidence that discounting pre- and post-work distorts and artificially impacts fair IWPUT and WPUT relativity comparison. However, if undiscounted work is applied, the recommendations for this set of codes are appropriately ranked.

* 2021 Formula: IWPUT calculation based on evaluation, positioning, immediate post op intensity of 0.0224; scrub/dress/wait intensity of 0.0081; and discounted same-day outpatient postop visit (not shown in table) equal to intra-service time at 0.0224. WPUT calculation equal to total time (including discounted postop visit time not shown on table) divided by work.
**2021 Full Value Formula: IWPUT calculation based on pre-service and immediate post-service time intensity of 0.043 (equal to WPUT for 99213) and same-day post EM at full value instead of discounted time for outpatient procedure as shown on table (highlighted in red).

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)
   
   - The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - Multiple codes allow flexibility to describe exactly what components the procedure included.
   - Multiple codes are used to maintain consistency with similar codes.
   - Historical precedents.
   - Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed)

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 11008

**Letter Referenced in Compelling Evidence Rationale**

November 29, 2011

The Honorable Kathleen Sebelius
Secretary
Department of Health and Human Services
Hubert H. Humphrey Building
200 Independence Avenue SW
Washington, DC 20201

Re: CY 2012 Medicare Physician Fee Schedule Final Rule and CMS Refinement Panels
Dear Secretary Sebelius:

On November 28, 2011, the Federal Register published the Centers for Medicare and Medicaid Services’ (CMS) Calendar Year (CY) 2012 Medicare Physician Fee Schedule Final Rule. On behalf of the American College of Surgeons (ACS), I am writing to express concern regarding the decision making process and lack of transparency on the part of CMS related to the work relative value units (wRVUs) for 2012 reviewed under CMS’ refinement panel process. The ACS, with over 78,000 members, is a scientific and educational organization of surgeons that was founded in 1913 to raise the standards of surgical practice and to improve the care of the surgical patient.

The ACS has participated in the efforts of the American Medical Association’s Relative Value Scale Update Committee (AMA RUC) for years given the value we place on the AMA RUC process and our assumption that CMS will evaluate the RUC recommendations with fairness, transparency, and accuracy according to a process that has been set out via the Federal rulemaking process. As part of the work that led to the CY 2012 Medicare Physician Fee Schedule Final Rule, the ACS devoted significant resources to conducting AMA RUC surveys for over 100 new or existing codes at the request of CMS. The AMA RUC evaluated wRVU recommendations made by the ACS, based upon those surveys, and came to agreement on final recommended values to be submitted to CMS.

Fifty-seven of the aforementioned codes that the ACS surveyed were sent to the refinement panel. CMS accepted only 12 percent of those refinement panel recommendations.

For most of the 88 percent of refinement panel recommendations that CMS rejected, CMS lowered the wRVU by reducing the value of the post-operative evaluation and management work performed by surgeons in the hospital by 69 percent. However, if that same work is performed by any other physician other than the surgeon, that same service is paid at 100 percent. We believe that the refinement panel physicians completely rejected this concept as they agreed to a work RVU that did not discount post-surgical work in this fashion. We note that the multispecialty panel included physicians from primary care, contractor medical directors (CMDs), physicians in related specialties, and general surgeons. At no time did the Agency's Medical Officer in charge of the panel process disagree with the presenters or offer a contrary opinion to the discussion.

Our concerns were piqued when CMS issued the CY 2011 Medicare Physician Fee Schedule Final Rule in which CMS stated that it could change wRVU recommendations of the refinement panel convened by CMS if “policy concerns warrant their modification,” without providing additional clarification on what would trigger this ability of CMS to subvert the more transparent process of the refinement panel. However, we continued to participate in the process under the belief that CMS would operate fairly and transparently and that if there were indeed “policy concerns” that CMS had regarding the values of the codes under consideration that those concerns would be stated clearly so all parties could address them during the refinement panel reviews.

CMS has now implemented a policy by which it is creating differential payments for the same work performed by different physicians as a backdoor mechanism for reducing the work RVUs for surgical procedures. They have valued the worth of a surgeon for post-operative evaluation and management work at about 30 percent of a non-surgeon. Non-surgeons are allowed to provide the same work to the same patient at 100 percent reimbursement. First, we believe that this policy leads to a loss of validity and integrity of the current system. In addition, this policy is prohibited by the Omnibus Budget Reconciliation Act of 1989, which states, “[t]he Secretary may not vary the conversion factor or the number of relative value units for a physicians’ service based on whether the physician furnishing the service is a specialist or based on the type of specialty of the physician.” (42 U.S.C. §1395w-4(c)(6)).

The ACS has been a vocal proponent of needed reforms in the delivery and payment of health care. We believe that the future of these reforms will be based on driving greater awareness of proven continuous quality improvement programs to achieve ongoing, tangible results for quality improvements. However, in order for these reforms to be effective, they must be built on a system that is consistent with previous Agency decisions, fair, and transparent, and it is our concern that many of the policy decisions made by CMS in the latest Medicare Physician Fee Schedule Final Rule move us away from those goals. The resource based relative value system (RBRVS) requires a resource basis for decisions on the valuation of physician services. We believe that the resource basis for the decision to reduce these values is not evident. We ask that under your authority as Secretary you will seek to have CMS define a more transparent process in the future for decisions that are not aligned with the RUC and refinement panel recommendations in order to help maintain the transparency and fairness of the current system and to restore the values of these services to the level that is supported by the RBRVS process.
Sincerely,
David B. Hoyt, MD, FACS
Executive Director
CPT Code: 49X05  
Tracking Number: C6  
Original Specialty Recommended RVU: 17.00

Presented Recommended RVU: 17.00

RUC Recommended RVU: 14.88

CPT Descriptor: Repair of anterior abdominal hernia(s) (ie, epigastric, incisional, ventral, umbilical, spigelian), any approach (ie, open, laparoscopic, robotic), initial including placement of mesh or other prosthesis, when performed total length of defect(s); greater than 10 cm, reducible

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 64-year-old obese male with a prior laparotomy has developed incisional hernias with defects of varying sizes at multiple points. He has symptoms of pain and tenderness at the sites. Physical exam reveals multiple reducible incisional hernias. He undergoes hernia repair of a defect that totals more than 10 cm with placement of mesh.

Percentage of Survey Respondents who found Vignette to be Typical: 90%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 100%, In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 3%, Overnight stay-less than 24 hours 48%, Overnight stay-more than 24 hours 50%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 87%

Description of Pre-Service Work: Results of preadmission testing (imaging, electrocardiogram and labs) are reviewed. Appropriate selection, timing, and administration of DVT prophylaxis are ensured. Appropriate selection, timing, and administration of antibiotics are ensured. The need for beta-blockers is assessed, and they are ordered as required. The patient is reexamined to confirm that physical findings have not changed, the patient’s medication regimen has remained the same, the patient has no new allergies, and the patient has not undergone any recent procedures. The history and physical examination are then updated in the electronic health record. The planned procedure and postoperative management are reviewed with the patient and family. Informed consent is reviewed and obtained from the patient, including witness confirmation. The palpable edge of the hernia defect(s) and sites of the proposed skin incisions are marked with cooperation of patient. The length and type of anesthesia, including adjuncts to postoperative analgesia management, are reviewed with the anesthesiologist. Verify that all required instruments and supplies are available, including reusable and disposable laparoscopic/robotic equipment and mesh. Assistance is provided in transfer of the patient from gurney to operating table. Monitor/assist with positioning of patient, including padding and securing patient to table that will adjust throughout procedure (eg, reverse Trendelenburg). Assist anesthesia team with line placement and induction of anesthesia and intubation, relative to all laparoscopic/robotic equipment. The areas of skin to be prepared and draped are indicated by the surgeon to ensure that all of the potential operative field is included in the preparation. The surgeon scrubs and gowns. A surgical time-out is performed with operating surgical team.

Description of Intra-Service Work: Abdominal access is obtained and a safe pneumoperitoneum is created with placement of a needle/trocar. As the hernia extends across the majority of the anterior abdominal wall, location for insertion of the needle/trocar is selected based on the prior surgical history and the safest location to avoid intra-abdominal injury. The camera is inserted and safe entry is verified. Additional trocars are placed in the lateral abdomen, and in additional areas as needed, all under direct vision. A field of adhesions occupies the entire anterior abdominal wall correlating with the extent of the prior laparotomy. The adhesions are divided sharply to free the anterior abdominal wall completely taking great care to avoid injury to the intestine. Each separate defect within the entire hernia defect contains adipose and intestinal components and requires a safe and effective clearance of tissue. The hernia defect is visualized. The falciform ligament and
preperitoneal fat are cleared from the abdominal wall fascia to expose the posterior fascia to include wide lateral clearance for adequate later mesh coverage. Peritoneal flaps are created for placement of mesh. The fascial defect is approximated with sutures placed along the entire length of the defect. The appropriate size mesh is calculated after total defect length is documented. Adequate overlap of at least 5 cm in all directions is included in the calculation. A trocar is removed from the abdominal wall and the track is dilated to allow insertion of the large mesh into the peritoneal cavity. The mesh is oriented intra-abdominally. Insufflation is reduced to facilitate mesh conformity to the anterior abdominal wall. The mesh is secured to the abdominal wall utilizing multiple sutures and numerous tacks. The peritoneal flaps are then sutured over the mesh to protect it from the abdominal viscera. Completion camera survey is performed of the abdomen and contents to inspect for bleeding and visceral injury. Irrigation is performed as necessary. Fascial incisions from laparoscopic ports larger than 1 cm are closed with a suture passer. Skin incisions are closed according to surgeon preference.

Description of Post-Service Work:
Immediate postoperative care [operative day through discharge from recovery room]: Apply sterile dressings. Monitor patient during reversal of anesthesia. Assist in transfer of patient from operating table to gurney. Monitor transport of patient from operating room to recovery room. Discuss postoperative recovery care with anesthesia and nursing staff, including need for patient-controlled analgesia. Discontinue prophylactic antibiotic therapy, as appropriate. Review postoperative labs. Discuss procedure and outcome with family in waiting area. Write brief operative note or complete final operative note and place in chart. Write postoperative note in the recovery room. Dictate operative report and copy referring physician(s). Call referring physician(s). Write orders for transferring to observation or general surgical floor and discuss ongoing care with nursing staff.

Later same day hospital observation care visit [operative day after discharge from recovery room]: Review interval nursing/other staff chart notes. Discuss ongoing care with nursing staff. Evaluate vital signs and intake/output. Auscultate heart, lungs, and abdomen for bowel sounds. Monitor fluid and electrolyte status and renal function; monitor for problems such as ileus, intestinal ischemia, and urinary retention. Examine patient, check wounds, and change dressings. Continue prophylaxis for DVT. Assess need for beta-blockers, order as required. Assess pain scores and adequacy of analgesia. Write orders for labs, films, medications, diet, and patient activity. Chart patient progress notes. Answer patient and family questions. Answer nursing/other staff questions. Advance diet, as appropriate.

### Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC’s rationale, please review the separate RUC recommendation document.
Background

RAW Screen
Code 49565, *Repair recurrent incisional or ventral hernia; reducible*, was identified by the RUC/RAW with a site of service anomaly: less than 50% inpatient status; includes inpatient visit codes; greater than 5,000 utilization. Prior to submitting an Action Plan to the RAW, the societies reviewed the site of service data and found: almost even split of 48% between inpatient and outpatient – with a few percent in the ASC. At the January 2020 RUC meeting, the societies requested referral of code 49565 to CPT to update the descriptor to current standard of practice and typical patient presentation.

CPT Coding Changes
At the February 2021 CPT meeting the following changes were approved:
- Delete all the current open and laparoscopic codes for repair of anterior abdominal hernias.
- Delete add-on code 49568 for mesh for open ventral/incisional hernias and large defects as a result of necrotizing soft tissue infection.
- Add 12 new codes for anterior abdominal hernia repair by any approach (ie, open laparoscopic, robotic); by initial or recurrent; by total defect size; and by reducible or incarcerated/strangulated
- Add 2 codes for parastomal hernia repair - by reducible or incarcerated/strangulated
- Add 1 add-on code for removal of mesh/prosthesis – only with the new hernia repair codes
- Add 1 new code for mesh/prosthesis for delayed closure of external genitalia, perineum and/or abdominal wall defect(s) due to soft tissue infection or trauma.

Coding Structure
Hernia repair for epigastric, incisional, ventral, umbilical, spigelian were merged as they all appear on the anterior abdomen. The location—upper, lower, midline—does not impact the work. But instead, the size and number of defects is the driving factor for work. For example, with respect to the code that was tagged by the RAW, a recurrent, incisional, reducible hernia can be anywhere from a small hernia at a port site from a prior laparoscopic procedure to an extremely large hernia with multiple defects clustered in a midline incision.

Initial versus recurrent differentiation was maintained. Recurrent hernias are re-reoperations. An initial hernia can be the result of a prior procedure (this is not a recurrent hernia) or weak muscles and fascia. A recurrent hernia is typically at least the third time the same site is being operated on.

For example,
- operation 1 might be an open colectomy
- operation 2 would be an initial midline hernia repair
- operation 3 would be a recurrent midline hernia involving the initial midline repair and may include other multiple hernias occurring in the same old incision, all needing to be repaired.

There are many examples in CPT that differentiate between a primary and secondary procedure: disarticulation of shoulder (23920-23921); amputation of arm through humerus (24900-24930) and other similar amputation families; tendon repair (eg, 25260-25274); CABG reoperation (33530); and revision total joint (eg, 23473, 23474, 24370, 24371, 27134-27138).

The hernia size ranges were based on a review of literature and expert panel. For example, an article published in the Journal of the American College of Surgeons reviewed technique and outcomes of abdominal incisional hernia repair and showed that the range of defect size was from less than 1 cm to more than 25 cm with a mean of 6 cm and a median of less than 3 cm. Other similar articles were submitted with the code change application, supporting different work for different defect size. David A. Iannitti, et.al, *Technique and Outcomes of Abdominal Incisional Hernia Repair Using a Synthetic Composite Mesh: A Report of 455 Cases*, Journal of the American College of Surgeons, Volume 206, Issue 1, 2008, Pages 83-88, ISSN 1072-7515, https://doi.org/10.1016/j.jamcollsurg.2007.07.030.

Differentiating the work of a procedure in relationship to size or extent is not new for CPT. For example, 36 skin repair codes by length of repair; 44 lesion excision codes by excised diameter; 46 soft tissue tumor excision codes by size of tumor; 23 hysterectomy codes by size of uterus (58260-58573); 3 myomectomy codes are differentiated by total weight of the myomas (58140-58146); and 10 nerve graft codes are based on length of graft. (64885-64898)
The CPT guidelines and illustrations that describe how to measure the total defect size are well understood by surgeons. This is not a new concept – surgeons are very familiar with measuring a hernia defect, and in fact the size of the hernia defect was included in some of the patient vignettes in 1993. Furthermore, measurement of hernia size is a necessary step for selecting and preparing the appropriately sized mesh for implantation.

Hernia repair coding has been complicated by changes in (1) technology and technique and (2) the recent implementation of ICD-10-PCS codes. For these reasons, the stakeholder societies believed this set of codes should describe "any approach." The societies and the AMA Coding Network have received numerous coding questions about correct reporting for "hybrid" abdominal hernia repair procedures where parts of the procedure are performed via an open approach and parts of the procedure are performed via laparoscopy or with the use of a robot. These are not laparoscopic procedures converted to open procedures, but instead procedures that are more often begun open and then finished as laparoscopic/robotic under pneumoperitoneum.

Another issue that has recently caused confusion about coding has appeared on national coder websites and coder discussion boards referring to International Classification of Diseases Tenth Revision Procedure Coding System (ICD-10-PCS) codes which classifies procedures performed in the facility (ie, not CPT physician procedures). This, however, is important because facilities want the procedure codes reported to correspond with the descriptors of ICD-10-PCS codes that the facility is reporting. Unfortunately, the new ICD-10-PCS codes define various surgical approaches that do not correspond to CPT coding (open, closed, percutaneous, and laparoscopic). For example, the ICD-10-PCS "open endoscopic" approach is defined as "cutting through the skin or mucous membrane and any other body layers necessary to expose a body part, and introduction of instrumentation to reach and visualize the site of the procedure." A second example is the "open with percutaneous endoscopic assistance" approach defined as "cutting through the skin or mucous membrane and any other body layers necessary to expose the site of the procedure, and entry, by puncture or minor incision, of instrumentation through the skin or mucous membrane and any other body layers necessary to aid in the performance of the procedure." These new ICD-10-PCS codes have resulted in coders stating that a procedure should be reported as open because the ICD-10-PCS code indicates open and to report any procedure that includes extension of a port incision (eg, for delivery of a specimen) to be reported as an open procedure --instead of being correctly reported as a laparoscopic procedure.

Mesh

- **Implantation of mesh is now typical and therefore was bundled into the new codes.** When code 49568 was created in 1993, mesh implantation with hernia repairs was not typical. This is supported by the typical patient described in 1993 as having a 10 cm midline incisional hernia – a very large hernia. With research on the causes of hernia recurrence, changes in technology and development of new types of mesh or other prosthesis, implantation of mesh is now typical for all types of hernias and all sizes to reduce the incidence of recurrence. This was supported by the literature submitted with the CCA.

- **Mesh removal is not always required and is not typical.** Technology and research have developed types of mesh that are now being implanted which are incorporated into the abdominal wall, reducing the risk of infection, complications, and recurrence. When mesh removal is indicated, it is typically due to hardening and fracturing of aged mesh, or when gross contamination and infection has occurred (eg, enterocutaneous fistula involving the mesh). For example, a recurrent hernia repair may require removal of fractured, brittle (old technology) mesh many years after an open repair following a colectomy. This work is typically significant, in that the mesh is often integrated with the abdominal wall or adhered to intestine, and involves removal of all of the mesh, not just a small portion. An add-on code to report mesh removal prior to hernia repair, when required, allows for accurate reporting of this work only when performed, which our expert panel believes is not typical of most hernia repairs.

- **Deletion of code 49658 resulted in rare "left over" work for implantation of mesh related to closure for a large open wound after debridement for necrotizing fasciitis.** Add-on code 46958 was reported for mesh placement for both open hernia repair and in relation to closure of wounds from necrotizing soft tissue infection. This code will be deleted and the work of mesh placement will be included in the work for all of the anterior abdominal hernia repair codes. The remaining use of code 46958 was for mesh placement for delayed closure of external genitalia, perineum and/or abdominal wall defect(s) due to soft tissue infection or trauma. As described in the vignette for 157X1, necrotizing soft tissue infections typically result in a large open wound that cannot be closed primarily. When the infection has resolved, absorbable mesh or other prosthesis is placed to allow healing by
Compelling Evidence - Flawed methodology of previous reviews, New technology

Flawed Methodology: Codes 49560, 49561, 49565, 49566, 49570, 49572, 49580, 49582, 49585, and 49590 were last reviewed in 2000 during the 2nd 5-year-review. During this review, the American College of Surgeons argued that there was compression of work values for big procedures and there were rank order issues within families of codes. We developed a methodology using NSQIP data that was approved by the Research Subcommittee. However, to validate the methodology, the 5YR Workgroup instructed the ACS to group the codes into families and survey one or two CPT codes as full surveys per family to act as anchors for each family and the rest of the codes to be surveyed as mini-surveys for only time and visits. After conducting all of the surveys, we believe we were able to validate the methodology that we proposed, however, the 5YR Workgroup did not agree. Instead, they decided that the value that they assigned to the anchor code (the full survey) would be extrapolated to all of the other codes grouped into the same survey. The hernia codes listed above were grouped with 49505 which was increased by 17% based on the survey data and compelling evidence. The 17% increase was applied to the other codes in the group without consideration of rank order, mini survey results or society recommendations. This resulted in continuation of compression and rank order issues. For example, although code 49572 was increased by 17%, the IWPUT for the code is negative. Other codes have near zero IWPUT. We believe this was a flawed methodology of review of the codes and meets compelling evidence.

Flawed Methodology: Codes 49587, 49652, 49653, 49654, and 49655 were last reviewed in 2011 based on a site of service anomaly screen. At that time, the RUC approved including a same day observation visit and full observation discharge on the subsequent day. The RUC noted that the typical patient requires close monitoring for problems such as ileus, intestinal ischemia and urinary retention. Additionally, there will be significant pain post-operatively requiring management before discharge. The specialty noted, and the RUC agreed, that the shift in patient facility status (in patient moving to outpatient—as determined by CMS) has little to do with healthier patients that require less physician work and everything to do with the recent OPPS changes related to facility reimbursement. This was substantiated by the survey data which showed that the typical patients stayed at least overnight and received a postoperative same-day E/M service. Given this data, the RUC enacted its (then current) policy to allocate the appropriate proxy for the postoperative visits which was categorized as either subsequent observation and/or observation discharge—both of which are outpatient codes. Importantly, the specialties argued and the RUC agreed that the work of providers who care for medical patients should not be discounted (eg, full observation E/M and full observation discharge E/M allowed for patient staying overnight for observation.)

CMS ignored the valid outpatient E/M visit code inputs that the RUC recommended and instead stated in the Rule that they have a policy of not allowing "inpatient" visits included in the details for outpatient services. These codes went through a Refinement Panel process [ie, a CMS convened group of Medical Officers and select physicians acting as a separate formal appeals process] that resulted in agreement with the RUC recommendations. Importantly, the Agency still maintained that inpatient visits would not be allowed (even though outpatient/observation visits were submitted by the RUC) and then used a reverse building block methodology to subtract work RVUs from the values. These values had been developed by magnitude estimation and approved by the RUC. The Agency deleted the observation visit code inputs and decreased discharge management by 50 percent even though it was performed on a subsequent date. We believe this action by CMS resulted in a flawed methodology of review of these codes and meets compelling evidence.

The rejection of equal value for equal work and rejection of the Refinement Panel results prompted the Executive Director of the American College of Surgeons to send a letter (see last page of SoR) to Kathleen Sebelius, then Secretary of the Department of Health and Human Services on November 29, 2011. This letter addressed the decision-making process for valuing procedure codes that have Medicare outpatient status, the use of refinement panels, and the arbitrary discount in physician work for the same work performed by any provider of a non-global service. Specifically, the letter included the following statement:

"CMS has now implemented a policy by which it is creating differential payments for the same work performed by different physicians as a backdoor mechanism for reducing the work RVUs for surgical procedures. They have valued the worth of a surgeon for post-operative evaluation and management work at about 30 percent of a non-surgeon. Non-surgeons are allowed to provide the same work to the same patient at 100 percent reimbursement. …we believe that this policy leads to a loss of validity and integrity of the current system."
We continue to believe there is no valid justification for a 50% discount to discharge management services provided by a surgeon that is performed the day after a procedure when a non-surgical provider observing a medical patient who is kept overnight for any reason is allowed to bill a discharge management service at 100 percent for work on the next day. We also believe there is no valid justification for discounting a postoperative visit later the same day of surgery to equal only the intra-service time of the visit multiplied by an intensity of 0.0224. No surgeon would round on a postoperative patient the same day and not review interval chart notes prior to the face-to-face with the patient and not follow up with charting the visit and confirming or modifying the current orders.

CMS implemented a 23-hour policy for discounting surgical postoperative work based on the argument that the Agency could not include inpatient work in their time/work file. However, the fact is that the Agency has also erroneously rejected RUC recommendations for outpatient/observation codes, stating "these inpatient codes" could not be included for procedure that are typically outpatient.

**Change in Technology:** Since the last review of the hernia repair codes (either in 2000 or in 2011), there has been introduction and application of new technology (ie, robotic assist) which adds work complexity and time with the goal of better patient outcomes. The diffusion of this new technology throughout this family of codes further meets compelling evidence.

**Recommendation – 49X05**

We recommend a work RVU of 17.00, which is the survey median.

**Pre-service time**

Scrub, dress, wait package time has been reduced so as to not exceed survey median data.

Laparoscopic/robotic anterior abdominal hernia repair positioning time:
The patient will initially be positioned supine and upper extremity intravenous and arterial access points are dressed, padded and secured. The arms are padded and tucked at the patient’s sides. The patient must be secured to the table, including a soft chest and thigh strap, as it may be necessary to roll the table during the procedure to use gravity to assist with shifting the abdominal contents. There is also consideration of positioning the patient relative to: laparoscopy equipment, including lines and video equipment and anesthesia lines relative to the rest of the equipment. The survey median positioning time reflects the time for this procedure for these activities.

**Postoperative E/M visit later on the day of surgery**

The typical patient will stay overnight or longer and there will typically be a visit later on the same day of the procedure at a level of 99232. Review data (eg, diagnostic and imaging studies) not available at the unit. Communicate with other health care professionals and with patient and/or family. Review medical records and data available on the unit. Perform a medically appropriate examination. Consider relevant data, options, and risks; formulate and/or revise diagnosis and treatment plan(s) (moderate complexity MDM). Discuss diagnosis and treatment options with the patient and/or family. Consider discharge needs of patient. Communicate with other health care professionals as necessary. Write and/or review orders, including arranging for necessary diagnostic testing, consultation(s), and therapeutic intervention(s). Complete medical record documentation. Address interval data obtained and reported changes in condition. Communicate results and additional care plans to other health care professionals and to the patient and/or family.

Per CMS policy for reporting postoperative work for 23-hour stay procedures, the intraservice time of 20 minutes for 99232 has been added to the survey immediate postoperative time (total = 40 min).

**Key Reference Code Intensity/Complexity Comparison**

Ref 1: The respondents indicated the intensity/complexity of survey code 49X05 is similar to somewhat more than reference code 21813. Ref 2: The respondents indicated the intensity/complexity of survey code 49X05 is somewhat more than reference code 11005.

**MPC Code Comparison**

MPC code 37244 has the highest RVW for the set of 0-day global codes.
CPT Code: 49X05

Relativity Assessment

Recommended RVW vs Total Time

The chart below that compares the recommended RVW and total time shows good correlation.

![Recommended RVW vs Total Time](Recommended_RVV_Ws_Total_Time.png)

The data below that were used to create the chart above show appropriate relative rank order for work for this new set of hernia repair codes.

</table>
Comparison of using the recommended RVW versus using the 25th percentile.

The first chart below shows reasonable correlation between the recommended RVW and WPUT—both trend lines have a similar slope. The second chart below shows no relationship of WPUT to the 25th percentile RVW—where WPUT decreases as work increases.

What if surgeon evaluation and management work were set equal to discrete E/M services?
As has been discussed by the RUC in the past, work intensities used for computation of IWPUT for time spent by physicians in the pre-service and immediate post-service period for surgical procedures have remained fixed since the early 1990s, while intensity of time for E/M values has received several increased values over several decades.

Recent increases for outpatient office E/M values were not allowed to be added to global codes by CMS. Because IWPUT is calculated by subtracting the pre- and post-work values from the RVW of a given CPT code, this has resulted in less value subtracted than would have occurred if the more appropriate pre- and post-work values were used for the IWPUT formula. This artificially increases the IWPUT and WPUT resulting in a decrease in relativity. This is especially true for codes that have a significant amount of pre-service and post-service work.

It has become difficult to compare IWPUT (and WPUT) for codes with different global periods because of the level of discounting of pre-service and post-service work. For example, for the top 34 high volume 10 and 90 day global codes, AMA staff recently calculated the difference in IWPUT if the office visit increases were used in the IWPUT equation. The AMA table, which is included in the Research Subcommittee agenda for this meeting, showed that the IWPUT would have decreased from -6% to -548% depending on the number of office visits included in the work/time file. To emphasize the importance of this information, the code which would have had the largest decrease (17000) has 3 minutes of intra-time and only one postop office visit (99212). In this table, it was also clear that relativity within a family of codes is lost, because each code within a family may have varying levels of post-service work. To summarize, IWPUT has become much less accurate when used as a comparator of intra-service work within and between families because of CMS actions (ie, not updating global RVW) and policy (ie, discounting postoperative work).

Using the discussion above, we have created the table below that presents the IWPUT and WPUT for the hernia set of codes using (1) the 2021 formulas, and (2) "full value" formulas. The note below the table describes each formula, but basically the full value formula sets pre- and post-service work equal to the same E/M work for non-surgical services. For comparison to facility non-surgical services, we have included codes 99283-99285 using the 2021 published RVW and time data. This table shows that most of the recommendations for 49X01-49X14 result in a WPUT that is less than an ED visit requiring moderate MDM (99284). This table also shows that those codes with similar WPUT to high MDM are appropriately the bigger and more complex procedures. Last, this table provides evidence that discounting pre- and post-work distorts and artificially impacts fair IWPUT and WPUT relativity comparison. However, if undiscounted work is applied, the recommendations for this set of codes are appropriately ranked.

* 2021 Formula: IWPUT calculation based on evaluation, positioning, immediate post intensity of 0.0224; scrub/dress/wait intensity of 0.0081; and discounted same-day outpatient postop visit (not shown in table) equal to intra-service time at 0.0224. WPUT calculation equal to total time (including discounted postop visit time not shown on table) divided by work.
SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed)

- 49560 Repair initial incisional or ventral hernia; reducible 090
- 49570 Repair epigastric hernia (eg, preperitoneal fat); reducible (separate procedure) 090
- 49585 Repair umbilical hernia, age 5 years or older; reducible 090
- 49590 Repair spigelian hernia 090
- 49652 Laparoscopy, surgical, repair, ventral, umbilical, spigelian or epigastric hernia (includes mesh insertion, when performed); reducible 090
- 49654 Laparoscopy, surgical, repair, incisional hernia (includes mesh insertion, when performed); reducible 090
- 49568 Implantation of mesh or other prosthesis for open incisional or ventral hernia repair or mesh for closure of debridement for necrotizing soft tissue infection (List separately in addition to code for the incisional or ventral hernia repair) ZZZ

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

**Letter Referenced in Compelling Evidence Rationale**

November 29, 2011

The Honorable Kathleen Sebelius
Secretary
Department of Health and Human Services
Hubert H. Humphrey Building
200 Independence Avenue SW
Washington, DC 20201

Re: CY 2012 Medicare Physician Fee Schedule Final Rule and CMS Refinement Panels

Dear Secretary Sebelius:
On November 28, 2011, the Federal Register published the Centers for Medicare and Medicaid Services’ (CMS) Calendar Year (CY) 2012 Medicare Physician Fee Schedule Final Rule. On behalf of the American College of Surgeons (ACS), I am writing to express concern regarding the decision making process and lack of transparency on the part of CMS related to the work relative value units (wRVUs) for 2012 reviewed under CMS’ refinement panel process. The ACS, with over 78,000 members, is a scientific and educational organization of surgeons that was founded in 1913 to raise the standards of surgical practice and to improve the care of the surgical patient.

The ACS has participated in the efforts of the American Medical Association’s Relative Value Scale Update Committee (AMA RUC) for years given the value we place on the AMA RUC process and our assumption that CMS will evaluate the RUC recommendations with fairness, transparency, and accuracy according to a process that has been set out via the Federal rulemaking process. As part of the work that led to the CY 2012 Medicare Physician Fee Schedule Final Rule, the ACS devoted significant resources to conducting AMA RUC surveys for over 100 new or existing codes at the request of CMS. The AMA RUC evaluated wRVU recommendations made by the ACS, based upon those surveys, and came to agreement on final recommended values to be submitted to CMS.

Fifty-seven of the aforementioned codes that the ACS surveyed were sent to the refinement panel. CMS accepted only 12 percent of those refinement panel recommendations.

For most of the 88 percent of refinement panel recommendations that CMS rejected, CMS lowered the wRVU by reducing the value of the post-operative evaluation and management work performed by surgeons in the hospital by 69 percent. However, if that same work is performed by any other physician other than the surgeon, that same service is paid at 100 percent. We believe that the refinement panel physicians completely rejected this concept as they agreed to a work RVU that did not discount post-surgical work in this fashion. We note that the multispecialty panel included physicians from primary care, contractor medical directors (CMDs), physicians in related specialties, and general surgeons. At no time did the Agency's Medical Officer in charge of the panel process disagree with the presenters or offer a contrary opinion to the discussion.

Our concerns were piqued when CMS issued the CY 2011 Medicare Physician Fee Schedule Final Rule in which CMS stated that it could change wRVU recommendations of the refinement panel convened by CMS if "policy concerns warrant their modification," without providing additional clarification on what would trigger this ability of CMS to subvert the more transparent process of the refinement panel. However, we continued to participate in the process under the belief that CMS would operate fairly and transparently and that if there were indeed “policy concerns” that CMS had regarding the values of the codes under consideration that those concerns would be stated clearly so all parties could address them during the refinement panel reviews.

CMS has now implemented a policy by which it is creating differential payments for the same work performed by different physicians as a backdoor mechanism for reducing the work RVUs for surgical procedures. They have valued the worth of a surgeon for post-operative evaluation and management work at about 30 percent of a non-surgeon. Non-surgeons are allowed to provide the same work to the same patient at 100 percent reimbursement. First, we believe that this policy leads to a loss of validity and integrity of the current system. In addition, this policy is prohibited by the Omnibus Budget Reconciliation Act of 1989, which states, “[t]he Secretary may not vary the conversion factor or the number of relative value units for a physicians’ service based on whether the physician furnishing the service is a specialist or based on the type of specialty of the physician.” (42 U.S.C. §1395w-4(c)(6)).

The ACS has been a vocal proponent of needed reforms in the delivery and payment of health care. We believe that the future of these reforms will be based on driving greater awareness of proven continuous quality improvement programs to achieve ongoing, tangible results for quality improvements. However, in order for these reforms to be effective, they must be built on a system that is consistent with previous Agency decisions, fair, and transparent, and it is our concern that many of the policy decisions made by CMS in the latest Medicare Physician Fee Schedule Final Rule move us away from those goals. The resource based relative value system (RBRVS) requires a resource basis for decisions on the valuation of physician services. We believe that the resource basis for the decision to reduce these values is not evident. We ask that under your authority as Secretary you will seek to have CMS define a more transparent process in the future for decisions that are not aligned with the RUC and refinement panel recommendations in order to help maintain the transparency and fairness of the current system and to restore the values of these services to the level that is supported by the RBRVS process.

Sincerely,
### AMERICAN MEDICAL ASSOCIATION SPECIALTY SOCIETY RVS UPDATE PROCESS

**CPT Descriptor:** Repair of anterior abdominal hernia(s) (ie, epigastric, incisional, ventral, umbilical, spigelian), any approach (ie, open, laparoscopic, robotic), initial including placement of mesh or other prosthesis, when performed total length of defect(s); greater than 10 cm, incarcerated or strangulated

### CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 64-year-old obese male with a prior laparotomy has developed incisional hernias with defects of varying sizes at multiple points. The defects have been increasing in size during follow-up with increasing symptoms. Physical exam reveals multiple tender and nonreducible incisional hernias. He undergoes hernia repair of a defect that totals more than 10 cm with placement of mesh.

Percentage of Survey Respondents who found Vignette to be Typical: 90%

**Site of Service (Complete for 010 and 090 Globals Only)**

</tr>
<tr>
<td>Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&amp;M service later on the same day 95%</td>
</tr>
</tbody>
</table>

**Description of Pre-Service Work:** Results of preadmission testing (imaging, electrocardiogram and labs) are reviewed. Appropriate selection, timing, and administration of DVT prophylaxis are ensured. Appropriate selection, timing, and administration of antibiotics are ensured. The need for beta-blockers is assessed, and they are ordered as required. The patient is reexamined to confirm that physical findings have not changed, the patient’s medication regimen has remained the same, the patient has no new allergies, and the patient has not undergone any recent procedures. The history and physical examination are then updated in the electronic health record. The planned procedure and postoperative management are reviewed with the patient and family. Informed consent is reviewed and obtained from the patient, including witness confirmation. The masses of the material incarcerated in the hernia are palpated obscuring the edge of the hernia defect(s). The sites of the proposed skin incisions are marked with cooperation of patient. The length and type of anesthesia, including adjuncts to postoperative analgesia management, are reviewed with the anesthesiologist. Verify that all required instruments and supplies are available, including reusable and disposable laparoscopic/robotic equipment and mesh. Assistance is provided in transfer of the patient from gurney to operating table. Monitor/assist with positioning of patient, including padding and securing patient to table that will adjust throughout procedure (eg, reverse Trendelenburg). Assist anesthesia team with line placement and induction of anesthesia and intubation, relative to all laparoscopic/robotic equipment. The areas of skin to be prepared and draped are indicated by the surgeon to ensure that all of the potential operative field is included in the preparation. The surgeon scrubs and gowns. A surgical time-out is performed with operating surgical team.

**Description of Intra-Service Work:** Abdominal access is obtained and a safe pneumoperitoneum is created with placement of a needle/trocar. As the hernia extends across the majority of the anterior abdominal wall, location for insertion of the needle/trocar is selected based on the prior surgical history and the safest location to avoid intra-abdominal injury. The camera is inserted and safe entry is verified. Additional trocars are placed in the lateral abdomen, under direct vision. A large field of adhesions occupies the entire anterior abdominal wall correlating with the extent of the prior laparotomy. Adhesions are divided sharply to free the anterior abdominal wall completely taking great care to avoid injury to the intestine. Each separate defect within the entire hernia defect contains adipose and intestinal components and requires a safe
and effective clearance of tissue. The incarcerated/strangulated bowel, mesentery and omentum are carefully reduced with dissection of the adhesions and sac to clear all the defects for repair. Care is taken to avoid injury to the incarcerated tissue. This requires manipulation both intra-abdominally with minimally invasive instrumentation and extra-abdominally with palpation and pressure applied to the abdominal wall to reduce the incarcerated contents. The reduced tissue is examined for viability and any inadvertent injury. The falciform ligament and preperitoneal fat are cleared from the abdominal wall fascia to expose all defects and enough surface for mesh overlap. The hernia sac is reduced and resected as needed to expose the fascial edges of the defect(s). The hernia defect is visualized. The defects are measured with a minimum craniocaudal length greater than 10 cm. Peritoneal flaps are created for placement of mesh. The fascial defect is approximated with sutures placed along the entirety of the defect. The appropriate size mesh is calculated after total defect length is documented. Adequate overlap of at least 5 cm in all directions is included in the calculation. A trocar is removed from the abdominal wall and the track is dilated to allow insertion of the large mesh into the peritoneal cavity. The mesh is oriented intra-abdominally. Insufflation is reduced to facilitate mesh conformity to the anterior abdominal wall. The mesh is secured to the abdominal wall utilizing sutures and tacks. The peritoneal flaps are then sutured over the mesh to protect it from the abdominal viscera. Completion camera survey is performed of the abdomen and contents to inspect for bleeding and visceral injury and perform a final viability assessment of the material once incarcerated in the hernia sac. Irrigation is performed as necessary. Fascial incisions for laparoscopic ports larger than 1 cm are closed with a suture passer. Skin incisions are closed according to surgeon preference.

Description of Post-Service Work:
Immediate postoperative care [operative day through discharge from recovery room]: Apply sterile dressings. Monitor patient during reversal of anesthesia. Assist in transfer of patient from operating table to gurney. Monitor transport of patient from operating room to recovery room. Discuss postoperative recovery care with anesthesia and nursing staff, including need for patient-controlled analgesia. Discontinue prophylactic antibiotic therapy, as appropriate. Review postoperative labs. Discuss procedure and outcome with family in waiting area. Write brief operative note or complete final operative note and place in chart. Write postoperative note in the recovery room. Dictate operative report and copy referring physician(s). Call referring physician(s). Write orders for transferring to general surgical floor and discuss ongoing care with nursing staff.

Later same day hospital inpatient care visit [operative day after discharge from recovery room]: Review interval nursing/other staff chart notes. Discuss ongoing care with nursing staff. Evaluate vital signs and intake/output. Auscultate heart, lungs, and abdomen for bowel sounds. Monitor fluid and electrolyte status and renal function; monitor for problems such as ileus, intestinal ischemia, and urinary retention. Examine patient, check wounds, and change dressings. Continue prophylaxis for DVT. Assess need for beta-blockers, order as required. Assess pain scores and adequacy of analgesia. Write orders for labs, films, medications, diet, and patient activity. Chart patient progress notes. Answer patient and family questions. Answer nursing/other staff questions. Advance diet, as appropriate.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

*The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC’s rationale, please review the separate RUC recommendation document.*
Background

RAW Screen
Code 49565, Repair recurrent incisional or ventral hernia; reducible, was identified by the RUC/RAW with a site of service anomaly: less than 50% inpatient status; includes inpatient visit codes; greater than 5,000 utilization. Prior to submitting an Action Plan to the RAW, the societies reviewed the site of service data and found: almost even split of 48% between inpatient and outpatient – with a few percent in the ASC. At the January 2020 RUC meeting, the societies requested referral of code 49565 to CPT to update the descriptor to current standard of practice and typical patient presentation.

CPT Coding Changes
At the February 2021 CPT meeting the following changes were approved:

- Delete all the current open and laparoscopic codes for repair of anterior abdominal hernias.
- Delete add-on code 49568 for mesh for open ventral/incisional hernias and large defects as a result of necrotizing soft tissue infection.
- Add 12 new codes for anterior abdominal hernia repair by any approach (ie, open laparoscopic, robotic); by initial or recurrent; by total defect size; and by reducible or incarcerated/strangulated
- Add 2 codes for parastomal hernia repair - by reducible or incarcerated/strangulated
- Add 1 add-on code for removal of mesh/prosthesis – only with the new hernia repair codes
- Add 1 new code for mesh/prosthesis for delayed closure of external genitalia, perineum and/or abdominal wall defect(s) due to soft tissue infection or trauma.

Coding Structure
Hernia repair for epigastric, incisional, ventral, umbilical, spigelian were merged as they all appear on the anterior abdomen. The location--upper, lower, midline—does not impact the work. But instead, the size and number of defects is the driving factor for work. For example, with respect to the code that was tagged by the RAW, a recurrent, incisional, reducible hernia can be anywhere from a small hernia at a port site from a prior laparoscopic procedure to an extremely large hernia with multiple defects clustered in a midline incision.

Initial versus recurrent differentiation was maintained. Recurrent hernias are re-reoperations. An initial hernia can be the result of a prior procedure (this is not a recurrent hernia) or weak muscles and fascia. A recurrent hernia is typically at least the third time the same site is being operated on.

For example,
- operation 1 might be an open colectomy
- operation 2 would be an initial midline hernia repair
- operation 3 would be a recurrent midline hernia involving the initial midline repair and may include other multiple hernias occurring in the same old incision, all needing to be repaired.

There are many examples in CPT that differentiate between a primary and secondary procedure: disarticulation of shoulder (23920-23921); amputation of arm through humerus (24900-24930) and other similar amputation families; tendon repair (eg, 25260-25274); CABG reoperation (33530); and revision total joint (eg, 23473, 23474, 24370, 24371, 27134-27138).

The hernia size ranges were based on a review of literature and expert panel. For example, an article published in the Journal of the American College of Surgeons reviewed technique and outcomes of abdominal incisional hernia repair and showed that the range of defect size was from less than 1 cm to more than 25 cm with a mean of 6 cm and a median of less than 3 cm. Other similar articles were submitted with the code change application, supporting different work for different defect size. David A. Iannitti, et al., Technique and Outcomes of Abdominal Incisional Hernia Repair Using a Synthetic Composite Mesh: A Report of 455 Cases, Journal of the American College of Surgeons, Volume 206, Issue 1, 2008, Pages 83-88, ISSN 1072-7515, https://doi.org/10.1016/j.jamcollsurg.2007.07.030.

Differentiating the work of a procedure in relationship to size or extent is not new for CPT. For example, 36 skin repair codes by length of repair; 44 lesion excision codes by excised diameter; 46 soft tissue tumor excision codes by size of tumor; 23 hysterectomy codes by size of uterus (58260-58573); 3 myomectomy codes are differentiated by total weight of the myomas (58140-58146); and 10 nerve graft codes are based on length of graft. (64885-64898)
The CPT guidelines and illustrations that describe how to measure the total defect size are well understood by surgeons. This is not a new concept – surgeons are very familiar with measuring a hernia defect, and in fact the size of the hernia defect was included in some of the patient vignettes in 1993. Furthermore, measurement of hernia size is a necessary step for selecting and preparing the appropriately sized mesh for implantation.

Hernia repair coding has been complicated by changes in (1) technology and technique and (2) the recent implementation of ICD-10-PCS codes. For these reasons, the stakeholder societies believed this set of codes should describe "any approach." The societies and the AMA Coding Network have received numerous coding questions about correct reporting for "hybrid" abdominal hernia repair procedures where parts of the procedure are performed via an open approach and parts of the procedure are performed via laparoscopy or with the use of a robot. These are not laparoscopic procedures converted to open procedures, but instead procedures that are more often begun open and then finished as laparoscopic/robotic under pneumoperitoneum.

Another issue that has recently caused confusion about coding has appeared on national coder websites and coder discussion boards referring to International Classification of Diseases Tenth Revision Procedure Coding System (ICD-10-PCS) codes which classifies procedures performed in the facility (ie, not CPT physician procedures). This, however, is important because facilities want the procedure codes reported to correspond with the descriptors of ICD-10-PCS codes that the facility is reporting. Unfortunately, the new ICD-10-PCS codes define various surgical approaches that do not correspond to CPT coding (open, closed, percutaneous, and laparoscopic). For example, the ICD-10-PCS "open endoscopic" approach is defined as "cutting through the skin or mucous membrane and any other body layers necessary to expose a body part, and introduction of instrumentation to reach and visualize the site of the procedure." A second example is the "open with percutaneous endoscopic assistance" approach defined as "cutting through the skin or mucous membrane and any other body layers necessary to expose the site of the procedure, and entry, by puncture or minor incision, of instrumentation through the skin or mucous membrane and any other body layers necessary to aid in the performance of the procedure." These new ICD-10-PCS codes have resulted in coders stating that a procedure should be reported as open because the ICD-10-PCS code indicates open and to report any procedure that includes extension of a port incision (eg, for delivery of a specimen) to be reported as an open procedure --instead of being correctly reported as a laparoscopic procedure.

Mesh

**Implantation of mesh is now typical and therefore was bundled into the new codes.** When code 49568 was created in 1993, mesh implantation with hernia repairs was not typical. This is supported by the typical patient described in 1993 as having a 10 cm midline incisional hernia – a very large hernia. With research on the causes of hernia recurrence, changes in technology and development of new types of mesh or other prosthesis, implantation of mesh is now typical for all types of hernias and all sizes to reduce the incidence of recurrence. This was supported by the literature submitted with the CCA.

**Mesh removal is not always required and is not typical.** Technology and research have developed types of mesh that are now being implanted which are incorporated into the abdominal wall, reducing the risk of infection, complications, and recurrence. When mesh removal is indicated, it is typically due to hardening and fracturing of aged mesh, or when gross contamination and infection has occurred (eg, enterocutaneous fistula involving the mesh). For example, a recurrent hernia repair may require removal of fractured, brittle (old technology) mesh many years after an open repair following a colectomy. This work is typically significant, in that the mesh is often integrated with the abdominal wall or adhered to intestine, and involves removal of all of the mesh, not just a small portion. An add-on code to report mesh removal prior to hernia repair, when required, allows for accurate reporting of this work only when performed, which our expert panel believes is not typical of most hernia repairs.

**Deletion of code 49658 resulted in rare "left over" work for implantation of mesh related to closure for a large open wound after debridement for necrotizing fasciitis.** Add-on code 46958 was reported for mesh placement for both open hernia repair and in relation to closure of wounds from necrotizing soft tissue infection. This code will be deleted and the work of mesh placement will be included in the work for all of the anterior abdominal hernia repair codes. The remaining use of code 46958 was for mesh placement for delayed closure of external genitalia, perineum and/or abdominal wall defect(s) due to soft tissue infection or trauma. As described in the vignette for 157X1, necrotizing soft tissue infections typically result in a large open wound that cannot be closed primarily. When the infection has resolved, absorbable mesh or other prosthesis is placed to allow healing by
secondary intent until such time that a skin graft or skin closure can be accomplished. The literature submitted with the CCA supports this work.

**Compelling Evidence - Flawed methodology of previous reviews, New technology**

**Flawed Methodology:** Codes 49560, 49561, 49565, 49566, 49570, 49572, 49580, 49582, 49585, and 49590 were last reviewed in 2000 during the 2nd 5-year-review. During this review, the American College of Surgeons argued that there was compression of work values for big procedures and there were rank order issues within families of codes. We developed a methodology using NSQIP data that was approved by the Research Subcommittee. However, to validate the methodology, the 5YR Workgroup instructed the ACS to group the codes into families and survey one or two CPT codes as full surveys per family to act as anchors for each family and the rest of the codes to be surveyed as mini-surveys for only time and visits. After conducting all of the surveys, we believe we were able to validate the methodology that we proposed, however, the 5YR Workgroup did not agree. Instead, they decided that the value that they assigned to the anchor code (the full survey) would be extrapolated to all of the other codes grouped into the same survey. The hernia codes listed above were grouped with 49505 which was increased by 17% based on the survey data and compelling evidence. The 17% increase was applied to the other codes in the group without consideration of rank order, mini survey results or society recommendations. This resulted in continuation of compression and rank order issues. For example, although code 49572 was increased by 17%, the IWPUT for the code is negative. Other codes have near zero IWPUT. We believe this was a flawed methodology of review of the codes and meets compelling evidence.

**Flawed Methodology:** Codes 49587, 49652, 49653, 49654, and 49655 were last reviewed in 2011 based on a site of service anomaly screen. At that time, the RUC approved including a same day observation visit and full observation discharge on the subsequent day. The RUC noted that the typical patient requires close monitoring for problems such as ileus, intestinal ischemia and urinary retention. Additionally, there will be significant pain post-operatively requiring management before discharge. The specialty noted, and the RUC agreed, that the shift in patient facility status (in patient moving to outpatient—as determined by CMS) has little to do with healthier patients that require less physician work and everything to do with the recent OPPS changes related to facility reimbursement. This was substantiated by the survey data which showed that the typical patients stayed at least overnight and received a postoperative same-day E/M service. Given this data, the RUC enacted its (then current) policy to allocate the appropriate proxy for the postoperative visits which was categorized as either subsequent observation and/or observation discharge—both of which are outpatient codes. Importantly, the specialties argued and the RUC agreed that the work of providers who care for medical patients should not be discounted (eg, full observation E/M and full observation discharge E/M allowed for patient staying overnight for observation.)

CMS ignored the valid outpatient E/M visit code inputs that the RUC recommended and instead stated in the Rule that they have a policy of not allowing "inpatient" visits included in the details for outpatient services. These codes went through a Refinement Panel process [ie, a CMS convened group of Medical Officers and select physicians acting as a separate formal appeals process] that resulted in agreement with the RUC recommendations. Importantly, the Agency still maintained that inpatient visits would not be allowed (even though outpatient/observation visits were submitted by the RUC) and then used a reverse building block methodology to subtract work RVUs from the values. These values had been developed by magnitude estimation and approved by the RUC. The Agency deleted the observation visit code inputs and decreased discharge management by 50 percent even though it was performed on a subsequent date. We believe this action by CMS resulted in a flawed methodology of review of these codes and meets compelling evidence.

The rejection of equal value for equal work and rejection of the Refinement Panel results prompted the Executive Director of the American College of Surgeons to send a letter (see last page of SoR) to Kathleen Sebelius, then Secretary of the Department of Health and Human Services on November 29, 2011. This letter addressed the decision-making process for valuing procedure codes that have Medicare outpatient status, the use of refinement panels, and the arbitrary discount in physician work for the same work performed by any provider of a non-global service. Specifically, the letter included the following statement:

"CMS has now implemented a policy by which it is creating differential payments for the same work performed by different physicians as a backdoor mechanism for reducing the work RVUs for surgical procedures. They have valued the worth of a surgeon for post-operative evaluation and management work at about 30 percent of a non-surgeon. Non-surgeons are allowed to provide the same work to the same patient at 100 percent reimbursement. …we believe that this policy leads to a loss of validity and integrity of the current system."
We continue to believe there is no valid justification for a 50% discount to discharge management services provided by a surgeon that is performed the day after a procedure when a non-surgical provider observing a medical patient who is kept overnight for any reason is allowed to bill a discharge management service at 100 percent for work on the next day. We also believe there is no valid justification for discounting a postoperative visit later the same day of surgery to equal only the intra-service time of the visit multiplied by an intensity of 0.0224. No surgeon would round on a postoperative patient the same day and not review interval chart notes prior to the face-to-face with the patient and not followup with charting the visit and confirming or modifying the current orders.

CMS implemented a 23-hour policy for discounting surgical postoperative work based on the argument that the Agency could not include inpatient work in their time/work file. However, the fact is that the Agency has also erroneously rejected RUC recommendations for outpatient / observation codes, stating "these inpatient codes" could not be included for procedure that are typically outpatient.

Change in Technology: Since the last review of the hernia repair codes (either in 2000 or in 2011), there has been introduction and application of new technology (ie, robotic assist) which adds work complexity and time with the goal of better patient outcomes. The diffusion of this new technology throughout this family of codes further meets compelling evidence.

Recommendation – 49X06

We recommend a work RVU of 24.24, which is the survey 75th percentile. We believe the limited number of 0-day global codes that are familiar to general surgeons to be used on a reference service list hindered the ability for survey respondents to provide an accurate magnitude estimation of work.

Pre-service time

Scrub, dress, wait package time has been reduced so as to not exceed survey median data. Laparoscopic/robotic anterior abdominal hernia repair positioning time: The patient will initially be positioned supine and upper extremity intravenous and arterial access points are dressed, padded and secured. The arms are padded and tucked at the patient’s sides. The patient must be secured to the table, including a soft chest and thigh strap, as it may be necessary to roll the table during the procedure to use gravity to assist with shifting the abdominal contents.. There is also consideration of positioning the patient relative to: laparoscopy equipment, including lines and video equipment and anesthesia lines relative to the rest of the equipment. The survey median positioning time reflects the time for this procedure for these activities.

Postoperative E/M visit later on the day of surgery

The typical patient will be admitted and a visit will occur later on the same day to monitor for postoperative complications including ileus, intestinal ischemia, and urinary retention. Review data (eg, diagnostic and imaging studies) not available at the unit. Communicate with other health care professionals and with patient and/or family. Review medical records and data available on the unit. Perform a medically appropriate examination. Consider relevant data, options, and risks; formulate and/or revise diagnosis and treatment plan(s) (high complexity MDM). Discuss diagnosis and treatment options with the patient and/or family. Communicate with other health care professionals as necessary. Write and/or review orders, including arranging for necessary diagnostic testing, consultation(s), and therapeutic intervention(s). Complete medical record documentation. Address interval data obtained and reported changes in condition. Communicate results and additional care plans to other health care professionals and to the patient and/or family. Patients undergoing the repair of this size of hernia will require significant postoperative care on the same day to address pain control, review vital signs and fluid status commonly affected by repair of larger hernias, and eliminate concerns for bleeding and infection more common with larger or more numerous incisions.

Key Reference Code Intensity/Complexity Comparison

Ref 1: The respondents indicated the intensity/complexity of survey code 49X06 is somewhat/much more than reference code 11005. Ref 2: The respondents indicated the intensity/complexity of survey code 49X06 is somewhat/much more than reference code 61624.

MPC Code Comparison
MPC code 37244 has the highest RVW for the set of 0-day global codes.

Comparison of using the recommended RVW versus using the 25th percentile.

The first chart below shows reasonable correlation between the recommended RVW and WPUT—both trend lines have a similar slope. The second chart below shows no relationship of WPUT to the 25th percentile RVW—where WPUT decreases as work increases.
What if surgeon evaluation and management work were set equal to discrete E/M services?

As has been discussed by the RUC in the past, work intensities used for computation of IWPUT for time spent by physicians in the pre-service and immediate post-service period for surgical procedures have remained fixed since the early 1990s, while intensity of time for E/M values has received several increased values over several decades.

Recent increases for outpatient office E/M values were not allowed to be added to global codes by CMS. Because IWPUT is calculated by subtracting the pre- and post-work values from the RVW of a given CPT code, this has resulted in less value subtracted than would have occurred if the more appropriate pre- and post-work values were used for the IWPUT formula. This artificially increases the IWPUT and WPUT resulting in a decrease in relativity. This is especially true for codes that have a significant amount of pre-service and post-service work.

It has become difficult to compare IWPUT (and WPUT) for codes with different global periods because of the level of discounting of pre-service and post-service work. For example, for the top 34 high volume 10 and 90 day global codes, AMA staff recently calculated the difference in IWPUT if the office visit increases were used in the IWPUT equation. The AMA table, which is included in the Research Subcommittee agenda for this meeting, showed that the IWPUT would have decreased from -6% to -548% depending on the number of office visits included in the work/time file. To emphasize the importance of this information, the code which would have had the largest decrease (17000) has 3 minutes of intra-time and only one postop office visit (99212). In this table, it was also clear that relativity within a family of codes is lost, because each code within a family may have varying levels of post-service work. To summarize, IWPUT has become much less accurate when used as a comparator of intra-service work within and between families because of CMS actions (ie, not updating global RVW) and policy (ie, discounting postoperative work).

Using the discussion above, we have created the table below that presents the IWPUT and WPUT for the hernia set of codes using (1) the 2021 formulas, and (2) "full value" formulas. The note below the table describes each formula, but basically the full value formula sets pre- and post-service work equal to the same E/M work for non-surgical services. For comparison to facility non-surgical services, we have included codes 99283-99285 using the 2021 published RVW and time data. This table shows that most of the recommendations for 49X01-49X14 result in a WPUT that is less than an ED visit requiring moderate MDM (99284). This table also shows that those codes with similar WPUT to high MDM are appropriately the bigger and more complex procedures. Last, this table provides evidence that discounting pre- and post-work distorts and artificially impacts fair IWPUT and WPUT relativity comparison. However, if undiscounted work is applied, the recommendations for this set of codes are appropriately ranked.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - [ ] The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - [ ] Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - [ ] Multiple codes allow flexibility to describe exactly what components the procedure included.
   - [ ] Multiple codes are used to maintain consistency with similar codes.
   - [ ] Historical precedents.
   - [ ] Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed)

49561  Repair initial incisional or ventral hernia; incarcerated or strangulated  090
49572  Repair epigastric hernia (eg, preperitoneal fat); incarcerated or strangulated 090
49587  Repair umbilical hernia, age 5 years or older; incarcerated or strangulated 090
49590  Repair spigelian hernia  090
49653  Laparoscopy, surgical, repair, ventral, umbilical, spigelian or epigastric hernia (includes mesh insertion, when performed); incarcerated or strangulated 090
49655  Laparoscopy, surgical, repair, incisional hernia (includes mesh insertion, when performed); incarcerated or strangulated 090
CPT Code: 49X06

49568 Implantation of mesh or other prosthesis for open incisional or ventral hernia repair or mesh for closure of debridement for necrotizing soft tissue infection (List separately in addition to code for the incisional or ventral hernia repair) ZZZ

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Do many physicians perform this service across the United States? Yes

**Berenson-Eggers Type of Service (BETOS) Assignment**

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

- **Main BETOS Classification:** Procedures
  - **BETOS Sub-classification:** Major procedure
    - **BETOS Sub-classification Level II:** Other

**Professional Liability Insurance Information (PLI)**

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number
Letter Referenced in Compelling Evidence Rationale

November 29, 2011

The Honorable Kathleen Sebelius
Secretary
Department of Health and Human Services
Hubert H. Humphrey Building
200 Independence Avenue SW
Washington, DC 20201

Re: CY 2012 Medicare Physician Fee Schedule Final Rule and CMS Refinement Panels

Dear Secretary Sebelius:

On November 28, 2011, the Federal Register published the Centers for Medicare and Medicaid Services’ (CMS) Calendar Year (CY) 2012 Medicare Physician Fee Schedule Final Rule. On behalf of the American College of Surgeons (ACS), I am writing to express concern regarding the decision making process and lack of transparency on the part of CMS related to the work relative value units (wRVUs) for 2012 reviewed under CMS’ refinement panel process. The ACS, with over 78,000 members, is a scientific and educational organization of surgeons that was founded in 1913 to raise the standards of surgical practice and to improve the care of the surgical patient.

The ACS has participated in the efforts of the American Medical Association’s Relative Value Scale Update Committee (AMA RUC) for years given the value we place on the AMA RUC process and our assumption that CMS will evaluate the RUC recommendations with fairness, transparency, and accuracy according to a process that has been set out via the Federal rulemaking process. As part of the work that led to the CY 2012 Medicare Physician Fee Schedule Final Rule, the ACS devoted significant resources to conducting AMA RUC surveys for over 100 new or existing codes at the request of CMS. The AMA RUC evaluated wRVU recommendations made by the ACS, based upon those surveys, and came to agreement on final recommended values to be submitted to CMS.

Fifty-seven of the aforementioned codes that the ACS surveyed were sent to the refinement panel. CMS accepted only 12 percent of those refinement panel recommendations.

For most of the 88 percent of refinement panel recommendations that CMS rejected, CMS lowered the wRVU by reducing the value of the post-operative evaluation and management work performed by surgeons in the hospital by 69 percent. However, if that same work is performed by any other physician other than the surgeon, that same service is paid at 100 percent. We believe that the refinement panel physicians completely rejected this concept as they agreed to a work RVU that did not discount post-surgical work in this fashion. We note that the multispecialty panel included physicians from primary care, contractor medical directors (CMDs), physicians in related specialties, and general surgeons. At no time did the Agency’s Medical Officer in charge of the panel process disagree with the presenters or offer a contrary opinion to the discussion.

Our concerns were piqued when CMS issued the CY 2011 Medicare Physician Fee Schedule Final Rule in which CMS stated that it could change wRVU recommendations of the refinement panel convened by CMS if “policy concerns warrant their modification,” without providing additional clarification on what would trigger this ability of CMS to subvert the more transparent process of the refinement panel. However, we continued to participate in the process under the belief that CMS would operate fairly and transparently and that if there were indeed “policy concerns” that CMS had regarding the values of the codes under consideration that those concerns would be stated clearly so all parties could address them during the refinement panel reviews.

CMS has now implemented a policy by which it is creating differential payments for the same work performed by different physicians as a backdoor mechanism for reducing the work RVUs for surgical procedures. They have valued
the worth of a surgeon for post-operative evaluation and management work at about 30 percent of a non-surgeon. Non-surgeons are allowed to provide the same work to the same patient at 100 percent reimbursement. First, we believe that this policy leads to a loss of validity and integrity of the current system. In addition, this policy is prohibited by the Omnibus Budget Reconciliation Act of 1989, which states, “[t]he Secretary may not vary the conversion factor or the number of relative value units for a physicians’ service based on whether the physician furnishing the service is a specialist or based on the type of specialty of the physician.” (42 U.S.C. §1395w-4(c)(6)).

The ACS has been a vocal proponent of needed reforms in the delivery and payment of health care. We believe that the future of these reforms will be based on driving greater awareness of proven continuous quality improvement programs to achieve ongoing, tangible results for quality improvements. However, in order for these reforms to be effective, they must be built on a system that is consistent with previous Agency decisions, fair, and transparent, and it is our concern that many of the policy decisions made by CMS in the latest Medicare Physician Fee Schedule Final Rule move us away from those goals. The resource based relative value system (RBRVS) requires a resource basis for decisions on the valuation of physician services. We believe that the resource basis for the decision to reduce these values is not evident. We ask that under your authority as Secretary you will seek to have CMS define a more transparent process in the future for decisions that are not aligned with the RUC and refinement panel recommendations in order to help maintain the transparency and fairness of the current system and to restore the values of these services to the level that is supported by the RBRVS process.

Sincerely,
David B. Hoyt, MD, FACS
Executive Director
CPT Code: 49X07  
AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION  

CPT Code: 49X07  
Tracking Number C8  
Original Specialty Recommended RVU: 7.75  
Presented Recommended RVU: 7.75  
RUC Recommended RVU: 7.75  

CPT Descriptor: Repair of anterior abdominal hernia(s) (ie, epigastric, incisional, ventral, umbilical, spigelian), any approach (ie, open, laparoscopic, robotic), recurrent, including placement of mesh or other prosthesis, when performed total length of defect(s); less than 3 cm, reducible  

CLINICAL DESCRIPTION OF SERVICE:  

Vignette Used in Survey: A 60-year-old obese male has a surgical history of a prior laparotomy with a resultant hernia in the incision. The prior hernia was repaired 5 years ago. He now has a bulge in the mid-epigastric area for 2 months that disappears when he lies down. Physical exam reveals a small recurrent reducible incisional hernia. He undergoes hernia repair of a defect that is less than 3 cm with placement of mesh.  

Percentage of Survey Respondents who found Vignette to be Typical: 88%  

Site of Service (Complete for 010 and 090 Globals Only)  
Percent of survey respondents who stated they perform the procedure; In the hospital 93%, In the ASC 7%, In the office 0%  

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is;  
Discharged the same day 55%, Overnight stay-less than 24 hours 42%, Overnight stay-more than 24 hours 3%  

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 82%  

Description of Pre-Service Work: Results of preadmission testing (imaging, electrocardiogram and labs) are reviewed. Appropriate selection, timing, and administration of DVT prophylaxis are ensured. Appropriate selection, timing, and administration of antibiotics are ensured. The need for beta-blockers is assessed, and they are ordered as required. The patient is reexamined to confirm that physical findings have not changed, the patient’s medication regimen has remained the same, the patient has no new allergies, and the patient has not undergone any recent procedures. The history and physical examination are then updated in the electronic health record. The planned procedure and postoperative management are reviewed with the patient and family. Informed consent is reviewed and obtained from the patient, including witness confirmation. The palpable edge of the hernia defect(s) and sites of the proposed skin incisions are marked with cooperation of patient. The length and type of anesthesia, including adjuncts to postoperative analgesia management, are reviewed with the anesthesiologist. Verify that all required instruments and supplies are available, including reusable and disposable laparoscopic/robotic equipment and mesh. Assistance is provided in transfer of the patient from gurney to operating table. Monitor/assist with positioning of patient, including padding and securing patient to table that will adjust throughout procedure (eg, reverse Trendelenburg). Assist anesthesia team with line placement and induction of anesthesia and intubation, relative to all laparoscopic/robotic equipment. The areas of skin to be prepared and draped are indicated by the surgeon to ensure that all of the potential operative field is included in the preparation. The surgeon scrubs and gowns. A surgical time-out is performed with operating surgical team.  

Description of Intra-Service Work: Abdominal access is obtained and a safe pneumoperitoneum is created with placement of a needle/trocar in the left upper quadrant. The camera is inserted and safe entry is verified. Additional trocars are placed in the lateral abdomen, under direct vision. Adhesiolysis is performed to clear adhesions between omentum, small intestines and colon from the abdominal wall and prior mesh. The hernia defect is visualized. Adhesions to the abdominal wall are divided sharply to free the anterior abdominal wall completely. The falciform ligament and preperitoneal fat are cleared from the abdominal wall fascia to expose the posterior fascia. Peritoneal flaps are created for placement of mesh. The fascial defect is approximated with sutures. The hernia defect is measured at less than 3 cm in diameter. A mesh is selected to provide adequate overlap of the hernia defect. A mesh is introduced into the peritoneal cavity through a trocar and is
oriented. Insufflation is reduced to facilitate mesh conformity to the anterior abdominal wall. The mesh is secured to the abdominal wall utilizing sutures and/or tacks. The peritoneal flaps are then sutured over the mesh to protect it from the abdominal viscera. Completion camera survey is performed of the abdomen and contents to inspect for bleeding and visceral injury. Irrigation is performed as necessary. Fascial incisions for laparoscopic ports larger than 1 cm are closed with a suture passer. Skin incisions are closed according to surgeon preference.

Description of Post-Service Work: Apply sterile dressings. Monitor patient during reversal of anesthesia. Assist in transfer of patient from operating table to gurney. Monitor transport of patient from operating room to recovery room. Discuss postoperative recovery care with anesthesia and nursing staff. Discuss procedure and outcome with family in waiting area. Write brief operative note or complete final operative note and place in chart. Write postoperative note in the recovery room. When safe to discharge patient to home, conduct final exam. Auscultate heart, lungs, and abdomen for bowel sounds. Assess for problems such as ileus, intestinal ischemia, and urinary retention. Assess pain status, write orders for follow-up visits, post-discharge laboratory tests, imaging, home care, and physical therapy. Order medications needed post-discharge. Discuss home restrictions and activity levels (ie, diet, bathing) with patient/family. Complete all appropriate medical records, including day of discharge progress notes, discharge summary, discharge instructions, and insurance forms.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC’s rationale, please review the separate RUC recommendation document.
Background

RAW Screen
Code 49565, *Repair recurrent incisional or ventral hernia; reducible*, was identified by the RUC/RAW with a site of service anomaly: less than 50% inpatient status; includes inpatient visit codes; greater than 5,000 utilization. Prior to submitting an Action Plan to the RAW, the societies reviewed the site of service data and found: almost even split of 48% between inpatient and outpatient – with a few percent in the ASC. At the January 2020 RUC meeting, the societies requested referral of code 49565 to CPT to update the descriptor to current standard of practice and typical patient presentation.

CPT Coding Changes
At the February 2021 CPT meeting the following changes were approved:
- Delete all the current open and laparoscopic codes for repair of anterior abdominal hernias.
- Delete add-on code 49568 for mesh for open ventral/incisional hernias and large defects as a result of necrotizing soft tissue infection.
- Add 12 new codes for anterior abdominal hernia repair by any approach (ie, open laparoscopic, robotic); by initial or recurrent; by total defect size; and by reducible or incarcerated/strangulated.
- Add 2 codes for parastomal hernia repair - by reducible or incarcerated/strangulated.
- Add 1 add-on code for removal of mesh/prosthesis – only with the new hernia repair codes.
- Add 1 new code for mesh/prosthesis for delayed closure of external genitalia, perineum and/or abdominal wall defect(s) due to soft tissue infection or trauma.

Coding Structure
Hernia repair for epigastric, incisional, ventral, umbilical, spigelian were merged as they all appear on the anterior abdomen. The location--upper, lower, midline—does not impact the work. But instead, the size and number of defects is the driving factor for work. For example, with respect to the code that was tagged by the RAW, a recurrent, incisional, reducible hernia can be anywhere from a small hernia at a port site from a prior laparoscopic procedure to an extremely large hernia with multiple defects clustered in a midline incision.

Initial versus recurrent differentiation was maintained. Recurrent hernias are re-reoperations. An initial hernia can be the result of a prior procedure (this is not a recurrent hernia) or weak muscles and fascia. A recurrent hernia is typically at least the third time the same site is being operated on.

For example,
- operation 1 might be an open colectomy
- operation 2 would be an initial midline hernia repair
- operation 3 would be a recurrent midline hernia involving the initial midline repair and may include other multiple hernias occurring in the same old incision, all needing to be repaired.

There are many examples in CPT that differentiate between a primary and secondary procedure: disarticulation of shoulder (23920-23921); amputation of arm through humerus (24900-24930) and other similar amputation families; tendon repair (eg, 25260-25274); CABG reoperation (33530); and revision total joint (eg, 23473, 23474, 24370, 24371, 27134-27138).

The hernia size ranges were based on a review of literature and expert panel. For example, an article published in the Journal of the American College of Surgeons reviewed technique and outcomes of abdominal incisional hernia repair and showed that the range of defect size was from less than 1 cm to more than 25 cm with a mean of 6 cm and a median of less than 3 cm. Other similar articles were submitted with the code change application, supporting different work for different defect size. David A. Iannitti, et.al, *Technique and Outcomes of Abdominal Incisional Hernia Repair Using a Synthetic Composite Mesh: A Report of 455 Cases*, Journal of the American College of Surgeons, Volume 206, Issue 1, 2008, Pages 83-88, ISSN 1072-7515, https://doi.org/10.1016/j.jamcollsurg.2007.07.030.

Differentiating the work of a procedure in relationship to size or extent is not new for CPT. For example, 36 skin repair codes by length of repair; 44 lesion excision codes by excised diameter; 46 soft tissue tumor excision codes by size of tumor; 23 hysterectomy codes by size of uterus (58260-58573); 3 myomectomy codes are differentiated by total weight of the myomas (58140-58146); and 10 nerve graft codes are based on length of graft. (64885-64898)
The CPT guidelines and illustrations that describe how to measure the total defect size are well understood by surgeons. This is not a new concept – surgeons are very familiar with measuring a hernia defect, and in fact the size of the hernia defect was included in some of the patient vignettes in 1993. Furthermore, measurement of hernia size is a necessary step for selecting and preparing the appropriately sized mesh for implantation.

Hernia repair coding has been complicated by changes in (1) technology and technique and (2) the recent implementation of ICD-10-PCS codes. For these reasons, the stakeholder societies believed this set of codes should describe "any approach." The societies and the AMA Coding Network have received numerous coding questions about correct reporting for "hybrid" abdominal hernia repair procedures where parts of the procedure are performed via an open approach and parts of the procedure are performed via laparoscopy or with the use of a robot. These are not laparoscopic procedures converted to open procedures, but instead procedures that are more often begun open and then finished as laparoscopic/robotic under pneumoperitoneum.

Another issue that has recently caused confusion about coding has appeared on national coder websites and coder discussion boards referring to International Classification of Diseases Tenth Revision Procedure Coding System (ICD-10-PCS) codes which classify procedures performed in the facility (i.e., not CPT physician procedures). This, however, is important because facilities want the procedure codes reported to correspond with the descriptors of ICD-10-PCS codes that the facility is reporting. Unfortunately, the new ICD-10-PCS codes define various surgical approaches that do not correspond to CPT coding (open, closed, percutaneous, and laparoscopic). For example, the ICD-10-PCS "open endoscopic" approach is defined as "cutting through the skin or mucous membrane and any other body layers necessary to expose a body part, and introduction of instrumentation to reach and visualize the site of the procedure." A second example is the "open with percutaneous endoscopic assistance" approach defined as "cutting through the skin or mucous membrane and any other body layers necessary to expose the site of the procedure, and entry, by puncture or minor incision, of instrumentation through the skin or mucous membrane and any other body layers necessary to aid in the performance of the procedure." These new ICD-10-PCS codes have resulted in coders stating that a procedure should be reported as open because the ICD-10-PCS code indicates open and to report any procedure that includes extension of a port incision (e.g., for delivery of a specimen) to be reported as an open procedure -- instead of being correctly reported as a laparoscopic procedure.

Mesh

- **Implantation of mesh is now typical and therefore was bundled into the new codes.** When code 49568 was created in 1993, mesh implantation with hernia repairs was not typical. This is supported by the typical patient described in 1993 as having a 10 cm midline incisional hernia – a very large hernia. With research on the causes of hernia recurrence, changes in technology and development of new types of mesh or other prosthesis, implantation of mesh is now typical for all types of hernias and all sizes to reduce the incidence of recurrence. This was supported by the literature submitted with the CCA.

- **Mesh removal is not always required and is not typical.** Technology and research have developed types of mesh that are now being implanted which are incorporated into the abdominal wall, reducing the risk of infection, complications, and recurrence. When mesh removal is indicated, it is typically due to hardening and fracturing of aged mesh, or when gross contamination and infection has occurred (e.g., enterocutaneous fistula involving the mesh). For example, a recurrent hernia repair may require removal of fractured, brittle (old technology) mesh many years after an open repair following a colectomy. This work is typically significant, in that the mesh is often integrated with the abdominal wall or adhered to intestine, and involves removal of all of the mesh, not just a small portion. An add-on code to report mesh removal prior to hernia repair, when required, allows for accurate reporting of this work only when performed, which our expert panel believes is not typical of most hernia repairs.

- **Deletion of code 49658 resulted in rare "left over" work for implantation of mesh related to closure for a large open wound after debridement for necrotizing fasciitis.** Add-on code 46958 was reported for mesh placement for both open hernia repair and in relation to closure of wounds from necrotizing soft tissue infection. This code will be deleted and the work of mesh placement will be included in the work for all of the anterior abdominal hernia repair codes. The remaining use of code 46958 was for mesh placement for delayed closure of external genitalia, perineum and/or abdominal wall defect(s) due to soft tissue infection or trauma. As described in the vignette for 157X1, necrotizing soft tissue infections typically result in a large open wound that cannot be closed primarily. When the infection has resolved, absorbable mesh or other prosthesis is placed to allow healing by secondary intent until such time that a skin graft or skin closure can be accomplished. The literature submitted with the CCA supports this work.
Compelling Evidence - Flawed methodology of previous reviews, New technology

Flawed Methodology: Codes 49560, 49561, 49565, 49566, 49570, 49572, 49580, 49582, 49585, and 49590 were last reviewed in 2000 during the 2nd 5-year-review. During this review, the American College of Surgeons argued that there was compression of work values for big procedures and there were rank order issues within families of codes. We developed a methodology using NSQIP data that was approved by the Research Subcommittee. However, to validate the methodology, the 5YR Workgroup instructed the ACS to group the codes into families and survey one or two CPT codes as full surveys per family to act as anchors for each family and the rest of the codes to be surveyed as mini-surveys for only time and visits. After conducting all of the surveys, we believe we were able to validate the methodology that we proposed, however, the 5YR Workgroup did not agree. Instead, they decided that the value that they assigned to the anchor code (the full survey) would be extrapolated to all of the other codes grouped into the same survey. The hernia codes listed above were grouped with 49505 which was increased by 17% based on the survey data and compelling evidence. The 17% increase was applied to the other codes in the group without consideration of rank order, mini survey results or society recommendations. This resulted in continuation of compression and rank order issues. For example, although code 49572 was increased by 17%, the IWPUT for the code is negative. Other codes have near zero IWPUT. We believe this was a flawed methodology of review of the codes and meets compelling evidence.

Flawed Methodology: Codes 49587, 49652, 49653, 49654, and 49655 were last reviewed in 2011 based on a site of service anomaly screen. At that time, the RUC approved including a same day observation visit and full observation discharge on the subsequent day. The RUC noted that the typical patient requires close monitoring for problems such as ileus, intestinal ischemia and urinary retention. Additionally, there will be significant pain post-operatively requiring management before discharge. The specialty noted, and the RUC agreed, that the shift in patient facility status (in patient moving to outpatient—as determined by CMS) has little to do with healthier patients that require less physician work and everything to do with the recent OPPS changes related to facility reimbursement. This was substantiated by the survey data which showed that the typical patients stayed at least overnight and received a postoperative same-day E/M service. Given this data, the RUC enacted its (then current) policy to allocate the appropriate proxy for the postoperative visits which was categorized as either subsequent observation and/or observation discharge—both of which are outpatient codes. Importantly, the specialties argued and the RUC agreed that the work of providers who care for medical patients should not be discounted (eg, full observation E/M and full observation discharge E/M allowed for patient staying overnight for observation.)

CMS ignored the valid outpatient E/M visit code inputs that the RUC recommended and instead stated in the Rule that they have a policy of not allowing "inpatient" visits included in the details for outpatient services. These codes went through a Refinement Panel process [ie, a CMS convened group of Medical Officers and select physicians acting as a separate formal appeals process] that resulted in agreement with the RUC recommendations. Importantly, the Agency still maintained that inpatient visits would not be allowed (even though outpatient/observation visits were submitted by the RUC) and then used a reverse building block methodology to subtract work RVUs from the values. These values had been developed by magnitude estimation and approved by the RUC. The Agency deleted the observation visit code inputs and decreased discharge management by 50 percent even though it was performed on a subsequent date. We believe this action by CMS resulted in a flawed methodology of review of these codes and meets compelling evidence.

The rejection of equal value for equal work and rejection of the Refinement Panel results prompted the Executive Director of the American College of Surgeons to send a letter (see last page of SoR) to Kathleen Sebelius, then Secretary of the Department of Health and Human Services on November 29, 2011. This letter addressed the decision-making process for valuing procedure codes that have Medicare outpatient status, the use of refinement panels, and the arbitrary discount in physician work for the same work performed by any provider of a non-global service. Specifically, the letter included the following statement:

"CMS has now implemented a policy by which it is creating differential payments for the same work performed by different physicians as a backdoor mechanism for reducing the work RVUs for surgical procedures. They have valued the worth of a surgeon for post-operative evaluation and management work at about 30 percent of a non-surgeon. Non-surgeons are allowed to provide the same work to the same patient at 100 percent reimbursement. ...we believe that this policy leads to a loss of validity and integrity of the current system."

We continue to believe there is no valid justification for a 50% discount to discharge management services provided by a surgeon that is performed the day after a procedure when a non-surgical provider observing a medical patient who is kept overnight for any reason is allowed to bill a discharge management service at 100 percent for work on the next day.
We also believe there is no valid justification for discounting a postoperative visit later the same day of surgery to equal only the intra-service time of the visit multiplied by an intensity of 0.0224. No surgeon would round on a postoperative patient the same day and not review interval chart notes prior to the face-to-face with the patient and not followup with charting the visit and confirming or modifying the current orders.

CMS implemented a 23-hour policy for discounting surgical postoperative work based on the argument that the Agency could not include inpatient work in their time/work file. However, the fact is that the Agency has also erroneously rejected RUC recommendations for outpatient / observation codes, stating "these inpatient codes" could not be included for procedure that are typically outpatient.

**Change in Technology**: Since the last review of the hernia repair codes (either in 2000 or in 2011), there has been introduction and application of new technology (ie, robotic assist) which adds work complexity and time with the goal of better patient outcomes. The diffusion of this new technology throughout this family of codes further meets compelling evidence.

**Recommendation – 49X07**

We recommend a work RVU of 7.75, which is the survey 25th percentile. The typical patient will be discharged on the same day of the procedure.

**Pre-service time**

Evaluation package time has been reduced so as to not exceed survey median data. Laparoscopic/robotic anterior abdominal hernia repair positioning time: The patient will initially be positioned supine and upper extremity intravenous and arterial access points are dressed, padded and secured. The arms are padded and tucked at the patient’s sides. The patient must be secured to the table, including a soft chest and thigh strap, as it may be necessary to roll the table during the procedure to use gravity to assist with shifting the abdominal contents. There is also consideration of positioning the patient relative to: laparoscopy equipment, including lines and video equipment and anesthesia lines relative to the rest of the equipment. The survey median positioning time reflects the time for this procedure for these activities.

**Post-service time**

Package time has been reduced so as to not exceed survey median data.

**Key Reference Code Intensity/Complexity Comparison**

Ref 1: The respondents indicated the intensity/complexity of survey code 49X07 is similar to reference code 37225. Ref 2: The respondents indicated the intensity/complexity of survey code 49X07 is somewhat more than reference code 49013.

Comparison of using the recommended RVW versus using the 25th percentile.

The first chart below shows reasonable correlation between the recommended RVW and WPUT—both trend lines have a similar slope. The second chart below shows no relationship of WPUT to the 25th percentile RVW—where WPUT decreases as work increases.

What if surgeon evaluation and management work were set equal to discrete E/M services?

As has been discussed by the RUC in the past, work intensities used for computation of IWPUT for time spent by physicians in the pre-service and immediate post-service period for surgical procedures have remained fixed since the early 1990s, while intensity of time for E/M values has received several increased values over several decades.

Recent increases for outpatient office E/M values were not allowed to be added to global codes by CMS. Because IWPUT is calculated by subtracting the pre- and post-work values from the RVW of a given CPT code, this has resulted in less value subtracted than would have occurred if the more appropriate pre- and post-work values were used for the IWPUT formula. This artificially increases the IWPUT and WPUT resulting in a decrease in relativity. This is especially true for codes that have a significant amount of pre-service and post-service work.

It has become difficult to compare IWPUT (and WPUT) for codes with different global periods because of the level of discounting of pre-service and post-service work. For example, for the top 34 high volume 10 and 90 day global codes, AMA staff recently calculated the difference in IWPUT if the office visit increases were used in the IWPUT equation. The AMA table, which is included in the Research Subcommittee agenda for this meeting, showed that the IWPUT would have decreased from -6% to -548% depending on the number of office visits included in the work/time file. To emphasize the importance of this information, the code which would have had the largest decrease (17000) has 3
minutes of intra-time and only one postop office visit (99212). In this table, it was also clear that relativity within a family of codes is lost, because each code within a family may have varying levels of post-service work. To summarize, IWPUT has become much less accurate when used as a comparator of intra-service work within and between families because of CMS actions (ie, not updating global RVW) and policy (ie, discounting postoperative work).

Using the discussion above, we have created the table below that presents the IWPUT and WPUT for the hernia set of codes using (1) the 2021 formulas, and (2) "full value" formulas. The note below the table describes each formula, but basically the full value formula sets pre- and post-service work equal to the same E/M work for non-surgical services. For comparison to facility non-surgical services, we have included codes 99283-99285 using the 2021 published RVW and time data. This table shows that most of the recommendations for 49X01-49X14 result in a WPUT that is less than an ED visit requiring moderate MDM (99284). This table also shows that those codes with similar WPUT to high MDM are appropriately the bigger and more complex procedures. Last, this table provides evidence that discounting pre- and post-work distorts and artificially impacts fair IWPUT and WPUT relativity comparison. However, if undiscounted work is applied, the recommendations for this set of codes are appropriately ranked.

</table>

* 2021 Formula: IWPUT calculation based on evaluation, positioning, immediate post intensity of 0.0224; scrub/dress/wait intensity of 0.0081; and discounted same-day outpatient postop visit (not shown in table) equal to intra-service time at 0.0224. WPUT calculation equal to total time (including discounted postop visit time not shown on table) divided by work.

**2021 Full Value Formula: IWPUT calculation based on pre-service and immediate post-service time intensity of 0.043 (equal to WPUT for 99213) and same-day post EM at full value instead of discounted time for outpatient procedure as shown on table (highlighted in red).

---

**SERVICES REPORTED WITH MULTIPLE CPT CODES**

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - Multiple codes allow flexibility to describe exactly what components the procedure included.
2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

**FREQUENCY INFORMATION**

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed)
49565 Repair recurrent incisional or ventral hernia; reducible 090
49656 Laparoscopy, surgical, repair, recurrent incisional hernia (includes mesh insertion, when performed); reducible 090
49568 Implantation of mesh or other prosthesis for open incisional or ventral hernia repair or mesh for closure of debridement for necrotizing soft tissue infection (List separately in addition to code for the incisional or ventral hernia repair) ZZZ

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

<table>
<thead>
<tr>
<th>Specialty</th>
<th>How often?</th>

Do many physicians perform this service across the United States? Yes

**Berenson-Eggers Type of Service (BETOS) Assignment**

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.
Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)
If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number.

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 11008

Letter Referenced in Compelling Evidence Rationale

November 29, 2011

The Honorable Kathleen Sebelius
Secretary
Department of Health and Human Services
Hubert H. Humphrey Building
200 Independence Avenue SW
Washington, DC 20201

Re: CY 2012 Medicare Physician Fee Schedule Final Rule and CMS Refinement Panels

Dear Secretary Sebelius:

On November 28, 2011, the Federal Register published the Centers for Medicare and Medicaid Services’ (CMS) Calendar Year (CY) 2012 Medicare Physician Fee Schedule Final Rule. On behalf of the American College of Surgeons (ACS), I am writing to express concern regarding the decision making process and lack of transparency on the part of CMS related to the work relative value units (wRVUs) for 2012 reviewed under CMS’ refinement panel process. The ACS, with over 78,000 members, is a scientific and educational organization of surgeons that was founded in 1913 to raise the standards of surgical practice and to improve the care of the surgical patient.

The ACS has participated in the efforts of the American Medical Association’s Relative Value Scale Update Committee (AMA RUC) for years given the value we place on the AMA RUC process and our assumption that CMS will evaluate the RUC recommendations with fairness, transparency, and accuracy according to a process that has been set out via the Federal rulemaking process. As part of the work that led to the CY 2012 Medicare Physician Fee Schedule Final Rule, the ACS devoted significant resources to conducting AMA RUC surveys for over 100 new or existing codes at the request of CMS. The AMA RUC evaluated wRVU recommendations made by the ACS, based upon those surveys, and came to agreement on final recommended values to be submitted to CMS.

Fifty-seven of the aforementioned codes that the ACS surveyed were sent to the refinement panel. CMS accepted only 12 percent of those refinement panel recommendations.

For most of the 88 percent of refinement panel recommendations that CMS rejected, CMS lowered the wRVU by reducing the value of the post-operative evaluation and management work performed by surgeons in the hospital by 69 percent. However, if that same work is performed by any other physician other than the surgeon, that same service is paid at 100 percent. We believe that the refinement panel physicians completely rejected this concept as they agreed to a
work RVU that did not discount post-surgical work in this fashion. We note that the multispecialty panel included
physicians from primary care, contractor medical directors (CMDs), physicians in related specialties, and general
surgeons. At no time did the Agency's Medical Officer in charge of the panel process disagree with the presenters or
offer a contrary opinion to the discussion.

Our concerns were piqued when CMS issued the CY 2011 Medicare Physician Fee Schedule Final Rule in which CMS
stated that it could change wRVU recommendations of the refinement panel convened by CMS if “policy concerns
warrant their modification,” without providing additional clarification on what would trigger this ability of CMS to
subvert the more transparent process of the refinement panel. However, we continued to participate in the process under
the belief that CMS would operate fairly and transparently and that if there were indeed “policy concerns” that CMS had
regarding the values of the codes under consideration that those concerns would be stated clearly so all parties could
address them during the refinement panel reviews.

CMS has now implemented a policy by which it is creating differential payments for the same work performed by
different physicians as a backdoor mechanism for reducing the work RVUs for surgical procedures. They have valued
the worth of a surgeon for post-operative evaluation and management work at about 30 percent of a non-surgeon. Non-
surgeons are allowed to provide the same work to the same patient at 100 percent reimbursement. First, we believe that
this policy leads to a loss of validity and integrity of the current system. In addition, this policy is prohibited by the
Omnibus Budget Reconciliation Act of 1989, which states, “[t]he Secretary may not vary the conversion factor or the
number of relative value units for a physicians’ service based on whether the physician furnishing the service is a
specialist or based on the type of specialty of the physician.” (42 U.S.C. §1395w-4(c)(6)).

The ACS has been a vocal proponent of needed reforms in the delivery and payment of health care. We believe that the
future of these reforms will be based on driving greater awareness of proven continuous quality improvement programs
to achieve ongoing, tangible results for quality improvements. However, in order for these reforms to be effective, they
must be built on a system that is consistent with previous Agency decisions, fair, and transparent, and it is our concern
that many of the policy decisions made by CMS in the latest Medicare Physician Fee Schedule Final Rule move us away
from those goals. The resource based relative value system (RBRVS) requires a resource basis for decisions on the
valuation of physician services. We believe that the resource basis for the decision to reduce these values is not evident.
We ask that under your authority as Secretary you will seek to have CMS define a more transparent process in the future
for decisions that are not aligned with the RUC and refinement panel recommendations in order to help maintain the
transparency and fairness of the current system and to restore the values of these services to the level that is supported
by the RBRVS process.

Sincerely,
David B. Hoyt, MD, FACS
Executive Director
CPT Code: 49X08

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 49X08 Tracking Number C9 Original Specialty Recommended RVU: 10.79
Global Period: 000 Current Work RVU: RUC Recommended RVU: 10.79
Presented Recommended RVU: 10.79

CPT Descriptor: Repair of anterior abdominal hernia(s) (ie, epigastric, incisional, ventral, umbilical, spigelian), any approach (ie, open, laparoscopic, robotic), recurrent, including placement of mesh or other prosthesis, when performed total length of defect(s); less than 3 cm, incarcerated or strangulated

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 60-year-old obese male has a surgical history of a prior laparotomy with a resultant hernia in the incision. The prior hernia was repaired 5 years ago. He now has a small bulge in the midepigastric area for 2 months that previously disappeared when supine. The bulge is now irreducible and tender. Physical exam reveals a small recurrent incarcerated incisional hernia. He undergoes hernia repair of a defect that is less than 3 cm with placement of mesh.

Percentage of Survey Respondents who found Vignette to be Typical: 88%

Site of Service (Complete for 010 and 090 Globals Only)
Percent of survey respondents who stated they perform the procedure; In the hospital 98%, In the ASC 2%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 25%, Overnight stay-less than 24 hours 55%, Overnight stay-more than 24 hours 20%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 97%

Description of Pre-Service Work: Results of preadmission testing (imaging, electrocardiogram and labs) are reviewed. Appropriate selection, timing, and administration of DVT prophylaxis are ensured. Appropriate selection, timing, and administration of antibiotics are ensured. The need for beta-blockers is assessed, and they are ordered as required. The patient is reexamined to confirm that physical findings have not changed, the patient’s medication regimen has remained the same, the patient has no new allergies, and the patient has not undergone any recent procedures. The history and physical examination are then updated in the electronic health record. The planned procedure and postoperative management are reviewed with the patient and family. Informed consent is reviewed and obtained from the patient, including witness confirmation. The masses of material incarcerated in the hernia are palpated obscuring the edge of the hernia defect(s). The sites of the proposed skin incisions are marked with cooperation of patient. The length and type of anesthesia, including adjuncts to postoperative analgesia management, are reviewed with the anesthesiologist. Verify that all required instruments and supplies are available, including reusable and disposable laparoscopic/robotic equipment and mesh. Assistance is provided in transfer of the patient from gurney to operating table. Monitor/assist with positioning of patient, including padding and securing patient to table that will adjust throughout procedure (eg, reverse Trendelenburg). Assist anesthesia team with line placement and induction of anesthesia and intubation, relative to all laparoscopic/robotic equipment. The areas of skin to be prepared and draped are indicated by the surgeon to ensure that all of the potential operative field is included in the preparation. The surgeon scrubs and gowns. A surgical time-out is performed with operating surgical team.

Description of Intra-Service Work: Abdominal access is obtained and a safe pneumoperitoneum is created with placement of a needle/trocar in the left upper quadrant. The camera is inserted and safe entry is verified. Additional trocars are placed in the lateral abdomen, under direct vision. The incarcerated/strangulated bowel, mesentery and omentum are carefully reduced with dissection of the adhesions from any previous mesh to expose and to clear the defect for repair. This requires manipulation both intra-abdominally with minimally invasive instrumentation and extra-abdominally with palpation and pressure applied to the abdominal wall to reduce the incarcerated contents. The reduced tissue is examined for viability and any inadvertent injury. The hernia sac is reduced and resected as needed to expose the fascial edges of the defect(s). The hernia defect is visualized. The falciform ligament and preperitoneal fat are cleared from the abdominal wall fascia to
expose the posterior fascia. Peritoneal flaps are created for placement of mesh. The fascial defect is sutured. A mesh is introduced into the peritoneal cavity through a trocar and is oriented. Insufflation is reduced to facilitate mesh conformity to the anterior abdominal wall. The mesh is secured to the abdominal wall utilizing sutures and/or tacks. The peritoneal flaps are then sutured over the mesh to protect it from the abdominal viscera. Completion camera survey is performed of the abdomen and contents to inspect for bleeding and visceral injury and perform a final viability assessment of the material once incarcerated in the hernia sac. Irrigation is performed as necessary. Fascial incisions from laparoscopic ports larger than 1 cm are closed with a suture passer. Skin incisions are closed according to surgeon preference.

Description of Post-Service Work:
Immediate postoperative care [operative day through discharge from recovery room]: Apply sterile dressings. Monitor patient during reversal of anesthesia. Assist in transfer of patient from operating table to gurney. Monitor transport of patient from operating room to recovery room. Discuss postoperative recovery care with anesthesia and nursing staff, including need for patient-controlled analgesia. Discontinue prophylactic antibiotic therapy, as appropriate. Review postoperative labs. Discuss procedure and outcome with family in waiting area. Write brief operative note or complete final operative note and place in chart. Write postoperative note in the recovery room. Dictate operative report and copy referring physician(s). Call referring physician(s). Write orders for transferring to observation or general surgical floor and discuss ongoing care with nursing staff.

Later same day hospital observation care visit [operative day after discharge from recovery room]: Review interval nursing/other staff chart notes. Discuss ongoing care with nursing staff. Evaluate vital signs and intake/output. Auscultate heart, lungs, and abdomen for bowel sounds. Monitor fluid and electrolyte status and renal function; monitor for problems such as ileus, intestinal ischemia, and urinary retention. Examine patient, check wounds, and change dressings. Continue prophylaxis for DVT. Assess need for beta-blockers, order as required. Assess pain scores and adequacy of analgesia. Write orders for labs, films, medications, diet, and patient activity. Chart patient progress notes. Answer patient and family questions. Answer nursing/other staff questions. Advance diet, as appropriate.

### Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC’s rationale, please review the separate RUC recommendation document.
Background

**RAW Screen**
Code 49565, *Repair recurrent incisional or ventral hernia; reducible*, was identified by the RUC/RAW with a site of service anomaly: less than 50% inpatient status; includes inpatient visit codes; greater than 5,000 utilization. Prior to submitting an Action Plan to the RAW, the societies reviewed the site of service data and found: almost even split of 48% between inpatient and outpatient – with a few percent in the ASC. At the January 2020 RUC meeting, the societies requested referral of code 49565 to CPT to update the descriptor to current standard of practice and typical patient presentation.

**CPT Coding Changes**
At the February 2021 CPT meeting the following changes were approved:

- Delete all the current open and laparoscopic codes for repair of anterior abdominal hernias.
- Delete add-on code 49568 for mesh for open ventral/incisional hernias and large defects as a result of necrotizing soft tissue infection.
- Add 12 new codes for anterior abdominal hernia repair by any approach (ie, open laparoscopic, robotic); by initial or recurrent; by total defect size; and by reducible or incarcerated/strangulated.
- Add 2 codes for parastomal hernia repair - by reducible or incarcerated/strangulated.
- Add 1 add-on code for removal of mesh/prosthesis – only with the new hernia repair codes.
- Add 1 new code for mesh/prosthesis for delayed closure of external genitalia, perineum and/or abdominal wall defect(s) due to soft tissue infection or trauma.

**Coding Structure**
Hernia repair for epigastric, incisional, ventral, umbilical, spigelian were merged as they all appear on the anterior abdomen. The location—upper, lower, midline—does not impact the work. But instead, the size and number of defects is the driving factor for work. For example, with respect to the code that was tagged by the RAW, a recurrent, incisional, reducible hernia can be anywhere from a small hernia at a port site from a prior laparoscopic procedure to an extremely large hernia with multiple defects clustered in a midline incision.

Initial versus recurrent differentiation was maintained. Recurrent hernias are re-reoperations. An initial hernia can be the result of a prior procedure (this is not a recurrent hernia) or weak muscles and fascia. A recurrent hernia is typically at least the third time the same site is being operated on.

For example,

- operation 1 might be an open colectomy
- operation 2 would be an initial midline hernia repair
- operation 3 would be a recurrent midline hernia involving the initial midline repair and may include other multiple hernias occurring in the same old incision, all needing to be repaired.

There are many examples in CPT that differentiate between a primary and secondary procedure: disarticulation of shoulder (23920-23921); amputation of arm through humerus (24900-24930) and other similar amputation families; tendon repair (eg, 25260-25274); CABG reoperation (33530); and revision total joint (eg, 23473, 23474, 24370, 24371, 27134-27138).

The hernia size ranges were based on a review of literature and expert panel. For example, an article published in the Journal of the American College of Surgeons reviewed technique and outcomes of abdominal incisional hernia repair and showed that the range of defect size was from less than 1 cm to more than 25 cm with a mean of 6 cm and a median of less than 3 cm. Other similar articles were submitted with the code change application, supporting different work for different defect size. David A. Iannitti, et.al, *Technique and Outcomes of Abdominal Incisional Hernia Repair Using a Synthetic Composite Mesh: A Report of 455 Cases*, Journal of the American College of Surgeons, Volume 206, Issue 1, 2008, Pages 83-88, ISSN 1072-7515, https://doi.org/10.1016/j.jamcollsurg.2007.07.030.

Differentiating the work of a procedure in relationship to size or extent is not new for CPT. For example, 36 skin repair codes by length of repair; 44 lesion excision codes by excised diameter; 46 soft tissue tumor excision codes by size of tumor; 23 hysterectomy codes by size of uterus (58260-58573); 3 myomectomy codes are differentiated by total weight of the myomas (58140-58146); and 10 nerve graft codes are based on length of graft. (64885-64898)
The CPT guidelines and illustrations that describe how to measure the total defect size are well understood by surgeons. This is not a new concept—the surgeons are very familiar with measuring a hernia defect, and in fact the size of the hernia defect was included in some of the patient vignettes in 1993. Furthermore, measurement of hernia size is a necessary step for selecting and preparing the appropriately sized mesh for implantation.

Hernia repair coding has been complicated by changes in (1) technology and technique and (2) the recent implementation of ICD-10-PCS codes. For these reasons, the stakeholder societies believed this set of codes should describe "any approach." The societies and the AMA Coding Network have received numerous coding questions about correct reporting for "hybrid" abdominal hernia repair procedures where parts of the procedure are performed via an open approach and parts of the procedure are performed via laparoscopy or with the use of a robot. These are not laparoscopic procedures converted to open procedures, but instead procedures that are more often begun open and then finished as laparoscopic/robotic under pneumoperitoneum.

Another issue that has recently caused confusion about coding has appeared on national coder websites and coder discussion boards referring to International Classification of Diseases Tenth Revision Procedure Coding System (ICD-10-PCS) codes which classify procedures performed in the facility (ie, not CPT physician procedures). This, however, is important because facilities want the procedure codes reported to correspond with the descriptors of ICD-10-PCS codes that the facility is reporting. Unfortunately, the new ICD-10-PCS codes define various surgical approaches that do not correspond to CPT coding (open, closed, percutaneous, and laparoscopic). For example, the ICD-10-PCS "open endoscopic" approach is defined as "cutting through the skin or mucous membrane and any other body layers necessary to expose a body part, and introduction of instrumentation to reach and visualize the site of the procedure." A second example is the "open with percutaneous endoscopic assistance" approach defined as "cutting through the skin or mucous membrane and any other body layers necessary to expose the site of the procedure, and entry, by puncture or minor incision, of instrumentation through the skin or mucous membrane and any other body layers necessary to aid in the performance of the procedure." These new ICD-10-PCS codes have resulted in coders stating that a procedure should be reported as open because the ICD-10-PCS code indicates open and to report any procedure that includes extension of a port incision (eg, for delivery of a specimen) to be reported as an open procedure—instead of being correctly reported as a laparoscopic procedure.

**Mesh**

- **Implantation of mesh is now typical and therefore was bundled into the new codes.** When code 49568 was created in 1993, mesh implantation with hernia repairs was not typical. This is supported by the typical patient described in 1993 as having a 10 cm midline incisional hernia—a very large hernia. With research on the causes of hernia recurrence, changes in technology and development of new types of mesh or other prosthesis, implantation of mesh is now typical for all types of hernias and all sizes to reduce the incidence of recurrence. This was supported by the literature submitted with the CCA.

- **Mesh removal is not always required and is not typical.** Technology and research have developed types of mesh that are now being implanted which are incorporated into the abdominal wall, reducing the risk of infection, complications, and recurrence. When mesh removal is indicated, it is typically due to hardening and fracturing of aged mesh, or when gross contamination and infection has occurred (eg, enterocutaneous fistula involving the mesh). For example, a recurrent hernia repair may require removal of fractured, brittle (old technology) mesh many years after an open repair following a colectomy. This work is typically significant, in that the mesh is often integrated with the abdominal wall or adhered to intestine, and involves removal of all of the mesh, not just a small portion. An add-on code to report mesh removal prior to hernia repair, when required, allows for accurate reporting of this work only when performed, which our expert panel believes is not typical of most hernia repairs.

- **Deletion of code 49658 resulted in rare "left over" work for implantation of mesh related to closure for a large open wound after debridement for necrotizing fasciitis.** Add-on code 46958 was reported for mesh placement for both open hernia repair and in relation to closure of wounds from necrotizing soft tissue infection. This code will be deleted and the work of mesh placement will be included in the work for all of the anterior abdominal hernia repair codes. The remaining use of code 46958 was for mesh placement for delayed closure of external genitalia, perineum and/or abdominal wall defect(s) due to soft tissue infection or trauma. As described in the vignette for 157X1, necrotizing soft tissue infections typically result in a large open wound that cannot be closed primarily. When the infection has resolved, absorbable mesh or other prosthesis is placed to allow healing by secondary intent until such time that a skin graft or skin closure can be accomplished. The literature submitted with the CCA supports this work.
Compelling Evidence - Flawed methodology of previous reviews, New technology

Flawed Methodology: Codes 49560, 49561, 49565, 49566, 49570, 49572, 49580, 49582, 49585, and 49590 were last reviewed in 2000 during the 2nd 5-year-review. During this review, the American College of Surgeons argued that there was compression of work values for big procedures and there were rank order issues within families of codes. We developed a methodology using NSQIP data that was approved by the Research Subcommittee. However, to validate the methodology, the 5YR Workgroup instructed the ACS to group the codes into families and survey one or two CPT codes as full surveys per family to act as anchors for each family and the rest of the codes to be surveyed as mini-surveys for only time and visits. After conducting all of the surveys, we believe we were able to validate the methodology that we proposed, however, the 5YR Workgroup did not agree. Instead, they decided that the value that they assigned to the anchor code (the full survey) would be extrapolated to all of the other codes grouped into the same survey. The hernia codes listed above were grouped with 49505 which was increased by 17% based on the survey data and compelling evidence. The 17% increase was applied to the other codes in the group without consideration of rank order, mini survey results or society recommendations. This resulted in continuation of compression and rank order issues. For example, although code 49572 was increased by 17%, the IWPUT for the code is negative. Other codes have near zero IWPUT. We believe this was a flawed methodology of review of the codes and meets compelling evidence.

Flawed Methodology: Codes 49587, 49652, 49653, 49654, and 49655 were last reviewed in 2011 based on a site of service anomaly screen. At that time, the RUC approved including a same day observation visit and full observation discharge on the subsequent day. The RUC noted that the typical patient requires close monitoring for problems such as ileus, intestinal ischemia and urinary retention. Additionally, there will be significant pain post-operatively requiring management before discharge. The specialty noted, and the RUC agreed, that the shift in patient facility status (in patient moving to outpatient—as determined by CMS) has little to do with healthier patients that require less physician work and everything to do with the recent OPPS changes related to facility reimbursement. This was substantiated by the survey data which showed that the typical patients stayed at least overnight and received a postoperative same-day E/M service. Given this data, the RUC enacted its (then current) policy to allocate the appropriate proxy for the postoperative visits which was categorized as either subsequent observation and/or observation discharge—both of which are outpatient codes. Importantly, the specialties argued and the RUC agreed that the work of providers who care for medical patients should not be discounted (eg, full observation E/M and full observation discharge E/M allowed for patient staying overnight for observation.)

CMS ignored the valid outpatient E/M visit code inputs that the RUC recommended and instead stated in the Rule that they have a policy of not allowing "inpatient" visits included in the details for outpatient services. These codes went through a Refinement Panel process [ie, a CMS convened group of Medical Officers and select physicians acting as a separate formal appeals process] that resulted in agreement with the RUC recommendations. Importantly, the Agency still maintained that inpatient visits would not be allowed (even though outpatient/observation visits were submitted by the RUC) and then used a reverse building block methodology to subtract work RVUs from the values. These values had been developed by magnitude estimation and approved by the RUC. The Agency deleted the observation visit code inputs and decreased discharge management by 50 percent even though it was performed on a subsequent date. We believe this action by CMS resulted in a flawed methodology of review of these codes and meets compelling evidence.

The rejection of equal value for equal work and rejection of the Refinement Panel results prompted the Executive Director of the American College of Surgeons to send a letter (see last page of SoR) to Kathleen Sebelius, then Secretary of the Department of Health and Human Services on November 29, 2011. This letter addressed the decision-making process for valuing procedure codes that have Medicare outpatient status, the use of refinement panels, and the arbitrary discount in physician work for the same work performed by any provider of a non-global service. Specifically, the letter included the following statement:

"CMS has now implemented a policy by which it is creating differential payments for the same work performed by different physicians as a backdoor mechanism for reducing the work RVUs for surgical procedures. They have valued the worth of a surgeon for post-operative evaluation and management work at about 30 percent of a non-surgeon. Non-surgeons are allowed to provide the same work to the same patient at 100 percent reimbursement. …we believe that this policy leads to a loss of validity and integrity of the current system."

We continue to believe there is no valid justification for a 50% discount to discharge management services provided by a surgeon that is performed the day after a procedure when a non-surgical provider observing a medical patient who is kept overnight for any reason is allowed to bill a discharge management service at 100 percent for work on the next day.
We also believe there is no valid justification for discounting a postoperative visit later the same day of surgery to equal only the intra-service time of the visit multiplied by an intensity of 0.0224. No surgeon would round on a postoperative patient the same day and not review interval chart notes prior to the face-to-face with the patient and not follow up with charting the visit and confirming or modifying the current orders.

CMS implemented a 23-hour policy for discounting surgical postoperative work based on the argument that the Agency could not include inpatient work in their time/work file. However, the fact is that the Agency has also erroneously rejected RUC recommendations for outpatient/observation codes, stating "these inpatient codes" could not be included for procedure that are typically outpatient.

**Change in Technology:** Since the last review of the hernia repair codes (either in 2000 or in 2011), there has been introduction and application of new technology (ie, robotic assist) which adds work complexity and time with the goal of better patient outcomes. The diffusion of this new technology throughout this family of codes further meets compelling evidence.

---

**Recommendation – 49X08**

We recommend a work RVU of 10.79, which is the survey 25th percentile median.

**Pre-service time**

Evaluation and scrub, dress, wait package time has been reduced so as not to exceed survey median data.

Laparoscopic/robotic anterior abdominal hernia repair positioning time: The patient will initially be positioned supine and upper extremity intravenous and arterial access points are dressed, padded and secured. The arms are padded and tucked at the patient’s sides. The patient must be secured to the table, including a soft chest and thigh strap, as it may be necessary to roll the table during the procedure to use gravity to assist with shifting the abdominal contents. There is also consideration of positioning the patient relative to: laparoscopy equipment, including lines and video equipment and anesthesia lines relative to the rest of the equipment. The survey median positioning time reflects the time for this procedure.

**Postoperative E/M visit later on the day of surgery**

The typical patient will stay overnight or longer and there will typically be a visit later on the same day of the procedure at a level of 99231. Review data (eg, diagnostic and imaging studies) not available at the unit. Communicate with other health care professionals and with patient and/or family. Review medical records and data available on the unit. Perform a medically appropriate examination. Consider relevant data, options, and risks; formulate and/or revise diagnosis and treatment plan(s) (straightforward or low-complexity MDM). Discuss diagnosis and treatment options with the patient and/or family. Consider discharge needs of patient. Communicate with other health care professionals as necessary. Write and/or review orders, including arranging for necessary diagnostic testing, consultation(s), and therapeutic intervention(s). Complete medical record documentation. Address interval data obtained and reported changes in condition. Communicate results and additional care plans to other health care professionals and to the patient and/or family.

Per CMS policy for reporting postoperative work for 23-hour stay procedures, the intraservice time of 10 minutes for 99231 has been added to the survey immediate postoperative time (total = 30 min).

**Key Reference Code Intensity/Complexity Comparison**

Ref 1: The respondents indicated the intensity/complexity of survey code 49X08 is somewhat more than reference code 21811. Ref 2: The respondents indicated the intensity/complexity of survey code 49X08 is somewhat more than reference code 11005.

Comparison of using the recommended RVW versus using the 25th percentile.

The first chart below shows reasonable correlation between the recommended RVW and WPUT—both trend lines have a similar slope. The second chart below shows no relationship of WPUT to the 25th percentile RVW—where WPUT decreases as work increases.

What if surgeon evaluation and management work were set equal to discrete E/M services?

As has been discussed by the RUC in the past, work intensities used for computation of IWPUT for time spent by physicians in the pre-service and immediate post-service period for surgical procedures have remained fixed since the early 1990s, while intensity of time for E/M values has received several increased values over several decades.
Recent increases for outpatient office E/M values were not allowed to be added to global codes by CMS. Because IWPUT is calculated by subtracting the pre- and post-work values from the RVW of a given CPT code, this has resulted in less value subtracted than would have occurred if the more appropriate pre- and post-work values were used for the IWPUT formula. This artificially increases the IWPUT and WPUT resulting in a decrease in relativity. This is especially true for codes that have a significant amount of pre-service and post-service work.

It has become difficult to compare IWPUT (and WPUT) for codes with different global periods because of the level of discounting of pre-service and post-service work. For example, for the top 34 high volume 10 and 90 day global codes, AMA staff recently calculated the difference in IWPUT if the office visit increases were used in the IWPUT equation. The AMA table, which is included in the Research Subcommittee agenda for this meeting, showed that the IWPUT would have decreased from -6% to -548% depending on the number of office visits included in the work/time file. To emphasize the importance of this information, the code which would have had the largest decrease (17000) has 3 minutes of intra-time and only one postop office visit (99212). In this table, it was also clear that relativity within a family of codes is lost, because each code within a family may have varying levels of post-service work. To summarize, IWPUT has become much less accurate when used as a comparator of intra-service work within and between families because of CMS actions (ie, not updating global RVW) and policy (ie, discounting postoperative work).

Using the discussion above, we have created the table below that presents the IWPUT and WPUT for the hernia set of codes using (1) the 2021 formulas, and (2) "full value" formulas. The note below the table describes each formula, but basically the full value formula sets pre- and post-service work equal to the same E/M work for non-surgical services. For comparison to facility non-surgical services, we have included codes 99283-99285 using the 2021 published RVW and time data. This table shows that most of the recommendations for 49X01-49X14 result in a WPUT that is less than an ED visit requiring moderate MDM (99284). This table also shows that those codes with similar WPUT to high MDM are appropriately the bigger and more complex procedures. Last, this table provides evidence that discounting pre- and post-work distorts and artificially impacts fair IWPUT and WPUT relativity comparison. However, if undiscounted work is applied, the recommendations for this set of codes are appropriately ranked.

* 2021 Formula: IWPUT calculation based on evaluation, positioning, immediate post intensity of 0.0224; scrub/dress/wait intensity of 0.0081; and discounted same-day outpatient postop visit (not shown in table) equal to intra-service time at 0.0224. WPUT calculation equal to total time (including discounted postop visit time not shown on table) divided by work.

**2021 Full Value Formula: IWPUT calculation based on pre-service and immediate post-service time intensity of 0.043 (equal to WPUT for 99213) and same-day post EM at full value instead of discounted time for outpatient procedure as shown on table (highlighted in red).
SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - Multiple codes allow flexibility to describe exactly what components the procedure included.
   - Multiple codes are used to maintain consistency with similar codes.
   - Historical precedents.
   - Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed)

49565 Repair recurrent incisional or ventral hernia; reducible 090
49657 Laparoscopy, surgical, repair, recurrent incisional hernia (includes mesh insertion, when performed); incarcerated or strangulated 090
49568 Implantation of mesh or other prosthesis for open incisional or ventral hernia repair or mesh for closure of debridement for necrotizing soft tissue infection (List separately in addition to code for the incisional or ventral hernia repair) ZZZ

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

<table>

Do many physicians perform this service across the United States? Yes

**Berenson-Eggers Type of Service (BETOS) Assignment**
Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Other

**Professional Liability Insurance Information (PLI)**

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 11008

**Letter Referenced in Compelling Evidence Rationale**

November 29, 2011

The Honorable Kathleen Sebelius
Secretary
Department of Health and Human Services
Hubert H. Humphrey Building
200 Independence Avenue SW
Washington, DC 20201

Re: CY 2012 Medicare Physician Fee Schedule Final Rule and CMS Refinement Panels

Dear Secretary Sebelius:

On November 28, 2011, the Federal Register published the Centers for Medicare and Medicaid Services’ (CMS) Calendar Year (CY) 2012 Medicare Physician Fee Schedule Final Rule. On behalf of the American College of Surgeons (ACS), I am writing to express concern regarding the decision making process and lack of transparency on the part of CMS related to the work relative value units (wRVUs) for 2012 reviewed under CMS’ refinement panel process. The ACS, with over 78,000 members, is a scientific and educational organization of surgeons that was founded in 1913 to raise the standards of surgical practice and to improve the care of the surgical patient.

The ACS has participated in the efforts of the American Medical Association’s Relative Value Scale Update Committee (AMA RUC) for years given the value we place on the AMA RUC process and our assumption that CMS will evaluate the RUC recommendations with fairness, transparency, and accuracy according to a process that has been set out via the
Federal rulemaking process. As part of the work that led to the CY 2012 Medicare Physician Fee Schedule Final Rule, the ACS devoted significant resources to conducting AMA RUC surveys for over 100 new or existing codes at the request of CMS. The AMA RUC evaluated wRVU recommendations made by the ACS, based upon those surveys, and came to agreement on final recommended values to be submitted to CMS.

Fifty-seven of the aforementioned codes that the ACS surveyed were sent to the refinement panel. CMS accepted only 12 percent of those refinement panel recommendations.

For most of the 88 percent of refinement panel recommendations that CMS rejected, CMS lowered the wRVU by reducing the value of the post-operative evaluation and management work performed by surgeons in the hospital by 69 percent. However, if that same work is performed by any other physician other than the surgeon, that same service is paid at 100 percent. We believe that the refinement panel physicians completely rejected this concept as they agreed to a work RVU that did not discount post-surgical work in this fashion. We note that the multispecialty panel included physicians from primary care, contractor medical directors (CMDs), physicians in related specialties, and general surgeons. At no time did the Agency's Medical Officer in charge of the panel process disagree with the presenters or offer a contrary opinion to the discussion.

Our concerns were piqued when CMS issued the CY 2011 Medicare Physician Fee Schedule Final Rule in which CMS stated that it could change wRVU recommendations of the refinement panel convened by CMS if “policy concerns warrant their modification,” without providing additional clarification on what would trigger this ability of CMS to subvert the more transparent process of the refinement panel. However, we continued to participate in the process under the belief that CMS would operate fairly and transparently and that if there were indeed “policy concerns” that CMS had regarding the values of the codes under consideration that those concerns would be stated clearly so all parties could address them during the refinement panel reviews.

CMS has now implemented a policy by which it is creating differential payments for the same work performed by different physicians as a backdoor mechanism for reducing the work RVUs for surgical procedures. They have valued the worth of a surgeon for post-operative evaluation and management work at about 30 percent of a non-surgeon. Non-surgeons are allowed to provide the same work to the same patient at 100 percent reimbursement. First, we believe that this policy leads to a loss of validity and integrity of the current system. In addition, this policy is prohibited by the Omnibus Budget Reconciliation Act of 1989, which states, “[t]he Secretary may not vary the conversion factor or the number of relative value units for a physicians’ service based on whether the physician furnishing the service is a specialist or based on the type of specialty of the physician.” (42 U.S.C. §1395w-4(c)(6)).

The ACS has been a vocal proponent of needed reforms in the delivery and payment of health care. We believe that the future of these reforms will be based on driving greater awareness of proven continuous quality improvement programs to achieve ongoing, tangible results for quality improvements. However, in order for these reforms to be effective, they must be built on a system that is consistent with previous Agency decisions, fair, and transparent, and it is our concern that many of the policy decisions made by CMS in the latest Medicare Physician Fee Schedule Final Rule move us away from those goals. The resource based relative value system (RBRVS) requires a resource basis for decisions on the valuation of physician services. We believe that the resource basis for the decision to reduce these values is not evident. We ask that under your authority as Secretary you will seek to have CMS define a more transparent process in the future for decisions that are not aligned with the RUC and refinement panel recommendations in order to help maintain the transparency and fairness of the current system and to restore the values of these services to the level that is supported by the RBRVS process.

Sincerely,
David B. Hoyt, MD, FACS
Executive Director
CPT Code: 49X09

Tracking Number: C10

CPT Descriptor: Repair of anterior abdominal hernia(s) (i.e., epigastric, incisional, ventral, umbilical, spigelian), any approach (i.e., open, laparoscopic, robotic), recurrent, including placement of mesh or other prosthesis, when performed total length of defect(s); 3 cm to 10 cm, reducible.

Original Specialty Recommended RVU: 12.00
Presented Recommended RVU: 12.00
RUC Recommended RVU: 12.00

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

Percentage of Survey Respondents who found Vignette to be Typical: 81%

Site of Service (Complete for 010 and 090 Globals Only)
Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%
Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 16%, Overnight stay-less than 24 hours 51%, Overnight stay-more than 24 hours 33%
Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 94%

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 60-year-old obese male presents with of a large bulge in midepigastric area that disappears when he lies down. His surgical history includes a prior laparotomy with resultant hernia that was repaired 5 years ago. Physical exam reveals a large recurrent reducible incisional hernia. He undergoes hernia repair of a defect that is 3 to 10 cm with placement of mesh.

Description of Pre-Service Work: Results of preadmission testing (imaging, electrocardiogram and labs) are reviewed. Appropriate selection, timing, and administration of DVT prophylaxis are ensured. Appropriate selection, timing, and administration of antibiotics are ensured. The need for beta-blockers is assessed, and they are ordered as required. The patient is reexamined to confirm that physical findings have not changed, the patient’s medication regimen has remained the same, the patient has no new allergies, and the patient has not undergone any recent procedures. The history and physical examination are then updated in the electronic health record. The planned procedure and postoperative management are reviewed with the patient and family. Informed consent is reviewed and obtained from the patient, including witness confirmation. The palpable edge of the hernia defect(s) and sites of the proposed skin incisions are marked with cooperation of patient. The length and type of anesthesia, including adjuncts to postoperative analgesia management, are reviewed with the anesthesiologist. Verify that all required instruments and supplies are available, including reusable and disposable laparoscopic/robotic equipment and mesh. Assistance is provided in transfer of the patient from gurney to operating table.

Description of Intra-Service Work: Abdominal access is obtained and a safe pneumoperitoneum is created with placement of a needle/trocar in the left upper quadrant. The camera is inserted and safe entry is verified. Additional trocars are placed in the lateral abdomen, under direct vision. A large field of adhesions occupies approximately half of the anterior abdominal wall correlating with the extent of the prior laparotomy and hernia repair. Adhesions to the abdominal wall are divided sharply to free the anterior abdominal wall completely. The careful process of adhesiolysis is performed to clear adhesions from between omentum, small intestines and colon and the abdominal wall and prior mesh. Each separate defect within the entire hernia defect contains adipose and intestinal components and requires a safe and effective clearance of tissue. The hernia defect is visualized. The falciform ligament and preperitoneal fat are cleared from the abdominal wall fascia to
expose the posterior fascia. Peritoneal flaps are created for placement of mesh. The fascial defect is sutured the entire length. A mesh is selected to provide adequate overlap of the hernia defect. A mesh is introduced into the peritoneal cavity through a trocar and is oriented. Insufflation is reduced to facilitate mesh conformity to the anterior abdominal wall. The mesh is secured to the abdominal wall utilizing sutures and/or tacks. The peritoneal flaps are then sutured over the mesh to protect it from the abdominal viscera. Completion camera survey is performed of the abdomen and contents to inspect for bleeding and visceral injury. Irrigation is performed as necessary. Fascial incisions for laparoscopic ports larger than 1 cm are closed with a suture passer. Skin incisions are closed according to surgeon preference.

Description of Post-Service Work:
Immediate postoperative care [operative day through discharge from recovery room]: Apply sterile dressings. Monitor patient during reversal of anesthesia. Assist in transfer of patient from operating table to gurney. Monitor transport of patient from operating room to recovery room. Discuss postoperative recovery care with anesthesia and nursing staff, including need for patient-controlled analgesia. Discontinue prophylactic antibiotic therapy, as appropriate. Review postoperative labs. Discuss procedure and outcome with family in waiting area. Write brief operative note or complete final operative note and place in chart. Write postoperative note in the recovery room. Dictate operative report and copy referring physician(s). Call referring physician(s). Write orders for transferring to observation or general surgical floor and discuss ongoing care with nursing staff.

Later same day hospital observation care visit [operative day after discharge from recovery room]: Review interval nursing/other staff chart notes. Discuss ongoing care with nursing staff. Evaluate vital signs and intake/output. Auscultate heart, lungs, and abdomen for bowel sounds. Monitor fluid and electrolyte status and renal function; monitor for problems such as ileus, intestinal ischemia, and urinary retention. Examine patient, check wounds, and change dressings. Continue prophylaxis for DVT. Assess need for beta-blockers, order as required. Assess pain scores and adequacy of analgesia. Write orders for labs, films, medications, diet, and patient activity. Chart patient progress notes. Answer patient and family questions. Answer nursing/other staff questions. Advance diet, as appropriate.

---

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC’s rationale, please review the separate RUC recommendation document.
Background

**RAW Screen**
Code 49565, *Repair recurrent incisional or ventral hernia; reducible*, was identified by the RUC/RAW with a site of service anomaly: less than 50% inpatient status; includes inpatient visit codes; greater than 5,000 utilization. Prior to submitting an Action Plan to the RAW, the societies reviewed the site of service data and found: almost even split of 48% between inpatient and outpatient – with a few percent in the ASC. At the January 2020 RUC meeting, the societies requested referral of code 49565 to CPT to update the descriptor to current standard of practice and typical patient presentation.

**CPT Coding Changes**
At the February 2021 CPT meeting the following changes were approved:
- Delete all the current open and laparoscopic codes for repair of anterior abdominal hernias.
- Delete add-on code 49568 for mesh for open ventral/incisional hernias and large defects as a result of necrotizing soft tissue infection.
- Add 12 new codes for anterior abdominal hernia repair by any approach (ie, open laparoscopic, robotic); by initial or recurrent; by total defect size; and by reducible or incarcerated/strangulated
- Add 2 codes for parastomal hernia repair - by reducible or incarcerated/strangulated
- Add 1 add-on code for removal of mesh/prosthesis – only with the new hernia repair codes
- Add 1 new code for mesh/prosthesis for delayed closure of external genitalia, perineum and/or abdominal wall defect(s) due to soft tissue infection or trauma.

**Coding Structure**
Hernia repair for epigastric, incisional, ventral, umbilical, spigelian were merged as they all appear on the anterior abdomen. The location--upper, lower, midline—does not impact the work. But instead, the size and number of defects is the driving factor for work. For example, with respect to the code that was tagged by the RAW, a recurrent, incisional, reducible hernia can be anywhere from a small hernia at a port site from a prior laparoscopic procedure to an extremely large hernia with multiple defects clustered in a midline incision.

Initial versus recurrent differentiation was maintained. Recurrent hernias are re-reoperations. An initial hernia can be the result of a prior procedure (this is not a recurrent hernia) or weak muscles and fascia. A recurrent hernia is typically at least the third time the same site is being operated on.

For example,
- operation 1 might be an open colectomy
- operation 2 would be an initial midline hernia repair
- operation 3 would be a recurrent midline hernia involving the initial midline repair and may include other multiple hernias occurring in the same old incision, all needing to be repaired.

There are many examples in CPT that differentiate between a primary and secondary procedure: disarticulation of shoulder (23920-23921); amputation of arm through humerus (24900-24930) and other similar amputation families; tendon repair (eg, 25260-25274); CABG reoperation (33530); and revision total joint (eg, 23473, 23474, 24370, 24371, 27134-27138).

The hernia size ranges were based on a review of literature and expert panel. For example, an article published in the Journal of the American College of Surgeons reviewed technique and outcomes of abdominal incisional hernia repair and showed that the range of defect size was from less than 1 cm to more than 25 cm with a mean of 6 cm and a median of less than 3 cm. Other similar articles were submitted with the code change application, supporting different work for different defect size. David A. Iannitti, et.al, *Technique and Outcomes of Abdominal Incisional Hernia Repair Using a Synthetic Composite Mesh: A Report of 455 Cases*, Journal of the American College of Surgeons, Volume 206, Issue 1, 2008, Pages 83-88, ISSN 1072-7515, https://doi.org/10.1016/j.jamcollsurg.2007.07.030.

Differentiating the work of a procedure in relationship to size or extent is not new for CPT. For example, 36 skin repair codes by length of repair; 44 lesion excision codes by excised diameter; 46 soft tissue tumor excision codes by size of tumor; 23 hysterectomy codes by size of uterus (58260-58573); 3 myomectomy codes are differentiated by total weight of the myomas (58140-58146); and 10 nerve graft codes are based on length of graft. (64885-64898)
The CPT guidelines and illustrations that describe how to measure the total defect size are well understood by surgeons. This is not a new concept—surgeons are very familiar with measuring a hernia defect, and in fact the size of the hernia defect was included in some of the patient vignettes in 1993. Furthermore, measurement of hernia size is a necessary step for selecting and preparing the appropriately sized mesh for implantation.

Hernia repair coding has been complicated by changes in (1) technology and technique and (2) the recent implementation of ICD-10-PCS codes. For these reasons, the stakeholder societies believed this set of codes should describe "any approach." The societies and the AMA Coding Network have received numerous coding questions about correct reporting for "hybrid" abdominal hernia repair procedures where parts of the procedure are performed via an open approach and parts of the procedure are performed via laparoscopy or with the use of a robot. These are not laparoscopic procedures converted to open procedures, but instead procedures that are more often begun open and then finished as laparoscopic/robotic under pneumoperitoneum.

Another issue that has recently caused confusion about coding has appeared on national coder websites and coder discussion boards referring to International Classification of Diseases Tenth Revision Procedure Coding System (ICD-10-PCS) codes which classifies procedures performed in the facility (ie, not CPT physician procedures). This, however, is important because facilities want the procedure codes reported to correspond with the descriptors of ICD-10-PCS codes that the facility is reporting. Unfortunately, the new ICD-10-PCS codes define various surgical approaches that do not correspond to CPT coding (open, closed, percutaneous, and laparoscopic). For example, the ICD-10-PCS "open endoscopic" approach is defined as "cutting through the skin or mucous membrane and any other body layers necessary to expose a body part, and introduction of instrumentation to reach and visualize the site of the procedure." A second example is the "open with percutaneous endoscopic assistance" approach defined as "cutting through the skin or mucous membrane and any other body layers necessary to expose the site of the procedure, and entry, by puncture or minor incision, of instrumentation through the skin or mucous membrane and any other body layers necessary to aid in the performance of the procedure." These new ICD-10-PCS codes have resulted in coders stating that a procedure should be reported as open because the ICD-10-PCS code indicates open and to report any procedure that includes extension of a port incision (eg, for delivery of a specimen) to be reported as an open procedure—instead of being correctly reported as laparoscopic/robotic under pneumoperitoneum.

Mesh

- **Implantation of mesh is now typical and therefore was bundled into the new codes.** When code 49568 was created in 1993, mesh implantation with hernia repairs was not typical. This is supported by the typical patient described in 1993 as having a 10 cm midline incisional hernia—a very large hernia. With research on the causes of hernia recurrence, changes in technology and development of new types of mesh or other prosthesis, implantation of mesh is now typical for all types of hernias and all sizes to reduce the incidence of recurrence. This was supported by the literature submitted with the CCA.

- **Mesh removal is not always required and is not typical.** Technology and research have developed types of mesh that are now being implanted which are incorporated into the abdominal wall, reducing the risk of infection, complications, and recurrence. When mesh removal is indicated, it is typically due to hardening and fracturing of aged mesh, or when gross contamination and infection has occurred (eg, enterocutaneous fistula involving the mesh). For example, a recurrent hernia repair may require removal of fractured, brittle (old technology) mesh many years after an open repair following a colectomy. This work is typically significant, in that the mesh is often integrated with the abdominal wall or adhered to intestine, and involves removal of all of the mesh, not just a small portion. An add-on code to report mesh removal prior to hernia repair, when required, allows for accurate reporting of this work only when performed, which our expert panel believes is not typical of most hernia repairs.

- **Deletion of code 49658 resulted in rare "left over" work for implantation of mesh related to closure for a large open wound after debridement for necrotizing fasciitis.** Add-on code 46958 was reported for mesh placement for both open hernia repair and in relation to closure of wounds from necrotizing soft tissue infection. This code will be deleted and the work of mesh placement will be included in the work for all of the anterior abdominal hernia repair codes. The remaining use of code 46958 was for mesh placement for delayed closure of external genitalia, perineum and/or abdominal wall defect(s) due to soft tissue infection or trauma. As described in the vignette for 157X1, necrotizing soft tissue infections typically result in a large open wound that cannot be closed primarily. When the infection has resolved, absorbable mesh or other prosthesis is placed to allow healing by secondary intent until such time that a skin graft or skin closure can be accomplished. The literature submitted with the CCA supports this work.
**Compelling Evidence - Flawed methodology of previous reviews, New technology**

**Flawed Methodology:** Codes 49560, 49561, 49564, 49566, 49570, 49572, 49580, 49582, 49585, and 49590 were last reviewed in 2000 during the 2nd 5-year-review. During this review, the American College of Surgeons argued that there was compression of work values for big procedures and there were rank order issues within families of codes. We developed a methodology using NSQIP data that was approved by the Research Subcommittee. However, to validate the methodology, the 5YR Workgroup instructed the ACS to group the codes into families and survey one or two CPT codes as full surveys per family to act as anchors for each family and the rest of the codes to be surveyed as mini-surveys for only time and visits. After conducting all of the surveys, we believe we were able to validate the methodology that we proposed, however, the 5YR Workgroup did not agree. Instead, they decided that the value that they assigned to the anchor code (the full survey) would be extrapolated to all of the other codes grouped into the same survey. The hernia codes listed above were grouped with 49505 which was increased by 17% based on the survey data and compelling evidence. The 17% increase was applied to the other codes in the group without consideration of rank order, mini survey results or society recommendations. This resulted in continuation of compression and rank order issues. For example, although code 49572 was increased by 17%, the IWPUT for the code is negative. Other codes have near zero IWPUT. We believe this was a flawed methodology of review of the codes and meets compelling evidence.

**Flawed Methodology:** Codes 49587, 49652, 49653, 49654, and 49655 were last reviewed in 2011 based on a site of service anomaly screen. At that time, the RUC approved including a same day observation visit and full observation discharge on the subsequent day. The RUC noted that the typical patient requires close monitoring for problems such as ileus, intestinal ischemia and urinary retention. Additionally, there will be significant pain post-operatively requiring management before discharge. The specialty noted, and the RUC agreed, that the shift in patient facility status (in patient moving to outpatient—as determined by CMS) has little to do with healthier patients that require less physician work and everything to do with the recent OPPS changes related to facility reimbursement. This was substantiated by the survey data which showed that the typical patients stayed at least overnight and received a postoperative same-day E/M service. Given this data, the RUC enacted its (then current) policy to allocate the appropriate proxy for the postoperative visits which was categorized as either subsequent observation and/or observation discharge—both of which are outpatient codes. Importantly, the specialties argued and the RUC agreed that the work of providers who care for medical patients should not be discounted (eg, full observation E/M and full observation discharge E/M allowed for patient staying overnight for observation.)

CMS ignored the valid outpatient E/M visit code inputs that the RUC recommended and instead stated in the Rule that they have a policy of not allowing "inpatient" visits included in the details for outpatient services. These codes went through a Refinement Panel process [ie, a CMS convened group of Medical Officers and select physicians acting as a separate formal appeals process] that resulted in agreement with the RUC recommendations. Importantly, the Agency still maintained that inpatient visits would not be allowed (even though outpatient/observation visits were submitted by the RUC) and then used a reverse building block methodology to subtract work RVUs from the values. These values had been developed by magnitude estimation and approved by the RUC. The Agency deleted the observation visit code inputs and decreased discharge management by 50 percent even though it was performed on a subsequent date. We believe this action by CMS resulted in a flawed methodology of review of these codes and meets compelling evidence.

The rejection of equal value for equal work and rejection of the Refinement Panel results prompted the Executive Director of the American College of Surgeons to send a letter (see last page of SoR) to Kathleen Sebelius, then Secretary of the Department of Health and Human Services on November 29, 2011. This letter addressed the decision-making process for valuing procedure codes that have Medicare outpatient status, the use of refinement panels, and the arbitrary discount in physician work for the same work performed by any provider of a non-global service. Specifically, the letter included the following statement:

"CMS has now implemented a policy by which it is creating differential payments for the same work performed by different physicians as a backdoor mechanism for reducing the work RVUs for surgical procedures. They have valued the worth of a surgeon for post-operative evaluation and management work at about 30 percent of a non-surgeon. Non-surgeons are allowed to provide the same work to the same patient at 100 percent reimbursement. ...we believe that this policy leads to a loss of validity and integrity of the current system."

We continue to believe there is no valid justification for a 50% discount to discharge management services provided by a surgeon that is performed the day after a procedure when a non-surgical provider observing a medical patient who is kept overnight for any reason is allowed to bill a discharge management service at 100 percent for work on the next day.
We also believe there is no valid justification for discounting a postoperative visit later the same day of surgery to equal only the intra-service time of the visit multiplied by an intensity of 0.0224. No surgeon would round on a postoperative patient the same day and not review interval chart notes prior to the face-to-face with the patient and not followup with charting the visit and confirming or modifying the current orders.

CMS implemented a 23-hour policy for discounting surgical postoperative work based on the argument that the Agency could not include inpatient work in their time/work file. However, the fact is that the Agency has also erroneously rejected RUC recommendations for outpatient / observation codes, stating "these inpatient codes" could not be included for procedure that are typically outpatient.

**Change in Technology:** Since the last review of the hernia repair codes (either in 2000 or in 2011), there has been introduction and application of new technology (ie, robotic assist) which adds work complexity and time with the goal of better patient outcomes. The diffusion of this new technology throughout this family of codes further meets compelling evidence.

---

**Recommendation – 49X09**

We recommend a work RVU of 12.00, which is the survey 25th percentile median.

**Pre-service time**

Evaluation and scrub, dress, wait package time has been reduced so as to not exceed survey median data.

Laparoscopic/robotic anterior abdominal hernia repair positioning time: The patient will initially be positioned supine and upper extremity intravenous and arterial access points are dressed, padded and secured. The arms are padded and tucked at the patient’s sides. The patient must be secured to the table, including a soft chest and thigh strap, as it may be necessary to roll the table during the procedure to use gravity to assist with shifting the abdominal contents. There is also consideration of positioning the patient relative to: laparoscopy equipment, including lines and video equipment and anesthesia lines relative to the rest of the equipment. The survey median positioning time reflects the time for this procedure for these activities.

**Postoperative E/M visit later on the day of surgery**

The typical patient will stay overnight or longer and there will typically be a visit later on the same day of the procedure at a level of 99231. Review data (eg, diagnostic and imaging studies) not available at the unit. Communicate with other health care professionals and with patient and/or family. Review medical records and data available on the unit. Perform a medically appropriate examination. Consider relevant data, options, and risks; formulate and/or revise diagnosis and treatment plan(s) (straightforward or low-complexity MDM). Discuss diagnosis and treatment options with the patient and/or family. Consider discharge needs of patient. Communicate with other health care professionals as necessary. Write and/or review orders, including arranging for necessary diagnostic testing, consultation(s), and therapeutic intervention(s). Complete medical record documentation. Address interval data obtained and reported changes in condition. Communicate results and additional care plans to other health care professionals and to the patient and/or family.

Per CMS policy for reporting postoperative work for 23-hour stay procedures, the intraservice time of 10 minutes for 99231 has been added to the survey immediate postoperative time (total = 30 min).

**Key Reference Code Intensity/Complexity Comparison**

Ref 1: The respondents indicated the intensity/complexity of survey code 49X09 is somewhat more than reference code 11006. Ref 2: The respondents indicated the intensity/complexity of survey code 49X09 is somewhat more than reference code 11005.

**Comparison of using the recommended RVW versus using the 25th percentile.**

The first chart below shows reasonable correlation between the recommended RVW and WPUT—both trend lines have a similar slope. The second chart below shows no relationship of WPUT to the 25th percentile RVW—where WPUT decreases as work increases.

What if surgeon evaluation and management work were set equal to discrete E/M services?
As has been discussed by the RUC in the past, work intensities used for computation of IWPUT for time spent by physicians in the pre-service and immediate post-service period for surgical procedures have remained fixed since the early 1990s, while intensity of time for E/M values has received several increased values over several decades.

Recent increases for outpatient office E/M values were not allowed to be added to global codes by CMS. Because IWPUT is calculated by subtracting the pre- and post-work values from the RVW of a given CPT code, this has resulted in less value subtracted than would have occurred if the more appropriate pre- and post-work values were used for the IWPUT formula. This artificially increases the IWPUT and WPUT resulting in a decrease in relativity. This is especially true for codes that have a significant amount of pre-service and post-service work.

It has become difficult to compare IWPUT (and WPUT) for codes with different global periods because of the level of discounting of pre-service and post-service work. For example, for the top 34 high volume 10 and 90 day global codes, it has become difficult to compare IWPUT (and WPUT) for time spent by physicians in the pre-service and immediate post-service period for surgical procedures have remained fixed since the early 1990s, while intensity of time for E/M values has received several increased values over several decades.

Using the discussion above, we have created the table below that presents the IWPUT and WPUT for the hernia set of codes using (1) the 2021 formulas, and (2) "full value" formulas. The note below the table describes each formula, but basically the full value formula sets pre- and post-service work equal to the same E/M work for non-surgical services. For comparison to facility non-surgical services, we have included codes 99283-99285 using the 2021 published RVW and time data. This table shows that most of the recommendations for 49X01-49X14 result in a WPUT that is less than an ED visit requiring moderate MDM (99284). This table also shows that those codes with similar WPUT to high MDM are appropriately the bigger and more complex procedures. Last, this table provides evidence that discounting pre- and post-work distorts and artificially impacts fair IWPUT and WPUT relativity comparison. However, if undiscounted work is applied, the recommendations for this set of codes are appropriately ranked.

</table>

* 2021 Formula: IWPUT calculation based on evaluation, positioning, immediate post intensity of 0.0224; scrub/dress/wait intensity of 0.0081; and discounted same-day outpatient postop visit (not shown in table) equal to intra-service time at 0.0224. WPUT calculation equal to total time (including discounted postop visit time not shown on table) divided by work.
CPT Code: 49X09

**2021 Full Value Formula: IWPUT calculation based on pre-service and immediate post-service time intensity of 0.043 (equal to WPUT for 99213) and same-day post EM at full value instead of discounted time for outpatient procedure as shown on table (highlighted in red).**

---

**SERVICES REPORTED WITH MULTIPLE CPT CODES**

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)
   - The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - Multiple codes allow flexibility to describe exactly what components the procedure included.
   - Multiple codes are used to maintain consistency with similar codes.
   - Historical precedents.
   - Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

---

**FREQUENCY INFORMATION**

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed)

49565  Repair recurrent incisional or ventral hernia; reducible  090
49656  Laparoscopy, surgical, repair, recurrent incisional hernia (includes mesh insertion, when performed); reducible  090
49568  Implantation of mesh or other prosthesis for open incisional or ventral hernia repair or mesh for closure of debridement for necrotizing soft tissue infection (List separately in addition to code for the incisional or ventral hernia repair)  ZZZ

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

<table>

**Letter Referenced in Compelling Evidence Rationale**

November 29, 2011

The Honorable Kathleen Sebelius
Secretary
Department of Health and Human Services
Hubert H. Humphrey Building
200 Independence Avenue SW
Washington, DC 20201

Re: CY 2012 Medicare Physician Fee Schedule Final Rule and CMS Refinement Panels

Dear Secretary Sebelius:

On November 28, 2011, the Federal Register published the Centers for Medicare and Medicaid Services’ (CMS) Calendar Year (CY) 2012 Medicare Physician Fee Schedule Final Rule. On behalf of the American College of Surgeons (ACS), I am writing to express concern regarding the decision making process and lack of transparency on the part of CMS related to the work relative value units (wRVUs) for 2012 reviewed under CMS’ refinement panel process. The
ACS, with over 78,000 members, is a scientific and educational organization of surgeons that was founded in 1913 to raise the standards of surgical practice and to improve the care of the surgical patient.

The ACS has participated in the efforts of the American Medical Association’s Relative Value Scale Update Committee (AMA RUC) for years given the value we place on the AMA RUC process and our assumption that CMS will evaluate the RUC recommendations with fairness, transparency, and accuracy according to a process that has been set out via the Federal rulemaking process. As part of the work that led to the CY 2012 Medicare Physician Fee Schedule Final Rule, the ACS devoted significant resources to conducting AMA RUC surveys for over 100 new or existing codes at the request of CMS. The AMA RUC evaluated wRVU recommendations made by the ACS, based upon those surveys, and came to agreement on final recommended values to be submitted to CMS.

Fifty-seven of the aforementioned codes that the ACS surveyed were sent to the refinement panel. CMS accepted only 12 percent of those refinement panel recommendations.

For most of the 88 percent of refinement panel recommendations that CMS rejected, CMS lowered the wRVU by reducing the value of the post-operative evaluation and management work performed by surgeons in the hospital by 69 percent. However, if that same work is performed by any other physician other than the surgeon, that same service is paid at 100 percent. We believe that the refinement panel physicians completely rejected this concept as they agreed to a work RVU that did not discount post-surgical work in this fashion. We note that the multispecialty panel included physicians from primary care, contractor medical directors (CMDs), physicians in related specialties, and general surgeons. At no time did the Agency’s Medical Officer in charge of the panel process disagree with the presenters or offer a contrary opinion to the discussion.

Our concerns were piqued when CMS issued the CY 2011 Medicare Physician Fee Schedule Final Rule in which CMS stated that it could change wRVU recommendations of the refinement panel convened by CMS if “policy concerns warrant their modification,” without providing additional clarification on what would trigger this ability of CMS to subvert the more transparent process of the refinement panel. However, we continued to participate in the process under the belief that CMS would operate fairly and transparently and that if there were indeed “policy concerns” that CMS had regarding the values of the codes under consideration that those concerns would be stated clearly so all parties could address them during the refinement panel reviews.

CMS has now implemented a policy by which it is creating differential payments for the same work performed by different physicians as a backdoor mechanism for reducing the work RVUs for surgical procedures. They have valued the worth of a surgeon for post-operative evaluation and management work at about 30 percent of a non-surgeon. Non-surgeons are allowed to provide the same work to the same patient at 100 percent reimbursement. First, we believe that this policy leads to a loss of validity and integrity of the current system. In addition, this policy is prohibited by the Omnibus Budget Reconciliation Act of 1989, which states, “[t]he Secretary may not vary the conversion factor or the number of relative value units for a physicians’ service based on whether the physician furnishing the service is a specialist or based on the type of specialty of the physician.” (42 U.S.C. §1395w-4(c)(6)).

The ACS has been a vocal proponent of needed reforms in the delivery and payment of health care. We believe that the future of these reforms will be based on driving greater awareness of proven continuous quality improvement programs to achieve ongoing, tangible results for quality improvements. However, in order for these reforms to be effective, they must be built on a system that is consistent with previous Agency decisions, fair, and transparent, and it is our concern that many of the policy decisions made by CMS in the latest Medicare Physician Fee Schedule Final Rule move us away from those goals. The resource based relative value system (RBRVS) requires a resource basis for decisions on the valuation of physician services. We believe that the resource basis for the decision to reduce these values is not evident. We ask that under your authority as Secretary you will seek to have CMS define a more transparent process in the future for decisions that are not aligned with the RUC and refinement panel recommendations in order to help maintain the transparency and fairness of the current system and to restore the values of these services to the level that is supported by the RBRVS process.

Sincerely,
David B. Hoyt, MD, FACS
Executive Director
AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 49X10  Tracking Number: C11  Original Specialty Recommended RVU: 18.50
Global Period: 000  Current Work RVU:  RUC Recommended RVU: 16.50

Presented Recommended RVU: 18.50

CPT Descriptor: Repair of anterior abdominal hernia(s) (ie, epigastric, incisional, ventral, umbilical, spigelian), any approach (ie, open, laparoscopic, robotic), recurrent, including placement of mesh or other prosthesis, when performed total length of defect(s); 3 cm to 10 cm, incarcerated or strangulated

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 60-year-old obese male presents with an irreducible mass in the midline of the abdomen. He has a history of a previous laparotomy with an incisional hernia from that operation that was repaired 5 years ago. Over the course of the last few months, he has developed a recurrence that has been slowly increasing in size. Suddenly, the hernia is not reducible, and the mass is tender with severe, unremitting pain. He undergoes hernia repair of a defect that is 3 to 10 cm with placement of mesh.

Percentage of Survey Respondents who found Vignette to be Typical: 91%

Site of Service (Complete for 010 and 090 Globals Only)
Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is;
Discharged the same day 7%, Overnight stay-less than 24 hours 35%, Overnight stay-more than 24 hours 58%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 95%

Description of Pre-Service Work: Results of preadmission testing (imaging, electrocardiogram and labs) are reviewed. Appropriate selection, timing, and administration of DVT prophylaxis are ensured. Appropriate selection, timing, and administration of antibiotics are ensured. The need for beta-blockers is assessed, and they are ordered as required. The patient is reexamined to confirm that physical findings have not changed, the patient’s medication regimen has remained the same, the patient has no new allergies, and the patient has not undergone any recent procedures. The history and physical examination are then updated in the electronic health record. The planned procedure and postoperative management are reviewed with the patient and family. Informed consent is reviewed and obtained from the patient, including witness confirmation. The masses of material incarcerated in the hernia are palpated obscuring the edge of the hernia defect(s). The sites of the proposed skin incisions are marked with cooperation of patient. The length and type of anesthesia, including adjuncts to postoperative analgesia management, are reviewed with the anesthesiologist. Verify that all required instruments and supplies are available, including reusable and disposable laparoscopic/robotic equipment and mesh. Assistance is provided in transfer of the patient from gurney to operating table. Monitor/assist with positioning of patient, including padding and securing patient to table that will adjust throughout procedure (eg, reverse Trendelenburg). Assist anesthesia team with line placement and induction of anesthesia and intubation, relative to all laparoscopic/robotic equipment. The areas of skin to be prepared and draped are indicated by the surgeon to ensure that all of the potential operative field is included in the preparation. The surgeon scrubs and gowns. A surgical time-out is performed with operating surgical team.

Description of Intra-Service Work: Abdominal access is obtained and a safe pneumoperitoneum is created with placement of a needle/trocar in the left upper quadrant. The camera is inserted and safe entry is verified. Additional trocars are placed in the lateral abdomen, under direct vision. A large field of adhesions occupies approximately half of the anterior abdominal wall correlating with the extent of the prior laparotomy and hernia repair. The incarcerated/strangulated bowel, mesentery and omentum are carefully reduced with dissection of the adhesions from prior mesh to expose and to clear the defects for repair. This requires manipulation both intra-abdominally with minimally invasive instrumentation and extra-abdominally...
with palpation and pressure applied to the abdominal wall to reduce the incarcerated contents. The reduced tissue is examined for viability and any inadvertent injury. The hernia sac is reduced and resected as needed to expose the fascial edges of the defect(s). The hernia defect(s) is visualized. Peritoneal flaps are created for placement of mesh The falciform ligament and preperitoneal fat are cleared from the abdominal wall fascia to expose the posterior fascia. All of the defects are measured. The fascial defect is approximated with suture. A mesh is selected to provide adequate overlap of the hernia defect. A mesh is introduced into the peritoneal cavity through a trocar and is oriented. Insufflation is reduced to facilitate mesh conformity to the anterior abdominal wall. The mesh is secured to the abdominal wall utilizing numerous sutures and/or tacks. The peritoneal flaps are then sutured over the mesh to protect it from the abdominal viscera. Completion camera survey is performed of the abdomen and contents to inspect for bleeding and visceral injury and perform a final viability assessment of the material once incarcerated in the hernia sac. Irrigation is performed as necessary. Fascial incisions for laparoscopic ports larger than 1 cm are closed with a suture passer. Skin incisions are closed according to surgeon preference.

Description of Post-Service Work:
Immediate postoperative care [operative day through discharge from recovery room]: Apply sterile dressings. Monitor patient during reversal of anesthesia. Assist in transfer of patient from operating table to gurney. Monitor transport of patient from operating room to recovery room. Discuss postoperative recovery care with anesthesia and nursing staff, including need for patient-controlled analgesia. Discontinue prophylactic antibiotic therapy, as appropriate. Review postoperative labs. Discuss procedure and outcome with family in waiting area. Write brief operative note or complete final operative note and place in chart. Write postoperative note in the recovery room. Dictate operative report and copy referring physician(s). Call referring physician(s). Write orders for transferring to general surgical floor and discuss ongoing care with nursing staff.

Later same day hospital inpatient care visit [operative day after discharge from recovery room]: Review interval nursing/other staff chart notes. Discuss ongoing care with nursing staff. Evaluate vital signs and intake/output. Auscultate heart, lungs, and abdomen for bowel sounds. Monitor fluid and electrolyte status and renal function; monitor for problems such as ileus, intestinal ischemia, and urinary retention. Examine patient, check wounds, and change dressings. Continue prophylaxis for DVT. Assess need for beta-blockers, order as required. Assess pain scores and adequacy of analgesia. Write orders for labs, films, medications, diet, and patient activity. Chart patient progress notes. Answer patient and family questions. Answer nursing/other staff questions. Advance diet, as appropriate.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC’s rationale, please review the separate RUC recommendation document.
**Background**

**RAW Screen**
Code 49565, *Repair recurrent incisional or ventral hernia; reducible*, was identified by the RUC/RAW with a site of service anomaly: less than 50% inpatient status; includes inpatient visit codes; greater than 5,000 utilization. Prior to submitting an Action Plan to the RAW, the societies reviewed the site of service data and found: almost even split of 48% between inpatient and outpatient – with a few percent in the ASC. At the January 2020 RUC meeting, the societies requested referral of code 49565 to CPT to update the descriptor to current standard of practice and typical patient presentation.

**CPT Coding Changes**
At the February 2021 CPT meeting the following changes were approved:
- Delete all the current open and laparoscopic codes for repair of anterior abdominal hernias.
- Delete add-on code 49568 for mesh for open ventral/incisional hernias and large defects as a result of necrotizing soft tissue infection.
- Add 12 new codes for anterior abdominal hernia repair by any approach (ie, open laparoscopic, robotic); by initial or recurrent; by total defect size; and by reducible or incarcerated/strangulated.
- Add 2 codes for parastomal hernia repair - by reducible or incarcerated/strangulated.
- Add 1 add-on code for removal of mesh/prosthesis – only with the new hernia repair codes.
- Add 1 new code for mesh/prosthesis for delayed closure of external genitalia, perineum and/or abdominal wall defect(s) due to soft tissue infection or trauma.

**Coding Structure**
Hernia repair for epigastric, incisional, ventral, umbilical, spigelian were merged as they all appear on the anterior abdomen. The location--upper, lower, midline—does not impact the work. But instead, the size and number of defects is the driving factor for work. For example, with respect to the code that was tagged by the RAW, a recurrent, incisional, reducible hernia can be anywhere from a small hernia at a port site from a prior laparoscopic procedure to an extremely large hernia with multiple defects clustered in a midline incision.

Initial versus recurrent differentiation was maintained. Recurrent hernias are re-reoperations. An initial hernia can be the result of a prior procedure (this is not a recurrent hernia) or weak muscles and fascia. A recurrent hernia is typically at least the third time the same site is being operated on.

For example,
- operation 1 might be an open colectomy
- operation 2 would be an initial midline hernia repair
- operation 3 would be a recurrent midline hernia involving the initial midline repair and may include other multiple hernias occurring in the same old incision, all needing to be repaired.

There are many examples in CPT that differentiate between a primary and secondary procedure: disarticulation of shoulder (23920-23921); amputation of arm through humerus (24900-24930) and other similar amputation families; tendon repair (eg, 25260-25274); CABG reoperation (33530); and revision total joint (eg, 23473, 23474, 24370, 24371, 27134-27138).

The hernia size ranges were based on a review of literature and expert panel. For example, an article published in the Journal of the American College of Surgeons reviewed technique and outcomes of abdominal incisional hernia repair and showed that the range of defect size was from less than 1 cm to more than 25 cm with a mean of 6 cm and a median of less than 3 cm. Other similar articles were submitted with the code change application, supporting different work for different defect size. David A. Iannitti, et.al, *Technique and Outcomes of Abdominal Incisional Hernia Repair Using a Synthetic Composite Mesh: A Report of 455 Cases*, Journal of the American College of Surgeons, Volume 206, Issue 1, 2008, Pages 83-88, ISSN 1072-7515, https://doi.org/10.1016/j.jamcollsurg.2007.07.030.

Differentiating the work of a procedure in relationship to size or extent is not new for CPT. For example, 36 skin repair codes by length of repair; 44 lesion excision codes by excised diameter; 46 soft tissue tumor excision codes by size of tumor; 23 hysterectomy codes by size of uterus (58260-58573); 3 myomectomy codes are differentiated by total weight of the myomas (58140-58146); and 10 nerve graft codes are based on length of graft. (64885-64898)
The CPT guidelines and illustrations that describe how to measure the total defect size are well understood by surgeons. This is not a new concept – surgeons are very familiar with measuring a hernia defect, and in fact the size of the hernia defect was included in some of the patient vignettes in 1993. Furthermore, measurement of hernia size is a necessary step for selecting and preparing the appropriately sized mesh for implantation.

Hernia repair coding has been complicated by changes in (1) technology and technique and (2) the recent implementation of ICD-10-PCS codes. For these reasons, the stakeholder societies believed this set of codes should describe "any approach." The societies and the AMA Coding Network have received numerous coding questions about correct reporting for "hybrid" abdominal hernia repair procedures where parts of the procedure are performed via an open approach and parts of the procedure are performed via laparoscopy or with the use of a robot. These are not laparoscopic procedures converted to open procedures, but instead procedures that are more often begun open and then finished as laparoscopic/robotic under pneumoperitoneum.

Another issue that has recently caused confusion about coding has appeared on national coder websites and coder discussion boards referring to International Classification of Diseases Tenth Revision Procedure Coding System (ICD-10-PCS) codes which classifies procedures performed in the facility (ie, not CPT physician procedures). This, however, is important because facilities want the procedure codes reported to correspond with the descriptors of ICD-10-PCS codes that the facility is reporting. Unfortunately, the new ICD-10-PCS codes define various surgical approaches that do not correspond to CPT coding (open, closed, percutaneous, and laparoscopic). For example, the ICD-10-PCS "open endoscopic" approach is defined as "cutting through the skin or mucous membrane and any other body layers necessary to expose a body part, and introduction of instrumentation to reach and visualize the site of the procedure." A second example is the "open with percutaneous endoscopic assistance" approach defined as "cutting through the skin or mucous membrane and any other body layers necessary to expose the site of the procedure, and entry, by puncture or minor incision, of instrumentation through the skin or mucous membrane and any other body layers necessary to aid in the performance of the procedure." These new ICD-10-PCS codes have resulted in coders stating that a procedure should be reported as open because the ICD-10-PCS code indicates open and to report any procedure that includes extension of a port incision (eg, for delivery of a specimen) to be reported as an open procedure --instead of being correctly reported as a laparoscopic procedure.

**Mesh**

- **Implantation of mesh is now typical and therefore was bundled into the new codes.** When code 49568 was created in 1993, mesh implantation with hernia repairs was not typical. This is supported by the typical patient described in 1993 as having a 10 cm midline incisional hernia – a very large hernia. With research on the causes of hernia recurrence, changes in technology and development of new types of mesh or other prosthesis, implantation of mesh is now typical for all types of hernias and all sizes to reduce the incidence of recurrence. This was supported by the literature submitted with the CCA.

- **Mesh removal is not always required and is not typical.** Technology and research have developed types of mesh that are now being implanted which are incorporated into the abdominal wall, reducing the risk of infection, complications, and recurrence. When mesh removal is indicated, it is typically due to hardening and fracturing of aged mesh, or when gross contamination and infection has occurred (eg, enterocutaneous fistula involving the mesh). For example, a recurrent hernia repair may require removal of fractured, brittle (old technology) mesh many years after an open repair following a colectomy. This work is typically significant, in that the mesh is often integrated with the abdominal wall or adhered to intestine, and involves removal of all of the mesh, not just a small portion. An add-on code to report mesh removal prior to hernia repair, when required, allows for accurate reporting of this work only when performed, which our expert panel believes is not typical of most hernia repairs.

- **Deletion of code 49658 resulted in rare "left over" work for implantation of mesh related to closure for a large open wound after debridement for necrotizing fasciitis.** Add-on code 46958 was reported for mesh placement for both open hernia repair and in relation to closure of wounds from necrotizing soft tissue infection. This code will be deleted and the work of mesh placement will be included in the work for all of the anterior abdominal hernia repair codes. The remaining use of code 46958 was for mesh placement for delayed closure of external genitalia, perineum and/or abdominal wall defect(s) due to soft tissue infection or trauma. As described in the vignette for 157X1, necrotizing soft tissue infections typically result in a large open wound that cannot be closed primarily. When the infection has resolved, absorbable mesh or other prosthesis is placed to allow healing by

---

**CPT Code: 49X10**
secondary intent until such time that a skin graft or skin closure can be accomplished. The literature submitted with the CCA supports this work.

Compelling Evidence - Flawed methodology of previous reviews, New technology

Flawed Methodology: Codes 49560, 49561, 49565, 49566, 49570, 49572, 49580, 49582, 49585, and 49590 were last reviewed in 2000 during the 2nd 5-year-review. During this review, the American College of Surgeons argued that there was compression of work values for big procedures and there were rank order issues within families of codes. We developed a methodology using NSQIP data that was approved by the Research Subcommittee. However, to validate the methodology, the 5YR Workgroup instructed the ACS to group the codes into families and survey one or two CPT codes as full surveys per family to act as anchors for each family and the rest of the codes to be surveyed as mini-surveys for only time and visits. After conducting all of the surveys, we believe we were able to validate the methodology that we proposed, however, the 5YR Workgroup did not agree. Instead, they decided that the value that they assigned to the anchor code (the full survey) would be extrapolated to all of the other codes grouped into the same survey. The hernia codes listed above were grouped with 49505 which was increased by 17% based on the survey data and compelling evidence. The 17% increase was applied to the other codes in the group without consideration of rank order, mini survey results or society recommendations. This resulted in continuation of compression and rank order issues. For example, although code 49572 was increased by 17%, the IWPUT for the code is negative. Other codes have near zero IWPUT. We believe this was a flawed methodology of review of the codes and meets compelling evidence.

Flawed Methodology: Codes 49587, 49652, 49653, 49654, and 49655 were last reviewed in 2011 based on a site of service anomaly screen. At that time, the RUC approved including a same day observation visit and full observation discharge on the subsequent day. The RUC noted that the typical patient requires close monitoring for problems such as ileus, intestinal ischemia and urinary retention. Additionally, there will be significant pain post-operatively requiring management before discharge. The specialty noted, and the RUC agreed, that the shift in patient facility status (in patient moving to outpatient—as determined by CMS) has little to do with healthier patients that require less physician work and everything to do with the recent OPPS changes related to facility reimbursement. This was substantiated by the survey data which showed that the typical patients stayed at least overnight and received a postoperative same-day E/M service. Given this data, the RUC enacted its (then current) policy to allocate the appropriate proxy for the postoperative visits which was categorized as either subsequent observation and/or observation discharge—both of which are outpatient codes. Importantly, the specialties argued and the RUC agreed that the work of providers who care for medical patients should not be discounted (eg, full observation E/M and full observation discharge E/M allowed for patient staying overnight for observation.)

CMS ignored the valid outpatient E/M visit code inputs that the RUC recommended and instead stated in the Rule that they have a policy of not allowing "inpatient" visits included in the details for outpatient services. These codes went through a Refinement Panel process [ie, a CMS convened group of Medical Officers and select physicians acting as a separate formal appeals process] that resulted in agreement with the RUC recommendations. Importantly, the Agency still maintained that inpatient visits would not be allowed (even though outpatient/observation visits were submitted by the RUC) and then used a reverse building block methodology to subtract work RVUs from the values. These values had been developed by magnitude estimation and approved by the RUC. The Agency deleted the observation visit code inputs and decreased discharge management by 50 percent even though it was performed on a subsequent date. We believe this action by CMS resulted in a flawed methodology of review of these codes and meets compelling evidence.

The rejection of equal value for equal work and rejection of the Refinement Panel results prompted the Executive Director of the American College of Surgeons to send a letter (see last page of SoR) to Kathleen Sebelius, then Secretary of the Department of Health and Human Services on November 29, 2011. This letter addressed the decision-making process for valuing procedure codes that have Medicare outpatient status, the use of refinement panels, and the arbitrary discount in physician work for the same work performed by any provider of a non-global service. Specifically, the letter included the following statement:

"CMS has now implemented a policy by which it is creating differential payments for the same work performed by different physicians as a backdoor mechanism for reducing the work RVUs for surgical procedures. They have valued the worth of a surgeon for post-operative evaluation and management work at about 30 percent of a non-surgeon. Non-surgeons are allowed to provide the same work to the same patient at 100 percent reimbursement. …we believe that this policy leads to a loss of validity and integrity of the current system."
We continue to believe there is no valid justification for a 50% discount to discharge management services provided by a surgeon that is performed the day after a procedure when a non-surgical provider observing a medical patient who is kept overnight for any reason is allowed to bill a discharge management service at 100 percent for work on the next day. We also believe there is no valid justification for discounting a postoperative visit later the same day of surgery to equal only the intra-service time of the visit multiplied by an intensity of 0.0224. No surgeon would round on a postoperative patient the same day and not review interval chart notes prior to the face-to-face with the patient and not follow up with charting the visit and confirming or modifying the current orders.

CMS implemented a 23-hour policy for discounting surgical postoperative work based on the argument that the Agency could not include inpatient work in their time/work file. However, the fact is that the Agency has also erroneously rejected RUC recommendations for outpatient / observation codes, stating "these inpatient codes" could not be included for procedure that are typically outpatient.

**Change in Technology:** Since the last review of the hernia repair codes (either in 2000 or in 2011), there has been introduction and application of new technology (ie, robotic assist) which adds work complexity and time with the goal of better patient outcomes. The diffusion of this new technology throughout this family of codes further meets compelling evidence.

**Recommendation – 49X10**

We recommend a work RVU of 18.50, which is the survey median.

**Pre-service time**

Scrub, dress, wait package time has been reduced so as to not exceed survey median data.

Laparoscopic/robotic anterior abdominal hernia repair positioning time: The patient will initially be positioned supine and upper extremity intravenous and arterial access points are dressed, padded and secured. The arms are padded and tucked at the patient’s sides. The patient must be secured to the table, including a soft chest and thigh strap, as it may be necessary to roll the table during the procedure to use gravity to assist with shifting the abdominal contents.. There is also consideration of positioning the patient relative to: laparoscopy equipment, including lines and video equipment and anesthesia lines relative to the rest of the equipment. The survey median positioning time reflects the time for this procedure for these activities.

**Postoperative E/M visit later on the day of surgery**

The typical patient will be admitted and a visit will occur later on the same day to monitor for postoperative complications including ileus, intestinal ischemia, and urinary retention. Review data (eg, diagnostic and imaging studies) not available at the unit. Communicate with other health care professionals and with patient and/or family. Review medical records and data available on the unit. Perform a medically appropriate examination. Consider relevant data, options, and risks; formulate and/or revise diagnosis and treatment plan(s) (moderate complexity MDM). Discuss diagnosis and treatment options with the patient and/or family. Consider discharge needs of patient. Communicate with other health care professionals as necessary. Write and/or review orders, including arranging for necessary diagnostic testing, consultation(s), and therapeutic intervention(s). Complete medical record documentation. Address interval data obtained and reported changes in condition. Communicate results and additional care plans to other health care professionals and to the patient and/or family.

**Key Reference Code Intensity/Complexity Comparison**

Ref 1: The respondents indicated the intensity/complexity of survey code 49X10 is similar to somewhat more than reference code 33891. Ref 2: The respondents indicated the intensity/complexity of survey code 49X10 is similar to somewhat more than reference code 21813.

**MPC Code Comparison**

MPC code 37244 has the highest RVW for the set of 0-day global codes.
radiological supervision and interpretation, intraprocedural roadmapping, and imaging
guidance necessary to complete the intervention; for arterial or venous hemorrhage or lymphatic
extravasation

Comparison of using the recommended RVW versus using the 25th percentile.

The first chart below shows reasonable correlation between the recommended RVW and WPUT—both trend lines have a similar slope. The second chart below shows no relationship of WPUT to the 25th percentile RVW—where WPUT decreases as work increases.
What if surgeon evaluation and management work were set equal to discrete E/M services?

As has been discussed by the RUC in the past, work intensities used for computation of IWPUT for time spent by physicians in the pre-service and immediate post-service period for surgical procedures have remained fixed since the early 1990s, while intensity of time for E/M values has received several increased values over several decades. Recent increases for outpatient office E/M values were not allowed to be added to global codes by CMS. Because IWPUT is calculated by subtracting the pre- and post-work values from the RVW of a given CPT code, this has resulted in less value subtracted than would have occurred if the more appropriate pre- and post-work values were used for the IWPUT formula. This artificially increases the IWPUT and WPUT resulting in a decrease in relativity. This is especially true for codes that have a significant amount of pre-service and post-service work.

It has become difficult to compare IWPUT (and WPUT) for codes with different global periods because of the level of discounting of pre-service and post-service work. For example, for the top 34 high volume 10 and 90 day global codes, AMA staff recently calculated the difference in IWPUT if the office visit increases were used in the IWPUT equation. The AMA table, which is included in the Research Subcommittee agenda for this meeting, showed that the IWPUT would have decreased from -6% to -548% depending on the number of office visits included in the work/time file. To emphasize the importance of this information, the code which would have had the largest decrease (17000) has 3 minutes of intra-time and only one postop office visit (99212). In this table, it was also clear that relativity within a family of codes is lost, because each code within a family may have varying levels of post-service work. To summarize, IWPUT has become much less accurate when used as a comparator of intra-service work within and between families because of CMS actions (ie, not updating global RVW) and policy (ie, discounting postoperative work).

Using the discussion above, we have created the table below that presents the IWPUT and WPUT for the hernia set of codes using (1) the 2021 formulas, and (2) "full value" formulas. The note below the table describes each formula, but basically the full value formula sets pre- and post-service work equal to the same E/M work for non-surgical services. For comparison to facility non-surgical services, we have included codes 99283-99285 using the 2021 published RVW and time data. This table shows that most of the recommendations for 49X01-49X14 result in a WPUT that is less than an ED visit requiring moderate MDM (99284). This table also shows that those codes with similar WPUT to high MDM are appropriately the bigger and more complex procedures. Last, this table provides evidence that discounting pre- and post-work distorts and artificially impacts fair IWPUT and WPUT relativity comparison. However, if undiscounted work is applied, the recommendations for this set of codes are appropriately ranked.

</table>

* 2021 Formula: IWPUT calculation based on evaluation, positioning, immediate post intensity of 0.0224; scrub/dress/wait intensity of 0.0081; and discounted same-day outpatient postop visit (not shown in table) equal to intra-service time at 0.0224. WPUT calculation equal to total time (including discounted postop visit time not shown on table) divided by work.

**2021 Full Value Formula: IWPUT calculation based on pre-service and immediate post-service time intensity of 0.043 (equal to WPUT for 99213) and same-day post EM at full value instead of discounted time for outpatient procedure as shown on table (highlighted in red).

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - Multiple codes allow flexibility to describe exactly what components the procedure included.
   - Multiple codes are used to maintain consistency with similar codes.
   - Historical precedents.
   - Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed)

49565 Repair recurrent incisional or ventral hernia; reducible 090
49657 Laparoscopy, surgical, repair, recurrent incisional hernia (includes mesh insertion, when performed); incarcerated or strangulated 090
49568 Implantation of mesh or other prosthesis for open incisional or ventral hernia repair or mesh for closure of debridement for necrotizing soft tissue infection (List separately in addition to code for the incisional or ventral hernia repair) ZZZ

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

<table>

The Honorable Kathleen Sebelius
Secretary
Department of Health and Human Services
Hubert H. Humphrey Building
200 Independence Avenue SW
Washington, DC 20201

Re: CY 2012 Medicare Physician Fee Schedule Final Rule and CMS
Refinement Panels

Dear Secretary Sebelius:

On November 28, 2011, the Federal Register published the Centers for Medicare and Medicaid Services’ (CMS) Calendar Year (CY) 2012 Medicare Physician Fee Schedule Final Rule. On behalf of the American College of Surgeons (ACS), I am writing to express concern regarding the decision making process and lack of transparency on the part of CMS related to the work relative value units (wRVUs) for 2012 reviewed under CMS’ refinement panel process. The ACS, with over 78,000 members, is a scientific and educational organization of surgeons that was founded in 1913 to raise the standards of surgical practice and to improve the care of the surgical patient.

The ACS has participated in the efforts of the American Medical Association’s Relative Value Scale Update Committee (AMA RUC) for years given the value we place on the AMA RUC process and our assumption that CMS will evaluate the RUC recommendations with fairness, transparency, and accuracy according to a process that has been set out via the Federal rulemaking process. As part of the work that led to the CY 2012 Medicare Physician Fee Schedule Final Rule, the ACS devoted significant resources to conducting AMA RUC surveys for over 100 new or existing codes at the request of CMS. The AMA RUC evaluated wRVU recommendations made by the ACS, based upon those surveys, and came to agreement on final recommended values to be submitted to CMS.

Fifty-seven of the aforementioned codes that the ACS surveyed were sent to the refinement panel. CMS accepted only 12 percent of those refinement panel recommendations.

For most of the 88 percent of refinement panel recommendations that CMS rejected, CMS lowered the wRVU by reducing the value of the post-operative evaluation and management work performed by surgeons in the hospital by 69 percent. However, if that same work is performed by any other physician other than the surgeon, that same service is paid at 100 percent. We believe that the refinement panel physicians completely rejected this concept as they agreed to a work RVU that did not discount post-surgical work in this fashion. We note that the multispecialty panel included physicians from primary care, contractor medical directors (CMDs), physicians in related specialties, and general surgeons. At no time did the Agency's Medical Officer in charge of the panel process disagree with the presenters or offer a contrary opinion to the discussion.

Our concerns were piqued when CMS issued the CY 2011 Medicare Physician Fee Schedule Final Rule in which CMS stated that it could change wRVU recommendations of the refinement panel convened by CMS if “policy concerns warrant their modification,” without providing additional clarification on what would trigger this ability of CMS to subvert the more transparent process of the refinement panel. However, we continued to participate in the process under the belief that CMS would operate fairly and transparently and that if there were indeed “policy concerns” that CMS had regarding the values of the codes under consideration that those concerns would be stated clearly so all parties could address them during the refinement panel reviews.

CMS has now implemented a policy by which it is creating differential payments for the same work performed by different physicians as a backdoor mechanism for reducing the work RVUs for surgical procedures. They have valued the worth of a surgeon for post-operative evaluation and management work at about 30 percent of a non-surgeon. Non-surgeons are allowed to provide the same work to the same patient at 100 percent reimbursement. First, we believe that this policy leads to a loss of validity and integrity of the current system. In addition, this policy is prohibited by the Omnibus Budget Reconciliation Act of 1989, which states, “[t]he Secretary may not vary the conversion factor or the number of relative value units for a physicians’ service based on whether the physician furnishing the service is a specialist or based on the type of specialty of the physician.” (42 U.S.C. §1395w-4(c)(6)).
The ACS has been a vocal proponent of needed reforms in the delivery and payment of health care. We believe that the future of these reforms will be based on driving greater awareness of proven continuous quality improvement programs to achieve ongoing, tangible results for quality improvements. However, in order for these reforms to be effective, they must be built on a system that is consistent with previous Agency decisions, fair, and transparent, and it is our concern that many of the policy decisions made by CMS in the latest Medicare Physician Fee Schedule Final Rule move us away from those goals. The resource based relative value system (RBRVS) requires a resource basis for decisions on the valuation of physician services. We believe that the resource basis for the decision to reduce these values is not evident. We ask that under your authority as Secretary you will seek to have CMS define a more transparent process in the future for decisions that are not aligned with the RUC and refinement panel recommendations in order to help maintain the transparency and fairness of the current system and to restore the values of these services to the level that is supported by the RBRVS process.

Sincerely,
David B. Hoyt, MD, FACS
Executive Director
CPT Code: 49X11

Original Specialty Recommended RVU: 18.53  
Presented Recommended RVU: 18.53  
RUC Recommended RVU: 16.97

CPT Descriptor: Repair of anterior abdominal hernia(s) (ie, epigastric, incisional, ventral, umbilical, spigelian), any approach (ie, open, laparoscopic, robotic), recurrent, including placement of mesh or other prosthesis, when performed total length of defect(s); greater than 10 cm, reducible

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 60-year-old obese male presents with an irreducible mass in the midline of the abdomen. He has a history of a previous laparotomy with an incisional hernia from that operation that was repaired 5 years ago. Over the course of the last few months, he has developed a recurrence that has been slowly increasing in size but is reducible. He undergoes hernia repair of a defect that totals more than 10 cm with placement of mesh.

Percentage of Survey Respondents who found Vignette to be Typical: 90%

**Site of Service (Complete for 010 and 090 Globals Only)**

<table>

</table>

Description of Pre-Service Work: Results of preadmission testing (imaging, electrocardiogram and labs) are reviewed. Appropriate selection, timing, and administration of DVT prophylaxis are ensured. Appropriate selection, timing, and administration of antibiotics are ensured. The need for beta-blockers is assessed, and they are ordered as required. The patient is reexamined to confirm that physical findings have not changed, the patient’s medication regimen has remained the same, the patient has no new allergies, and the patient has not undergone any recent procedures. The history and physical examination are then updated in the electronic health record. The planned procedure and postoperative management are reviewed with the patient and family. Informed consent is reviewed and obtained from the patient, including witness confirmation. The palpable edge of the hernia defect(s) and sites of the proposed skin incisions are marked with cooperation of patient. The length and type of anesthesia, including adjuncts to postoperative analgesia management, are reviewed with the anesthesiologist. Verify that all required instruments and supplies are available, including reusable and disposable laparoscopic/robotic equipment and mesh. Assistance is provided in transfer of the patient from gurney to operating table. Monitor/assist with positioning of patient, including padding and securing patient to table that will adjust throughout procedure (eg, reverse Trendelenburg). Assist anesthesia team with line placement and induction of anesthesia and intubation, relative to all laparoscopic/robotic equipment. The areas of skin to be prepared and draped are indicated by the surgeon to ensure that all of the potential operative field is included in the preparation. The surgeon scrubs and gowns. A surgical time-out is performed with operating surgical team.

Description of Intra-Service Work: Abdominal access is obtained and a safe pneumoperitoneum is created with placement of a needle/trocar. As the hernia extends across the majority of the anterior abdominal wall, location for insertion of the needle/trocar is selected based on the prior surgical history and the safest location to avoid intra-abdominal injury. The camera is inserted and safe entry is verified. Additional trocars are placed in the lateral abdomen, and in additional areas as needed, all under direct vision. A field of adhesions occupies the entire anterior abdominal wall correlating with the extent of the prior laparotomy and hernia repair. The careful process of adhesiolysis is performed to clear adhesions from between omentum, small intestines and colon and the abdominal wall and prior mesh. Each separate defect within the entire hernia
defect contains adipose and intestinal components and requires a safe and effective clearance of tissue. The hernia defect is visualized. The falciform ligament and preperitoneal fat are cleared from the abdominal wall fascia to expose the posterior fascia to include wide lateral clearance for adequate later mesh coverage. Peritoneal flaps are created for placement of mesh. The falcial defect is approximated with sutures placed along the entire length of the defect. The appropriate size mesh is calculated after total defect length is documented. Adequate overlap of at least 5 cm in all directions is included in the calculation. A trocar is removed from the abdominal wall and the track is dilated to allow insertion of the large mesh into the peritoneal cavity. The mesh is oriented intra-abdominally. Insufflation is reduced to facilitate mesh conformity to the anterior abdominal wall. The mesh is secured to the abdominal wall utilizing multiple sutures and numerous tacks. The peritoneal flaps are then sutured over the mesh to protect it from the abdominal viscera. Completion camera survey is performed of the abdomen and contents to inspect for bleeding and visceral injury. Irrigation is performed as necessary. Fascial incisions from laparoscopic ports larger than 1 cm are closed with a suture passer. Skin incisions are closed according to surgeon preference.

Description of Post-Service Work:
Immediate postoperative care [operative day through discharge from recovery room]: Apply sterile dressings. Monitor patient during reversal of anesthesia. Assist in transfer of patient from operating table to gurney. Monitor transport of patient from operating room to recovery room. Discuss postoperative recovery care with anesthesia and nursing staff, including need for patient-controlled analgesia. Discontinue prophylactic antibiotic therapy, as appropriate. Review postoperative labs. Discuss procedure and outcome with family in waiting area. Write brief operative note or complete final operative note and place in chart. Write postoperative note in the recovery room. Dictate operative report and copy referring physician(s). Call referring physician(s). Write orders for transferring to general surgical floor and discuss ongoing care with nursing staff.

Later same day hospital inpatient care visit [operative day after discharge from recovery room]: Review interval nursing/other staff chart notes. Discuss ongoing care with nursing staff. Evaluate vital signs and intake/output. Auscultate heart, lungs, and abdomen for bowel sounds. Monitor fluid and electrolyte status and renal function; monitor for problems such as ileus, intestinal ischemia, and urinary retention. Examine patient, check wounds, and change dressings. Continue prophylaxis for DVT. Assess need for beta-blockers, order as required. Assess pain scores and adequacy of analgesia. Write orders for labs, films, medications, diet, and patient activity. Chart patient progress notes. Answer patient and family questions. Answer nursing/other staff questions. Advance diet, as appropriate.

### Modifier -51 Exempt Status

Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? **No**

### New Technology/Service

Is this new/revised procedure considered to be a new technology or service? **No**

### TOP KEY REFERENCE SERVICE:

- **Key CPT Code**: 11005
  - **Global**: 000
  - **Work RVU**: 14.24
  - **Time Source**: RUC Time

  CPT Descriptor: Debridement of skin, subcutaneous tissue, muscle and fascia for necrotizing soft tissue infection; abdominal wall, with or without fascial closure

### SECOND HIGHEST KEY REFERENCE SERVICE:

- **Key CPT Code**: 11006
  - **Global**: 000
  - **Work RVU**: 13.10
  - **Time Source**: RUC Time

  CPT Descriptor: Debridement of skin, subcutaneous tissue, muscle and fascia for necrotizing soft tissue infection; external genitalia, perineum and abdominal wall, with or without fascial closure

### KEY MPC COMPARISON CODES:

Compare the surveyed code to codes on the RUC’s MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

- **MPC CPT Code 1**: 37244
  - **Global**: 000
  - **Work RVU**: 13.75
  - **Time Source**: RUC Time
  - **Medicare Utilization**: 12,731

  CPT Descriptor 1: Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; for arterial or venous hemorrhage or lymphatic extravasation

- **MPC CPT Code 2**: 000
  - **Global**: 000
  - **Work RVU**: 0.00
  - **Time Source**: RUC Time

  CPT Descriptor 2: [Other Reference CPT Code]

CPT Descriptor
RELATIONSHIP OF CODE BEING REVIEWED TO TOP TWO KEY REFERENCE SERVICES:
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by percent distribution) of the service you are rating to the top two chosen key reference services listed above. Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.

Number of respondents who choose Top Key Reference Code: 9  % of respondents: 21.4 %
Number of respondents who choose 2nd Key Reference Code: 6  % of respondents: 14.2 %

### Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC’s rationale, please review the separate RUC recommendation document.
Background

RAW Screen
Code 49565, Repair recurrent incisional or ventral hernia; reducible, was identified by the RUC/RAW with a site of service anomaly: less than 50% inpatient status; includes inpatient visit codes; greater than 5,000 utilization. Prior to submitting an Action Plan to the RAW, the societies reviewed the site of service data and found: almost even split of 48% between inpatient and outpatient – with a few percent in the ASC. At the January 2020 RUC meeting, the societies requested referral of code 49565 to CPT to update the descriptor to current standard of practice and typical patient presentation.

CPT Coding Changes
At the February 2021 CPT meeting the following changes were approved:

- Delete all the current open and laparoscopic codes for repair of anterior abdominal hernias.
- Delete add-on code 49568 for mesh for open ventral/incisional hernias and large defects as a result of necrotizing soft tissue infection.
- Add 12 new codes for anterior abdominal hernia repair by any approach (ie, open laparoscopic, robotic); by initial or recurrent; by total defect size; and by reducible or incarcerated/strangulated.
- Add 2 codes for parastomal hernia repair - by reducible or incarcerated/strangulated.
- Add 1 add-on code for removal of mesh/prosthesis – only with the new hernia repair codes.
- Add 1 new code for mesh/prosthesis for delayed closure of external genitalia, perineum and/or abdominal wall defect(s) due to soft tissue infection or trauma.

Coding Structure
Hernia repair for epigastric, incisional, ventral, umbilical, spigelian were merged as they all appear on the anterior abdomen. The location—upper, lower, midline—does not impact the work. But instead, the size and number of defects is the driving factor for work. For example, with respect to the code that was tagged by the RAW, a recurrent, incisional, reducible hernia can be anywhere from a small hernia at a port site from a prior laparoscopic procedure to an extremely large hernia with multiple defects clustered in a midline incision.

Initial versus recurrent differentiation was maintained. Recurrent hernias are re-reoperations. An initial hernia can be the result of a prior procedure (this is not a recurrent hernia) or weak muscles and fascia. A recurrent hernia is typically at least the third time the same site is being operated on.

For example,
- operation 1 might be an open colectomy
- operation 2 would be an initial midline hernia repair
- operation 3 would be a recurrent midline hernia involving the initial midline repair and may include other multiple hernias occurring in the same old incision, all needing to be repaired.

There are many examples in CPT that differentiate between a primary and secondary procedure: disarticulation of shoulder (23920-23921); amputation of arm through humerus (24900-24930) and other similar amputation families; tendon repair (eg, 25260-25274); CABG reoperation (33530); and revision total joint (eg, 23473, 23474, 24370, 24371, 27134-27138).

The hernia size ranges were based on a review of literature and expert panel. For example, an article published in the Journal of the American College of Surgeons reviewed technique and outcomes of abdominal incisional hernia repair and showed that the range of defect size was from less than 1 cm to more than 25 cm with a mean of 6 cm and a median of less than 3 cm. Other similar articles were submitted with the code change application, supporting different work for different defect size. David A. Iannitti, et.al, Technique and Outcomes of Abdominal Incisional Hernia Repair Using a Synthetic Composite Mesh: A Report of 455 Cases, Journal of the American College of Surgeons, Volume 206, Issue 1, 2008, Pages 83-88, ISSN 1072-7515, https://doi.org/10.1016/j.jamcollsurg.2007.07.030.

Differentiating the work of a procedure in relationship to size or extent is not new for CPT. For example, 36 skin repair codes by length of repair; 44 lesion excision codes by excised diameter; 46 soft tissue tumor excision codes by size of tumor; 23 hysterectomy codes by size of uterus (58260-58573); 3 myomectomy codes are differentiated by total weight of the myomas (58140-58146); and 10 nerve graft codes are based on length of graft. (64885-64898)
The CPT guidelines and illustrations that describe how to measure the total defect size are well understood by surgeons. This is not a new concept – surgeons are very familiar with measuring a hernia defect, and in fact the size of the hernia defect was included in some of the patient vignettes in 1993. Furthermore, measurement of hernia size is a necessary step for selecting and preparing the appropriately sized mesh for implantation.

Hernia repair coding has been complicated by changes in (1) technology and technique and (2) the recent implementation of ICD-10-PCS codes. For these reasons, the stakeholder societies believed this set of codes should describe "any approach." The societies and the AMA Coding Network have received numerous coding questions about correct reporting for "hybrid" abdominal hernia repair procedures where parts of the procedure are performed via an open approach and parts of the procedure are performed via laparoscopy or with the use of a robot. These are not laparoscopic procedures converted to open procedures, but instead procedures that are more often begun open and then finished as laparoscopic/robotic under pneumoperitoneum.

Another issue that has recently caused confusion about coding has appeared on national coder websites and coder discussion boards referring to International Classification of Diseases Tenth Revision Procedure Coding System (ICD-10-PCS) codes which classifies procedures performed in the facility (ie, not CPT physician procedures). This, however, is important because facilities want the procedure codes reported to correspond with the descriptors of ICD-10-PCS codes that the facility is reporting. Unfortunately, the new ICD-10-PCS codes define various surgical approaches that do not correspond to CPT coding (open, closed, percutaneous, and laparoscopic). For example, the ICD-10-PCS "open endoscopic" approach is defined as "cutting through the skin or mucous membrane and any other body layers necessary to expose a body part, and introduction of instrumentation to reach and visualize the site of the procedure." A second example is the "open with percutaneous endoscopic assistance" approach defined as "cutting through the skin or mucous membrane and any other body layers necessary to expose the site of the procedure, and entry, by puncture or minor incision, of instrumentation through the skin or mucous membrane and any other body layers necessary to aid in the performance of the procedure." These new ICD-10-PCS codes have resulted in coders stating that a procedure should be reported as open because the ICD-10-PCS code indicates open and to report any procedure that includes extension of a port incision (eg, for delivery of a specimen) to be reported as an open procedure --instead of being correctly reported as a laparoscopic procedure.

**Mesh**

- **Implantation of mesh is now typical and therefore was bundled into the new codes.** When code 49568 was created in 1993, mesh implantation with hernia repairs was not typical. This is supported by the typical patient described in 1993 as having a 10 cm midline incisional hernia – a very large hernia. With research on the causes of hernia recurrence, changes in technology and development of new types of mesh or other prosthesis, implantation of mesh is now typical for all types of hernias and all sizes to reduce the incidence of recurrence. This was supported by the literature submitted with the CCA.

- **Mesh removal is not always required and is not typical.** Technology and research have developed types of mesh that are now being implanted which are incorporated into the abdominal wall, reducing the risk of infection, complications, and recurrence. When mesh removal is indicated, it is typically due to hardening and fracturing of aged mesh, or when gross contamination and infection has occurred (eg, enterocutaneous fistula involving the mesh). For example, a recurrent hernia repair may require removal of fractured, brittle (old technology) mesh many years after an open repair following a colectomy. This work is typically significant, in that the mesh is often integrated with the abdominal wall or adhered to intestine, and involves removal of all of the mesh, not just a small portion. An add-on code to report mesh removal prior to hernia repair, when required, allows for accurate reporting of this work only when performed, which our expert panel believes is not typical of most hernia repairs.

- **Deletion of code 49658 resulted in rare "left over" work for implantation of mesh related to closure for a large open wound after debridement for necrotizing fasciitis.** Add-on code 46958 was reported for mesh placement for both open hernia repair and in relation to closure of wounds from necrotizing soft tissue infection. This code will be deleted and the work of mesh placement will be included in the work for all of the anterior abdominal hernia repair codes. The remaining use of code 46958 was for mesh placement for delayed closure of external genitalia, perineum and/or abdominal wall defect(s) due to soft tissue infection or trauma. As described in the vignette for 157X1, necrotizing soft tissue infections typically result in a large open wound that cannot be closed primarily. When the infection has resolved, absorbable mesh or other prosthesis is placed to allow healing by
Compelling Evidence - Flawed methodology of previous reviews, New technology

Flawed Methodology: Codes 49560, 49561, 49565, 49566, 49570, 49572, 49580, 49582, 49585, and 49590 were last reviewed in 2000 during the 2nd 5-year-review. During this review, the American College of Surgeons argued that there was compression of work values for big procedures and there were rank order issues within families of codes. We developed a methodology using NSQIP data that was approved by the Research Subcommittee. However, to validate the methodology, the 5YR Workgroup instructed the ACS to group the codes into families and survey one or two CPT codes as full surveys per family to act as anchors for each family and the rest of the codes to be surveyed as mini-surveys for only time and visits. After conducting all of the surveys, we believe we were able to validate the methodology that we proposed, however, the 5YR Workgroup did not agree. Instead, they decided that the value that they assigned to the anchor code (the full survey) would be extrapolated to all of the other codes grouped into the same survey. The hernia codes listed above were grouped with 49505 which was increased by 17% based on the survey data and compelling evidence. The 17% increase was applied to the other codes in the group without consideration of rank order, mini survey results or society recommendations. This resulted in continuation of compression and rank order issues. For example, although code 49572 was increased by 17%, the IWPUT for the code is negative. Other codes have near zero IWPUT. We believe this was a flawed methodology of review of the codes and meets compelling evidence.

Flawed Methodology: Codes 49587, 49652, 49653, 49654, and 49655 were last reviewed in 2011 based on a site of service anomaly screen. At that time, the RUC approved including a same day observation visit and full observation discharge on the subsequent day. The RUC noted that the typical patient requires close monitoring for problems such as ileus, intestinal ischemia and urinary retention. Additionally, there will be significant pain post-operatively requiring management before discharge. The specialty noted, and the RUC agreed, that the shift in patient facility status (in patient moving to outpatient—as determined by CMS) has little to do with healthier patients that require less physician work and everything to do with the recent OPPS changes related to facility reimbursement. This was substantiated by the survey data which showed that the typical patients stayed at least overnight and received a postoperative same-day E/M service. Given this data, the RUC enacted its (then current) policy to allocate the appropriate proxy for the postoperative visits which was categorized as either subsequent observation and/or observation discharge—both of which are outpatient codes. Importantly, the specialties argued and the RUC agreed that the work of providers who care for medical patients should not be discounted (eg, full observation E/M and full observation discharge E/M allowed for patient staying overnight for observation.)

CMS ignored the valid outpatient E/M visit code inputs that the RUC recommended and instead stated in the Rule that they have a policy of not allowing "inpatient" visits included in the details for outpatient services. These codes went through a Refinement Panel process [ie, a CMS convened group of Medical Officers and select physicians acting as a separate formal appeals process] that resulted in agreement with the RUC recommendations. Importantly, the Agency still maintained that inpatient visits would not be allowed (even though outpatient/observation visits were submitted by the RUC) and then used a reverse building block methodology to subtract work RVUs from the values. These values had been developed by magnitude estimation and approved by the RUC. The Agency deleted the observation visit code inputs and decreased discharge management by 50 percent even though it was performed on a subsequent date. We believe this action by CMS resulted in a flawed methodology of review of these codes and meets compelling evidence.

The rejection of equal value for equal work and rejection of the Refinement Panel results prompted the Executive Director of the American College of Surgeons to send a letter (see last page of SoR) to Kathleen Sebelius, then Secretary of the Department of Health and Human Services on November 29, 2011. This letter addressed the decision-making process for valuing procedure codes that have Medicare outpatient status, the use of refinement panels, and the arbitrary discount in physician work for the same work performed by any provider of a non-global service. Specifically, the letter included the following statement:

"CMS has now implemented a policy by which it is creating differential payments for the same work performed by different physicians as a backdoor mechanism for reducing the work RVUs for surgical procedures. They have valued the worth of a surgeon for post-operative evaluation and management work at about 30 percent of a non-surgeon. Non-surgeons are allowed to provide the same work to the same patient at 100 percent reimbursement. ...we believe that this policy leads to a loss of validity and integrity of the current system."
We continue to believe there is no valid justification for a 50% discount to discharge management services provided by a surgeon that is performed the day after a procedure when a non-surgical provider observing a medical patient who is kept overnight for any reason is allowed to bill a discharge management service at 100 percent for work on the next day. We also believe there is no valid justification for discounting a postoperative visit later the same day of surgery to equal only the intra-service time of the visit multiplied by an intensity of 0.0224. No surgeon would round on a postoperative patient the same day and not review interval chart notes prior to the face-to-face with the patient and not followup with charting the visit and confirming or modifying the current orders.

CMS implemented a 23-hour policy for discounting surgical postoperative work based on the argument that the Agency could not include inpatient work in their time/work file. However, the fact is that the Agency has also erroneously rejected RUC recommendations for outpatient / observation codes, stating "these inpatient codes" could not be included for procedure that are typically outpatient.

**Change in Technology:** Since the last review of the hernia repair codes (either in 2000 or in 2011), there has been introduction and application of new technology (ie, robotic assist) which adds work complexity and time with the goal of better patient outcomes. The diffusion of this new technology throughout this family of codes further meets compelling evidence.

**Recommendation – 49X11**

We recommend a work RVU of 18.53, which is the survey median.

**Pre-service time**

Evaluation package time has been reduced so as to not exceed survey median data. Laparoscopic/robotic anterior abdominal hernia repair positioning time: The patient will initially be positioned supine and upper extremity intravenous and arterial access points are dressed, padded and secured. The arms are padded and tucked at the patient’s sides. The patient must be secured to the table, including a soft chest and thigh strap, as it may be necessary to roll the table during the procedure to use gravity to assist with shifting the abdominal contents. There is also consideration of positioning the patient relative to: laparoscopy equipment, including lines and video equipment and anesthesia lines relative to the rest of the equipment. The survey median positioning time reflects the time for this procedure for these activities.

**Postoperative E/M visit later on the day of surgery**

The typical patient will be admitted and a visit will occur later on the same day to monitor for postoperative complications including ileus, intestinal ischemia, and urinary retention. Review data (eg, diagnostic and imaging studies) not available at the unit. Communicate with other health care professionals and with patient and/or family. Review medical records and data available on the unit. Perform a medically appropriate examination. Consider relevant data, options, and risks; formulate and/or revise diagnosis and treatment plan(s) (moderate complexity MDM). Discuss diagnosis and treatment options with the patient and/or family. Consider discharge needs of patient. Communicate with other health care professionals as necessary. Write and/or review orders, including arranging for necessary diagnostic testing, consultation(s), and therapeutic intervention(s). Complete medical record documentation. Address interval data obtained and reported changes in condition. Communicate results and additional care plans to other health care professionals and to the patient and/or family.
Key Reference Code Intensity/Complexity Comparison

Ref 1: The respondents indicated the intensity/complexity of survey code 49X11 is somewhat more than reference code 11005. Ref 2: The respondents indicated the intensity/complexity of survey code 49X11 is somewhat/much more than reference code 11006.

MPC Code Comparison

MPC code 37244 has the highest RVW for the set of 0-day global codes.

Relativity Assessment

Recommended RVW vs Total Time

The chart below that compares the recommended RVW and total time shows good correlation.
The data below that were used to create the chart above show appropriate relative rank order for work for this new set of hernia repair codes.

Comparison of using the recommended RVW versus using the 25th percentile.

The first chart below shows reasonable correlation between the recommended RVW and WPUT—both trend lines have a similar slope. The second chart below shows no relationship of WPUT to the 25th percentile RVW—where WPUT decreases as work increases.
What if surgeon evaluation and management work were set equal to discrete E/M services?

As has been discussed by the RUC in the past, work intensities used for computation of IWPUT for time spent by physicians in the pre-service and immediate post-service period for surgical procedures have remained fixed since the early 1990s, while intensity of time for E/M values has received several increased values over several decades.

Recent increases for outpatient office E/M values were not allowed to be added to global codes by CMS. Because IWPUT is calculated by subtracting the pre- and post-work values from the RVW of a given CPT code, this has resulted in less value subtracted than would have occurred if the more appropriate pre- and post-work values were used for the IWPUT formula. This artificially increases the IWPUT and WPUT resulting in a decrease in relativity. This is especially true for codes that have a significant amount of pre-service and post-service work.

It has become difficult to compare IWPUT (and WPUT) for codes with different global periods because of the level of discounting of pre-service and post-service work. For example, for the top 34 high volume 10 and 90 day global codes, AMA staff recently calculated the difference in IWPUT if the office visit increases were used in the IWPUT equation. The AMA table, which is included in the Research Subcommittee agenda for this meeting, showed that the IWPUT would have decreased from -6% to -548% depending on the number of office visits included in the work/time file. To emphasize the importance of this information, the code which would have had the largest decrease (17000) has 3 minutes of intra-time and only one postop office visit (99212). In this table, it was also clear that relativity within a family of codes is lost, because each code within a family may have varying levels of post-service work. To summarize, IWPUT has become much less accurate when used as a comparator of intra-service work within and between families because of CMS actions (ie, not updating global RVW) and policy (ie, discounting postoperative work).

Using the discussion above, we have created the table below that presents the IWPUT and WPUT for the hernia set of codes using (1) the 2021 formulas, and (2) "full value" formulas. The note below the table describes each formula, but basically the full value formula sets pre- and post-service work equal to the same E/M work for non-surgical services.
For comparison to facility non-surgical services, we have included codes 99283-99285 using the 2021 published RVW and time data. This table shows that most of the recommendations for 49X01-49X14 result in a WPUT that is less than an ED visit requiring moderate MDM (99284). This table also shows that those codes with similar WPUT to high MDM are appropriately the bigger and more complex procedures. Last, this table provides evidence that discounting pre- and post-work distorts and artificially impacts fair IWPUT and WPUT relativity comparison. However, if undiscounted work is applied, the recommendations for this set of codes are appropriately ranked.

**2021 Full Value Formula: IWPUT calculation based on pre-service and immediate post-service time intensity of 0.043 -33 -26 -32 -25 -31 -24. WPUT calculation equal to total time (including discounted postop visit time not shown on table) divided by work.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- [ ] The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- [ ] Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- [ ] Multiple codes allow flexibility to describe exactly what components the procedure included.
- [ ] Multiple codes are used to maintain consistency with similar codes.
- [ ] Historical precedents.
- [ ] Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the
FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed)

49565 Repair recurrent incisional or ventral hernia; reducible 090
49656 Laparoscopy, surgical, repair, recurrent incisional hernia (includes mesh insertion, when performed); reducible 090
49568 Implantation of mesh or other prosthesis for open incisional or ventral hernia repair or mesh for closure of debridement for necrotizing soft tissue infection (List separately in addition to code for the incisional or ventral hernia repair) ZZZ

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty general surgery How often? Rarely
Specialty colorectal surgery How often? Rarely
Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National frequency not available

Letter Referenced in Compelling Evidence Rationale

November 29, 2011

The Honorable Kathleen Sebelius
Secretary
Department of Health and Human Services
Hubert H. Humphrey Building
200 Independence Avenue SW
Washington, DC 20201

Re: CY 2012 Medicare Physician Fee Schedule Final Rule and CMS Refinement Panels

Dear Secretary Sebelius:

On November 28, 2011, the Federal Register published the Centers for Medicare and Medicaid Services’ (CMS) Calendar Year (CY) 2012 Medicare Physician Fee Schedule Final Rule. On behalf of the American College of Surgeons (ACS), I am writing to express concern regarding the decision making process and lack of transparency on the part of CMS related to the work relative value units (wRVUs) for 2012 reviewed under CMS’ refinement panel process. The ACS, with over 78,000 members, is a scientific and educational organization of surgeons that was founded in 1913 to raise the standards of surgical practice and to improve the care of the surgical patient.

The ACS has participated in the efforts of the American Medical Association’s Relative Value Scale Update Committee (AMA RUC) for years given the value we place on the AMA RUC process and our assumption that CMS will evaluate the RUC recommendations with fairness, transparency, and accuracy according to a process that has been set out via the Federal rulemaking process. As part of the work that led to the CY 2012 Medicare Physician Fee Schedule Final Rule, the ACS devoted significant resources to conducting AMA RUC surveys for over 100 new or existing codes at the request of CMS. The AMA RUC evaluated wRVU recommendations made by the ACS, based upon those surveys, and came to agreement on final recommended values to be submitted to CMS.

Fifty-seven of the aforementioned codes that the ACS surveyed were sent to the refinement panel. CMS accepted only 12 percent of those refinement panel recommendations.

For most of the 88 percent of refinement panel recommendations that CMS rejected, CMS lowered the wRVU by reducing the value of the post-operative evaluation and management work performed by surgeons in the hospital by 69 percent. However, if that same work is performed by any other physician other than the surgeon, that same service is paid at 100 percent. We believe that the refinement panel physicians completely rejected this concept as they agreed to a work RVU that did not discount post-surgical work in this fashion. We note that the multispecialty panel included physicians from primary care, contractor medical directors (CMDs), physicians in related specialties, and general surgeons. At no time did the Agency’s Medical Officer in charge of the panel process disagree with the presenters or offer a contrary opinion to the discussion.
Our concerns were piqued when CMS issued the CY 2011 Medicare Physician Fee Schedule Final Rule in which CMS stated that it could change wRVU recommendations of the refinement panel convened by CMS if “policy concerns warrant their modification,” without providing additional clarification on what would trigger this ability of CMS to subvert the more transparent process of the refinement panel. However, we continued to participate in the process under the belief that CMS would operate fairly and transparently and that if there were indeed “policy concerns” that CMS had regarding the values of the codes under consideration that those concerns would be stated clearly so all parties could address them during the refinement panel reviews.

CMS has now implemented a policy by which it is creating differential payments for the same work performed by different physicians as a backdoor mechanism for reducing the work RVUs for surgical procedures. They have valued the worth of a surgeon for post-operative evaluation and management work at about 30 percent of a non-surgeon. Non-surgeons are allowed to provide the same work to the same patient at 100 percent reimbursement. First, we believe that this policy leads to a loss of validity and integrity of the current system. In addition, this policy is prohibited by the Omnibus Budget Reconciliation Act of 1989, which states, “[t]he Secretary may not vary the conversion factor or the number of relative value units for a physicians’ service based on whether the physician furnishing the service is a specialist or based on the type of specialty of the physician.” (42 U.S.C. §1395w-4(c)(6)).

The ACS has been a vocal proponent of needed reforms in the delivery and payment of health care. We believe that the future of these reforms will be based on driving greater awareness of proven continuous quality improvement programs to achieve ongoing, tangible results for quality improvements. However, in order for these reforms to be effective, they must be built on a system that is consistent with previous Agency decisions, fair, and transparent, and it is our concern that many of the policy decisions made by CMS in the latest Medicare Physician Fee Schedule Final Rule move us away from those goals. The resource based relative value system (RBRVS) requires a resource basis for decisions on the valuation of physician services. We believe that the resource basis for the decision to reduce these values is not evident. We ask that under your authority as Secretary you will seek to have CMS define a more transparent process in the future for decisions that are not aligned with the RUC and refinement panel recommendations in order to help maintain the transparency and fairness of the current system and to restore the values of these services to the level that is supported by the RBRVS process.

Sincerely,
David B. Hoyt, MD, FACS
Executive Director

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 49X12  Tracking Number  C13  Original Specialty Recommended RVU: 25.00
Global Period: 000  Current Work RVU:  RUC Recommended RVU: 24.00
Presented Recommended RVU: 25.00

CPT Descriptor: Repair of anterior abdominal hernia(s) (ie, epigastric, incisional, ventral, umbilical, spigelian), any approach (ie, open, laparoscopic, robotic), recurrent, including placement of mesh or other prosthesis, when performed total length of defect(s); greater than 10 cm, incarcerated or strangulated

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 60-year-old obese male presents with an irreducible mass in the midline of the abdomen. He has a history of a previous laparotomy with an incisional hernia from that operation that was repaired 5 years ago. Over the course of the last few months, he has developed a recurrence that has been slowly increasing in size and is now tender and irreducible. He undergoes hernia repair of a defect that totals more than 10 cm with placement of mesh.

Percentage of Survey Respondents who found Vignette to be Typical: 90%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 5% , Overnight stay-more than 24 hours 95%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 95%

Description of Pre-Service Work: Results of preadmission testing (imaging, electrocardiogram and labs) are reviewed. Appropriate selection, timing, and administration of DVT prophylaxis are ensured. Appropriate selection, timing, and administration of antibiotics are ensured. The need for beta-blockers is assessed, and they are ordered as required. The patient is reexamined to confirm that physical findings have not changed, the patient’s medication regimen has remained the same, the patient has no new allergies, and the patient has not undergone any recent procedures. The history and physical examination are then updated in the electronic health record. The planned procedure and postoperative management are reviewed with the patient and family. Informed consent is reviewed and obtained from the patient, including witness confirmation. The masses of the material incarcerated in the hernia are palpated obscuring the edge of the hernia defect(s). The sites of the proposed skin incisions are marked with cooperation of patient. The length and type of anesthesia, including adjuncts to postoperative analgesia management, are reviewed with the anesthesiologist. Verify that all required instruments and supplies are available, including reusable and disposable laparoscopic/robotic equipment and mesh. Assistance is provided in transfer of the patient from gurney to operating table. Monitor/assist with positioning of patient, including padding and securing patient to table that will adjust throughout procedure (eg, reverse Trendelenburg). Assist anesthesia team with line placement and induction of anesthesia and intubation, relative to all laparoscopic/robotic equipment. The areas of skin to be prepared and draped are indicated by the surgeon to ensure that all of the potential operative field is included in the preparation. The surgeon scrubs and gowns. A surgical time-out is performed with operating surgical team.

Description of Intra-Service Work: Abdominal access is obtained and a safe pneumoperitoneum is created with placement of a needle/trocar. As the hernia extends across the majority of the anterior abdominal wall, location for insertion of the needle/trocar is selected based on the prior surgical history and the safest location to avoid intra-abdominal injury. The camera is inserted and safe entry is verified. Additional trocars are placed in the lateral abdomen, under direct vision. A large field of adhesions occupies the entire anterior abdominal wall correlating with the extent of the prior laparotomy. The careful process of adhesiolysis is performed to clear adhesions from between omentum, small intestines and colon and the abdominal wall and prior mesh. Each separate defect within the entire hernia defect contains adipose and intestinal components and requires a safe and effective clearance of tissue. The incarcerated/strangulated bowel, mesentery and
omentum are carefully reduced with dissection of the adhesions and sac to clear all the defects for repair. Care is taken to avoid injury to the incarcerated tissue. This requires manipulation both intra-abdominally with minimally invasive instrumentation and extra-abdominally with palpation and pressure applied to the abdominal wall to reduce the incarcerated contents. The reduced tissue is examined for viability and any inadvertent injury. The falciform ligament and preperitoneal fat are cleared from the abdominal wall fascia to expose all defects and enough surface for mesh overlap. The hernia sac is reduced and resected as needed to expose the fascial edges of the defect(s). The hernia defect is visualized. The defects are measured with a minimum craniocaudal length greater than 10 cm. Peritoneal flaps are created for placement of mesh. The fascial defect is approximated with sutures placed along the entirety of the defect. The appropriate size mesh is calculated after total defect length is documented. Adequate overlap of at least 5 cm in all directions is included in the calculation. A trocar is removed from the abdominal wall and the track is dilated to allow insertion of the large mesh into the peritoneal cavity. The mesh is oriented intra-abdominally. Insufflation is reduced to facilitate mesh conformity to the anterior abdominal wall. The mesh is secured to the abdominal wall utilizing sutures and tacks. The peritoneal flaps are then sutured over the mesh to protect it from the abdominal viscera. Completion camera survey is performed of the abdomen and contents to inspect for bleeding and visceral injury and perform a final viability assessment of the material once incarcerated in the hernia sac. Irrigation is performed as necessary. Fascial incisions for laparoscopic ports larger than 1 cm are closed with a suture passer. Skin incisions are closed according to surgeon preference.

Description of Post-Service Work:
Immediate postoperative care [operative day through discharge from recovery room]: Apply sterile dressings. Monitor patient during reversal of anesthesia. Assist in transfer of patient from operating table to gurney. Monitor transport of patient from operating room to recovery room. Discuss postoperative recovery care with anesthesia and nursing staff, including need for patient-controlled analgesia. Discontinue prophylactic antibiotic therapy, as appropriate. Review postoperative labs. Discuss procedure and outcome with family in waiting area. Write brief operative note or complete final operative note and place in chart. Write postoperative note in the recovery room. Dictate operative report and copy referring physician(s). Call referring physician(s). Write orders for transferring to general surgical floor and discuss ongoing care with nursing staff.

Later same day hospital inpatient care visit [operative day after discharge from recovery room]: Review interval nursing/other staff chart notes. Discuss ongoing care with nursing staff. Evaluate vital signs and intake/output. Auscultate heart, lungs, and abdomen for bowel sounds. Monitor fluid and electrolyte status and renal function; monitor for problems such as ileus, intestinal ischemia, and urinary retention. Examine patient, check wounds, and change dressings. Continue prophylaxis for DVT. Assess need for beta-blockers, order as required. Assess pain scores and adequacy of analgesia. Write orders for labs, films, medications, diet, and patient activity. Chart patient progress notes. Answer patient and family questions. Answer nursing/other staff questions. Advance diet, as appropriate.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC’s rationale, please review the separate RUC recommendation document.

---

**Background**

**RAW Screen**
CPT Code: 49X12

CPT Code: 49565, Repair recurrent incisional or ventral hernia; reducible, was identified by the RUC/RAW with a site of service anomaly: less than 50% inpatient status; includes inpatient visit codes; greater than 5,000 utilization. Prior to submitting an Action Plan to the RAW, the societies reviewed the site of service data and found: almost even split of 48% between inpatient and outpatient – with a few percent in the ASC. At the January 2020 RUC meeting, the societies requested referral of code 49565 to CPT to update the descriptor to current standard of practice and typical patient presentation.

**CPT Coding Changes**

At the February 2021 CPT meeting the following changes were approved:

- Delete all the current open and laparoscopic codes for repair of anterior abdominal hernias.
- Delete add-on code 49568 for mesh for open ventral/incisional hernias and large defects as a result of necrotizing soft tissue infection.
- Add 12 new codes for anterior abdominal hernia repair by any approach (ie, open laparoscopic, robotic); by initial or recurrent; by total defect size; and by reducible or incarcerated/strangulated.
- Add 2 codes for parastomal hernia repair - by reducible or incarcerated/strangulated.
- Add 1 add-on code for removal of mesh/prosthesis – only with the new hernia repair codes.
- Add 1 new code for mesh/prosthesis for delayed closure of external genitalia, perineum and/or abdominal wall defect(s) due to soft tissue infection or trauma.

**Coding Structure**

Hernia repair for epigastric, incisional, ventral, umbilical, spigelian were merged as they all appear on the anterior abdomen. The location--upper, lower, midline—does not impact the work. But instead, the size and number of defects is the driving factor for work. For example, with respect to the code that was tagged by the RAW, a recurrent, incisional, reducible hernia can be anywhere from a small hernia at a port site from a prior laparoscopic procedure to an extremely large hernia with multiple defects clustered in a midline incision.

Initial versus recurrent differentiation was maintained. Recurrent hernias are re-reoperations. An initial hernia can be the result of a prior procedure (this is not a recurrent hernia) or weak muscles and fascia. A recurrent hernia is typically at least the third time the same site is being operated on. For example,

- operation 1 might be an open colectomy
- operation 2 would be an initial midline hernia repair
- operation 3 would be a recurrent midline hernia involving the initial midline repair and may include other multiple hernias occurring in the same old incision, all needing to be repaired.

There are many examples in CPT that differentiate between a primary and secondary procedure: disarticulation of shoulder (23920-23921); amputation of arm through humerus (24900-24930) and other similar amputation families; tendon repair (eg, 25260-25274); CABG reoperation (33530); and revision total joint (eg, 23473, 23474, 24370, 24371, 27134-27138).

The hernia size ranges were based on a review of literature and expert panel. For example, an article published in the Journal of the American College of Surgeons reviewed technique and outcomes of abdominal incisional hernia repair and showed that the range of defect size was from less than 1 cm to more than 25 cm with a mean of 6 cm and a median of less than 3 cm. Other similar articles were submitted with the code change application, supporting different work for different defect size. David A. Iannitti, et al., *Technique and Outcomes of Abdominal Incisional Hernia Repair Using a Synthetic Composite Mesh: A Report of 455 Cases*, Journal of the American College of Surgeons, Volume 206, Issue 1, 2008, Pages 83-88, ISSN 1072-7515, https://doi.org/10.1016/j.jamcollsurg.2007.07.030.

Differentiating the work of a procedure in relationship to size or extent is not new for CPT. For example, 36 skin repair codes by length of repair; 44 lesion excision codes by excised diameter; 46 soft tissue tumor excision codes by size of tumor; 23 hysterectomy codes by size of uterus (58260-58573); 3 myomectomy codes are differentiated by total weight of the myomas (58140-58146); and 10 nerve graft codes are based on length of graft. (64885-64898)

The CPT guidelines and illustrations that describe how to measure the total defect size are well understood by surgeons. This is not a new concept – surgeons are very familiar with measuring a hernia defect, and in fact the size of the hernia defect was included in some of the patient vignettes in 1993. Furthermore, measurement of hernia size is a necessary step for selecting and preparing the appropriately sized mesh for implantation.
Hernia repair coding has been complicated by changes in (1) technology and technique and (2) the recent implementation of ICD-10-PCS codes. For these reasons, the stakeholder societies believed this set of codes should describe "any approach." The societies and the AMA Coding Network have received numerous coding questions about correct reporting for "hybrid" abdominal hernia repair procedures where parts of the procedure are performed via an open approach and parts of the procedure are performed via laparoscopy or with the use of a robot. These are not laparoscopic procedures converted to open procedures, but instead procedures that are more often begun open and then finished as laparoscopic/robotic under pneumoperitoneum.

Another issue that has recently caused confusion about coding has appeared on national coder websites and coder discussion boards referring to International Classification of Diseases Tenth Revision Procedure Coding System (ICD-10-PCS) codes which classifies procedures performed in the facility (i.e., not CPT physician procedures). This, however, is important because facilities want the procedure codes reported to correspond with the descriptors of ICD-10-PCS codes that the facility is reporting. Unfortunately, the new ICD-10-PCS codes define various surgical approaches that do not correspond to CPT coding (open, closed, percutaneous, and laparoscopic). For example, the ICD-10-PCS "open endoscopic" approach is defined as "cutting through the skin or mucous membrane and any other body layers necessary to expose a body part, and introduction of instrumentation to reach and visualize the site of the procedure." A second example is the "open with percutaneous endoscopic assistance" approach defined as "cutting through the skin or mucous membrane and any other body layers necessary to expose the site of the procedure, and entry, by puncture or minor incision, of instrumentation through the skin or mucous membrane and any other body layers necessary to aid in the performance of the procedure." These new ICD-10-PCS codes have resulted in coders stating that a procedure should be reported as open because the ICD-10-PCS code indicates open and to report any procedure that includes extension of a port incision (e.g., for delivery of a specimen) to be reported as an open procedure -- instead of being correctly reported as a laparoscopic procedure.

**Mesh**

- **Implantation of mesh is now typical and therefore was bundled into the new codes.** When code 49568 was created in 1993, mesh implantation with hernia repairs was not typical. This is supported by the typical patient described in 1993 as having a 10 cm midline incisional hernia – a very large hernia. With research on the causes of hernia recurrence, changes in technology and development of new types of mesh or other prosthesis, implantation of mesh is now typical for all types of hernias and all sizes to reduce the incidence of recurrence. This was supported by the literature submitted with the CCA.

- **Mesh removal is not always required and is not typical.** Technology and research have developed types of mesh that are now being implanted which are incorporated into the abdominal wall, reducing the risk of infection, complications, and recurrence. When mesh removal is indicated, it is typically due to hardening and fracturing of aged mesh, or when gross contamination and infection has occurred (e.g., enterocutaneous fistula involving the mesh). For example, a recurrent hernia repair may require removal of fractured, brittle (old technology) mesh many years after an open repair following a colectomy. This work is typically significant, in that the mesh is often integrated with the abdominal wall or adhered to intestine, and involves removal of all of the mesh, not just a small portion. An add-on code to report mesh removal prior to hernia repair, when required, allows for accurate reporting of this work only when performed, which our expert panel believes is not typical of most hernia repairs.

- **Deletion of code 49658 resulted in rare "left over" work for implantation of mesh related to closure for a large open wound after debridement for necrotizing fasciitis.** Add-on code 46958 was reported for mesh placement for both open hernia repair and in relation to closure of wounds from necrotizing soft tissue infection. This code will be deleted and the work of mesh placement will be included in the work for all of the anterior abdominal hernia repair codes. The remaining use of code 46958 was for mesh placement for delayed closure of external genitalia, perineum and/or abdominal wall defect(s) due to soft tissue infection or trauma. As described in the vignette for 157X1, necrotizing soft tissue infections typically result in a large open wound that cannot be closed primarily. When the infection has resolved, absorbable mesh or other prosthesis is placed to allow healing by secondary intent until such time that a skin graft or skin closure can be accomplished. The literature submitted with the CCA supports this work.

**Compelling Evidence - Flawed methodology of previous reviews, New technology**

**Flawed Methodology:** Codes 49560, 49561, 49565, 49566, 49570, 49572, 49580, 49582, 49585, and 49590 were last reviewed in 2000 during the 2nd 5-year-review. During this review, the American College of Surgeons argued that there was compression of work values for big procedures and there were rank order issues within families of codes. We
developed a methodology using NSQIP data that was approved by the Research Subcommittee. However, to validate the methodology, the 5YR Workgroup instructed the ACS to group the codes into families and survey one or two CPT codes as full surveys per family to act as anchors for each family and the rest of the codes to be surveyed as mini-surveys for only time and visits. After conducting all of the surveys, we believe we were able to validate the methodology that we proposed, however, the 5YR Workgroup did not agree. Instead, they decided that the value that they assigned to the anchor code (the full survey) would be extrapolated to all of the other codes grouped into the same survey. The hernia codes listed above were grouped with 49505 which was increased by 17% based on the survey data and compelling evidence. The 17% increase was applied to the other codes in the group without consideration of rank order, mini survey results or society recommendations. This resulted in continuation of compression and rank order issues. For example, although code 49572 was increased by 17%, the IWPUT for the code is negative. Other codes have near zero IWPUT. We believe this was a flawed methodology of review of the codes and meets compelling evidence.

**Flawed Methodology:** Codes 49587, 49652, 49653, 49654, and 49655 were last reviewed in 2011 based on a site of service anomaly screen. At that time, the RUC approved including a same day observation visit and full observation discharge on the subsequent day. The RUC noted that the typical patient requires close monitoring for problems such as ileus, intestinal ischemia and urinary retention. Additionally, there will be significant pain post-operatively requiring management before discharge. The specialty noted, and the RUC agreed, that the shift in patient facility status (in patient moving to outpatient—as determined by CMS) has little to do with healthier patients that require less physician work and everything to do with the recent OPPS changes related to facility reimbursement. This was substantiated by the survey data which showed that the typical patients stayed at least overnight and received a postoperative same-day E/M service. Given this data, the RUC enacted its (then current) policy to allocate the appropriate proxy for the postoperative visits which was categorized as either subsequent observation and/or observation discharge—both of which are outpatient codes. Importantly, the specialties argued and the RUC agreed that the work of providers who care for medical patients should not be discounted (eg, full observation E/M and full observation discharge E/M allowed for patient staying overnight for observation.)

CMS ignored the valid outpatient E/M visit code inputs that the RUC recommended and instead stated in the Rule that they have a policy of not allowing "inpatient" visits included in the details for outpatient services. These codes went through a Refinement Panel process [ie, a CMS convened group of Medical Officers and select physicians acting as a separate formal appeals process] that resulted in agreement with the RUC recommendations. Importantly, the Agency still maintained that inpatient visits would not be allowed (even though outpatient/observation visits were submitted by the RUC) and then used a reverse building block methodology to subtract work RVUs from the values. These values had been developed by magnitude estimation and approved by the RUC. The Agency deleted the observation visit code inputs and decreased discharge management by 50 percent even though it was performed on a subsequent date. We believe this action by CMS resulted in a flawed methodology of review of these codes and meets compelling evidence.

The rejection of equal value for equal work and rejection of the Refinement Panel results prompted the Executive Director of the American College of Surgeons to send a letter (see last page of SoR) to Kathleen Sebelius, then Secretary of the Department of Health and Human Services on November 29, 2011. This letter addressed the decision-making process for valuing procedure codes that have Medicare outpatient status, the use of refinement panels, and the arbitrary discount in physician work for the same work performed by any provider of a non-global service. Specifically, the letter included the following statement:

"CMS has now implemented a policy by which it is creating differential payments for the same work performed by different physicians as a backdoor mechanism for reducing the work RVUs for surgical procedures. They have valued the worth of a surgeon for post-operative evaluation and management work at about 30 percent of a non-surgeon. Non-surgeons are allowed to provide the same work to the same patient at 100 percent reimbursement. …we believe that this policy leads to a loss of validity and integrity of the current system."

We continue to believe there is no valid justification for a 50% discount to discharge management services provided by a surgeon that is performed the day after a procedure when a non-surgical provider observing a medical patient who is kept overnight for any reason is allowed to bill a discharge management service at 100 percent for work on the next day. We also believe there is no valid justification for discounting a postoperative visit later the same day of surgery to equal only the intra-service time of the visit multiplied by an intensity of 0.0224. No surgeon would round on a postoperative patient the same day and not review interval chart notes prior to the face-to-face with the patient and not followup with charting the visit and confirming or modifying the current orders.
CMS implemented a 23-hour policy for discounting surgical postoperative work based on the argument that the Agency could not include inpatient work in their time/work file. However, the fact is that the Agency has also erroneously rejected RUC recommendations for outpatient/observation codes, stating "these inpatient codes" could not be included for procedures that are typically outpatient.

**Change in Technology:** Since the last review of the hernia repair codes (either in 2000 or in 2011), there has been introduction and application of new technology (ie, robotic assist) which adds work complexity and time with the goal of better patient outcomes. The diffusion of this new technology throughout this family of codes further meets compelling evidence.

### Recommendation – 49X12

We recommend a work RVU of 25.00, which is the survey 75th percentile. We believe the limited number of 0-day global codes that are familiar to general surgeons to be used on a reference service list hindered the ability for survey respondents to provide an accurate magnitude estimation of work.

**Pre-service time**

Evaluation package time has been reduced so as to not exceed survey median data.

Laparoscopic/robotic anterior abdominal hernia repair positioning time: The patient will initially be positioned supine and upper extremity intravenous and arterial access points are dressed, padded and secured. The arms are padded and tucked at the patient’s sides. The patient must be secured to the table, including a soft chest and thigh strap, as it may be necessary to roll the table during the procedure to use gravity to assist with shifting the abdominal contents. There is also consideration of positioning the patient relative to: laparoscopy equipment, including lines and video equipment and anesthesia lines relative to the rest of the equipment. The survey median positioning time reflects the time for this procedure for these activities.

**Postoperative E/M visit later on the day of surgery**

The typical patient will be admitted and a visit will occur later on the same day to monitor for postoperative complications including ileus, intestinal ischemia, and urinary retention. Review data (eg, diagnostic and imaging studies) not available at the unit. Communicate with other health care professionals and with patient and/or family. Review medical records and data available on the unit. Perform a medically appropriate examination. Consider relevant data, options, and risks; formulate and/or revise diagnosis and treatment plan(s) (high complexity MDM). Discuss diagnosis and treatment options with the patient and/or family. Communicate with other health care professionals as necessary. Write and/or review orders, including arranging for necessary diagnostic testing, consultation(s), and therapeutic intervention(s). Complete medical record documentation. Address interval data obtained and reported changes in condition. Communicate results and additional care plans to other health care professionals and to the patient and/or family. Patients undergoing the repair of this size of hernia will require significant post-operative care on the same day to address pain control, review vital signs and fluid status commonly affected by repair of larger hernias, and eliminate concerns for bleeding and infection more common with larger or more numerous incisions.

**Key Reference Code Intensity/Complexity Comparison**

Ref 1: The respondents indicated the intensity/complexity of survey code 49X12 is somewhat more than reference code 61624. Ref 2: The respondents indicated the intensity/complexity of survey code 49X12 is similar to somewhat more than reference code 21813.

**MPC Code Comparison**

MPC code 37244 has the highest RVW for the set of 0-day global codes.

Comparison of using the recommended RVW versus using the 25th percentile.

The first chart below shows reasonable correlation between the recommended RVW and WPUT—both trend lines have a similar slope. The second chart below shows no relationship of WPUT to the 25th percentile RVW—where WPUT decreases as work increases.

What if surgeon evaluation and management work were set equal to discrete E/M services?

As has been discussed by the RUC in the past, work intensities used for computation of IWPUT for time spent by physicians in the pre-service and immediate post-service period for surgical procedures have remained fixed since the early 1990s, while intensity of time for E/M values has received several increased values over several decades.

Recent increases for outpatient office E/M values were not allowed to be added to global codes by CMS. Because IWPUT is calculated by subtracting the pre- and post-work values from the RVW of a given CPT code, this has resulted in less value subtracted than would have occurred if the more appropriate pre- and post-work values were used for the IWPUT formula. This artificially increases the IWPUT and WPUT resulting in a decrease in relativity. This is especially true for codes that have a significant amount of pre-service and post-service work.
It has become difficult to compare IWPUT (and WPUT) for codes with different global periods because of the level of discounting of pre-service and post-service work. For example, for the top 34 high volume 10 and 90 day global codes, AMA staff recently calculated the difference in IWPUT if the office visit increases were used in the IWPUT equation. The AMA table, which is included in the Research Subcommittee agenda for this meeting, showed that the IWPUT would have decreased from -6% to -548% depending on the number of office visits included in the work/time file. To emphasize the importance of this information, the code which would have had the largest decrease (17000) has 3 minutes of intra-time and only one postop office visit (99212). In this table, it was also clear that relativity within a family of codes is lost, because each code within a family may have varying levels of post-service work. To summarize, IWPUT has become much less accurate when used as a comparator of intra-service work within and between families because of CMS actions (ie, not updating global RVW) and policy (ie, discounting postoperative work).

Using the discussion above, we have created the table below that presents the IWPUT and WPUT for the hernia set of codes using (1) the 2021 formulas, and (2) "full value" formulas. The note below the table describes each formula, but basically the full value formula sets pre- and post-service work equal to the same E/M work for non-surgical services. For comparison to facility non-surgical services, we have included codes 99283-99285 using the 2021 published RVW and time data. This table shows that most of the recommendations for 49X01-49X14 result in a WPUT that is less than an ED visit requiring moderate MDM (99284). This table also shows that those codes with similar WPUT to high MDM are appropriately the bigger and more complex procedures. Last, this table provides evidence that discounting pre- and post-work distorts and artificially impacts fair IWPUT and WPUT relativity comparison. However, if undiscounted work is applied, the recommendations for this set of codes are appropriately ranked.

</table>

* 2021 Formula: IWPUT calculation based on evaluation, positioning, immediate post intensity of 0.0224; scrub/dress/wait intensity of 0.0081; and discounted same-day outpatient postop visit (not shown in table) equal to intra-service time at 0.0224. WPUT calculation equal to total time (including discounted postop visit time not shown on table) divided by work.

** 2021 Full Value Formula: IWPUT calculation based on pre-service and immediate post-service time intensity of 0.043 (equal to WPUT for 99213) and same-day EM at full value instead of discounted time for outpatient procedure as shown on table (highlighted in red).

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No
Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
☐ Multiple codes are used to maintain consistency with similar codes.
☐ Historical precedents.
☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (If unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed)

49565 Repair recurrent incisional or ventral hernia; reducible 090
49657 Laparoscopy, surgical, repair, recurrent incisional hernia (includes mesh insertion, when performed); incarcerated or strangulated 090
49568 Implantation of mesh or other prosthesis for open incisional or ventral hernia repair or mesh for closure of debridement for necrotizing soft tissue infection (List separately in addition to code for the incisional or ventral hernia repair) ZZZ

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty general surgery How often? Rarely
Specialty colorectal surgery How often? Rarely
Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National frequency not available

BETOS Sub-classification Level II:
Other

**Professional Liability Insurance Information (PLI)**

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 11008

**Letter Referenced in Compelling Evidence Rationale**

November 29, 2011

The Honorable Kathleen Sebelius
Secretary
Department of Health and Human Services
Hubert H. Humphrey Building
200 Independence Avenue SW
Washington, DC 20201

Re: CY 2012 Medicare Physician Fee Schedule Final Rule and CMS Refinement Panels

Dear Secretary Sebelius:

On November 28, 2011, the Federal Register published the Centers for Medicare and Medicaid Services’ (CMS) Calendar Year (CY) 2012 Medicare Physician Fee Schedule Final Rule. On behalf of the American College of Surgeons (ACS), I am writing to express concern regarding the decision making process and lack of transparency on the part of CMS related to the work relative value units (wRVUs) for 2012 reviewed under CMS’ refinement panel process. The ACS, with over 78,000 members, is a scientific and educational organization of surgeons that was founded in 1913 to raise the standards of surgical practice and to improve the care of the surgical patient.

The ACS has participated in the efforts of the American Medical Association’s Relative Value Scale Update Committee (AMA RUC) for years given the value we place on the AMA RUC process and our assumption that CMS will evaluate the RUC recommendations with fairness, transparency, and accuracy according to a process that has been set out via the Federal rulemaking process. As part of the work that led to the CY 2012 Medicare Physician Fee Schedule Final Rule, the ACS devoted significant resources to conducting AMA RUC surveys for over 100 new or existing codes at the request of CMS. The AMA RUC evaluated wRVU recommendations made by the ACS, based upon those surveys, and came to agreement on final recommended values to be submitted to CMS.
Fifty-seven of the aforementioned codes that the ACS surveyed were sent to the refinement panel. CMS accepted only 12 percent of those refinement panel recommendations.

For most of the 88 percent of refinement panel recommendations that CMS rejected, CMS lowered the wRVU by reducing the value of the post-operative evaluation and management work performed by surgeons in the hospital by 69 percent. However, if that same work is performed by any other physician other than the surgeon, that same service is paid at 100 percent. We believe that the refinement panel physicians completely rejected this concept as they agreed to a work RVU that did not discount post-surgical work in this fashion. We note that the multispecialty panel included physicians from primary care, contractor medical directors (CMDs), physicians in related specialties, and general surgeons. At no time did the Agency’s Medical Officer in charge of the panel process disagree with the presenters or offer a contrary opinion to the discussion.

Our concerns were piqued when CMS issued the CY 2011 Medicare Physician Fee Schedule Final Rule in which CMS stated that it could change wRVU recommendations of the refinement panel convened by CMS if “policy concerns warrant their modification,” without providing additional clarification on what would trigger this ability of CMS to subvert the more transparent process of the refinement panel. However, we continued to participate in the process under the belief that CMS would operate fairly and transparently and that if there were indeed “policy concerns” that CMS had regarding the values of the codes under consideration that those concerns would be stated clearly so all parties could address them during the refinement panel reviews.

CMS has now implemented a policy by which it is creating differential payments for the same work performed by different physicians as a backdoor mechanism for reducing the work RVUs for surgical procedures. They have valued the worth of a surgeon for post-operative evaluation and management work at about 30 percent of a non-surgeon. Non-surgeons are allowed to provide the same work to the same patient at 100 percent reimbursement. First, we believe that this policy leads to a loss of validity and integrity of the current system. In addition, this policy is prohibited by the Omnibus Budget Reconciliation Act of 1989, which states, “[t]he Secretary may not vary the conversion factor or the number of relative value units for a physicians’ service based on whether the physician furnishing the service is a specialist or based on the type of specialty of the physician.” (42 U.S.C. §1395w–4(c)(6)).

The ACS has been a vocal proponent of needed reforms in the delivery and payment of health care. We believe that the future of these reforms will be based on driving greater awareness of proven continuous quality improvement programs to achieve ongoing, tangible results for quality improvements. However, in order for these reforms to be effective, they must be built on a system that is consistent with previous Agency decisions, fair, and transparent, and it is our concern that many of the policy decisions made by CMS in the latest Medicare Physician Fee Schedule Final Rule move us away from those goals. The resource based relative value system (RBRVS) requires a resource basis for decisions on the valuation of physician services. We believe that the resource basis for the decision to reduce these values is not evident. We ask that under your authority as Secretary you will seek to have CMS define a more transparent process in the future for decisions that are not aligned with the RUC and refinement panel recommendations in order to help maintain the transparency and fairness of the current system and to restore the values of these services to the level that is supported by the RBRVS process.

Sincerely,
David B. Hoyt, MD, FACS
Executive Director

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 49X13  Tracking Number  C14  Original Specialty Recommended RVU: 15.50
Global Period: 000  Current Work RVU:
Presented Recommended RVU: 15.50
RUC Recommended RVU: 14.24

CPT Descriptor: Repair of parastomal hernia, any approach (ie, open, laparoscopic, robotic), initial or recurrent, including placement of mesh or other prosthesis, when performed; reducible

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 70-year-old male with history of rectal cancer with subsequent abdominoperineal resection and end colostomy presents with a worsening bulge around his stoma when coughing, pain and discomfort around the stoma, and difficulty keeping the stoma appliance in place due to leakage. CT scan revealed small bowel in the hernia sac. He undergoes parastomal hernia repair with placement of mesh.

Percentage of Survey Respondents who found Vignette to be Typical: 92%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 100%, In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 5%, Overnight stay-less than 24 hours 28%, Overnight stay-more than 24 hours 67%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 73%

Description of Pre-Service Work: Results of preadmission testing (imaging, electrocardiogram and labs) are reviewed. Appropriate selection, timing, and administration of DVT prophylaxis are ensured. Appropriate selection, timing, and administration of antibiotics are ensured. The need for beta-blockers is assessed, and they are ordered as required. The patient is reexamined to confirm that physical findings have not changed, the patient’s medication regimen has remained the same, the patient has no new allergies, and the patient has not undergone any recent procedures. The history and physical examination are then updated in the electronic health record. The planned procedure and postoperative management are reviewed with the patient and family. Informed consent is reviewed and obtained from the patient, including witness confirmation. The palpable edge of the hernia defect(s) and sites of the proposed skin incisions are marked with cooperation of patient. Location for a new and revised stoma site is marked if needed. The length and type of anesthesia, including adjuncts to postoperative analgesia management, are reviewed with the anesthesiologist. Verify that all required instruments and supplies are available, including reusable and disposable laparoscopic/robotic equipment and mesh. Assistance is provided in transfer of the patient from gurney to operating table. Monitor/assist with positioning of patient, including padding and securing patient to table that will adjust throughout procedure (eg, reverse Trendelenburg). Assist anesthesia team with line placement and induction of anesthesia and intubation, relative to all laparoscopic/robotic equipment. The colostomy appliance is removed and the areas of skin to be prepared and draped are indicated by the surgeon to ensure that all of the potential operative field is included in the preparation. A temporary closure suture is placed in the stoma to avoid evacuation during the procedure. The surgeon scrub and gowns. A surgical time-out is performed with operating surgical team.

Description of Intra-Service Work: Abdominal access is obtained and a safe pneumoperitoneum is created with placement of a needle/trocar. The camera is inserted and safe entry is verified. Additional trocars are placed in the lateral abdomen, under direct vision. A large field of adhesions occupies the anterior abdominal wall surrounding the stoma site. Adhesions around the stoma are taken down sharply avoiding injury to the stoma intestinal component traversing the abdominal wall. The careful process of adhesiolysis is performed to clear adhesions from between omentum, small intestines and colon and the abdominal wall and prior mesh when present. The hernia sac is identified and adhesions within the sac are also taken down. The hernia sac is excised. The hernia defect is narrowed with suture taking care to leave the appropriate size fascial
defect for the colostomy yet avoiding an opportunity for intestinal contents to traverse the abdominal wall beside it allowing a recurrence. The colon proximal to the colostomy is mobilized to ensure that there is no tension on the colostomy. The appropriate size of mesh is inserted into the peritoneal cavity and fashioned around the colostomy to cover the hernia defect also avoiding narrowing of the colostomy or offering space for material to traverse the abdominal wall beside it allowing a recurrence. Sutures and tacks are used to anchor the mesh to the anterior abdominal wall. Completion laparoscopic survey is performed to inspect for bleeding and visceral injury. Irrigation is performed as necessary. Hemostasis is assured. Fascial incisions for laparoscopic ports larger than 1 cm are closed with a suture passer. Skin incisions are closed according to surgeon preference. The temporary closure suture is removed from the stoma. Patency of the stoma is assessed prior to completion of the procedure.

Description of Post-Service Work:
Immediate postoperative care [operative day through discharge from recovery room]: A stoma appliance is applied. Apply sterile dressings. Monitor patient during reversal of anesthesia. Assist in transfer of patient from operating table to gurney. Monitor transport of patient from operating room to recovery room. Discuss postoperative recovery care with anesthesia and nursing staff, including need for patient-controlled analgesia. Discontinue prophylactic antibiotic therapy, as appropriate. Review postoperative labs. Discuss procedure and outcome with family in waiting area. Write brief operative note or complete final operative note and place in chart. Write postoperative note in the recovery room. Dictate operative report and copy referring physician(s). Call referring physician(s). Write orders for transferring to general surgical floor and discuss ongoing care with nursing staff.

Later same day hospital inpatient care visit [operative day after discharge from recovery room]: Review interval nursing/other staff chart notes. Discuss ongoing care with nursing staff. Evaluate vital signs and intake/output. Auscultate heart, lungs, and abdomen for bowel sounds. Monitor fluid and electrolyte status and renal function; monitor for problems such as ileus, intestinal ischemia, and urinary retention. Examine patient, check wounds, and change dressings. Continue prophylaxis for DVT. Assess need for beta-blockers, order as required. Assess pain scores and adequacy of analgesia. Write orders for labs, films, medications, diet, and patient activity. Chart patient progress notes. Answer patient and family questions. Answer nursing/other staff questions. Advance diet, as appropriate.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

*The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC’s rationale, please review the separate RUC recommendation document.*

**Background**

*RAW Screen*
Code 49565, *Repair recurrent incisional or ventral hernia; reducible*, was identified by the RUC/RAW with a site of service anomaly: less than 50% inpatient status; includes inpatient visit codes; greater than 5,000 utilization. Prior to submitting an Action Plan to the RAW, the societies reviewed the site of service data and found: almost even split of 48% between inpatient and outpatient – with a few percent in the ASC. At the January 2020 RUC meeting, the societies requested referral of code 49565 to CPT to update the descriptor to current standard of practice and typical patient presentation.

**CPT Coding Changes**

At the February 2021 CPT meeting the following changes were approved:

- Delete all the current open and laparoscopic codes for repair of anterior abdominal hernias.
- Delete add-on code 49568 for mesh for open ventral/incisional hernias and large defects as a result of necrotizing soft tissue infection.
- Add 12 new codes for anterior abdominal hernia repair by any approach (ie, open laparoscopic, robotic); by initial or recurrent; by total defect size; and by reducible or incarcerated/strangulated
- Add 2 codes for parastomal hernia repair - by reducible or incarcerated/strangulated
- Add 1 add-on code for removal of mesh/prosthesis – only with the new hernia repair codes
- Add 1 new code for mesh/prosthesis for delayed closure of external genitalia, perineum and/or abdominal wall defect(s) due to soft tissue infection or trauma.

**Coding Structure**

Hernia repair for epigastric, incisional, ventral, umbilical, spigelian were merged as they all appear on the anterior abdomen. The location—upper, lower, midline—does not impact the work. But instead, the size and number of defects is the driving factor for work. For example, with respect to the code that was tagged by the RAW, a recurrent, incisional, reducible hernia can be anywhere from a small hernia at a port site from a prior laparoscopic procedure to an extremely large hernia with multiple defects clustered in a midline incision.

Initial versus recurrent differentiation was maintained. Recurrent hernias are re-reoperations. An initial hernia can be the result of a prior procedure (this is not a recurrent hernia) or weak muscles and fascia. A recurrent hernia is typically at least the third time the same site is being operated on.

For example,

- operation 1 might be an open colectomy
- operation 2 would be an initial midline hernia repair
- operation 3 would be a recurrent midline hernia involving the initial midline repair and may include other multiple hernias occurring in the same old incision, all needing to be repaired.

There are many examples in CPT that differentiate between a primary and secondary procedure: disarticulation of shoulder (23920-23921); amputation of arm through humerus (24900-24930) and other similar amputation families; tendon repair (eg, 25260-25274); CABG reoperation (33530); and revision total joint (eg, 23473, 23474, 24370, 24371, 27134-27138).

The hernia size ranges were based on a review of literature and expert panel. For example, an article published in the Journal of the American College of Surgeons reviewed technique and outcomes of abdominal incisional hernia repair and showed that the range of defect size was from less than 1 cm to more than 25 cm with a mean of 6 cm and a median of less than 3 cm. Other similar articles were submitted with the code change application, supporting different work for different defect size. David A. Iannitti, et.al, *Technique and Outcomes of Abdominal Incisional Hernia Repair Using a Synthetic Composite Mesh: A Report of 455 Cases*, Journal of the American College of Surgeons, Volume 206, Issue 1, 2008, Pages 83-88, ISSN 1072-7515, https://doi.org/10.1016/j.jamcollsurg.2007.07.030.

Differentiating the work of a procedure in relationship to size or extent is not new for CPT. For example, 36 skin repair codes by length of repair; 44 lesion excision codes by excised diameter; 46 soft tissue tumor excision codes by size of tumor; 23 hysterectomy codes by size of uterus (58260-58573); 3 myomectomy codes are differentiated by total weight of the myomas (58140-58146); and 10 nerve graft codes are based on length of graft. (64885-64898)

The CPT guidelines and illustrations that describe how to measure the total defect size are well understood by surgeons. This is not a new concept – surgeons are very familiar with measuring a hernia defect, and in fact the size of the hernia defect was included in some of the patient vignettes in 1993. Furthermore, measurement of hernia size is a necessary step for selecting and preparing the appropriately sized mesh for implantation.
Hernia repair coding has been complicated by changes in (1) technology and technique and (2) the recent implementation of ICD-10-PCS codes. For these reasons, the stakeholder societies believed this set of codes should describe "any approach." The societies and the AMA Coding Network have received numerous coding questions about correct reporting for "hybrid" abdominal hernia repair procedures where parts of the procedure are performed via an open approach and parts of the procedure are performed via laparoscopy or with the use of a robot. These are not laparoscopic procedures converted to open procedures, but instead procedures that are more often begun open and then finished as laparoscopic/robotic under pneumoperitoneum.

Another issue that has recently caused confusion about coding has appeared on national coder websites and coder discussion boards referring to International Classification of Diseases Tenth Revision Procedure Coding System (ICD-10-PCS) codes which classifies procedures performed in the facility (ie, not CPT physician procedures). This, however, is important because facilities want the procedure codes reported to correspond with the descriptors of ICD-10-PCS codes that the facility is reporting. Unfortunately, the new ICD-10-PCS codes define various surgical approaches that do not correspond to CPT coding (open, closed, percutaneous, and laparoscopic). For example, the ICD-10-PCS "open endoscopic" approach is defined as "cutting through the skin or mucous membrane and any other body layers necessary to expose a body part, and introduction of instrumentation to reach and visualize the site of the procedure." A second example is the "open with percutaneous endoscopic assistance" approach defined as "cutting through the skin or mucous membrane and any other body layers necessary to expose the site of the procedure, and entry, by puncture or minor incision, of instrumentation through the skin or mucous membrane and any other body layers necessary to aid in the performance of the procedure." These new ICD-10-PCS codes have resulted in coders stating that a procedure should be reported as open because the ICD-10-PCS code indicates open and to report any procedure that includes extension of a port incision (eg, for delivery of a specimen) to be reported as an open procedure --instead of being correctly reported as a laparoscopic procedure.

**Mesh**

- **Implantation of mesh is now typical and therefore was bundled into the new codes.** When code 49568 was created in 1993, mesh implantation with hernia repairs was not typical. This is supported by the typical patient described in 1993 as having a 10 cm midline incisional hernia – a very large hernia. With research on the causes of hernia recurrence, changes in technology and development of new types of mesh or other prosthesis, implantation of mesh is now typical for all types of hernias and all sizes to reduce the incidence of recurrence. This was supported by the literature submitted with the CCA.

- **Mesh removal is not always required and is not typical.** Technology and research have developed types of mesh that are now being implanted which are incorporated into the abdominal wall, reducing the risk of infection, complications, and recurrence. When mesh removal is indicated, it is typically due to hardening and fracturing of aged mesh, or when gross contamination and infection has occurred (eg, enterocutaneous fistula involving the mesh). For example, a recurrent hernia repair may require removal of fractured, brittle (old technology) mesh many years after an open repair following a colectomy. This work is typically significant, in that the mesh is often integrated with the abdominal wall or adhered to intestine, and involves removal of all of the mesh, not just a small portion. An add-on code to report mesh removal prior to hernia repair, when required, allows for accurate reporting of this work only when performed, which our expert panel believes is not typical of most hernia repairs.

- **Deletion of code 49658 resulted in rare "left over" work for implantation of mesh related to closure for a large open wound after debridement for necrotizing fasciitis.** Add-on code 46958 was reported for mesh placement for both open hernia repair and in relation to closure of wounds from necrotizing soft tissue infection. This code will be deleted and the work of mesh placement will be included in the work for all of the anterior abdominal hernia repair codes. The remaining use of code 46958 was for mesh placement for delayed closure of external genitalia, perineum and/or abdominal wall defect(s) due to soft tissue infection or trauma. As described in the vignette for 157X1, necrotizing soft tissue infections typically result in a large open wound that cannot be closed primarily. When the infection has resolved, absorbable mesh or other prosthesis is placed to allow healing by secondary intent until such time that a skin graft or skin closure can be accomplished. The literature submitted with the CCA supports this work.

**Compelling Evidence - Flawed methodology of previous reviews, New technology**

**Flawed Methodology:** Codes 49560, 49561, 49565, 49566, 49570, 49572, 49580, 49582, 49585, and 49590 were last reviewed in 2000 during the 2nd 5-year-review. During this review, the American College of Surgeons argued that there was compression of work values for big procedures and there were rank order issues within families of codes. We
developed a methodology using NSQIP data that was approved by the Research Subcommittee. However, to validate the methodology, the 5YR Workgroup instructed the ACS to group the codes into families and survey one or two CPT codes as full surveys per family to act as anchors for each family and the rest of the codes to be surveyed as mini-surveys for only time and visits. After conducting all of the surveys, we believe we were able to validate the methodology that we proposed, however, the 5YR Workgroup did not agree. Instead, they decided that the value that they assigned to the anchor code (the full survey) would be extrapolated to all of the other codes grouped into the same survey. The hernia codes listed above were grouped with 49505 which was increased by 17% based on the survey data and compelling evidence. The 17% increase was applied to the other codes in the group without consideration of rank order, mini survey results or society recommendations. This resulted in continuation of compression and rank order issues. For example, although code 49572 was increased by 17%, the IWPUT for the code is negative. Other codes have near zero IWPUT. We believe this was a flawed methodology of review of the codes and meets compelling evidence.

**Flawed Methodology:** Codes 49587, 49652, 49653, 49654, and 49655 were last reviewed in 2011 based on a site of service anomaly screen. At that time, the RUC approved including a same day observation visit and full observation discharge on the subsequent day. The RUC noted that the typical patient requires close monitoring for problems such as ileus, intestinal ischemia and urinary retention. Additionally, there will be significant pain post-operatively requiring management before discharge. The specialty noted, and the RUC agreed, that the shift in patient facility status (in patient moving to outpatient—as determined by CMS) has little to do with healthier patients that require less physician work and everything to do with the recent OPPS changes related to facility reimbursement. This was substantiated by the survey data which showed that the typical patients stayed at least overnight and received a postoperative same-day E/M service. Given this data, the RUC enacted its (then current) policy to allocate the appropriate proxy for the postoperative visits which was categorized as either subsequent observation and/or observation discharge—both of which are outpatient codes. Importantly, the specialties argued and the RUC agreed that the work of providers who care for medical patients should not be discounted (eg, full observation E/M and full observation discharge E/M allowed for patient staying overnight for observation.)

CMS ignored the valid outpatient E/M visit code inputs that the RUC recommended and instead stated in the Rule that they have a policy of not allowing "inpatient" visits included in the details for outpatient services. These codes went through a Refinement Panel process [ie, a CMS convened group of Medical Officers and select physicians acting as a separate formal appeals process] that resulted in agreement with the RUC recommendations. Importantly, the Agency still maintained that inpatient visits would not be allowed (even though outpatient/observation visits were submitted by the RUC) and then used a reverse building block methodology to subtract work RVUs from the values. These values had been developed by magnitude estimation and approved by the RUC. The Agency deleted the observation visit code inputs and decreased discharge management by 50 percent even though it was performed on a subsequent date. We believe this action by CMS resulted in a flawed methodology of review of these codes and meets compelling evidence.

The rejection of equal value for equal work and rejection of the Refinement Panel results prompted the Executive Director of the American College of Surgeons to send a letter (see last page of SoR) to Kathleen Sebelius, then Secretary of the Department of Health and Human Services on November 29, 2011. This letter addressed the decision-making process for valuing procedure codes that have Medicare outpatient status, the use of refinement panels, and the arbitrary discount in physician work for the same work performed by any provider of a non-global service. Specifically, the letter included the following statement:

"CMS has now implemented a policy by which it is creating differential payments for the same work performed by different physicians as a backdoor mechanism for reducing the work RVUs for surgical procedures. They have valued the worth of a surgeon for post-operative evaluation and management work at about 30 percent of a non-surgeon. Non-surgeons are allowed to provide the same work to the same patient at 100 percent reimbursement. ...we believe that this policy leads to a loss of validity and integrity of the current system."

We continue to believe there is no valid justification for a 50% discount to discharge management services provided by a surgeon that is performed the day after a procedure when a non-surgical provider observing a medical patient who is kept overnight for any reason is allowed to bill a discharge management service at 100 percent for work on the next day. We also believe there is no valid justification for discounting a postoperative visit later the same day of surgery to equal only the intra-service time of the visit multiplied by an intensity of 0.0224. No surgeon would round on a postoperative patient the same day and not review interval chart notes prior to the face-to-face with the patient and not followup with charting the visit and confirming or modifying the current orders.
CMS implemented a 23-hour policy for discounting surgical postoperative work based on the argument that the Agency could not include inpatient work in their time/work file. However, the fact is that the Agency has also erroneously rejected RUC recommendations for outpatient/observation codes, stating "these inpatient codes" could not be included for procedure that are typically outpatient.

**Change in Technology:** Since the last review of the hernia repair codes (either in 2000 or in 2011), there has been introduction and application of new technology (ie, robotic assist) which adds work complexity and time with the goal of better patient outcomes. The diffusion of this new technology throughout this family of codes further meets compelling evidence.

**Recommendation – 49X13**

We recommend a work RVU of 15.50, which is the survey median.

**Pre-service time**

Scrub, dress, wait package time has been reduced so as to not exceed survey median data.

Laparoscopic/robotic anterior abdominal hernia repair positioning time: The patient will initially be positioned supine and upper extremity intravenous and arterial access points are dressed, padded and secured. The arms are padded and tucked at the patient’s sides. The patient must be secured to the table, including a soft chest and thigh strap, as it may be necessary to roll the table during the procedure to use gravity to assist with shifting the abdominal contents. There is also consideration of positioning the patient relative to: laparoscopy equipment, including lines and video equipment and anesthesia lines relative to the rest of the equipment. The survey median positioning time reflects the time for this procedure for these activities.

**Postoperative E/M visit later on the day of surgery**

The typical patient will be admitted and a visit will occur later on the same day. Review data (eg, diagnostic and imaging studies) not available at the unit. Communicate with other health care professionals and with patient and/or family. Review medical records and data available on the unit. Perform a medically appropriate examination. Consider relevant data, options, and risks; formulate and/or revise diagnosis and treatment plan(s) (straightforward or low-complexity MDM). Discuss diagnosis and treatment options with the patient and/or family. Consider discharge needs of patient. Communicate with other health care professionals as necessary. Write and/or review orders, including arranging for necessary diagnostic testing, consultation(s), and therapeutic intervention(s). Complete medical record documentation. Address interval data obtained and reported changes in condition. Communicate results and additional care plans to other health care professionals and to the patient and/or family.

**Key Reference Code Intensity/Complexity Comparison**

Ref 1: The respondents indicated the intensity/complexity of survey code 49X13 is similar to somewhat more than reference code 11005. Ref 2: The respondents indicated the intensity/complexity of survey code 49X13 is similar to somewhat more than reference code 21813.

**MPC Code Comparison**

MPC code 37244 has the highest RVW for the set of 0-day global codes.

Comparison of using the recommended RVW versus using the 25th percentile.

The first chart below shows reasonable correlation between the recommended RVW and WPUT—both trend lines have a similar slope. The second chart below shows no relationship of WPUT to the 25th percentile RVW—where WPUT decreases as work increases.

What if surgeon evaluation and management work were set equal to discrete E/M services?

As has been discussed by the RUC in the past, work intensities used for computation of IWPUT for time spent by physicians in the pre-service and immediate post-service period for surgical procedures have remained fixed since the early 1990s, while intensity of time for E/M values has received several increased values over several decades.

Recent increases for outpatient office E/M values were not allowed to be added to global codes by CMS. Because IWPUT is calculated by subtracting the pre- and post-work values from the RVW of a given CPT code, this has resulted in less value subtracted than would have occurred if the more appropriate pre- and post-work values were used for the IWPUT formula. This artificially increases the IWPUT and WPUT resulting in a decrease in relativity. This is especially true for codes that have a significant amount of pre-service and post-service work.
It has become difficult to compare IWPUT (and WPUT) for codes with different global periods because of the level of discounting of pre-service and post-service work. For example, for the top 34 high volume 10 and 90 day global codes, AMA staff recently calculated the difference in IWPUT if the office visit increases were used in the IWPUT equation. The AMA table, which is included in the Research Subcommittee agenda for this meeting, showed that the IWPUT would have decreased from -6% to -548% depending on the number of office visits included in the work/time file. To emphasize the importance of this information, the code which would have had the largest decrease (17000) has 3 minutes of intra-time and only one postop office visit (99212). In this table, it was also clear that relativity within a family of codes is lost, because each code within a family may have varying levels of post-service work. To summarize, IWPUT has become much less accurate when used as a comparator of intra-service work within and between families because of CMS actions (ie, not updating global RVW) and policy (ie, discounting postoperative work).

Using the discussion above, we have created the table below that presents the IWPUT and WPUT for the hernia set of codes using (1) the 2021 formulas, and (2) "full value" formulas. The note below the table describes each formula, but basically the full value formula sets pre- and post-service work equal to the same E/M work for non-surgical services. For comparison to facility non-surgical services, we have included codes 99283-99285 using the 2021 published RVW and time data. This table shows that most of the recommendations for 49X01-49X14 result in a WPUT that is less than an ED visit requiring moderate MDM (99284). This table also shows that those codes with similar WPUT to high MDM are appropriately the bigger and more complex procedures. Last, this table provides evidence that discounting pre- and post-service work for outpatients (not shown on table) has a significant impact on IWPUT and WPUT comparisons. For example, for the top 34 high volume 10 and 90 day global codes, AMA staff recently calculated the difference in IWPUT if the office visit increases were used in the IWPUT equation. This table also shows evidence that discounting postoperative work distorts and artificially impacts fair IWPUT and WPUT relativity comparison. However, if undiscounted work is applied, the recommendations for this set of codes are appropriately ranked.

* 2021 Formula: IWPUT calculation based on evaluation, positioning, immediate post intensity of 0.0224; scrub/dress/wait intensity of 0.0081; and discounted same-day outpatient postop visit (not shown in table) equal to intra-service time at 0.0224. WPUT calculation equal to total time (including discounted postop visit time not shown on table) divided by work.

**2021 Full Value Formula: IWPUT calculation based on pre-service and immediate post-service time intensity of 0.043 (equal to WPUT for 99213) and same-day post EM at full value instead of discounted time for outpatient procedure as shown on table (highlighted in red).

---

### Services Reported with Multiple CPT Codes

1. Is this code typically reported on the same date with other CPT codes? Yes/No: No
Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
☐ Multiple codes are used to maintain consistency with similar codes.
☐ Historical precedents.
☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

**FREQUENCY INFORMATION**

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed)

**Letter Referenced in Compelling Evidence Rationale**

November 29, 2011

The Honorable Kathleen Sebelius  
Secretary  
Department of Health and Human Services  
Hubert H. Humphrey Building  
200 Independence Avenue SW  
Washington, DC 20201

Re: CY 2012 Medicare Physician Fee Schedule Final Rule and CMS Refinement Panels

Dear Secretary Sebelius:

On November 28, 2011, the Federal Register published the Centers for Medicare and Medicaid Services’ (CMS) Calendar Year (CY) 2012 Medicare Physician Fee Schedule Final Rule. On behalf of the American College of Surgeons (ACS), I am writing to express concern regarding the decision making process and lack of transparency on the part of CMS related to the work relative value units (wRVUs) for 2012 reviewed under CMS’ refinement panel process. The ACS, with over 78,000 members, is a scientific and educational organization of surgeons that was founded in 1913 to raise the standards of surgical practice and to improve the care of the surgical patient.

The ACS has participated in the efforts of the American Medical Association’s Relative Value Scale Update Committee (AMA RUC) for years given the value we place on the AMA RUC process and our assumption that CMS will evaluate the RUC recommendations with fairness, transparency, and accuracy according to a process that has been set out via the Federal rulemaking process. As part of the work that led to the CY 2012 Medicare Physician Fee Schedule Final Rule, the ACS devoted significant resources to conducting AMA RUC surveys for over 100 new or existing codes at the
request of CMS. The AMA RUC evaluated wRVU recommendations made by the ACS, based upon those surveys, and came to agreement on final recommended values to be submitted to CMS.

Fifty-seven of the aforementioned codes that the ACS surveyed were sent to the refinement panel. CMS accepted only 12 percent of those refinement panel recommendations.

For most of the 88 percent of refinement panel recommendations that CMS rejected, CMS lowered the wRVU by reducing the value of the post-operative evaluation and management work performed by surgeons in the hospital by 69 percent. However, if that same work is performed by any other physician other than the surgeon, that same service is paid at 100 percent. We believe that the refinement panel physicians completely rejected this concept as they agreed to a work RVU that did not discount post-surgical work in this fashion. We note that the multispecialty panel included physicians from primary care, contractor medical directors (CMDs), physicians in related specialties, and general surgeons. At no time did the Agency’s Medical Officer in charge of the panel process disagree with the presenters or offer a contrary opinion to the discussion.

Our concerns were piqued when CMS issued the CY 2011 Medicare Physician Fee Schedule Final Rule in which CMS stated that it could change wRVU recommendations of the refinement panel convened by CMS if “policy concerns warrant their modification,” without providing additional clarification on what would trigger this ability of CMS to subvert the more transparent process of the refinement panel. However, we continued to participate in the process under the belief that CMS would operate fairly and transparently and that if there were indeed “policy concerns” that CMS had regarding the values of the codes under consideration that those concerns would be stated clearly so all parties could address them during the refinement panel reviews.

CMS has now implemented a policy by which it is creating differential payments for the same work performed by different physicians as a backdoor mechanism for reducing the work RVUs for surgical procedures. They have valued the worth of a surgeon for post-operative evaluation and management work at about 30 percent of a non-surgeon. Non-surgeons are allowed to provide the same work to the same patient at 100 percent reimbursement. First, we believe that this policy leads to a loss of validity and integrity of the current system. In addition, this policy is prohibited by the Omnibus Budget Reconciliation Act of 1989, which states, “[t]he Secretary may not vary the conversion factor or the number of relative value units for a physicians’ service based on whether the physician furnishing the service is a specialist or based on the type of specialty of the physician.” (42 U.S.C. §1395w-4(c)(6)).

The ACS has been a vocal proponent of needed reforms in the delivery and payment of health care. We believe that the future of these reforms will be based on driving greater awareness of proven continuous quality improvement programs to achieve ongoing, tangible results for quality improvements. However, in order for these reforms to be effective, they must be built on a system that is consistent with previous Agency decisions, fair, and transparent, and it is our concern that many of the policy decisions made by CMS in the latest Medicare Physician Fee Schedule Final Rule move us away from those goals. The resource based relative value system (RBRVS) requires a resource basis for decisions on the valuation of physician services. We believe that the resource basis for the decision to reduce these values is not evident. We ask that under your authority as Secretary you will seek to have CMS define a more transparent process in the future for decisions that are not aligned with the RUC and refinement panel recommendations in order to help maintain the transparency and fairness of the current system and to restore the values of these services to the level that is supported by the RBRVS process.

Sincerely,
David B. Hoyt, MD, FACS
Executive Director
CPT Code: 49X14

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 49X14 Tracking Number C15
Original Specialty Recommended RVU: 20.25
Presented Recommended RVU: 20.25
RUC Recommended RVU: 18.00

CPT Descriptor: Repair of parastomal hernia, any approach (ie, open, laparoscopic, robotic), initial or recurrent, including placement of mesh or other prosthesis, when performed; incarcerated or strangulated

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 70-year-old male with history of rectal cancer, colon resection and sigmoid colostomy presents with a worsening parastomal hernia associated with pain. The hernia cannot be reduced and a CT scan indicates incarcerated small bowel loops in the parastomal hernia sac. He undergoes parastomal hernia repair with placement of mesh.

Percentage of Survey Respondents who found Vignette to be Typical: 92%

Site of Service (Complete for 010 and 090 Globals Only)
Percent of survey respondents who stated they perform the procedure; In the hospital 100%, In the ASC 0%, In the office 0%
Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 3%, Overnight stay-less than 24 hours 3%, Overnight stay-more than 24 hours 95%
Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 82%

Description of Pre-Service Work: Results of preadmission testing (imaging, electrocardiogram and labs) are reviewed. Appropriate selection, timing, and administration of DVT prophylaxis are ensured. Appropriate selection, timing, and administration of antibiotics are ensured. The need for beta-blockers is assessed, and they are ordered as required. The patient is reexamined to confirm that physical findings have not changed, the patient’s medication regimen has remained the same, the patient has no new allergies, and the patient has not undergone any recent procedures. The history and physical examination are then updated in the electronic health record. The planned procedure and postoperative management are reviewed with the patient and family. Informed consent is reviewed and obtained from the patient, including witness confirmation. The mass of incarcerated material occupying the hernia is palpated obscuring the edge of the hernia defect(s). The sites of the proposed skin incisions are marked with cooperation of patient. A site for a new and revised stoma site is marked if needed. The length and type of anesthesia, including adjuncts to postoperative analgesia management, are reviewed with the anesthesiologist. Verify that all required instruments and supplies are available, including reusable and disposable laparoscopic/robotic equipment and mesh. Assistance is provided in transfer of the patient from gurney to operating table. Monitor/assist with positioning of patient, including padding and securing patient to table that will adjust throughout procedure (eg, reverse Trendelenburg) Assist anesthesia team with line placement and induction of anesthesia and intubation, relative to all laparoscopic/robotic equipment. The colostomy appliance is removed and the areas of skin to be prepared and draped are indicated by the surgeon to ensure that all of the potential operative field is included in the preparation. A temporary closure suture is placed in the stoma site to avoid evacuation during the procedure. The surgeon scrubs and gowns. A surgical time-out is performed with operating surgical team.

Description of Intra-Service Work: Abdominal access is obtained and a safe pneumoperitoneum is created with placement of a needle/trocar. The camera is inserted and safe entry is verified. Additional trocars are placed in the lateral abdomen, under direct vision. A large field of adhesions occupies the anterior abdominal wall surrounding the stoma site. Adhesions around the stoma are taken down sharply avoiding injury to the stoma intestinal component traversing the abdominal wall. The careful process of adhesiolysis is performed to clear adhesions from between omentum, small intestines and colon and the abdominal wall and prior mesh when present. Reduction of the incarcerated material is initiated. This requires manipulation both intra-abdominally with minimally invasive instrumentation and extra-abdominally with palpation and
pressure applied to the abdominal wall to reduce the incarcerated contents. The reduced tissue is examined for viability and any inadvertent injury. The hernia sac is identified and adhesions within the sac are taken down and the hernia sac is excised. The hernia defect is narrowed with suture taking care to leave the appropriate size fascial defect for the colostomy yet avoiding an opportunity for intestinal contents to traverse the abdominal wall beside it allowing a recurrence. The colon proximal to the colostomy is mobilized to ensure that there is no tension on the colostomy. The appropriate size of mesh is inserted into the peritoneal cavity and fashioned around the colostomy to cover the hernia defect also avoiding narrowing of the colostomy or offering space for material to traverse the abdominal wall beside it allowing a recurrence. Sutures and tacks are used to anchor the mesh to the anterior abdominal wall to secure the mesh. Completion laparoscopic survey is performed to inspect for bleeding and visceral injury and perform a final viability assessment of the material once incarcerated in the hernia sac. Irrigation is performed as necessary. Hemostasis is assured. Fascial incisions for laparoscopic ports larger than 1 cm are closed with a suture passer. Skin incisions are closed according to surgeon preference. The temporary closure suture is removed from the stoma. Patency of the stoma is assessed prior to completion of the procedure.

Description of Post-Service Work:
Immediate postoperative care [operative day through discharge from recovery room]: A stoma appliance is applied. Apply sterile dressings. Monitor patient during reversal of anesthesia. Assist in transfer of patient from operating table to gurney. Monitor transport of patient from operating room to recovery room. Discuss postoperative recovery care with anesthesia and nursing staff, including need for patient-controlled analgesia. Discontinue prophylactic antibiotic therapy, as appropriate. Review postoperative labs. Discuss procedure and outcome with family in waiting area. Write brief operative note or complete final operative note and place in chart. Write postoperative note in the recovery room. Dictate operative report and copy referring physician(s). Call referring physician(s). Write orders for transferring to general surgical floor and discuss ongoing care with nursing staff.

Later same day hospital inpatient care visit [operative day after discharge from recovery room]: Review interval nursing/other staff chart notes. Discuss ongoing care with nursing staff. Evaluate vital signs and intake/output. Auscultate heart, lungs, and abdomen for bowel sounds. Monitor fluid and electrolyte status and renal function; monitor for problems such as ileus, intestinal ischemia, and urinary retention. Examine patient, check wounds, and change dressings. Continue prophylaxis for DVT. Assess need for beta-blockers, order as required. Assess pain scores and adequacy of analgesia. Write orders for labs, films, medications, diet, and patient activity. Chart patient progress notes. Answer patient and family questions. Answer nursing/other staff questions. Advance diet, as appropriate.

## Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC’s rationale, please review the separate RUC recommendation document.

### Background

*RAW Screen*
CPT Code: 49X14

Code 49565, Repair recurrent incisional or ventral hernia; reducible, was identified by the RUC/RAW with a site of service anomaly: less than 50% inpatient status; includes inpatient visit codes; greater than 5,000 utilization. Prior to submitting an Action Plan to the RAW, the societies reviewed the site of service data and found: almost even split of 48% between inpatient and outpatient – with a few percent in the ASC. At the January 2020 RUC meeting, the societies requested referral of code 49565 to CPT to update the descriptor to current standard of practice and typical patient presentation.

CPT Coding Changes
At the February 2021 CPT meeting the following changes were approved:

- Delete all the current open and laparoscopic codes for repair of anterior abdominal hernias.
- Delete add-on code 49568 for mesh for open ventral/incisional hernias and large defects as a result of necrotizing soft tissue infection.
- Add 12 new codes for anterior abdominal hernia repair by any approach (ie, open laparoscopic, robotic); by initial or recurrent; by total defect size; and by reducible or incarcerated/strangulated
- Add 2 codes for parastomal hernia repair - by reducible or incarcerated/strangulated
- Add 1 add-on code for removal of mesh/prosthesis – only with the new hernia repair codes
- Add 1 new code for mesh/prosthesis for delayed closure of external genitalia, perineum and/or abdominal wall defect(s) due to soft tissue infection or trauma.

Coding Structure
Hernia repair for epigastric, incisional, ventral, umbilical, spigelian were merged as they all appear on the anterior abdomen. The location--upper, lower, midline—does not impact the work. But instead, the size and number of defects is the driving factor for work. For example, with respect to the code that was tagged by the RAW, a recurrent, incisional, reducible hernia can be anywhere from a small hernia at a port site from a prior laparoscopic procedure to an extremely large hernia with multiple defects clustered in a midline incision.

Initial versus recurrent differentiation was maintained. Recurrent hernias are re-reoperations. An initial hernia can be the result of a prior procedure (this is not a recurrent hernia) or weak muscles and fascia. A recurrent hernia is typically at least the third time the same site is being operated on.

For example,

- operation 1 might be an open colectomy
- operation 2 would be an initial midline hernia repair
- operation 3 would be a recurrent midline hernia involving the initial midline repair and may include other multiple hernias occurring in the same old incision, all needing to be repaired.

There are many examples in CPT that differentiate between a primary and secondary procedure: disarticulation of shoulder (23920-23921); amputation of arm through humerus (24900-24930) and other similar amputation families; tendon repair (eg, 25260-25274); CABG reoperation (33530); and revision total joint (eg, 23473, 23474, 24370, 24371, 27134-27138).

The hernia size ranges were based on a review of literature and expert panel. For example, an article published in the Journal of the American College of Surgeons reviewed technique and outcomes of abdominal incisional hernia repair and showed that the range of defect size was from less than 1 cm to more than 25 cm with a mean of 6 cm and a median of less than 3 cm. Other similar articles were submitted with the code change application, supporting different work for different defect size. David A. Iannitti, et al, *Technique and Outcomes of Abdominal Incisional Hernia Repair Using a Synthetic Composite Mesh: A Report of 455 Cases*, Journal of the American College of Surgeons, Volume 206, Issue 1, 2008, Pages 83-88, ISSN 1072-7515, https://doi.org/10.1016/j.amcollsurg.2007.07.030.

Differentiating the work of a procedure in relationship to size or extent is not new for CPT. For example, 36 skin repair codes by length of repair; 44 lesion excision codes by excised diameter; 46 soft tissue tumor excision codes by size of tumor; 23 hysterectomy codes by size of uterus (58260-58573); 3 myomectomy codes are differentiated by total weight of the myomas (58140-58146); and 10 nerve graft codes are based on length of graft. (64885-64898)

The CPT guidelines and illustrations that describe how to measure the total defect size are well understood by surgeons. This is not a new concept – surgeons are very familiar with measuring a hernia defect, and in fact the size of the hernia defect was included in some of the patient vignettes in 1993. Furthermore, measurement of hernia size is a necessary step for selecting and preparing the appropriately sized mesh for implantation.
Hernia repair coding has been complicated by changes in (1) technology and technique and (2) the recent implementation of ICD-10-PCS codes. For these reasons, the stakeholder societies believed this set of codes should describe "any approach." The societies and the AMA Coding Network have received numerous coding questions about correct reporting for "hybrid" abdominal hernia repair procedures where parts of the procedure are performed via an open approach and parts of the procedure are performed via laparoscopy or with the use of a robot. These are not laparoscopic procedures converted to open procedures, but instead procedures that are more often begun open and then finished as laparoscopic/robotic under pneumoperitoneum.

Another issue that has recently caused confusion about coding has appeared on national coder websites and coder discussion boards referring to International Classification of Diseases Tenth Revision Procedure Coding System (ICD-10-PCS) codes which classifies procedures performed in the facility (ie, not CPT physician procedures). This, however, is important because facilities want the procedure codes reported to correspond with the descriptors of ICD-10-PCS codes that the facility is reporting. Unfortunately, the new ICD-10-PCS codes define various surgical approaches that do not correspond to CPT coding (open, closed, percutaneous, and laparoscopic). For example, the ICD-10-PCS "open endoscopic" approach is defined as "cutting through the skin or mucous membrane and any other body layers necessary to expose a body part, and introduction of instrumentation to reach and visualize the site of the procedure." A second example is the "open with percutaneous endoscopic assistance" approach defined as "cutting through the skin or mucous membrane and any other body layers necessary to expose the site of the procedure, and entry, by puncture or minor incision, of instrumentation through the skin or mucous membrane and any other body layers necessary to aid in the performance of the procedure." These new ICD-10-PCS codes have resulted in coders stating that a procedure should be reported as open because the ICD-10-PCS code indicates open and to report any procedure that includes extension of a port incision (eg, for delivery of a specimen) to be reported as an open procedure --instead of being correctly reported as a laparoscopic procedure.

Mesh

- **Implantation of mesh is now typical and therefore was bundled into the new codes.** When code 49568 was created in 1993, mesh implantation with hernia repairs was not typical. This is supported by the typical patient described in 1993 as having a 10 cm midline incisional hernia – a very large hernia. With research on the causes of hernia recurrence, changes in technology and development of new types of mesh or other prosthesis, implantation of mesh is now typical for all types of hernias and all sizes to reduce the incidence of recurrence. This was supported by the literature submitted with the CCA.

- **Mesh removal is not always required and is not typical.** Technology and research have developed types of mesh that are now being implanted which are incorporated into the abdominal wall, reducing the risk of infection, complications, and recurrence. When mesh removal is indicated, it is typically due to hardening and fracturing of aged mesh, or when gross contamination and infection has occurred (eg, enterocutaneous fistula involving the mesh). For example, a recurrent hernia repair may require removal of fractured, brittle (old technology) mesh many years after an open repair following a colectomy. This work is typically significant, in that the mesh is often integrated with the abdominal wall or adhered to intestine, and involves removal of all of the mesh, not just a small portion. An add-on code to report mesh removal prior to hernia repair, when required, allows for accurate reporting of this work only when performed, which our expert panel believes is not typical of most hernia repairs.

- **Deletion of code 49658 resulted in rare "left over" work for implantation of mesh related to closure for a large open wound after debridement for necrotizing fasciitis.** Add-on code 46958 was reported for mesh placement for both open hernia repair and in relation to closure of wounds from necrotizing soft tissue infection. This code will be deleted and the work of mesh placement will be included in the work for all of the anterior abdominal hernia repair codes. The remaining use of code 46958 was for mesh placement for delayed closure of external genitalia, perineum and/or abdominal wall defect(s) due to soft tissue infection or trauma. As described in the vignette for 157X1, necrotizing soft tissue infections typically result in a large open wound that cannot be closed primarily. When the infection has resolved, absorbable mesh or other prosthesis is placed to allow healing by secondary intent until such time that a skin graft or skin closure can be accomplished. The literature submitted with the CCA supports this work.

**Compelling Evidence - Flawed methodology of previous reviews, New technology**

**Flawed Methodology:** Codes 49560, 49561, 49565, 49566, 49570, 49572, 49580, 49582, 49585, and 49590 were last reviewed in 2000 during the 2nd 5-year-review. During this review, the American College of Surgeons argued that there was compression of work values for big procedures and there were rank order issues within families of codes. We
Developed a methodology using NSQIP data that was approved by the Research Subcommittee. However, to validate the methodology, the 5YR Workgroup instructed the ACS to group the codes into families and survey one or two CPT codes as full surveys per family to act as anchors for each family and the rest of the codes to be surveyed as mini-surveys for only time and visits. After conducting all of the surveys, we believe we were able to validate the methodology that we proposed, however, the 5YR Workgroup did not agree. Instead, they decided that the value that they assigned to the anchor code (the full survey) would be extrapolated to all of the other codes grouped into the same survey. The hernia codes listed above were grouped with 49505 which was increased by 17% based on the survey data and compelling evidence. The 17% increase was applied to the other codes in the group without consideration of rank order, mini survey results or society recommendations. This resulted in continuation of compression and rank order issues. For example, although code 49572 was increased by 17%, the IWPUT for the code is negative. Other codes have near zero IWPUT. We believe this was a flawed methodology of review of the codes and meets compelling evidence.

**Flawed Methodology:** Codes 49587, 49652, 49653, 49654, and 49655 were last reviewed in 2011 based on a site of service anomaly screen. At that time, the RUC approved including a same day observation visit and full observation discharge on the subsequent day. The RUC noted that the typical patient requires close monitoring for problems such as ileus, intestinal ischemia and urinary retention. Additionally, there will be significant pain post-operatively requiring management before discharge. The specialty noted, and the RUC agreed, that the shift in patient facility status (in patient moving to outpatient—as determined by CMS) has little to do with healthier patients that require less physician work and everything to do with the recent OPPS changes related to facility reimbursement. This was substantiated by the survey data which showed that the typical patients stayed at least overnight and received a postoperative same-day E/M service. Given this data, the RUC enacted its (then current) policy to allocate the appropriate proxy for the postoperative visits which was categorized as either subsequent observation and/or observation discharge—both of which are outpatient codes. Importantly, the specialties argued and the RUC agreed that the work of providers who care for medical patients should not be discounted (eg, full observation E/M and full observation discharge E/M allowed for patient staying overnight for observation.)

CMS ignored the valid outpatient E/M visit code inputs that the RUC recommended and instead stated in the Rule that they have a policy of not allowing "inpatient" visits included in the details for outpatient services. These codes went through a Refinement Panel process [ie, a CMS convened group of Medical Officers and select physicians acting as a separate formal appeals process] that resulted in agreement with the RUC recommendations. Importantly, the Agency still maintained that inpatient visits would not be allowed (even though outpatient/observation visits were submitted by the RUC) and then used a reverse building block methodology to subtract work RVUs from the values. These values had been developed by magnitude estimation and approved by the RUC. The Agency deleted the observation visit code inputs and decreased discharge management by 50 percent even though it was performed on a subsequent date. We believe this action by CMS resulted in a flawed methodology of review of these codes and meets compelling evidence.

The rejection of equal value for equal work and rejection of the Refinement Panel results prompted the Executive Director of the American College of Surgeons to send a letter (see last page of SoR) to Kathleen Sebelius, then Secretary of the Department of Health and Human Services on November 29, 2011. This letter addressed the decision-making process for valuing procedure codes that have Medicare outpatient status, the use of refinement panels, and the arbitrary discount in physician work for the same work performed by any provider of a non-global service. Specifically, the letter included the following statement:

"CMS has now implemented a policy by which it is creating differential payments for the same work performed by different physicians as a backdoor mechanism for reducing the work RVUs for surgical procedures. They have valued the worth of a surgeon for post-operative evaluation and management work at about 30 percent of a non-surgeon. Non-surgeons are allowed to provide the same work to the same patient at 100 percent reimbursement. …we believe that this policy leads to a loss of validity and integrity of the current system."

We continue to believe there is no valid justification for a 50% discount to discharge management services provided by a surgeon that is performed the day after a procedure when a non-surgical provider observing a medical patient who is kept overnight for any reason is allowed to bill a discharge management service at 100 percent for work on the next day. We also believe there is no valid justification for discounting a postoperative visit later the same day of surgery to equal only the intra-service time of the visit multiplied by an intensity of 0.0224. No surgeon would round on a postoperative patient the same day and not review interval chart notes prior to the face-to-face with the patient and not follow up with charting the visit and confirming or modifying the current orders.
CMS implemented a 23-hour policy for discounting surgical postoperative work based on the argument that the Agency could not include inpatient work in their time/work file. However, the fact is that the Agency has also erroneously rejected RUC recommendations for outpatient / observation codes, stating "these inpatient codes" could not be included for procedures that are typically outpatient.

**Change in Technology:** Since the last review of the hernia repair codes (either in 2000 or in 2011), there has been introduction and application of new technology (i.e., robotic assist) which adds work complexity and time with the goal of better patient outcomes. The diffusion of this new technology throughout this family of codes further meets compelling evidence.

**Recommendation – 49X14**

We recommend a work RVU of 20.25, which is the survey 75th percentile. We believe a lack of recent or five year experience in conjunction with a challenging reference list may have resulted in an underestimation of work. One-third of the respondents had not performed this procedure in the past 12 months. The 12 month median experience was 2 and the 5 year median experience was only 6. This is not a common procedure. Incarcerated parastomal hernias can prove very challenging to identify which segment is the stoma component should remain penetrating through the abdominal wall and which loops are bowel that should be reduced adding to the complexity of the procedure.

**Pre-service time**

Scrub, dress, wait package time has been reduced so as to not exceed survey median data.

Laparoscopic/robotic anterior abdominal hernia repair positioning time: The patient will initially be positioned supine and upper extremity intravenous and arterial access points are dressed, padded and secured. The arms are padded and tucked at the patient’s sides. The patient must be secured to the table, including a soft chest and thigh strap, as it may be necessary to roll the table during the procedure to use gravity to assist with shifting the abdominal contents. There is also consideration of positioning the patient relative to: laparoscopy equipment, including lines and video equipment and anesthesia lines relative to the rest of the equipment. The survey median positioning time reflects the time for this procedure for these activities.

**Postoperative E/M visit later on the day of surgery**

The typical patient will be admitted and a visit will occur later on the same day. Review data (e.g., diagnostic and imaging studies) not available at the unit. Communicate with other health care professionals and with patient and/or family. Review medical records and data available on the unit. Perform a medically appropriate examination. Consider relevant data, options, and risks; formulate and/or revise diagnosis and treatment plan(s) (moderate complexity MDM). Discuss diagnosis and treatment options with the patient and/or family. Consider discharge needs of patient. Communicate with other health care professionals as necessary. Write and/or review orders, including arranging for necessary diagnostic testing, consultation(s), and therapeutic intervention(s). Complete medical record documentation. Address interval data obtained and reported changes in condition. Communicate results and additional care plans to other health care professionals and to the patient and/or family.

**Key Reference Code Intensity/Complexity Comparison**

Ref 1: The respondents indicated the intensity/complexity of survey code 49X14 is similar to somewhat more than reference code 21813. Ref 2: The respondents indicated the intensity/complexity of survey code 49X14 is similar to somewhat more than reference code 33891.

**MPC Code Comparison**

MPC code 37244 has the highest RVW for the set of 0-day global codes.

Relativity Assessment

Recommended RVW vs Total Time

The chart below that compares the recommended RVW and total time shows good correlation.

![Recommended RVW vs Total Time Chart]

R² = 0.982

The data below that were used to create the chart above show appropriate relative rank order for work for this new set of hernia repair codes.

Comparison of using the recommended RVW versus using the 25th percentile.

The first chart below shows reasonable correlation between the recommended RVW and WPUT—both trend lines have a similar slope. The second chart below shows no relationship of WPUT to the 25th percentile RVW—where WPUT decreases as work increases.

What if surgeon evaluation and management work were set equal to discrete E/M services?

As has been discussed by the RUC in the past, work intensities used for computation of IWPUT for time spent by physicians in the pre-service and immediate post-service period for surgical procedures have remained fixed since the early 1990s, while intensity of time for E/M values has received several increased values over several decades.

Recent increases for outpatient office E/M values were not allowed to be added to global codes by CMS. Because IWPUT is calculated by subtracting the pre- and post-work values from the RVW of a given CPT code, this has resulted in less value subtracted than would have occurred if the more appropriate pre- and post-work values were used for the
IWPUT formula. This artificially increases the IWPUT and WPUT resulting in a decrease in relativity. This is especially true for codes that have a significant amount of pre-service and post-service work.

It has become difficult to compare IWPUT (and WPUT) for codes with different global periods because of the level of discounting of pre-service and post-service work. For example, for the top 34 high volume 10 and 90 day global codes, AMA staff recently calculated the difference in IWPUT if the office visit increases were used in the IWPUT equation. The AMA table, which is included in the Research Subcommittee agenda for this meeting, showed that the IWPUT would have decreased from -6% to -54% depending on the number of office visits included in the work/time file. To emphasize the importance of this information, the code which would have had the largest decrease (17000) has 3 minutes of intra-time and only one postop office visit (99212). In this table, it was also clear that relativity within a family of codes is lost, because each code within a family may have varying levels of post-service work. To summarize, IWPUT has become much less accurate when used as a comparator of intra-service work within and between families because of CMS actions (ie, not updating global RVW) and policy (ie, discounting postoperative work).

Using the discussion above, we have created the table below that presents the IWPUT and WPUT for the hernia set of codes using (1) the 2021 formulas, and (2) "full value" formulas. The note below the table describes each formula, but basically the full value formula sets pre- and post-service work equal to the same E/M work for non-surgical services. For comparison to facility non-surgical services, we have included codes 99283-99285 using the 2021 published RVW and time data. This table shows that most of the recommendations for 49X01-49X14 result in a WPUT that is less than an ED visit requiring moderate MDM (99284). This table also shows that those codes with similar WPUT to high MDM are appropriately the bigger and more complex procedures. Last, this table provides evidence that discounting pre- and post-work distorts and artificially impacts fair IWPUT and WPUT relativity comparison. However, if undiscounted work is applied, the recommendations for this set of codes are appropriately ranked.

</table>

* 2021 Formula: IWPUT calculation based on evaluation, positioning, immediate post intensity of 0.0224; scrub/dress/wait intensity of 0.0081; and discounted same-day outpatient postop visit (not shown in table) equal to intra-service time at 0.0224. WPUT calculation equal to total time (including discounted postop visit time not shown on table) divided by work.

**2021 Full Value Formula: IWPUT calculation based on pre-service and immediate post-service time intensity of 0.043 (equal to WPUT for 99213) and same-day post EM at full value instead of discounted time for outpatient procedure as shown on table (highlighted in red).

SERVICES REPORTED WITH MULTIPLE CPT CODES
1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- [ ] The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- [ ] Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- [ ] Multiple codes allow flexibility to describe exactly what components the procedure included.
- [ ] Multiple codes are used to maintain consistency with similar codes.
- [ ] Historical precedents.
- [ ] Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (If unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed)

Letter Referenced in Compelling Evidence Rationale

November 29, 2011

The Honorable Kathleen Sebelius
Secretary
Department of Health and Human Services
Hubert H. Humphrey Building
200 Independence Avenue SW
Washington, DC 20201

Re: CY 2012 Medicare Physician Fee Schedule Final Rule and CMS Refinement Panels

Dear Secretary Sebelius:

On November 28, 2011, the Federal Register published the Centers for Medicare and Medicaid Services’ (CMS) Calendar Year (CY) 2012 Medicare Physician Fee Schedule Final Rule. On behalf of the American College of Surgeons (ACS), I am writing to express concern regarding the decision making process and lack of transparency on the part of CMS related to the work relative value units (wRVUs) for 2012 reviewed under CMS’ refinement panel process. The ACS, with over 78,000 members, is a scientific and educational organization of surgeons that was founded in 1913 to raise the standards of surgical practice and to improve the care of the surgical patient.
The ACS has participated in the efforts of the American Medical Association’s Relative Value Scale Update Committee (AMA RUC) for years given the value we place on the AMA RUC process and our assumption that CMS will evaluate the RUC recommendations with fairness, transparency, and accuracy according to a process that has been set out via the Federal rulemaking process. As part of the work that led to the CY 2012 Medicare Physician Fee Schedule Final Rule, the ACS devoted significant resources to conducting AMA RUC surveys for over 100 new or existing codes at the request of CMS. The AMA RUC evaluated wRVU recommendations made by the ACS, based upon those surveys, and came to agreement on final recommended values to be submitted to CMS.

Fifty-seven of the aforementioned codes that the ACS surveyed were sent to the refinement panel. CMS accepted only 12 percent of those refinement panel recommendations.

For most of the 88 percent of refinement panel recommendations that CMS rejected, CMS lowered the wRVU by reducing the value of the post-operative evaluation and management work performed by surgeons in the hospital by 69 percent. However, if that same work is performed by any other physician other than the surgeon, that same service is paid at 100 percent. We believe that the refinement panel physicians completely rejected this concept as they agreed to a work RVU that did not discount post-surgical work in this fashion. We note that the multispecialty panel included physicians from primary care, contractor medical directors (CMDs), physicians in related specialties, and general surgeons. At no time did the Agency's Medical Officer in charge of the panel process disagree with the presenters or offer a contrary opinion to the discussion.

Our concerns were piqued when CMS issued the CY 2011 Medicare Physician Fee Schedule Final Rule in which CMS stated that it could change wRVU recommendations of the refinement panel convened by CMS if “policy concerns warrant their modification,” without providing additional clarification on what would trigger this ability of CMS to subvert the more transparent process of the refinement panel. However, we continued to participate in the process under the belief that CMS would operate fairly and transparently and that if there were indeed “policy concerns” that CMS had regarding the values of the codes under consideration that those concerns would be stated clearly so all parties could address them during the refinement panel reviews.

CMS has now implemented a policy by which it is creating differential payments for the same work performed by different physicians as a backdoor mechanism for reducing the work RVUs for surgical procedures. They have valued the worth of a surgeon for post-operative evaluation and management work at about 30 percent of a non-surgeon. Non-surgeons are allowed to provide the same work to the same patient at 100 percent reimbursement. First, we believe that this policy leads to a loss of validity and integrity of the current system. In addition, this policy is prohibited by the Omnibus Budget Reconciliation Act of 1989, which states, “[t]he Secretary may not vary the conversion factor or the number of relative value units for a physicians’ service based on whether the physician furnishing the service is a specialist or based on the type of specialty of the physician.” (42 U.S.C. §1395w-4(c)(6)).

The ACS has been a vocal proponent of needed reforms in the delivery and payment of health care. We believe that the future of these reforms will be based on driving greater awareness of proven continuous quality improvement programs to achieve ongoing, tangible results for quality improvements. However, in order for these reforms to be effective, they must be built on a system that is consistent with previous Agency decisions, fair, and transparent, and it is our concern that many of the policy decisions made by CMS in the latest Medicare Physician Fee Schedule Final Rule move us away from those goals. The resource based relative value system (RBRVS) requires a resource basis for decisions on the valuation of physician services. We believe that the resource basis for the decision to reduce these values is not evident. We ask that under your authority as Secretary you will seek to have CMS define a more transparent process in the future for decisions that are not aligned with the RUC and refinement panel recommendations in order to help maintain the transparency and fairness of the current system and to restore the values of these services to the level that is supported by the RBRVS process.

Sincerely,
David B. Hoyt, MD, FACS
Executive Director

RUC Recommended RVU: **5.00**

CPT Descriptor: Removal of mesh or other prosthesis at the time of initial or recurrent anterior abdominal hernia repair or parastomal hernia repair, any approach (ie, open, laparoscopic, robotic) (List separately in addition to code for primary procedure)

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: At the time of hernia repair, a 64-year-old obese male who had mesh placed with a prior hernia repair now requires removal of the mesh to allow for an adequate repair of a new hernia. Note: This is an add-on service. Only consider the additional work related to mesh removal.

Percentage of Survey Respondents who found Vignette to be Typical: 91%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0%  , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: N/A

Description of Intra-Service Work: Utilizing electrocautery and sharp dissection, the previously placed mesh is dissected from the abdominal wall fascia. Care is taken to prevent damage to the abdominal wall and intraabdominal contents while removing the mesh in its entirety. Prior sutures and tacks are identified and dissected from the abdominal wall. Hemostasis is obtained in the abdominal wall over the surface area of the excised mesh.

Description of Post-Service Work: N/A

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC’s rationale, please review the separate RUC recommendation document.
Background

RAW Screen
Code 49565, Repair recurrent incisional or ventral hernia; reducible, was identified by the RUC/RAW with a site of service anomaly: less than 50% inpatient status; includes inpatient visit codes; greater than 5,000 utilization. Prior to submitting an Action Plan to the RAW, the societies reviewed the site of service data and found: almost even split of 48% between inpatient and outpatient – with a few percent in the ASC. At the January 2020 RUC meeting, the societies requested referral of code 49565 to CPT to update the descriptor to current standard of practice and typical patient presentation.

CPT Coding Changes
At the February 2021 CPT meeting the following changes were approved:
- Delete all the current open and laparoscopic codes for repair of anterior abdominal hernias.
- Delete add-on code 49568 for mesh for open ventral/incisional hernias and large defects as a result of necrotizing soft tissue infection.
- Add 12 new codes for anterior abdominal hernia repair by any approach (ie, open laparoscopic, robotic); by initial or recurrent; by total defect size; and by reducible or incarcerated/strangulated
- Add 2 codes for parastomal hernia repair - by reducible or incarcerated/strangulated
- Add 1 add-on code for removal of mesh/prosthesis – only with the new hernia repair codes
- Add 1 new code for mesh/prosthesis for delayed closure of external genitalia, perineum and/or abdominal wall defect(s) due to soft tissue infection or trauma.

Coding Structure
Hernia repair for epigastric, incisional, ventral, umbilical, spigelian were merged as they all appear on the anterior abdomen. The location—upper, lower, midline—does not impact the work. But instead, the size and number of defects is the driving factor for work. For example, with respect to the code that was tagged by the RAW, a recurrent, incisional, reducible hernia can be anywhere from a small hernia at a port site from a prior laparoscopic procedure to an extremely large hernia with multiple defects clustered in a midline incision.

Initial versus recurrent differentiation was maintained. Recurrent hernias are re-reoperations. An initial hernia can be the result of a prior procedure (this is not a recurrent hernia) or weak muscles and fascia. A recurrent hernia is typically at least the third time the same site is being operated on.

For example,
- operation 1 might be an open colectomy
- operation 2 would be an initial midline hernia repair
- operation 3 would be a recurrent midline hernia involving the initial midline repair and may include other multiple hernias occurring in the same old incision, all needing to be repaired.

There are many examples in CPT that differentiate between a primary and secondary procedure: disarticulation of shoulder (23920-23921); amputation of arm through humerus (24900-24930) and other similar amputation families; tendon repair (eg, 25260-25274); CABG reoperation (33530); and revision total joint (eg, 23473, 23474, 24370, 24371, 27134-27138).

The hernia size ranges were based on a review of literature and expert panel. For example, an article published in the Journal of the American College of Surgeons reviewed technique and outcomes of abdominal incisional hernia repair and showed that the range of defect size was from less than 1 cm to more than 25 cm with a mean of 6 cm and a median of less than 3 cm. Other similar articles were submitted with the code change application, supporting different work for different defect size. David A. Iannitti, et.al, Technique and Outcomes of Abdominal Incisional Hernia Repair Using a Synthetic Composite Mesh: A Report of 455 Cases, Journal of the American College of Surgeons, Volume 206, Issue 1, 2008, Pages 83-88, ISSN 1072-7515, https://doi.org/10.1016/j.jamcollsurg.2007.07.030.

Differentiating the work of a procedure in relationship to size or extent is not new for CPT. For example, 36 skin repair codes by length of repair; 44 lesion excision codes by excised diameter; 46 soft tissue tumor excision codes by size of tumor; 23 hysterectomy codes by size of uterus (58260-58573); 3 myomectomy codes are differentiated by total weight of the myomas (58140-58146); and 10 nerve graft codes are based on length of graft. (64885-64898)
The CPT guidelines and illustrations that describe how to measure the total defect size are well understood by surgeons. This is not a new concept—surgeons are very familiar with measuring a hernia defect, and in fact the size of the hernia defect was included in some of the patient vignettes in 1993. Furthermore, measurement of hernia size is a necessary step for selecting and preparing the appropriately sized mesh for implantation.

Hernia repair coding has been complicated by changes in (1) technology and technique and (2) the recent implementation of ICD-10-PCS codes. For these reasons, the stakeholder societies believed this set of codes should describe "any approach." The societies and the AMA Coding Network have received numerous coding questions about correct reporting for "hybrid" abdominal hernia repair procedures where parts of the procedure are performed via an open approach and parts of the procedure are performed via laparoscopy or with the use of a robot. These are not laparoscopic procedures converted to open procedures, but instead procedures that are more often begun open and then finished as laparoscopic/robotic under pneumoperitoneum.

Another issue that has recently caused confusion about coding has appeared on national coder websites and coder discussion boards referring to International Classification of Diseases Tenth Revision Procedure Coding System (ICD-10-PCS) codes which classifies procedures performed in the facility (ie, not CPT physician procedures). This, however, is important because facilities want the procedure codes reported to correspond with the descriptors of ICD-10-PCS codes that the facility is reporting. Unfortunately, the new ICD-10-PCS codes define various surgical approaches that do not correspond to CPT coding (open, closed, percutaneous, and laparoscopic). For example, the ICD-10-PCS "open endoscopic" approach is defined as "cutting through the skin or mucous membrane and any other body layers necessary to expose the site of the procedure, and entry, by puncture or minor incision, of instrumentation through the skin or mucous membrane and any other body layers necessary to aid in the performance of the procedure." A second example is the "open with percutaneous endoscopic assistance" approach defined as "cutting through the skin or mucous membrane and any other body layers necessary to expose the site of the procedure, and entry, by puncture or minor incision, of instrumentation to reach and visualize the site of the procedure." These new ICD-10-PCS codes have resulted in coders stating that a procedure should be reported as open because the ICD-10-PCS code indicates open and to report any procedure that includes extension of a port incision (eg, for delivery of a specimen) to be reported as an open procedure—instead of being correctly reported as a laparoscopic procedure.

Mesh

- **Implantation of mesh is now typical and therefore was bundled into the new codes.** When code 49568 was created in 1993, mesh implantation with hernia repairs was not typical. This is supported by the typical patient described in 1993 as having a 10 cm midline incisional hernia—very large hernia. With research on the causes of hernia recurrence, changes in technology and development of new types of mesh or other prosthesis, implantation of mesh is now typical for all types of hernias and all sizes to reduce the incidence of recurrence. This was supported by the literature submitted with the CCA.

- **Mesh removal is not always required and is not typical.** Technology and research have developed types of mesh that are now being implanted which are incorporated into the abdominal wall, reducing the risk of infection, complications, and recurrence. When mesh removal is indicated, it is typically due to hardening and fracturing of aged mesh, or when gross contamination and infection has occurred (eg, enterocutaneous fistula involving the mesh). For example, a recurrent hernia repair may require removal of fractured, brittle (old technology) mesh many years after an open repair following a colectomy. This work is typically significant, in that the mesh is often integrated with the abdominal wall or adhered to intestine, and involves removal of all of the mesh, not just a small portion. An add-on code to report mesh removal prior to hernia repair, when required, allows for accurate reporting of this work only when performed, which our expert panel believes is not typical of most hernia repairs.

- **Deletion of code 49658 resulted in rare "left over" work for implantation of mesh related to closure for a large open wound after debridement for necrotizing fasciitis.** Add-on code 46958 was reported for mesh placement for both open hernia repair and in relation to closure of wounds from necrotizing soft tissue infection. This code will be deleted and the work of mesh placement will be included in the work for all of the anterior abdominal hernia repair codes. The remaining use of code 46958 was for mesh placement for delayed closure of external genitalia, perineum and/or abdominal wall defect(s) due to soft tissue infection or trauma. As described in the vignette for 157X1, necrotizing soft tissue infections typically result in a large open wound that cannot be closed primarily. When the infection has resolved, absorbable mesh or other prosthesis is placed to allow healing by secondary intent until such time that a skin graft or skin closure can be accomplished. The literature submitted with the CCA supports this work.
Compelling Evidence - Flawed methodology of previous reviews, New technology

**Flawed Methodology:** Codes 49560, 49561, 49565, 49566, 49570, 49572, 49580, 49582, 49585, and 49590 were last reviewed in 2000 during the 2nd 5-year-review. During this review, the American College of Surgeons argued that there was compression of work values for big procedures and there were rank order issues within families of codes. We developed a methodology using NSQIP data that was approved by the Research Subcommittee. However, to validate the methodology, the 5YR Workgroup instructed the ACS to group the codes into families and survey one or two CPT codes as full surveys per family to act as anchors for each family and the rest of the codes to be surveyed as mini-surveys for only time and visits. After conducting all of the surveys, we believe we were able to validate the methodology that we proposed, however, the 5YR Workgroup did not agree. Instead, they decided that the value that they assigned to the anchor code (the full survey) would be extrapolated to all of the other codes grouped into the same survey. The hernia codes listed above were grouped with 49505 which was increased by 17% based on the survey data and compelling evidence. The 17% increase was applied to the other codes in the group without consideration of rank order, mini survey results or society recommendations. This resulted in continuation of compression and rank order issues. For example, although code 49572 was increased by 17%, the IWPUT for the code is negative. Other codes have near zero IWPUT. We believe this was a flawed methodology of review of the codes and meets compelling evidence.

**Flawed Methodology:** Codes 49587, 49652, 49653, 49654, and 49655 were last reviewed in 2011 based on a site of service anomaly screen. At that time, the RUC approved including a same day observation visit and full observation discharge on the subsequent day. The RUC noted that the typical patient requires close monitoring for problems such as ileus, intestinal ischemia and urinary retention. Additionally, there will be significant pain post-operatively requiring management before discharge. The specialty noted, and the RUC agreed, that the shift in patient facility status (in patient moving to outpatient—as determined by CMS) has little to do with healthier patients that require less physician work and everything to do with the recent OPPS changes related to facility reimbursement. This was substantiated by the survey data which showed that the typical patients stayed at least overnight and received a postoperative same-day E/M service. Given this data, the RUC enacted its (then current) policy to allocate the appropriate proxy for the postoperative visits which was categorized as either subsequent observation and/or observation discharge—both of which are outpatient codes. Importantly, the specialties argued and the RUC agreed that the work of providers who care for medical patients should not be discounted (eg, full observation E/M and full observation discharge E/M allowed for patient staying overnight for observation.)

CMS ignored the valid outpatient E/M visit code inputs that the RUC recommended and instead stated in the Rule that they have a policy of not allowing "inpatient" visits included in the details for outpatient services. These codes went through a Refinement Panel process [ie, a CMS convened group of Medical Officers and select physicians acting as a separate formal appeals process] that resulted in agreement with the RUC recommendations. Importantly, the Agency still maintained that inpatient visits would not be allowed (even though outpatient/observation visits were submitted by the RUC) and then used a reverse building block methodology to subtract work RVUs from the values. These values had been developed by magnitude estimation and approved by the RUC. The Agency deleted the observation visit code inputs and decreased discharge management by 50 percent even though it was performed on a subsequent date. We believe this action by CMS resulted in a flawed methodology of review of these codes and meets compelling evidence.

The rejection of equal value for equal work and rejection of the Refinement Panel results prompted the Executive Director of the American College of Surgeons to send a letter (see last page of SoR) to Kathleen Sebelius, then Secretary of the Department of Health and Human Services on November 29, 2011. This letter addressed the decision-making process for valuing procedure codes that have Medicare outpatient status, the use of refinement panels, and the arbitrary discount in physician work for the same work performed by any provider of a non-global service. Specifically, the letter included the following statement:

"CMS has now implemented a policy by which it is creating differential payments for the same work performed by different physicians as a backdoor mechanism for reducing the work RVUs for surgical procedures. They have valued the worth of a surgeon for post-operative evaluation and management work at about 30 percent of a non-surgeon. Non-surgeons are allowed to provide the same work to the same patient at 100 percent reimbursement. ...we believe that this policy leads to a loss of validity and integrity of the current system."
We continue to believe there is no valid justification for a 50% discount to discharge management services provided by a surgeon that is performed the day after a procedure when a non-surgical provider observing a medical patient who is kept overnight for any reason is allowed to bill a discharge management service at 100 percent for work on the next day. We also believe there is no valid justification for discounting a postoperative visit later the same day of surgery to equal only the intra-service time of the visit multiplied by an intensity of 0.0224. No surgeon would round on a postoperative patient the same day and not review interval chart notes prior to the face-to-face with the patient and not followup with charting the visit and confirming or modifying the current orders.

CMS implemented a 23-hour policy for discounting surgical postoperative work based on the argument that the Agency could not include inpatient work in their time/work file. However, the fact is that the Agency has also erroneously rejected RUC recommendations for outpatient / observation codes, stating "these inpatient codes” could not be included for procedure that are typically outpatient.

**Change in Technology:** Since the last review of the hernia repair codes (either in 2000 or in 2011), there has been introduction and application of new technology (ie, robotic assist) which adds work complexity and time with the goal of better patient outcomes. The diffusion of this new technology throughout this family of codes further meets compelling evidence.

**Recommendation – 49X15 (add-on code)**

We recommend a work RVU of 5.00, which is the survey median.

**Key Reference Code Intensity/Complexity Comparison**

Ref 1: The respondents indicated the intensity/complexity of survey code 49X15 is similar to somewhat more than reference code 11008. Ref 2: The respondents indicated the intensity/complexity of survey code 49X15 is somewhat more than reference code 35572.

**SERVICES REPORTED WITH MULTIPLE CPT CODES**

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No
Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.

☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.

☐ Multiple codes allow flexibility to describe exactly what components the procedure included.

☐ Multiple codes are used to maintain consistency with similar codes.

☐ Historical precedents.

☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

Letter Referenced in Compelling Evidence Rationale

November 29, 2011

The Honorable Kathleen Sebelius
Secretary
Department of Health and Human Services
Hubert H. Humphrey Building
200 Independence Avenue SW
Washington, DC 20201

Re: CY 2012 Medicare Physician Fee Schedule Final Rule and CMS Refinement Panels

Dear Secretary Sebelius:

On November 28, 2011, the Federal Register published the Centers for Medicare and Medicaid Services’ (CMS) Calendar Year (CY) 2012 Medicare Physician Fee Schedule Final Rule. On behalf of the American College of Surgeons (ACS), I am writing to express concern regarding the decision making process and lack of transparency on the part of CMS related to the work relative value units (wRVUs) for 2012 reviewed under CMS’ refinement panel process. The ACS, with over 78,000 members, is a scientific and educational organization of surgeons that was founded in 1913 to raise the standards of surgical practice and to improve the care of the surgical patient.

The ACS has participated in the efforts of the American Medical Association’s Relative Value Scale Update Committee (AMA RUC) for years given the value we place on the AMA RUC process and our assumption that CMS will evaluate the RUC recommendations with fairness, transparency, and accuracy according to a process that has been set out via the Federal rulemaking process. As part of the work that led to the CY 2012 Medicare Physician Fee Schedule Final Rule,
the ACS devoted significant resources to conducting AMA RUC surveys for over 100 new or existing codes at the request of CMS. The AMA RUC evaluated wRVU recommendations made by the ACS, based upon those surveys, and came to agreement on final recommended values to be submitted to CMS.

Fifty-seven of the aforementioned codes that the ACS surveyed were sent to the refinement panel. CMS accepted only 12 percent of those refinement panel recommendations.

For most of the 88 percent of refinement panel recommendations that CMS rejected, CMS lowered the wRVU by reducing the value of the post-operative evaluation and management work performed by surgeons in the hospital by 69 percent. However, if that same work is performed by any other physician other than the surgeon, that same service is paid at 100 percent. We believe that the refinement panel physicians completely rejected this concept as they agreed to a work RVU that did not discount post-surgical work in this fashion. We note that the multispecialty panel included physicians from primary care, contractor medical directors (CMDs), physicians in related specialties, and general surgeons. At no time did the Agency's Medical Officer in charge of the panel process disagree with the presenters or offer a contrary opinion to the discussion.

Our concerns were piqued when CMS issued the CY 2011 Medicare Physician Fee Schedule Final Rule in which CMS stated that it could change wRVU recommendations of the refinement panel convened by CMS if “policy concerns warrant their modification,” without providing additional clarification on what would trigger this ability of CMS to subvert the more transparent process of the refinement panel. However, we continued to participate in the process under the belief that CMS would operate fairly and transparently and that if there were indeed “policy concerns” that CMS had regarding the values of the codes under consideration that those concerns would be stated clearly so all parties could address them during the refinement panel reviews.

CMS has now implemented a policy by which it is creating differential payments for the same work performed by different physicians as a backdoor mechanism for reducing the work RVUs for surgical procedures. They have valued the worth of a surgeon for post-operative evaluation and management work at about 30 percent of a non-surgeon. Non-surgeons are allowed to provide the same work to the same patient at 100 percent reimbursement. First, we believe that this policy leads to a loss of validity and integrity of the current system. In addition, this policy is prohibited by the Omnibus Budget Reconciliation Act of 1989, which states, “[t]he Secretary may not vary the conversion factor or the number of relative value units for a physicians’ service based on whether the physician furnishing the service is a specialist or based on the type of specialty of the physician.” (42 U.S.C. §1395w-4(c)(6)).

The ACS has been a vocal proponent of needed reforms in the delivery and payment of health care. We believe that the future of these reforms will be based on driving greater awareness of proven continuous quality improvement programs to achieve ongoing, tangible results for quality improvements. However, in order for these reforms to be effective, they must be built on a system that is consistent with previous Agency decisions, fair, and transparent, and it is our concern that many of the policy decisions made by CMS in the latest Medicare Physician Fee Schedule Final Rule move us away from those goals. The resource based relative value system (RBRVS) requires a resource basis for decisions on the valuation of physician services. We believe that the resource basis for the decision to reduce these values is not evident. We ask that under your authority as Secretary you will seek to have CMS define a more transparent process in the future for decisions that are not aligned with the RUC and refinement panel recommendations in order to help maintain the transparency and fairness of the current system and to restore the values of these services to the level that is supported by the RBRVS process.

Sincerely,
David B. Hoyt, MD, FACS
Executive Director
CPT Code: 157X1

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 157X1  Tracking Number C1  Original Specialty Recommended RVU: **8.50**

Presented Recommended RVU: **8.50**

RUC Recommended RVU: **8.00**

CPT Descriptor: Implantation of absorbable mesh or other prosthesis for delayed closure of defect(s) (ie, external genitalia, perineum, abdominal wall) due to soft tissue infection or trauma

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 60-year-old obese male with a large abdominal wall defect as a result of necrotizing infection and extensive debridement of all involved skin, subcutaneous tissue, fascia, and muscle now undergoes delayed closure with implantation of absorbable mesh.

Percentage of Survey Respondents who found Vignette to be Typical: 89%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is;
Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 100%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 92%

Description of Pre-Service Work: Interval tests (imaging, electrocardiogram and labs) are reviewed. Appropriate selection, timing, and administration of DVT prophylaxis are ensured. Appropriate selection, timing, and administration of antibiotics are ensured. The need for beta-blockers is assessed, and they are ordered as required. The patient is reexamined to confirm that physical findings have not changed. The history and physical examination are then updated in the electronic health record. The planned procedure and postoperative management are reviewed with the patient and family. Informed consent is reviewed and obtained from the patient, including witness confirmation. The length and type of anesthesia, including adjuncts to postoperative analgesia management, are reviewed with the anesthesiologist. Verify that all required instruments and supplies are available, including mesh. Assistance is provided in transfer of the patient from gurney to operating table. Assist anesthesia team with line placement and induction of anesthesia and intubation. The dressing covering the wound from the previous debridement is removed. The areas of skin to be prepared and draped are indicated by the surgeon to ensure that all of the potential operative field is included in the preparation. The surgeon scrubs and gowns. A surgical time-out is performed with operating surgical team.

Description of Intra-Service Work: Extent of the open wound is examined including assessment of adherence of intestine and intra-abdominal contents to the fascia. Adhesiolysis is performed separating these contents from the fascial boundaries to allow for mesh fixation. Care is taken during the lysis of adhesions to avoid injury to inflamed, exposed intra-abdominal contents including small intestine and colon. Omentum is draped across the exposed intestine. The abdominal wall defect resulting from the surgical debridement is measured. An absorbable mesh is sized to allow for closure of the abdominal wall defect and re-establishment of abdominal wall integrity. The mesh is sutured to the fascial edges circumferentially avoiding errant placement of sutures injuring the inflamed, exposed intra-abdominal contents.

Description of Post-Service Work:
Immediate postoperative care [operative day through discharge from recovery room]: Apply sterile dressings. Monitor patient during reversal of anesthesia. Assist in transfer of patient from operating table to gurney. Monitor transport of patient from operating room to recovery room. Discuss postoperative recovery care with anesthesia and nursing staff, including need for patient-controlled analgesia. Discontinue prophylactic antibiotic therapy, as appropriate. Review
postoperative labs. Discuss procedure and outcome with family in waiting area. Write brief operative note or complete final operative note and place in chart. Write postoperative note in the recovery room. Dictate operative report and copy referring physician(s). Call referring physician(s). Write orders and discuss ongoing care with nursing staff.

Later same day hospital inpatient care visit [operative day after discharge from recovery room]: Review interval nursing/other staff chart notes. Discuss ongoing care with nursing staff. Evaluate vital signs and intake/output. Monitor fluid and electrolyte status and renal function. Examine patient and assess status of newly placed mesh. Continue prophylaxis for DVT. Assess need for beta-blockers, order as required. Assess pain scores and adequacy of analgesia. Write orders for labs, films, medications, diet, and patient activity. Chart patient progress notes. Answer patient and family questions. Answer nursing/other staff questions.

### Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

*The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC’s rationale, please review the separate RUC recommendation document.*
Background

RAW Screen
Code 49565, Repair recurrent incisional or ventral hernia; reducible, was identified by the RUC/RAW with a site of service anomaly: less than 50% inpatient status; includes inpatient visit codes; greater than 5,000 utilization. Prior to submitting an Action Plan to the RAW, the societies reviewed the site of service data and found: almost even split of 48% between inpatient and outpatient – with a few percent in the ASC. At the January 2020 RUC meeting, the societies requested referral of code 49565 to CPT to update the descriptor to current standard of practice and typical patient presentation.

CPT Coding Changes
At the February 2021 CPT meeting the following changes were approved:

• Delete all the current open and laparoscopic codes for repair of anterior abdominal hernias.
• Delete add-on code 49568 for mesh for open ventral/incisional hernias and large defects as a result of necrotizing soft tissue infection.
• Add 12 new codes for anterior abdominal hernia repair by any approach (ie, open laparoscopic, robotic); by initial or recurrent; by total defect size; and by reducible or incarcerated/strangulated
• Add 2 codes for parastomal hernia repair - by reducible or incarcerated/strangulated
• Add 1 add-on code for removal of mesh/prosthesis – only with the new hernia repair codes
• Add 1 new code for mesh/prosthesis for delayed closure of external genitalia, perineum and/or abdominal wall defect(s) due to soft tissue infection or trauma.

Coding Structure
Hernia repair for epigastric, incisional, ventral, umbilical, spigelian were merged as they all appear on the anterior abdomen. The location—upper, lower, midline—does not impact the work. But instead, the size and number of defects is the driving factor for work. For example, with respect to the code that was tagged by the RAW, a recurrent, incisional, reducible hernia can be anywhere from a small hernia at a port site from a prior laparoscopic procedure to an extremely large hernia with multiple defects clustered in a midline incision.

Initial versus recurrent differentiation was maintained. Recurrent hernias are re-reoperations. An initial hernia can be the result of a prior procedure (this is not a recurrent hernia) or weak muscles and fascia. A recurrent hernia is typically at least the third time the same site is being operated on. For example,

• operation 1 might be an open colectomy
• operation 2 would be an initial midline hernia repair
• operation 3 would be a recurrent midline hernia involving the initial midline repair and may include other multiple hernias occurring in the same old incision, all needing to be repaired.

There are many examples in CPT that differentiate between a primary and secondary procedure: disarticulation of shoulder (23920-23921); amputation of arm through humerus (24900-24930) and other similar amputation families; tendon repair (eg, 25260-25274); CABG reoperation (33530); and revision total joint (eg, 23473, 23474, 24370, 24371, 27134-27138).

The hernia size ranges were based on a review of literature and expert panel. For example, an article published in the Journal of the American College of Surgeons reviewed technique and outcomes of abdominal incisional hernia repair and showed that the range of defect size was from less than 1 cm to more than 25 cm with a mean of 6 cm and a median of less than 3 cm. Other similar articles were submitted with the code change application, supporting different work for different defect size. David A. Iannitti, et.al, Technique and Outcomes of Abdominal Incisional Hernia Repair Using a Synthetic Composite Mesh: A Report of 455 Cases, Journal of the American College of Surgeons, Volume 206, Issue 1, 2008, Pages 83-88, ISSN 1072-7515, https://doi.org/10.1016/j.jamcollsurg.2007.07.030.

Differentiating the work of a procedure in relationship to size or extent is not new for CPT. For example, 36 skin repair codes by length of repair; 44 lesion excision codes by excised diameter; 46 soft tissue tumor excision codes by size of tumor; 23 hysterectomy codes by size of uterus (58260-58573); 3 myomectomy codes are differentiated by total weight of the myomas (58140-58146); and 10 nerve graft codes are based on length of graft. (64885-64898)
The CPT guidelines and illustrations that describe how to measure the total defect size are well understood by surgeons. This is not a new concept – surgeons are very familiar with measuring a hernia defect, and in fact the size of the hernia defect was included in some of the patient vignettes in 1993. Furthermore, measurement of hernia size is a necessary step for selecting and preparing the appropriately sized mesh for implantation.

Hernia repair coding has been complicated by changes in (1) technology and technique and (2) the recent implementation of ICD-10-PCS codes. For these reasons, the stakeholder societies believed this set of codes should describe "any approach." The societies and the AMA Coding Network have received numerous coding questions about correct reporting for "hybrid" abdominal hernia repair procedures where parts of the procedure are performed via an open approach and parts of the procedure are performed via laparoscopy or with the use of a robot. These are not laparoscopic procedures converted to open procedures, but instead procedures that are more often begun open and then finished as laparoscopic/robotic under pneumoperitoneum.

Another issue that has recently caused confusion about coding has appeared on national coder websites and coder discussion boards referring to International Classification of Diseases Tenth Revision Procedure Coding System (ICD-10-PCS) codes which classifies procedures performed in the facility (ie, not CPT physician procedures). This, however, is important because facilities want the procedure codes reported to correspond with the descriptors of ICD-10-PCS codes that the facility is reporting. Unfortunately, the new ICD-10-PCS codes define various surgical approaches that do not correspond to CPT coding (open, closed, percutaneous, and laparoscopic). For example, the ICD-10-PCS "open endoscopic" approach is defined as "cutting through the skin or mucous membrane and any other body layers necessary to expose a body part, and introduction of instrumentation to reach and visualize the site of the procedure." A second example is the "open with percutaneous endoscopic assistance" approach defined as "cutting through the skin or mucous membrane and any other body layers necessary to expose the site of the procedure, and entry, by puncture or minor incision, of instrumentation through the skin or mucous membrane and any other body layers necessary to aid in the performance of the procedure." These new ICD-10-PCS codes have resulted in coders stating that a procedure should be reported as open because the ICD-10-PCS code indicates open and to report any procedure that includes extension of a port incision (eg, for delivery of a specimen) to be reported as an open procedure --instead of being correctly reported as a laparoscopic procedure.

Mesh

- **Implantation of mesh is now typical and therefore was bundled into the new codes.** When code 49568 was created in 1993, mesh implantation with hernia repairs was not typical. This is supported by the typical patient described in 1993 as having a 10 cm midline incisional hernia – a very large hernia. With research on the causes of hernia recurrence, changes in technology and development of new types of mesh or other prosthesis, implantation of mesh is now typical for all types of hernias and all sizes to reduce the incidence of recurrence. This was supported by the literature submitted with the CCA.

- **Mesh removal is not always required and is not typical.** Technology and research have developed types of mesh that are now being implanted which are incorporated into the abdominal wall, reducing the risk of infection, complications, and recurrence. When mesh removal is indicated, it is typically due to hardening and fracturing of aged mesh, or when gross contamination and infection has occurred (eg, enterocutaneous fistula involving the mesh). For example, a recurrent hernia repair may require removal of fractured, brittle (old technology) mesh many years after an open repair following a colectomy. This work is typically significant, in that the mesh is often integrated with the abdominal wall or adhered to intestine, and involves removal of all of the mesh, not just a small portion. An add-on code to report mesh removal prior to hernia repair, when required, allows for accurate reporting of this work only when performed, which our expert panel believes is not typical of most hernia repairs.

- **Deletion of code 49658 resulted in rare "left over" work for implantation of mesh related to closure for a large open wound after debridement for necrotizing fasciitis.** Add-on code 46958 was reported for mesh placement for both open hernia repair and in relation to closure of wounds from necrotizing soft tissue infection. This code will be deleted and the work of mesh placement will be included in the work for all of the anterior abdominal hernia repair codes. The remaining use of code 46958 was for mesh placement for delayed closure of external genitalia, perineum and/or abdominal wall defect(s) due to soft tissue infection or trauma. As described in the vignette for 157X1, necrotizing soft tissue infections typically result in a large open wound that cannot be closed primarily. When the infection has resolved, absorbable mesh or other prosthesis is placed to allow healing by
secondary intent until such time that a skin graft or skin closure can be accomplished. The literature submitted with the CCA supports this work.

**Compelling Evidence - Flawed methodology of previous reviews, New technology**

**Flawed Methodology:** Codes 49560, 49561, 49565, 49566, 49570, 49572, 49580, 49582, 49585, and 49590 were last reviewed in 2000 during the 2nd 5-year-review. During this review, the American College of Surgeons argued that there was compression of work values for big procedures and there were rank order issues within families of codes. We developed a methodology using NSQIP data that was approved by the Research Subcommittee. However, to validate the methodology, the 5YR Workgroup instructed the ACS to group the codes into families and survey one or two CPT codes as full surveys per family to act as anchors for each family and the rest of the codes to be surveyed as mini-surveys for only time and visits. After conducting all of the surveys, we believe we were able to validate the methodology that we proposed, however, the 5YR Workgroup did not agree. Instead, they decided that the value that they assigned to the anchor code (the full survey) would be extrapolated to all of the other codes grouped into the same survey. The hernia codes listed above were grouped with 49505 which was increased by 17% based on the survey data and compelling evidence. The 17% increase was applied to the other codes in the group without consideration of rank order, mini survey results or society recommendations. This resulted in continuation of compression and rank order issues. For example, although code 49572 was increased by 17%, the IWPUT for the code is negative. Other codes have near zero IWPUT. **We believe this was a flawed methodology of review of the codes and meets compelling evidence.**

**Flawed Methodology:** Codes 49587, 49652, 49653, 49654, and 49655 were last reviewed in 2011 based on a site of service anomaly screen. At that time, the RUC approved including a same day observation visit and full observation discharge on the subsequent day. The RUC noted that the typical patient requires close monitoring for problems such as ileus, intestinal ischemia and urinary retention. Additionally, there will be significant pain post-operatively requiring management before discharge. The specialty noted, and the RUC agreed, that the shift in patient facility status (in patient moving to outpatient—as determined by CMS) has little to do with healthier patients that require less physician work and everything to do with the recent OPPS changes related to facility reimbursement. This was substantiated by the survey data which showed that the typical patients stayed at least overnight and received a postoperative same-day E/M service. Given this data, the RUC enacted its (then current) policy to allocate the appropriate proxy for the postoperative visits which was categorized as either subsequent observation and/or observation discharge—both of which are outpatient codes. Importantly, the specialties argued and the RUC agreed that the work of providers who care for medical patients should not be discounted (eg, full observation E/M and full observation discharge E/M allowed for patient staying overnight for observation.)

CMS ignored the valid outpatient E/M visit code inputs that the RUC recommended and instead stated in the Rule that they have a policy of not allowing "inpatient" visits included in the details for outpatient services. These codes went through a Refinement Panel process [ie, a CMS convened group of Medical Officers and select physicians acting as a separate formal appeals process] that resulted in agreement with the RUC recommendations. Importantly, the Agency still maintained that inpatient visits would not be allowed (even though outpatient/observation visits were submitted by the RUC) and then used a reverse building block methodology to subtract work RVUs from the values. These values had been developed by magnitude estimation and approved by the RUC. The Agency deleted the observation visit code inputs and decreased discharge management by 50 percent even though it was performed on a subsequent date. **We believe this action by CMS resulted in a flawed methodology of review of these codes and meets compelling evidence.**

The rejection of equal value for equal work and rejection of the Refinement Panel results prompted the Executive Director of the American College of Surgeons to send a letter (see last page of SoR) to Kathleen Sebelius, then Secretary of the Department of Health and Human Services on November 29, 2011. This letter addressed the decision-making process for valuing procedure codes that have Medicare outpatient status, the use of refinement panels, and the arbitrary discount in physician work for the same work performed by any provider of a non-global service. Specifically, the letter included the following statement:

"CMS has now implemented a policy by which it is creating differential payments for the same work performed by different physicians as a backdoor mechanism for reducing the work RVUs for surgical procedures. They have valued the worth of a surgeon for post-operative evaluation and management work at about 30 percent of a non-surgeon. Non-surgeons are allowed to provide the same work to the same patient at 100 percent reimbursement. …we believe that this policy leads to a loss of validity and integrity of the current system."
CPT Code: 157X1

We continue to believe there is no valid justification for a 50% discount to discharge management services provided by a surgeon that is performed the day after a procedure when a non-surgical provider observing a medical patient who is kept overnight for any reason is allowed to bill a discharge management service at 100 percent for work on the next day. We also believe there is no valid justification for discounting a postoperative visit later the same day of surgery to equal only the intra-service time of the visit multiplied by an intensity of 0.0224. No surgeon would round on a postoperative patient the same day and not review interval chart notes prior to the face-to-face with the patient and not follow up with charting the visit and confirming or modifying the current orders.

CMS implemented a 23-hour policy for discounting surgical postoperative work based on the argument that the Agency could not include impatient work in their time/work file. However, the fact is that the Agency has also erroneously rejected RUC recommendations for outpatient/observation codes, stating "these inpatient codes" could not be included for procedure that are typically outpatient.

**Change in Technology:** Since the last review of the hernia repair codes (either in 2000 or in 2011), there has been introduction and application of new technology (i.e., robotic assist) which adds work complexity and time with the goal of better patient outcomes. The diffusion of this new technology throughout this family of codes further meets compelling evidence.

**Recommendation – 157X1**

We recommend a work RVU of 8.50, which is the survey median.

**Pre-service time**

Scrub, dress, wait package time has been reduced so as to not exceed survey median data.

**Postoperative E/M visit later on the day of surgery**

The typical patient will be inpatient and a visit will occur later on the same day. Review data (e.g., diagnostic and imaging studies) not available at the unit. Communicate with other health care professionals and with patient and/or family. Review medical records and data available on the unit. Perform a medically appropriate examination. Consider relevant data, options, and risks; formulate and/or revise diagnosis and treatment plan(s) (moderate complexity MDM). Discuss diagnosis and treatment options with the patient and/or family. Consider discharge needs of patient. Communicate with other health care professionals as necessary. Write and/or review orders, including arranging for necessary diagnostic testing, consultation(s), and therapeutic intervention(s). Complete medical record documentation. Address interval data obtained and reported changes in condition. Communicate results and additional care plans to other health care professionals and to the patient and/or family.

**Key Reference Code Intensity/Complexity Comparison**

Ref 1: The respondents indicated the intensity/complexity of survey code 157X1 is somewhat more than reference code 49013. Ref 2: The respondents indicated the intensity/complexity of survey code 157X1 is somewhat/much more than reference code 15273.

Other Code Comparison

The table below presents codes reviewed by the RUC since 2005 with 90 minutes intra-service time. Unlike 157X1, almost all of the codes on this list with an RVW less than 12 are typically performed in the outpatient setting and some are performed a significant amount of time in an office setting.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)
   - The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - Multiple codes allow flexibility to describe exactly what components the procedure included.
   - Multiple codes are used to maintain consistency with similar codes.
   - Historical precedents.
   - Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed)
49999 Unlisted procedure, abdomen, peritoneum and omentum YYY
49568 Implantation of mesh or other prosthesis for open incisional or ventral hernia repair or mesh for closure of debridement for necrotizing soft tissue infection (List separately in addition to code for the incisional or ventral hernia repair) ZZZ

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

**Letter Referenced in Compelling Evidence Rationale**

November 29, 2011

The Honorable Kathleen Sebelius  
Secretary  
Department of Health and Human Services  
Hubert H. Humphrey Building  
200 Independence Avenue SW  
Washington, DC 20201

Re: CY 2012 Medicare Physician Fee Schedule Final Rule and CMS Refinement Panels

Dear Secretary Sebelius:

On November 28, 2011, the Federal Register published the Centers for Medicare and Medicaid Services’ (CMS) Calendar Year (CY) 2012 Medicare Physician Fee Schedule Final Rule. On behalf of the American College of Surgeons (ACS), I am writing to express concern regarding the decision making process and lack of transparency on the part of CMS related to the work relative value units (wRVUs) for 2012 reviewed under CMS’ refinement panel process. The ACS, with over 78,000 members, is a scientific and educational organization of surgeons that was founded in 1913 to raise the standards of surgical practice and to improve the care of the surgical patient.

The ACS has participated in the efforts of the American Medical Association’s Relative Value Scale Update Committee (AMA RUC) for years given the value we place on the AMA RUC process and our assumption that CMS will evaluate the RUC recommendations with fairness, transparency, and accuracy according to a process that has been set out via the Federal rulemaking process. As part of the work that led to the CY 2012 Medicare Physician Fee Schedule Final Rule,
the ACS devoted significant resources to conducting AMA RUC surveys for over 100 new or existing codes at the request of CMS. The AMA RUC evaluated wRVU recommendations made by the ACS, based upon those surveys, and came to agreement on final recommended values to be submitted to CMS.

Fifty-seven of the aforementioned codes that the ACS surveyed were sent to the refinement panel. CMS accepted only 12 percent of those refinement panel recommendations.

For most of the 88 percent of refinement panel recommendations that CMS rejected, CMS lowered the wRVU by reducing the value of the post-operative evaluation and management work performed by surgeons in the hospital by 69 percent. However, if that same work is performed by any other physician other than the surgeon, that same service is paid at 100 percent. We believe that the refinement panel physicians completely rejected this concept as they agreed to a work RVU that did not discount post-surgical work in this fashion. We note that the multispecialty panel included physicians from primary care, contractor medical directors (CMDs), physicians in related specialties, and general surgeons. At no time did the Agency's Medical Officer in charge of the panel process disagree with the presenters or offer a contrary opinion to the discussion.

Our concerns were piqued when CMS issued the CY 2011 Medicare Physician Fee Schedule Final Rule in which CMS stated that it could change wRVU recommendations of the refinement panel convened by CMS if “policy concerns warrant their modification,” without providing additional clarification on what would trigger this ability of CMS to subvert the more transparent process of the refinement panel. However, we continued to participate in the process under the belief that CMS would operate fairly and transparently and that if there were indeed “policy concerns” that CMS had regarding the values of the codes under consideration that those concerns would be stated clearly so all parties could address them during the refinement panel reviews.

CMS has now implemented a policy by which it is creating differential payments for the same work performed by different physicians as a backdoor mechanism for reducing the work RVUs for surgical procedures. They have valued the worth of a surgeon for post-operative evaluation and management work at about 30 percent of a non-surgeon. Non-surgeons are allowed to provide the same work to the same patient at 100 percent reimbursement. First, we believe that this policy leads to a loss of validity and integrity of the current system. In addition, this policy is prohibited by the Omnibus Budget Reconciliation Act of 1989, which states, “[t]he Secretary may not vary the conversion factor or the number of relative value units for a physicians’ service based on whether the physician furnishing the service is a specialist or based on the type of specialty of the physician.” (42 U.S.C. §1395w-4(c)(6)).

The ACS has been a vocal proponent of needed reforms in the delivery and payment of health care. We believe that the future of these reforms will be based on driving greater awareness of proven continuous quality improvement programs to achieve ongoing, tangible results for quality improvements. However, in order for these reforms to be effective, they must be built on a system that is consistent with previous Agency decisions, fair, and transparent, and it is our concern that many of the policy decisions made by CMS in the latest Medicare Physician Fee Schedule Final Rule move us away from those goals. The resource based relative value system (RBRVS) requires a resource basis for decisions on the valuation of physician services. We believe that the resource basis for the decision to reduce these values is not evident.

We ask that under your authority as Secretary you will seek to have CMS define a more transparent process in the future for decisions that are not aligned with the RUC and refinement panel recommendations in order to help maintain the transparency and fairness of the current system and to restore the values of these services to the level that is supported by the RBRVS process.

Sincerely,
David B. Hoyt, MD, FACS
Executive Director

<tbody>
<tr>
<td>49X04</td>
<td>A 60-year-old obese male with a prior laparotomy has developed an incisional hernia in the midline incision. Over the past few months, the defect has become chronically protuberant. Physical exam reveals a hernia that is tender and nonreducible by manual manipulation. He undergoes hernia repair of a defect that totals more than 10 cm with placement of mesh.</td>
</tr>
<tr>
<td>49X05</td>
<td>A 64-year-old obese male with a prior laparotomy has developed incisional hernias with defects of varying sizes at multiple points. He has symptoms of pain and tenderness at the sites. Physical exam reveals multiple reducible incisional hernias. He undergoes hernia repair of a defect that totals more than 10 cm with placement of mesh.</td>
</tr>
<tr>
<td>49X06</td>
<td>A 64-year-old obese male with a prior laparotomy has developed incisional hernias with defects of varying sizes at multiple points. The defects have been increasing in size during follow-up with increasing symptoms. Physical exam reveals multiple tender and nonreducible incisional hernias. He undergoes hernia repair of a defect that totals more than 10 cm with placement of mesh.</td>
</tr>
<tr>
<td>49X07</td>
<td>A 60-year-old obese male has a surgical history of a prior laparotomy with a resultant hernia in the incision. The prior hernia was repaired 5 years ago. He now has a bulge in the midepigastric area for 2 months that disappears when he lies down. Physical exam reveals a small recurrent reducible incisional hernia. He undergoes hernia repair of a defect that is less than 3 cm with placement of mesh.</td>
</tr>
<tr>
<td>49X08</td>
<td>A 60-year-old obese male has a surgical history of a prior laparotomy with a resultant hernia in the incision. The prior hernia was repaired 5 years ago. He now has a small bulge in the midepigastric area for 2 months that previously disappeared when supine. The bulge is now irreducible and tender. Physical exam reveals a small recurrent incarcerated incisional hernia. He undergoes hernia repair of a defect that is less than 3 cm with placement of mesh.</td>
</tr>
<tr>
<td>49X09</td>
<td>A 60-year-old obese male presents with a large bulge in midepigastric area that disappears when he lies down. His surgical history includes a prior laparotomy with resultant hernia that was repaired 5 years ago. Physical exam reveals a large recurrent reducible incisional hernia. He undergoes hernia repair of a defect that is 3 to 10 cm with placement of mesh.</td>
</tr>
<tr>
<td>49X10</td>
<td>A 60-year-old obese male presents with an irreducible mass in the midline of the abdomen. He has a history of a previous laparotomy with an incisional hernia from that operation that was repaired 5 years ago. Over the course of the last few months, he has developed a recurrence that has been slowly increasing in size. Suddenly, the hernia is not reducible, and the mass is tender with severe, unremitting pain. He undergoes hernia repair of a defect that is 3 to 10 cm with placement of mesh.</td>
</tr>
<tr>

</tr>
</tbody>
</table>

No inputs recommended for this facility only ZZZ code:

+49X15 At the time of hernia repair, a 64-year-old obese male who had mesh placed with a prior hernia repair now requires removal of the mesh to allow for an adequate repair of a new hernia. Note: This is an add-on service. Only consider the additional work related to mesh removal.

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:
   ACS, SAGES, and ASCRS Advisors reviewed the PE details for the current codes to develop a recommendation for the new codes

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code, but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here (for service reviewed prior to the implementation of clinical activity codes, detail is not provided in the RUC database, please contact Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org for PE spreadsheets for your reference codes):
   Current codes used as reference

3. Is this code(s) typically reported with an E/M service?
   No

4. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time:
   n/a
5. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies for the code family, please provide compelling evidence (please see PE compelling evidence guidelines) Please explain if the increase can be entirely accounted for because of an increase in physician time:

n/a

6. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (please see second worksheet in PE spreadsheet workbook), please explain the difference here:

n/a

7. Please provide a brief description of the clinical staff work for the following:
   a. Pre-Service period:

   **49X01-49X14**
   These 14 new anterior abdominal hernia repair codes are replacing 15 anterior abdominal hernia repair codes that have a 90-day global assignment.

   When reviewing the details of the hernia codes that will be deleted, the specialties recognize that a vast majority of hernia repairs will be performed in the hospital, with very few cases performed in an ASC.

   Of the cases performed in the hospital, the split between inpatient and outpatient will not be completely aligned with size of defect. For example, the second size group (3 to 10 cm) is still a wide variation in terms of postoperative care (overnight or admit). Similarly, very large hernias - over 10 cm - will all be inpatient, but there is variability in the length of stay depending on whether the defect is 12 cm or 25 cm.

   The expert panel determined that a 0-day global would allow correct reporting of inpatient and outpatient postoperative work as medically necessary, without the need to create significantly more codes (eg, more sizes and separating incarcerated from strangulated) – similar to the 23 hysterectomy codes that include various sizes of uterus, various different approaches and various different bundled additional work.

   As support of a 0-day global and the variability of postop work, the CMS DRG LOS MedPAR data for the 2021 IPPS Final Rule shows that even patients without CC/MCC, the LOS range is 1-5.

      | MS_DRG | Number of Discharges | Arithmetic Mean LOS | 10th pctl | 25th pctl | Median | 75th pctl | 90th pctl |
      |---------|---------------------|-------------------|--------|--------|-------|--------|--------|
      | 353 HERNIA PROCEDURES EXCEPT INGUINAL AND FEMORAL WITH MCC | 2,743 | 7.69 | 2 | 4 | 6 | 10 | 15 |
      | 354 HERNIA PROCEDURES EXCEPT INGUINAL AND FEMORAL WITH CC | 7,265 | 4.52 | 1 | 2 | 4 | 6 | 8 |
      | 355 HERNIA PROCEDURES EXCEPT INGUINAL AND FEMORAL WITHOUT CC/MCC | 5,310 | 2.84 | 1 | 2 | 2 | 4 | 5 |

Changing the postoperative global payment package from 90-days to 0-days does not change the clinical staff preservice work. We strongly urge the PE Subcommittee to recognize this fact and to establish a pre-time clinical staff package for major surgical procedures that move from a 90-day to 0-day global.

CPT has recently defined "minor" and "major" surgery as:
**Surgery—Minor or Major:** The classification of surgery into minor or major is based on the common meaning of such terms when used by trained clinicians, similar to the use of the term “risk.” These
terms are not defined by a surgical package classification.

We are recommending the following clinical staff preservice times for codes 49X01-49X14. These times are consistent with all major surgical procedures and the hernia repair procedures represented by 49X01-49X14 are all major surgery.

<table>
<thead>

<td>Complete pre-procedure phone calls and prescription</td>
<td>Staff reviews preoperative medication changes, reviews patient medical status and answers final pre-admission questions.</td>
<td>7</td>
</tr>
</tbody>
</table>

157X1
The typical patient undergoing 157X1 will have been in the hospital for many days to weeks. After resolution of the necrotizing infection and multiple debridements, mesh may be an option for closure. The pre-service clinical staff work will be limited to activities to coordinate the surgeon's schedule, timing of the procedure, arranging for supplies/equipment with the hospital and confirming approval with the payor. For these reasons, the recommendation for code 157X1 is to crosswalk to the times assigned for emergent procedures.

b. Service period (includes pre, intra and post):

n/a

c. Post-service period:

49X01 and 49X07

The typical patient for 49X01 and 49X07 will be discharged on the same day of the procedure. Office clinical staff will assist with necessary post-discharge care via phone or electronically, such as: responding to patient/family questions about home activity restrictions; confirmation of discharge antibiotics if needed, and pain medication; coordination with other physicians and QHPs involved in the care of the patient for transfer of records; and transitioning discharge information to the surgeon’s office medical record, including medication list, correspondence and imaging or lab results pending at discharge. The total time of 6 minutes is consistent with the total time for same-day outpatient work assigned a discounted 0.5 x 99238 (ie, 6 minutes).

8. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (please see second worksheet in PE spreadsheet workbook):

n/a

9. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov.

n/a

INVOICES

10. ☐ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

11. ☐ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

12. If you wish to include a supply that is not on the list (please see fourth worksheet in PE spreadsheet workbook) please provide a paid invoice. Identify and explain the invoice here:

n/a

13. Are you recommending a PE supply pack for this recommendation? Yes or No.
   If Yes, please indicate if the pack is an established package of supplies as defined by CMS (eg, SA047 pack, E/M visit) or a pack that is commercially available?

N/A

14. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation. Please include the description, CMS supply code, unit, item quantity and unit price (if available). See documents two and three under PE reference materials on the RUC Collaboration Website for information on the contents of kits, packs and trays.

ITEMIZED LIST OF CHANGES (FOLLOWING THE PE SUBCOMMITTEE MEETING)

During and immediately following the review of this tab at the PE Subcommittee meeting please revise the summary of recommendation (PE SOR) based on modifications made during the meeting. Please submit the revised form electronically to Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org immediately following the close of business the same day that the tab is reviewed. On the PE spreadsheet, please highlight the cells and/or use red font to show the changes made during the PE Subcommittee meeting (if you have provided any of this highlighting based on changes from the reference code prior to the PE Subcommittee meeting please remove it, so not to be confused with changes made during the meeting). In addition to those revisions please also provide an itemized list of the modifications made to the PE spreadsheet during the PE Subcommittee meeting in the space below (e.g. clinical activity CA010 obtain vital signs was reduced from 5 minutes to 3 minutes).

Suture removal pack was removed as not utilized on the day of the procedure.
NOTE: The virtual meetings have provided for real-time updates to the PE spreadsheets. PE SORs must still be updated and resubmitted asap.

RE: January 2021 CPT Tab 18 / April 2021 RUC Tab 9

Dear Dr. Synovec:

As the RUC and CPT Advisors for the American College of Surgeons (ACS), Society of American Gastrointestinal Endoscopic Surgeons (SAGES), and American Society of Colon and Rectal Surgeons (ASCRS), we request that the CPT Executive Committee consider an editorial change to the guidelines and code descriptor for new add-on code 49X15 that was approved at the January 2021 CPT Panel meeting.

During RUC review at the April 2021 meeting, a concern was expressed that the intent of "how much mesh" needed to be removed to report 49X15 was not clear. The stakeholder societies indicated that the intent was total or near total removal of the mesh. To clarify the intent of this code, we request two edits as shown on the attached page: (1) add the words "total or near total" to the guidelines; and (2) add the words "total or near total non-infected" to the 49X15 code descriptor.

The words "total or near total" have been used by CPT previously (eg, see 43107, 43112, 43286, 43288, 48146, 48153), so this is not a precedent. With respect to adding "non-infected" to the code descriptor, it appears this was an inadvertent error since: (1) the guidelines stipulate removal of non-infected mesh; and (2) a parenthetical below code 49X15 instructs what code to report for removal of "infected" mesh.

Thank you for consideration of this request. If you have any questions, please contact Ms. Jan Nagle at JNagle@facs.org.

Sincerely,

Samuel Smith, MD, FACS

Anterior Abdominal Hernia Repair

Digestive System
Abdomen, Peritoneum, and Omentum
Repair
Hernioplasty, Herniorrhaphy, Herniotomy

Codes 49X01-49X12 describe repair of an anterior abdominal hernia(s) (ie, epigastric, incisional, ventral, umbilical, spigelian) by any approach (ie, open, laparoscopic, robotic). Codes 49X01-49X12 are reported only once, based on the total defect size for one or more anterior abdominal hernia(s), measured as the maximal craniocaudal or transverse distance between the outer margins of all defects repaired. For example, "Swiss cheese" defects (ie, multiple separate defects) would be measured from the superior most aspect of the upper defect to the inferior most aspect of the lowest defect. In addition, the hernia defect size should be measured prior to opening the hernia defect(s) (ie, during repair the fascia will typically retract creating a falsely elevated measurement).

When both reducible and incarcerated/strangulated anterior abdominal hernias are repaired at the same operative session, all hernias are reported as incarcerated/strangulated. For example, one 2 cm reducible initial incisional hernia and one 4 cm incarcerated initial incisional hernias separated by 2 cm would be reported as an initial incarcerated hernia repair with a maximum craniocaudal distance of 8 cm (49X04).

Inguinal, femoral, lumbar, omphalocele and/or parastomal hernia repair may be separately reported when performed at the same operative session as anterior abdominal hernia repair by appending modifier 59 as appropriate.

Codes 49X13, 49X14 describe repair of a parastomal hernia (initial or recurrent) by any approach (ie, open, laparoscopic, robotic). Code 49X13 is reported for repair of a reducible parastomal hernia and code 49X14 is reported for an incarcerated or strangulated parastomal hernia.

Implantation of mesh or other prosthesis, when performed, is included in 49X01-49X14 and may not be separately reported. For total or near total removal of non-infected mesh when performed, use 49X15 in conjunction with 49X01-49X14. For removal of infected mesh, see 11004, 11005, 11006, 11008.

Measuring Total Length of Anterior Abdominal Hernia Defect(s)

Hernia measurements are performed either in the transverse or craniocaudal dimension. The total length of the defect(s) corresponds to the maximum width or height of an oval drawn to encircle the outer perimeter of all repaired defects. If the defects are not contiguous and are separated by greater than or equal to 10 cm of intact fascia, total defect size is the sum of each defect measured individually.

Codes 49X01-49X12 are reported only once, based on the total defect size for one or more anterior abdominal hernia(s), measured as the maximal craniocaudal or transverse distance between the outer margins of all defects repaired.

- **49X01** Repair of anterior abdominal hernia(s) (ie, epigastric, incisional, ventral, umbilical, spigelian), any approach (ie, open, laparoscopic, robotic), initial including placement of mesh or other prosthesis, when performed total length of defect(s); less than 3 cm, reducible
- **49X02** less than 3 cm, incarcerated or strangulated
- **49X03** 3 cm to 10 cm, reducible
- **49X04** 3 cm to 10 cm, incarcerated or strangulated
Repair of anterior abdominal hernia(s) (ie, epigastric, incisional, ventral, umbilical, spigelian), any approach (ie, open, laparoscopic, robotic), recurrent, including placement of mesh or other prosthesis, when performed total length of defect(s); less than 3 cm, reducible

Repair of anterior abdominal hernia(s) (ie, epigastric, incisional, ventral, umbilical, spigelian), any approach (ie, open, laparoscopic, robotic), recurrent, including placement of mesh or other prosthesis, when performed total length of defect(s); incarcerated or strangulated

Repair of anterior abdominal hernia(s) (ie, epigastric, incisional, ventral, umbilical, spigelian), any approach (ie, open, laparoscopic, robotic), recurrent, including placement of mesh or other prosthesis, when performed total length of defect(s); greater than 10 cm, reducible

Repair of anterior abdominal hernia(s) (ie, epigastric, incisional, ventral, umbilical, spigelian), any approach (ie, open, laparoscopic, robotic), recurrent, including placement of mesh or other prosthesis, when performed total length of defect(s); incarcerated or strangulated

Repair of anterior abdominal hernia(s) (ie, epigastric, incisional, ventral, umbilical, spigelian), any approach (ie, open, laparoscopic, robotic), recurrent, including placement of mesh or other prosthesis, when performed total length of defect(s); less than 3 cm, incarcered or strangulated

Repair of anterior abdominal hernia(s) (ie, epigastric, incisional, ventral, umbilical, spigelian), any approach (ie, open, laparoscopic, robotic), recurrent, including placement of mesh or other prosthesis, when performed total length of defect(s); incarcerated or strangulated

Repair of anterior abdominal hernia(s) (ie, epigastric, incisional, ventral, umbilical, spigelian), any approach (ie, open, laparoscopic, robotic), recurrent, including placement of mesh or other prosthesis, when performed total length of defect(s); greater than 10 cm, incarcered or strangulated

Repair of anterior abdominal hernia(s) (ie, epigastric, incisional, ventral, umbilical, spigelian), any approach (ie, open, laparoscopic, robotic), recurrent, including placement of mesh or other prosthesis, when performed total length of defect(s); 3 cm to 10 cm, incarcered or strangulated

Repair of anterior abdominal hernia(s) (ie, epigastric, incisional, ventral, umbilical, spigelian), any approach (ie, open, laparoscopic, robotic), recurrent, including placement of mesh or other prosthesis, when performed total length of defect(s); incarcered or strangulated

Repair of parastomal hernia, any approach (ie, open, laparoscopic, robotic), initial or recurrent, includes placement of mesh or other prosthesis, when performed; incarcered or strangulated

Removal of total or near total non-infected mesh or other prosthesis at the time of initial or recurrent anterior abdominal hernia repair or parastomal hernia repair, any approach (ie, open, laparoscopic, robotic) (List separately in addition to code for primary procedure)

(For removal of infected mesh, use 11008)
Orthoptic Training – Tab 10

CPT code 92065 was identified in October 2019 as Harvard Valued utilization over 30,000. The Workgroup requested action plans to examine this service. In January 2020, the RUC recommended that this service be referred to CPT May 2020. This service with an “and/or” connector should be two different codes given their different patient populations and techniques used for the treatment. For that reason, this code should go back to CPT for a descriptor edit as well as creation of separate codes. At the October 2020 RUC meeting, based on pre-facilitation by the RUC, the specialty societies requested their intent to take this code back to the CPT Editorial Panel again to create two separate codes. The societies requested referral to CPT and plan to submit a new code change application for the February 2021 CPT Editorial Panel meeting. During review and analysis of the survey, it became evident that this service is delivered in two different ways. Because of this, it is necessary to create two codes to delineate when the training is provided directly by the physician/qualified healthcare professional (QHP) and when it is provided by a technician under the supervision of the physician/QHP. Doing so will ensure more accurate valuation of both work and practice expense associated with this service. The RUC supports creation of a companion code and concurs that code 92065 should be referred to the February 2021 CPT Editorial Panel meeting for CPT 2023. In February 2021, the CPT Editorial Panel revised code 92065 and created a new code to describe this service under the supervision of a physician or qualified health care professional.

Compelling Evidence
The RUC reviewed and agreed that there is compelling evidence to support a change in physician work for CPT code 92065. The compelling evidence is based on documentation in the peer-reviewed ophthalmological literature that there have been changes in physician work due to new techniques, knowledge, and technology that have added to the complexity of orthoptic training.

The Convergence Insufficiency Treatment Trial (CITT) was an NEI-sponsored multi-center randomized clinical trial which compared traditional pencil push-up therapy with three additional treatments for symptomatic convergence insufficiency: (1) home-based computer vergence and accommodation exercises, (2) office-based, supervised vergence and accommodative therapy plus computer training with home reinforcement, and (3) office-based placebo therapy with home reinforcement. With results first published in 2008, the CITT demonstrated that office-based vergence/accommodative therapy with home reinforcement was statistically significantly more effective than placebo and each of the other treatment regimens studied in improving both the symptoms and clinical signs associated with symptomatic convergence insufficiency. This transformed orthoptic training methodology. Today’s office-based training employs new training exercises and computer equipment/software that differ from those manual and mechanical devices in use in 1992 when the procedure was first valued in the Harvard study. The training exercises and computer equipment/software also differ from those in use in 2002, prior to publication of the CITT, when the PE was last updated to include computer and VDT software.
Current therapy for non-strabismic accommodative and vergence disorders including convergence insufficiency involves highly specific, sequential, sensory-motor-perceptual stimulation paradigms and regimens. It incorporates purposeful, controlled, and scientifically based manipulations of target blur, disparity, and proximity, with the aim of normalizing the accommodative system, the vergence system, and their mutual interactions. In addition, other sources of sensory information, such as kinesthesia and audition correlated to the accommodative and vergence states (e.g., position, innervation, effort, etc.) can provide cue reinforcement. It involves oculomotor integration with the head (i.e., eye-head coordination), neck (i.e., proprioceptive information), limbs, and overall body, with information from the other sensory modalities, producing temporally efficient, coordinated behavior.

The RUC agreed that compelling evidence has been met due to a change in physician work because of new techniques, knowledge, and technology. However, it was noted that compelling evidence was not necessarily required considering the service is going to be performed only 45 percent of the time at the frequency it was done before, while 55 percent of the time it is going to be a PE-only service, resulting in a total reduction in work RVUs. That is, even though the value is increasing from the current work RVU of 0.37 to 0.71, the total expenditure will decrease. The estimate of the 45 percent and 55 percent split was considered tenuous, however, and the RUC proceeded with approval of compelling evidence.

92065 Orthoptic training; performed by a physician or other qualified health care professional
CPT code 92065 involves the physician/QHP personally administering neurosensory and neuromuscular training activities to develop, rehabilitate and enhance visual skills and processing. The use of lenses, prisms, filters, specialized instruments, and computer programs is an integral part of the therapy protocol. The typical patient has convergence insufficiency resulting in discomfort, strain, blur, headache, diplopia and difficulty with reading and other near tasks. Exercises are taught to the patient by the physician/QHP, including physician review of the patient’s understanding of the plan and ability to perform the exercises correctly.

The RUC reviewed the survey results from 34 ophthalmologists and optometrists and determined that the survey 25th percentile work RVU of 0.71 appropriately accounts for the physician work involved in this service. The RUC recommends 2 minutes pre-service time, 30 minutes intra-service time and 4 minutes post-service time. CPT code 92065 is not a time-based code; it is a training procedure that is reported only once a day, unlike therapy sessions that can be reported several times in 30-minute increments on a single day. Optometrists are the dominant specialty, with 97.4 percent of Medicare claims in 2019. They were also the dominant survey responders, with 73.5 percent of the responses. The recommendations are based on the entire survey dataset as a better reflection of the overall times and values for this code, including a median intra-service time of 30 minutes.

The RUC noted that the procedure is performed on the same day as an office or eye Evaluation and Management (E/M) visit 39 percent of the time and with a sensorimotor exam (CPT code 92060) 15 percent of the time, which includes pre- and post-service work like that of an office visit. Therefore, the survey pre- and post-times were reduced from 10 to 2 minutes to not duplicate any work provided with the E/M service. During the office visit or sensorimotor exam, the physician develops a treatment plan consisting of a sequence of neurosensory and neuromuscular activities for the patient. The survey post-time was reduced from 9 to 4 minutes. This time is required to record patient performance into the medical record, develop a treatment plan for the next training session, enter that plan into the medical record, and generate a letter to the referring physician.
To justify a work RVU of 0.71, the RUC compared the survey code to the key reference service codes 99202 Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and straightforward medical decision making. When using time for code selection, 15-29 minutes of total time is spent on the date of the encounter (work RVU = 0.93, 2 minutes pre-service time, 15 minutes intra-service time and 3 minutes immediate post-service time) and 99212 Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and straightforward medical decision making. When using time for code selection, 10-19 minutes of total time is spent on the date of the encounter. (work RVU = 0.70, 2 minutes pre-service time, 11 minutes intra-service time and 3 minutes immediate post-service time) and noted that the intra-service times do not match and the survey code has both greater intra-service and total time than the reference services. The RUC also noted, however, that the survey code is closely bracketed by the work values of MPC code 99212 and MPC code 93015 Cardiovascular stress test using maximal or submaximal treadmill or bicycle exercise, continuous electrocardiographic monitoring, and/or pharmacological stress; with supervision, interpretation and report (work RVU = 0.75, 2 minutes pre-service time, 20 minutes intra-service time and 4 minutes immediate post-service time).

For additional support, the RUC compared the survey code to HCPCS code G0108 Diabetes outpatient self-management training services, individual, per 30 minutes (work RVU = 0.90, 2 minutes pre-service time, 30 minutes intra-service time and 5 minutes immediate post-service time) and noted the G-code is also a training code with identical intra-service time, nearly identical total time, yet a higher work value. The RUC noted that the recommended value is less than the median of the 37 XXX global codes in the RUC database with work values assigned within the last 10 years and 30 minute intra-service time (range 0.55 to 4.00, median 1.48 work RVUs). The RUC concluded that CPT code 92065 should be valued at the 25th percentile work RVU as supported by the survey. The RUC recommends a work RVU of 0.71 for CPT code 92065.

920XX Orthoptic training; under supervision of a physician or other qualified health care professional

The new CPT code 920XX specifies training under supervision of a physician or other qualified health professional. The code has practice expense (PE) inputs only and was not surveyed for physician work. This PE-only code requires identical work and intra-service time as code 92065 but with a different health care professional, typically the technician, L038A COMT/COT/RN/CST, performing the service; thus, there are 30 minutes allocated to CA021 Perform procedure/service---NOT directly related to physician work time. Only one session per day is reported. The anticipated course of treatment is 1-2 sessions per week over a three-month period based upon the Convergence Insufficiency Treatment Trial (CITT).

The PE Subcommittee thoroughly reviewed the practice expense recommendations for the companion codes and approved the inputs with few modifications. For the medical supply inputs, the PE Subcommittee determined that they are not redundant and are disposable. There was one adjustment to supply item SK057 Paper, laser to accurately reflect the type of paper that is utilized for the patient to be working on cheiroscope and other visual motor skills. The updates to equipment reflect new changes in management of convergence insufficiency. The equipment location has changed from EL006 lane, screening (oph) to a room with table and 4 chairs to reflect the typical practice more accurately. The time applied for EF043 Set of 8 chairs was reduced by half to reflect the use of 4 chairs during the activities rather than the full 8 chairs. The PE Subcommittee recommends two new equipment inputs for this service, Pro Vision Therapy Starter System Model VTSSP and Sanet Vision Integrator display/software. The starter system contains several devices to stimulate fusion/convergence. Various components of this system are used as part of training for these vision activities. It is entirely reusable and thus considered as an equipment input for valuation. EQ232 stereo trainer

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.
(wheatstone) was removed to avoid duplication with the contents of the starter system. The Sanet Vision Integrator display/software is used as part of visual activities to address near acuity and depth perception issues. This replaces ED009 computer and VDT and software which was a more generic equipment previously included when the code was initially valued. Two paid invoices are included with this recommendation for these items. **The RUC recommends the direct practice expense inputs as modified by the Practice Expense Subcommittee for CPT codes 920XX and 92065.**

**New Technology**

CPT codes 920XX and 92065 will be placed on the New Technology list and will be re-reviewed by the RUC in three years to ensure correct valuation and utilization assumptions.

CPT Code: 92065

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 92065    Tracking Number: D1

Original Specialty Recommended RVU: 0.71
Presented Recommended RVU: 0.71
RUC Recommended RVU: 0.71

Global Period: XXX    Current Work RVU: 0.37

CPT Descriptor: Orthoptic training; performed by a physician or other qualified health care professional (Do not report 92065 in conjunction with 920XX, 058XT, 059XT, when performed on the same day)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 25-year-old female is referred for orthoptic training by a physician or other qualified health care professional to address convergence insufficiency issues after a concussion.

Percentage of Survey Respondents who found Vignette to be Typical: 91%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0%, In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0%, Overnight stay-less than 24 hours 0%, Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Details of the treatment plan are discussed with the patient. The patient is brought into the treatment room.

Description of Intra-Service Work: The patient is positioned before specialized instruments which allow the systematic application of lenses, prisms and angular disparity designed to address the ocular motor defect and to treat the dysfunction. Prescribed treatment regimens include a series of interventions during the treatment period including convergence exercises using an accommodative target of letters, numbers, or pictures; vergence exercises with applied base in or base out prism; jump to near convergence training on a Brock string; stereogram convergence exercises; and 3-D vergence demand exercises applied with an interactive video display. The patient demonstrates understanding to the physician or other QHP by proper performance of each of the prescribed exercises.

Description of Post-Service Work: Patient performance on each instrument and activity addressed during the session is evaluated and entered into the medical record. A treatment plan for the next orthoptic training session is developed and entered into the medical record. A report to the referring provider is generated.

### Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC’s rationale, please review the separate RUC recommendation document.
CPT 92065, Orthoptic training performed by a physician or other qualified health care professional (do not report 92065 in conjunction with 920XX, 058XT, 059XT when performed on the same day) is an XXX code that was flagged by a screen for Harvard-valued procedures with utilization over 30,000. The code was taken to the CPT Editorial Panel to remove “and/or pleoptic” and “with continuing medical direction and evaluation” from the descriptor in order to update the service to current practice. It was then surveyed for the October 2020 meeting. Survey results indicated that respondents were valuing two separate services: training by the physician and training by a technician under supervision of the physician. The RUC valuation was deferred so that the code could be taken to CPT to create separate codes for each service. CPT 92065 now specifies that training is performed by a physician or other qualified health care professional. A new CPT code, 920XX, specifies training under supervision of a physician or other qualified health professional. The new code has PE only and was not surveyed for physician work. Survey results and work value recommendations are presented for CPT 92065.

The procedure is performed on the same day as an office visit 33% of the time and with a sensorimotor exam (CPT 92060) 18% of the time. We considered the sensorimotor exam similar enough to an office visit to treat the surveyed code as typically performed with a same-day office visit, and reduced survey pre- and post-times to eliminate duplicative work. During the office visit or sensorimotor exam, the physician develops a treatment plan consisting of a sequence of neurosensory and neuromuscular activities for the patient.

The intraservice work of CPT 92065 consists of the provider personally administering neurosensory and neuromuscular training activities to develop, rehabilitate and enhance visual skills and processing. The use of lenses, prisms, filters, specialized instruments, and computer programs is an integral part of the therapy protocol. The goals of orthoptic treatment are to achieve desired visual outcomes, alleviate signs and symptoms, meet the patient’s needs and improve the patient’s quality of life. The typical patient has convergence insufficiency resulting in discomfort, strain, blur, headache, diplopia and difficulty with reading and other near tasks. Exercises are taught to the patient by the provider, including physician review of the patient’s understanding of the plan and ability to perform the exercises correctly.

COMPELLING EVIDENCE
There is compelling evidence to support an increase in the work value of CPT 92065, which also is supported by the survey results. The compelling evidence is based documentation in the peer-reviewed ophthalmological literature that there have been changes in physician work due to new techniques, knowledge, and technology that have added to the complexity of the training.

Change in Physician Work Due to New Techniques, Knowledge, and Technology
The Convergence Insufficiency Treatment Trial (CITT) was an NEI-sponsored multi-center randomized clinical trial which compared traditional pencil push-up therapy with three additional treatments for symptomatic convergence insufficiency: (1) home-based computer vergence and accommodation exercises, (2) office-based, supervised vergence and accommodative therapy plus computer training with home reinforcement, and (3) office-based placebo therapy with home reinforcement. With results first published in 2008, the CITT demonstrated that office-based vergence/accommodative therapy with home reinforcement was statistically significantly more effective than placebo and each of the other treatment regimens studied in improving both the symptoms and clinical signs associated with symptomatic convergence insufficiency.1-7 This transformed orthoptic training methodology. Today’s office-based training employs new training exercises and computer equipment/software that differ from those manual and mechanical devices in use in 1992 when the procedure was first valued using Hsiao’s methodology. They also differ from those in use in 2002, prior to publication of the CITT, when the PE was last updated to include computer and VDT software.

Current therapy for nonstrabismic accommodative and vergence disorders including convergence insufficiency involves highly specific, sequential, sensory-motor-perceptual stimulation paradigms and regimens. It incorporates purposeful, controlled, and scientifically based manipulations of target blur, disparity, and proximity, with the aim of normalizing the accommodative system, the vergence system, and their mutual interactions. In addition, other sources of sensory information, such as kinesthesia and audition correlated to the accommodative and vergence states (e.g., position, innervation, effort, etc.) can provide cue reinforcement. It involves oculomotor integration with the head (i.e., eye-head coordination), neck (i.e., proprioceptive information), limbs, and overall body, with information from the other sensory modalities, producing temporally efficient, coordinated behavior.

SURVEY RESULTS
A survey was sent to a random selection of American Academy of Ophthalmology (AAO) and the American Optometric Association (AOA). There were 34 responses, 91% of whom found the vignette to be typical. The median WRVU was 0.93, and the 25th percentile was 0.71. The current value of the code is 0.37 WRVU. The median IST was 30 minutes, with 10 minutes of pre-service evaluation time and 9 minutes of immediate post-service time.
The survey data were analyzed by subgroup according to specialty (ophthalmology vs. optometry), whether the respondent performed the service or not, and excluding the three outliers who responded that they performed the service over 1,000 times annually. The subgroup data are listed in separate rows of the revised Summary Spreadsheet.

There was a significant difference in the 25th percentile WRVU between the OD and MD subgroups: 0.90 for ODs and 0.55 for MDs. The combined data 25th percentile WRVU is 0.71.

The median IST was also different between the OD and MD subgroups: 40 minutes for ODs and 10 minutes for MDs. The overall median IST is 30 minutes.

The panel considered the possibility of reporting the service with an IST as short as 10 minutes. CPT 92065 is not a time-based code. It is a training procedure that is reported only once a day, unlike therapy sessions that can be reported several times in 30-minute increments on a single day.

Optometrists are the dominant specialty, with 97.4% of claims in 2019. They were also the dominant survey responders, with 73.5% of the responses. The typical optometric training session is 40 minutes long. Some sessions may be shorter if the patient is too fatigued to continue, and some may be longer, but the 25th to 75th percentile range of IST was 30 to 45 minutes. The IST for 75% of the OD cases is 30 minutes.

Optometrists accounted for 2.2% of claims (723) in 2019, and for only 9 survey responses. Although the median IST for MDs was 10 minutes, only about 350 claims would be expected from MDs with an IST of 10 minutes or less.

This might argue for use of the OD data exclusively. The panel chose to use the combined data as a better reflection of the overall times and values for this code, and to avoid over-valuating it.

Deleting the data from zero performers resulted in no significant difference in median IST or 25th percentile WRVU between performers and the full data set. The IST is 30 min in both groups. The 25th percentile WRVU is 0.71 for the entire data set and 0.69 for those who reported performing the procedure.

Eliminating the 3 hyperperformers did not change the analysis significantly.

We therefore based our recommendations on the entire data set. This includes a median IST of 30 minutes which is appropriate for training administered by the provider rather than delegated to a technician, a median work value of 0.93, and a 25th percentile work value of 0.71.

The top key reference service, chosen by 56% of respondents, was CPT 99202, Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and straightforward medical decision making. When using time for code selection, 15-29 minutes of total time is spent on the date of the encounter, (RUC 2019), with a WRVU of 0.93, an IST of 15 minutes, and a total time of 20 minutes. The second reference service, chosen by 24% of respondents, was CPT 99212, Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and straightforward medical decision making. When using time for code selection, 10-19 minutes of total time is spent on the date of the encounter. (RUC 2019), with a WRVU of 0.70, an IST of 11 minutes, and total time of 16 minutes. The majority of respondents ranked the surveyed code higher or much higher than the top key reference service on overall intensity and complexity and all of the submeasures. Of the 24% who chose the second key reference service, half ranked the surveyed code somewhat lower than the second key reference service on overall intensity and complexity and psychological stress, and identical or higher on the other submeasures.

We treated the service as typically provided with a same-day office visit because it is performed 33% of the time with an office visit and 18% of the time with a sensorimotor exam (CPT 92060), which includes pre- and post-service work similar to that of an office visit. We therefore reduced the pre-time from the survey value of 10 minutes to 2 minutes. This time is required to review the plan with the patient and bring them to the treatment room. We reduced the survey post-time from 9 minutes to 4 minutes. This time is required to record patient performance into the medical record, develop a treatment plan for the next training session, enter that plan into the medical record, and generate a letter to the referring provider. The total time for the procedure is 36 minutes, with a 30-minute IST.
We recommend a work value equal to the survey’s 25th percentile value: 0.71 WRVU. This is less than the median of the 37 XXX CPT codes in the RUC database with work values assigned within the last 10 years and 30-minute ISTs (median 1.48 WRVU, range 0.55 to 4.00 WRVU).

Although we are not recommending a crosswalk to this code, the recommended value is supported by HCPCS code G0108, *Diabetes outpatient self-management training services, individual, per 30 minutes* (RUC 2017). This is also a training code with an identical 30-minute IST, an almost-identical 37-minute total time, and a higher work value of 0.90 WRVU. There is additional support from CPT 88365, *In situ hybridization (eg, FISH), per specimen; initial single probe stain procedure* (RUC 2014) and CPT 88368, *Morphometric analysis, in situ hybridization (quantitative or semi-quantitative), manual, per specimen; initial single probe stain procedure* (RUC 2014), both of which have 30-minute ISTs and higher valuations at 0.88 WRVU.

We recommend the survey 25th percentile work value of 0.71 WRVU for CPT 92065 with times of 2/30/4 and a total time of 36 minutes.

References

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- Multiple codes allow flexibility to describe exactly what components the procedure included.
- Multiple codes are used to maintain consistency with similar codes.
- Historical precedents.
- Other reason (please explain) Typically billed with an office visit or sensorimotor measurements.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

3. CPT Code | Global Period | Work RVU | Pre | Intra | Post | % Billed Together
--- | --- | --- | --- | --- | --- | ---
4. 92060 | XXX | 0.69 | 5 | 30 | 5 | 18.3%
5. 92012 | XXX | 0.92 | 5 | 15 | 5 | 12.8%
FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 92065

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Ophthalmology  How often?  Sometimes
Specialty Optometry  How often?  Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 60000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimate.

Specialty Ophthalmology  Frequency 2000  Percentage  3.33 %
Specialty Optometry  Frequency 58000  Percentage  96.66 %

Estimate the number of times this service might be provided to Medicare patients nationally in a one-year period? 20,000
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimate.

Specialty Ophthalmology  Frequency 1000  Percentage  5.00 %
Specialty Optometry  Frequency 19000  Percentage  95.00 %

Do many physicians perform this service across the United States? Yes

Berenson-Eggers Type of Service (BETOS) Assignment
Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Eye procedure

BETOS Sub-classification Level II:
Other
Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 92065

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. N/A

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:
The Academy convenes a consensus subcommittee utilizing the appropriate subspecialty representatives who sit on our Health Policy Committee that oversees our activities at RUC and CPT. Additionally we use other healthcare providers who have the appropriate expertise as needed. The consensus committee considered the survey data and PE details in order to determine clinical time and applicable standard packages were also applied. The healthcare providers on the consensus panel familiar with the service provided input on whether or not any changes were needed for the existing supplies and equipment.

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code, but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here (for service reviewed prior to the implementation of clinical activity codes, detail is not provided in the RUC database, please contact Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org for PE spreadsheets for your reference codes):
This code is new and 92065 which is the same procedure when performed by the physician is used as a reference.

3. Is this code(s) typically reported with an E/M service?
Is this code(s) typically reported with the E/M service in the nonfacility?
(Please see provided data titled Medicare Same Day NF EM Billed Together - NF Dom Spec in the RUC Review Resource Materials)

New Code; We anticipate it being used similar to 92065. The answers provided for 92065 are listed below:

No.
No.

However, because the procedure is performed on the same day as an office visit 33% of the time, and is also reported with a sensorimotor exam (CPT 92060) 18% of the time. We considered the sensorimotor exam similar enough to an office visit to treat the surveyed code as typically performed with a same-day office visit.

4. What specialty is the dominant provider in the nonfacility?
What percent of the time does the dominant provider provide the service(s) in the nonfacility?
Is the dominant provider in the nonfacility different than for the global?
(Please see provided data titled Medicare Same Day NF EM Billed Together - NF Dom Spec in the RUC Review Resource Materials)
New Code: We anticipate findings similar to 92065 whose findings are below:

<table>

5. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time:

   N/A

6. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies for the code family, please provide compelling evidence (please see PE compelling evidence guidelines) Please explain if the increase can be entirely accounted for because of an increase in physician time:

   N/A

7. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (please see second worksheet in PE spreadsheet workbook), please explain the difference here:

   N/A

8. How much time was allocated to clinical activity, obtain vital signs (CA010) prior to CMS increasing the clinical activity to 5 minutes for calendar year 2018? The standard for clinical activity, obtains vital signs remains 0, 3 and 5 based on the number of vital signs taken. Please provide a rationale for the clinical staff time that you are requesting for obtain vital signs here:

   N/A

9. Please provide a brief description of the clinical staff work for the following:
   a.  Pre-Service period:

      N/A

   b.  Service period (includes pre, intra and post):

      During the service period multiple activities (visual exercises) are taught to the patient and these activities are repeated to ensure proper performance, and adjust/enhance difficulties during the testing period. The person conducting all of this work varies by code 92065 (physician) and 920XX (technician).

      Granular detail is provided below. Standard input times used for pre, intra, and post activities. Survey times used for intra-service activities.

      **Pre:** (Standard Inputs)
      Line CA011 – The technician provides education and obtains consent for the procedure.
      Line CA013 – The technician prepares the room, equipment, and supplies. During this time, typically the first activity is setup for the patient. Since anywhere between 6-8 activities (visual exercises) are taught they are setup in succession during the intra-service period for the remaining activities.
      Line CA016 – The patient is positioned and height of the table is adjusted to begin the first activity.

      **Intra:** (Survey Time of Physician Time Input)
      Line CA021 – The technician performs the following activities. The patient is positioned before specialized instruments which allow the systematic application of lenses, prisms and angular disparity designed to address the ocular motor defect and to treat the dysfunction. Prescribed treatment regimens include a series of interventions during the treatment period including convergence exercises using an accommodative target of letters, numbers, or pictures; vergence exercises with applied base in or base out prism; jump to near
convergence training on a Brock string; stereogram convergence exercises; and 3D vergence demand exercises applied with an interactive video display. The patient demonstrates understanding to the technician by proper performance of each of the prescribed exercises.

**Post:** (Standard Inputs)
Line CA024 – The technician will clean the room and pack up the equipment utilized.
Line CA031 – The technician will review with the healthcare provider the patient’s performance on the activities, before the provider comes up with a finalize plan.
Line CA035 - Based on the providers plan, “homework” packets of the exercises needed to be performed are obtained and given to the patient.

c. Post-service period:
Line CA038 – Removed

10. Please provide granular detail regarding what the clinical staff is doing during the intra-service (of service period) clinical activity, *assist physician or other qualified healthcare professional*---directly related to physician work time or *Perform procedure/service*---NOT directly related to physician work time:

The patient is positioned before specialized instruments which allow the systematic application of lenses, prisms and angular disparity designed to address the ocular motor defect and to treat the dysfunction. Prescribed treatment regimens include a series of interventions during the treatment period including convergence exercises using an accommodative target of letters, numbers, or pictures; vergence exercises with applied base in or base out prism; jump to near convergence training on a Brock string; stereogram convergence exercises; and 3D vergence demand exercises applied with an interactive video display. The patient demonstrates understanding to the technician by proper performance of each of the prescribed exercises.

11. If you have used a percentage of the physician intra-service work time other then 100 or 67 percent for the intra-service (of service period) clinical activity, please indicate the percentage and explain why the alternate percentage is needed and how it was derived.

N/A

12. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities *(please see second worksheet in PE spreadsheet workbook)*:

N/A

13. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at [http://www.bls.gov](http://www.bls.gov).

N/A

**INVOICES**

14. ☒ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

15. ☒ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?
16. If you wish to include a supply that is not on the list (please see fourth worksheet in PE spreadsheet workbook) please provide a paid invoice. Identify and explain the invoice here:

N/A

17. Are you recommending a PE supply pack for this recommendation? Yes or No.
If Yes, please indicate if the pack is an established package of supplies as defined by CMS (eg, SA047 pack, E/M visit) or a pack that is commercially available?

No.

18. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation. Please include the description, CMS supply code, unit, item quantity and unit price (if available). See documents two and three under PE reference materials on the RUC Collaboration Website for information on the contents of kits, packs and trays.

**Supplies:**
- Line SG043 Dressing, eye pad – still used and kept in supply list
- Line SK057 Paper, laser - still used for patient to be working on cheiroscope and other visual motor skills and kept in supply list
- Line SJ053 Swab-pad, alcohol – Was omitted in error, but is utilized to sterilize equipment prior to patient use

19. If you wish to include an equipment item that is not on the list (please see fifth worksheet in PE spreadsheet workbook) please provide a paid invoice. Identify and explain the invoice here:

Invoices will be provided for new supplies with standard/default formulas.

**Pro Vision Therapy Starter System Model VTSSP** – contains a number of devices to stimulate fusion/convergence. Various components of this system are used as part of training for these vision activities. Invoice attached. This is entirely reusable and thus considered as an equipment for valuation.

**Sanet Vision Integrator display/software**  This is used as part of visual activities to address near acuity and depth perception issues. This replaces the computer VDT and software which was a more generic equipment previously included when the code was initially valued.

20. Please provide an estimate of the useful life of the new equipment item as required to calculate the equipment cost per minute (please see fifth worksheet in PE spreadsheet workbook):

5 years

21. Have you recommended equipment minutes for a computer or equivalent laptop/integrated computer, equipment item computer, desktop, w-monitor, ED021 or notebook (Dell Latitude D600), ED038?
   a. If yes, please explain how the computer is used for this service(s).
   b. Is the computer used exclusively as an integral component of the service or is it also used for other purposes not specific to the code?
   c. Does the computer include code specific software that is typically used to provide the service(s)?

N/A

22. List all the equipment included in your recommendation and the equipment formula chosen (please see document titled Calculating equipment time). If you have selected “other formula” for any of the equipment please explain here:

Default formulas were used for all equipment, as there is no highly technical equipment. Time included for all supplies reflects time room occupied for the procedure. For the chairs listed as supplies we listed half the time the room is occupied in order to price the use of 4 (rather than 8 chairs) in the room.
### AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC) PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

<table>
<thead>
<tr>
<th>Line</th>
<th>Description</th>
<th>Remarks</th>
</tr>
</thead>
<tbody>
<tr>
<td>122</td>
<td>NEW Sanet Vision Integrator display/software – This is used as part of visual activities to address near acuity and depth perception issues. This replaces the computer VDT and software which was a more generic equipment previously included when the code was initially valued.</td>
<td></td>
</tr>
<tr>
<td>123</td>
<td>NEW Pro Vision Therapy Starter System Model VTSSP – This system includes various devices to test and stimulate fusion and is integral for many of the visual activities performed</td>
<td></td>
</tr>
<tr>
<td>EQ165</td>
<td>Lens set, trial – Trial lenses allow for the increasing/decreasing the difficulties of the activities being performed</td>
<td></td>
</tr>
<tr>
<td>EQ232</td>
<td>Stereo Trainer – Removed</td>
<td></td>
</tr>
<tr>
<td>EQ236</td>
<td>Telebinocular, ophthalmic – Used as part of the visual activities. Time included reflects time room occupied for the procedure.</td>
<td></td>
</tr>
<tr>
<td>EQ049</td>
<td>Anomaloscope, diagnostic – Removed – No longer the typically used.</td>
<td></td>
</tr>
<tr>
<td>ED009</td>
<td>Computer and VDT and software – Removed and replaced with Sanet Vision Integrator which is a more specific type of device utilized as part of the visual activities. Time included reflects time room occupied for the procedure.</td>
<td></td>
</tr>
<tr>
<td>EL006</td>
<td>lane, screening (oph) – Removed – No longer typically performed in this room.</td>
<td></td>
</tr>
<tr>
<td>EF030</td>
<td>table, power – Added – A room with a power table and 4 chairs was added in place of an exam room as this is more typical</td>
<td></td>
</tr>
<tr>
<td>EF043</td>
<td>chairs (set of 8) – The time applied for the chairs was cut in half, to reflect the use of 4 chairs during the activities rather than the full 8 chairs.</td>
<td></td>

</tbody>
</table>

23. If there is any other item(s) on your spreadsheet not covered in the categories above that require greater detail/explanation, please include here:

<table>
<thead>
<tr>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>The updates to equipment reflect new changes in management of convergence insufficiency. Moreover, the equipment location (exam room to a room with table and 4 chairs) reflects the current typical practice.</td>
</tr>
</tbody>
</table>

### PROFESSIONAL LIABILITY INSURANCE (PLI) INFORMATION

24. If this is a PE only code please select a crosswalk based on a similar specialty mix:

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>92065</td>
<td>For PLI information the best crosswalk is 92065 as the procedure is identical but performed by a technician. However since this code is being surveyed at this meeting alternative codes are below.</td>
</tr>
<tr>
<td>92083</td>
<td>92083 would be an alternative if 92065 cannot be utilized.</td>
</tr>
</tbody>
</table>

### ITEMIZED LIST OF CHANGES (FOLLOWING THE PE SUBCOMMITTEE MEETING)

During and immediately following the review of this tab at the PE Subcommittee meeting, please revise the summary of recommendation (PE SOR) based on modifications made during the meeting. Please submit the revised form electronically to Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org immediately following the close of business the same day that the tab is reviewed. On the PE spreadsheet, please highlight the cells and/or use red font to show the changes made during the PE Subcommittee meeting (if you have provided any of this highlighting based on changes from the reference code prior to the PE Subcommittee meeting please remove it, so not to be confused with changes made during the meeting). In addition to those revisions please also provide an itemized list of the modifications made to
the PE spreadsheet during the PE Subcommittee meeting in the space below (e.g. clinical activity CA010 obtain vital signs was reduced from 5 minutes to 3 minutes).

The changes in **RED** were made when submitting the amended spreadsheet. The changes in **GREEN** were the additional changes made AFTER the PE Meeting. The same color coding is used in PE spreadsheet.

1. Changed the type of paper utilized from SK059 to SK057. This paper more accurately reflects the type of paper used.
2. Changed Computer VDT and software (the more generic equipment input) to zero and instead put in a specific device, the Sanet Vision Integrator display/software as the device used in the plurality of cases. An invoice has been provided for this system.

NOTE: The virtual meetings have provided for real-time updates to the PE spreadsheets. PE SORs must still be updated and resubmitted asap.
Meeting Date: April 2021

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:
   The Academy convenes a consensus subcommittee utilizing the appropriate subspecialty representatives who sit on our Health Policy Committee that oversees our activities at RUC and CPT. Additionally, we use other healthcare providers who have the appropriate expertise as needed. The consensus committee considered the survey data and PE details in order to determine clinical time and applicable standard packages were also applied. The healthcare providers on the consensus panel familiar with the service provided input on whether or not any changes were needed for the existing supplies and equipment.

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code, but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here (for service reviewed prior to the implementation of clinical activity codes, detail is not provided in the RUC database, please contact Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org for PE spreadsheets for your reference codes):
   The current code was used as a reference.

3. Is this code(s) typically reported with an E/M service?
   Is this code(s) typically reported with the E/M service in the nonfacility?
   (Please see provided data titled Medicare Same Day NF EM Billed Together - NF Dom Spec in the RUC Review Resource Materials)
   No.
   No.
   However, because the procedure is performed on the same day as an office visit 33% of the time, and is also reported with a sensorimotor exam (CPT 92060) 18% of the time. We considered the sensorimotor exam similar enough to an office visit to treat the surveyed code as typically performed with a same-day office visit.

4. What specialty is the dominant provider in the nonfacility?
   What percent of the time does the dominant provider provide the service(s) in the nonfacility?
   Is the dominant provider in the nonfacility different than for the global?
   (Please see provided data titled Medicare Same Day NF EM Billed Together - NF Dom Spec in the RUC Review Resource Materials)
   Optometry (97%)
   Non-facility Performance (100%)
5. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time:

N/A

6. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies for the code family, please provide compelling evidence (please see PE compelling evidence guidelines) Please explain if the increase can be entirely accounted for because of an increase in physician time:

N/A

7. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (please see second worksheet in PE spreadsheet workbook), please explain the difference here:

N/A

8. How much time was allocated to clinical activity, obtain vital signs (CA010) prior to CMS increasing the clinical activity to 5 minutes for calendar year 2018? The standard for clinical activity, obtains vital signs remains 0, 3 and 5 based on the number of vital signs taken. Please provide a rationale for the clinical staff time that you are requesting for obtain vital signs here:

N/A

9. Please provide a brief description of the clinical staff work for the following:

   a. Pre-Service period:

   N/A

   b. Service period (includes pre, intra and post):

   During the service period multiple activities (visual exercises) are taught to the patient and these activities are repeated to ensure proper performance, and adjust/enhance difficulties during the testing period. The person conducting all of this work varies by code 92065 (physician) and 920XX (technician).

   Granular detail is provided below. Standard input times used for pre, intra, and post activities. Survey times used for intra-service activities.

   **Pre**: (Standard Inputs)
   Line CA011 – The technician provides education and obtains consent for the procedure.
   Line CA013 – The technician prepares the room, equipment, and supplies. During this time, typically the first activity is setup for the patient. Since anywhere between 6-8 activities (visual exercises) are taught they are setup in succession during the intra-service period for the remaining activities.
   Line CA016 – The patient is positioned and height of the table is adjusted to begin the first activity.

   **Intra**: (Survey Time of Physician Time Input)
   Line CA020 – Removed

   **Post**: (Standard Inputs)
   Line CA024 – The technician will clean the room and pack up the equipment utilized.
   Line CA031 – Removed
   Line CA035 - Based on the providers plan, “homework” packets of the exercises needed to be performed are obtained and given to the patient.

   c. Post-service period:

   Line CA038 – Removed and moved to Line CA035
10. Please provide granular detail regarding what the clinical staff is doing during the intra-service (of service period) clinical activity, assist physician or other qualified healthcare professional—directly related to physician work time or Perform procedure/service—NOT directly related to physician work time:

The physician alone is performing the intraservice work.

11. If you have used a percentage of the physician intra-service work time other than 100 or 67 percent for the intra-service (of service period) clinical activity, please indicate the percentage and explain why the alternate percentage is needed and how it was derived.

Does not apply.

12. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (please see second worksheet in PE spreadsheet workbook):

N/A

13. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov.

N/A

INVOICES

14. ☒ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

15. ☒ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

16. If you wish to include a supply that is not on the list (please see fourth worksheet in PE spreadsheet workbook) please provide a paid invoice. Identify and explain the invoice here:

N/A

17. Are you recommending a PE supply pack for this recommendation? Yes or No. If Yes, please indicate if the pack is an established package of supplies as defined by CMS (e.g., SA047 pack, E/M visit) or a pack that is commercially available?

No.

18. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation. Please include the description, CMS supply code, unit, item quantity and unit price (if available). See documents two and three under PE reference materials on the RUC Collaboration Website for information on the contents of kits, packs and trays.

Supplies:
- Line SG043 Dressing, eye pad – still used and kept in supply list
- Line SK057 Paper, laser - still used for patient to be working on cheiroscope and other visual motor skills and kept in supply list
- Line SJ053 Swab-pad, alcohol – Was omitted in error, but is utilized to sterilize equipment prior to patient use
19. If you wish to include an equipment item that is not on the list (please see fifth worksheet in PE spreadsheet workbook) please provide a paid invoice. Identify and explain the invoice here:

Invoices will be provided for new supplies with standard/default formulas.

**Pro Vision Therapy Starter System Model VTSSP** – contains a number of devices to stimulate fusion/convergence. Various components of this system are used as part of training for these vision activities. Invoice attached. This is entirely reusable and thus considered as an equipment for valuation.

**Sanet Vision Integrator display/software** This is used as part of visual activities to address near acuity and depth perception issues. This replaces the computer VDT and software which was a more generic equipment previously included when the code was initially valued.

20. Please provide an estimate of the useful life of the new equipment item as required to calculate the equipment cost per minute (please see fifth worksheet in PE spreadsheet workbook):

5 years

21. Have you recommended equipment minutes for a computer or equivalent laptop/integrated computer, equipment item computer, desktop, w-monitor, ED021 or notebook (Dell Latitude D600), ED038?
   a. If yes, please explain how the computer is used for this service(s).
   b. Is the computer used exclusively as an integral component of the service or is it also used for other purposes not specific to the code?
   c. Does the computer include code specific software that is typically used to provide the service(s)?

N/A

22. List all the equipment included in your recommendation and the equipment formula chosen (please see document titled Calculating equipment time). If you have selected “other formula” for any of the equipment please explain here:

Default formulas were used for all equipment, as there is no highly technical equipment. Time included for all supplies reflects time room occupied for the procedure. For the chairs listed as supplies we listed half the time the room is occupied in order to price the use of 4 (rather than 8 chairs) in the room.

**Line 122 NEW** Sanet Vision Integrator display/software – This is used as part of visual activities to address near acuity and depth perception issues. This replaces the computer VDT and software which was a more generic equipment previously included when the code was initially valued.

**Line 123 NEW** Pro Vision Therapy Starter System Model VTSSP – This system includes various devices to test and stimulate fusion and is integral for many of the visual activities performed

**Line EQ165** Lens set, trial – Trial lenses allow for the increasing/decreasing the difficulties of the activities being performed

**Line EQ232** Stereo Trainer – Removed

**Line EQ236** Telebinocular, ophthalmic – Used as part of the visual activities. Time included reflects time room occupied for the procedure.

**Line EQ049** Anomaloscope, diagnostic – Removed – No longer the typically used.

**Line ED009** Computer and VDT and software – Removed and replaced with Sanet Vision Integrator which is more specific type of device utilized as part of the visual activities. Time included reflects time room occupied for the procedure.

**Line EL006** lane, screening (oph) – Removed – No longer typically performed in this room.

**Line EF030** table, power – Added – A room with a power table and 4 chairs was added in place of an exam room as this is more typical

**Line EF043** chairs (set of 8) – The time applied for the chairs was cut in half, to reflect the use of 4 chairs during the activities rather than the full 8 chairs.
23. If there is any other item(s) on your spreadsheet not covered in the categories above that require greater detail/explanation, please include here:

| The updates to equipment reflect new changes in management of convergence insufficiency. Moreover, the equipment location (exam room to a room with table and 4 chairs) reflects the current typical practice. 30 minutes of intraservice time while the physician is actually performing the training activities are included in the determining total equipment time. Ie we used the standard formula times to calculate equipment time, and then added the 30 minutes that the physician is using the equipment to determine the complete amount of time. |

PROFESSIONAL LIABILITY INSURANCE (PLI) INFORMATION

24. If this is a PE only code please select a crosswalk based on a similar specialty mix:

ITEMIZED LIST OF CHANGES (FOLLOWING THE PE SUBCOMMITTEE MEETING)

During and immediately following the review of this tab at the PE Subcommittee meeting, please revise the summary of recommendation (PE SOR) based on modifications made during the meeting. Please submit the revised form electronically to Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org immediately following the close of business the same day that the tab is reviewed. On the PE spreadsheet, please highlight the cells and/or use red font to show the changes made during the PE Subcommittee meeting (if you have provided any of this highlighting based on changes from the reference code prior to the PE Subcommittee meeting please remove it, so not to be confused with changes made during the meeting). In addition to those revisions please also provide an itemized list of the modifications made to the PE spreadsheet during the PE Subcommittee meeting in the space below (e.g. clinical activity CA010 obtain vital signs was reduced from 5 minutes to 3 minutes).

The changes in **RED** were made when submitting the amended spreadsheet. The changes in **GREEN** were the additional changes made AFTER the PE Meeting. The same color coding is used in PE spreadsheet.

1. Changed the type of paper utilized from SK059 to SK057. This paper more accurately reflects the type of paper used.
2. Changed Computer VDT and software (the more generic equipment input) to zero and instead put in a specific device, the Sanet Vision Integrator display/software as the device used in the plurality of cases. An invoice has been provided for this system.

NOTE: The virtual meetings have provided for real-time updates to the PE spreadsheets. PE SORs must still be updated and resubmitted asap.

**NEW**  
- **Pro Vision Therapy Starter System Model VTSSP**: 2229.95, 0.00835499, 38, 38
- **Samet Vision Integrator display/software**: 8249, 0.032668308, 38, 38
In February 2021, the CPT Editorial Panel created two new group caregiver behavior management training codes. CPT codes 96X70 and 96X71 are used to report the total duration of face-to-face time spent by the physician or other qualified healthcare professional (QHP) providing the group training session.

96X70 Multiple-family group behavior management/modification training for guardians/caregivers of patients with a mental or physical health diagnosis, administered by physician or other qualified health care professional (without the patient present), face-to-face with multiple sets of guardians/caregivers; initial 60 minutes

The RUC reviewed the survey results from 75 psychologists, child and adolescent psychiatrists, and dieticians with the understanding that the survey respondents were asked to evaluate the group service in total and not based on an individual group participant. Also, a custom survey question was added that asked respondents to provide the average number of patients that were represented at a typical caregiver behavior management group session. The question yielded a median response of six patients. The intent was to obtain per session data on the service, that could then be divided by the average number of patients to yield the per patient data. This methodology for surveying time-based group codes has recent precedent when it was relied on for group health behavior intervention codes 96164-96165; CMS accepted the HCPAC’s recommendation in CY2020 rulemaking.

The purpose of this service is to train caregivers how to structure the environment to actively provide for and reinforce desired behaviors, reduce the negative impacts of the patient’s diagnosis on patient’s daily life, develop highly structured technical skills to better manage specific behaviors and support the compliance with the patient’s treatment and clinical plan of care. While this service is performed without the patient present, the goals and outcomes are solely for the therapeutic benefit of the identified patient. This service is a skills training process; it is not a support group or a lecture. While the interventions are evidence-based, they are not scripted. The physician or other qualified healthcare professional must rely on their expertise and ability to integrate multiple factors, while effectively capitalizing upon the group dynamics to personalize the intervention and optimize treatment outcomes.

The specialty societies noted that although the median survey respondent has not performed this service in the past 12 months, likely due to the ongoing COVID-19 public health emergency, 2/3rds of the survey respondents have performed this service in the past 5 years and the other survey respondents were instructed to only complete the survey if they were sufficiently familiar with the service.

The RUC agreed that the median per session work value of 2.60 RVUs converted to the per patient work value of 0.43 RVUs by dividing by the typical six patients would appropriately value this service. The RUC recommends 2 minutes pre-service time, 10 minutes intra-service time, 3 minutes post-service time, for 15 minutes total time for survey code 96X70. These physician/QHP times were a result of converting the median group survey times of 10 minutes pre-service, 60 minutes intra-service and 20 minutes post-service and converting them to per patient times and rounding to the nearest whole number. The RUC compared the survey code to 2nd key reference code 90847 Family psychotherapy (conjoint

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.
psychotherapy) (with patient present), 50 minutes (work RVU = 2.50, intra-service time of 50 minutes, total time of 76 minutes) and noted that for a typical group size, the survey code would involve 10 more minutes of intra-service time, 14 more minutes of total time. In addition, 76 percent of the respondents that selected the 2nd key reference code indicated the survey code is more intense and complex to perform. For additional reference, the RUC compared the survey code to CPT code 90839 Psychotherapy for crisis; first 60 minutes (work RVU = 3.13, intra-service time of 60 minutes, total time of 90 minutes) and noted that for a typical group size both services would have identical intra-service and total times, though the reference code is somewhat less intense to perform for the typical group size of 6 patients represented.

The RUC also compared the survey code to CMS code G0109 Diabetes outpatient self-management training services, group session (2 or more), per 30 minutes (work RVU = 0.25, intra-service time of 6 minutes and total time of 10 minutes), another time-based group service, which was valued based on a typical group size of 5 patients and is reported per 30 minutes instead of for the first hour of the group session (as is the case for the survey code). If G0109 was performed for 5 patients for a one hour session, the total aggregate work RVU would be 2.50; however, if the group size for G0109 was 6 patients for a one hour session, as is the case for the typical survey code, the total aggregate work RVU would be 3.00 for the reference. Group caregiver behavior management training is a somewhat more intense service to perform relative to diabetes management group training. Comparison to this reference code confirms that a value of 0.43 per patient for the survey code would not overvalue the typical physician or other QHP work. In addition, the RUC noted that unlike the reference code, which is reported in multiple units for the same patient, the survey code is structured as a base code; therefore, all the pre-service and post-service work for the entire session are included only in the base code. Also, although the median number of patients represented in a group is six, it is not uncommon for two parents/caregivers to attend a group session for the same patient for caregiver behavior management training. All else held equal, larger group sizes are somewhat more intense to lead. The RUC recommends a work RVU of 0.43 for CPT code 96X70. The RUC noted that this recommendation is based on a median group size of six.

96X71 Multiple-family group behavior management/modification training for guardians/caregivers of patients with a mental or physical health diagnosis, administered by physician or other qualified health care professional (without the patient present), face-to-face with multiple sets of guardians/caregivers; each additional 15 minutes (List separately in addition to code for primary service)

The RUC reviewed the survey results from 75 psychologists, child and adolescent psychiatrists, and dieticians with the understanding that the survey respondents were asked to evaluate the group service in total and not based on an individual group participant. Also, a custom survey question was added that asked respondents to provide the average number of patients that were represented at a typical caregiver behavior management group session. The question yielded a median response of six patients. The intent was to obtain per session data on the service, that could then be divided by the average number of patients to yield the per patient data. This methodology for surveying time-based group codes has recent precedent when it was relied on for group health behavior intervention codes 96164-96165; CMS accepted the HCPAC’s recommendation in CY2020 rulemaking.

The specialty societies noted that although the median survey respondent has not performed this service in the past 12 months, likely due to the ongoing COVID-19 public health emergency, 2/3rds of the survey respondents have performed this service in the past 5 years and the other survey respondents were instructed to only complete the survey if they were at least sufficiently familiar with the service.
The RUC agreed that the median per session work value of 0.73 RVUs converted to the per patient work value of 0.12 work RVUs by dividing by the typical six patients would appropriately value this service. The RUC recommends 3 minutes of intra-service and total time for this group-based add-on service. These physician/QHP times were a result of converting the median group survey times of 15 minutes of intra-service time and converting it to per patient times and rounding to the nearest whole number. To justify a work value of 0.12 per patient (or 0.73 for the typical group), the RUC compared the survey code to CPT code 90840 *Psychotherapy for crisis; each additional 30 minutes (List separately in addition to code for primary service)* (work RVU = 1.50, intra-service time of 30 minutes) and noted that, relative to a typical group session for the survey code reported for the same length of 30 minutes, the reference code is assigned a higher work value of 1.50 versus 1.46 for two units of the add-on survey code for 6 patients. The RUC also compared the survey code to another time-based group code 96165 *Health behavior intervention, group (2 or more patients), face-to-face; each additional 15 minutes (List separately in addition to code for primary service)* (work RVU = 0.10, intra-service time of 10 minutes). CPT code 96165 was valued assuming a larger group size of 7 patients. Using both services assumed typical group sizes, the survey code would represent a total aggregate work value of 0.73 compared to 0.70 for the reference code. As the survey code is slightly more intense to perform, in part because the actual number of people in the room is often higher due to the two parents commonly representing a single patient for the survey code, assigning a slightly higher value to the survey code is warranted. The RUC recommends a work RVU of 0.12 for CPT code 96X71. The RUC noted that this recommendation is based on a median group size of 6.

**Relativity Assessment Workgroup Flag**
The RUC recommends that the Relativity Assessment Workgroup review these services in three years (October 2024) to review whether assumption of a median group size of 6 patients remains appropriate.

**Practice Expense**
The Practice Expense (PE) Subcommittee agreed to recommend a new direct supply input for a binder with dividers and noted that it is typical to provide the parent(s)/caregiver(s) with a 3-ring binder at the first session to store materials throughout the duration of the 8 sessions and there is no existing supply item that appropriately captures this resource. The PE Subcommittee also confirmed that for SK114 *tissues (Kleenex)* the number of assigned tissues is appropriate (2 tissues per patient per session (2/144 of a box)). The RUC recommends the direct practice expense inputs as submitted by the specialty societies.

</table>

Behavior modification is the process of changing patterns of human behavior over the long-term using various motivational techniques, mainly consequences and rewards. More simply, behavior modification is the method of changing the way a person reacts either physically or mentally to a given stimulus.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.
Behavior modification treatment is based on the values of operant conditioning. The ultimate goal is to exchange objectionable, problematic, or disagreeable behaviors with more positive, desirable behaviors through the use of evidence-based techniques and methods.

The purpose of the group-based behavioral management/modification training services is to teach the parent(s)/caregiver(s) interventions that they can independently use to effectively manage the identified patient’s illness(s)/disease(s). Codes 96X70, 96X71 are used to report the total duration of face-to-face time spent by the physician or other qualified health care professional providing group-based parent/caregiver behavioral management/modification training services. This service involves behavioral treatment training provided to a multiple-family group of parent(s)/caregiver(s), without the patient present. These services emphasize active engagement and involvement of the parent(s)/caregiver(s) in the treatment of a patient with a mental or physical health diagnosis. These services do not represent preventive medicine counseling and risk factor reduction interventions.

During these sessions, the parent(s)/caregiver(s) are trained, using verbal instruction, video and live demonstrations, and feedback from physician or other qualified health care professional or other parents in group sessions, to use skills and strategies to address behaviors impacting the patient’s mental or physical health diagnosis. These skills and strategies help to support compliance with the identified patient’s treatment and the clinical plan of care.

For counseling and education provided by a physician or other qualified health care professional to an individual and/or family, see the appropriate evaluation and management codes including office or other outpatient services (99202, 99203, 99204, 99205, 99211, 99212, 99213, 99214, 99215), hospital inpatient and observation care services (99221, 99222, 99223, 99231, 99232, 99233), new or established patient office or other outpatient consultations (99241, 99242, 99243, 99244, 99245), inpatient or observation consultations (99251, 99252, 99253, 99254, 99255), emergency department services (99281, 99282, 99283, 99284, 99285), nursing facility services (99304, 99305, 99306, 99307, 99308, 99309, 99310, 99315, 99316, 99318), domiciliary, rest home, or custodial care services (99324, 99325, 99326, 99327, 99328, 99334, 99335, 99336, 99337), home and residence services (99341, 99342, 99343, 99344, 99345, 99347, 99348, 99349, 99350), and counseling risk factor reduction and behavior change intervention (99401-99429). See also Instructions for Use of the CPT Codebook for definition of reporting qualifications.

Counseling risk factor reduction and behavior change intervention codes (99401, 99402, 99403, 99404, 99406, 99407, 99408, 99409, 99411, 99412) are included and may not be separately reported on the same day as parent/caregiver training services codes 96X70, 96X71 by the same provider.

Medical nutrition therapy codes 97802, 97803, 97804, provided to the identified patient may be reported on the same date of service as parent/caregiver training service.

(For health behavior assessment and intervention that is not part of a standardized curriculum, see 96156, 96158, 96159, 96164, 96165, 96167, 96168, 96170, 96171)

(For educational services that use a standardized curriculum provided to patients with an established illness/disease, see 98960, 98961, 98962)

(For education provided as genetic counseling services, use 96040. For education to a group regarding genetic risks, see 98961, 98962)

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 96X70  Tracking Number: E1  Original Specialty Recommended RVU: 0.50
Presented Recommended RVU: 0.43  RUC Recommended RVU: 0.43

CPT Descriptor: Multiple-family group behavior modification/management training for guardians/caregivers of a patient with a mental or physical health diagnosis, administered by physician or other qualified nonphysician health care professional (without the patient present), face-to-face with multiple sets of guardians/caregivers; initial 60 minutes

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:
Vignette #1 - Used by APA & AACAP:
A 7-year-old male patient presents with attention-deficit/hyperactivity disorder and Oppositional Defiant Disorder. The patient’s symptoms of inattention, hyperactivity and impulsiveness results in difficulties in social and psychological functioning. The patient’s parent(s)/caregiver(s) is referred for group-based behavior management/modification training to learn strategies and techniques to improve monitoring and management of patient’s behaviors, facilitate positive behavior changes, improved parent-child interactions, and improve overall symptom management and functioning.

Vignette #2 - Used by AND:
Parent(s)/caregiver(s) of a 10-year-old male patient with obesity, limited variety of food intake, limited physical activity, and a family history of Type 2 diabetes are referred for group-based behavior management/modification training.

Percentage of Survey Respondents who found Vignette to be Typical: 84%

Site of Service (Complete for 010 and 090 Globals Only)
Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 16%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Review patient records, including those from the patient's physician and other team members, and results of any prior diagnostic, evaluation and/or assessment services. Review findings from assessment tools and how they relate to the identified patient’s treatment goals. Review and prepare materials to be presented during group behavior management/modification training session.

Description of Intra-Service Work: Initiate or continue the multiple-family group–based session of behavior training intervention for parent(s)/caregiver(s), training them on behavioral strategies and interventions that they can use independently, outside of treatment, and developing new skills to help improve functioning and better manage/reduce the identified patient’s challenging behaviors that result from or impact the identified patient's diagnosis. Parent(s)/caregiver(s) are taught to engage via verbal instruction (didactic discussion and Socratic questioning), video, and live demonstrations, role-playing, and feedback sessions to learn how to: set realistic and age-appropriate expectations for the identified patient’s behavior; reinforce positive/healthy behaviors to improve social and psychological functioning and physical health; and reduce or modify negative behaviors that are impairing function and treatment progress. Complete assessment of the identified patient’s progress towards treatment goals.

Description of Post-Service Work: Documentation in the identified patient’s medical record includes description of the parent(s)/caregiver(s) status and report of successes or challenges experienced with the patient, an overview of topics/skills (e.g. behavioral strategies, techniques and interventions) covered in the session, results of assessment tools completed by the
parent(s)/caregiver(s), and progress toward and/or modification of treatment goals based on patient and/or parent(s)/caregiver(s) progress or other confounding factors that arise. When applicable, coordinate with and provide feedback to the identified patient’s referring provider or interdisciplinary team members. Facilitate follow-up care with identified patient and parent(s)/caregiver(s).

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC’s rationale, please review the separate RUC recommendation document.

**Background**

Caregiver Behavioral Management/Modification Training is a highly specialized service that requires the clinical expertise of a physician or qualified health care professional (QHP) to train parent(s)/caregiver(s) how to utilize
behavioral interventions, strategies and techniques to address and effectively manage behavioral problems impacting an identified patient’s mental and/or physical health diagnosis. The service is offered in cases where the provider believes psychosocial intervention (typically and most effectively provided through parent/caregiver behavioral modification/management training) is needed for the benefit of the patient to help increase effectiveness and therapeutic benefit for the patient’s condition.

While this service may seem similar to existing Psychotherapy or Health Behavior Assessment and Intervention (HBAI) services, parent/caregiver behavioral management/modification training services are unique for many reasons. Primarily, the surveyed codes represent a service that is provided to parent(s)/caregiver(s) from multiple families who meet for a series of group-based sessions, conducted by a physician/QHP. While the identified patients are not present during the service, the behavioral management/modification training the parent(s)/caregiver(s) receive is solely for the benefit of the patient. The emphasis is placed on helping parent(s)/caregiver(s) develop highly structured technical skills to deal with specific problem behaviors exhibited by the identified patients.

Behavioral management/modification training is also unique in that it is not a diagnosis-specific service. Psychotherapy services are intended to be used for patients who present with a primary mental health diagnosis, while Health Behavior Assessment and Intervention (HBAI) services are intended for patients who present with a primary physical health diagnosis. The surveyed codes are typically provided to a cohort of parent(s)/caregiver(s) from multiple families over a series of eight (8) to twelve (12) closed group sessions. The participants represent identified patients that share the same or similar diagnosis.

Using our vignettes as an example, a parent/caregiver of a patient diagnosed with ADHD attends group-based behavioral management/modification training with parent(s)/caregiver(s) from multiple other families, who represent patients who have also been diagnosed with ADHD. They would not be placed in a multi-family group dedicated to addressing behavioral management/modification training for pediatric patients with obesity.

That being said, while the two (2) vignettes used in our survey process both focused on pediatric patients, a large body of scientific literature exists which describes the efficacy and effectiveness of behavioral modification and management training for caregivers of patients across the lifespan. Caregiver training for patients with dementia for example, focuses on specific behaviors the patient exhibits, and involves approaches such as modifying patient and/or caregiver cognitions, behaviors, or environments, or strategies for reducing a patient’s increased vulnerability to their environment.

A new base/add-on code pair was developed to reflect the physician/QHP work involved in providing multiple-family group-based services to parent(s)/caregiver(s) (without the patient present) for which there was no existing CPT code available to capture this provision of clinical service. The CPT Editorial Panel approved 96X70; Multiple-family group behavior management/modification training for guardians/caregivers of patients with a mental or physical health diagnosis, administered by physician or other qualified health care professional (without the patient present), face-to-face with multiple sets of guardians/caregivers; initial 60 minutes and 96X71; Multiple-family group behavior management/modification training for guardians/caregivers of patients with a mental or physical health diagnosis, administered by physician or other qualified health care professional (without the patient present), face-to-face with multiple sets of guardians/caregivers; each additional 15 minutes, at their February 2021 meeting. The codes were then surveyed by the American Psychological Association (APA), Academy of Nutrition and Dietetics (AND), and American Academy of Child and Adolescent Psychiatry (AACAP) for the April 2021 RUC meeting.

**Survey Process**

APA, AND, and AACAP sought the approval of the RUC’s Research Subcommittee prior to fielding their surveys. The subcommittee granted approval for modification of the survey tools, including the following items:

- Providing thorough review and feedback on appropriate codes to include in our Reference Service List. All codes recommended for deletion from our initial draft of the RSLs were removed and all codes recommended for addition were added to our final versions.
- Based on the subcommittee’s recommendation, we conducted the survey with two (2) separate RSLs:
  - One dedicated for use with the base code (96X70) which has an XXX global period, and
  - A second dedicated for use with the add-on code (96X71) which has an ZZZ global period.
Approval of our request to utilize a secondary vignette which described the service provided to parent(s)/caregiver(s) of a pediatric patient with obesity. This vignette was only approved for use by survey respondents from AND.

- Combining the XXX – Therapy survey tool with the standard ZZZ survey template and the time-based code template to survey
- Replacing the term “physician” with “physician/qualified health care professional” to address all provider types being surveyed.
- Minor language changes throughout the survey to ask the respondents to base their time and RVU estimates on the entire group session rather than calculating them on a per patient basis.
- Adding two (2) custom questions to the survey tool:
  - The first custom question asked survey participants to indicate the total amount of time they spend performing the entire service from start to finish (including the base code and all units of the add-on code) to allow capturing the total time and work involved in each group-based service.
  - The second custom question asked survey participants to indicate the typical number of identified patients represented by their parent(s)/caregiver(s) during a typical multi-family group behavior management/modification training group session.

All three (3) specialty societies sent surveys to a random sample of applicable subsets within their membership base. The combined sample size for the survey was 10,906. APA’s sample included 1,262 members randomly selected from Division 37 – Society for Child and Family Policy and Practice, Division 53 – Society of Clinical Child and Adolescent Psychology and Division 54 – Society for Pediatric Psychology. AND’s overall sample size included 8,600 members, representing a random sampling of members from 11 Dietetic Practice Groups, representing individuals providing clinical services to patients of all ages and physical health diagnoses included in the CPT Code Change Application, including pediatric patients with obesity, and eating disorders. AACAP’s survey sample combined a random sample the general membership and members of the Collaborative and Integrated Care, Family, and Systems of Care Committees with a sample size of 1,044 people.

**Analysis and Recommendations from the Expert Panel – 96X70**

An expert panel was convened with the RUC and HCPAC advisors and alternate advisors from all three surveying specialty societies, as well as practitioners from academic, and hospital-based practices, who are currently offering these services in adult and pediatric patient populations. The expert panel reviewed survey data and developed the recommendations.

When combined, 84% (63/75) of our survey respondents found the vignettes to be typical; however, as previously stated, the Research Subcommittee approved the use of two (2) vignettes during our survey process. For survey respondents from APA and AACAP, 88% (53/60) found the following vignette, which describes a patient diagnosed with a mental health condition, to be typical: A 7-year-old male patient presents with attention-deficit/hyperactivity disorder and Oppositional Defiant Disorder. The patient’s symptoms of inattention, hyperactivity and impulsiveness results in difficulties in social and psychological functioning. The patient’s parent(s)/caregiver(s) is referred for group-based behavior management/modification training to learn strategies and techniques to improve monitoring and management of patient’s behaviors, facilitate positive behavior changes, improved parent-child interactions, and improve overall symptom management and functioning.

For survey respondents from AND, 67% (10/15) found the following vignette, which describes a patient with a physical health diagnosis, to be typical: Parent(s)/caregiver(s) of a 10-year-old male patient with obesity, limited variety of food intake, limited physical activity, and a family history of Type 2 diabetes are referred for group-based behavior management/modification training.

Of the 75 completed surveys, CPT code 90846; Family psychotherapy (without the patient present), 50 minutes, was selected as the key reference service by 76% (57/75) of respondents. Further, of the remaining 23 respondents, 39% selected CPT code 90847; Family psychotherapy (conjoint psychotherapy) (with patient present), 50 minutes as their key reference service.

**Time Recommendations**

Based on review of the survey results, it is clear that the survey respondents saw an analogous relationship between the surveyed codes and existing Psychotherapy and Health Behavior Assessment and Intervention
(HBAI) services. The median survey results regarding time are 30 minutes pre-service, 60 minutes intra-service, and 30 minutes post-service. The expert panel felt that the survey median intra-service time of 60 minutes, was perfectly valued, likely because it is clearly stated in the code descriptor. However, they also believed that the median pre-service and post-service times may have been slightly overvalued.

The expert panel determined that this service should be consistent with pre-service and post-service times for similar existing services. Detailed in the table below are the pre-, intra-, post-, and total times for existing family and group-based services, some of which have been calculated to show relativity and consistency:

<table>
<thead>

<td>21 x 1.2 = 25</td>
<td>76 x 1.2 = 91</td>
</tr>
<tr>
<td>96164</td>
<td>Health behavior intervention, group (2 or more patients), face-to-face; initial 30 minutes</td>
<td>2(7*) = 24</td>
<td>35 x 1.72 = 60</td>
<td>14 x 1.72 = 24</td>
<td>63 x 1.72 = 108</td>
</tr>
<tr>
<td>90853</td>
<td>Group psychotherapy (other than of a multiple-family group)</td>
<td>2(5*) = 10</td>
<td>14(5*) = 70</td>
<td>8(5*) = 40</td>
<td>24(5*) = 120</td>
</tr>
</tbody>
</table>

To illustrate relativity, service time has been calculated to show each service with 60 minutes of intra time. *Additionally, for group-based services, the per patient time values have been multiplied by the RUC-determined typical number of patients in the group [96164 (7), 90853 (5)] to show time for the entire group.

Response to reviewer comments: One reviewer asked if it was typical to review each identified patient’s medical record prior to every session, or was the physician/QHP just reviewing the general tenor of the material that was to be covered in the upcoming session? The expert panel appreciates the reviewer comments and we have revised our pre- and post-service descriptors to provide greater detail on the activities performed by the physician/QHP prior to and following each session.

Our expert panel agreed that, based on relativity to existing services, and taking into account that our survey respondents indicated that there are typically six (6) patients represented in a group of parent(s)/caregiver(s) participating in behavior modification/management training, there is sufficient evidence to support our recommended times for this service, to allow the physician/QHP enough pre-service time to review each identified patient’s medical record and review/prepare the materials to be presented for each session, as well as post-service time to complete coordination activities (when applicable) and complete session-specific documentation in each identified patient’s record. Therefore, the expert panel recommends 10 minutes pre-, 60 minutes intra-, and 20 minutes post-service times for a total of 90 minutes for the entire group, or 2 minutes pre-, 10 minutes intra-, and 3 minutes post-service time for a total time of 15 minutes per identified patient represented by their parent(s)/caregiver(s) during behavioral management / modification training services.

RVU Recommendations
The expert panel reviewed the RVW survey data and conducted several searches of the RUC database to identify codes that were similar to the surveyed time and RVW data. The database searches resulted in identifying numerous codes for comparison, across the fee schedule, as well as the family and group-based services reviewed with our time recommendations. An expanded version of the previous table, used to support our time
To illustrate relativity, service RVW and time has been calculated to show each service with 60 minutes of intra time.

*Additionally, for each of the codes describing group-based services, the per patient time and wRVU values have been multiplied by the RUC-determined typical number of patients in the group [90853 (5), 96164 (7), G0109(5), 97804 (6)] to show RVW and time for the entire group.

**Response to reviewer comments:** The expert panel determined that the 75th percentile value of 3.00 was the most appropriate value for this service; however, based on feedback from our reviewers as well as other members of Facilitation Committee #2, we have revised our original recommendation.
The expert panel recommends code 96X70 be valued at the survey median RVW of 2.60 for the entire group, or 0.43 per identified patient represented by their parent(s)/caregiver(s), for the first 60 minutes of behavioral management/modification training services.

Additional Comments

Performance Rate
The surveying specialty societies conducted a RUC survey to value the newly created base/add-on code pair 96X70 and 96X71 which describe Caregiver Behavior Management/Modification Training. Upon initial analysis, the survey data revealed a median performance rate of zero for both 96X70 and 96X71.

Of the 75 total survey responses, 57 survey respondents selected code 90846 as the Top Key Reference Service, which had a median 12-month performance rate of 15. The Second Key Reference Service, code 90847, was selected by 7 survey respondents, and had a median 12-month performance rate of 18.

In the original version of the Survey Summary Spreadsheet, we presented the survey data in aggregate as well as for those survey respondents who had and had not performed the service in the last 12 months. For the subset of respondents who had performed the service in the last 12 months, the data showed a pre-time of 25 minutes, median intra-service time of 60 minutes, and post-service time of 30 minutes with a median RVW of 2.56 and the 75th percentile value at 2.75.

Subsequent to submission of our original recommendations, the surveying specialties felt that further analysis of the performance rate data was needed. Even though there currently is no mechanism for reporting the service, we believed this service was more commonly performed than indicated in the survey data.

Presented in the updated version of our Survey Summary Spreadsheet is recalculated performance rate information for 96X70, showing the data in aggregate for all 75 survey respondents, as well as for the 50 survey respondents who said they had performed the service (either in the last 12 months and/or in the last 5 years), and those 25 survey respondents who indicated they have never performed this service. Additionally, we have included a second tab in the summary spreadsheet that only includes the 12-month performance rate data. We felt presenting the data as “performed” versus “not performed” as well as the 12-month data in isolation was a more valid and useful presentation to assist the RUC in its decision-making.

For the “performed” versus “not performed” recalculated data, time data for 96X70 in aggregate showed median times of 30/60/30, totaling 120 minutes. These data points were exactly the same for those who have performed the service, and for those who indicated they have never performed the service, the only difference was a median pre-time of 27 minutes, which in turn brought the total time down to 117 minutes. For the data on the estimated RVW, the median value in the aggregate data for 96X70 was 2.60 and the 75th percentile was 3.00. These RVW values were exactly the same for the 50 survey respondents who indicated they have performed the service, and for those 25 respondents who said they’d never performed the service, the 25th percentile RVW at 2.60, the median at 3.00 and the 75th percentile at 3.06. In summary, the updated performance rate data reveals that there is very little variation in the data across all three (3) cohorts. This also shows that the survey conducted yielded strong, consistent data, further supporting our time and valuation recommendations for this service.

Additionally, the re-calculated data for those survey respondents who indicated that they have performed the service results in a median service performance rate of 19 for 96X70. It should be noted however, that although these service performance rates may still seem low, this service is provided over 8-12 sessions. Therefore, a performance rate of 19 means the service was provided to 19 groups, totaling 152-228 sessions provided by the physician/QHP.

We had 33 respondents who indicated they had performed 96X70 in the last 12 months. The top and second KRS codes were the same as the overall data, with 90846 being selected by 64% (21/33) respondents and 90847 being selected by 21% (7/33) respondents. The aggregate data was consistent with the data from the overall survey, with the median RVW at 2.56, and median surveyed times of 25/60/30.

Additionally, the 12-month performance data showed a median service performance rate of 20 for 96X70. It should be noted however, that although these service performance rates may still seem low, this service is
provided over 8-12 sessions. Therefore, a performance rate of 20 means the service was provided to 20 groups, totaling 160-240 sessions provided by the physician/QHP.

**Custom Question Survey Results**

As noted previously under the Survey Process section of our rationale, approval was granted by the RUC Research Subcommittee, to modify question 5 on the survey instrument to request that respondents value the service based on the entire group, not the individual patient. Approval was also granted to add custom questions to ascertain the typical time spent performing the entire service and the typical number of patients represented in the group.

**Custom Question 1 – Total Time/Units for XXX base survey code and ZZZ add-on survey code(s)**

The first custom question asked survey participants to indicate the total amount of time they spend performing the entire service from start to finish (including the base code and all units of the add-on code) to allow capturing the total time and work involved in each group-based service.

The responses to this custom question regarding the typical number patients represented by their parent(s)/caregiver(s) in a typical group session, are summarized below:

<table>
<thead>
<tr>
<th>Min.</th>
<th>25th Percentile</th>
<th>Median</th>
<th>75th Percentile</th>
<th>Max.</th>
</tr>
</thead>
<tbody>
<tr>
<td>30 minutes</td>
<td>60 minutes</td>
<td>90 minutes</td>
<td>90 minutes</td>
<td>180 minutes</td>
</tr>
</tbody>
</table>

Also, as seen in the table below, based on the 12-month performance rate data, the total time, in minutes, it takes to perform the service, was very consistent with the overall survey data:

<table>
<thead>
<tr>
<th>Min.</th>
<th>25th Percentile</th>
<th>Median</th>
<th>75th Percentile</th>
<th>Max.</th>
</tr>
</thead>
<tbody>
<tr>
<td>55 minutes</td>
<td>75 Minutes</td>
<td>90 minutes</td>
<td>90 minutes</td>
<td>180 minutes</td>
</tr>
</tbody>
</table>

Based on the responses from the survey respondents, the typical length of this service is between 60-90 minutes; therefore, it can be expected that the service will be reported with either a single unit of the 96X70 for a 60 minute service, or one (1) unit of 96X70, and two (2) units of the 96X71 for a 90 minute service.

**Custom Question 2 – Typical Number of Patients Represented in the Group**

The second custom question asked survey participants to indicate the typical number of identified patients represented by their parent(s)/caregiver(s) during a typical multi-family group behavioral management/modification training group session.

What is the typical number of patients represented by their parent(s)/caregiver(s) in a typical group session for survey base code 96X70 *Multiple-family group behavior modification/management training for guardians/caregivers of a patient with a mental or physical health diagnosis, administered by physician or other qualified nonphysician health care professional (without the patient present), face-to-face with multiple sets of guardians/caregivers; initial 60 minutes*?

The responses to this custom question regarding the typical number patients represented by their parent(s)/caregiver(s) in a typical group session, are summarized below:

<table>
<thead>
<tr>
<th>Min.</th>
<th>25th Percentile</th>
<th>Median</th>
<th>75th Percentile</th>
<th>Max.</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>4</td>
<td>6</td>
<td>8</td>
<td>15</td>
</tr>
</tbody>
</table>
Also, as seen in the table below, based on the 12-month performance rate data, the typical number patients represented by their parent(s)/caregiver(s) in a typical group session, was very consistent with the overall survey data:

<table>
<thead>
<tr>
<th>Min.</th>
<th>25th Percentile</th>
<th>Median</th>
<th>75th Percentile</th>
<th>Max.</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>4</td>
<td>6</td>
<td>8</td>
<td>19</td>
</tr>
</tbody>
</table>

With six (6) identified patients represented in a group of parent(s)/caregiver(s) receiving behavior modification and management training, a typical series of training sessions would include two (2) parent(s)/caregiver(s) representing each identified patient, or a total of 12 parent(s)/caregiver(s) participating in the group-based series of sessions.

**Response to reviewer comments:** A comment was made by one of our reviewers related to how number of RVUs generated is dependent upon the number of patients represented in the group. Another reviewer asked whether there needed to be any limits on the number of patients that can be represented in a single group. Upon further analysis, the surveying specialties found when comparing the data in aggregate to those survey respondents who indicated they had “performed” or “not performed” this service, the typical number of patients represented in the group remained the same.

**Recommendations**

In summary, based on strong support from our overall survey data as well as consistency with the 12-month performance rate data, **we recommend the survey median RVW of 2.60 with 10 minutes pre-, 60 minutes intra-, and 20 minutes post-time for a total time of 90 minutes for 96X70 (for the entire group). When divided by the typical number of patients represented in a group (6), the per patient recommendations are 0.43 RVUs with 2 minutes pre-, 10 minutes intra-, and 3 minutes post-time for a total time of 15 minutes.**

---

**SERVICES REPORTED WITH MULTIPLE CPT CODES**

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - [ ] The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - [ ] Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - [ ] Multiple codes allow flexibility to describe exactly what components the procedure included.
   - [ ] Multiple codes are used to maintain consistency with similar codes.
   - [ ] Historical precedents.
   - [ ] Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

<table>
<thead>
<tr>
<th>CPT Code</th>
<th>Global</th>

<td>15</td>
<td>0</td>
</tr>
</tbody>
</table>

---

**FREQUENCY INFORMATION**
How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed)

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

<table>
<thead>
<tr>
<th>Specialty</th>
<th>How often?</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clinical Psychology</td>
<td>Commonly</td>
</tr>
<tr>
<td>Registered Dietitian/Nutrition Professional</td>
<td>Commonly</td>
</tr>
<tr>
<td>Child &amp; Adolescent Psychiatry</td>
<td>Commonly</td>
</tr>
</tbody>
</table>

Estimate the number of times this service might be provided nationally in a one-year period? 260000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. A typical course of treatment is 8 sessions per cohort. If a physician/QHP provides 4 cohorts per year, that would be 32 sessions per year. With the survey median data showing that there are typically 6 patients represented in each of the annual 32 sessions then, if we assume that 10% of our combined survey sample (10,960) utilized the codes, then we estimate the national utilization to be 200,000 base units/year.

<table>
<thead>
<tr>
<th>Specialty</th>
<th>Frequency</th>
<th>Percentage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clinical Psychology</td>
<td>75000</td>
<td>28.84 %</td>
</tr>
<tr>
<td>Registered Dietitian Nutritionists</td>
<td>165000</td>
<td>63.46 %</td>
</tr>
<tr>
<td>Child &amp; Adolescent Psychiatry</td>
<td>20000</td>
<td>7.69 %</td>
</tr>
</tbody>
</table>

Estimate the number of times this service might be provided to Medicare patients nationally in a one-year period? 100,000
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. When comparing utilization of existing codes, AND believes that 2019 utilization of G0109 would be similar to utilization of the new services while APA and AACAP believe current utilization for 90846 would be similar. Calculating for differences in time between the existing and surveyed codes yeild the estimated utilization in Medicare.

<table>

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:
Vignette #1 - Used by APA & AACAP:
During the group-based behavior management/modification training, the parent(s)/caregiver(s) of a 7-year-old male patient with attention-deficit/hyperactivity disorder and Oppositional Defiant Disorder, received training on monitoring and coping with the identified patient’s symptoms of inattention, hyperactivity and impulsiveness, and facilitating positive behavior changes. An additional 15 minutes, beyond the first 60 minutes, was required to complete group behavior management/modification training on improving overall symptom management and functioning.

[Note: This is an add-on service. Only consider the additional physician/QHP work beyond the work separately reported with base code 96X70.]

Vignette #2 - Used by AND:
During the group-based behavior management/modification training, the parent(s)/caregiver(s) of a 10-year-old male patient with obesity, limited variety of food intake, limited physical activity and a family history of Type 2 diabetes received training. An additional 15 minutes was required.

[Note: This is an add-on service. Only consider the additional physician/QHP work beyond the work separately reported with base code 96X70.]

Percentage of Survey Respondents who found Vignette to be Typical: **84%**

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital **0%**, In the ASC **0%**, In the office **12%**

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day **0%**, Overnight stay-less than 24 hours **0%**, Overnight stay-more than 24 hours **0%**

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day **0%**

Description of Pre-Service Work:

Description of Intra-Service Work: Continue multiple-family group–based session of behavior training intervention for parent(s)/caregiver(s), including verbal instruction (didactic discussion and Socratic questioning), video, and live demonstrations, role-playing, and feedback sessions to learn how to: set realistic and age-appropriate expectations for the identified patient’s behavior; reinforce positive/healthy behaviors to improve social and psychological functioning and physical health; and reduce or modify negative behaviors that are impairing function and treatment progress.

Description of Post-Service Work:

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC’s rationale, please review the separate RUC recommendation document.
Background

Caregiver Behavioral Management/Modification Training is a highly specialized service that requires the clinical expertise of a physician or qualified health care professional (QHP) to train parent(s)/caregiver(s) how to utilize behavioral interventions, strategies, and techniques to address and effectively manage behavioral problems impacting an identified patient’s mental and/or physical health diagnosis. The service is offered in cases where the provider believes psychosocial intervention (typically and most effectively provided through parent/caregiver behavioral modification/management training) is needed for the benefit of the patient to help increase effectiveness and therapeutic benefit for the patient’s condition.

While this service may seem similar to existing Psychotherapy or Health Behavior Assessment and Intervention (HBAI) services, parent/caregiver behavioral management/modification training services are unique for many reasons. Primarily, the surveyed codes represent a service that is provided to parent(s)/caregiver(s) from multiple families who meet for a series of group-based sessions, conducted by a physician/QHP. While the identified patients are not present during the service, the behavioral management/modification training the parent(s)/caregiver(s) receive is solely for the benefit of the patient. The emphasis is placed on helping parent(s)/caregiver(s) develop highly structured technical skills to deal with specific problem behaviors exhibited by the identified patients.

Behavioral management/modification training is also unique in that it is not a diagnosis-specific service. Psychotherapy services are intended to be used for patients who present with a primary mental health diagnosis, while Health Behavior Assessment and Intervention (HBAI) services are intended for patients who present with a primary physical health diagnosis. The surveyed codes are typically provided to a cohort of parent(s)/caregiver(s) from multiple families over a series of eight (8) to twelve (12) closed group sessions. The participants represent identified patients that share the same or similar diagnosis.

Using our vignettes as an example, a parent/caregiver of a patient diagnosed with ADHD attends group-based behavioral management/modification training with parent(s)/caregiver(s) from multiple other families, who represent patients who have also been diagnosed with ADHD. They would not be placed in a multi-family group dedicated to addressing behavioral management/modification training for pediatric patients with obesity.

While the two (2) vignettes used in our survey process both focused on pediatric patients, a large body of scientific literature exists which describes the efficacy and effectiveness of behavioral modification and management training for caregivers of patients across the lifespan. Caregiver training for patients with dementia, for example, focuses on specific behaviors the patient exhibits, and involves approaches such as modifying patient and/or caregiver cognitions, behaviors, or environments, or strategies for reducing a patient’s increased vulnerability to their environment.

The CPT Editorial Panel approved this new base/add code pair at their February 2021 meeting to reflect the physician/QHP work involved in providing multiple-family group-based services to parent(s)/caregiver(s) (without the patient present) for which there was no existing CPT code available to capture this provision of clinical service.

The surveyed code 96X71; Multiple-family group behavior management/modification training for guardians/caregivers of patients with a mental or physical health diagnosis, administered by physician or other qualified health care professional (without the patient present), face-to-face with multiple sets of guardians/caregivers; each additional 15 minutes (List separately in addition to code for primary service), is an 15-minute add-on code to the base service, code 96X70, which is reported for the first 60 minutes of behavior management/modification training. Based on feedback from those that completed the RUC survey, the survey median value for the length of a single session of this service was 90 minutes and the typical number of identified patients represented in a group was six (6); therefore, for a typical single session, we anticipate physicians/QHPs to report one unit of the base code (96X70) and two units of the add-on code (96X71) per patient.

Survey Process

APA, AND, and AACAP sought the approval of the RUC’s Research Subcommittee prior to fielding their surveys. The subcommittee granted approval for modification of the survey tools, including the following items:
• Providing thorough review and feedback on appropriate codes to include in our Reference Service List. All codes recommended for deletion from our initial draft of the RSLs were removed and all codes recommended for addition were added to our final versions.
• Based on the subcommittee’s recommendation, we conducted the survey with two (2) separate RSLs:
  o One dedicated for use with the base code (96X70) which has an XXX global period, and
  o A second dedicated for use with the add-on code (96X71) which has an ZZZ global period.
• Approval of our request to utilize a secondary vignette which described the service provided to parent(s)/caregiver(s) of a pediatric patient with obesity. This vignette was only approved for use by survey respondents from AND.
• Combining the XXX – Therapy survey tool with the standard ZZZ survey template and the time-based code template to survey
• Replacing the term “physician” with “physician/qualified health care professional” to address all provider types being surveyed.
• Minor language changes throughout the survey to ask the respondents to base their time and RVU estimates on the entire group session rather than calculating them on a per patient basis.
• Adding two (2) custom questions to the survey tool:
  o The first custom question asked survey participants to indicate the total amount of time they spend performing the entire service from start to finish (including the base code and all units of the add-on code) to allow capturing the total time and work involved in each group-based service.
  o The second custom question asked survey participants to indicate the typical number of identified patients represented by their parent(s)/caregiver(s) during a typical multi-family group behavioral management/modification training group session.

All three (3) specialty societies sent surveys to a random sample of applicable subsets within their membership base. The combined sample size for the survey was 10,906. APA’s sample included 1,262 members randomly selected from Division 37 – Society for Child and Family Policy and Practice, Division 53 – Society of Clinical Child and Adolescent Psychology and Division 54 – Society for Pediatric Psychology. AND’s overall sample size included 8,600 members, representing a random sampling of members from 11 Dietetic Practice Groups, representing individuals providing clinical services to patients of all ages and physical health diagnoses included in the CPT Code Change Application, including pediatric patients with obesity. AACAP’s survey sample combined a random sample the general membership and members of the Collaborative and Integrated Care, Family, and Systems of Care Committees with a sample size of 1,044 people.

Analysis and Recommendations from the Expert Panel – 96X71

An expert panel was convened with the RUC and HCPAC advisors and alternate advisors from all three surveying specialty societies, as well as practitioners from academic, and hospital-based practices, who are currently offering these services in adult and pediatric patient populations. The expert panel reviewed survey data and developed the recommendations.

The use of two (2) vignettes was approved by the Research Subcommittee for use in the survey of these services. The first vignette, used by survey respondents from APA and AACAP, described a patient with a mental health diagnosis, and 90% (53/59) of the respondents found the following described their typical patient: During the group-based behavior management/modification training, the parent(s)/caregiver(s) of a 7-year-old male patient with Attention Deficit Hyperactivity Disorder and Oppositional Defiant Disorder, received training on monitoring and coping with the identified patient's symptoms of inattention, hyperactivity and impulsiveness, and facilitating positive behavior changes. An additional 15 minutes, beyond the first 60 minutes, was required to complete group behavior management/modification training on improving overall symptom management and functioning.

The second vignette, used by survey respondents from AND, described a patient with a physical health diagnosis, and 73% (11/15) of the respondents found the following to describe their typical patient: During the group-based behavior management/modification training, the parent(s)/caregiver(s) of a 10-year-old male patient with obesity, limited variety of food intake, limited physical activity and a family history of Type 2 diabetes received training. An additional 15 minutes was required.
When combined, 86% (64/74) of our survey respondents found the vignettes to be typical; however, it should be noted that five (5) APA members commented that they did not find the vignette to be typical because they typically provide behavioral management/modification training to the parent(s)/caregiver(s) of patients with physical health diagnosis (e.g. obesity); therefore, given the option, the secondary vignette that was approved by the Research Subcommittee for use only by AND’s survey respondents, would have been selected, increasing our combined approval rate to 95%.

**Time Recommendations**

Based on review of the survey results, our expert panel believed that the survey respondents saw an analogous relationship between the surveyed code and existing add-on codes in the family of Health Behavior Assessment and Intervention (HBAI) services. Of the 75 completed surveys, CPT code 96171; Health behavior intervention, family (without the patient present), face-to-face; each additional 15 minutes (List separately in addition to code for primary service), was selected as the key reference service by 75% (56/75) of respondents. Of the remaining survey respondents, 74% (14/19) selected CPT code 96168; Health behavior intervention, family (with the patient present), face-to-face; each additional 15 minutes (List separately in addition to code for primary service) as their key reference service. The intra-service survey median time for 96X71 was 15 minutes, as is the intra-service time for each of the HBAI add-on codes.

When compared to the 12-month performance data, the intra-time estimation is very consistent with the overall survey data, yielding a median intra-time of 15 minutes.

For 96X71, the expert panel recommends 15 minutes of intra-service time for the entire group, or 3 minutes intra-service time per identified patient represented by their parent(s)/caregiver(s) during behavioral management / modification training services.

**RVW Recommendations**

*Response to reviewer comments:* The expert panel determined that the 75th percentile value of 1.00 was the most appropriate value for this service; however, based on feedback from our reviewers as well as other members of Facilitation Committee #2, we have revised our original recommendation.

For 96X71, the expert panel recommends the survey median RVW value of 0.73 for the entire group, or 0.12 per identified patient represented by their parent(s)/caregiver(s) during behavioral management / modification training services.

**Additional Comments**

*Performance Rate*

The surveying specialty societies conducted a RUC survey to value the newly created base/add-on code pair 96X70 and 96X71 which describe Caregiver Behavior Management/Modification Training. Upon initial analysis, the survey data revealed a median performance rate of zero for 96X71. The median performance rate of zero for 96X71.

Of the 75 total survey responses, 56 survey respondents selected code 96171 as the Top Key Reference Service, which had a median performance rate was 2. The Second Key Reference Service, code 96168, was selected by 14 survey respondents, and had a median performance rate of 10.

In the original version of the Survey Summary Spreadsheet, we presented the survey data in aggregate as well as for those survey respondents who had and had not performed the service in the last 12 months. For the subset of respondents who had performed the service in the last 12 months, the data showed a pre-time of 25 minutes, median intra-service time of 60 minutes, and post-service time of 30 minutes with a median RVW of 2.56 and the 75th percentile value at 2.75.

Subsequent to submission of our original recommendations, the surveying specialties felt that further analysis of the performance rate data was needed. Even though there currently is no mechanism for reporting the service, we believed this service was more commonly performed than indicated in the survey data.
Presented in the updated version of our Survey Summary Spreadsheet is recalculated performance rate information for 96X71, showing the data in aggregate for all 75 survey respondents, as well as for the 50 survey respondents who said they had performed the service (either in the last 12 months and/or in the last 5 years), and those 25 survey respondents who indicated they have never performed this service. Additionally, we have included a second tab in the summary spreadsheet that only includes the 12-month performance rate data for 96X71. We felt presenting the data as “performed” versus “not performed” as well as the 12-month data in isolation was a more valid and useful presentation to assist the RUC in its decision-making. When compared to the data in aggregate, the updated performance rate data reveals significant consistency across all three (3) data sets, with very little variation in the estimated times or RVW values.

For the “performed” versus “not performed” recalculated data, the survey data for 96X71 for all 75 survey respondents showed the median intra-time was 15 minutes, with the median RVW was 0.73, and the 75th percentile at 1.00. The median intra-time was the same for the 50 survey respondents who indicated they had performed the service, with the median RVU valued at 0.70. For those 25 respondents who indicated they had never performed the service, the 25th percentile intra-time was 15 minutes, and the median was 17 minutes, and the estimated RVW was 0.75. In summary, the updated performance rate data reveals that there is very little variation in the data across all three (3) cohorts. This also shows that the survey conducted yielded strong, consistent data, further supporting our time and valuation recommendations for of this service.

Additionally, the re-calculated data for those survey respondents who indicated that they have performed the service results in a median service performance rate of 20 for 96X71. It should be noted however, that although these service performance rates may still seem low, this service is provided over 8-12 sessions. Therefore, a performance rate of 20 means the service was provided to 20 groups, totaling 160-240 sessions provided by the physician/QHP.

We had 30 respondents who indicated they had performed 96X70 in the last 12 months. The top and second KRS codes were the same as the overall data, with 96171 being selected by 67% (20/30) respondents and 96168 being selected by 27% (8/30) respondents. The aggregate 12-month performance data was consistent with the data from the overall survey, with the median RVW at 0.70, and surveyed median intra-time at 15 minutes.

Additionally, the 12-month performance data showed a median service performance rate of 24 for 96X71. It should be noted however, that although these service performance rates may still seem low, this service is provided over 8-12 sessions. Therefore, a performance rate of 24 means the service was provided to 24 groups, totaling 192-288 sessions provided by the physician/QHP.

**Custom Question Survey Results**

As noted previously under the Survey Process section of our rationale, approval was granted by the RUC Research Subcommittee, to modify question 5 on the survey instrument to request that respondents value the service based on the entire group, not the individual patient. Approval was also granted to add custom questions to ascertain the typical time spent performing the entire service and the typical number of patients represented in the group.

*Custom Question – Total Time/Units for XXX base survey code and ZZZ add-on survey code(s)*

The first custom question asked survey participants to indicate the total amount of time they spend performing the entire service from start to finish (including the base code and all units of the add-on code) to allow capturing the total time and work involved in each group-based service.

**For the typical group, how much time do you personally spend performing this entire service from start to finish (96X70 and all increments of 96X71)? Please answer in minutes. Please do not count pre-service time (e.g., chart review) or post-service time (e.g., documentation).**

The intent of including this custom question was to determine the total time, in minutes, it takes to perform the service, as well as the typical number of add-on code units that would be reported, beyond the initial 60 minutes included in the base code, for a typical training session. The survey data collected is summarized below:

<table>
<thead>
<tr>
<th>Min.</th>
<th>25th Percentile</th>
<th>Median</th>
<th>75th Percentile</th>
<th>Max.</th>
</tr>
</thead>
</table>
The consistency in the data provided by our survey respondents allows us to better understand and anticipate how this service will be provided and reported by physicians/QHPs upon implementation.

**Custom Question 2 – Typical Number of Patients Represented in the Group**

The second custom question asked survey participants to indicate the typical number of identified patients represented by their parent(s)/caregiver(s) during a typical multi-family group behavioral management/modification training group session.

What is the typical number of patients represented by their parent(s)/caregiver(s) in a typical group session for survey base code 96X70, *Multiple-family group behavior modification/management training for guardians/caregivers of a patient with a mental or physical health diagnosis, administered by physician or other qualified nonphysician health care professional (without the patient present), face-to-face with multiple sets of guardians/caregivers; initial 60 minutes*?

The responses to this custom question regarding the typical number patients represented by their parent(s)/caregiver(s) in a typical group session, are summarized below:

<table>
<thead>
<tr>
<th>Min.</th>
<th>25th Percentile</th>
<th>Median</th>
<th>75th Percentile</th>
<th>Max.</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>4</td>
<td>6</td>
<td>8</td>
<td>15</td>
</tr>
</tbody>
</table>

Also, as seen in the table below, based on the 12-month performance rate data, the typical number patients represented by their parent(s)/caregiver(s) in a typical group session, was very consistent with the overall survey data:

<table>
<thead>
<tr>
<th>Min.</th>
<th>25th Percentile</th>
<th>Median</th>
<th>75th Percentile</th>
<th>Max.</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>4</td>
<td>6</td>
<td>8</td>
<td>19</td>
</tr>
</tbody>
</table>

**Recommendations**

In summary, based on our overall survey results, as well as consistency with the 12-month performance data, we recommend the survey median RVW of 0.73 with 0 minutes pre-, 15 minutes intra-, and 0 minutes post-time for a total time of 15 minutes for 96X71 (for the entire group), or 0.12 RVUs and 3 minutes of intra-time on a per patient basis.

**SERVICES REPORTED WITH MULTIPLE CPT CODES**

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions:

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)
   - [x] The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - [ ] Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - [ ] Multiple codes allow flexibility to describe exactly what components the procedure included.
   - [ ] Multiple codes are used to maintain consistency with similar codes.
   - [ ] Historical precedents.
   - [ ] Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the
CPT Code: 96X71

provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

3. CPT Code Global Work RVU Pre- Intra- Post-
4. 96X70 XXX 2.60 10 60 20
5. +96X71 ZZZ 0.73 0 15 0

**FREQUENCY INFORMATION**

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed)

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Clinical Psychology How often? Commonly
Specialty Registered Dietitian/Nutrition Professional How often? Commonly
Specialty Child & Adolescent Psychiatry How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 400,000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. We estimated that the national utilization for the base code, 96X70, to be 200,000 base units/year and considering our survey respondents indicated that the typical total time per session would be 90 minutes, we doubled that estimate for the add-on code units.

Specialty Clinical Psychology Frequency 150000 Percentage 37.50 %
Specialty Registered Dietitian Nutritionists Frequency 330000 Percentage 82.50 %
Specialty Child & Adolescent Psychiatry Frequency 40000 Percentage 10.00 %

Estimate the number of times this service might be provided to Medicare patients nationally in a one-year period? 200,000
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. We estimated that the Medicare utilization for the base code, 96X70, to be 100,000 base units/year and considering using the same methodology as we did for the national estimates, we doubled that estimate to meet the survey respondent's indication that the typical total time per session would be 90 minutes.

Specialty Clinical Psychology Frequency 50000 Percentage 25.00 %
Specialty Registered Dietitian Nutritionists Frequency 110000 Percentage 55.00 %
Specialty Child & Adolescent Psychiatry Frequency 40000 Percentage 20.00 %

Do many physicians perform this service across the United States? Yes

**Berenson-Eggers Type of Service (BETOS) Assignment**

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Evaluation Management

BETOS Sub-classification:
Specialist
Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number.

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. G0109

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:
FACILITY DIRECT PE INPUTS

CPT CODE(S): 96X70-96X71

SPECIALTY SOCIETY(IES): American Psychological Association, Academy of Nutrition and Dietetics (AND), & American Academy of Child and Adolescent Psychiatry (AACAP)

PRESENTER(S): Stephen Gillaspy, PhD, Sherry Barron-Seabrook, MD, Kai-ping Wang, MD, Karen Smith, MS, MBA, RD, LD, FAND, Eileen Myers, MPH, LDN, RDN, FAND, Scott Sperling, PsyD, Melissa Santos, PhD, Richard E.A. Loren, PhD

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

A consensus panel of experts from the American Psychological Association (APA), Academy of Nutrition and Dietetics (AND), and the American Academy of Child and Adolescent Psychiatry (AACAP) met by video conference to develop the practice expense input recommendations. The panel was comprised of the advisors and alternate advisors from the participating societies utilizing additional input obtained via email from experts from each of the societies providing the services in both facility and non-facility settings across the country.

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code, but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here (for service reviewed prior to the implementation of clinical activity codes, detail is not provided in the RUC database, please contact Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org for PE spreadsheets for your reference codes):

| Reference for 96X70: 90846 | Family psychotherapy (without the patient present), 50 minutes which was the key reference service selected by 76% of our survey respondents. |
| Reference for 96X71: 96171 | Health behavior intervention, family (without the patient present); face-to-face; each additional 15 minutes, which was the key reference service selected by 73% of our survey respondents. |

We also looked at PE for similar services deemed appropriate reference codes:

| 96164 | Health behavior intervention, group (2 or more patients), face-to-face; initial 30 minutes |
| 96165 | Health behavior intervention, group (2 or more patients), face-to-face; each additional 15 minutes |
| 96167 | Health behavior intervention, family (with patient present), face-to-face, initial 30 minutes |
| 96168 | Health behavior intervention, family (with patient present), face-to-face, each additional 15 minutes |
| 96170 | Health behavior intervention, family (without the patient present), face-to-face; initial 30 minutes |
| 96047 | Family psychotherapy (conjoint psychotherapy) (with patient present), 50 minutes |
| 90849 | Multiple-family group psychotherapy |
| 90853 | Group psychotherapy (other than of a multiple-family group) |
| G0109 | Diabetes outpatient self-management training services, group session (2 or more), per 30 minutes |
| 97804 | Medical nutrition therapy; group (2 or more individual(s)), each 30 minutes |

3. Is this code(s) typically reported with an E/M service?

   No.

4. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time:

   N/A

5. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies for the code family, please provide compelling evidence (please see PE compelling evidence
FACILITY DIRECT PE INPUTS

INVOICES

10. ☒ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

11. ☒ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

12. If you wish to include a supply that is not on the list (please see fourth worksheet in PE spreadsheet workbook) please provide a paid invoice. Identify and explain the invoice here:

   N/A

13. Are you recommending a PE supply pack for this recommendation? Yes or No X

   If Yes, please indicate if the pack is an established package of supplies as defined by CMS (eg, SA047 pack, E/M visit) or a pack that is commercially available?
14. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation. Please include the description, CMS supply code, unit, item quantity and unit price (if available). See documents two and three under PE reference materials on the RUC Collaboration Website for information on the contents of kits, packs and trays.

| N/A |

15. If you wish to include an equipment item that is not on the list (please see fifth worksheet in PE spreadsheet workbook) please provide a paid invoice. Identify and explain the invoice here:

| N/A |

16. Please provide an estimate of the useful life of the new equipment item as required to calculate the equipment cost per minute (please see fifth worksheet in PE spreadsheet workbook):

| N/A |

17. Have you recommended equipment minutes for a computer or equivalent laptop/integrated computer, equipment item computer, desktop, w-monitor, ED021 or notebook (Dell Latitute D600), ED038?
   a. If yes, please explain how the computer is used for this service(s).
   b. Is the computer used exclusively as an integral component of the service or is it also used for other purposes not specific to the code?
   c. Does the computer include code specific software that is typically used to provide the service(s)?

| N/A |

18. List all the equipment included in your recommendation and the equipment formula chosen (please see document titled Calculating equipment time). If you have selected “other formula” for any of the equipment please explain here:

19. If there is any other item(s) on your spreadsheet not covered in the categories above that require greater detail/explanation, please include here:

| N/A |

NONFACILITY DIRECT PE INPUTS

CPT CODE(S): 96X70-96X71

SPECIALTY SOCIETY(IES): American Psychological Association, Academy of Nutrition and Dietetics (AND), & American Academy of Child and Adolescent Psychiatry (AACAP)

PRESENTER(S): Stephen Gillaspy, PhD, Sherry Barron-Seabrook, MD, Kai-ping Wang, MD, Karen Smith, MS, MBA, RD, LD, FAND, Eileen Myers, MPH, LDN, RDN, FAND, Scott Sperling, PsyD, Melissa Santos, PhD, Richard E.A. Loren, PhD

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

A consensus panel of experts from the American Psychological Association (APA), Academy of Nutrition and Dietetics (AND), and the American Academy of Child and Adolescent Psychiatry (AACAP) met by video conference to develop the practice expense input recommendations. The panel was comprised of the advisors and alternate advisors from the participating societies utilizing additional input obtained via email from experts from each of the societies providing the services in both facility and non-facility settings across the country.

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code, but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here (for service reviewed prior to the implementation of clinical activity codes, detail is not provided in the RUC database, please contact Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org for PE spreadsheets for your reference codes):

| Reference for 96X70: 90846; Family psychotherapy (without the patient present), 50 minutes which was the key reference service selected by 76% of our survey respondents. |
| Reference for 96X71: 96171; Health behavior intervention, family (without the patient present); face-to-face; each additional 15 minutes, which was the key reference service selected by 73% of our survey respondents. |

We also looked at PE for similar services deemed appropriate reference codes:
96164: Health behavior intervention, group (2 or more patients), face-to-face; initial 30 minutes
96165: Health behavior intervention, group (2 or more patients), face-to-face; each additional 15 minutes
96167: Health behavior intervention, family (with patient present), face-to-face, initial 30 minutes
96168: Health behavior intervention, family (with patient present), face-to-face, each additional 15 minutes
96170: Health behavior intervention, family (without the patient present), face-to-face; initial 30 minutes
96047: Family psychotherapy (conjoint psychotherapy) (with patient present), 50 minutes
90849: Multiple-family group psychotherapy
90853: Group psychotherapy (other than of a multiple-family group)
G0109: Diabetes outpatient self-management training services, group session (2 or more), per 30 minutes
97804: Medical nutrition therapy; group (2 or more individual(s)), each 30 minutes

3. Is this code(s) typically reported with an E/M service?
Is this code(s) typically reported with the E/M service in the nonfacility? (Please see provided data titled Medicare Same Day NF EM Billed Together - NF Dom Spec in the RUC Review Resource Materials)

| No. New Codes. |

4. What specialty is the dominant provider in the nonfacility?
What percent of the time does the dominant provider provide the service(s) in the nonfacility? Is the dominant provider in the nonfacility different than for the global? (Please see provided data titled Medicare Same Day NF EM Billed Together - NF Dom Spec in the RUC Review Resource Materials)

| New codes. |
5. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time:

N/A

6. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies for the code family, please provide compelling evidence (please see PE compelling evidence guidelines) Please explain if the increase can be entirely accounted for because of an increase in physician time:

N/A

7. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (please see second worksheet in PE spreadsheet workbook), please explain the difference here:

N/A

8. How much time was allocated to clinical activity, obtain vital signs (CA010) prior to CMS increasing the clinical activity to 5 minutes for calendar year 2018? The standard for clinical activity, obtains vital signs remains 0, 3 and 5 based on the number of vital signs taken. Please provide a rationale for the clinical staff time that you are requesting for obtain vital signs here:

New codes. No vital signs are obtained for this service.

9. Please provide a brief description of the clinical staff work for the following:
   a. Pre-Service period:
      N/A
   b. Service period (includes pre, intra and post):
      No clinical staff work. Standard pre-service PE activities such as greeting parent(s)/caregiver(s) performed by administrative staff.
   c. Post-service period:
      N/A

10. Please provide granular detail regarding what the clinical staff is doing during the intra-service (of service period) clinical activity, assist physician or other qualified healthcare professional---directly related to physician work time or Perform procedure/service---NOT directly related to physician work time:
    N/A

11. If you have used a percentage of the physician intra-service work time other then 100 or 67 percent for the intra-service (of service period) clinical activity, please indicate the percentage and explain why the alternate percentage is needed and how it was derived.
    N/A
12. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities *(please see second worksheet in PE spreadsheet workbook)*:

N/A

13. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at [http://www.bls.gov](http://www.bls.gov).

N/A

**INVOICES**

14. ☒ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

15. ☒ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

16. If you wish to include a supply that is not on the list *(please see fourth worksheet in PE spreadsheet workbook)* please provide a paid invoice. Identify and explain the invoice here:

See attached paid invoice for the 2 inch 3 ring binder and set of 8 divider tabs purchased from an office supply vendor under a corporate office supply account.

17. Are you recommending a PE supply pack for this recommendation? Yes or No. If Yes, please indicate if the pack is an established package of supplies as defined by CMS (eg, SA047 pack, E/M visit) or a pack that is commercially available?

N/A

18. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation. Please include the description, CMS supply code, unit, item quantity and unit price (if available). See documents two and three under PE reference materials on the [RUC Collaboration Website](http://www.ruc.org) for information on the contents of kits, packs and trays.

N/A

19. If you wish to include an equipment item that is not on the list *(please see fifth worksheet in PE spreadsheet workbook)* please provide a paid invoice. Identify and explain the invoice here:

N/A

20. Please provide an estimate of the useful life of the new equipment item as required to calculate the equipment cost per minute *(please see fifth worksheet in PE spreadsheet workbook)*:

N/A
21. Have you recommended equipment minutes for a computer or equivalent laptop/integrated computer, equipment item computer, desktop, w-monitor, ED021 or notebook (Dell Latitude D600), ED038?
   a. If yes, please explain how the computer is used for this service(s).
   b. Is the computer used exclusively as an integral component of the service or is it also used for other purposes not specific to the code?
   c. Does the computer include code specific software that is typically used to provide the service(s)?

   N/A

22. List all the equipment included in your recommendation and the equipment formula chosen (please see document titled Calculating equipment time). If you have selected “other formula” for any of the equipment please explain here:

   Line 115: EF043 Set of 8 Chairs
   In the non-facility setting, this service is typically performed in the practice’s waiting room during non-office hours. Additional seating is needed for the entire duration of the service beyond what is typically available in the waiting room to accommodate the typical group size of 13 individuals (1 physician or QHP and 6 patients represented by 2 parents/caregivers each). In developing our recommendations, our expert panel felt it was typical to have 5 chairs available in the waiting room, hence we are requesting 8 additional chairs to accommodate the typical group size. In the facility setting, waiting rooms are typically larger or classroom/conference room space is typically available within the facility for use for this service. The total intra-service time of 60 minutes for the base code was divided by the typical group size (6) to yield 10 minutes. Similarly, the total intra-service time of 15 minutes for the add-on code was divided by the typical group size (6) to yield 2.5 minutes. This methodology is consistent with methodology used for the group reference service codes.

23. If there is any other item(s) on your spreadsheet not covered in the categories above that require greater detail/explanation, please include here:

   SK114 tissue (Kleenex): 2 tissues per patient represented per session (2/144 of a box).
   SK005 assessment monitoring instruments: An important feature of this service is self-reported monitoring data used to assess parent(s)/caregiver(s) effectiveness at facilitating desired behavior changes to reach care plan goals. Standardized tools with simple scoring guidelines are used to support self-assessment by the parents/caregivers and support decision-making by the physician/QHP on the design of each service session. An instrument is used at the beginning and end of each session.
   SK057: paper, laser printing: In a typical session, parent(s)/caregiver(s) are provided with printed materials, generally reproduced by the practice, on the behavior management/training techniques introduced and practiced during the session as a reference for use when applying/practicing the techniques with the patient. Written homework assignments are provided along with written tools for documenting these assignments (e.g., behavior logs, journals, other tracking tools).
   New Items: 2” 3-ring binder and set of 8 dividers: Per our expert panel and providers they consulted who have provided this service, it is typical to provide the parent(s)/caregiver(s) with a 3-ring binder at the first session to store materials throughout the duration of sessions. With the typical service consisting of 8 sessions, dividers are used to separate content for each session. The binder with dividers is provided at the first session, hence we divided the total cost by 8. At the time we originally submitted our PE spreadsheet and SOR, while our expert panel felt a binder was

Following the implementation of the revisions to the Evaluation and Management (E/M) office visits (99201-99215) for the CPT 2021 code set, the CPT/RUC Workgroup on E/M met twelve times in 2020 and early 2021 to standardize the rest of the E/M sections in the CPT code set. The CPT/RUC Workgroup on E/M was committed to changing the current coding and documentation requirements for E/M visits to simplify the work of the health care provider and improve the health of the patient. To achieve these goals, the Workgroup set forth the following guiding principles related to the group’s ongoing work product:

1. To decrease administrative burden of documentation and coding and align CPT and CMS whenever possible
2. To decrease the need for audits
3. To decrease unnecessary documentation in the medical record that is not needed for patient care
4. To ensure that payment for E/M is resource-based and that there is no direct goal for payment redistribution between specialties.

In February 2021, the CPT Editorial Panel revised the five emergency department visit codes to align with the principles included in the E/M office visit services by documenting and selecting level of service based on medical decision making.

Compelling Evidence

RUC members expressed concern with comparing the specialty society proposed values with the 2021 CMS values which were increased by CMS prior to receiving any input from the RUC. Although the RUC recommendations below are budget neutral, if making no adjustments to utilization assumptions for these revised codes, the RUC had concurred that it would be beneficial for the societies to still present compelling evidence arguments. The specialty societies presented two points for compelling evidence that the work of providing emergency department services has changed. First, a flaw in the methodology used in the current valuation; and second, a change in technology due to the implementation and more recent changes to EHRs leading to an increase in workflow disruption and task switching for emergency department services.

Flaw in the Methodology Used in the Current Valuation

In 2021, the revisions and updated relative value units (RVUs) went into effect for E/M office visit codes (99202-99215). Concurrently, even though the emergency department Services were not revised for the CPT cycle or reviewed by the RUC for 2021, CMS decided to increase the RVUs of the emergency department services to remain either equal or slightly higher than the corresponding level of a new patient office visit codes. In February 2021, the CPT Editorial Panel revised the five emergency department visit codes to align with the principles included in the E/M office visit services by documenting and selecting level of service based on medical decision making. Hypothetically, had the 2020 valuation of emergency department services remained in effect for 2021, that would have resulted in a rank order anomaly between office visit services and emergency medicine services. The RUC noted that the level of decision making required for 99282-99285 mirrors the corresponding new patient office visit codes 99202-99215. However, the methodology employed by CMS did not rely on a standardized survey or a crosswalk methodology.
Change in Technology
According to National Medical Ambulatory Care Survey (NAMCS) data, in 2017, 90 percent of emergency physicians used electronic health records exclusively, 8 percent used them partially, and 2% used only paper records. Relative to the 2016 data, which was not yet available when the emergency department services were reviewed by the RUC in 2018, the percentage of emergency physicians exclusively using electronic health records increased by 10 percent in only one year. Separately, in 2008, the corresponding numbers were 23 percent, 49 percent, and 28 percent. These differences demonstrate that the technology used to deliver emergency care has changed dramatically. The EHR contains more data than paper records, most of which must be reviewed including for drug-drug interactions and, with increasing use of homeopathic substances, drug-substance interactions. The use of EHRs has increased physician work by increasing the time physicians spend documenting the medical record. The centralization of data is in the best interest of patients and will help support quality care; however, this centralization does increase the time that physicians spend reviewing patient information.

The specialties claimed that EHR adoption has led to a decrease in workflow efficiency. Emergency physician workflow has been particularly impacted by relatively more recent updates to EHR systems; these systems now generate large numbers of alerts for the provider to review. According to a recent study published in the Journal of Emergency Medicine on the impact of EMR alerts on emergency physician workflow, 78 percent of emergency department patient encounters involved alerts. 70 percent of that subset of patient encounters trigger multiple alerts. In addition, just 2 percent of these alerts result in a change in clinical management. The specialties noted that this recent increase in workflow disruption and task switching for emergency department services has increased their intensity and complexity, the stress for providers and the risk for patients.

The RUC agrees that there is compelling evidence of 1) flaw in the methodology used in the current 2021 valuation of the services and 2) technology changes with the growth in use of EHRs and more recent changes to EHRs leading to an increase in workflow disruption and task switching for emergency department services.

Intra-service Only time on Date of Encounter
Time is not a descriptive component for the emergency department levels of E/M services because emergency department services are typically provided on a variable intensity basis, often involving multiple encounters with several patients over an extended period of time. Therefore, it is often difficult to provide accurate estimates of the time spent face-to-face with the patient. As was also done for the office visit services in 2019 and all other E/M services, all face-to-face and non-face-to-face physician or qualified healthcare professional (QHP) work on the date of the encounter was determined to be intra-service work and of the same intensity. In addition, as all the pre-service and post-service work for an emergency department visit would occur on the date of the encounter, all time is considered intra-time or total time. This is consistent with all inpatient and observation hospital codes, as the reporting of these inpatient services is based on total time on the date of encounter.

---

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.
99281 Emergency department visit for the evaluation and management of a patient, that may not require the presence of a physician or other qualified health care professional
The RUC reviewed the survey results from 158 emergency physicians, pediatricians and advanced practice nurses for the lowest level emergency department visit code, CPT code 99281, and determined that the survey median value of 0.25 work RVUs appropriately accounts for the physician work typically required to perform this service. The RUC recommended an intra-service and total time of 10 minutes for 99281, 3 minutes higher than the total time of reference code 99211 Office or other outpatient visit for the evaluation and management of an established patient, that may not require the presence of a physician or other qualified health care professional. Usually, the presenting problem(s) are minimal (work RVU= 0.18, total time of 7 minutes). The RUC noted that the survey code has a disparate typical patient that may require slightly more time than the typical patient for 99211.

To further support a value of 0.25, the RUC compared the survey code to MPC code 99406 Smoking and tobacco use cessation counseling visit; intermediate, greater than 3 minutes up to 10 minutes (work RVU= 0.24, intra-service and total time of 7 minutes) and noted that the survey code typically involves 3 more minutes of intra-service and total time, supporting a value of 0.25 for the survey code. The RUC concluded that CPT code 99281 should be valued at the median work RVU as supported by the survey. The RUC recommends a work RVU of 0.25 for CPT code 99281.

99282 Emergency department visit for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and straightforward medical decision making
The RUC reviewed the survey results from 162 emergency medicine physicians, pediatricians and advanced practice nurses and determined that a value between the survey 25th percentile of 0.80 and survey median of 0.99 work RVUs would appropriately account for the work required to perform this service. Therefore, the RUC recommends crosswalking CPT code 99282 to top key reference service code 99202 Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and straightforward medical decision making. When using time for code selection, 15-29 minutes of total time is spent on the date of the encounter (work RVU= 0.93, total time of 20 minutes). The RUC noted that this value is also the current CMS value. The RUC recommends 18 minutes of intra-service and total time, as supported by the survey. Although, both services involve straightforward medical decision making and would be assigned the same absolute work value, the emergency department service requires a higher work intensity due to the service typically involving somewhat less time. The acute and unscheduled care of multiple undifferentiated patients simultaneously make emergency department services relatively more intense and complex to perform relative to the analogous level of a new patient office visit. The physician/QHP has little to no control over incoming volume or workflow which increases psychological stress.

For additional support, the RUC compared the survey code to CPT code 73700 Computed tomography, lower extremity; without contrast material (work RVU= 1.00, total time of 20 minutes) and noted that the survey code typically involves slightly less time and slightly less physician work. The RUC concluded that CPT code 99282 should be valued based on a direct work RVU crosswalk to CPT code 99202 which falls between the survey median and 25th percentile. The RUC recommends a work RVU of 0.93 for CPT code 99282.

99283 Emergency department visit for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and low level of medical decision making
CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.
The RUC reviewed the survey results from 163 emergency medicine physicians, pediatricians and advanced practice nurses and determined that a value between the survey 25th percentile of 1.50 and survey median of 1.75 would appropriately account for the work required to perform this service. Therefore, the RUC recommends a direct work RVU crosswalk for CPT code 99283 to top key reference service code 99203 Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and low level of medical decision making. When using time for code selection, 30-44 minutes of total time is spent on the date of the encounter (work RVU= 1.60, total time of 35 minutes). The RUC noted that this value is also the current CMS value. The RUC recommends 30 minutes of intra-service and total time. Although, both services involve a low level of medical decision making and would be assigned the same absolute work value, the emergency department service requires a higher work intensity due to the service typically involving somewhat less time. The acute and unscheduled care of multiple undifferentiated patients simultaneously make emergency department services relatively more intense and complex to perform relative to the analogous level of a new patient office visit. The physician/QHP has little to no control over incoming volume or workflow which increases psychological stress.

For additional support, the RUC also compared the survey code to MPC code 78072 Parathyroid planar imaging (including subtraction, when performed); with tomographic (SPECT), and concurrently acquired computed tomography (CT) for anatomical localization (work RVU= 1.60, total time of 30 minutes) and noted that both services involve the same amount of total time and a similar amount of physician work. The RUC concluded that CPT code 99283 should be valued based on a direct work RVU crosswalk to CPT code 99203 which falls between the survey median and 25th percentile. The RUC recommends a work RVU of 1.60 for CPT code 99283.

99284 Emergency department visit for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making

The RUC reviewed the survey results from 163 emergency medicine physicians, pediatricians and advanced practice nurses and determined that the survey median overestimated the work typically required to perform this service. After thorough discussion, the RUC recommends the survey 25th percentile work RVU of 2.60 for CPT code 99284 which is also the same work value as top key reference code 99204 Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. When using time for code selection, 45-59 minutes of total time is spent on the date of the encounter (work RVU= 2.60, total time of 60 minutes). The RUC recommends 40 minutes of intra-service and total time as supported by the survey. The RUC compared the survey code to top key reference code 99204 and noted that, although it concurs with the presenting specialties that 99284 is a more intense service to perform, 99204 typically involves 20 more minutes of total time. Although both services involve moderate medical decision making and would be assigned the same absolute work value, the emergency department service requires a higher work intensity due to the service typically involving less time. The acute and unscheduled care of multiple undifferentiated patients simultaneously make emergency department services relatively more intense and complex to perform relative to the analogous level of a new patient office visit. The physician/QHP has little to no control over incoming volume or workflow which increases psychological stress. The RUC concluded that CPT code 99284 should be valued at the 25th percentile work RVU as supported by the survey. The RUC recommends a work RVU of 2.60 for CPT code 99284.

99285 Emergency department visit for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and high level of medical decision making

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.
The RUC reviewed the survey results for 162 emergency medicine physicians, pediatricians and advanced practice nurses for the highest level emergency department visit code, CPT code 99285, and determined that the survey median value of 4.00 appropriately accounts for the physician work required to perform this service. The RUC noted that this value is also the current CMS value. The RUC recommends 60 minutes of intra-service and total time, 5 minutes more than the current time assigned to this service. The RUC noted that a work value of 4.00 would appropriately assign 99285 a work value that reflects an intensity higher than 99284. The RUC compared the survey code to critical care visits 99291 Critical care, evaluation and management of the critically ill or critically injured patient; first 30-74 minutes (work RVU= 4.50, total time of 70 minutes) and add-on code 99292 Critical care, evaluation and management of the critically ill or critically injured patient; each additional 30 minutes (List separately in addition to code for primary service) (work RVU=2.25, total time of 30 minutes) and noted that a value of 4.00 for the highest level ED visit code maintains appropriate relativity with critical care services. The RUC also compared the survey code to top key reference service code 99205 Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and high level of medical decision making. When using time for code selection, 60-74 minutes of total time is spent on the date of the encounter (work RVU=3.50, total time of 88 minutes) and noted that although both services involve a high level of medical decision making and the reference code involves more total time, it is appropriate to assign the highest level ED visit code a higher work value. 76 percent of the survey respondents that selected 99205 as their top key reference service had indicated that a level 5 emergency department visit is more intense and complex to perform (with another 11 percent rating 99285 as somewhat more intense/complex). The acute and unscheduled care of multiple undifferentiated patients simultaneously make emergency department services relatively more intense and complex to perform relative to the analogous level of a new patient office visit. The physician/QHP has little to no control over incoming volume or workflow which increases psychological stress. The RUC concluded that CPT code 99285 should be valued at the median work RVU as supported by the survey. The RUC recommends a work RVU of 4.00 for CPT code 99285.

Work Neutrality
The RUC’s recommendation for this family of codes will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

Practice Expense
No direct practice expense inputs are recommended for CPT codes 99281-99285 as they are facility-only services.
Evaluation and Management
Emergency Department Services
New or Established Patient

The following codes are used to report evaluation and management services provided in the emergency department. No distinction is made between new and established patients in the emergency department.

An emergency department is defined as an organized hospital-based facility for the provision of unscheduled episodic services to patients who present for immediate medical attention. The facility must be available 24 hours a day.

For critical care services provided in the emergency department, see Critical Care notes and 99291, 99292. Critical care and emergency department services may both be reported on the same day when after completion of the emergency department service, the condition of the patient changes, and critical care services are provided.

For evaluation and management services provided to a patient in an observation status area of a hospital, see 99221, 99222, 99223 for the initial observation encounter and 99231, 99232, 99233, 99238, 99239 for subsequent observation or inpatient encounters.

For hospital inpatient or observation or inpatient care services (including admission and discharge services), see 99234-99236.

To report services when a patient is admitted to hospital inpatient, or observation status, or to a nursing facility in the course of an encounter in another setting, see Initial Hospital Inpatient or Observation Care or Initial Nursing Facility Care.

For procedures or services identified by a CPT code that may be separately reported on the same date, use the appropriate CPT code. Use the appropriate modifier(s) to report separately identifiable evaluation and management services and the extent of services provided in a surgical package.

If a patient is seen in the emergency department for the convenience of a physician or other qualified health care professional, use office or other outpatient services codes (99202-99215).

Coding Tip

Time as a Factor in the Emergency Department Setting

Time is not a descriptive component for the emergency department levels of E/M services because emergency department services are typically provided on a variable intensity basis, often involving multiple encounters with several patients over an extended period of time. Therefore, it is often difficult for physicians to provide accurate estimates of the time spent face to face with the patient.

**Coding Tip**

**Emergency Department Classification of New vs Established Patient**

No distinction is made between new and established patients in the emergency department. E/M services in the emergency department category may be reported for any new or established patient who presents for treatment in the emergency department.

*CPT Coding Guidelines, Evaluation and Management, Guidelines Common to All E/M Services, New and Established Patient*
CPT 2023 E/M Guidelines

Category I
Evaluation and Management (E/M) Services Guidelines

In addition to the information presented in the Introduction, several other items unique to this section are defined or identified here.

E/M Guidelines Overview

The E/M guidelines have sections that are common to all E/M categories and sections that are category specific. Most of the categories and many of the subcategories of service have special guidelines or instructions unique to that category or subcategory. Where these are indicated, eg, “Hospital Inpatient and Observation Care,” special instructions are presented before the listing of the specific E/M services codes. It is important to review the instructions for each category or subcategory. These guidelines are to be used by the reporting physician or other qualified health care professional to select the appropriate level of service. These guidelines do not establish documentation requirements or standards of care. The main purpose of documentation is to support care of the patient by current and future health care team(s). These guidelines are for services that require a face-to-face encounter. (For 99211 and 99281 the face-to-face services may be performed by clinical staff).

In the Evaluation and Management section (99202-99499) there are many code categories. Each category may have specific guidelines, or the codes may include specific details. These E/M guidelines are written for the following categories:

- Office or Other Outpatient Services
- Hospital Inpatient and Observation Care Services
- Consultations
- Emergency Department Services
- Nursing Facility Services
- Home and Residence Services
- Prolonged Service With or Without Direct Contact on the Date of an Evaluation and Management Service

Classification of Evaluation and Management (E/M) Services

The E/M section is divided into broad categories such as office visits, hospital inpatient or observation care visits, and consultations. Most of the categories are further divided into two or more subcategories of E/M services. For example, there are two subcategories of office visits (new patient and established patient) and there are two subcategories of hospital inpatient and observation care visits (initial and subsequent). The subcategories of E/M services are further classified into levels of E/M services that are identified by specific codes.

The basic format of codes with levels of E/M services based on medical decision making (MDM) or time is the same. First, a unique code number is listed. Second, the place and/or type of service is specified, eg, office or other outpatient visit. Third, the content of the service is defined. Fourth, time is specified. (A detailed discussion of time is provided following the Decision Tree for New vs Established Patients.)

The place of service and service type is defined by the location where the face-to-face encounter occurs. For example, service provided to a nursing facility resident brought to the office is reported with an office or other outpatient code.
New and Established Patients

Solely for the purpose of distinguishing between new and established patients, professional services are those face-to-face services rendered by physicians and other qualified health care professionals who may report evaluation and management services. A new patient is one who has not received any professional services from the physician or other qualified health care professional or another physician or other qualified health care professional of the exact same specialty and subspecialty who belongs to the same group practice, within the past three years.

An established patient is one who has received professional services from the physician or other qualified health care professional or another physician or other qualified health care professional of the exact same specialty and subspecialty who belongs to the same group practice, within the past three years. See Decision Tree for New vs Established Patients.

In the instance where a physician or other qualified health care professional is on call for or covering for another physician or other qualified health care professional, the patient’s encounter will be classified as it would have been by the physician or other qualified health care professional who is not available. When advanced practice nurses and physician assistants are working with physicians, they are considered as working in the exact same specialty and subspecialty as the physician.

No distinction is made between new and established patients in the emergency department. E/M services in the emergency department category may be reported for any new or established patient who presents for treatment in the emergency department.

The Decision Tree for New vs Established Patients is provided to aid in determining whether to report the E/M service provided as a new or an established patient encounter.

Coding Tip

Instructions for Use of the CPT Codebook

When advanced practice nurses and physician assistants are working with physicians, they are considered as working in the exact same specialty and exact same subspecialty as the physician. A “physician or other qualified health care professional” is an individual who is qualified by education, training, licensure/regulation (when applicable), and facility privileging (when applicable) who performs a professional service within his or her scope of practice and independently reports that professional service. These professionals are distinct from “clinical staff.” A clinical staff member is a person who works under the supervision of a physician or other qualified health care professional, and who is allowed by law, regulation and facility policy to perform or assist in the performance of a specific professional service but does not individually report that professional service. Other policies may also affect who may report specific services.

CPT Coding Guidelines, Introduction, Instructions for Use of the CPT Codebook

Decision Tree for New vs Established Patients
Initial and Subsequent Services

Some categories apply to both new and established patients (e.g., hospital inpatient or observation care). These categories differentiate services by whether the service is the initial service or a subsequent service. For the purpose of distinguishing between initial or subsequent visits, professional services are those face-to-face services rendered by physicians and other qualified health care professionals who may report evaluation and management services. An initial service is when the patient has not received any professional services from the physician or other qualified health care professional or another physician or other qualified health care professional of the exact same specialty and subspecialty who belongs to the same group practice, during the inpatient or observation or nursing facility admission and stay.

A subsequent service is when the patient has received professional service(s) from the physician or other qualified health care professional or another physician or other qualified health care professional of the exact same specialty and subspecialty who belongs to the same group practice, during the admission and stay.

In the instance where a physician or other qualified health care professional is on call for or covering for another physician or other qualified health care professional, the patient’s encounter will be classified as it would have been by the physician or other qualified health care professional who is not available. When advanced practice nurses and physician assistants are working with physicians, they are considered as working in the exact same specialty and subspecialty as the physician.

For reporting hospital inpatient or observation care services, a stay that includes a transition from observation to inpatient is a single stay. For reporting nursing facility services, a stay that includes transition(s) between skilled nursing facility and nursing facility level of care is the same stay.

Services Reported Separately

Any specifically identifiable procedure or service (i.e., identified with a specific CPT code) performed on the date of E/M services may be reported separately.

The ordering and actual performance and/or interpretation of diagnostic tests/studies during a patient encounter are not included in determining the levels of E/M services when the professional interpretation...
of those tests/studies is reported separately by the physician or other qualified health care professional reporting the E/M service. Tests that do not require separate interpretation (eg, tests that are results only) and are analyzed as part of MDM do not count as an independent interpretation and may be counted as ordered or reviewed for selecting an MDM level.

The performance of diagnostic tests/studies for which specific CPT codes are available may be reported separately, in addition to the appropriate E/M code. The interpretation of the results of diagnostic tests/studies (ie, professional component) with preparation of a separate distinctly identifiable signed written report may also be reported separately, using the appropriate CPT code and, if required, with modifier 26 appended.

See Instructions for Selecting a Level Based on MDM or Time.

The physician or other qualified health care professional may need to indicate that on the day a procedure or service identified by a CPT code was performed, the patient’s condition required a significant separately identifiable E/M service. The E/M service may be caused or prompted by the symptoms or condition for which the procedure and/or service was provided. This circumstance may be reported by adding modifier 25 to the appropriate level of E/M service. As such, different diagnoses are not required for reporting of the procedure and the E/M services on the same date.

History and/or Examination

These E/M services include a medically appropriate history and/or physical examination, when performed. The nature and extent of the history and/or physical examination are determined by the treating physician or other qualified health care professional reporting the service. The care team may collect information, and the patient or caregiver may supply information directly (eg, by electronic health record [EHR] portal or questionnaire) that is reviewed by the reporting physician or other qualified health care professional. The extent of history and physical examination is not an element in selection of the level of these E/M service codes.

Levels of E/M Services

Select the appropriate level of E/M services based on the following:

1. The level of the MDM as defined for each service, or
2. The total time for E/M services performed on the date of the encounter.

Within each category or subcategory of E/M service based on MDM or time, there are three to five levels of E/M services available for reporting purposes. Levels of E/M services are not interchangeable among the different categories or subcategories of service. For example, the first level of E/M services in the subcategory of office visit, new patient, does not have the same definition as the first level of E/M services in the subcategory of office visit, established patient. Each level of E/M services may be used by all physicians or other qualified health care professionals.

Guidelines for Selecting a level service based on Medical Decision Making

Four types of MDM are recognized: straightforward, low, moderate, and high. The concept of the level of MDM does not apply to 99211 or 99281.

MDM includes establishing diagnoses, assessing the status of a condition, and/or selecting a management option. MDM is defined by three elements. The elements are:

- **The number and complexity of problem(s) that are addressed during the encounter.**
- **The amount and/or complexity of data to be reviewed and analyzed.** These data include medical records, tests, and/or other information that must be obtained, ordered, reviewed, and analyzed for the encounter. This includes information obtained from multiple sources or interprofessional communications that are not reported separately and interpretation of tests that are not reported
separately. Ordering a test is included in the category of test result(s) and the review of the test result is part of the encounter and not a subsequent encounter. **Ordering a test may include those considered, but not selected after shared decision making.** For example, a patient may request diagnostic imaging that is not necessary for their condition and discussion of the lack of benefit may be required. Alternatively, a test may normally be performed, but due to risk for a specific patient is not ordered. These considerations must be documented. Data are divided into three categories:

- **Tests, documents, orders, or independent historian(s).** (Each unique test, order, or document is counted to meet a threshold number.)
- **Independent interpretation of tests (not separately reported)**
- **Discussion of management or test interpretation with external physician or other qualified health care professional or appropriate source (not separately reported)**

**The risk of complications and/or morbidity or mortality of patient management:** This includes decisions made at the encounter associated with the diagnostic procedure(s) and treatment(s). This includes the possible management options selected and those considered but not selected, after shared decision making with the patient and/or family. For example, a decision about hospitalization includes consideration of alternative levels of care. Examples may include a psychiatric patient with a sufficient degree of support in the outpatient setting or the decision to not hospitalize a patient with advanced dementia with an acute condition that would generally warrant inpatient care, but for whom the goal is palliative treatment.

Shared decision making involves eliciting patient and/or family preferences, patient and/or family education, and explaining risks and benefits of management options.

**MDM may be impacted by role and management responsibility.**

When the physician or other qualified health care professional is reporting a separate CPT code that includes interpretation and/or report, the interpretation and/or report is not counted toward the MDM when selecting a level of E/M services.

When the physician or other qualified health care professional is reporting a separate service for discussion of management with a physician or another qualified health care professional, the discussion is not counted toward the MDM when selecting a level of E/M services.

The Levels of Medical Decision Making (MDM) table (Table 2) is a guide to assist in selecting the level of MDM for reporting an E/M services code. The table includes the four levels of MDM (ie, straightforward, low, moderate, high) and the three elements of MDM (ie, number and complexity of problems addressed at the encounter, amount and/or complexity of data reviewed and analyzed, and risk of complications and/or morbidity or mortality of patient management). To qualify for a particular level of MDM, two of the three elements for that level of MDM must be met or exceeded.

Examples in the table may be more or less applicable to specific settings of care. For example, the decision to hospitalize applies to the outpatient or nursing facility encounters, whereas the decision to escalate hospital level of care (eg, transfer to ICU) applies to the hospitalized or observation care patient. See also the introductory guidelines of each code family section.

• Decision not to resuscitate or to de-escalate care because of poor prognosis  
• Parenteral controlled substances
Number and Complexity of Problems Addressed at the Encounter

One element used in selecting the level of services is the number and complexity of the problems that are addressed at the encounter. Multiple new or established conditions may be addressed at the same time and may affect MDM. Symptoms may cluster around a specific diagnosis and each symptom is not necessarily a unique condition. Comorbidities and underlying diseases, in and of themselves, are not considered in selecting a level of E/M services unless they are addressed, and their presence increases the amount and/or complexity of data to be reviewed and analyzed or the risk of complications and/or morbidity or mortality of patient management. The final diagnosis for a condition does not, in and of itself, determine the complexity or risk, as extensive evaluation may be required to reach the conclusion that the signs or symptoms do not represent a highly morbid condition. Therefore, presenting symptoms which are likely to represent a highly morbid condition may drive MDM even when the ultimate diagnosis is not highly morbid. The evaluation and/or treatment should be consistent with the likely nature of the condition. Multiple problems of a lower severity may, in the aggregate, create higher risk due to interaction.

The term “risk” as used in these definitions relates to risk from the condition. While condition risk and management risk may often correlate, the risk from the condition is distinct from the risk of the management.

Definitions for the elements of MDM (see Table 2, Levels of Medical Decision Making) are:

**Problem:** A problem is a disease, condition, illness, injury, symptom, sign, finding, complaint, or other matter addressed at the encounter, with or without a diagnosis being established at the time of the encounter.

**Problem addressed:** A problem is addressed or managed when it is evaluated or treated at the encounter by the physician or other qualified health care professional reporting the service. This includes consideration of further testing or treatment that may not be elected by virtue of risk/benefit analysis or patient/parent/guardian/surrogate choice. Notation in the patient’s medical record that another professional is managing the problem without additional assessment or care coordination documented does not qualify as being addressed or managed by the physician or other qualified health care professional reporting the service. Referral without evaluation (by history, examination, or diagnostic study[ies]) or consideration of treatment does not qualify as being addressed or managed by the physician or other qualified health care professional reporting the service. For hospital inpatient and observation care services, the problem addressed is the problem status on the date of the encounter, which may be significantly different than on admission. It is the problem being managed or co-managed by the reporting physician or qualified health care professional and may not be the cause of admission or continued stay.

**Minimal problem:** A problem that may not require the presence of the physician or other qualified health care professional, but the service is provided under the physician’s or other qualified health care professional’s supervision (see 99211, 99281).

**Self-limited or minor problem:** A problem that runs a definite and prescribed course, is transient in nature, and is not likely to permanently alter health status.

**Stable, chronic illness:** A problem with an expected duration of at least one year or until the death of the patient. For the purpose of defining chronicity, conditions are treated as chronic whether or not stage or severity changes (eg, uncontrolled diabetes and controlled diabetes are a single chronic condition). “Stable” for the purposes of categorizing MDM is defined by the specific treatment goals for an individual patient. A patient who is not at his or her treatment goal is not stable, even if the condition has not changed and there is no short-term threat to life or function. For example, a patient with persistently poorly controlled blood pressure for whom better control is a goal is not stable, even if the pressures are not changing and the patient is asymptomatic. The risk of morbidity without treatment is significant.
Acute, uncomplicated illness or injury: A recent or new short-term problem with low risk of morbidity for which treatment is considered. There is little to no risk of mortality with treatment, and full recovery without functional impairment is expected. A problem that is normally self-limited or minor but is not resolving consistent with a definite and prescribed course is an acute, uncomplicated illness.

Acute, uncomplicated illness or injury requiring hospital inpatient or observation level care: A recent or new short-term problem with low risk of morbidity for which treatment is required. There is little to no risk of mortality with treatment, and full recovery without functional impairment is expected. The treatment required is delivered in a hospital inpatient or observation level setting.

Stable, acute illness: A problem that is new or recent for which treatment has been initiated. The patient is improved and while resolution may not be complete is stable with respect to this condition.

Chronic illness with exacerbation, progression, or side effects of treatment: A chronic illness that is acutely worsening, poorly controlled, or progressing with an intent to control progression and requiring additional supportive care or requiring attention to treatment for side effects.

Undiagnosed new problem with uncertain prognosis: A problem in the differential diagnosis that represents a condition likely to result in a high risk of morbidity without treatment.

Acute illness with systemic symptoms: An illness that causes systemic symptoms and has a high risk of morbidity without treatment. For systemic general symptoms, such as fever, body aches, or fatigue in a minor illness that may be treated to alleviate symptoms, see the definitions for self-limited or minor problem or acute, uncomplicated illness or injury. Systemic symptoms may not be general but may be single system.

Acute, complicated injury: An injury which requires treatment that includes evaluation of body systems that are not directly part of the injured organ, the injury is extensive, or the treatment options are multiple and/or associated with risk of morbidity.

Chronic illness with severe exacerbation, progression, or side effects of treatment: The severe exacerbation or progression of a chronic illness or severe side effects of treatment that have significant risk of morbidity and may require escalation in level of care.

Acute or chronic illness or injury that poses a threat to life or bodily function: An acute illness with systemic symptoms, an acute complicated injury, or a chronic illness or injury with exacerbation and/or progression or side effects of treatment, that poses a threat to life or bodily function in the near term without treatment. Some symptoms may represent a condition that is significantly probable and poses a potential threat to life or bodily function. These may be included in this category when the evaluation and treatment is consistent with this degree of potential severity.

Amount and/or Complexity of Data to be Reviewed and Analyzed

One element used in selecting the level of services is the amount and/or complexity of data to be reviewed or analyzed at an encounter.

Analyzed: Analyzed is a term describing the process of using the data as part of the MDM. The data element itself may not be subject to analysis (eg, glucose), but it is instead included in the thought processes for diagnosis, evaluation, or treatment. Tests ordered are presumed to be analyzed when the results are reported. Therefore, when they are ordered during an encounter, they are counted in that encounter. Tests that are ordered outside of an encounter may be counted in the encounter where they are analyzed. In the case of a recurring order, each new result may be counted in the encounter at which it is analyzed. For example, an encounter that includes an order for monthly prothrombin times would count for one prothrombin time ordered and reviewed. Additional future results, if analyzed in a subsequent encounter, may be counted as a single test in that subsequent encounter. Any service for which the professional component is separately reported by the physician or other qualified health care professional
reporting the E/M services is not counted as a data element ordered, reviewed, analyzed, or independently interpreted for the purposes of determining the level of MDM.

**Test:** Tests are imaging, laboratory, psychometric, or physiologic data. A clinical laboratory panel (eg, basic metabolic panel [80047]) is a single test. The differentiation between single or multiple tests is defined in accordance with the CPT code set. For the purposes of data reviewed and analyzed, pulse oximetry is not a test.

**Unique:** A unique test is defined by the CPT code set. When multiple results of the same unique test (eg, serial blood glucose values) are compared during an E/M service, only count one unique test. Tests that have overlapping elements are not unique, even if they are identified with distinct CPT codes. For example, a CBC with differential would incorporate the set of hemoglobin, CBC without differential, and platelet count. A unique source is defined as a physician or qualified health care professional in a distinct group or different specialty or subspecialty, or a unique entity. Review of all materials from any unique source counts as one element towards MDM.

**Combination of Data Elements:** A combination of different data elements, for example a combination of notes reviewed, tests ordered, tests reviewed, or independent historian, allows these elements to be summed. It does not require each item type or category to be represented. A unique test ordered, plus a note reviewed and an independent historian would be a combination of three elements.

**External:** External records, communications and/or test results are from an external physician, other qualified health care professional, facility, or health care organization.

**External physician or other qualified health care professional:** An external physician or other qualified health care professional who is not in the same group practice or is of a different specialty or subspecialty. This includes licensed professionals who are practicing independently. The individual may also be a facility or organizational provider such as from a hospital, nursing facility, or home health care agency.

**Discussion:** Discussion requires an interactive exchange. The exchange must be direct and not through intermediaries (eg, clinical staff or trainees). Sending chart notes or written exchanges that are within progress notes does not qualify as an interactive exchange. The discussion does not need to be on the date of the encounter but is counted only once and only when it is used in the decision making of the encounter. It may be asynchronous (ie, does not need to be in person), but it must be initiated and completed within a short time period (eg, within a day or two).

**Independent historian(s):** An individual (eg, parent, guardian, surrogate, spouse, witness) who provides a history in addition to a history provided by the patient who is unable to provide a complete or reliable history (eg, due to developmental stage, dementia, or psychosis) or because a confirmatory history is judged to be necessary. In the case where there may be conflict or poor communication between multiple historians and more than one historian is needed, the independent historian requirement is met. It does not include translation services. The independent history does not need to be obtained in person but does need to be obtained directly from the historian providing the independent information.

**Independent interpretation:** The interpretation of a test for which there is a CPT code, and an interpretation or report is customary. This does not apply when the physician or other qualified health care professional who reports the E/M service is reporting or has previously reported the test. A form of interpretation should be documented but need not conform to the usual standards of a complete report for the test.

**Appropriate source:** For the purpose of the discussion of management data element (see Table 2, Levels of Medical Decision Making), an appropriate source includes professionals who are not health care professionals but may be involved in the management of the patient (eg, lawyer, parole officer, case manager, teacher). It does not include discussion with family or informal caregivers.
**Risk of Complications and/or Morbidity or Mortality of Patient Management**

One element used in selecting the level of services is the risk of complications and/or morbidity or mortality of patient management at an encounter. This is distinct from the risk of the condition itself.

**Risk:** The probability and/or consequences of an event. The assessment of the level of risk is affected by the nature of the event under consideration. For example, a low probability of death may be high risk, whereas a high chance of a minor, self-limited adverse effect of treatment may be low risk. Definitions of risk are based upon the usual behavior and thought processes of a physician or other qualified health care professional in the same specialty. Trained clinicians apply common language usage meanings to terms such as high, medium, low, or minimal risk and do not require quantification for these definitions (though quantification may be provided when evidence-based medicine has established probabilities). For the purposes of MDM, level of risk is based upon consequences of the problem(s) addressed at the encounter when appropriately treated. Risk also includes MDM related to the need to initiate or forego further testing, treatment, and/or hospitalization. The risk of patient management criteria applies to the patient management decisions made by the reporting physician or other qualified health care professional as part of the reported encounter.

**Morbidity:** A state of illness or functional impairment that is expected to be of substantial duration during which function is limited, quality of life is impaired, or there is organ damage that may not be transient despite treatment.

**Social determinants of health:** Economic and social conditions that influence the health of people and communities. Examples may include food or housing insecurity.

**Surgery (minor or major, elective, emergency, procedure or patient risk):**

- **Surgery-Minor or Major:** The classification of surgery into minor or major is based upon the common meaning of such terms when used by trained clinicians, similar to the use of the term “risk”. These terms are not defined by a surgical package classification.

- **Surgery-Elective or Emergency:** Elective procedures and emergent or urgent procedures describe the timing of a procedure when the timing is related to the patient’s condition. An elective procedure is typically planned in advance (e.g., scheduled for weeks later), while an emergent procedure is typically performed immediately or with minimal delay to allow for patient stabilization. Both elective and emergent procedures may be minor or major procedures.

- **Surgery-Risk Factors, Patient or Procedure:** Risk factors are those that are relevant to the patient and procedure. Evidence-based risk calculators may be used, but are not required, in assessing patient and procedure risk.

**Drug therapy requiring intensive monitoring for toxicity:** A drug that requires intensive monitoring is a therapeutic agent that has the potential to cause serious morbidity or death. The monitoring is performed for assessment of these adverse effects and not primarily for assessment of therapeutic efficacy. The monitoring should be that which is generally accepted practice for the agent but may be patient-specific in some cases. Intensive monitoring may be long-term or short-term. Long-term intensive monitoring is not performed less than quarterly. The monitoring may be performed with a laboratory test, a physiologic test, or imaging. Monitoring by history or examination does not qualify. The monitoring affects the level of MDM in an encounter in which it is considered in the management of the patient. An example may be monitoring for cytopenia in the use of an antineoplastic agent between dose cycles. Examples of monitoring that do not qualify include monitoring glucose levels during insulin therapy, as the primary reason is the therapeutic effect (unless severe hypoglycemia is a current, significant concern); or annual electrolytes and renal function for a patient on a diuretic, as the frequency does not meet the threshold.
Guidelines for Selecting Level of Service Based on Time

Certain categories of time-based E/M codes that do not have levels of services based on MDM (eg, Critical Care Services) in the E/M section use time differently. It is important to review the instructions for each category.

Time is not a descriptive component for the emergency department levels of E/M services because emergency department services are typically provided on a variable intensity basis, often involving multiple encounters with several patients over an extended period of time.

When time is used for reporting E/M services codes, the time defined in the service descriptors is used for selecting the appropriate level of services. The E/M services for which these guidelines apply require a face-to-face encounter with the physician or other qualified health care professional. For office or other outpatient services, if the physician’s or other qualified health care professional’s time is spent in the supervision of clinical staff who perform the face-to-face services of the encounter, use 99211.

For coding purposes, time for these services is the total time on the date of the encounter. It includes both the face-to-face and non-face-to-face time personally spent by the physician and/or other qualified health care professional(s) on the day of the encounter (includes time in activities that require the physician or other qualified health care professional and does not include time in activities normally performed by clinical staff). It does not include any time spent in the performance of other separately reported service(s).

A shared or split visit is defined as a visit in which a physician and other qualified health care professional(s) both provide the face-to-face and non-face-to-face work related to the visit. When time is being used to select the appropriate level of services for which time-based reporting of shared or split visits is allowed, the time personally spent by the physician and other qualified health care professional(s) assessing and managing the patient on the date of the encounter is summed to define total time. Only distinct time should be summed for shared or split visits (ie, when two or more individuals jointly meet with or discuss the patient, only the time of one individual should be counted).

When prolonged time occurs, the appropriate prolonged services code may be reported. The total time on the date of the encounter spent caring for the patient should be documented in the medical record when it is used as the basis for code selection.

Physician or other other qualified health care professional time includes the following activities, when performed:

- preparing to see the patient (eg, review of tests)
- obtaining and/or reviewing separately obtained history
- performing a medically appropriate examination and/or evaluation
- counseling and educating the patient/family/caregiver
- ordering medications, tests, or procedures
- referring and communicating with other health care professionals (when not separately reported)
- documenting clinical information in the electronic or other health record
- independently interpreting results (when not separately reported) and communicating results to the patient family/caregiver
- care coordination (when not separately reported)

Do not count time spent on the following:

- the performance of other services reported separately
- travel
- teaching that is general and not limited to discussion that is required for the management of the specific patient

Unlisted Service

An E/M service may be provided that is not listed in this section of the CPT codebook. When reporting such a service, the appropriate unlisted code may be used to indicate the service, identifying it by “Special Report,” as discussed in the following paragraph. The “Unlisted Services” and accompanying codes for the E/M section are as follows:

99429 Unlisted preventive medicine service

99499 Unlisted evaluation and management service

Special Report

An unlisted service or one that is unusual, variable, or new may require a special report demonstrating the medical appropriateness of the service. Pertinent information should include an adequate definition or description of the nature, extent, and need for the procedure and the time, effort, and equipment necessary to provide the service. Additional items that may be included are complexity of symptoms, final diagnosis, pertinent physical findings, diagnostic and therapeutic procedures, concurrent problems, and follow-up care.
**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A patient presents to the emergency department for suture removal after repair of a forearm laceration by a different provider in another location. There are no complaints, and the wound appears well healed.

Percentage of Survey Respondents who found Vignette to be Typical: 93%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0%, Overnight stay-less than 24 hours 0%, Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: .

Description of Intra-Service Work: Obtain a medically appropriate history, including interviews with patient, prehospital personnel, family members, and caregivers in person or by phone as needed, and perform a medically appropriate physical examination. Formulate a diagnosis and develop a treatment plan (MDM is not a component). Enter orders in the EHR during the evaluation of the patient and begin the documentation. Formulate a discharge plan. Discuss follow-up and reasons for return to the emergency department. Explain any prescriptions or other treatments and work, school, or activity restrictions. Answer patient and patient caregiver questions.

Description of Post-Service Work: .
### SURVEY DATA

- **RUC Meeting Date (mm/yyyy):** 04/2021
- **CPT Code:** 99281
- **Presenter(s):**

<th>Work RVU</th>
<th>Time Source</th>
</tr>
</thead>
<tbody>
<tr>
<td>99211</td>
<td>XXX</td>
<td>0.18</td>
<td>RUC Time</td>
</tr>
</tbody>
</table>

CPT Descriptor: Office or other outpatient visit for the evaluation and management of an established patient, that may not require the presence of a physician or other qualified health care professional. Usually, the presenting problem(s) are minimal.

### SECOND HIGHEST KEY REFERENCE SERVICE:

<table>
<thead>
<tr>
<th>Key CPT Code</th>
<th>Global</th>
<th>Work RVU</th>
<th>Time Source</th>
</tr>
</thead>
<tbody>
<tr>
<td>99212</td>
<td>XXX</td>
<td>0.70</td>
<td>RUC Time</td>
</tr>
</tbody>
</table>

CPT Descriptor: Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and straightforward medical decision making. When using time for code selection, 10-19 minutes of total time is spent on the date of the encounter.

### KEY MPC COMPARISON CODES:

Compare the surveyed code to codes on the RUC’s MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

**Most Recent**

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC’s rationale, please review the separate RUC recommendation document.

The current 99281 RVUw is 0.48. Our combined survey median was 0.25 with a 25th percentile of 0.18. The intraservice time has increased from the current 8 minutes to the survey median of 10 minutes. The intensity has dropped with new code descriptor, which may not require the presence of a physician or other qualified health care professional, such as a well healed wound recheck. The WPUT is about the same for the first key reference...
service 99211 (0.025 vs. 0.026). The majority of respondents, with seventy two percent, said the intensity of 99281 is the same as 99211. Only 15% said it was somewhat more, and zero% said it was much more. Of note, the intensity dropped compared to the current 99281 intensity values (0.032 vs. 0.025). We are asking for a slightly longer intraservice time of ten minutes and about half the current work value of 99281 (0.48) at 0.25.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- Multiple codes allow flexibility to describe exactly what components the procedure included.
- Multiple codes are used to maintain consistency with similar codes.
- Historical precedents.
- Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 2019 Medicare claims data

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Emergency Medicine How often? Commonly
Specialty Pediatrie Medicine How often? Sometimes
Specialty Nurse Practitioner How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 270920
CPT Code: 99281

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare represents 20% of ED claims.

SUMMARY OF RECOMMENDATION

CPT Code: 99282  Tracking Number H2  Original Specialty Recommended RVU: 0.93
Global Period: XXX  Current Work RVU: 0.93  Presented Recommended RVU: 0.93
RUC Recommended RVU: 0.93

CPT Descriptor: Emergency department visit for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and straightforward medical decision making.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A patient presents to the emergency department with a self-limited or minor problem.

Percentage of Survey Respondents who found Vignette to be Typical: 95%

Site of Service (Complete for 010 and 090 Globals Only)
Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work:.

Description of Intra-Service Work: Obtain a medically appropriate history, including interviews with patient, prehospital personnel, and family members in person or by phone as needed. Perform a medically appropriate examination; formulate a diagnosis and develop a treatment plan (MDM of straightforward complexity). Enter orders in the computer during the evaluation of the patient and begin the medical record. Explain any prescriptions required along with discharge instructions and any follow-up care required, including reasons to return to the ED. Answer patient and patient caregiver questions.

Description of Post-Service Work:.
SURVEY DATA

RUC Meeting Date (mm/yyyy): 04/2021

Presenter(s): Steven Krug, MD, FAAP, AAP Advisor; Jordan Celeste, MD, FACEP, ACEP Advisor; Korinne Van Keuren, DNP, MS, RN, CPNP-AC, APRN-BC, RNFA, ANA Advisor; Elisabeth Volpert DNP, APRN, FNP-C, ANA Advisor

CPT Code: 99282

Sample Size: 8316  Resp N: 162

Description of Sample: Emergency physicians, pediatricians, and advanced practice nurses.

### Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

*The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC’s rationale, please review the separate RUC recommendation document.*
The current 99282 RVUw is 0.93. Our combined survey median is 0.99 with a 25th percentile of 0.80. 99282 Intra time increased from 10 to 18 minutes while the total time dropped by one minute. The 99282 WPUT is greater than the forest key reference service 99202 (0.055 vs. 0.047). Thirty six percent of respondents said this intensity/complexity of 99282 was somewhat more than 99202. We are asking to retain the current value of 99282 at 0.93 to maintain the current relativity with 99202 in 2021. Both RUC and CMS have considered these services equivalent in multiple prior considerations of these codes.

### SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - Multiple codes allow flexibility to describe exactly what components the procedure included.
   - Multiple codes are used to maintain consistency with similar codes.
   - Historical precedents.
   - Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

### FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 2019 Medicare claims data

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

**Specialty Emergency Medicine** How often? Commonly

**Specialty Pediatric Medicine** How often? Sometimes

**Specialty Nurse Practitioner** How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 1409984
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare represents 20% of all ED claims.
<table>
<thead>
<tr>

Do many physicians perform this service across the United States? Yes

**Berenson-Eggers Type of Service (BETOS) Assignment**

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Evaluation Management

BETOS Sub-classification:
Emergency room visit

BETOS Sub-classification Level II:
NA

**Professional Liability Insurance Information (PLI)**

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 99282

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.
CPT Code: 99283

Tracking Number: H3

Original Specialty Recommended RVU: 1.60
Presented Recommended RVU: 1.60
RUC Recommended RVU: 1.60

CPT Descriptor: Emergency department visit for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and low level of medical decision making.

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A patient presents to the emergency department with a stable chronic illness of acute uncomplicated injury.

Percentage of Survey Respondents who found Vignette to be Typical: 95%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0%, In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0%, Overnight stay-less than 24 hours 0%, Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: 

Description of Intra-Service Work: Obtain a medically appropriate history, including interviews with patient, physician office, nursing home, or EMS personnel, and family members in person or by phone as needed, and perform a medically appropriate examination. Formulate a diagnosis and treatment plan (MDM of low complexity). Enter orders in the computer during the evaluation of the patient and begin the medical record. Communicate with other health care professionals as necessary during the encounter. Evaluate response to therapy, review data from diagnostic testing, and reassess the patient. Formulate a discharge plan, including medication and other treatments as well as follow-up planning. Explain any prescriptions or other therapies required along with discharge instructions, activity limitations, and any follow-up care required, including reasons to return to the ED. Answer patient and patient caregiver questions.

Description of Post-Service Work:

**CPT Descriptor**
Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and low level of medical decision making. When using time for code selection, 20-29 minutes of total time is spent on the date of the encounter.

**KEY MPC COMPARISON CODES**

Compare the surveyed code to codes on the RUC’s MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

- **Most Recent**
  - **MPC CPT Code 1** 95861  Global XXX  Work RVU 1.54  Time Source RUC Time  Medicare Utilization 44,204
    **CPT Descriptor 1** Needle electromyography; 2 extremities with or without related paraspinal areas

- **Most Recent**
  - **MPC CPT Code 2** 93351  Global XXX  Work RVU 1.75  Time Source RUC Time  Medicare Utilization 151,068
    **CPT Descriptor 2** Echocardiography, transthoracic, real-time with image documentation (2D), includes M-mode recording, when performed, during rest and cardiovascular stress test using treadmill, bicycle exercise and/or pharmacologically induced stress, with interpretation and report; including performance of continuous electrocardiographic monitoring, with supervision by a physician or other qualified health care professional

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC’s rationale, please review the separate RUC recommendation document.
The current 99283 RVUw is 1.60. Our combined survey median is 1.75 with a 25th percentile of 1.50. Intra time is higher than the first key reference service 99203 at 30 vs. 25 minutes. WPUT for 99283 is greater than 99203 (0.058 vs. 0.046). Sixty three percent or respondents said this intensity/complexity was somewhat more than 99203. Fourteen percent said intensity/complexity was much more. 

We are asking to maintain the current value of 99283 as compared to 99203 at 1.60 to maintain relativity across the code families as previously approved by RUC and CMS multiple times.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
☐ Multiple codes are used to maintain consistency with similar codes.
☐ Historical precedents.
☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 2019 Medicare claims data

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely) If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Emergency Medicine How often? Commonly
Specialty Pediatric Medicine How often? Sometimes
Specialty Nurse Practitioner How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 10978840
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare represents 20% of ED claims
<table>

Do many physicians perform this service across the United States? Yes

**Berenson-Eggers Type of Service (BETOS) Assignment**

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

- **Main BETOS Classification:** Evaluation Management
- **BETOS Sub-classification:** Emergency room visit
- **BETOS Sub-classification Level II:** NA

**Professional Liability Insurance Information (PLI)**

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 99283.

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

</tbody>
</table>

**Description of Pre-Service Work:**

Obtain a medically appropriate history, including interviews with patient, physician office, nursing home, or EMS personnel, and family members and caregivers present or by phone as needed. Perform a medically appropriate physical examination. Formulate a diagnosis and treatment plan (MDM of moderate complexity). Enter orders in the EHR during the evaluation of the patient and begin the medical record. Communicate with other healthcare professionals as necessary during the encounter. Review data from diagnostic testing and evaluate response to therapy by reassessing the patient and then adjusting the treatment plan accordingly. Formulate a discharge plan, included needed medications, therapies, and work or activity restrictions and recommendations. Arrange and review follow-up. Explain any prescriptions and treatments required along with discharge instructions and any follow-up care required, including reasons to return to the ED. Answer patient and patient caregiver questions.

**Description of Post-Service Work:**

...

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC’s rationale, please review the separate RUC recommendation document.

The current 99284 RVUw is 2.74. Our combined survey median is 2.95 with a 25th percentile of 2.60. 99284 Intra time is the same as the first key reference service of 99204 at 40 minutes. Maintaining the current work RVU driven WPUT for 99284 at 0.069 (which is lower than the survey median of 0.074) is higher than that of 99204 at 0.43. This is supported as thirty six percent of respondents said this intensity/complexity of 99284 was somewhat more than 99204. And forty five
percent said it was much more intense/complex. In addition, to maintain historic relativity to 99204, 99284 should be raised by 6.9 percent to **2.74**. We are asking to maintain the current CMS value of **2.74** to maintain relativity across the families as previously approved by RUC and the value approved by CMS in 2021.

**SERVICES REPORTED WITH MULTIPLE CPT CODES**

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)
   - The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - Multiple codes allow flexibility to describe exactly what components the procedure included.
   - Multiple codes are used to maintain consistency with similar codes.
   - Historical precedents.
   - Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

**FREQUENCY INFORMATION**

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 2019 Medicare claims data

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely) If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Emergency Medicine  How often? Commonly

Specialty Pediatric Medicine  How often? Sometimes

Specialty Nurse Practitioner  How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 21,662,600

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare represents 20% of all ED claims

Specialty Emergency Medicine  Frequency 15293795  Percentage 70.59 %

Specialty Nurse Practitioner  Frequency 1557540  Percentage 7.18 %
CPT Code: 99284

Specialty Pediatric Medicine  Frequency 21662  Percentage 0.01 %

Estimate the number of times this service might be provided to Medicare patients nationally in a one-year period? 5,415,650. If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2019 Medicare claims data frequency.

Specialty Emergency Medicine  Frequency 3823448  Percentage 70.59 %
Specialty Nurse Practitioner  Frequency 389926  Percentage 7.19 %
Specialty Pediatric Medicine  Frequency 5415  Percentage 0.01 %

Do many physicians perform this service across the United States? Yes

Berenson-Eggers Type of Service (BETOS) Assignment
Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Evaluation Management

BETOS Sub-classification:
Emergency room visit

BETOS Sub-classification Level II:
NA

Professional Liability Insurance Information (PLI)
If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 99284.

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.
CPT Code: 99285

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 99285  Tracking Number: H5

Original Specialty Recommended RVU: 4.00
Presented Recommended RVU: 4.00
RUC Recommended RVU: 4.00

Global Period: XXX  Current Work RVU: 4.00

CPT Descriptor: Emergency department visit for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and high level of medical decision making.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A patient presents to the emergency department with a chronic illness with severe exacerbation that poses a threat to life or bodily function, or an acute illness/injury that poses a threat to life or bodily function.

Percentage of Survey Respondents who found Vignette to be Typical: 95%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0%, In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0%, Overnight stay-less than 24 hours 0%, Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: .

Description of Intra-Service Work: Obtain a medically appropriate history, including interviews with patient, physician office, nursing home, or EMS personnel, and family members and caregivers present or by phone. Perform a medically appropriate physical examination. Formulate a diagnosis and treatment plan (MDM of high complexity). Enter orders in the EHR during the evaluation of the patient and begin the medical record. Review data from diagnostic testing, including labs, imaging, and imaging interpretation. Reassess the patient multiple times, order additional diagnostic tests as indicated, and adjust treatment plan accordingly. Communicate with other health care professionals as necessary for consultation or care coordination during the encounter. Formulate a disposition plan, including communication to and coordination with an inpatient team if appropriate, or more typically, prepare a discharge plan, with prescriptions and additional therapies, work or activity restrictions, and arrange follow-up appointments or testing as needed. Explain any prescriptions or other therapies as required along with discharge instructions, expected course, and any follow-up care required, including reasons to return to the ED. Answer patient and patient caregiver questions.

Description of Post-Service Work: .

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC’s rationale, please review the separate RUC recommendation document.

The current 99285 RVUw is 4.00. Our combined survey median is 4.00 with a 25th percentile of 3.71. 99285 Intra time is slightly higher than 99205 at 60 vs. 59 minutes. WPUT for 99285 is higher at 0.067 vs. 0.040. While eleven percent of respondents said this intensity/complexity was somewhat more than 99204 a robust Seventy six percent said it was much more intense/complex than 99205.
To maintain historic relativity of 99285 to 99205, the RUC should raise the code by 10.41 percent to 4.20. However, we are asking for the current value at 4.00 as this is supported by both the 2021 and the 2018 RUC surveys, and this to maintains relativity across the ED and new office or other outpatient code families as previously approved by RUC and CMS multiple times, and as the value approved by CMS in 2021.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- Multiple codes allow flexibility to describe exactly what components the procedure included.
- Multiple codes are used to maintain consistency with similar codes.
- Historical precedents.
- Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

March 26, 2021

Ezequiel Silva III, MD
Chairperson, AMA/Specialty Society Relative Value Scale Update Committee
Relative Value Systems, American Medical Association
330 N Wabash, Suite 39300
Chicago, IL 60611

RE: Direct Practice Expense Inputs for Tab 12 (99281-99285; H1-H5)

Dear Doctor Silva:

Codes 99281-99285 *(Emergency Department Services)* are among the codes being considered during the April 2021 RUC meeting.

The American Academy of Pediatrics (AAP), American College of Emergency Physicians (ACEP), and American Nurses Association (ANA) have conducted a physician and other qualified healthcare provider work survey for 99821-99825 and developed a work RVU recommendation based on the survey results. However, since the service described by codes 99821-99825 is one that typically occurs in the facility setting, we recommend no direct practice expense inputs for codes 99821-99825.

If you have any questions, please contact Linda Walsh, AAP staff at 630/626-6331 or lwalsh@aap.org.

Thank you.

Sincerely,
Steven Krug, MD, FAAP
AAP RUC Advisor

Jordan Celeste, MD, FACEP
ACEP RUC Advisor

Korinne Van Keuren, DNP, MS, RN, CPNP-AC, APRN-BC, RNFA
ANA RUC/HPAC Advisor
Following the implementation of the revisions to the Evaluation and Management (E/M) office visits (99201-99215) for the CPT 2021 code set, the CPT/RUC Workgroup on E/M met twelve times in 2020 and early 2021 to standardize the rest of the E/M sections in the CPT code set. The CPT/RUC Workgroup on E/M was committed to changing the current coding and documentation requirements for E/M visits to simplify the work of the health care provider and improve the health of the patient. To achieve these goals, the Workgroup set forth the following guiding principles related to the group’s ongoing work product:

1. To decrease administrative burden of documentation and coding and align CPT and CMS whenever possible
2. To decrease the need for audits
3. To decrease unnecessary documentation in the medical record that is not needed for patient care
4. To ensure that payment for E/M is resource-based and that there is no direct goal for payment redistribution between specialties.

In February 2021, the CPT Editorial Panel deleted the annual nursing facility assessment code and revised seven nursing facility codes to align with the principles included in the E/M office visit services by documenting and selecting level of service based on total time or medical decision making.

Similar to the office visits, beginning in 2023, when total time on the date of encounter is used to select the appropriate level of a nursing facility visit service code, both the face-to-face and non-face-to-face time personally spent by the physician (or other qualified health care professional that is reporting the office visit) assessing and managing the patient are summed to select the appropriate code. The nursing facility services were surveyed for the April 2021 RUC meeting. The survey time captured includes pre-service time 1-day before the date of encounter, intra-service time is all the time on the date of encounter and post-service time is 3-days after the date of encounter.

The RUC noted that all the of these services are typically performed in the skilled nursing facility which requires a higher level of care than the nursing facility.

**COMPELLING EVIDENCE**

In April 2021, the RUC met to review the nursing facility changes. The specialty societies indicated that there is compelling evidence based on flawed methodology. The specialty societies reviewed the methodology used by the RUC in 2007 to arrive at the current values. That methodology was inconsistent among the codes in the family and was not based on survey values or direct crosswalks. For example, 99304, the initial nursing visit code requiring low level medical decision making was valued based on the sum of the value of 99203, a new patient visit also requiring a low level of medical decision making, plus one-fourth the value of 99374, physician supervision of a patient under the care of a home health CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.
agency. The RUC justified its recommendations for all the initial nursing visit codes by dividing the median time of the nursing visit code by the median time of the comparable subsequent hospital visit code, multiplying that fraction by the work RVU of the hospital visit code and adding one-fourth of 99374. Similarly, the methodology for valuing the subsequent nursing visit codes was inconsistent and differed from the methodology used for the initial visit codes. The RUC agreed that there is compelling evidence that the previous valuation was based on flawed methodology.

**INITIAL NURSING FACILITY CARE**

99304 Initial nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and straightforward or low level of medical decision making. When using total time on the date of the encounter for code selection, 25 minutes must be met or exceeded.

The RUC reviewed the survey results from 203 physicians and determined that the survey 25th percentile work RVU of 1.50 appropriately accounts for the work required to perform this service. The RUC recommends 6 minutes of pre-service time, 25 minutes of intra-service time and 5 minutes of post-service time.

The RUC compared the surveyed code to the top key reference service 99203 Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and low level of medical decision making. When using time for code selection, 30-44 minutes of total time is spent on the date of the encounter (work RVU = 1.60, 25 minutes intra-service time and 35 minutes total time) and determined that 99304 describing straightforward/low medical decision-making is appropriately slightly less physician work than CPT code 99203.

The RUC also compared 99304 to the second top key reference service 99202 Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and straightforward medical decision making. When using time for code selection, 15-29 minutes of total time is spent on the date of the encounter (work RVU = 0.93, 15 minutes intra-service time and 20 minutes total time) and determined that CPT code 99304 requires much more physician work and time, thus is valued appropriately. The survey supports a value between the two new patient office visits and the RUC agrees CPT code 99304 is in the proper rank order among other similar services.

For additional support, the RUC referenced MPC code 95861 Needle electromyography; 2 extremities with or without related paraspinal areas (work RVU = 1.54 and 29 minutes of intra-service time) and code 74181 Magnetic resonance (eg, proton) imaging, abdomen; without contrast material(s) (work RVU = 1.46 and 20 minutes of intra-service time), which require similar physician work and time. The RUC recommends a work RVU of 1.50 for CPT code 99304.
99305 Initial nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. When using total time on the date of the encounter for code selection, 35 minutes must be met or exceeded.

The RUC reviewed the survey results from 204 physicians and determined that the survey 25th percentile work RVU of 2.50 appropriately accounts for the work required to perform this service. The RUC recommends 10 minutes of pre-service time, 35 minutes of intra-service time and 10 minutes of post-service time.

The RUC compared the surveyed code to the top key reference service 99204 Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. When using time for code selection, 45-59 minutes of total time is spent on the date of the encounter (work RVU = 2.60, 40 minutes intra-service time and 60 minutes total time) and determined that 99305 requires slightly less physician work and time to perform.

The RUC also compared 99305 to the second top key reference service, 99203 Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and low level of medical decision making. When using time for code selection, 30-44 minutes of total time is spent on the date of the encounter. (work RVU = 1.60, 25 minutes intra-service time and 35 minutes total time) and determined that 99305 requires much more physician work and time than 99203. The survey supports a value between the two new patient office visits and the RUC agrees CPT code 99305 is in the proper rank order among other similar services.

For additional support, the RUC referenced MPC code 95810 Polysomnography; age 6 years or older, sleep staging with 4 or more additional parameters of sleep, attended by a technologist (work RVU = 2.50 and 36.5 minutes of intra-service time) and code 75574 Computed tomographic angiography, heart, coronary arteries and bypass grafts (when present), with contrast material, including 3D image postprocessing (including evaluation of cardiac structure and morphology, assessment of cardiac function, and evaluation of venous structures, if performed) (work RVU = 2.40 and 30 minutes of intra-service time), which require similar physician work and time. The RUC recommends a work RVU of 2.50 for CPT code 99305.

99306 Initial nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and high level of medical decision making. When using total time on the date of the encounter for code selection, 45 minutes must be met or exceeded.

The RUC reviewed the survey results from 208 physicians and determined that the survey 25th percentile work RVU of 3.50 appropriately accounts for the work required to perform this service. The RUC recommends 15 minutes of pre-service time, 50 minutes of intra-service time and 15 minutes of post-service time.

The RUC compared the surveyed code to the top key reference service 99205 Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and high level of medical decision making. When using time for code selection, 60-74 minutes of total time is spent on the date of the encounter. (work RVU = 3.50, 59 minutes intra-service time and 88 minutes total time) and determined that these services require the same physician work and should be valued the same. Although 99306 requires slightly less physician time, both require a high level of medical decision making and similar typical patients who require intensive management.
For additional support, the RUC referenced MPC code 90962 *End-stage renal disease (ESRD) related services monthly, for patients 20 years of age and older; with 1 face-to-face visit by a physician or other qualified health care professional per month* (work RVU = 3.57 and 70 minutes of intra-service/total time) and code 50328 *Backbench reconstruction of cadaver or living donor renal allograft prior to transplantation; arterial anastomosis, each* (work RVU = 3.50 and 45 minutes of intra-service/total time), which require similar physician work and time. The RUC recommends a work RVU of 3.50 for CPT code 99306.

**SUBSEQUENT NURSING FACILITY CARE**

**99307** Subsequent nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and straightforward medical decision making. When using total time on the date of the encounter for code selection, 10 minutes must be met or exceeded.

The RUC reviewed the survey results from 196 physicians and determined that the survey 25th percentile work RVU of 0.70 appropriately accounts for the work required to perform this service. The RUC recommends 1 minutes of pre-service time, 12 minutes of intra-service time and 1 minute of post-service time.

The RUC compared the surveyed code to the top key reference service 99212 *Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and straightforward medical decision making*. When using time for code selection, 10-19 minutes of total time is spent on the date of the encounter (work RVU = 0.70, 11 minutes intra-service time and 16 minutes total time) and determined that these services require the same straightforward level of medical decision making, the same physician work and similar physician time to perform, thus should be valued the same.

The RUC also compared 99307 to the second top key reference service 99213 *Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and low level of medical decision making*. When using time for code selection, 20-29 minutes of total time is spent on the date of the encounter (work RVU = 1.30, 20 minutes intra-service time and 40 minutes total time) and determined that 99307 requires much less physician work, time and a lower level of medical decision making, thus is valued appropriately.

For additional support, the RUC referenced MPC code 95251 *Ambulatory continuous glucose monitoring of interstitial tissue fluid via a subcutaneous sensor for a minimum of 72 hours; analysis, interpretation and report* (work RVU = 0.70 and 15 minutes of intra-service time) and code 62368 *Electronic analysis of programmable, implanted pump for intrathecal or epidural drug infusion (includes evaluation of reservoir status, alarm status, drug prescription status); with reprogramming* (work RVU = 0.67 and 15 minutes of intra-service time), which require similar physician work and time. The RUC recommends a work RVU of 0.70 for CPT code 99307.
99308 Subsequent nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and low medical decision making. When using total time on the date of the encounter for code selection, 15 minutes must be met or exceeded.

The RUC reviewed the survey results from 214 physicians and determined that the survey 25th percentile work RVU of 1.30 appropriately accounts for the work required to perform this service. The RUC recommends 5 minutes of pre-service time, 18 minutes of intra-service time and 4 minutes of post-service time.

The RUC compared the surveyed code to the top key reference service 99213 Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and low level of medical decision making. When using time for code selection, 20-29 minutes of total time is spent on the date of the encounter (work RVU = 1.30, 20 minutes intra-service time and 40 minutes total time) and determined that these services require the same low level of medical decision making, the same physician work and similar physician time to perform.

The RUC also compared 99308 to the second top key reference service 99214 Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. When using time for code selection, 30-39 minutes of total time is spent on the date of the encounter (work RVU = 1.92, 30 minutes intra-service time and 47 minutes total time) and determined that 99308 requires less physician work, time and level of medical decision making to perform than 99214, thus is valued appropriately.

For additional support, the RUC referenced MPC code 74170 Computed tomography, abdomen; without contrast material, followed by contrast material(s) and further sections (work RVU = 1.40 and 18 minutes of intra-service time) and code 74280 Radiologic examination, colon, including scout abdominal radiograph(s) and delayed image(s), when performed; double-contrast (eg, high density barium and air) study, including glucagon, when administered (work RVU = 1.26 and 20 minutes of intra-service time), which require similar physician work and time.

The RUC recommends a work RVU of 1.30 for CPT code 99308.

99309 Subsequent nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and moderate medical decision making. When using total time on the date of the encounter for code selection, 30 minutes must be met or exceeded.

The RUC reviewed the survey results from 217 physicians and determined that the 25th percentile work RVU of 1.92 appropriately accounts for the work required to perform this service. The RUC recommends 7 minutes of pre-service time, 30 minutes of intra-service time and 10 minutes of post-service time.

The RUC compared the surveyed code to the top key reference service 99214 Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. When using time for code selection, 30-39 minutes of total time is spent on the date of the encounter (work RVU = 1.92, 30 minutes intra-service time and 47 minutes total time) and determined that these services require the same moderate level of medical decision making, physician work and physician time to perform.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.
The RUC also compared 99309 to the second top key reference service 99215 Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and high level of medical decision making. When using time for code selection, 40-54 minutes of total time is spent on the date of the encounter (work RVU = 2.80, 45 minutes intra-service time and 70 minutes total time) and determined that 99309 requires less physician work, time and level of decision making, thus is valued appropriately.

For additional support, the RUC referenced MPC code 94002 Ventilation assist and management, initiation of pressure or volume preset ventilators for assisted or controlled breathing; hospital inpatient/observation, initial day (work RVU = 1.99 and 30 minutes of intra-service time) and code 95957 Digital analysis of electroencephalogram (EEG) (eg, for epileptic spike analysis) (work RVU = 1.98 and 30 minutes of intra-service time), which require similar physician work and time. The RUC recommends a work RVU of 1.92 for CPT code 99309.

**99310 Subsequent nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and high medical decision making. When using total time on the date of the encounter for code selection, 45 minutes must be met or exceeded.**

The RUC reviewed the survey results from 203 physicians and determined that the survey 25th percentile work RVU of 2.80 appropriately accounts for the work required to perform this service. The RUC recommends 10 minutes of pre-service time, 45 minutes of intra-service time and 15 minutes of post-service time.

The RUC compared the surveyed code to the top key reference service 99215 Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and high level of medical decision making. When using time for code selection, 40-54 minutes of total time is spent on the date of the encounter (work RVU = 2.80, 45 minutes intra-service time and 70 minutes total time) and determined that these services require the same high level of medical decision making, physician work and physician time to perform, thus should be valued the same.

The RUC also compared 99310 to the second top key reference service 99291 Critical care, evaluation and management of the critically ill or critically injured patient; first 30-74 minutes (work RVU = 4.50, 40 minutes intra-service time and 70 minutes total time) and determined 99310 requires less physician work and the typical patient is less intense than the critical care service. Thus, CPT code 99310 is appropriately valued lower than 99291.

For additional support, the RUC referenced MPC code 99204 Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. When using time for code selection, 45-59 minutes of total time is spent on the date of the encounter (work RVU = 2.60 and 40 minutes of intra-service time) and code 75561 Cardiac magnetic resonance imaging for morphology and function without contrast material(s), followed by contrast material(s) and further sequences; (work RVU = 2.60 and 45 minutes of intra-service time), which require similar physician work and time. The RUC recommends a work RVU of 2.80 for CPT code 99310.
**Nursing Facility Care Discharge Day Management**

99315 *Nursing facility discharge day management; 30 minutes or less*
99316 *Nursing facility discharge day management; more than 30 minutes*

The RUC reviewed CPT codes 99315 and 99316 and determined to maintain the proper rank order, these services should be reviewed with the hospital discharge day management codes, 99238 and 99239, in October 2021. **The RUC recommends to table review of CPT codes 99315 and 99316 until October 2021.**

**CPT Descriptor Time**
The RUC recommends the following times for the CPT descriptors based on the survey medians. The time in the CPT descriptors are rounded or incremental between this family of services for the ease of those who may report these services based on time.

Evaluation and Management
Nursing Facility Services

The following codes are used to report evaluation and management services to patients in nursing facilities and skilled nursing facilities (formerly called skilled nursing facilities [SNFs], intermediate care facilities [ICFs], or long-term care facilities [LTCFs]). These codes should also be used to report evaluation and management services provided to a patient in a psychiatric residential treatment center and intermediate care facility for individuals with intellectual disabilities, (a facility or a distinct part of a facility for psychiatric care, which provides a 24-hour therapeutically planned and professionally staffed group living and learning environment). If procedures such as medical psychotherapy are provided in addition to evaluation and management services, these should be reported in addition to the evaluation and management services provided.

Nursing facilities that provide convalescent, rehabilitative, or long-term care are required to conduct comprehensive, accurate, standardized, and reproducible assessments of each resident’s functional capacity using a Resident Assessment Instrument (RAI). All RAIs include the Minimum Data Set (MDS), Resident Assessment Protocols (RAPs), and utilization guidelines. The MDS is the primary screening and assessment tool; the RAPs trigger the identification of potential problems and provide guidelines for follow-up assessments.

Regulations pertaining to the care of nursing facility residents govern the nature and minimum frequency of assessments and visits. These regulations also govern who may perform the initial comprehensive visits.

These services are performed by the principal physician(s) and other qualified health care professional(s), overseeing the care of the patient in the facility. The principal physician is sometimes referred to as the admitting physician and is the physician who oversees the patient’s care as compared to other physicians or other qualified health care professionals who may be furnishing specialty care. These services are also performed by physicians or other qualified health care professionals in the role of a specialist performing a consultation or concurrent care. Modifiers may be required to identify the role of the individual performing the service.

Physicians have a central role in assuring that all residents receive thorough assessments and that medical plans of care are instituted or revised to enhance or maintain the residents’ physical and psychosocial functioning. This role includes providing input in the development of the MDS and a multi-disciplinary plan of care, as required by regulations pertaining to the care of nursing facility residents.

Two major subcategories of nursing facility services are recognized: Initial Nursing Facility Care and Subsequent Nursing Facility Care. Both subcategories apply to new or established patients.

The types of care (eg, skilled nursing facility and nursing facility care) are reported with the same codes. Place of service codes should be reported to specify the type of facility (and care) where the service(s) are performed.

For definitions of commonly used terms, see Evaluation and Management Services Guidelines.
When selecting a level of medical decision making (MDM) for nursing facility services, the Nature and Complexity of Problems Addressed at the Encounter is considered. For this determination, a high level MDM type specific to Initial Nursing Facility Care by the principal physician or other qualified health care professional is recognized. This type is:

**Multiple morbidities requiring intensive management:** A set of conditions, syndromes or functional impairments that are likely to require frequent medication changes or other treatment changes and/or re-evaluations. The patient is at significant risk of worsening medical (including behavioral) status and risk for (re)admission to a hospital.

The definitions and requirements related to the Amount and Complexity of Data to be Reviewed and Analyzed and the Risk of Complications and/or Morbidity or Mortality of Patient Management are unchanged.

(For care plan oversight services provided to nursing facility residents, see 99379-99380)

**Initial Nursing Facility Care**  
**New or Established Patient**

When the patient is admitted to the nursing facility in the course of an encounter in another site of service (e.g., hospital emergency department, office), the services in the initial site may be separately reported. Modifier 25 may be added to the other evaluation and management service to indicate a significant, separately identifiable service by the same physician or qualified health care professional was performed on the same date. All evaluation and management services provided by that physician in conjunction with that admission are considered part of the initial nursing facility care when performed on the same date as the admission or readmission. The nursing facility care level of service reported by the admitting physician should include the services related to the admission he/she provided in the other sites of service as well as in the nursing facility setting. In the case when services in a separate site are reported and the initial nursing facility care service is a consultation service by the same physician or other qualified health care professional and reported on the same date, do not report 99304, 99305, 99306, 99252, 99253, 99254, 99255. The consultant reports the subsequent nursing facility care codes 99307, 99308, 99309, 99310 for the second service on the same date.

Hospital inpatient discharge or observation discharge services performed on the same date of nursing facility admission or readmission may be reported separately. For a patient discharged from inpatient or observation status on the same date of nursing facility admission or readmission, the hospital or observation discharge services should be reported with codes 99238, 99239 as appropriate. For a patient discharged from observation status on the same date of nursing facility admission or readmission, the observation care discharge services should be reported with code 99217. For a patient admitted and discharged from observation or inpatient status on the same date, see codes 99234-99236. Time related to these hospital inpatient or observation care services may not be used for code selection of any nursing facility service.

(For nursing facility care discharge, see 99315, 99316)

Initial nursing facility care codes 99304, 99305, 99306 may be used once per admission, per physician or other qualified health care professional, regardless of length of stay. They may be used for the initial comprehensive visit performed by the principal physician or other qualified health care professional. Skilled nursing facility initial comprehensive visits must be performed by a physician. Qualified health care professionals may report initial comprehensive nursing facility visits for nursing facility level of care patients, if allowed by state law or regulation. The principal physician or qualified health care professional may work with others (who may not always be in the same group) but are overseeing the overall medical care of the patient, in order to provide
timely care to the patient. Medically necessary assessments conducted by these professionals prior to the initial comprehensive visit are reported using subsequent care codes (99307, 99308, 99309, 99310).

Initial services by other physicians and other qualified health care professionals who are performing consultations may be reported using initial nursing facility care codes (99304, 99305, 99306) or inpatient consultations (99252, 99253, 99254, 99255). This is not dependent upon the principal care professionals completion of the initial comprehensive services first.

An initial service may be reported when the patient has not received any face-to-face professional services from the physician or other qualified health care professional or another physician or other qualified health care professional of the exact same specialty and subspecialty who belongs to the same group practice during the stay. When advanced practice nurses or physician assistants are working with physicians they are considered as working in the exact same specialty and subspecialty as the physician. An initial service may also be reported if the patient is a new patient as defined in the Evaluation and Management Guidelines.

For reporting initial nursing facility care, transitions between skilled nursing facility level of care ad nursing facility level of care do not constitute a new stay.

**Coding-Tip**

**The Significance of Time as a Factor in Selection of an Evaluation and Management Code from This Section**

The inclusion of time as an explicit factor beginning in CPT-1992 was done to assist in selecting the most appropriate level of E/M services included in codes in this section. Beginning with CPT 2021, except for 99211, time alone may be used to select the appropriate code level for the office or other outpatient E/M services codes (99202, 99203, 99204, 99205, 99212, 99213, 99214, 99215). Different categories of services use time differently. It is important to review the instructions for each category.

**Unit/floor time (hospital observation services [99218, 99219, 99220, 99224, 99225, 99226, 99234, 99235, 99236], hospital inpatient services [99221, 99222, 99223, 99231, 99232, 99233], inpatient consultations [99251, 99252, 99253, 99254, 99255], nursing facility services [99304, 99305, 99306, 99307, 99308, 99309, 99310, 99315, 99316, 99318]):**

For coding purposes, time for these services is defined as unit/floor time, which includes the time present on the patient’s hospital unit and at the bedside rendering services for that patient. This includes the time to establish and/or review the patient’s chart, examine the patient, write notes, and communicate with other professionals and the patient’s family.

CPT Coding Guidelines, Evaluation and Management, Guidelines Common to All E/M Services, Time
| 99304 | 11 | Initial nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and straightforward or low level of medical decision making. These 3 key components:
• A detailed or comprehensive history;
• A detailed or comprehensive examination; and
• Medical decision making that is straightforward or of low complexity.
Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient’s and/or family’s needs. Usually, the problem(s) requiring admission are of low severity. Typically, 25 minutes are spent at the bedside and on the patient’s facility floor or unit.
When using total time on the date of the encounter for code selection, 25 minutes must be met or exceeded. | XXX | 1.50 |
| 99305 | 12 | Initial nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. These 3 key components:
• A comprehensive history;
• A comprehensive examination; and
• Medical decision making of moderate complexity.
Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient’s and/or family’s needs. Usually, the problem(s) requiring admission are of moderate severity. Typically, 35 minutes are spent at the bedside and on the patient’s facility floor or unit.
When using total time on the date of the encounter for code selection, 35 minutes must be met or exceeded. | XXX | 2.50 |

| 99306   | Initial nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and high level of medical decision making. these 3 key components:  
  - A comprehensive history;  
  - A comprehensive examination; and  
  - Medical decision making of high complexity.  
Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient’s and/or family’s needs.  
Usually, the problem(s) requiring admission are of high severity. Typically, 45 minutes are spent at the bedside and on the patient’s facility floor or unit.  
When using total time on the date of the encounter for code selection, 45 minutes must be met or exceeded.  
(For services 60 minutes or longer, use prolonged services code 993X0) | XXX   | 3.50   |

| 99307   | Subsequent nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and straightforward medical decision making. at least 2 of these 3 key components:  
  - A problem focused interval history;  
  - A problem focused examination;  
  - Straightforward medical decision making.  
Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient’s and/or family’s needs.  
Usually, the patient is stable, recovering, or improving. Typically, 10 minutes are spent at the bedside and on the patient's facility floor or unit.  
When using total time on the date of the encounter for code selection, 10 minutes must be met or exceeded. | XXX   | 0.70   |

Subsequent Nursing Facility Care

All levels of subsequent nursing facility care include reviewing the medical record and reviewing the results of diagnostic studies and changes in the patient’s status (ie, changes in history, physical condition, and response to management) since the last assessment by the physician or other qualified health are professional.
<table>

</table>
| 99308    | I5       | Subsequent nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and low level of medical decision making. At least 2 of these 3 key components:  
- An expanded problem-focused interval history;  
- An expanded problem-focused examination;  
- Medical decision making of low complexity.  
Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient’s and/or family’s needs.  
Usually, the patient is responding inadequately to therapy or has developed a minor complication. Typically, 15 minutes are spent at the bedside and on the patient’s facility floor or unit.  
When using total time on the date of the encounter for code selection, 15 minutes must be met or exceeded. |

| 99309    | I6       | Subsequent nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. At least 2 of these 3 key components:  
- A detailed interval history;  
- A detailed examination;  
- Medical decision making of moderate complexity.  
Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient’s and/or family’s needs.  
Usually, the patient has developed a significant complication or a significant new problem. Typically, 25 minutes are spent at the bedside and on the patient’s facility floor or unit.  
When using total time on the date of the encounter for code selection, 30 minutes must be met or exceeded. |
| 99310 | 17 | Subsequent nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and high level of medical decision making, at least 2 of these 3 key components:  
  • A comprehensive interval history;  
  • A comprehensive examination;  
  • Medical decision making of high complexity  
  Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient’s and/or family’s needs.  
  The patient may be unstable or may have developed a significant new problem requiring immediate physician attention. Typically, 35 minutes are spent at the bedside and on the patient's facility floor or unit.  
  When using total time on the date of the encounter for code selection, 45 minutes must be met or exceeded.  
  (For services 60 minutes or longer, use prolonged services code 993X0) | XXX | 2.80 |

**Nursing Facility Discharge Services**  
The nursing facility discharge day management codes are to be used to report the total duration of time spent by a physician or other qualified health care professional for the final nursing facility discharge of a patient. The codes include, as appropriate, final examination of the patient, discussion of the nursing facility stay, even if the time spent on that date is not continuous. Instructions are given for continuing care to all relevant caregivers, and preparation of discharge records, prescriptions and referral forms. These services require a face-to-face encounter but that may be performed on a calendar date prior to the actual discharge date. The time of the face-to-face encounter performed on a date prior to the discharge date is counted toward 99315, 99316 and not reported separately.

| 99315 | 18 | Nursing facility discharge day management; 30 minutes or less | XXX | Tabled until October 2021 RUC Meeting |
| 99316 | 19 | more than 30 minutes | XXX | Tabled until October 2021 RUC Meeting |

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.
Other Nursing Facility Services

| D99318 |   | Evaluation and management of a patient involving an annual nursing facility assessment, which requires these 3 key components:
|        |   | • A detailed interval history;
|        |   | • A comprehensive examination; and
|        |   | • Medical decision making that is of low to moderate complexity.

CPT 2023 E/M Guidelines

Category I
Evaluation and Management (E/M) Services Guidelines

In addition to the information presented in the Introduction, several other items unique to this section are defined or identified here.

E/M Guidelines Overview

The E/M guidelines have sections that are common to all E/M categories and sections that are category specific. Most of the categories and many of the subcategories of service have special guidelines or instructions unique to that category or subcategory. Where these are indicated, eg, “Hospital Inpatient and Observation Care,” special instructions are presented before the listing of the specific E/M services codes. It is important to review the instructions for each category or subcategory. These guidelines are to be used by the reporting physician or other qualified health care professional to select the appropriate level of service. These guidelines do not establish documentation requirements or standards of care. The main purpose of documentation is to support care of the patient by current and future health care team(s). These guidelines are for services that require a face-to-face encounter. (For 99211 and 99281 the face-to-face services may be performed by clinical staff).

In the Evaluation and Management section (99202-99499) there are many code categories. Each category may have specific guidelines, or the codes may include specific details. These E/M guidelines are written for the following categories:

- Office or Other Outpatient Services
- Hospital Inpatient and Observation Care Services
- Consultations
- Emergency Department Services
- Nursing Facility Services
- Home and Residence Services
- Prolonged Service With or Without Direct Contact on the Date of an Evaluation and Management Service

Classification of Evaluation and Management (E/M) Services

The E/M section is divided into broad categories such as office visits, hospital inpatient or observation care visits, and consultations. Most of the categories are further divided into two or more subcategories of E/M services. For example, there are two subcategories of office visits (new patient and established patient) and there are two subcategories of hospital inpatient and observation care visits (initial and subsequent). The subcategories of E/M services are further classified into levels of E/M services that are identified by specific codes.

The basic format of codes with levels of E/M services based on medical decision making (MDM) or time is the same. First, a unique code number is listed. Second, the place and/or type of service is specified, eg, office or other outpatient visit. Third, the content of the service is defined. Fourth, time is specified. (A detailed discussion of time is provided following the Decision Tree for New vs Established Patients.)

The place of service and service type is defined by the location where the face-to-face encounter occurs. For example, service provided to a nursing facility resident brought to the office is reported with an office or other outpatient code.
New and Established Patients

Solely for the purposes of distinguishing between new and established patients, professional services are those face-to-face services rendered by physicians and other qualified health care professionals who may report evaluation and management services. A new patient is one who has not received any professional services from the physician or other qualified health care professional or another physician or other qualified health care professional of the exact same specialty and subspecialty who belongs to the same group practice, within the past three years.

An established patient is one who has received professional services from the physician or other qualified health care professional or another physician or other qualified health care professional of the exact same specialty and subspecialty who belongs to the same group practice, within the past three years. See Decision Tree for New vs Established Patients.

In the instance where a physician or other qualified health care professional is on call for or covering for another physician or other qualified health care professional, the patient’s encounter will be classified as it would have been by the physician or other qualified health care professional who is not available. When advanced practice nurses and physician assistants are working with physicians, they are considered as working in the exact same specialty and subspecialty as the physician.

No distinction is made between new and established patients in the emergency department. E/M services in the emergency department category may be reported for any new or established patient who presents for treatment in the emergency department.

The Decision Tree for New vs Established Patients is provided to aid in determining whether to report the E/M service provided as a new or an established patient encounter.

Coding Tip

Instructions for Use of the CPT Codebook

When advanced practice nurses and physician assistants are working with physicians, they are considered as working in the exact same specialty and exact same subspecialty as the physician. A “physician or other qualified health care professional” is an individual who is qualified by education, training, licensure/regulation (when applicable), and facility privileging (when applicable) who performs a professional service within his or her scope of practice and independently reports that professional service. These professionals are distinct from “clinical staff.” A clinical staff member is a person who works under the supervision of a physician or other qualified health care professional, and who is allowed by law, regulation and facility policy to perform or assist in the performance of a specific professional service but does not individually report that professional service. Other policies may also affect who may report specific services.

CPT Coding Guidelines, Introduction, Instructions for Use of the CPT Codebook

Decision Tree for New vs Established Patients
Initial and Subsequent Services

Some categories apply to both new and established patients (e.g., hospital inpatient or observation care). These categories differentiate services by whether the service is the initial service or a subsequent service. For the purpose of distinguishing between initial or subsequent visits, professional services are those face-to-face services rendered by physicians and other qualified health care professionals who may report evaluation and management services. An initial service is when the patient has not received any professional services from the physician or other qualified health care professional or another physician or other qualified health care professional of the exact same specialty and subspecialty who belongs to the same group practice, during the inpatient or observation or nursing facility admission and stay.

A subsequent service is when the patient has received professional service(s) from the physician or other qualified health care professional or another physician or other qualified health care professional of the exact same specialty and subspecialty who belongs to the same group practice, during the admission and stay.

In the instance where a physician or other qualified health care professional is on call for or covering for another physician or other qualified health care professional, the patient’s encounter will be classified as it would have been by the physician or other qualified health care professional who is not available. When advanced practice nurses and physician assistants are working with physicians, they are considered as working in the exact same specialty and subspecialty as the physician.

For reporting hospital inpatient or observation care services, a stay that includes a transition from observation to inpatient is a single stay. For reporting nursing facility services, a stay that includes transition(s) between skilled nursing facility and nursing facility level of care is the same stay.

Services Reported Separately

Any specifically identifiable procedure or service (i.e., identified with a specific CPT code) performed on the date of E/M services may be reported separately.

The ordering and actual performance and/or interpretation of diagnostic tests/studies during a patient encounter are not included in determining the levels of E/M services when the professional interpretation
of those tests/studies is reported separately by the physician or other qualified health care professional reporting the E/M service. Tests that do not require separate interpretation (eg, tests that are results only) and are analyzed as part of MDM do not count as an independent interpretation and may be counted as ordered or reviewed for selecting an MDM level.

The performance of diagnostic tests/studies for which specific CPT codes are available may be reported separately, in addition to the appropriate E/M code. The interpretation of the results of diagnostic tests/studies (ie, professional component) with preparation of a separate distinctly identifiable signed written report may also be reported separately, using the appropriate CPT code and, if required, with modifier 26 appended.

See Instructions for Selecting a Level Based on MDM or Time.

The physician or other qualified health care professional may need to indicate that on the day a procedure or service identified by a CPT code was performed, the patient’s condition required a significant separately identifiable E/M service. The E/M service may be caused or prompted by the symptoms or condition for which the procedure and/or service was provided. This circumstance may be reported by adding modifier 25 to the appropriate level of E/M service. As such, different diagnoses are not required for reporting of the procedure and the E/M services on the same date.

History and/or Examination

These E/M services include a medically appropriate history and/or physical examination, when performed. The nature and extent of the history and/or physical examination are determined by the treating physician or other qualified health care professional reporting the service. The care team may collect information, and the patient or caregiver may supply information directly (eg, by electronic health record [EHR] portal or questionnaire) that is reviewed by the reporting physician or other qualified health care professional. The extent of history and physical examination is not an element in selection of the level of these E/M service codes.

Levels of E/M Services

Select the appropriate level of E/M services based on the following:

1. The level of the MDM as defined for each service, or
2. The total time for E/M services performed on the date of the encounter.

Within each category or subcategory of E/M service based on MDM or time, there are three to five levels of E/M services available for reporting purposes. Levels of E/M services are not interchangeable among the different categories or subcategories of service. For example, the first level of E/M services in the subcategory of office visit, new patient, does not have the same definition as the first level of E/M services in the subcategory of office visit, established patient. Each level of E/M services may be used by all physicians or other qualified health care professionals.

Guidelines for Selecting a level service based on Medical Decision Making

Four types of MDM are recognized: straightforward, low, moderate, and high. The concept of the level of MDM does not apply to 99211 or 99281.

MDM includes establishing diagnoses, assessing the status of a condition, and/or selecting a management option. MDM is defined by three elements. The elements are:

- The number and complexity of problem(s) that are addressed during the encounter.
- The amount and/or complexity of data to be reviewed and analyzed. These data include medical records, tests, and/or other information that must be obtained, ordered, reviewed, and analyzed for the encounter. This includes information obtained from multiple sources or interprofessional communications that are not reported separately and interpretation of tests that are not reported
separately. Ordering a test is included in the category of test result(s) and the review of the test result is part of the encounter and not a subsequent encounter. Ordering a test may include those considered, but not selected after shared decision making. For example, a patient may request diagnostic imaging that is not necessary for their condition and discussion of the lack of benefit may be required. Alternatively, a test may normally be performed, but due to risk for a specific patient is not ordered. These considerations must be documented. Data are divided into three categories:

- **Tests, documents, orders, or independent historian(s).** (Each unique test, order, or document is counted to meet a threshold number.)
- **Independent interpretation of tests (not separately reported)**
- **Discussion of management or test interpretation with external physician or other qualified health care professional or appropriate source (not separately reported)**

**The risk of complications and/or morbidity or mortality of patient management:** This includes decisions made at the encounter associated with the diagnostic procedure(s) and treatment(s). This includes the possible management options selected and those considered but not selected, after shared decision making with the patient and/or family. For example, a decision about hospitalization includes consideration of alternative levels of care. Examples may include a psychiatric patient with a sufficient degree of support in the outpatient setting or the decision to not hospitalize a patient with advanced dementia with an acute condition that would generally warrant inpatient care, but for whom the goal is palliative treatment.

Shared decision making involves eliciting patient and/or family preferences, patient and/or family education, and explaining risks and benefits of management options.

**MDM may be impacted by role and management responsibility.**

When the physician or other qualified health care professional is reporting a separate CPT code that includes interpretation and/or report, the interpretation and/or report is not counted toward the MDM when selecting a level of E/M services.

When the physician or other qualified health care professional is reporting a separate service for discussion of management with a physician or another qualified health care professional, the discussion is not counted toward the MDM when selecting a level of E/M services.

The Levels of Medical Decision Making (MDM) table (Table 2) is a guide to assist in selecting the level of MDM for reporting an E/M services code. The table includes the four levels of MDM (ie, straightforward, low, moderate, high) and the three elements of MDM (ie, number and complexity of problems addressed at the encounter, amount and/or complexity of data reviewed and analyzed, and risk of complications and/or morbidity or mortality of patient management). To qualify for a particular level of MDM, two of the three elements for that level of MDM must be met or exceeded.

Examples in the table may be more or less applicable to specific settings of care. For example, the decision to hospitalize applies to the outpatient or nursing facility encounters, whereas the decision to escalate hospital level of care (eg, transfer to ICU) applies to the hospitalized or observation care patient.

See also the introductory guidelines of each code family section.

Moderate

- 1 or more chronic illnesses with exacerbation, progression, or side effects of treatment;
- or
- 2 or more stable, chronic illnesses;
- or
- 1 undiagnosed new problem with uncertain prognosis;
- or
- 1 acute illness with systemic symptoms;
- or
- 1 acute, complicated injury

(Must meet the requirements of at least 1 out of 3 categories)

Moderate risk of morbidity from additional diagnostic testing or treatment

Examples only:
- Prescription drug management
- Decision regarding minor surgery with identified patient or procedure risk factors
- Decision regarding elective major surgery without identified patient or procedure risk factors
- Diagnosis or treatment significantly limited by social determinants of health

*Examples only: • Drug therapy requiring intensive monitoring for toxicity • Decision regarding elective major surgery with identified patient or procedure risk factors • Decision regarding emergency major surgery • Decision regarding hospitalization or escalation of hospital-level of care • Decision not to resuscitate or to de-escalate care because of poor prognosis • Parenteral controlled substances
Number and Complexity of Problems Addressed at the Encounter

One element used in selecting the level of services is the number and complexity of the problems that are addressed at the encounter. Multiple new or established conditions may be addressed at the same time and may affect MDM. Symptoms may cluster around a specific diagnosis and each symptom is not necessarily a unique condition. Comorbidities and underlying diseases, in and of themselves, are not considered in selecting a level of E/M services unless they are addressed, and their presence increases the amount and/or complexity of data to be reviewed and analyzed or the risk of complications and/or morbidity or mortality of patient management. The final diagnosis for a condition does not, in and of itself, determine the complexity or risk, as extensive evaluation may be required to reach the conclusion that the signs or symptoms do not represent a highly morbid condition. Therefore, presenting symptoms which are likely to represent a highly morbid condition may drive MDM even when the ultimate diagnosis is not highly morbid. The evaluation and/or treatment should be consistent with the likely nature of the condition. Multiple problems of a lower severity may, in the aggregate, create higher risk due to interaction.

The term “risk” as used in these definitions relates to risk from the condition. While condition risk and management risk may often correlate, the risk from the condition is distinct from the risk of the management.

Definitions for the elements of MDM (see Table 2, Levels of Medical Decision Making) are:

**Problem:** A problem is a disease, condition, illness, injury, symptom, sign, finding, complaint, or other matter addressed at the encounter, with or without a diagnosis being established at the time of the encounter.

**Problem addressed:** A problem is addressed or managed when it is evaluated or treated at the encounter by the physician or other qualified health care professional reporting the service. This includes consideration of further testing or treatment that may not be elected by virtue of risk/benefit analysis or patient/parent/guardian/surrogate choice. Notation in the patient’s medical record that another professional is managing the problem without additional assessment or care coordination documented does not qualify as being addressed or managed by the physician or other qualified health care professional reporting the service. Referral without evaluation (by history, examination, or diagnostic study[ies]) or consideration of treatment does not qualify as being addressed or managed by the physician or other qualified health care professional reporting the service. For hospital inpatient and observation care services, the problem addressed is the problem status on the date of the encounter, which may be significantly different than on admission. It is the problem being managed or co-managed by the reporting physician or qualified health care professional and may not be the cause of admission or continued stay.

**Minimal problem:** A problem that may not require the presence of the physician or other qualified health care professional, but the service is provided under the physician’s or other qualified health care professional’s supervision (see 99211, 99281).

**Self-limited or minor problem:** A problem that runs a definite and prescribed course, is transient in nature, and is not likely to permanently alter health status.

**Stable, chronic illness:** A problem with an expected duration of at least one year or until the death of the patient. For the purpose of defining chronicity, conditions are treated as chronic whether or not stage or severity changes (eg, uncontrolled diabetes and controlled diabetes are a single chronic condition). “Stable” for the purposes of categorizing MDM is defined by the specific treatment goals for an individual patient. A patient who is not at his or her treatment goal is not stable, even if the condition has not changed and there is no short-term threat to life or function. For example, a patient with persistently poorly controlled blood pressure for whom better control is a goal is not stable, even if the pressures are not changing and the patient is asymptomatic. The risk of morbidity without treatment is significant.
Acute, uncomplicated illness or injury: A recent or new short-term problem with low risk of morbidity for which treatment is considered. There is little to no risk of mortality with treatment, and full recovery without functional impairment is expected. A problem that is normally self-limited or minor but is not resolving consistent with a definite and prescribed course is an acute, uncomplicated illness.

Acute, uncomplicated illness or injury requiring hospital inpatient or observation level care: A recent or new short-term problem with low risk of morbidity for which treatment is required. There is little to no risk of mortality with treatment, and full recovery without functional impairment is expected. The treatment required is delivered in a hospital inpatient or observation level setting.

Stable, acute illness: A problem that is new or recent for which treatment has been initiated. The patient is improved and while resolution may not be complete is stable with respect to this condition.

Chronic illness with exacerbation, progression, or side effects of treatment: A chronic illness that is acutely worsening, poorly controlled, or progressing with an intent to control progression and requiring additional supportive care or requiring attention to treatment for side effects.

Undiagnosed new problem with uncertain prognosis: A problem in the differential diagnosis that represents a condition likely to result in a high risk of morbidity without treatment.

Acute illness with systemic symptoms: An illness that causes systemic symptoms and has a high risk of morbidity without treatment. For systemic general symptoms, such as fever, body aches, or fatigue in a minor illness that may be treated to alleviate symptoms, see the definitions for self-limited or minor problem or acute, uncomplicated illness or injury. Systemic symptoms may not be general but may be single system.

Acute, complicated injury: An injury which requires treatment that includes evaluation of body systems that are not directly part of the injured organ, the injury is extensive, or the treatment options are multiple and/or associated with risk of morbidity.

Chronic illness with severe exacerbation, progression, or side effects of treatment: The severe exacerbation or progression of a chronic illness or severe side effects of treatment that have significant risk of morbidity and may require escalation in level of care.

Acute or chronic illness or injury that poses a threat to life or bodily function: An acute illness with systemic symptoms, an acute complicated injury, or a chronic illness or injury with exacerbation and/or progression or side effects of treatment, that poses a threat to life or bodily function in the near term without treatment. Some symptoms may represent a condition that is significantly probable and poses a potential threat to life or bodily function. These may be included in this category when the evaluation and treatment is consistent with this degree of potential severity.

Amount and/or Complexity of Data to be Reviewed and Analyzed

One element used in selecting the level of services is the amount and/or complexity of data to be reviewed or analyzed at an encounter.

Analyzed: Analyzed is a term describing the process of using the data as part of the MDM. The data element itself may not be subject to analysis (eg, glucose), but it is instead included in the thought processes for diagnosis, evaluation, or treatment. Tests ordered are presumed to be analyzed when the results are reported. Therefore, when they are ordered during an encounter, they are counted in that encounter. Tests that are ordered outside of an encounter may be counted in the encounter where they are analyzed. In the case of a recurring order, each new result may be counted in the encounter at which it is analyzed. For example, an encounter that includes an order for monthly prothrombin times would count for one prothrombin time ordered and reviewed. Additional future results, if analyzed in a subsequent encounter, may be counted as a single test in that subsequent encounter. Any service for which the professional component is separately reported by the physician or other qualified health care professional
reporting the E/M services is not counted as a data element ordered, reviewed, analyzed, or independently interpreted for the purposes of determining the level of MDM.

**Test:** Tests are imaging, laboratory, psychometric, or physiologic data. A clinical laboratory panel (e.g., basic metabolic panel [80047]) is a single test. The differentiation between single or multiple tests is defined in accordance with the CPT code set. For the purposes of data reviewed and analyzed, pulse oximetry is not a test.

**Unique:** A unique test is defined by the CPT code set. When multiple results of the same unique test (e.g., serial blood glucose values) are compared during an E/M service, only count one unique test. Tests that have overlapping elements are not unique, even if they are identified with distinct CPT codes. For example, a CBC with differential would incorporate the set of hemoglobin, CBC without differential, and platelet count. A unique source is defined as a physician or qualified health care professional in a distinct group or different specialty or subspecialty, or a unique entity. Review of all materials from any unique source counts as one element towards MDM.

**Combination of Data Elements:** A combination of different data elements, for example a combination of notes reviewed, tests ordered, tests reviewed, or independent historian, allows these elements to be summed. It does not require each item type or category to be represented. A unique test ordered, plus a note reviewed and an independent historian would be a combination of three elements.

**External:** External records, communications and/or test results are from an external physician, other qualified health care professional, facility, or health care organization.

**External physician or other qualified health care professional:** An external physician or other qualified health care professional who is not in the same group practice or is of a different specialty or subspecialty. This includes licensed professionals who are practicing independently. The individual may also be a facility or organizational provider such as from a hospital, nursing facility, or home health care agency.

**Discussion:** Discussion requires an interactive exchange. The exchange must be direct and not through intermediaries (e.g., clinical staff or trainees). Sending chart notes or written exchanges that are within progress notes does not qualify as an interactive exchange. The discussion does not need to be on the date of the encounter but is counted only once and only when it is used in the decision making of the encounter. It may be asynchronous (i.e., does not need to be in person), but it must be initiated and completed within a short time period (e.g., within a day or two).

**Independent historian(s):** An individual (e.g., parent, guardian, surrogate, spouse, witness) who provides a history in addition to a history provided by the patient who is unable to provide a complete or reliable history (e.g., due to developmental stage, dementia, or psychosis) or because a confirmatory history is judged to be necessary. In the case where there may be conflict or poor communication between multiple historians and more than one historian is needed, the independent historian requirement is met. It does not include translation services. The independent history does not need to be obtained in person but does need to be obtained directly from the historian providing the independent information.

**Independent interpretation:** The interpretation of a test for which there is a CPT code, and an interpretation or report is customary. This does not apply when the physician or other qualified health care professional who reports the E/M service is reporting or has previously reported the test. A form of interpretation should be documented but need not conform to the usual standards of a complete report for the test.

**Appropriate source:** For the purpose of the discussion of management data element (see Table 2, Levels of Medical Decision Making), an appropriate source includes professionals who are not health care professionals but may be involved in the management of the patient (e.g., lawyer, parole officer, case manager, teacher). It does not include discussion with family or informal caregivers.
Risk of Complications and/or Morbidity or Mortality of Patient Management

One element used in selecting the level of services is the risk of complications and/or morbidity or mortality of patient management at an encounter. This is distinct from the risk of the condition itself.

Risk: The probability and/or consequences of an event. The assessment of the level of risk is affected by the nature of the event under consideration. For example, a low probability of death may be high risk, whereas a high chance of a minor, self-limited adverse effect of treatment may be low risk. Definitions of risk are based upon the usual behavior and thought processes of a physician or other qualified health care professional in the same specialty. Trained clinicians apply common language usage meanings to terms such as high, medium, low, or minimal risk and do not require quantification for these definitions (though quantification may be provided when evidence-based medicine has established probabilities). For the purposes of MDM, level of risk is based upon consequences of the problem(s) addressed at the encounter when appropriately treated. Risk also includes MDM related to the need to initiate or forego further testing, treatment, and/or hospitalization. The risk of patient management criteria applies to the patient management decisions made by the reporting physician or other qualified health care professional as part of the reported encounter.

Morbidity: A state of illness or functional impairment that is expected to be of substantial duration during which function is limited, quality of life is impaired, or there is organ damage that may not be transient despite treatment.

Social determinants of health: Economic and social conditions that influence the health of people and communities. Examples may include food or housing insecurity.

Surgery (minor or major, elective, emergency, procedure or patient risk):

Surgery-Minor or Major: The classification of surgery into minor or major is based upon the common meaning of such terms when used by trained clinicians, similar to the use of the term “risk”. These terms are not defined by a surgical package classification.

Surgery-Elective or Emergency: Elective procedures and emergent or urgent procedures describe the timing of a procedure when the timing is related to the patient’s condition. An elective procedure is typically planned in advance (eg, scheduled for weeks later), while an emergent procedure is typically performed immediately or with minimal delay to allow for patient stabilization. Both elective and emergent procedures may be minor or major procedures.

Surgery-Risk Factors, Patient or Procedure: Risk factors are those that are relevant to the patient and procedure. Evidence-based risk calculators may be used, but are not required, in assessing patient and procedure risk.

Drug therapy requiring intensive monitoring for toxicity: A drug that requires intensive monitoring is a therapeutic agent that has the potential to cause serious morbidity or death. The monitoring is performed for assessment of these adverse effects and not primarily for assessment of therapeutic efficacy. The monitoring should be that which is generally accepted practice for the agent but may be patient-specific in some cases. Intensive monitoring may be long-term or short-term. Long-term intensive monitoring is not performed less than quarterly. The monitoring may be performed with a laboratory test, a physiologic test, or imaging. Monitoring by history or examination does not qualify. The monitoring affects the level of MDM in an encounter in which it is considered in the management of the patient. An example may be monitoring for cytopenia in the use of an antineoplastic agent between dose cycles. Examples of monitoring that do not qualify include monitoring glucose levels during insulin therapy, as the primary reason is the therapeutic effect (unless severe hypoglycemia is a current, significant concern); or annual electrolytes and renal function for a patient on a diuretic, as the frequency does not meet the threshold.
Guidelines for Selecting Level of Service Based on Time

Certain categories of time-based E/M codes that do not have levels of services based on MDM (e.g., Critical Care Services) in the E/M section use time differently. It is important to review the instructions for each category.

Time is not a descriptive component for the emergency department levels of E/M services because emergency department services are typically provided on a variable intensity basis, often involving multiple encounters with several patients over an extended period of time.

When time is used for reporting E/M services codes, the time defined in the service descriptors is used for selecting the appropriate level of services. The E/M services for which these guidelines apply require a face-to-face encounter with the physician or other qualified health care professional. For office or other outpatient services, if the physician’s or other qualified health care professional’s time is spent in the supervision of clinical staff who perform the face-to-face services of the encounter, use 99211.

For coding purposes, time for these services is the total time on the date of the encounter. It includes both the face-to-face and non-face-to-face time personally spent by the physician and/or other qualified health care professional(s) on the day of the encounter (includes time in activities that require the physician or other qualified health care professional and does not include time in activities normally performed by clinical staff). It does not include any time spent in the performance of other separately reported service(s).

A shared or split visit is defined as a visit in which a physician and other qualified health care professional(s) both provide the face-to-face and non-face-to-face work related to the visit. When time is being used to select the appropriate level of services for which time-based reporting of shared or split visits is allowed, the time personally spent by the physician and other qualified health care professional(s) assessing and managing the patient on the date of the encounter is summed to define total time. Only distinct time should be summed for shared or split visits (i.e., when two or more individuals jointly meet with or discuss the patient, only the time of one individual should be counted).

When prolonged time occurs, the appropriate prolonged services code may be reported. The total time on the date of the encounter spent caring for the patient should be documented in the medical record when it is used as the basis for code selection.

Physician or other other qualified health care professional time includes the following activities, when performed:

- preparing to see the patient (e.g., review of tests)
- obtaining and/or reviewing separately obtained history
- performing a medically appropriate examination and/or evaluation
- counseling and educating the patient/family/caregiver
- ordering medications, tests, or procedures
- referring and communicating with other health care professionals (when not separately reported)
- documenting clinical information in the electronic or other health record
- independently interpreting results (when not separately reported) and communicating results to the patient family/caregiver
- care coordination (when not separately reported)

Do not count time spent on the following:

- the performance of other services reported separately
travel

-teaching that is general and not limited to discussion that is required for the management of the specific patient

Unlisted Service

An E/M service may be provided that is not listed in this section of the CPT codebook. When reporting such a service, the appropriate unlisted code may be used to indicate the service, identifying it by “Special Report,” as discussed in the following paragraph. The “Unlisted Services” and accompanying codes for the E/M section are as follows:

99429 Unlisted preventive medicine service

99499 Unlisted evaluation and management service

Special Report

An unlisted service or one that is unusual, variable, or new may require a special report demonstrating the medical appropriateness of the service. Pertinent information should include an adequate definition or description of the nature, extent, and need for the procedure and the time, effort, and equipment necessary to provide the service. Additional items that may be included are complexity of symptoms, final diagnosis, pertinent physical findings, diagnostic and therapeutic procedures, concurrent problems, and follow-up care.
CPT Code: 99304  Tracking Number 11

Original Specialty Recommended RVU: 1.60

Presented Recommended RVU: 1.50

CPT Descriptor: Initial nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and straightforward or low level of medical decision making. When using total time on the date of the encounter for code selection, 25 minutes must be met or exceeded.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: Initial nursing facility visit for a patient with limited supports at home receiving post-acute care for an operative procedure that was uncomplicated.

Percentage of Survey Respondents who found Vignette to be Typical: 79%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0%, In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0%, Overnight stay-less than 24 hours 0%, Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Prepare to see patient; review medical records, and communicate with other health professionals as necessary.

Description of Intra-Service Work: Obtain a detailed history and fluid intake and other health conditions from patient's family, assisted living staff, and other health care professionals as necessary. Vital signs are noted. Perform a comprehensive physical examination that includes inspecting skin for pre-ulcerations and ulcerations; evaluating patients oral hygiene; cardiovascular, pulmonary, abdominal and genitourinary (GU) exams for evidence of obstructive urinary retention and fecal impaction; evaluating patient's ability to communicate; and assessing safety of patient's gait.

Description of Post-Service Work: Follow up with telephone calls to the facility regarding diagnostic findings, intraservice coordination and documentation of care, and interaction with facility health care professionals associated with delivery of care to this patient until the next face-to-face physician encounter. Discuss with family and/or surrogate decision maker the preferred intensity of care as it relates to do not resuscitate (DNR) orders for this patient.

### Modifier -51 Exempt Status

Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

### New Technology/Service:

Is this new/revised procedure considered to be a new technology or service? No

### TOP KEY REFERENCE SERVICE:

<table>
<thead>
<tr>
<th>Key CPT Code</th>
<th>Global</th>
<th>Work RVU</th>
<th>Time Source</th>
</tr>
</thead>
<tbody>
<tr>
<td>99203</td>
<td>XXX</td>
<td>1.60</td>
<td>RUC Time</td>
</tr>
</tbody>
</table>

CPT Descriptor: Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and low level of medical decision making. When using time for code selection, 30-44 minutes of total time is spent on the date of the encounter.

### SECOND HIGHEST KEY REFERENCE SERVICE:

<table>
<thead>
<tr>
<th>Key CPT Code</th>
<th>Global</th>
<th>Work RVU</th>
<th>Time Source</th>
</tr>
</thead>
<tbody>
<tr>
<td>99202</td>
<td>XXX</td>
<td>0.93</td>
<td>RUC Time</td>
</tr>
</tbody>
</table>

CPT Descriptor: Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and straightforward medical decision making. When using time for code selection, 15-29 minutes of total time is spent on the date of the encounter.

### KEY MPC COMPARISON CODES:

Compare the surveyed code to codes on the RUC’s MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

<table>
<thead>

### Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC’s rationale, please review the separate RUC recommendation document.
The CPT codes for initial and subsequent nursing facility services were surveyed because the CPT editorial panel changed the descriptors of the codes so that the choice of code to report is based on either medical decision making or the total time spent on the date of the encounter. The total time will be based on the results of the surveys for each code. The CPT codes for discharge services were not changed because they are part of the nursing facility services family. CPT also deleted 99318 which was used to report annual nursing facility assessment because such assessments may be required by law. In the future these annual assessments will be reported using the appropriate initial or subsequent care code.

The codes were surveyed by the American Geriatrics Society (AGS), the American Medical Directors Association (AMDA), the American Academy of Physical Medicine & Rehabilitation (AAPM&R), the American Nurses Association (ANA), the American Podiatric Medical Association (APMA), and the American College of Physicians (ACP). The surveying societies convened an expert panel to review the survey results and make work and time recommendations to the RUC.

**Compelling Evidence**

The last time the nursing facility services codes were reviewed by the RUC was in February 2007. The expert panel reviewed peer-reviewed literature (see attached articles) that documented that there have been changes in physician work due to patient population and length of hospital stay. After its review the expert panel agreed that these codes met these compelling evidence criteria.

Specifically, the acuity of patients admitted to nursing home after being discharged from an acute care hospital has increased significantly from 2011 to 2018. The table below shows the increase in patient acuity upon hospital discharge (Elixhauser scale) and the Hierarchical Condition Category (HCC) score on SNF admission. Note that a SNF patient is the typical patient for nursing home visits.

</tbody>
</table>

The Elixhauser index is a well-established tool that categorizes 30 patient comorbidities based on ICD diagnosis, in this case upon hospital discharge, and is used in a variety of ways including predicting adverse events and utilization of resources. The HCC is a risk adjustment model which calculates risk scores for aged and disable Medicare beneficiaries, often used to represent the expected costs of a Medicare member in the coming year. This data was supplied by Dr Vincent Mor, Brown University Center for Gerontology and Healthcare Research, using LTCFocus.org, a research data base from the Shaping Long-Term Care in America Project sponsored by Brown University and the National Institute on Aging.

Fashaw et. al. (JAMDA 21 (2020) 233-239, reviewed comprehensive data in US Nursing Homes from 1985-2015 and found that in 2015, as opposed to 1985, among other things, the resident cognitive function has decreased (e.g., percent of residents with dementia increased from 39% in 1995 to 45% in 2015), the percent of patients with a psychiatric diagnosis increased from 11% in 1995 to 31% in 2015, the percent of residents receiving antidepressants increased from 20% in 1995 to 49% in 2015, and the need to assistance with activities of daily living has increased,

Teno, et. al. (JAMA 2017) reviewed Medicare Part B claims data and showed that the care of SNF patients has shifted from physicians to nurse practitioners and physician assistances and that those physicians, NPs, and PAs who provide SNF care are SNFists - i.e., providers who bill more than 90% of all their visits in the nursing home setting.
Werner (JAMA 2018) reviewed MEDPAR data and determined that the length of acute care hospital stay before discharge to a post-acute facility decreased from 9.0 days in 2000 to 7.3 days in 2015 and length of stay in the post-acute care facility increased from 21.7 days in 2000 to more than 25 days in 2014 and 2015.

McCarthy et. al. (JAMA 2020) reviewed the nationwide Minimum Data Set (MDS) to look at transfers from nursing homes to acute care hospitals. They found that the number of transfers decreased from 2011 to 2016, especially for patients with dementia, heart failure, and chronic obstructive pulmonary disease - without an increased mortality rate in nursing homes.

After reviewing these data, the expert panel concluded that due to changes in patient population, changes in specialty mix, and the reduced length of acute care hospital stay before discharge to a nursing home, that the compelling evidence criteria were met.

**Survey Data Review**

The expert panel reviewed the initial visit code 99304.

99304 requires straightforward or low-level medical decision making or is based on total time spent on the date of the encounter. There were 203 respondents of whom 79% found the vignette to be typical. The survey times and median work RVU were 6/25/5/36/1.70. The 25th percentile work RVU was 1.5. The key reference services were 99203, Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and low level of medical decision making. When using time for code selection, 30-44 minutes of total time is spent on the date of the encounter, with times and work RVU of 5/25/5/35/1.6, and 99202, Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and straightforward medical decision making. When using time for code selection, 15-29 minutes of total time is spent on the date of the encounter, with times and work RVU of 2/15/3/20/0.93.

The expert panel reviewed the current times and work RVU for 99304, 10/23/10/43/1.64.

The panel agreed that while the survey median intra-service time was two minutes higher than the current intra-service time, the total time has decreased by seven minutes. In addition, the survey median intra-service time and total time were practically identical to 99203, the most commonly chosen reference service. Based on the survey times, the expert panel determined a crosswalk to the key reference service, 99203 would result in the most accurate valuation.

Therefore, the expert panel recommends for 99304, times and work RVU of 6/25/5/36/1.60.

Finally, the expert panel reviewed its recommendations for all the surveyed codes to determine whether the recommendations placed the codes in proper rank order with each other.

The panel reviewed the total times, intra times and work RVUs among the subsequent visit codes, among the initial visit codes, and between the discharge codes to determine if the ratios (i.e., percent) differences of those parameters were consistent. They were very consistent. The expert panel also reviewed these data for the comparable initial visit and subsequent visit codes (e.g., 99306 and 99310) to determine if the percent differences were consistent. They were very consistent. Similarly, the date between the two discharge codes were very consistent. The expert panel agreed that this analysis supported all the recommendations for time and work RVUs.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
☐ Multiple codes are used to maintain consistency with similar codes.
☐ Historical precedents.
☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.
FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 99304

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Podiatry   How often?  Sometimes
Specialty Internal Medicine   How often?  Sometimes
Specialty Nurse Practitioner   How often?  Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 449940
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National estimate was based on total Medicare volume and Medicaid volume plus an additional 10% estimated for private and self-pay patients.

Specialty Podiatry  Frequency 102586  Percentage  22.79 %
Specialty Family medicine  Frequency 82789  Percentage  18.40 %
Specialty Internal Medicine  Frequency 56242  Percentage  12.49 %

Estimate the number of times this service might be provided to Medicare patients nationally in a one-year period? 336,776  If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimates are based on 2019 Medicare data from the RUC Database

Specialty Podiatry  Frequency 76785  Percentage  22.80 %
Specialty Family Medicine  Frequency 61967  Percentage  18.40 %
Specialty Internal Medicine  Frequency 42097  Percentage 12.50 %

Do many physicians perform this service across the United States? Yes

Berenson-Eggers Type of Service (BETOS) Assignment
Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Evaluation Management

BETOS Sub-classification:
Nursing home visit

BETOS Sub-classification Level II:
NA

Professional Liability Insurance Information (PLI)
If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 99304
If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.
CPT Code: 99305

Tracking Number: I2

Original Specialty Recommended RVU: 2.50
Presented Recommended RVU: 2.50
RUC Recommended RVU: 2.50

Global Period: XXX

Current Work RVU: 2.35

CPT Descriptor: Initial nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. When using total time on the date of the encounter for code selection, 35 minutes must be met or exceeded.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: Initial nursing facility visit for a patient recovering from an illness or acute injury that requires ongoing medical management of their multiple stable problems.

Percentage of Survey Respondents who found Vignette to be Typical: 90%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Prepare to see the patient. Review medical records, laboratory results, and diagnostic findings. Communicate with facility health care professionals as necessary.

Description of Intra-Service Work: Obtain a comprehensive patient history and perform a comprehensive physical examination. Review patient's intake and hydration status, postoperative condition, initial rehabilitation results, and status of recent urosepsis and pressure ulcer. Evaluate status of patient's multiple chronic health problems. Examine patient's vision and hearing and neurological examination. Develop a multidisciplinary plan of care that includes physical therapy (PT) and occupational therapy (OT) services, initiation of a pressure wound care program, adjustments in diet, weaning off catheter, re-titration of medications, evaluation of dietary and fluid intake, and monitoring for mental status changes due to changes in environment.

Description of Post-Service Work: Follow up with telephone calls to patient's orthopedist and to SNF facility regarding diagnostic findings, post-service coordination and documentation of care, and interaction with facility health care professionals associated with delivery of care to this patient until the next face-to-face physician encounter. Discuss with family and/or surrogate decision maker the preferred intensity of care as it relates to DNR orders for this patient.

### Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC’s rationale, please review the separate RUC recommendation document.
The CPT codes for initial and subsequent nursing facility services were surveyed because the CPT editorial panel changed the descriptors of the codes so that the choice of code to report is based on either medical decision making or the total time spent on the date of the encounter. The total time will be based on the results of the surveys for each code. The CPT codes for discharge services were not changed by were surveyed because they are part of the nursing facility services family. CPT also deleted 99318 which was used to report annual nursing facility assessment because such assessments may be required by law. In the future these annual assessments will be reported using the appropriate initial or subsequent care code.

The codes were surveyed by the American Geriatrics Society (AGS), the American Medical Directors Association (AMDA), the American Academy of Physical Medicine & Rehabilitation (AAPM&R), the American Nurses Association (ANA), the American Podiatric Medical Association (APMA), and the American College of Physicians (ACP). The surveying societies convened an expert panel to review the survey results and make work and time recommendations to the RUC.

**Compelling Evidence**

The last time the nursing facility services codes were reviewed by the RUC was in February 2007. The expert panel reviewed peer-reviewed literature (see attached articles) that documented that there have been changes in physician work due to patient population and length of hospital stay. After its review the expert panel agreed that these codes met these compelling evidence criteria.

Specifically, the acuity of patients admitted to nursing home after being discharged from an acute care hospital has increased significantly from 2011 to 2018. The table below shows the increase in patient acuity upon hospital discharge (Elixhauser scale) and the Hierarchical Condition Category (HCC) score on SNF admission. Note that a SNF patient is the typical patient for nursing home visits.

</table>

The Elixhauser index is a well-established tool that categorizes 30 patient comorbidities based on ICD diagnosis, in this case upon hospital discharge, and is used in a variety of ways including predicting adverse events and utilization of resources. The HCC is a risk adjustment model which calculates risk scores for aged and disable Medicare beneficiaries, often used to represent the expected costs of a Medicare member in the coming year. This data was supplied by Dr Vincent Mor, Brown University Center for Gerontology and Healthcare Research, using LTCFocus.org, a research data base from the Shaping Long-Term Care in America Project sponsored by Brown University and the National Institute on Aging.

Fashaw et. al. (JAMDA 21 (2020) 233-239, reviewed comprehensive data in US Nursing Homes from 1985-2015 and found that in 2015, as opposed to 1985, among other things, the resident cognitive function has decreased (e.g., percent of residents with dementia increased from 39% in 1995 to 45% in 2015), the percent of patients with a psychiatric diagnosis increased from 11% in 1995 to 31% in 2015, the percent of residents receiving antidepressants increased from 20% in 1995 to 49% in 2015, and the need to assistance with activities of daily living has increased,

Teno, et. al. (JAMA 2017) reviewed Medicare Part B claims data and showed that the care of SNF patients has shifted from physicians to nurse practitioners and physician assistances and that those physicians, NPs, and PAs who provide SNF care are SNFists - i.e., providers who bill more than 90% of all their visits in the nursing home setting.
Werner (JAMA 2018) reviewed MEDPAR data and determined that the length of acute care hospital stay before discharge to a post-acute facility decreased from 9.0 days in 2000 to 7.3 days in 2015 and length of stay in the post-acute care facility increased from 21.7 days in 2000 to more than 25 days in 2014 and 2015.

McCarthy et. al. (JAMA 2020) reviewed the nationwide Minimum Data Set (MDS) to look at transfers from nursing homes to acute care hospitals. They found that the number of transfers decreased from 2011 to 2016, especially for patients with dementia, heart failure, and chronic obstructive pulmonary disease - without an increased mortality rate in nursing homes.

After reviewing these data, the expert panel concluded that due to changes in patient population, changes in specialty mix, and the reduced length of acute care hospital stay before discharge to a nursing home, that the compelling evidence criteria were met.

**Survey Data Review**

The panel reviewed 99305.

99305, requires moderate level medical decision making or is based on total time spent on the date of the encounter. There were 204 respondents of whom 90% found the vignette to be typical. The survey times and median work RVU were 10/35/10/55/2.75. The 25th percentile work RVU was 2.50. The key reference services were 99204, Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. When using time for code selection, 45-59 minutes of total time is spent on the date of the encounter, with times and work RVU of 10/40/10/60/2.60, and 99203, Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and low level of medical decision making. When using time for code selection, 30-44 minutes of total time is spent on the date of the encounter, with times and work RVU of 5/25/5/35/1.6.

The expert panel noted that the current times and work RVU for 99305 are 11/33/13/57/2.35.

The panel agreed that the increased patient acuity in the nursing facility setting and the shortened length of stay in acute care hospitals before patients are discharged into the nursing home setting supported the survey 25th percentile work RVU of 2.50 and the times of 10/35/10/55/2.75. The panel reviewed the data for the key reference services and agreed that 99202 describes a patient population that is significantly less acute and complex then the patient population described by 99305. The expert panel also agreed that a work RVU of 2.50 placed 99305 in proper rank order with 99204 which has a work RVU of 2.60, a total time of 60 minutes and an intra-time of 40 minutes.

Therefore, the panel recommends times and work RVU of 10/35/10/55/ 2.50

Finally, the expert panel reviewed its recommendations for all the surveyed codes to determine whether the recommendations placed the codes in proper rank order with each other.

The panel reviewed the total times, intra times and work RVUs among the subsequent visit codes, among the initial visit codes, and between the discharge codes to determine if the ratios (i.e., percent) differences of those parameters were consistent. They were very consistent. The expert panel also reviewed these data for the comparable initial visit and subsequent visit codes (e.g., 99306 and 99310) to determine if the percent differences were consistent. They were very consistent. Similarly, the date between the two discharge codes were very consistent. The expert panel agreed that this analysis supported all the recommendations for time and work RVUs.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)
   - The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - Multiple codes allow flexibility to describe exactly what components the procedure included.
   - Multiple codes are used to maintain consistency with similar codes.
   - Historical precedents.
   - Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the
FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 99305

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Internal Medicine
How often? Sometimes

Specialty Family Medicine
How often? Sometimes

Specialty Nurse Practitioner
How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 1333571
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National estimate was based on total Medicare volume and Medicaid volume plus an additional 10% estimated for private payors

Specialty Internal Medicine
Frequency 397404
Percentage 29.79%

Specialty Family Medicine
Frequency 257379
Percentage 19.29%

Specialty Nurse Practitioner
Frequency 184033
Percentage 13.80%

Estimate the number of times this service might be provided to Medicare patients nationally in a one-year period? 1,054,727 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimates are based on 2019 Medicare data from the RUC database

Specialty Internal Medicine
Frequency 314309
Percentage 29.80%

Specialty Family Medicine
Frequency 203562
Percentage 19.29%

Specialty Nurse Practitioner
Frequency 145552
Percentage 13.79%

Do many physicians perform this service across the United States? Yes

Berenson-Eggers Type of Service (BETOS) Assignment

RUC Recommended RVU: **3.50**

Global Period: XXX  Current Work RVU: **3.06**

CPT Descriptor: Initial nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and high level of medical decision making. When using total time on the date of the encounter for code selection, 45 minutes must be met or exceeded.

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: Initial nursing facility visit for a patient with multiple morbidities requiring intensive management

Percentage of Survey Respondents who found Vignette to be Typical: 93%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0%, Overnight stay-less than 24 hours 0%, Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Prepare to see the patient. Review medical records, laboratory results, and diagnostic findings. Communicate with facility health care professionals as necessary.

Description of Intra-Service Work: Obtain a comprehensive history and perform a comprehensive physical examination. Review patient's intake and hydration status and sliding scale insulin and psychotropic regimen. Discuss patient's multiple, still unstable, health problems with health care providers. Assess current status of cardiopulmonary function, swallowing and mobility function, and cognitive function. Review laboratory test findings including oxygenation, hydration, white blood cell count (WBC), cardiac rhythm, and glucose level trends. Initiate orders for O2, IV fluids, antibiotics, pain control, rehabilitation, and diagnostic testing to assess status. Develop a multidisciplinary care plan that includes PT, respiratory therapy (RT), and speech services; titration off insulin sliding scale; adjustments in diet and hydration; re-titration of psychotropic and analgesic medications; and monitoring for mental status changes.

Description of Post-Service Work: Follow up with telephone calls to the facility regarding diagnostic findings and intraservice coordination and documentation of care. Interact with facility health care professionals associated with delivery of care to this patient until the next face-to-face physician encounter. Discuss with family and/or surrogate decision maker the preferred intensity of care as it relates to DNR orders for this patient.
### SURVEY DATA

RUC Meeting Date (mm/yyyy): 04/2021

Presenter(s): Carlo Milani, MD, Tanvir Hussain, MD, Audrey Chun, MD, Charles Crecelius, MD, PhD, CMD, David Nace, MD, Korinne Van Keuren, DNP, APRN, Brooke Bisbee, DPM

Specialty Society(ies): AAPM&R, ACP, AGS, AMDA, ANA, APMA

### Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*
The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC’s rationale, please review the separate RUC recommendation document.

The CPT codes for initial and subsequent nursing facility services were surveyed because the CPT editorial panel changed the descriptors of the codes so that the choice of code to report is based on either medical decision making or the total time spent on the date of the encounter. The total time will be based on the results of the surveys for each code. The CPT codes for discharge services were not changed by were surveyed because they are part of the nursing facility services family. CPT also deleted 99318 which was used to report annual nursing facility assessment because such assessments may be required by law. In the future these annual assessments will be reported using the appropriate initial or subsequent care code.

The codes were surveyed by the American Geriatrics Society (AGS), the American Medical Directors Association (AMDA), the American Academy of Physical Medicine & Rehabilitation (AAPM&R), the American Nurses Association (ANA), the American Podiatric Medical Association (APMA), and the American College of Physicians (ACP). The surveying societies convened an expert panel to review the survey results and make work and time recommendations to the RUC.

Compelling Evidence

The last time the nursing facility services codes were reviewed by the RUC was in February 2007. The expert panel reviewed peer-reviewed literature (see attached articles) that documented that there have been changes in physician work due to patient population and length of hospital stay. After its review the expert panel agreed that these codes met these compelling evidence criteria.

Specifically, the acuity of patients admitted to nursing home after being discharged from an acute care hospital has increased significantly from 2011 to 2018. The table below shows the increase in patient acuity upon hospital discharge (Elixhauser scale) and the Hierarchical Condition Category (HCC) score on SNF admission. Note that a SNF patient is the typical patient for nursing home visits.

The Elixhauser index is a well-established tool that categorizes 30 patient comorbidities based on ICD diagnosis, in this case upon hospital discharge, and is used in a variety of ways including predicting adverse events and utilization of resources. The HCC is a risk adjustment model which calculates risk scores for aged and disable Medicare beneficiaries, often used to represent the expected costs of a Medicare member in the coming year. This data was supplied by Dr Vincent Mor, Brown University Center for Gerontology and Healthcare Research, using LTCFocus.org, a research data base from the Shaping Long-Term Care in America Project sponsored by Brown University and the National Institute on Aging.

Fashaw et. al. (JAMDA 21 (2020) 233-239, reviewed comprehensive data in US Nursing Homes from 1985-2015 and found that in 2015, as opposed to 1985, among other things, the resident cognitive function has decreased (e.g., percent of residents with dementia increased from 39% in 1995 to 45% in 2015), the percent of patients with a psychiatric diagnosis increased from 11% in 1995 to 31% in 2015, the percent of residents receiving antidepressants increased from 20% in 1995 to 49% in 2015, and the need to assistance with activities of daily living has increased,
Teno, et. al. (JAMA 2017) reviewed Medicare Part B claims data and showed that the care of SNF patients has shifted from physicians to nurse practitioners and physician assistants and that those physicians, NPs, and PAs who provide SNF care are SNFists - i.e., providers who bill more than 90% of all their visits in the nursing home setting.

Werner (JAMA 2018) reviewed MEDPAR data and determined that the length of acute care hospital stay before discharge to a post-acute facility decreased from 9.0 days in 2000 to 7.3 days in 2015 and length of stay in the post-acute care facility increased from 21.7 days in 2000 to more than 25 days in 2014 and 2015.

McCarthy et. al. (JAMA 2020) reviewed the nationwide Minimum Data Set (MDS) to look at transfers from nursing homes to acute care hospitals. They found that the number of transfers decreased from 2011 to 2016, especially for patients with dementia, heart failure, and chronic obstructive pulmonary disease - without an increased mortality rate in nursing homes.

After reviewing these data, the expert panel concluded that due to changes in patient population, changes in specialty mix, and the reduced length of acute care hospital stay before discharge to a nursing home, that the compelling evidence criteria were met.

**Survey Data Review**

Next, the panel reviewed 99306 which requires a high level of medical decision making or is based on the total time spent on the date of the encounter. There were 208 respondents of whom 94% found the vignette to be typical. The survey times and median work RVU were 15/50/80/3.75 and the 25th percentile work RVU was 3.50. The two key reference services were, 99205, Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and high level of medical decision making. When using time for code selection, 60-74 minutes of total time is spent on the date of the encounter, with times and work RVU of 14/59/88/3.5 and, 99496, Transitional Care Management Services with the following required elements: Communication (direct contact, telephone, electronic) with the patient and/or caregiver within 2 business days of discharge Medical decision making of high complexity during the service period Face-to-face visit, within 7 calendar days of discharge of medical decision making, with times and work RVU of 0/75/75/3.79.

The expert panel noted that the current times and work RVU for 99306 were 15/45/20/80/3.06.

The panel noted that while the total time for 99306 remained the same, the intra-service time increased by 5 minutes (more than 10%). The panel also noted that while the total times and intra-service times were less than for 99205, the patient population and acuity supported a work value at least equal to 99205. Further 99496 has a lower total time than 99406 - but a greater intra time. And the survey median of 3.50 places 99306 in proper rank order with 99496. The panel also reviewed MPC code 90962, End-stage renal disease (ESRD) related services monthly, for patients 20 years of age and older; with 1 face-to-face visit by a physician or other qualified health care professional per month, which is an MPC code and has times and work RVU of 0/70/70/3.57

The expert panel noted that 90962 has less total time than 99306 but more intra-service time and that the survey 25th percentile work RVU for 99306 of 3.50 places it in correct rank order with 90962 and the key reference services.

Therefore, the expert panel recommends times and work RVU of 15/50/15/80/3.50.

Finally, the expert panel reviewed its recommendations for all the surveyed codes to determine whether the recommendations placed the codes in proper rank order with each other.

The panel reviewed the total times, intra times and work RVUs among the subsequent visit codes, among the initial visit codes, and between the discharge codes to determine if the ratios (i.e., percent) differences of those parameters were consistent. They were very consistent. The expert panel also reviewed these data for the comparable initial visit and subsequent visit codes (e.g., 99306 and 99310) to determine if the percent differences were consistent. They were very
consistent. Similarly, the date between the two discharge codes were very consistent. The expert panel agreed that this analysis supported all the recommendations for time and work RVUs.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No
Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- Multiple codes allow flexibility to describe exactly what components the procedure included.
- Multiple codes are used to maintain consistency with similar codes.
- Historical precedents.
- Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 99306

How often do physicians in your specialty perform this service? (i.e. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Estimate the number of times this service might be provided nationally in a one-year period? 1751100
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National estimate is based on total Medicare volume and Medicaid volume plus an additional 10% estimated for other payors.
