Estimate the number of times this service might be provided to Medicare patients nationally in a one-year period? 1,389,990
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimates are based on 2019 Medicare data from the RUC database.

Do many physicians perform this service across the United States? Yes
Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Evaluation Management

BETOS Sub-classification:
Nursing home visit

BETOS Sub-classification Level II:
NA

**Professional Liability Insurance Information (PLI)**

If the surveyed code is an existing code and the specialty believes the specialty utilization mix *will not* change, enter the surveyed existing CPT code number 99306.

If this code is a new/revised code or an existing code in which the specialty utilization mix *will* change, please select another crosswalk based on a similar specialty mix.
CPT Code: 99307

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 99307  Tracking Number  14  Original Specialty Recommended RVU: 0.70
Global Period: XXX  Current Work RVU: 0.76  Presented Recommended RVU: 0.70
RUC Recommended RVU: 0.70

CPT Descriptor: Subsequent nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and straightforward medical decision making. When using total time on the date of the encounter for code selection, 10 minutes must be met or exceeded.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: Subsequent nursing facility visit for a patient with a self-limited or minor problem.

Percentage of Survey Respondents who found Vignette to be Typical: 89%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0%, Overnight stay-less than 24 hours 0%, Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Prepare to see the patient. Review records of previously attempted interventions. Communicate with facility health care professionals as necessary.

Description of Intra-Service Work: Obtain an interval history that reveals ongoing poor dietary intake and urinary incontinence in a patient who cannot participate in pressure relief activities because of cognitive impairment. Perform a focused physical examination that reveals an improving lesion with no peripheral inflammation and no evidence of systemic involvement. As a result, alter patient's topical regimen, order a new nutritional program, and authorize a support surface.

Description of Post-Service Work: Follow-up with telephone calls to the facility.

- Estimated risk of malpractice suit with poor outcome

---

### Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IQPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC’s rationale, please review the separate RUC recommendation document.
The CPT codes for initial and subsequent nursing facility services were surveyed because the CPT editorial panel changed the descriptors of the codes so that the choice of code to report is based on either medical decision making or the total time spent on the date of the encounter. The total time will be based on the results of the surveys for each code. The CPT codes for discharge services were not changed because they are part of the nursing facility services family. CPT also deleted 99318 which was used to report annual nursing facility assessment because such assessments may be required by law. In the future these annual assessments will be reported using the appropriate initial or subsequent care code.

The codes were surveyed by the American Geriatrics Society (AGS), the American Medical Directors Association (AMDA), the American Academy of Physical Medicine & Rehabilitation (AAPM&R), the American Nurses Association (ANA), the American Podiatric Medical Association (APMA), and the American College of Physicians (ACP). The surveying societies convened an expert panel to review the survey results and make work and time recommendations to the RUC.

Compelling Evidence

The last time the nursing facility services codes were reviewed by the RUC was in February 2007. The expert panel reviewed peer-reviewed literature (see attached articles) that documented that there have been changes in physician work due to patient population and length of hospital stay. After its review the expert panel agreed that these codes met these compelling evidence criteria.

Specifically, the acuity of patients admitted to nursing home after being discharged from an acute care hospital has increased significantly from 2011 to 2018. The table below shows the increase in patient acuity upon hospital discharge (Elixhauser scale) and the Hierarchical Condition Category (HCC) score on SNF admission. Note that a SNF patient is the typical patient for nursing home visits.

</tbody>
</table>

The Elixhauser index is a well-established tool that categorizes 30 patient comorbidities based on ICD diagnosis, in this case upon hospital discharge, and is used in a variety of ways including predicting adverse events and utilization of resources. The HCC is a risk adjustment model which calculates risk scores for aged and disable Medicare beneficiaries, often used to represent the expected costs of a Medicare member in the coming year. This data was supplied by Dr Vincent Mor, Brown University Center for Gerontology and Healthcare Research, using LTCFocus.org, a research data base from the Shaping Long-Term Care in America Project sponsored by Brown University and the National Institute on Aging.

Fashaw et. al. (JAMDA 21 (2020) 233-239, reviewed comprehensive data in US Nursing Homes from 1985-2015 and found that in 2015, as opposed to 1985, among other things, the resident cognitive function has decreased (e.g., percent of residents with dementia increased from 39% in 1995 to 45% in 2015), the percent of patients with a psychiatric diagnosis increased from 11% in 1995 to 31% in 2015, the percent of residents receiving antidepressants increased from 20% in 1995 to 49% in 2015, and the need to assistance with activities of daily living has increased.

Teno, et. al. (JAMA 2017) reviewed Medicare Part B claims data and showed that the care of SNF patients has shifted from physicians to nurse practitioners and physician assistances and that those physicians, NPs, and PAs who provide SNF care are SNFists - i.e., providers who bill more than 90% of all their visits in the nursing home setting.
Werner (JAMA 2018) reviewed MEDPAR data and determined that the length of acute care hospital stay before discharge to a post-acute facility decreased from 9.0 days in 2000 to 7.3 days in 2015 and length of stay in the post-acute care facility increased from 21.7 days in 2000 to more than 25 days in 2014 and 2015.

McCarthy et. al. (JAMA 2020) reviewed the nationwide Minimum Data Set (MDS) to look at transfers from nursing homes to acute care hospitals. They found that the number of transfers decreased from 2011 to 2016, especially for patients with dementia, heart failure, and chronic obstructive pulmonary disease - without an increased mortality rate in nursing homes.

After reviewing these data, the expert panel concluded that due to changes in patient population, changes in specialty mix, and the reduced length of acute care hospital stay before discharge to a nursing home, that the compelling evidence criteria were met.

Survey Data Review

The panel reviewed 99307, which requires straightforward medical decision making or is based on total time spent on the date of the encounter. There were 196 respondents of whom 89% found the vignette to be typical. The survey times and median work RVU were 5/10/5/20/0.76 and the 25th percentile work RVU was 0.70. The two key reference services were 99212, Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and straightforward medical decision making. When using time for code selection, 10-19 minutes of total time is spent on the date of the encounter, with times and work RVU of 2/11/3/0.70, and 99213, Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and low level of medical decision making. When using time for code selection, 20-29 minutes of total time is spent on the date of the encounter, with times and work RVU of 5/20/5/30/1.30.

The expert panel noted that the current times and work RVU for 99307 are 5/10/5/20/0.76.

The panel agreed that while the survey intra-service time was two minutes higher than the current time, the total time decreased by six minutes. Furthermore, the survey intra-service time was one minute more than intra-service time for 99212 and the total time was two minutes less. Given the increased acuity of nursing home patients, the expert panel agreed that the 25th percentile work RVU of 0.70 - which is identical to that of 99212 - placed 99307 in proper rank order with 99212. In addition, the work value of 0.70 places 99307 in proper rank order with 99213 which has a total time more than twice the survey total time for 99307, an intra-service time 66% higher than the 99307 survey median and a work RVU 85% higher than the survey 25th percentile work RVU for 99307.

Therefore, the expert panel recommends times and work RVU for 99307 of 1/12/1/14/0.70.

Finally, the expert panel reviewed its recommendations for all the surveyed codes to determine whether the recommendations placed the codes in proper rank order with each other.

The panel reviewed the total times, intra times and work RVUs among the subsequent visit codes, among the initial visit codes, and between the discharge codes to determine if the ratios (i.e., percent) differences of those parameters were consistent. They were very consistent. The expert panel also reviewed these data for the comparable initial visit and subsequent visit codes (e.g., 99306 and 99310) to determine if the percent differences were consistent. They were very consistent. Similarly, the date between the two discharge codes were very consistent. The expert panel agreed that this analysis supported all the recommendations for time and work RVUs.

**SERVICES REPORTED WITH MULTIPLE CPT CODES**

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - [ ] The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - [ ] Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - [ ] Multiple codes allow flexibility to describe exactly what components the procedure included.
   - [ ] Multiple codes are used to maintain consistency with similar codes.
   - [ ] Historical precedents.
   - [ ] Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.
FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 99307

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Nurse Practitioner  How often?  Sometimes
Specialty Internal Medicine  How often?  Sometimes
Specialty Family Medicine  How often?  Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 4035247
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National estimate was based on total Medicare volume and Medicaid volume plus an additional 10% estimated for other payors

Specialty Nurse Practitioner  Frequency 1000741  Percentage  24.79 %
Specialty Internal Medicine  Frequency 823190  Percentage  20.39 %
Specialty Family Medicine  Frequency 702133  Percentage  17.40 %

Estimate the number of times this service might be provided to Medicare patients nationally in a one-year period? 2,372,760  If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimates are based on 2019 medicare data from the RUC Database

Specialty Nurse Practitioner  Frequency 588444  Percentage  24.79 %
Specialty Internal Medicine  Frequency 484043  Percentage  20.39 %
Specialty Family Medicine  Frequency 412860  Percentage  17.39 %

Do many physicians perform this service across the United States? Yes

Berenson-Eggers Type of Service (BETOS) Assignment
Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Evaluation Management

BETOS Sub-classification:
Nursing home visit

BETOS Sub-classification Level II:
NA

Professional Liability Insurance Information (PLI)
CPT Code: 99307

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 99307.

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.
CPT Code: 99308

Tracking Number  15

Original Specialty Recommended RVU: **1.30**

Presented Recommended RVU: **1.30**

Global Period: XXX  Current Work RVU: **1.16**

RUC Recommended RVU: **1.30**

CPT Descriptor: Subsequent nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and low level of medical decision making. When using total time on the date of the encounter for code selection, 15 minutes must be met or exceeded.

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: Subsequent nursing facility visit for a patient with a stable chronic illness or recovering from an acute uncomplicated injury.

Percentage of Survey Respondents who found Vignette to be Typical: 94%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Prepare to see the patient. Review medical records. Communicate with other facility health care professionals as necessary.

Description of Intra-Service Work: Obtain an expanded history that includes intake and hydration information, discussion of the suprapubic-localized discomfort, muscle spasm, and psychosocial review of patient's coping ability with underlying disease. Perform an expanding physical examination, which reveals no evidence of dehydration, additional gross hematuria, or focal neurological findings, however, increased patient depression is observed. After necessary laboratory tests are ordered, patient is treated for the UTI and started on anti-depression medication.

Description of Post-Service Work: Follow up with telephone calls to the NF regarding titration of anti-depressant. Review confirming diagnostic laboratory data and antibiotic effectiveness. Discuss coordination and documentation of care and interaction with facility health care professionals associated with delivery of care to this patient until the next face-to-face physician encounter.

### Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC’s rationale, please review the separate RUC recommendation document.
The CPT codes for initial and subsequent nursing facility services were surveyed because the CPT editorial panel changed the descriptors of the codes so that the choice of code to report is based on either medical decision making or the total time spent on the date of the encounter. The total time will be based on the results of the surveys for each code. The CPT codes for discharge services were not changed because they are part of the nursing facility services family. CPT also deleted 99318 which was used to report annual nursing facility assessment because such assessments may be required by law. In the future these annual assessments will be reported using the appropriate initial or subsequent care code.

The codes were surveyed by the American Geriatrics Society (AGS), the American Medical Directors Association (AMDA), the American Academy of Physical Medicine & Rehabilitation (AAPM&R), the American Nurses Association (ANA), the American Podiatric Medical Association (APMA), and the American College of Physicians (ACP). The surveying societies convened an expert panel to review the survey results and make work and time recommendations to the RUC.

**Compelling Evidence**

The last time the nursing facility services codes were reviewed by the RUC was in February 2007. The expert panel reviewed peer-reviewed literature (see attached articles) that documented that there have been changes in physician work due to patient population and length of hospital stay. After its review the expert panel agreed that these codes met these compelling evidence criteria.

Specifically, the acuity of patients admitted to nursing home after being discharged from an acute care hospital has increased significantly from 2011 to 2018. The table below shows the increase in patient acuity upon hospital discharge (Elixhauser scale) and the Hierarchical Condition Category (HCC) score on SNF admission. Note that a SNF patient is the typical patient for nursing home visits.

</table>

The Elixhauser index is a well-established tool that categorizes 30 patient comorbidities based on ICD diagnosis, in this case upon hospital discharge, and is used in a variety of ways including predicting adverse events and utilization of resources. The HCC is a risk adjustment model which calculates risk scores for aged and disable Medicare beneficiaries, often used to represent the expected costs of a Medicare member in the coming year. This data was supplied by Dr Vincent Mor, Brown University Center for Gerontology and Healthcare Research, using LTCFocus.org, a research data base from the Shaping Long-Term Care in America Project sponsored by Brown University and the National Institute on Aging.

Fashaw et. al. (JAMDA 21 (2020) 233-239, reviewed comprehensive data in US Nursing Homes from 1985-2015 and found that in 2015, as opposed to 1985, among other things, the resident cognitive function has decreased (e.g., percent of residents with dementia increased from 39% in 1995 to 45% in 2015), the percent of patients with a psychiatric diagnosis increased from 11% in 1995 to 31% in 2015, the percent of residents receiving antidepressants increased from 20% in 1995 to 49% in 2015, and the need to assistance with activities of daily living has increased,

Teno, et. al. (JAMA 2017) reviewed Medicare Part B claims data and showed that the care of SNF patients has shifted from physicians to nurse practitioners and physician assistances and that those physicians, NPs, and PAs who provide SNF care are SNFists - i.e., providers who bill more than 90% of all their visits in the nursing home setting.
Werner (JAMA 2018) reviewed MEDPAR data and determined that the length of acute care hospital stay before discharge to a post-acute facility decreased from 9.0 days in 2000 to 7.3 days in 2015 and length of stay in the post-acute care facility increased from 21.7 days in 2000 to more than 25 days in 2014 and 2015.

McCarthy et. al. (JAMA 2020) reviewed the nationwide Minimum Data Set (MDS) to look at transfers from nursing homes to acute care hospitals. They found that the number of transfers decreased from 2011 to 2016, especially for patients with dementia, heart failure, and chronic obstructive pulmonary disease - without an increased mortality rate in nursing homes.

After reviewing these data, the expert panel concluded that due to changes in patient population, changes in specialty mix, and the reduced length of acute care hospital stay before discharge to a nursing home, that the compelling evidence criteria were met.

Survey Data Review

The panel reviewed 99308 which requires low level medical decision making or is based on total time spent on the date of the encounter. There were 214 respondents of whom 95% found the vignette to be typical. The survey times and median work RVU were 5/18/4/27/1.44 with a 25th percentile work RVU of 1.30. The two key reference services were 99213, Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and low level of medical decision making. When using time for code selection, 20-29 minutes of total time is spent on the date of the encounter, with times and work RVU of 5/20/5/1.3, and 99214, Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. When using time for code selection, 30-39 minutes of total time is spent on the date of the encounter, with times and work RVUs of 7/30/10/47/1.92.

The expert panel noted that the current times and work RVU for 99308 are 7/15/9/31/1.16.

The expert panel noted that while the survey median intra-service time was three minutes higher than the current time, the total time was four minutes less than the current time. Moreover, even though the total and intra-service time were slightly less than the comparable times for 99213 (the first key reference service), the increased acuity of nursing home patients supported an equivalent work RVU. Furthermore, the total and intra-service times for 99214 are 74% and 66% higher than the survey times for 99308 which supports a work RVU for 99308 of 1.30 which is 67% of the work value of 99214.

Therefore, the expert panel recommends times and work RVU for 99308 of 5/18/4/27/1.3.

Finally, the expert panel reviewed its recommendations for all the surveyed codes to determine whether the recommendations placed the codes in proper rank order with each other.

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - [ ] The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - [ ] Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - [ ] Multiple codes allow flexibility to describe exactly what components the procedure included.
   - [ ] Multiple codes are used to maintain consistency with similar codes.
   - [ ] Historical precedents.
   - [ ] Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 99308

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Nurse Practitioner  How often?  Sometimes
Specialty Internal Medicine  How often?  Sometimes
Specialty Family Medicine  How often?  Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 15664105
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National estimate was based on total Medicare volume and Medicaid volume plus an additional 10% estimated for other payors

Specialty Nurse Practitioner  Frequency 5874039  Percentage 37.49 %
Specialty Internal Medicine  Frequency 3461039  Percentage 22.09 %
Specialty Family Medicine  Frequency 2036334  Percentage 13.00 %

Estimate the number of times this service might be provided to Medicare patients nationally in a one-year period? 11,312,117  If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimates are based on 2019 Medicare data from the RUC Database, plus 10% from deleted code 99318.

Specialty Nurse Practitioner  Frequency 4239781  Percentage 37.47 %
Specialty Internal Medicine  Frequency 2499977  Percentage 22.09 %
Specialty Family Medicine  Frequency 1470575  Percentage 12.99 %

Do many physicians perform this service across the United States? Yes

Berenson-Eggers Type of Service (BETOS) Assignment
Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Evaluation Management

BETOS Sub-classification:
Nursing home visit

BETOS Sub-classification Level II:
NA
Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 99308.

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.
CPT Code: 99309

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 99309   Tracking Number: 16

Original Specialty Recommended RVU: 1.92
Presented Recommended RVU: 1.92
RUC Recommended RVU: 1.92

Global Period: XXX   Current Work RVU: 1.55

CPT Descriptor: Subsequent nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. When using total time on the date of the encounter for code selection, 30 minutes must be met or exceeded.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: Subsequent nursing facility visit for a patient with a new or progressing illness or acute injury that requires diagnostic evaluation, medical management or potential surgical treatment.

Percentage of Survey Respondents who found Vignette to be Typical: 86%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0%, In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0%, Overnight stay-less than 24 hours 0%, Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Prepare to see the patient. Review telephonic orders associated with recently reported URI; changes in dietary, bowel, and psychotropic regimens; and treatment of non-infected skin tear. Communicate with facility health care professionals as necessary.

Description of Intra-Service Work: Obtain a detailed interval history of each organ system that has an acute or active medical problem, including review of patient's multiple medications and recent laboratory and diagnostic testing ordered to evaluate patient's comprised respiratory condition. Perform a detailed physical examination and update the nursing plan of care.

Description of Post-Service Work: Evaluate additional diagnostic testing to determine hydration and pulmonary status and further changes in patient's psychotropic regimen. Follow up with telephone calls to facility staff, discussing coordination and documentation of care and interaction with facility health care professionals associated with delivery of care to this patient until the next face-to-face physician encounter.

### Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC’s rationale, please review the separate RUC recommendation document.
The CPT codes for initial and subsequent nursing facility services were surveyed because the CPT editorial panel changed the descriptors of the codes so that the choice of code to report is based on either medical decision making or the total time spent on the date of the encounter. The total time will be based on the results of the surveys for each code. The CPT codes for discharge services were not changed by were surveyed because they are part of the nursing facility services family. CPT also deleted 99318 which was used to report annual nursing facility assessment because such assessments may be required by law. In the future these annual assessments will be reported using the appropriate initial or subsequent care code.

The codes were surveyed by the American Geriatrics Society (AGS), the American Medical Directors Association (AMDA), the American Academy of Physical Medicine & Rehabilitation (AAPM&R), the American Nurses Association (ANA), the American Podiatric Medical Association (APMA), and the American College of Physicians (ACP). The surveying societies convened an expert panel to review the survey results and make work and time recommendations to the RUC.

Compelling Evidence

The last time the nursing facility services codes were reviewed by the RUC was in February 2007. The expert panel reviewed peer-reviewed literature (see attached articles) that documented that there have been changes in physician work due to patient population and length of hospital stay. After its review the expert panel agreed that these codes met these compelling evidence criteria.

Specifically, the acuity of patients admitted to nursing home after being discharged from an acute care hospital has increased significantly from 2011 to 2018. The table below shows the increase in patient acuity upon hospital discharge (Elixhauser scale) and the Hierarchical Condition Category (HCC) score on SNF admission. Note that a SNF patient is the typical patient for nursing home visits.

The Elixhauser index is a well-established tool that categorizes 30 patient comorbidities based on ICD diagnosis, in this case upon hospital discharge, and is used in a variety of ways including predicting adverse events and utilization of resources. The HCC is a risk adjustment model which calculates risk scores for aged and disable Medicare beneficiaries, often used to represent the expected costs of a Medicare member in the coming year. This data was supplied by Dr Vincent Mor, Brown University Center for Gerontology and Healthcare Research, using LTCFocus.org, a research data base from the Shaping Long-Term Care in America Project sponsored by Brown University and the National Institute on Aging.

Fashaw et. al. (JAMDA 21 (2020) 233-239, reviewed comprehensive data in US Nursing Homes from 1985-2015 and found that in 2015, as opposed to 1985, among other things, the resident cognitive function has decreased (e.g., percent of residents with dementia increased from 39% in 1995 to 45% in 2015), the percent of patients with a psychiatric diagnosis increased from 11% in 1995 to 31% in 2015, the percent of residents receiving antidepressants increased from 20% in 1995 to 49% in 2015, and the need to assistance with activities of daily living has increased.

Teno, et. al. (JAMA 2017) reviewed Medicare Part B claims data and showed that the care of SNF patients has shifted from physicians to nurse practitioners and physician assistances and that those physicians, NPs, and PAs who provide SNF care are SNFists - i.e., providers who bill more than 90% of all their visits in the nursing home setting.
Werner (JAMA 2018) reviewed MEDPAR data and determined that the length of acute care hospital stay before discharge to a post-acute facility decreased from 9.0 days in 2000 to 7.3 days in 2015 and length of stay in the post-acute care facility increased from 21.7 days in 2000 to more than 25 days in 2014 and 2015.

McCarthy et. al. (JAMA 2020) reviewed the nationwide Minimum Data Set (MDS) to look at transfers from nursing homes to acute care hospitals. They found that the number of transfers decreased from 2011 to 2016, especially for patients with dementia, heart failure, and chronic obstructive pulmonary disease - without an increased mortality rate in nursing homes.

After reviewing these data, the expert panel concluded that due to changes in patient population, changes in specialty mix, and the reduced length of acute care hospital stay before discharge to a nursing home, that the compelling evidence criteria were met.

Survey Data Review

The expert panel reviewed 99309 which requires a moderate level of medical decision making or is based on the total time spent on the date of the encounter. There were 217 respondents of whom 86% found the vignette to be typical. The times and median work RVU were 7/30/10/47/2.09 and the 25th percentile work RVU was 1.92. The two key reference services were 99214, Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. When using time for code selection, 30-39 minutes of total time is spent on the date of the encounter, with times and work RVUs of 7/30/10/47/1.92, and 99215, Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and high level of medical decision making. When using time for code selection, 40-54 minutes of total time is spent on the date of the encounter, with times and work RVU of 10/45/15/70/2.80.

The panel noted that the current times and work RVU for 99309 are 10/25/10/45/1.55.

The survey median intra time is five minutes longer than the current intra time and the total time is two minutes higher. Furthermore, the survey times and survey 25th percentile work RVU are identical to the times and work RVU for 99214, the key reference services chosen by 149 of the 217 respondents. Because the survey data for 99309 was a direct crosswalk to the key reference service at the 25th percentile the expert panel agreed to recommend the 25th percentile work RVU of 1.92. This also places 99309 in correct rank order to 99215 which has 50% more intra time (45 min. vs. 30 min.) and 49% more total time (70 min. vs. 47 min.) and 2.80 is 46% higher than 1.92.

Therefore, the expert panel recommends for 99309 times and work RVU of 7/30/10/47/1.92.

Finally, the expert panel reviewed its recommendations for all the surveyed codes to determine whether the recommendations placed the codes in proper rank order with each other.

The panel reviewed the total times, intra times and work RVUs among the subsequent visit codes, among the initial visit codes, and between the discharge codes to determine if the ratios (i.e., percent) differences of those parameters were consistent. They were very consistent. The expert panel also reviewed these data for the comparable initial visit and subsequent visit codes (e.g., 99306 and 99310) to determine if the percent differences were consistent. They were very consistent. Similarly, the date between the two discharge codes were very consistent. The expert panel agreed that this analysis supported all the recommendations for time and work RVUs.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - [ ] The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - [ ] Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - [ ] Multiple codes allow flexibility to describe exactly what components the procedure included.
   - [ ] Multiple codes are used to maintain consistency with similar codes.
   - [ ] Historical precedents.
   - [ ] Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the
FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 99309

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Nurse Practitioner  How often?  Sometimes
Specialty Internal Medicine  How often?  Sometimes
Specialty Family Medicine  How often?  Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 13567069
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National estimate was based on total Medicare volume and Medicaid volume plus an additional 10% estimated for other payors

Specialty Nurse Practitioner  Frequency 6146335  Percentage  45.30 %
Specialty Internal Medicine  Frequency 2930703  Percentage  21.60 %
Specialty Family Medicine  Frequency 1628168  Percentage  12.00 %

Estimate the number of times this service might be provided to Medicare patients nationally in a one-year period? 10,094,874  If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimates are based on 2019 Medicare data from the RUC Database plus 85% of deleted 99318

Specialty Nurse Practitioner  Frequency 4571968  Percentage  45.28 %
Specialty Internal Medicine  Frequency 2180492  Percentage  21.59 %
Specialty Family Medicine  Frequency 1222384  Percentage 12.10 %

Do many physicians perform this service across the United States? Yes

Berenson-Eggers Type of Service (BETOS) Assignment
Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Evaluation Management

BETOS Sub-classification:
Nursing home visit

BETOS Sub-classification Level II:
NA
**Professional Liability Insurance Information (PLI)**

**Description of Pre-Service Work:** Prepare to see the patient. Review medical records and previously ordered diagnostic laboratory tests. Communicate with facility health care professionals as necessary.

**Description of Intra-Service Work:** Obtain a comprehensive history. Perform a comprehensive physical examination. Formulate a multidisciplinary treatment plan (MDM of moderate-complexity) that includes IV hydration and antibiotic therapy; nursing instructions regarding monitoring of respiratory, mental, functional, and diabetic status; respiratory and physical therapy assessments with treatment as indicated; and further laboratory monitoring to track effectiveness of treatment.

**Description of Post-Service Work:** Evaluate results of additionally ordered laboratory and diagnostic testing. Follow up with telephone calls to the facility to adjust interventions as indicated. Document coordination of care and interaction with facility health care professionals associated with delivery of care to this patient until the next face-to-face physician encounter. Discuss end-of-life issues with family members.

### Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC’s rationale, please review the separate RUC recommendation document.
The CPT codes for initial and subsequent nursing facility services were surveyed because the CPT editorial panel changed the descriptors of the codes so that the choice of code to report is based on either medical decision making or the total time spent on the date of the encounter. The total time will be based on the results of the surveys for each code. The CPT codes for discharge services were not changed by were surveyed because they are part of the nursing facility services family. CPT also deleted 99318 which was used to report annual nursing facility assessment because such assessments may be required by law. In the future these annual assessments will be reported using the appropriate initial or subsequent care code.

The codes were surveyed by the American Geriatrics Society (AGS), the American Medical Directors Association (AMDA), the American Academy of Physical Medicine & Rehabilitation (AAPM&R), the American Nurses Association (ANA), the American Podiatric Medical Association (APMA), and the American College of Physicians (ACP). The surveying societies convened an expert panel to review the survey results and make work and time recommendations to the RUC.

**Compelling Evidence**

The last time the nursing facility services codes were reviewed by the RUC was in February 2007. The expert panel reviewed peer-reviewed literature (see attached articles) that documented that there have been changes in physician work due to patient population and length of hospital stay. After its review the expert panel agreed that these codes met these compelling evidence criteria.

Specifically, the acuity of patients admitted to nursing home after being discharged from an acute care hospital has increased significantly from 2011 to 2018. The table below shows the increase in patient acuity upon hospital discharge (Elixhauser scale) and the Hierarchical Condition Category (HCC) score on SNF admission. Note that a SNF patient is the typical patient for nursing home visits.

The Elixhauser index is a well-established tool that categorizes 30 patient comorbidities based on ICD diagnosis, in this case upon hospital discharge, and is used in a variety of ways including predicting adverse events and utilization of resources. The HCC is a risk adjustment model which calculates risk scores for aged and disable Medicare beneficiaries, often used to represent the expected costs of a Medicare member in the coming year. This data was supplied by Dr Vincent Mor, Brown University Center for Gerontology and Healthcare Research, using LTCFocus.org, a research data base from the Shaping Long-Term Care in America Project sponsored by Brown University and the National Institute on Aging.

Fashaw et. al. (JAMDA 21 (2020) 233-239, reviewed comprehensive data in US Nursing Homes from 1985-2015 and found that in 2015, as opposed to 1985, among other things, the resident cognitive function has decreased (e.g., percent of residents with dementia increased from 39% in 1995 to 45% in 2015), the percent of patients with a psychiatric diagnosis increased from 11% in 1995 to 31% in 2015, the percent of residents receiving antidepressants increased from 20% in 1995 to 49% in 2015, and the need to assistance with activities of daily living has increased.

Teno, et. al. (JAMA 2017) reviewed Medicare Part B claims data and showed that the care of SNF patients has shifted from physicians to nurse practitioners and physician assistances and that those physicians, NPs, and PAs who provide SNF care are SNFists - i.e., providers who bill more than 90% of all their visits in the nursing home setting.
Werner (JAMA 2018) reviewed MEDPAR data and determined that the length of acute care hospital stay before discharge to a post-acute facility decreased from 9.0 days in 2000 to 7.3 days in 2015 and length of stay in the post-acute care facility increased from 21.7 days in 2000 to more than 25 days in 2014 and 2015.

McCarthy et al. (JAMA 2020) reviewed the nationwide Minimum Data Set (MDS) to look at transfers from nursing homes to acute care hospitals. They found that the number of transfers decreased from 2011 to 2016, especially for patients with dementia, heart failure, and chronic obstructive pulmonary disease - without an increased mortality rate in nursing homes.

After reviewing these data, the expert panel concluded that due to changes in patient population, changes in specialty mix, and the reduced length of acute care hospital stay before discharge to a nursing home, that the compelling evidence criteria were met.

Survey Data Review

The panel reviewed 99310 which requires high level medical decision making or is based on the total time spent on the day of the encounter. There were 203 respondents of whom 86% found the vignette to be typical. The survey times and median work RVU were 10/45/15/70/3.00 and the 25th percentile work RVU was 2.80. The two key reference services were 99215, Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and high level of medical decision making. When using time for code selection, 40-54 minutes of total time is spent on the date of the encounter, with times and work RVU of 10/45/15/70/2.80, and 99291, Critical care, evaluation and management of the critically ill or critically injured patient; first 30-74 minutes, with times and work RVU of 15/40/15/70/4.5.

The expert panel noted that the current times and work RVU for 99310 are 15/35/20/70/2.35.

The expert panel noted that the survey intra time was 10 minutes longer than the current intra time even though the total time was the same. In addition, the survey times and 25th percentile RVU were identical to the times and work RVU for 99215 which was chosen as the key reference service by 147 of the 203 respondents. The survey times and 25th percentile work RVU also place 99310 in correct rank order with 99291 because while the times are similar, 99291 is much more intense service which is reflected by the work RVU for 99291 which is 60% higher then the recommended work RVU for 99310.

Therefore, the expert panel recommends for 99310, times and work RVU of 10/45/15/70/2.8.

Finally, the expert panel reviewed its recommendations for all the surveyed codes to determine whether the recommendations placed the codes in proper rank order with each other.

The panel reviewed the total times, intra times and work RVUs among the subsequent visit codes, among the initial visit codes, and between the discharge codes to determine if the ratios (i.e., percent) differences of those parameters were consistent. They were very consistent. The expert panel also reviewed these data for the comparable initial visit and subsequent visit codes (e.g., 99306 and 99310) to determine if the percent differences were consistent. They were very consistent. Similarly, the date between the two discharge codes were very consistent. The expert panel agreed that this analysis supported all the recommendations for time and work RVUs.

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - [ ] The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - [ ] Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - [ ] Multiple codes allow flexibility to describe exactly what components the procedure included.
   - [ ] Multiple codes are used to maintain consistency with similar codes.
   - [ ] Historical precedents.
   - [ ] Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. N/A
FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 99310

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Original Study

Thirty-Year Trends in Nursing Home Composition and Quality Since the Passage of the Omnibus Reconciliation Act

Shekinah A. Fashaw MSPHa,b,* Kali S. Thomas PhDa,b,c Ellen McCreedy PhDa,b, Vincent Mor PhDa,b,c

a Center for Gerontology and Healthcare Research, School of Public Health, Brown University, Providence, RI
b Department of Health Services, Policy, and Practice, School of Public Health, Brown University, Providence, RI
c Center of Innovation in Long-Term Services and Supports, US Department of Veterans Affairs Medical Center, Providence, RI

Keywords: Quality Nursing Home Reform Act OBRA 1987 nursing home characteristics

Abstract

Objective: In 1987, the Omnibus Reconciliation Act (OBRA) called for a dramatic overhaul of the nursing home (NH) quality assurance system. This study examines trends in facility, resident, and quality characteristics since passage of that legislation.

Methods: We conducted univariate analyses of national data on US NHs from 3 sources: (1) the 1985 National Nursing Home Survey (NNHS), (2) the 1992-2015 Online Survey Certification and Reporting (OSCAR) Data, and (3) LTCfocUS data for 2000-2015. We examined changes in NH characteristics, resident composition, and quality.

Setting and participants: US NH facilities and residents between 1985 and 2015.

Results: The proportion of NHs that are Medicare and Medicaid certified, members of chains, and operating not-for-profit has increased over the past 30 years. There have also been reductions in occupancy and increases in the share of residents who are racial or ethnic minorities, admitted for post-acute care, in need of physical assistance with daily activities, primarily supported by Medicare, and diagnosed with a psychiatric condition such as schizophrenia. With regard to NH quality, direct care staffing levels have increased. The proportion of residents physically restrained has decreased dramatically, coupled with changes in inappropriate antipsychotic (chemical restraint) use.

Conclusions and implications: Together with changes in the long-term care market, the NHs of today look very different from NHs 30 years ago. The 30th anniversary of OBRA provides a unique opportunity to reflect, consider what we have learned, and think about the future of this and other sectors of long-term care.

© 2019 AMDA – The Society for Post-Acute and Long-Term Care Medicine.

For more than 30 years, the quality of nursing home (NH) care has been a continuous concern.1 In 1984, following published reports and concerns about resident abuse, neglect, and a lack of regulation and oversight, Congress asked the Institute of Medicine (IOM) to investigate the quality of NHs and make recommendations for improvement. The resulting report proposed radical NH reforms,2 many of which were codified by Congress as part of the Nursing Home Reform Act of the Omnibus Budget Reconciliation Act of 1987 (OBRA 1987).

OBRA 1987 created regulations for NHs in an effort to improve the quality of care delivered to residents. OBRA included a minimum set of care standards and rights for people residing in Medicare- and Medicaid-certified NHs. OBRA 1987 had a focus on residents’ quality of life and care, expectations for improved or maintained resident health, as well as residents’ rights to banking, organized family councils, and freedom from unnecessary physical and chemical restraints. The Act also standardized certification standards and enforcement strategies. As such, OBRA 1987 was an overhaul of the NH industry and marked a new beginning for NH care and regulation.

In the 30+ years since OBRA 1987, there have been a number of other changes that have directly affected the NH industry. In response...
to consumer preferences to remain in the community, “age-in-place,” and efforts to rebalance states’ long-term care budgets, there has been a considerable increase in home- and community-based services (HCBS). HCBS were seen as mechanisms to divert or delay expensive, and often undesired, NH placement. Over the last several decades, states have begun funding more HCBS, primarily through Medicaid waiver programs; and, for the first time in 2013, states spent more on HCBS than care provided in NHs. Accompanying these care delivery, market, and financing changes has been growth of an aging and diversifying population, as well as a number of laws and regulations directly impacting the NH industry (eg, the Balanced Budget Act of 1997 and the introduction of case-mix reimbursement).

The purpose of this study was to summarize changes in the NH industry in the 30 years since the seminal regulatory change affecting NHs. Specifically, we use historical data from 3 national sources and describe changes in NH facility characteristics, resident characteristics, and quality of care from 1985 through 2015. The 30th Anniversary of OBRA provides a unique opportunity to examine the changes within this vital industry. This article can aid in understanding long-term trends, as well as provide insight into what changes we might expect in the future.

Methods

Data

We analyzed data from 3 sources to examine resident and facility characteristics, longitudinally: (a) National Nursing Home Survey, (b) Online Survey Certification and Reporting Data/Certification and Survey Provider Enhanced Reporting, and (c) LTCFocUS data.

National Nursing Home Survey (NNHS)

The National Center for Health Statistics conducted the NNHS. The NNHS consists of a nationally representative sample of more than 1,000 NHs and their residents. NHs included in the surveys had at least 3 or more beds and were Medicare or Medicaid certified or had a state license to operate as an NH. The facilities and residents were selected by a stratified 2-stage probability design. In the first stage, NHs were selected, and in the second stage, residents were sampled from the selected NHs. NNHS data were used to describe facility and aggregated resident characteristics. Data for these analyses came from the University of Michigan ICPSR public use NNHS data files for 1985.7

Online Survey Certification and Reporting Data (OSCAR)/Certification and Survey Provider Enhanced Reporting (CASPER)

CMS’ OSCAR/CASPER database is a national database of all NH data elements collected by state survey agencies during the required annual onsite Medicare and Medicaid Certification inspection. The inspections occur at least once during a 15-month period. OSCAR/CASPER data are used to determine facility characteristics, deficiencies in care noted during the survey, and aggregated resident data. Data included all certified NHs between the years 1992 and 2015. Variables in OSCAR/CASPER have been validated for research purposes.8

Long-Term Care FocUS (LTCFocUS)

We used LTCFocUS.org, a product of the Shaping Long-Term Care in America Project at the Brown University Center for Gerontology and Healthcare Research and supported, in part, by the National Institute on Aging (www.ltcfocus.org). This data set included information for years 2000-2015 and combined variables from the OSCAR data; the Minimum Data Set (MDS), resident-level data related to resident clinical and functional status; the Area Resource File (ARF), a national county-level health resources database maintained by the Health Resources and Services Administration that contains data about the health professionals and facilities in each county; and the Residential History File, a data resource built using Medicare Enrollment data, Medicare claims data, and assessment data to track individuals as they move through the long-term care system.9 For these analyses, we used the LTCFocUS data to describe the aggregated characteristics of residents served in NHs between 2000 and 2015.

Variables

We included the following facility characteristics to describe changes in the NH market over time: dual certification for Medicare and Medicaid, multifacility chain membership, for-profit status (vs nonprofit or government), presence of an Alzheimer’s special care unit, facility size (ie, total number of beds), and occupancy rate.

To describe the resident composition, we included demographic characteristics, length of stay, admission source, physical function, mental health diagnoses, and medication use measures. Demographic variables from LTCFocUS included the percentage of female residents in each facility; the percentage of blacks, whites, and Hispanics in each facility; and the average age for residents residing in each facility. Also from the LTCFocUS, we included the percentage of long-stay residents, defined as the percentage of residents in the NH at least 90 of the last 100 days. We also include the percentage of residents admitted to the NH directly from the hospital vs the community or other LTC setting. From the OSCAR/CASPER, we included information about residents’ primary payer as the percentage of residents whose primary support was Medicaid or Medicare. Measures of resident physical and cognitive function included the facility’s average Activities of Daily Living (ADL) scale score, bed/chair bound measures, individual early-, middle-, and late-loss ADL, and the percentage of residents with dementia. The ADL scale score comes from LTCFocUS, ranges from 0 to 28, and is created by summing 7 ADL items on a scale from 0 to 4 (with 0 = complete independence and 4 = total dependence for each item). The facility average represents the average across all residents in the facility. Chairbound and bedbound measures come from the NNHS and OSCAR/CASPER data and refer to the percentage of residents unable to leave their chair or bed, respectively, at the time of the survey. The individual ADL of interest from the NNHS and OSCAR/CASPER data include dressing, bathing, transferring, toileting, and eating, and represent the percentage of residents who were not completely independent in each of these activities at the time of the survey. From the NNHS and OSCAR/CASPER data, we also included a measure for the percentage of residents with dementia within the facility. Measures of resident mental health and medication use included the percentage of residents with a psychiatric diagnosis (excluding dementia and depression), a schizophrenia diagnosis, receiving antianxiety medications, receiving antidepressants, and receiving antipsychotics.

Information on facility quality consisted of structure, process, and outcome measures.10 As a measure of structure, we included the number of certified nursing aides, licensed professional nurses, and registered nurse hours per resident per day from the OSCAR/CASPER data. We obtained information about facilities’ quality process measures including the percentage of residents in a facility who were physically restrained, received tube feeding, had a catheter, received antipsychotic medications without a diagnosis of schizophrenia or bipolar disorder at the time of the survey, and the percentage of facilities experiencing medication errors. Medication error refers to the percentage of facilities cited for drug error rates higher than 5% reported during the annual survey. Quality outcome measures included the percentage of residents within a facility with pressure ulcers, and the percentage of residents within a facility experiencing incontinence. Values for pressure ulcers indicate the percentage of residents during the annual survey with pressure sores. The incontinence measures indicate the percentage of residents with bladder or bowel incontinence at the time of the survey.
Univariate analyses of the above variables were completed using Stata, version 14 (StataCorp, College Station, TX). Data from the NNHS were weighted using the facility, bed, and current resident weights provided. OSCAR/CASPER and LTCFocUS data are available at the facility level. Facility-level variables are averaged for each study year. We do not include inferential statistics in this article because we are presenting data for the entire population of NHs in the United States for the majority of years.

Results

Facility Characteristics

In the past 30 years, the NH industry has decreased in size, from 19,068 facilities in 1985 to 15,686 in 2016 (Table 1). There has also been an increase in the percentage of facilities that are nonprofit (25% in 1985 and 31% in 2015) and that are dually certified by both Medicare and Medicaid (33% in 1985 and up to 97% 2015). Between 1995 and 2015, chain membership increased from 51% to 57%, the percentage of facilities with an Alzheimer’s special care unit increased by both Medicare and Medicaid (+33.3% in 1995 to 97.1% in 2015). Between 1992 and 2015, the average percentage of residents with Medicaid as a primary payer decreased from 64% to 58%, whereas the average percentage of residents with Medicare as the primary payer rose from 36% to 47%. The share of residents with psychiatric diagnoses has increased over the years (Table 3). According to LTCFocUS data, the average ADL dependency score among NH residents increased slightly, from 15 to 17 between 2000 and 2015. According to NNHS and OSCAR/CASPER data, residents who required assistance in bathing increased from a national average of 89% in 1985 to an average facility average of 96% in 2015. The same trend is demonstrated by the increased share of residents who required assistance with the other ADL from 1985 to 2015: assistance with dressing rose from 74% to 92%, assistance with transferring from 60% to 85%, assistance with toileting from 49% to 88%, and assisting with eating increased from 38% to 56%. However, there was a decrease in the percentage of residents who were bed-bound from 6% in 1985 to 4% in 2015, whereas being chair bound rose from 39% to 64%. The percentage of residents with dementia increased from an average of 39% in 1995 to an average of 45% across the facilities in 2015.

Resident Composition

The population that NHs serve has changed over the last 30 years (Table 2). Data from the NNHS and LTCFocUS suggest that although the average age of residents has remained constant, the percentage of residents who are racial and ethnic minorities has increased from 7.8% in 1985 to 20.7% in 2015. The average percentage of females decreased from 72% of residents in 1985 to 67% in 2015. The prevalence of long-stay residents within NHs has remained stable at 69% of all residents over this period. However, the percentage of residents admitted from the hospital increased from 67% in 2000 to 85% in 2015. There has also been a shift of payer types over time (Figure 1). Between 1992 and 2015, the average percentage of residents with Medicaid as a primary payer decreased from 64% to 58%, whereas the average percentage of residents with Medicare as the primary payer rose from 9% to 15%.

residents with schizophrenia increased from 6% to 11%. The percentages of residents receiving antianxiety, antidepressant, and antipsychotic medications in 1995 were 15%, 20%, and 16%, respectively, and by 2015 increased to 23%, 49%, and 20%, respectively.

Quality of Care

The average direct care staffing hours have increased over time, with the greatest increases observed among CNAs (see Table 4). Overall, quality process measures have also improved since the passage of OBRA 1987. Notably, the average proportion of residents being physically restrained decreased dramatically from 19% to 1%, and the percentage of residents receiving antipsychotic medications inappropriately, as a chemical restraint, decreased from 16% in 2000 to 12% in 2015, although there was a peak of 22% in 2005. However, there was not much change in the proportion of facilities cited for medication errors over this time period.

Quality outcome measures also improved over time. The proportion of residents with pressure ulcers decreased from 8% to 6%. Lastly, congruent with increased need for assistance, bowel and bladder incontinence increased from 42% to 44% and 49% to 62%, respectively.

NNHS data represent the national averages, whereas OSCAR data represent the average of facility averages. The average ADL score is based on 7 ADL ranges from 0 to 28, where 0 = total independence and 28 = total dependence. The Average Acuity Index includes ADL and special treatment measures.

*Weighted number of residents.

These data are from the 2000, 2005, and 2015 LTCfocUs instead of the OSCAR/CASPER data.

Within this 30-year period, there were facility, resident, and quality of care changes that can be linked to regulations adopted through the OBRA 1987 and other policy shifts in the long-term care sector.

Certification

Over the last 30 years, we witnessed a change in NH certification. This change is consistent with the OBRA 1987 requirement for NHs to be certified and meet the federal participation requirements in order to receive Medicaid and Medicare payments.\(^{11}\) Previously, Medicare-certified facilities had more stringent requirements, but seeing that the majority of government spending came from Medicaid, OBRA 1987 stipulated that all Medicaid-certified facilities met a set of standards that were similar to that of Medicare.\(^{1}\) Additionally, noting Medicare’s generous reimbursement for skilled care, many Medicaid-only NHs became dually certified in both Medicare and Medicaid.\(^{12}\) These policy and financing incentives likely contributed to the increase in the proportion of facilities that were dually certified during this time period.

Changing Demand and Supply, and Lower Occupancy

Concurrent with shifting US demographics (eg, an aging and increasingly diverse population), NHs in the last 30 years have witnessed increases in the proportion of minorities and decreases in the proportion of white residents. Recognizing the aging population, the long-term care market began to appear more lucrative and attracted a greater number of investors to NH operations.\(^{15,17}\) This is evidenced by the percentage of NHs that were owned and operated by a chain. Stevenson, Grabowski, and Coots (2006) posit that chain facilities increased because of the interplay of certificate of need laws and resulting acquisitions.

Despite the aging of the population, there was a decrease in the number of NHs and facility occupancy rates during this time period. This decrease in NH supply and occupancy is likely attributable to the rise of community options such as assisted living and other HCBS.\(^{14,15}\) In 2000, Medicaid spent about 27% of its total Medicaid long-term services and supports expenditures on HCBS and 73% on institutional care; by 2016, 57% of the expenditures were for HCBS and 43% for NH care.\(^{5}\) It can be difficult to quantify the increase in community-based services due to data challenges; however, the National Survey of Resident Care Facilities identified approximately 31,100 residential facilities in 2010 and researchers have suggested a continued growth in the market.\(^{16–18}\) The growth of long-term care alternatives allows individuals to remain in their homes and communities longer, in many cases delaying NH placement or diverting it altogether.\(^{19–23}\) These trends may also explain some of the reasons behind the increase in functional impairment among NH residents over this time period.

Another potential explanation for the increase in functional impairment witnessed over this 30-year period may be the increase in post-acute, rehabilitative care provided in NHs. Recognizing the profitability associated with providing Medicare-reimbursed services,\(^{24,25}\) NHs began to accept more post-acute care patients, with a large number of NHs choosing to specialize in the care of post-acute patients.\(^{2,25}\) This shift in the orientation of NHs over this time period, from providing typically long-term custodial care to post-acute, rehabilitative care, may contribute to the increase in resident acuity witnessed in this study. It is evident from our findings that there is an increased percentage of residents being admitted directly from the hospital, presumably for post-acute care, which may contribute to higher levels of functional impairment as residents may be leaving hospitals “quicker and sicker.”\(^{26,27}\)

Quality Improvement

Despite higher resident levels of need, NH quality appears to have improved over time. Our data show modest gains in quality indicators between 1995 and 2015. The literature around drivers of quality improvement in NHs is vast and includes mechanisms such as NH ownership, nurse staffing, public reporting, and quality improvement initiatives. The quality improvement that we witnessed during this time period could have been attributable to the increase in nonprofit NHs, which have consistently shown to have higher quality ratings.\(^{13}\) Quality improvement could also be directly related to the increase in nursing hours witnessed over this time period. OBRA 1987 improved the standards for nursing hours, and we observed these increases over time. Although it is possible that the increase in nursing hours may be in direct response to increasing need among residents, prior research has concluded that increasing nursing hours improves patient outcomes.\(^{28–30}\) It is also plausible that new inspection, survey, enforcement efforts, and public reporting prompted improvements in quality.

measures. Although it can be argued that NHs still have room to improve in their quality indicators, it is important to note that despite an increasingly vulnerable and higher need population, we still observe quality gains among NHs during this time period.

One of the direct effects of OBRA 1987 was a substantial decrease in the use of physical restraints. Physical restraints were initially used on residents with serious mental illness to manage behaviors, but began to be used more widely on residents with behavioral symptoms, including residents with dementia. Prior research indicates that physical restraints are associated with worse outcomes for residents, such as increased depression, less social engagement among NH residents, reduced muscle strength, and pressure ulcers. Parts of OBRA 1987 focused directly on the residents’ rights to be free from all restraints. Unfortunately, decreases in physical restraints were coupled with initial increases in chemical restraint use, such as inappropriate antipsychotic use. Antipsychotic medications increase the risk of falls and death. In 2005, the FDA released a Black Box warning to decrease the use of antipsychotics among older adults. This warning is consistent with the 2005 peak in antipsychotic use that is present in our data. In 2011, CMS launched a national partnership to further reduce inappropriate antipsychotic use, which has been largely successful. With the increase in dementia residents and initiatives to improve dementia care in NHs, there was a simultaneous increase in Alzheimer’s SCUs, with a peak in the percentage of facilities with an Alzheimer’s SCU in 2005. Literature suggests that residents within facilities with SCUs have significantly more challenging behaviors and have increased risk for chemical restraint use. The presence of these units may also account for the increased resident impairment.

It is also important to note the dramatic increase in residents with serious mental illnesses (SMI), as this could be a direct result of state psychiatric facilities closures in the 1960s and 1970s. The increase in the SMI population creates a new and increased burden for NHs and their staff that may negatively affect the quality of care that NHs are able to provide.

Despite the success of several prompted voiding interventions, we observed increases into the share of NH residents experiencing incontinence over the past 30 years, potentially reflective of the increasing needs of the NH population. Prompting toileting interventions can be labor intensive, and it is often more convenient to diaper a resident than toilet. More work is needed in this important quality of life area.

Limitations

This work provides a high-level look at national trends in NH characteristics, resident composition, and quality measures. Data are averaged across all facilities for the available study years. We do not have access to annual data available between 1986 and 1994, and because of the facility-level nature of our data we are unable to summarize resident-level changes over time. For example, it would be interesting to examine changes in acuity, separately for long-stay vs short-stay residents, or changes in residents’ lengths of stay. This would help us understand if the increase in acuity over time is due to an increased focus on post-acute care, or attributable to higher levels of acuity among long-term residents who may delay entry into NHs through home- and community-based alternatives. Future work in this area would be beneficial to understanding additional impacts of OBRA on the long-term care industry as a whole.

Conclusions and Implications

Overall, OBRA 1987 is positively associated with the quality of care improvements in NHs despite increasing impairment of NH residents. OBRA 1987 was also successful in implementing and enforcing the MDS resident assessment survey, and without that this research would not be possible. Because of the aging-in-place movement, we are seeing lower occupancy rates in NHs. Older adults without financial resources, disproportional minority older adults, are becoming an increasing proportion of NH residents, as they may not be able to as readily access these care alternatives. Current and future policies should focus on expanding equitable access to the remaining long-term care services and supports in the continuum of care, particularly given the policies and initiatives focused on decreasing NH utilization through support of home and community based alternatives. Although NHs continue to focus more on short-stay post-acute care residents and long-stay residents with dementia, more work will need to be done in community-based settings to ensure the highest quality care and life. Improving quality is also about improving equity, and it is important for future work to examine access to quality care for our most vulnerable older adults who are sometimes triply and doubly vulnerable because of their cognitive status, race, and/or socioeconomic position. As our work shows, much of the quality progress made in NHs has been because of regulation and oversight over the years. The same level of oversight does not exist for all community alternatives, but the evidence presented here is indicative of effective practices.

Future research is also needed to understand whether these improvements in quality over the past 30 years have been equitable on the basis of race, socioeconomic status, gender, and geography. In sum, our findings document the 30-year history of NHs since the passage of the seminal legislation: OBRA 1987. As we look toward the future of long-term care, it is important that we reflect on the past.

Hospital Transfer Rates Among US Nursing Home Residents With Advanced Illness Before and After Initiatives to Reduce Hospitalizations

Ellen P. McCarthy, PhD, MPH; Jessica A. Ogarek, MS; Lacey Loomer, MSPH; Pedro L. Gozalo, MSc, PhD; Vincent Mor, PhD; Mary Beth Hamel, MD, MPH; Susan L. Mitchell, MD, MPH

**IMPORTANCE** Hospital transfers among nursing home residents in the United States who have been diagnosed with advanced illnesses and have limited life expectancy are often burdensome, costly, and of little clinical benefit. National initiatives, introduced since 2012, have focused on reducing such hospitalizations, but little is known about the consequences of these initiatives in this population.

**OBJECTIVE** To investigate the change in hospital transfer rates among nursing home residents with advanced illnesses, such as dementia, congestive heart failure (CHF), and chronic obstructive pulmonary disease (COPD), from 2011 to 2017—before and after the introduction of national initiatives to reduce hospitalizations.

**DESIGN, SETTING, AND PARTICIPANTS** In this cross-sectional study, nationwide Minimum Data Set (MDS) assessments from January 1, 2011, to December 31, 2016 (with the follow-up for transfer rates until December 31, 2017), were used to identify annual inception cohorts of long-stay (>100 days) nursing home residents who had recently progressed to the advanced stages of dementia, CHF, or COPD. The data were analyzed from October 24, 2018, to October 3, 2019.

**MAIN OUTCOMES AND MEASURES** The number of hospital transfers (hospitalizations, observation stays, and emergency department visits) per person-year alive was calculated from the MDS assessment from the date when residents first met the criteria for advanced illness up to 12 months afterward using Medicare claims from 2011 to 2017. Transfer rates for all causes, potentially avoidable conditions (sepsis, pneumonia, dehydration, urinary tract infections, CHF, and COPD), and serious bone fractures (pelvis, hip, wrist, ankle, and long bones of arms or legs) were investigated. Hospice enrollment and mortality were also ascertained.

**RESULTS** The proportions of residents in the 2011 and 2016 cohorts who underwent any hospital transfer were 56.1% and 45.4% of those with advanced dementia, 77.6% and 69.5% of those with CHF, and 76.2% and 67.2% of those with COPD. The mean (SD) number of transfers per person-year alive for potentially avoidable conditions was higher in the 2011 cohort vs 2016 cohort: advanced dementia, 2.4 (14.0) vs 1.6 (11.2) (adjusted risk ratio [aRR], 0.73; 95% CI, 0.65-0.81); CHF, 8.5 (32.0) vs 6.7 (26.8) (aRR, 0.72; 95% CI, 0.65-0.81); and COPD, 7.8 (30.9) vs 5.5 (24.8) (aRR, 0.64; 95% CI, 0.57-0.72). Transfers for bone fractures remained unchanged, and mortality did not increase. Hospice enrollment was low across all illness groups and years (range, 23%-30%).

**CONCLUSIONS AND RELEVANCE** The findings of this study suggest that concurrent with new initiatives aimed at reducing hospitalizations, hospital transfers declined between 2011 and 2017 among nursing home residents with advanced illnesses without increased mortality rates. Opportunities remain to further reduce unnecessary hospital transfers in this population and improve goal-directed care for those residents who opt to forgo hospitalization.
A central objective of the Patient Protection and Affordable Care Act (ACA) of 2010 was to transform health care by ensuring that patients receive high-value, effective care. Toward this objective, there has been particular focus on reducing potentially avoidable hospital transfers from the long-term care setting. The opportunity and need to reduce avoidable hospitalizations are greatest among people with advanced chronic illnesses for whom the burdens of hospitalization often outweigh the benefits. Little is currently known about how hospital transfer rates have changed among this population since broad initiatives were introduced.

Approximately 50% of nursing home residents experience 1 or more hospitalization in their last year of life. At least half of these hospitalizations are estimated to be potentially avoidable because the acute condition could be managed effectively in the nursing home or the hospital-level care is not aligned with patient preferences. Decisions regarding hospital transfers should be guided by the primary goal of care (eg, prolongation of life vs comfort), which is comfort for most nursing home residents with advanced illness. With rare exceptions (eg, serious bone fractures), hospitalization seldom promotes the goal of comfort.

Since 2012, several new approaches have emerged from the ACA to try to reduce hospital transfers of nursing home residents. Care models that enhance the nursing home’s on-site capability to manage specific targeted conditions (sepsis, pneumonia, urinary tract infections, dehydration, congestive heart failure [CHF], and chronic obstructive pulmonary disease [COPD]) have shown promise through the quality initiative program of the Centers for Medicare & Medicaid Services (CMS) to reduce avoidable hospitalizations. Evaluation of the initiative’s first phase in 7 states demonstrated net reductions in 2015 of 2.2% to 9.3% in the probability of an all-cause hospitalization and 1.4% to 7.2% in the probability of a potentially avoidable hospitalization for participating residents compared with comparison groups. Alternative payment models, such as accountable care organizations and bundled payments, also create financial incentives for nursing homes to reduce hospital transfers. The Hospital Readmissions Reduction Program (HRRP) implemented financial penalties for hospitals with excess readmissions for target conditions including pneumonia, CHF, and COPD. These concurrent initiatives raised national awareness and forged collaborations around transitional care to avoid unnecessary hospitalizations. The consequences of such initiatives on hospital transfer rates, specifically among residents with advanced illnesses, have not been reported, to our knowledge.

The present study used Minimum Data Set (MDS) assessments linked to Medicare data to examine the national trends of hospital transfer rates from 2011 to 2017 among long-stay, fee-for-service nursing home residents with advanced dementia, CHF, or COPD. We specifically examined transfers for conditions that were deemed to be potentially avoidable and were the target of recent policy initiatives. For comparison, we also examined hospital transfer rates for serious bone fractures, which we hypothesized would be less affected by such initiatives. Finally, we assessed mortality and hospice enrollment rates.

Findings
In this US nationwide cross-sectional study of 6 cohorts of nursing home residents with advanced illness, such as dementia, congestive heart failure, and chronic obstructive pulmonary disease, although hospital transfers for all causes and for potentially avoidable conditions were common, such transfers were found to have declined considerably from 2011 to 2017, and concurrent hospice use was low across all cohorts.

Methods
Advanced Illness Cohorts
In this cross-sectional study, the MDS version 3.0 assessments from federally licensed nursing homes in the United States were used from January 1, 2011, to December 31, 2016, to construct annual inception cohorts of long-stay residents (ie, ≥100 days) aged 65 years or older who were diagnosed with advanced dementia, CHF, or COPD. The MDS version 3.0 is a standardized, comprehensive assessment conducted on all nursing home residents at admission and at routine intervals (eg, quarterly) and was implemented in 2011. Key differences between MDS 3.0 and MDS 2.0 precluded us from using MDS before 2011. To construct these cohorts, we identified residents from the first MDS assessment at which they met the full criteria for advanced dementia, CHF, or COPD (hereafter, baseline assessment) in each calendar year. Residents may have had the illness, such as CHF, on a prior MDS assessment but were not included in the cohort until they first met the criteria for advanced disease, as described below. Residents had to be continuously enrolled in the Medicare Parts A and B fee-for-service program for up to 12 months after their baseline assessment and could belong to more than 1 advanced illness group. Residents enrolled in hospice at the baseline assessment were excluded. The institutional review board at Brown University approved this study under expedited review and waived informed consent under 45 CFR 46.116.

We defined advanced dementia, CHF, and COPD using criteria adapted from previous studies using MDS to approximate hospice eligibility criteria, thus implying limited life expectancy. Advanced dementia criteria included the following: diagnosis of Alzheimer disease or other dementia, advanced cognitive impairment as defined by a score of 3 (moderate impairment) or 4 (severe impairment) on the Cognitive Function Scale, and extensive or total assistance needed for eating and transferring. Advanced CHF was defined as follows: CHF diagnosis, shortness of breath while sitting or supine, and extensive or total assistance needed for transferring. Advanced COPD was...
Hospital Transfer Rates Among US Nursing Home Residents With Advanced Illness

Covariates
Age, sex, nonwhite race, dual-eligible status indicating beneficiaries qualifying for both Medicare and Medicaid, MDS 3.0 mortality risk score (MRS3), and cohort year were ascertained from the baseline MDS assessment. The MRS3 (0-39) is a validated risk score based on demographic, clinical, and functional characteristics, with higher values indicating greater 30- and 60-day mortality risk. An MRS3 score of 8 or higher is associated with a 5.4 times increased odds of 30-day mortality compared with scores lower than 8.25

Outcomes
Residents were followed for up to 12 months from their baseline MDS assessment using Medicare claims from January 1, 2011, to December 31, 2017, to ascertain the occurrence of hospital transfers for all causes, potentially avoidable conditions, and serious bone fractures. Thus, person-time and outcomes spanned 2 calendar years (eg, for the 2016 cohort, outcomes were assessed in both 2016 and 2017). Hospital transfers included acute hospitalizations, observation stays, and emergency department (ED) visits. Hospitalizations were identified from the Medicare Provider Analysis and Review file.26 Observation stays were defined as any outpatient facility claim for observation services using Healthcare Common Procedure Codes G0378-G0379,27 Current Procedural Terminology codes 99217-99220,28 or hospital outpatient revenue center code 0762. Emergency department visits were ascertained using outpatient facility claims with revenue center codes 0450-0459 or 0981, Healthcare Common Procedure Codes G0380-G0385, or carrier claims for ED services using Current Procedural Terminology codes 99281-99285. Observation stays that became admissions were considered to be hospitalizations. Emergency department visits that became hospitalizations or observation stays were classified accordingly.

Potentially avoidable transfers were identified using ambulatory care-sensitive conditions,29 including sepsis, pneumonia, dehydration, urinary tract infections, heart failure, and COPD (including emphysema and asthma) (eTable 1 in the Supplement). These conditions account for 78% of the potentially avoidable hospitalizations among nursing home residents.9 Serious bone fractures were examined as counterfactual conditions that usually result in hospital transfers regardless of existing policies and included fractures of the pelvis, hip, long bones of arms (humerus, ulna, and radius) and legs (femur, tibia, and fibula), wrists, and ankles (eTable 1 in the Supplement). We classified hospital transfers for these conditions using the claim’s principal diagnosis. Mortality and hospice enrollment within 12 months after the baseline assessment were identified from the Medicare Master Beneficiary Summary File29 and the 2011 to 2017 hospice claims, respectively.

Statistical Analysis
The data were analyzed from October 24, 2018, to October 3, 2019. Descriptive analyses were performed for resident characteristics and outcomes using means with SDs for continuous variables and proportions for categorical variables. Descriptive results were generated for each advanced illness group stratified by cohort year. Hospital transfers were further described by type (hospitalizations, observation stays, and ED visits) and by condition (all causes, potentially avoidable, and serious bone fractures). The proportion of potentially avoidable transfers attributable to specific diagnoses (eg, sepsis, pneumonia) were also calculated and presented graphically. Outliers defined as residents with all-cause hospital transfer rates exceeding 365 transfers per person-year alive across 12 months were removed (<1% of residents across all cohorts combined). Hospital transfer outcomes across 12 months were measured as the proportion of residents who experienced at least 1 transfer and the number of transfers per person-year alive. Mortality and hospice enrollment outcomes across 12 months were measured as the proportion of residents who experienced the event and the time to event. For all models, the main independent variable was the cohort year, with 2011 as the referent category. All models were adjusted for age, sex, nonwhite race, and MRS3 score. All models were fitted using generalized estimating equations to account for clustering within nursing homes and included an offset for log-transformed person-time.

Binary outcomes (any hospital transfers, hospice enrollment, and mortality) were analyzed using log-linked binomial models to estimate relative risk with cohort year. Zero-inflated Poisson regression models were used to analyze outcomes measured as number of transfers per person-year alive to allow for overdispersion owing to the high proportion of residents without a hospital transfer.30 Adjusted risk ratios (aRRs) and 95% CIs were generated for these analyses. Finally, Cox proportional hazards regression models were used to analyze time-to-event outcomes (hospice enrollment, mortality) across 12 months of follow-up. In the hospice model, death without hospice was considered to be a competing risk. Adjusted hazard ratios and 95% CIs were estimated from these analyses. Analyses were performed using SAS, version 9.4 (SAS Institute Inc).

Results
Table 1 gives the characteristics of the nursing home residents by cohort year and advanced illness group. The 2011 cohort sizes were smaller for all illness groups compared with those of other years because residents had to be in the nursing home for at least 100 days and MDS data before 2011 were not used. Nonetheless, the overall distributions of age and sex were similar across cohort years within illness groups. Residents with advanced CHF (10.1-10.9) and COPD (9.0-9.6) generally had higher MRS3 scores (higher mortality risk) compared with residents with advanced dementia (7.5-8.4). All cohorts were predominately female, white, and dually eligible for Medicare and Medicaid.

Table 2 provides hospital transfer outcomes. All-cause hospital transfers were common in all illness groups across all years and were consistently lower for residents with advanced dementia compared with other groups. The most pronounced reduction in transfers occurred from the 2011 to 2012 cohort and
then from the 2012 to 2013 cohort. Data showed no further reduction after 2013 and higher rates in 2016 than in 2015, particularly in the CHF and COPD cohorts. The adjusted proportions of residents who had at least 1 hospital transfer for any cause in the 2011 and 2016 cohorts were 56.1% and 45.4% for those with advanced dementia, 77.6% and 69.5% for those with CHF, and 76.2% and 67.2% for those with COPD. The mean (SD) number of hospital transfers per person-year alive for any cause was higher in the 2011 vs 2016 cohorts for nursing home residents with advanced dementia, 5.8 (2.7) vs 3.9 (1.7); CHF, 16.8 (43.9) vs 13.5 (38.9); and COPD, 15.6 (42.4) vs 11.2 (35.8). For each illness, the decrease in transfer rates between the 2011 and 2016 cohorts remained significant (advanced dementia [aRR, 0.72; 95% CI, 0.67-0.78]; CHF [aRR, 0.74; 95% CI, 0.68-0.80]; and COPD [aRR, 0.66; 95% CI, 0.61-0.72]) after adjustment for baseline characteristics. As demonstrated in Figure 1, reductions in hospital transfer rates over time were almost entirely attributable to declines in acute hospitalizations in each illness group.

Transfers for potentially avoidable conditions were common and decreased over time in each illness group in patterns similar to those of transfers for all causes (Table 2). The adjusted proportions of residents having at least 1 hospital transfer for a potentially avoidable condition in the 2011 and 2016 cohorts, respectively, were 26.5% and 20.4% for those with advanced dementia; 50.0% and 42.9% for those with CHF; and 49.2% and 40.7% for those with COPD. The mean (SD) number of hospital transfers per person-year alive for potentially avoidable conditions for the 2011 vs 2016 cohorts were 2.4 (14.0) vs 1.6 (11.2) (aRR, 0.73; 95% CI, 0.65-0.81) for those with advanced dementia; 8.5 (32.0) vs 6.7 (26.8) (aRR, 0.72; 95% CI, 0.65-0.81) for those with CHF; and 7.8 (30.9) vs 5.5 (24.8) (aRR, 0.64; 95% CI, 0.57-0.72) for those with COPD. Septicemia was the most frequent condition attributed to potentially avoidable transfers in all cohort years for all groups (Figure 2). The next most frequent conditions documented for potentially avoidable transfers were pneumonia and urinary tract infections for advanced dementia and CHF and pneumonia for both advanced CHF and COPD.

Hospital transfers for a primary diagnosis of serious bone fractures were relatively uncommon and, as hypothesized, remained unchanged for all advanced illness groups across all years (Table 2). Table 3 gives the mortality and hospice enrollment outcomes. Hospice enrollment was low across all illness groups and years (range, 23%-30%). Mortality within 1 year exceeded 50% for all advanced illness groups across all years but did not increase over time in any illness group. Hospice use

d MDS 3.0 mortality risk score, range 0-39; higher scores indicate higher risk of mortality.
was low for all illnesses across all years but increased slightly for the 2016 cohort of residents with advanced dementia.

**Discussion**

We examined changes in national hospital transfer rates among long-stay nursing home residents with advanced dementia, CHF, and COPD from 2011 to 2017, a period during which national initiatives were introduced to reduce hospital transfers across care settings, including the long-term care setting. Transfers for all causes and potentially avoidable conditions declined for the advanced illness group during these years without adversely affecting mortality. This decline was almost entirely attributable to a reduction in hospitalizations rather than in observation stays or ED visits. In contrast, transfer rates for serious bone fractures, which are less likely to be associated with policy changes, remained stable. Sepsis and pneumonia were common reasons for potentially avoidable hospital transfers across all groups. Although the hospital transfer rates for all causes and potentially avoidable conditions declined, they remained common. In the 2016 cohorts, 45% of the residents with advanced dementia had multiple hospital transfers during the year, and 63% of the residents had at least one hospital transfer. These findings highlight the need for continued efforts to reduce hospital transfers, particularly for potentially avoidable conditions.
dementia and roughly two-thirds of those with advanced CHF and COPD experienced at least 1 transfer despite the greater than 50% mortality rate across all groups. These observations, coupled with low hospice enrollment throughout all years, suggest that opportunities remain to further reduce hospital transfers and improve end-of-life care for nursing home residents with advanced illnesses.

Although several studies describe changes in hospitalization rates in the United States in 2014 and 2015, the present study focused on long-term care residents with advanced illness. The issue is particularly pertinent for this population because hospital transfers can be especially burdensome, of little clinical benefit, and distressing for family members. Treatment decisions should be guided by patient preferences. Thus, if the decline in transfer rates observed in this study reflect, in part, decisions to avoid hospitalizations in favor of comfort-focused care, then such care should be available in the nursing home. High-quality palliative care is currently lacking in many US nursing homes.

Palliative care and hospice improve the quality of end-of-life care among nursing home residents, including reducing hospitalization rates. Although we could not ascertain whether residents received palliative care outside the Medicare Hospice Benefit, we observed low rates of hospice enrollment and no concurrent uptake of hospice as hospital transfer rates declined. Given the increased scrutiny and federal audits of nursing homes with long hospice stays, the present study suggests that most residents with advanced dementia, CHF, and COPD are not receiving hospice care near the end of life.

Potentially avoidable hospital transfers among dual-eligible beneficiaries are key quality measures in long-term care and cost Medicare an estimated $2.6 billion annually. Infections accounted for most potentially avoidable hospital transfers across advanced illness groups. Among residents with advanced CHF and COPD, exacerbations of these underlying conditions were also common reasons for transfers. Consequently, advance care planning among providers, residents, and family members presents a critical opportunity for informed decision-making about wishes for future hospitalizations in anticipation of expected clinical complications, and online resources are available to help guide these discussions. Proxies of residents with advanced dementia should understand that recurrent infections are a hallmark of the end stage of the disease. Among residents with advanced illness for whom curative care remains aligned with their preferences, infections and cardiopulmonary decompensations can often be managed in the nursing home. Of note, mortality did not increase across the cohort years in any group despite the decline in hospital transfers.

Programmatic initiatives, such as Interventions to Reduce Acute Care Transfers (INTERACT), have been adopted widely to avoid unnecessary hospitalizations by improving the nursing home’s capacity to provide on-site evaluation and management of acute changes through early recognition, monitoring, and staff training. Although a recent cluster randomized clinical trial of INTERACT demonstrated no effect on hospitalizations or ED visits, the trial highlighted the complexities of implementing and sustaining such interventions in nursing homes.

This study’s findings are consistent with those of studies documenting prominent declines in hospitalization and readmission rates between 2010 and 2012 after the enactment of the ACA and announcement of the HRRP, a Medicare value-based purchasing program that financially penalizes hospitals with excess readmissions for specific conditions. Health care systems may have made systemic preparations in anticipation of the HRRP penalty phase in October 2012. Our findings also support the possible spillover effect of HRRP onto nonspecific conditions. Consistent with other studies, we...
observed a leveling off of hospital transfer rates during 2014 to 2016. Chhabra and colleagues\textsuperscript{48} suggest that this pattern may reflect a floor effect—a point at which achieving additional reductions in rates becomes more difficult. Regression to the mean may also partly explain the marked decline observed in transfer rates compared with those in 2011.\textsuperscript{33}

Several factors acting in parallel may contribute to the observed declines in potentially avoidable transfers. Increased attention and quality and performance improvement initiatives have targeted unnecessary hospital transfers. Recent studies demonstrate reductions in hospital readmissions for potentially avoidable conditions after implementation of the HRRP.\textsuperscript{17,18} Although nursing homes were not subject to financial penalties under HRRP, many nursing homes across the United States adopted quality improvement programs, such as INTERACT, in anticipation of CMS quality assurance and performance improvement regulations.\textsuperscript{46} In addition, nursing homes included in accountable care organizations or other preferred referral
were similar for all-cause and potentially avoidable transfers. Declines in all-cause mortality risk score. In addition, rates of decline were unfounded in this population. * Cohort year refers to the calendar year of the inception cohort constructed for each advanced illness using MDS assessments from 2011 to 2016. Medicare data from 2011 to 2017 were used to identify outcomes occurring within 12 months of meeting the criteria for advanced illness for each cohort. Thus, person-time and outcomes were assessed for up to 12 months and spanned 2 calendar years (eg, for the 2016 cohort, outcomes were assessed in both 2016 and 2017).

** Limitations**

This study has limitations. The application of claims-based measures of potentially avoidable conditions to nursing home populations remains controversial because they do not capture the complex health status of frail, older nursing home residents with multimorbid conditions or the specific challenges of managing acute illnesses in this population and setting.7,45 Moreover, insurance claims and MDS 3.0 networks were further incentivized to reduce hospitalizations to remain in network.16 The CMS is conducting demonstration projects to examine payment models that include value-based purchasing incentives as part of the initiative to reduce avoidable hospitalizations among nursing home residents.10 The Skilled Nursing Facility (SNF) value-based purchasing program took effect in October 2018 to extend penalties for excess readmissions to SNFs; preliminary data suggest that 73% of SNFs face financial penalties after failing to achieve benchmarks.51 Previous research in long-term care settings has focused almost exclusively on potentially avoidable hospitalizations. The present study extends prior work to include all potentially avoidable hospital transfers, including ED visits and observation stays. We found that declines in all-cause hospital transfer rates were almost exclusively associated with reductions in acute hospitalizations, and the rates of observation stays remained low between 2011 and 2017. Thus, concerns that hospitals may shift admissions to observation stay status to avoid HRRP penalties18 appear to be unfounded in this population. In addition, rates of decline were similar for all-cause and potentially avoidable transfers, suggesting that broader efforts are being made to reduce hospital transfers or that there is a spillover effect from the focus on potentially avoidable conditions. Although we observed reductions in potentially avoidable hospital transfers, several thousand nursing home residents with advanced illness continue to be transferred to hospitals near the end of life. We estimated 708,096 transfers for all-cause transfers across the 3 advanced illness cohorts from 2011 to 2017, of which 259,339 (36.8%) were potentially avoidable. Moreover, despite the initial reduction in potentially avoidable transfers from 39.1% in 2011 to 35.1% in 2013, the rate appears to have rebounded to 37.7% by 2016 (eTable 2 and eFigure in the Supplement).
assessments do not fully capture the circumstances leading to decisions for hospital transfer, including advance directives. Important drivers of decisions to transfer are associated with decisional processes and organizational factors, including communication, family preferences, and nursing home resources.52-56 Furthermore, the principal diagnoses listed on hospital claims are assigned at discharge as the diagnosis that was chiefly responsible for the admission, whereas the diagnosis assigned to an ED visit or observation stay is based on more limited information.57 However, we focused on long-term care residents with advanced illness for whom care decisions should align with values and goals of care and for whom the harms associated with hospital transfers usually outweigh possible benefits.3-5

Conclusions

Hospital transfer rates for all causes and for potentially avoidable causes declined in 2017 compared with 2011 for long-stay nursing home residents with advanced dementia, CHF, or COPD, with no increase in mortality. Reductions in potentially avoidable transfers are encouraging, yet many residents still experienced multiple transfers for infections and CHF or COPD exacerbations. These findings indicate important opportunities to improve care of nursing home residents with advanced illness through improvements in advance care planning, acute care management, and the delivery of high-quality palliative care.

Temporal Trends in the Numbers of Skilled Nursing Facility Specialists From 2007 Through 2014

Residents of nursing homes (NHs) comprise a medically complex and vulnerable population with many persons experiencing multiple comorbid conditions, frailty, and advanced dementia. Health care professionals such as physicians, nurse practitioners (NPs), and physician assistants (PAs) play an important role in managing their care. An Office of Inspector General Report noted that specialization of health care professionals in NH care could potentially improve care through increased presence of health care professionals in NHs, enhanced knowledge in the care of patients with medically complex conditions, and better understanding of the regulatory environment. On the contrary, specialization in settings of care could result in increased fragmentation of care, giving rise to concerns about medical errors and lack of care coordination. Little empirical research is available about the number of clinicians who primarily practice in NHs or the proportion of NH care delivered by these clinicians. Using national Medicare Part B claims from 2007, 2010, and 2014, we characterized temporal trends in the number of physicians, NPs, and PAs concentrating their practice in the NH or skilled nursing facility (SNF) setting (ie, SNFists), the fraction of all NH and SNF claims generated by SNFists, and state variation in this phenomenon in 2014.

Methods | The Medicare Part B Carrier File includes Evaluation and Management codes based on common sites of service: the nursing home, outpatient office, hospital, emergency department, a patient’s home, and assisted living, custodial care facilities. Using Evaluation and Management codes from 20% of all Medicare Part B Carrier file claims from 2007, 2010, and 2014, we identified all physicians, NPs, and PAs who billed more than 90% of all their visits in the NH setting. The 90% threshold is consistent with a prior study of hospitalist care in the United States; in a sensitivity analysis, we relaxed this threshold to 50%. Temporal trend comparisons for 2007, 2010, and 2014 were performed using variance-weighted least squares. We further characterized, in each state, the fraction of all outpatient visits in NHs that were accounted for by SNFists. An institutional review board waiver was obtained from Brown University.

Results | Between 2007 and 2014, the proportion of physicians ever billing in an NH decreased from 13.7% to 9.8% (test of trend, \( P < .001 \)) while the number of physicians classified as SNFists increased by 48.2% (1496 vs 2225), increasing from 0.34% to 0.49% of all physicians (Table). The number of NPs or PAs classified as SNFists nearly doubled (1678 vs 3074). The proportion of NPs and PAs classified as SNFists remained stable because of increasing numbers of these clinicians. The proportion of all Evaluation and Management bills for care in an NH or SNF submitted by clinicians classified as SNFists increased from 11.6% to 14.3% among physicians (test of trend, \( P < .001 \)) and from 10.4% to 17.2% among NPs and PAs (test of trend, \( P < .001 \)). Between 2007 and 2014, the proportion of total SNF billing accounted for by SNFists clinicians increased from 22.0% to 31.5% (test of trend, \( P < .001 \)). The SNFists’ proportion of total NH billing varied by state, amounting to nearly 50% in Delaware, Hawaii, Tennessee, Connecticut, and Massachusetts. In a sensitivity analysis using a threshold of more than 50% of visits in the SNF, the number of physician SNFists increased from 2551 to 3529 and the number of NP or PA SNFists increased from 3267 to 5477.

Abbreviation: SNF, skilled nursing facility.

\(^a\) For the physicians ever billing in an SNF or physicians billing 90% or more in an SNF, the denominator is physicians billing Medicare in that year.

\(^b\) For nurse practitioner or physician assistant billing Medicare in that year.

\(^c\) The denominator for physicians, nurse practitioners, and physician assistants billing at 90% or more is the number of evaluation and management codes billed in a nursing home or SNF in the year 2007, 2010, or 2014.
Discussion | The care of frail and medically complex NH residents is increasingly performed by NPs and PAs who focus nearly exclusively in this site of care. In some states, SNFists accounted for nearly half of the total billing in the NH setting of care. Future research is needed to understand how this specialization of care affects not only care delivery but the overall experience of frail, elderly patients.

RESEARCH LETTER

Trends in Post–Acute Care Use Among Medicare Beneficiaries: 2000 to 2015

Since Medicare's adoption of the inpatient prospective payment system in 1983, hospitals have sought ways to reduce costs, resulting in a decrease in hospital length of stay and an increase in the use of institutional post–acute care,1 making it a major Medicare expenditure.2 Since the Affordable Care Act passed in 2010, Medicare has implemented payment reforms designed to make hospitals and clinicians accountable for the cost and quality of care delivered. Examples include the Hospital Readmissions Reduction Program (implemented in 2012), accountable care organizations (2012), and bundled payments (2013). How these payment reforms affect the use of post–acute care is unknown.3 The expense of post–acute care may diminish its use under cost-containment incentives.4 Alternatively, pressure to reduce costs by reducing unnecessary readmissions may encourage its use. Our objective was to document recent trends in use of institutional post–acute care (including the 2 most common sites: skilled nursing facilities [SNFs] and inpatient rehabilitation facilities [IRFs]) and, simultaneously, hospital and post–acute care length of stay.

Methods | We used the 100% MedPAR file5 to identify Medicare beneficiaries discharged alive from an acute care hospital between January 2000 and December 2015 (n = 199,069,327), excluding discharges younger than 65 years or discharged to hospice (n = 39,036,324 or 19.6%), enrolled in Medicare Advantage (n = 20,250,852 or 10.2%), or discharged to institutional settings other than SNF or IRF (eg, psychiatric hospital; n = 1,808,518 or 0.9%). We identified each discharge's first post–hospitalization destination (home vs institutional post–acute care) and the number of days in the hospital and post–acute care. We used multivariable regression to predict risk–adjusted annual outcomes adjusted for patient age, sex, race, and 31 Elixhauser comorbidities. We tested for the statistical significance of differences over time using t tests (2-tailed with an α of .05). All analyses were performed using Stata (StataCorp), version 15. This study was approved by the institutional review board of the University of Pennsylvania with a waiver of informed consent.

Results | Among 137,973,633 hospital discharges, 20.3% were discharged to SNFs and 3.7% were discharged to IRFs. The adjusted percentage of hospital discharges to post–acute care increased from 21.0% in 2000 to 26.3% in 2015 (increase of 5.36 percentage points [95% CI, 5.32 to 5.40]; P < .001), whereas the adjusted percentage of discharges home decreased from 79.0% in 2000 to 73.6% in 2015 (decrease of 5.36 percentage points [95% CI, −5.40 to −5.32]; P < .001) (Figure 1).

Among patients discharged to post–acute care, hospital length of stay decreased from 9.0 days in 2000 to 7.3 days in 2015 (decrease of 1.70 days [95% CI, −1.71 to −1.69]; P < .001) (Figure 2). Among patients discharged home, hospital stays decreased from 5.7 days in 2000 to 4.8 days in 2015 (decrease of −0.91 days [95% CI, −0.92 to −0.91]; P < .001). At the same time, length of stay in post–acute care increased from 21.7 days in 2000 to 25.7 days in 2014 (increase of 3.98 days [95% CI, 3.93 to 4.02]; P < .001) and then decreased to 25.1 days in 2015 (decrease of 0.54 days [95% CI, 0.50 to 0.59]; P < .001).

Discussion | The use of institutional post–acute care increased between 2000 and 2015 and was accompanied by increasing length of post–acute care stays through 2014. These trends did not appear to change when payment reform was implemented under the Affordable Care Act. SNFs (which accounted for 85% of institutional post–acute care) are paid per diem and thus may have strong incentives to maintain longer lengths of stay. This study was limited by the exclusion of Medicare Advantage enrollees. If policy incentives are to effectively reduce SNF length of stay, they might need to align SNF payment with the goal of reducing SNF use.

It is uncertain whether the use of post–acute care benefits patients. Despite its proliferation, there is little evidence that post–acute care improves key patient outcomes—preventing rehospitalizations or improving functional recovery. Further investigating how post–acute care affects patient outcomes is essential.

COMMENT & RESPONSE

Diagnosis and Treatment of Hidradenitis Suppurativa

To the Editor  
Drs Saunte and Jemec performed an illustrative review focused on the advances in diagnosis and treatment of hidradenitis suppurativa (HS).

However, the advances in imaging of the disease were not discussed.

For example, regarding the pathogenesis, ultrasound studies have allowed visualization of the hidden connections between the tunnels or fistulous tracts and fluid collections and the dilated and ruptured base of the hair follicles, which were illustrated in Figure 3 in the article.

Regarding the staging of hidradenitis, ultrasonography has also demonstrated that clinical evaluation and commonly used clinical scoring systems can misclassify as healthy skin corporal segments with fluid collections or fistulous tracts underneath. The latter findings on imaging can be critical because, as pointed out by the authors, the choice of therapy is guided by disease severity. Currently, color Doppler ultrasound can support the detection of key subclinical lesions, the staging of the disease, and the assessment of activity and has been added to the clinical evaluation of hidradenitis in many centers around the world. Moreover, ultrasound is also being used in ongoing trials.

In patients with indications for local or systemic treatments, imaging can be a noninvasive tool for monitoring the response. In patients with a surgical indication, an image-guided mapping of the extent of the abnormalities can be performed. Ultrasound has the ability to detect, categorize, and measure the lesions in all the corporal regions affected by hidradenitis. This imaging information may allow better selection of the type of medical treatment or the location and extent of the surgical incision.

Successful Discharge to Community Gap of FFS Medicare Beneficiaries With and Without ADRD Narrowed

Barbara H. Bardenheier, PhD,*‡‡ Momotazur Rahman, PhD,*‡ Cyrus Kosar, MS,*‡ Rachel M. Werner, MD, PhD,§¶ and Vincent Mor, PhD*‡

BACKGROUND/OBJECTIVES: We sought to compare the post-acute and long-term care experience of Medicare beneficiaries with and without Alzheimer Disease and Related Dementias (ADRD), and whether differences changed from January 1, 2007 to September 30, 2015.

DESIGN: Retrospective cross-sectional trend study using Medicare claims linked to the Centers for Medicare & Medicaid Services’ (CMS) Minimum Data Set.

SETTING: CMS-certified skilled nursing facilities (skilled nursing facility (SNF), n = 17,043).

PARTICIPANTS: Fee-for-service Medicare beneficiaries aged ≥66 years (n = 6,614,939) discharged from a hospital to a SNF who had not lived in a nursing home during the year before hospitalization.

MEASUREMENTS: ADRD was defined by the Chronic Condition Data Warehouse. Outcome measures included: (1) successful discharge defined as being in SNF less than 90 days, then discharged back to the community, alive without subsequent inpatient health care for 30 continuous days; (2) became long-stay resident in SNF; (3) death in SNF within 90 days; (4) hospital readmission within 30 days of entering SNF; and (5) transferred to another nursing home within 30 days of entering SNF.

RESULTS: Successful discharge of beneficiaries with ADRD increased from 43.4% in 2007 to 53.9% in 2015 (average annual percent change (AAPC) = 2.1 (95% CI = 2.0–2.2)); those without ADRD also increased (from 59.1% to 63.6%, AAPC = 0.9 (95% CI = 0.7–1.1)) but not as fast as those with ADRD (P < .01). The proportion of all beneficiaries who became long-stay or were readmitted to the hospital decreased (P < .05). The proportion with ADRD who became long-stay was nearly three times higher than those without throughout the study (15.0% vs 5.5% in 2007; 11.3% vs 4.3% in 2015).

CONCLUSION: Though disparity in ADRD in becoming long-stay residents remains, the increase in successful discharges among those with ADRD also stresses the increasing importance of community as a care setting for adults with ADRD. J Am Geriatr Soc 00:1-7, 2020.

Keywords: ADRD; successful discharge; disparity

INTRODUCTION

Between 2010 and 2016 20.3% of Medicare beneficiaries received post-acute care (PAC) services in a skilled nursing facility (SNF) after being discharged from the hospital.1 The improving Medicare Post-Acute-Care Transformation Act of 2014 mandated addition of a national quality measure for successful community discharge from PAC services. Although the goal of PAC rehabilitation is to maximize independence and facilitate a safe community transition, some SNF patients may be awaiting family arrangements to provide care at home or for selection of a long-term nursing facility. Some may need to stabilize and to get their numerous medical conditions to a manageable care plan. But generally, returning to and remaining in the community after an illness, injury, or surgery reflects the quality of PAC2 (https://impactcollaboratory.org/). Although some studies have assessed inpatient rehabilitation facilities patients’ success in
community discharge,\textsuperscript{3,4} little is known about SNF patients’ success in returning and staying home post-discharge.

SNF admission is often the gateway to becoming a long-term nursing home resident. And, Alzheimer Disease and Related Dementias (ADRD) patients are more likely to become long-stay residents. The Affordable Care Act (ACA) and other policy initiatives strongly encourage community based long-term care for ADRD patients.\textsuperscript{5} In 2012, under the ACA the Centers for Medicare & Medicaid Services (CMS) could penalize hospitals for readmissions in less than 30 days for certain conditions. Successful transitioning from the hospital to a SNF is even more complicated for persons with ADRD. For example, patients with ADRD whose behavioral problems surpass the SNF’s capacity to accommodate them are at high risk of rehospitalization or transfer to a different SNF.\textsuperscript{6} For this reason, SNF administrators may be less likely to accept patients with ADRD after acute hospitalization. Indeed, one study reported that SNF personnel believe hospital personnel downplay ADRD patients’ behavioral problems to increase their chances of SNF admission.\textsuperscript{6} For these reasons, real and perceived about patients with ADRD, we hypothesized that Medicare beneficiaries with ADRD would experience more negative outcomes than those without ADRD, in terms of their likelihood of successfully returning home, experiencing rehospitalization, dying in the SNF, becoming a permanent nursing home resident, or transferring to another SNF, and we assessed whether the differences changed between 2007 and 2015.

METHODS

Study Population

Our sample was drawn from 100\% of Medicare SNF claims linked to the CMS Minimum Data Set, which are mandatory clinical assessments for all nursing home residents of Medicare-certified nursing homes, from January 1, 2007 through September 30, 2015 (with follow-up for post-discharge outcomes dated through December 31, 2015). The study period was chosen to include only events occurring before the introduction of the ICD-10 coding system. We included fee-for-service Medicare beneficiaries aged ≥66 years who were discharged alive from the hospital and admitted to a SNF within 1 day of hospital discharge. We excluded those with history of being in a nursing home within the 12 months (using the MDS) before hospital admission because they were likely to be sicker and/or more severely demented.\textsuperscript{7}

Main Exposure Measure

We identified Medicare beneficiaries with ADRD using the Chronic Condition Data Warehouse (CCW) flag in the Medicare beneficiary summary file as of the day of hospital discharge. The CCW algorithm identifies beneficiaries as having ADRD if they have one of 24 ICD-9 codes present on one or more inpatient, SNF, HHA, outpatient, or carrier claim over a 3-year look-back period.\textsuperscript{8} This definition has a sensitivity (0.85) and specificity (0.89).\textsuperscript{9} We believe this is sufficient to assess changes in trends because (1) the measure did not change during the study period (ICD-9 codes were used throughout) and (2) we hypothesized post-discharge outcomes of ADRD patients may differ from those without ADRD, in part due to perceptions of ADRD patients. In other words, regardless of truly having ADRD, if beneficiaries’ have an ADRD diagnosis, then healthcare providers perceive that they have ADRD.

Outcome Measures

We assessed trends over our study period in seven outcome measures. First, we defined successful discharge as being discharged alive from a SNF to the community within 90 days of SNF admission without subsequent inpatient healthcare utilization for 30 continuous days. Second, we defined becoming a long-stay resident as remaining in the SNF more than 90 days after SNF admission. Fourth, we assessed death within 90 days after discharge from the SNF (after being in the SNF at least 90 days). We assessed rehospitalization two ways: within 30 days and within 90 of hospital discharge. For both rehospitalization measures, those who died in the same

Note: All years are from January 1 to December 31, except 2015 is from January 1 to September 30. Adjusted for age, sex, race, dual eligible status, % MA penetration in zipcode, % dual eligible in zipcode. AAPC, average annual percentage change; CI, confidence interval; died in SNF, within 30 days of entering SNF; FFS, fee-for-service; long-stay, still in SNF after 90 days of entering; SNF, skilled nursing facility; successful discharge, in SNF 90 days, then they were discharged back to the community, alive without subsequent inpatient healthcare utilization for 30 continuous days.
timeframe were censored. Finally, we assessed transfer to another NH within 30 days of entering the SNF. To clarify “SNF,” our focus is not on SNF coverage for payment, but rather PAC in a SNF which is typically short-stay or ≥90 days. We used the sequence of claims and the MDS to identify outcomes.

Statistical Analyses
First, we assessed the overall change in number of beneficiaries with and without ADRD from 2007 to 2014 (for this we excluded 2015 because it was a partial year). Trends for each outcome were then assessed on annual cohorts of beneficiaries who were discharged from the hospital to a SNF, adjusting for age, sex, race, dual-eligibility, Medicare Advantage penetration (zipcode of residence), and percent dual-eligible (zipcode of residence). We used STATA version 16 software to obtain adjusted predictive margins and standard errors. We evaluated monotonic trends by joinpoint regression using Joinpoint software, which has the same underlying assumptions as simple regression and allows for input of estimates and standard errors. To determine if the trend was statistically significant we used the average annual percent change (AAPC) and its associated P-value. We also compared AAPC differences in trends between those with and without ADRD. All analyses were stratified by beneficiary ADRD status.

Sensitivity Analyses
Because our analyses included all FFS beneficiaries discharged from the hospital to a SNF, we wanted to determine if results would be similar for a more homogenous group or if our findings were driven by certain subgroups. Therefore, we performed the same trend analyses for patients hospitalized for hip fractures and were discharged from the hospital to a SNF. Codes used to define hip fractures were 820.xx.

All analyses were conducted after establishing a data use agreement with CMS and obtaining final approval from Brown University’s Institutional Review Board.

RESULTS
We identified 2,134,798 beneficiaries with prevalent ADRD (243,321 or 11.4% were included in multiple years) and 3,582,546 without (654,274 or 18.3% were included in multiple years) who otherwise met study eligibility criteria. The average age of beneficiaries with ADRD discharged from hospital to SNF was close to 84 years in 2007, 2011, and 2015; the average age of those without ADRD was approximately 80 years at the beginning, middle, and end of the study (Table 1). About two-thirds of those with and without ADRD were female. The average proportion with Medicare Advantage penetration in the residents’ zip code increased from 2007 to 2015 for those with (17.8%–28.7%) and without ADRD (17.6%–28.1%). A few (7.4% n = 486,715) of beneficiaries were referred to a hospice within 90 days of entering the SNF or in the 90 days following SNF discharge; of those, 85.2% died.

The number of beneficiaries with ADRD discharged from the hospital to a SNF increased 36.3% from 211,518 in 2007 to 288,361 in 2014 (2015 was a partial year, AAPC = 3.1 (0.3, 5.9)). There was no significant change in the number of beneficiaries without ADRD discharged from the hospital to a SNF from 2007 to 2014 (AAPC = 1.1 (−1.6, 3.9)). The proportion of traditional Medicare beneficiaries with ADRD who had a successful discharge from the SNF to the community increased from 43.5% in 2007 to 50.9% in 2015 (AAPC = 2.0 (1.8, 2.2)) (Table 2 and Figure 1). Successful discharge for those without ADRD also increased (from 59.0% to 62.9%, AAPC = 1.0 (0.8, 1.2)), but not as fast as for those with ADRD (AAPC difference (ADR D−No ADR D) = 1.0 (0.8, 1.2), P < .01). The proportion of beneficiaries with ADRD who became long-stay nursing home residents decreased (from 15.0% in 2007 to 11.3% in 2015, AAPC = −3.6 (−4.4, −2.8)); those without ADRD decreased also (from 5.5% to 4.3%, AAPC = −3.4 (−4.3, −2.6)) similar to those with ADRD (P = .70). However, the proportion of those with ADRD who became long-stay was nearly three times higher than those without. The proportion of beneficiaries with ADRD who died within 90 days of entering the SNF decreased from 2007 (16.9%) to 2015 (15.8%, AAPC = −0.7 (−1.2, −0.2)); those without ADRD decreased as well from 13.9% in 2007 to 12.8% in 2015 (AAPC = −1.4 (−1.8, −0.9)), faster than those with ADRD (AAPC difference (ADR D−No ADR D) = 0.9 (1.7, 0.1), P < .01). The proportion of beneficiaries with ADRD who died within 90 days of discharge from the SNF did not change from 2007 (8.9%) to 2015 (8.2%, P = .7); those without ADRD decreased from 6.3% in 2007 to 5.7% in 2015 (AAPC = −1.1 (−1.5, −0.6)), faster than those with ADRD (AAPC difference (ADR D−No ADR D) = 0.9 (1.7, 0.1), P < .01).

Note: All years are from January 1 to December 31, except 2015 is from January 1 to September 30. Adjusted for age, sex, race, dual eligible status, % MA penetration in zipcode, % dual eligible in zipcode. AAPC, average annual percentage change; CI, confidence interval; died in SNF, within 30 days of entering SNF; FFS, fee-for-service; long-stay, still in SNF after 90 days of entering; SNF, skilled nursing facility; successful discharge, in SNF 90 days, then they were discharged back to the community, alive without subsequent inpatient healthcare utilization for 30 continuous days.
Higher rates of successful discharge from SNF to the community and fewer rehospitalizations, long-stays, and transfers to other nursing facilities among beneficiaries with ADRD over a decade are quite encouraging. Previous studies have reported persons with ADRD experience frequent transitions across the range of care, especially into and out of hospital and SNF settings.12,13 And, nearly half of long-stay nursing home residents suffer from ADRD.14,15 Our data suggest that the proportion of patients with ADRD who become long-stay residents after entering the SNF after being hospitalized is decreasing.

It is not surprising that rates of rehospitalization after hospital discharge to SNF decreased for all beneficiaries. In October 2012 a policy was mandated by the ACA to penalize hospitals with high readmission rates for certain conditions.16 Readmission rates for some SNFs may have been high before 2012 because of the change in use of SNF care. Most SNFs (>90%) are dually certified as a SNF and as a nursing home.17 Thus, a facility that offers skilled care often also provides long-term care services that Medicare does not cover. Ideally, SNF care is provided to restore function to patients discharged from acute hospital care before transitioning back to the community. In the decade before 2012, use of SNF care after acute hospitalization had greatly increased in part because of the shift of nursing homes from serving life long residents to facilities treating increasingly medically complex patients seeking PAC for recuperation after hospitalization. This may in part have been driven by a financial incentive to take advantage of the short-term Medicare benefit. Medicare covers up to 100 days after 3 days of hospitalization whereas Medicaid pays for most of long-term care, the Medicare payment for SNF services being higher than that for Medicaid. In other words, some patients may have been sent to the SNF as long as the financial benefit was available and then sent back to the hospital. Yet since the 2012 policy, that practice likely diminished.

Our result of decline in long-stay residents, with and without ADRD, helps to explain why occupancy in nursing homes continues to decline even though the number of beds has been steadily declining.18,20 In nursing homes in states with no or nursing home-specific certificate-of-need programs (designed to curb healthcare spending), the number of beds has decreased since 1992.21 The decline in long-stay residents may also be a reflection of the number of nursing home closures. Facilities with large proportions of long-stay residents tended to have high Medicaid occupancy,22 and those facilities were most at risk of closure.23

Our study was subject to several limitations. First, discharge data for the Medicare Advantage population are not reliable and therefore were not included. Given the rapid growth of Medicare Advantage, which has a strong disincentive for hospital use, the results observed may not reflect the overall population aged 66 years and older. Second, the proportion of ADRD we reported likely includes some false-positive and false-negative ADRD cases; however, the CCW algorithm is the only approach that can identify a broad sample of beneficiaries with ADRD across community and nursing home settings in hospitalization data. Still, regardless of how ADRD is diagnosed, the trends reveal an increase in successful discharges but a steady gap in becoming long-stay residents with a nearly threefold risk among

proportion of beneficiaries discharged and rehospitalized within 30 days and 90 days decreased among both those with (AAPP = −2.8 (−3.6, −2.0) and AAPC = −1.7 (−2.3, −1.2)) and without ADRD (AAPC = −2.9 (−3.6, −2.1) and AAPC = −2.1 (−2.7, −1.5)) during the study period, though not significantly different from each other (P = .90 and P = .20, respectively). The proportion of beneficiaries discharged to SNF and transferred to another nursing facility decreased among both those with ADRD from 5.0% to 4.3% (AAPC = −2.0 (−3.3, −0.7)) and without ADRD from 3.5% to 2.8% (AAPC = −3.1 (−4.4, −1.8)), though not significantly different from each other (P = .20).

Results of Sensitivity Analyses
Overall, 9.5% of patients discharged had claims for being hospitalized with hip fracture. The number of beneficiaries discharged from the hospital to a SNF increased 35.8% from 23,485 in 2007 to 31,882 in 2014 (2015 was a partial year and therefore excluded, AAPC = 3.1 (0.7, 5.6)). There was no significant change in beneficiaries without ADRD discharged from the hospital to a SNF (AAPC = 0.6 (−1.8, 3.1)). Those hospitalized for hip fracture, with and without ADRD, experienced more successful SNF-to-community discharges after acute hospitalization, fewer deaths, rehospitalizations, long-stays, and transfers to other nursing facilities within 30 days of entering the SNF from 2007 to 2015 (P < .05) (Table 3). The gap between those with and without ADRD in successful SNF-to-community discharges after acute hospitalization narrowed, as rates of successful discharges increased faster among those with ADRD (AAPC difference (ADRDP−No ADRD) = 0.9 (0.6, 1.2)).

DISCUSSION
In general, traditional Medicare beneficiaries with ADRD have worse outcomes than those without ADRD, but the gap is narrowing with respect to returning home from the SNF, surviving and not being rehospitalized. From 2007 to 2015, Medicare beneficiaries experienced more successful SNF-to-community discharges after acute hospitalization, due to fewer rehospitalizations, long-stays, and transfers to other nursing facilities within 30 days of entering the SNF. The gap between those with and without ADRD in successful SNF-to-community discharges after acute hospitalization narrowed, as the rates of successful discharges increased faster among those with ADRD. Deaths within 90 days of discharge to SNF did not change among beneficiaries with ADRD, yet the mortality rate decreased among the non-ADRD group. Notably, the gap between those with and without ADRD in becoming long-stay remained; those with ADRD were nearly three times as likely to become long-stay residents.

Studies have reported an increase in the number of adults living with ADRD.11 This is reflected in our study showing an increase in ADRD patients discharged from the hospital to the SNF overall and also in our sensitivity analysis among hospitalizations for hip fractures. Our results may indicate that the greater number of patients with ADRD discharged home may reflect healthier people being diagnosed with ADRD at earlier stages.
those with ADRD. Third, we did not assess the geographic availability of PAC services; hence some patients may have been discharged to the community because of access rather than recovery. Fourth, we could not account for health beliefs, financial resources, availability of an appropriate caregiver (paid or unpaid), or cultural differences which may have influenced discharge to and remaining in the community. Finally, a potential limitation is that certain cohorts of beneficiaries discharged from the hospital to SNFs could have driven the results. However, sensitivity analyses confirmed overall results with a homogenous group. Among patients who had been hospitalized for hip fractures, trends for those with and without ADRD were in the same direction and the same estimates were statistically significant as were found for the overall group of beneficiaries with two exceptions.

We examined the trends in outcomes among Medicare beneficiaries discharged to SNF with and without a diagnosis of ADRD and found that many outcomes improved for all persons but that successful discharge rates, going home and remaining there, improved more rapidly for persons living with dementia than for persons without dementia. It may be that practices with regard to hospitalization may have influenced the trends in addition to practices in the SNF. Thus, more research is needed to understand what is driving the reduction in transfers, deaths, and long-stays among patients with ADRD discharged from hospital to SNF. In addition, the increase in successful SNF to community discharges stresses the increasing importance of community as the care setting for adults with ADRD.

ACKNOWLEDGMENTS

Conflict of Interest: BHB, MR, CK, and RMW have no conflicts of interest to report. VM receives compensation for his role as Chair of the Scientific Advisory Committee of naviHealth, a post-acute care convening company serving managed care companies and integrated hospital systems.

Author Contributions: VM and MR conceived and designed the study. BHB drafted the manuscript and did the statistical analyses. MR and CK obtained and compiled the data. All authors revised the report for intellectual content and contributed to the literature search. VM and RMW provided administrative, technical and material support.

Sponsor’s Role: This research was supported, in part, by NIH P01AG027296.

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

   The specialty society expert panel, comprised of advisors from the participating specialties, met and discussed recommendations for practice expense both via phone and over email. The expert panel reviewed the existing PE inputs for the code family and made revisions as necessary to reflect current practice.

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code, but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here (for service reviewed prior to the implementation of clinical activity codes, detail is not provided in the RUC database, please contact Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org for PE spreadsheets for your reference codes):

   Existing PE inputs from 2005 (99304-99310) were used as reference.

3. Is this code(s) typically reported with an E/M service?

   No

4. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time:

   N/A

5. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies for the code family, please provide compelling evidence (please see PE compelling evidence guidelines) Please explain if the increase can be entirely accounted for because of an increase in physician time:

   N/A

6. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (please see second worksheet in PE spreadsheet workbook), please explain the difference here:

   **Pre-Service**
   
   All codes include time for an activity described in 2005 PE spreadsheets as “phone calls between visits with patient, family, pharmacy.” This has been rolled into CA005 Complete pre-procedure phone calls and prescription.
   
   Several codes, specifically 99308, 99309 and 99310, include time for an activity described in the 2005 PE spreadsheets a “review/read x-ray, lab and pathology reports.” This has been rolled into CA006 Confirm availability of prior images/studies.
All codes include time for an activity described in 2004 and 2005 PE spreadsheets as “phone calls between visits with patient, family, pharmacy.” This has been rolled into CA037 Conduct patient communications.

Codes 99304-99310 included time for an activity described in the 2005 PE spreadsheet as “review/read x-ray, lab, and pathology reports” as well as “respond to consultant pharmacist or nutritionist reviews and recommendations” and “monitoring patient/notifying physician of change in condition” which have all be rolled into CA038 Coordinate post-procedure services.

### Post-Service

ITEMIZED LIST OF CHANGES (FOLLOWING THE PE SUBCOMMITTEE MEETING)

During and immediately following the review of this tab at the PE Subcommittee meeting please revise the summary of recommendation (PE SOR) based on modifications made during the meeting. Please submit the revised form electronically to Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org immediately following the close of business the same day that the tab is reviewed. On the PE spreadsheet, please highlight the cells and/or use red font to show the changes made during the PE Subcommittee meeting (if you have provided any of this highlighting based on changes from the reference code prior to the PE Subcommittee meeting please remove it, so not to be confused with changes made during the meeting). In addition to those revisions please also provide an itemized list of the modifications made to the PE spreadsheet during the PE Subcommittee meeting in the space below (e.g. clinical activity CA010 obtain vital signs was reduced from 5 minutes to 3 minutes).
NOTE: The virtual meetings have provided for real-time updates to the PE spreadsheets. PE SORs must still be updated and resubmitted asap.

</table>
If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time:

N/A

If you are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies for the code family, please provide compelling evidence (please see PE compelling evidence guidelines) Please explain if the increase can be entirely accounted for because of an increase in physician time:

N/A

If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (please see second worksheet in PE spreadsheet workbook), please explain the difference here:

Pre-Service

All codes include time for an activity described in 2004 and 2005 PE spreadsheets as “phone calls between visits with patient, family, pharmacy.” This has been rolled into CA005 Complete pre-procedure phone calls and prescription.

Several codes, specifically 99308, 99309 and 99310, include time for an activity described in the 2005 PE spreadsheets a “review/read x-ray, lab and pathology reports.” This has been rolled into CA006 Confirm availability of prior images/studies.
Post-Service
All codes include time for an activity described in 2004 and 2005 PE spreadsheets as “phone calls between visits with patient, family, pharmacy.” This has been rolled into CA037 Conduct patient communications.
Codes 99304-99310 included time for an activity described in the 2005 PE spreadsheet as “review/read x-ray, lab, and pathology reports” as well as “respond to consultant pharmacist or nutritionist reviews and recommendations” and “monitoring patient/notifying physician of change in condition” which have all be rolled into CA038 Coordinate post-procedure services.

8. How much time was allocated to clinical activity, obtain vital signs (CA010) prior to CMS increasing the clinical activity to 5 minutes for calendar year 2018? The standard for clinical activity, obtains vital signs remains 0, 3 and 5 based on the number of vital signs taken. Please provide a rationale for the clinical staff time that you are requesting for obtain vital signs here:

N/A

9. Please provide a brief description of the clinical staff work for the following:
   a. Pre-Service period:

<table>

10. Please provide granular detail regarding what the clinical staff is doing during the intra-service (of service period) clinical activity, assist physician or other qualified healthcare professional—directly related to physician work time or Perform procedure/service—NOT directly related to physician work time:

   N/A

11. If you have used a percentage of the physician intra-service work time other than 100 or 67 percent for the intra-service (of service period) clinical activity, please indicate the percentage and explain why the alternate percentage is needed and how it was derived.

   N/A

12. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (please see second worksheet in PE spreadsheet workbook):

   N/A

13. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at [http://www.bls.gov](http://www.bls.gov).

   N/A
INVOICES

14. ☐ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

15. ☐ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

16. If you wish to include a supply that is not on the list (please see fourth worksheet in PE spreadsheet workbook) please provide a paid invoice. Identify and explain the invoice here:

   N/A

17. Are you recommending a PE supply pack for this recommendation? Yes or No.
   If Yes, please indicate if the pack is an established package of supplies as defined by CMS (eg, SA047 pack, E/M visit) or a pack that is commercially available?

   N/A

18. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation. Please include the description, CMS supply code, unit, item quantity and unit price (if available). See documents two and three under PE reference materials on the RUC Collaboration Website for information on the contents of kits, packs and trays.

   N/A

19. If you wish to include an equipment item that is not on the list (please see fifth worksheet in PE spreadsheet workbook) please provide a paid invoice and the useful life. Identify and explain the invoice here:

   N/A

20. Have you recommended equipment minutes for a computer or equivalent laptop/integrated computer, equipment item computer, desktop, w-monitor, ED021 or notebook (Dell Latitude D600), ED038?
   a. If yes, please explain how the computer is used for this service(s).
   b. Is the computer used exclusively as an integral component of the service or is it also used for other purposes not specific to the code?
   c. Does the computer include code specific software that is typically used to provide the service(s)?

   N/A

21. List all the equipment included in your recommendation and the equipment formula chosen (please see document titled Calculating equipment time). If you have selected “other formula” for any of the equipment please explain here:

   N/A

22. If there is any other item(s) on your spreadsheet not covered in the categories above that require greater detail/explanation, please include here:

   N/A

ITEMIZED LIST OF CHANGES (FOLLOWING THE PE SUBCOMMITTEE MEETING)

During and immediately following the review of this tab at the PE Subcommittee meeting, please revise the summary of recommendation (PE SOR) based on modifications made during the meeting. Please submit the revised form electronically to Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org immediately following the close of business the same day that the tab is reviewed. On the PE spreadsheet, please highlight the cells and/or use red font to show the changes made during the PE Subcommittee meeting (if you have provided any of this highlighting based on changes from the reference code prior to the PE Subcommittee meeting please remove it, so not to be confused with changes made during the meeting). In addition to those revisions please also provide an itemized list of the modifications made to the PE spreadsheet during the PE Subcommittee meeting in the space below (e.g. clinical activity CA010 obtain vital signs was reduced from 5 minutes to 3 minutes).

NOTE: The virtual meetings have provided for real-time updates to the PE spreadsheets. PE SORs must still be updated and resubmitted asap.

AMA/Specialty Society RVS Update Committee Summary of Recommendations
April 2021

Home and Residence Services – Tab 14

Following the implementation of the revisions to the Evaluation and Management (E/M) office visits (99201-99215) for the CPT 2021 code set, the CPT/RUC Workgroup on E/M met twelve times in 2020 and early 2021 to standardize the rest of the E/M sections in the CPT code set. The CPT/RUC Workgroup on E/M was committed to changing the current coding and documentation requirements for E/M visits to simplify the work of the health care provider and improve the health of the patient. To achieve these goals, the Workgroup set forth the following guiding principles related to the group’s ongoing work product:

1. To decrease administrative burden of documentation and coding and align CPT and CMS whenever possible
2. To decrease the need for audits
3. To decrease unnecessary documentation in the medical record that is not needed for patient care
4. To ensure that payment for E/M is resource-based and that there is no direct goal for payment redistribution between specialties.

In February 2021, the CPT Editorial Panel deleted twelve of the domiciliary, rest home (e.g., boarding home) and custodial care services to merge these services with the home visit services. The eight revised codes describe home and residence services to align with the principles included in the office or other outpatient E/M office visits by documenting and selecting level of service based on total time or medical decision making.

In April 2021, the specialty societies surveyed the eight home and residence codes but did not obtain the required number of survey responses for the established patients (99347, 99348, 99349 and 99350). More importantly, responses from the predominant provider, such as nurse practitioners, for some of the services was not achieved (99344, 99345, 99349 and 99350). The specialty societies intend to work with the Research Subcommittee to develop a targeted survey, using the Medicare Claims database to identify qualified healthcare professionals, focusing on nurse practitioners, who predominantly perform home visit services and match them with societies to survey those individuals. The specialty societies also would like to ask the Research Subcommittee if it would be possible to limit the additional surveys to focus on obtaining valid responses and from the predominant providers (99344-99450).

The RUC recommends that the home and residence services be postponed until October 2021, and the specialty societies work with the Research Subcommittee to obtain valid and representative responses.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.
**Evaluation and Management**

**Domiciliary, Rest Home (eg, Boarding Home), or Custodial Care Services**

The following codes are used to report evaluation and management services in a facility which provides room, board and other personal assistance services, generally on a long-term basis. These codes include evaluation and management services provided in an assisted living facility, group home, custodial care, and intermediate care facilities.

The facility’s services do not include a medical component.

For definitions of key components and commonly used terms, please see Evaluation and Management Services Guidelines.

(For care plan oversight services provided to a patient in a domiciliary facility under the care of a home health agency, see 99374, 99375, and for hospice agency, see 99377, 99378. For care plan oversight provided to a patient not under hospice or home health agency care, see 99339, 99340)

**New Patient**

(99324, 99325, 99326, 99327, 99328 have been deleted. For domiciliary, rest home [eg, boarding home], or custodial care services, new patient, see home and residence services codes 99341, 99342, 99344, 99345)

| 99324    | Domiciliary or rest home visit for the evaluation and management of a new patient, which requires these 3 key components:  
- A problem focused history;  
- A problem focused examination; and  
- Straightforward medical decision making.  
Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient’s and/or family’s needs.  
Usually, the presenting problem(s) are of low severity. Typically, 20 minutes are spent with the patient and/or family or caregiver. | XXX | N/A |
| 99325    | Domiciliary or rest home visit for the evaluation and management of a new patient, which requires these 3 key components:  
- An expanded problem focused history;  
- An expanded problem focused examination; and  
- Medical decision making of low complexity.  
Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient’s and/or family’s needs.  
Usually, the presenting problem(s) are of moderate severity. Typically, 30 minutes are spent with the patient and/or family or caregiver. | XXX | N/A |

**Home and Residence Services**

The following codes are used to report evaluation and management services provided in a home or residence. Home may be defined as a private residence, temporary lodging, or short term accommodation (eg, hotel, campground, hostel, or cruise ship).

For definitions of key components and commonly used terms, please see *Evaluation and Management Services Guidelines*. 

(For care plan oversight services provided to a patient in the home under the care of a home health agency, see 99374, 99375, and for hospice agency, see 99377, 99378. For care plan oversight provided to a patient under hospice or home health agency care, see 99339, 99340)

These codes are also used when the residence is an assisted living facility, group home (that is not licensed as an intermediate care facility for individuals with intellectual disabilities), custodial care facility, or residential substance abuse treatment facility.

For services in an intermediate care facility for individuals with intellectual disabilities and services provided in a psychiatric residential treatment center, see *Nursing Facility Services*.

When selecting code level using time, do not count any travel time.

To report services when a patient is admitted to hospital inpatient, observation status, or to a nursing facility in the course of an encounter in another setting, see *Initial Hospital Inpatient and Observation Care* or *Initial Nursing Facility Care*.

RE: Home and Residence Services (Tab 14) CPT 2023

Dear Dr. Silva,

The undersigned medical societies submitted an LOI of 1 for the revised home visit codes. We have kept the survey open as long as we could in order to get as many responses as possible. However, we did not reach our required minimum for all the codes in time to send summary data to the RUC by the deadline. As you can see, in spite of our best efforts, which included daily, RUC approved, reminders to surveyees, (as well as adding more potential surveyees) we have been unable to obtain the required number of responses for the subsequent home visit codes.

More important, the breakout of completed responses not date, for some of these codes are missing the predominant users, the nurse practitioners (NP).

</tr>
</tbody>
</table>

The undersigned societies believe it is imperative that all eight codes be presented to the RUC at the same time. Therefore, we are writing to request more time so we can reach the required number of responses and to focus on the predominant users the nurse practitioners. We are not sure how long that will take but we do have a proposal that should maximize our chance for success. Specifically, we would like to use the Medicare Claims database to identify QHPs focusing on nurse practitioners who predominantly perform home visit services and match them with societies and ask the Research Committee if we can send the survey to those individuals. We need time to review this targeted list against our member lists. We also would like to ask the Research Committee if it would be possible to limit the additional surveys to the four subsequent visit codes or to two of the new services codes and either two or four of the subsequent codes again focusing on the predominant users, Nurse Practitioners, Family Medicine and Internal Medicine. We look forward to successfully completing these surveys and presenting to the RUC in October.

Sincerely,

American Geriatrics Society

American Nurses Association

American Podiatric Medical Association

American Academy of Home Care Medicine

Attachment: Survey data as of March 24, 2021

Page 2 of 2
In May 2014, the CPT Editorial Panel established two new add-on codes to describe prolonged office observation in conjunction with an evaluation and management (E/M) service, specifically to address additional clinical staff resources in the office or outpatient setting. CPT code 99415 was created to describe the first hour of prolonged clinical staff services provided in addition to an office E/M visit, while CPT code 99416 was created to describe each additional 30 minutes beyond that first hour of prolonged clinical staff service time that was provided in addition to the office E/M. CPT codes 99415 and 99416 are now under consideration by the RUC and Practice Expense (PE) Subcommittee due to the recent changes by the Panel to the prolonged services family code set.

As part of its deliberations, the PE Subcommittee first reviewed and concurred that there is compelling evidence to support an increase in the clinical staff time based on flawed methodology. When the RUC initially valued these add-on codes in September 2014, they assumed a one clinical staff to four patient ratio for these services. Meaning that the clinical staff time was divided among four patients due to anticipated multi-tasking. For 99415, 60 minutes was divided by four patients, hence 15 minutes each. Similarly, the clinical staff time that was included in the original recommendation for 99416 was reached by dividing four patients by 30 minutes for roughly 8 minutes of time. However, since the RUC’s original valuation in 2014, changes to CPT language have specifically clarified that the time reported for these codes are for a single patient. This is contradictory to the 1:4 multi-tasking ratio used by the RUC to value these codes and as such, the specialties presented compelling evidence based on flawed methodology which passed unanimously.

The PE Subcommittee thoroughly reviewed the practice expense recommendations for these two codes and approved the inputs with no modifications. The PE Subcommittee noted that the 30 minutes of clinical staff time for 99415 and the 15 minutes for 99416 were appropriately shifted from CA020 Assist physician or other qualified healthcare professional---directly related to physician work time (other%) to CA021 Perform procedure/service---NOT directly related to physician work time. There are no additional clinical activities recommended and no medical supply inputs. There are only two equipment items, EQ189 otoscope-ophthalmoscope (wall unit) and EF023 table, exam, which were deemed appropriate as they are standard inputs for use in the physician office setting.

The PE Subcommittee agreed that the practice expense inputs for CPT codes 99415 and 99416 were appropriate and that the recommended clinical staff times are correctly valued. The RUC recommends the direct practice expense inputs as submitted by the specialty society for CPT codes 99415 and 99416.

RUC Referral to CPT
The PE Subcommittee asked for additional clarification about how these time-based codes will be tracked and whether these services are required to be provided face-to-face. There was discussion at both the PE Subcommittee meeting and the RUC regarding discrepancies between the long
descriptors for these codes and the introductory CPT language. The descriptors for 99415 and 99416 state “direct patient contact with physician supervision;” while the preparatory paragraph for these codes describes “face-to-face time.” Given these inconsistencies, there was confusion as to whether the two codes could be used for non-face-to-face (asynchronous) patient encounters. The CPT representative stated that the CPT Editorial Panel is working to reconcile the language.

**Prolonged Clinical Staff Services With Physician or Other Qualified Health Care Professional Supervision**

Codes 99415, 99416 are used when an prolonged evaluation and management (E/M) service is provided in the office or outpatient setting that involves prolonged clinical staff face-to-face time beyond the highest total time of the E/M service, as stated in the ranges of time in the code descriptions. The physician or qualified health care professional is present to provide direct supervision of the clinical staff. This service is reported in addition to the designated E/M services and any other services provided at the same session as E/M services.

Codes 99415, 99416 are used to report the total duration of face-to-face time spent by clinical staff on a given date providing prolonged service in the office or other outpatient setting, even if the time spent by the clinical staff on that date is not continuous. Time spent performing separately reported services other than the E/M service is not counted toward the prolonged services time.

Code 99415 is used to report the first hour of prolonged clinical staff service on a given date. Code 99415 should be used only once per date, even if the time spent by the clinical staff is not continuous on that date. Prolonged service of less than 30 minutes total duration on a given date is not separately reported because the clinical staff time involved is included in the E/M codes. The highest total time in the time ranges of the code descriptions is used in defining when prolonged services time begins. For example, prolonged clinical staff services for 99214 begin after 39 minutes, and 99415 is not reported until at least 69 minutes total face-to-face clinical staff time has been performed. When face-to-face time is noncontiguous, use only the face-to-face time provided to the patient by the clinical staff.

Codes 99415, 99416 may be reported for no more than two simultaneous patients and the time reported is the time devoted only to a single patient. The use of the time-based add-on codes requires that the primary E/M service has a time published in the CPT code set.

For prolonged services by the physician or other qualified health care professional, see 99354, 99355, 99417. Do not report 99415, 99416 in conjunction with 99354, 99355, 99417.

*Facilities may not report 99415, 99416.*

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:
   RUC advisors from the surveying societies acted as an expert panel and met by video conferencing and email to develop the inputs.

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code, but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here (for service reviewed prior to the implementation of clinical activity codes, detail is not provided in the RUC database, please contact Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org for PE spreadsheets for your reference codes):
   We used the current codes as reference codes for 99415 and 99416.

3. Is this code(s) typically reported with an E/M service?
   Is this code(s) typically reported with the E/M service in the nonfacility?
   (Please see provided data titled Medicare Same Day NF EM Billed Together - NF Dom Spec in the RUC Review Resource Materials)
   Yes. 99415 is typically reported with E/M codes 99213, 99214, 99215, and 99416 in the non-facility setting. 99416 is typically reported with 99415.

4. What specialty is the dominant provider in the nonfacility?
   What percent of the time does the dominant provider provide the service(s) in the nonfacility?
   Is the dominant provider in the nonfacility different than for the global?
NON-FACILITY DIRECT PE INPUTS

CPT CODE(S): 99415, 99416

SPECIALTY SOCIETY(IES): AAHPM, AAP, ACP, AGS, ANA, ASCO, ATS, CHEST, SVS

PRESENTER(S): Audrey Chun, MD, Michael Perskin, MD, Robert DeMarco, MD, Phillip Rogers, MD, Steven Krug, MD, Tanvir Hussain, MD, Korinne Van Keuren, DNP, David Regan, MD, Matthew Sideman, MD

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

(Please see provided data titled Medicare Same Day NF EM Billed Together - NF Dom Spec in the RUC Review Resource Materials)

99415:

Hematology/Oncology is the dominant provider in the non-facility setting at 21.4% of all claims. The dominant provider is not different for the global period.

99416:

Psychiatry is the dominant provider in the non-facility setting at 36.8% of all claims. The dominant provider is not different for the global period.

5. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time:

N/A

6. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies for the code family, please provide compelling evidence (please see PE compelling evidence guidelines) Please explain if the increase can be entirely accounted for because of an increase in physician time:

Flawed Methodology

The guidelines preceding these codes in Current Procedural Terminology (CPT) state, in part:

Code 99415 is used to report the first hour of prolonged clinical staff service on a given date. Code 99415 should be used only once per date, even if the time spent by the clinical staff is not continuous on that date. Prolonged service of less than 30 minutes total duration on a given date is not separately reported because the clinical staff time involved is included in the E/M codes.

Thus, per CPT, the clinical staff time required to report 99415 must be a minimum of 30 minutes. However, the current clinical staff time assigned to 99415 is only 15 minutes, which implies there was a flaw in the methodology used to assign that clinical staff time.

Similarly, for 99416, the CPT guidelines state:

Code 99416 is used to report each additional 30 minutes of prolonged clinical staff service beyond the first hour. Code 99416 may also be used to report the final 15-30 minutes of prolonged service on a given date. Prolonged service of less than 15 minutes beyond the first hour or less than 15 minutes beyond the final 30 minutes is not reported separately.

Thus, per CPT, the clinical staff time required to report 99416 must be a minimum of 15 minutes. However, the current clinical staff time assigned to 99416 is only 8 minutes, which implies there was a flaw in the methodology used to assign that clinical staff time as well.
AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

7. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (please see second worksheet in PE spreadsheet workbook), please explain the difference here:

N/A

8. How much time was allocated to clinical activity, obtain vital signs (CA010) prior to CMS increasing the clinical activity to 5 minutes for calendar year 2018? The standard for clinical activity, obtains vital signs remains 0, 3 and 5 based on the number of vital signs taken. Please provide a rationale for the clinical staff time that you are requesting for obtain vital signs here:

N/A

9. Please provide a brief description of the clinical staff work for the following:
   a. Pre-Service period:

N/A
   
   b. Service period (includes pre, intra and post):

   The clinical staff is spending this time following up on the patient’s care plan, providing care to the patient, and helping the patient understand their care plan.

   N/A

   c. Post-service period:

10. Please provide granular detail regarding what the clinical staff is doing during the intra-service (of service period) clinical activity, assist physician or other qualified healthcare professional---directly related to physician work time or Perform procedure/service---NOT directly related to physician work time:

    When the provider enters the room, the clinical staff presents the history to the provider in front of the patient, allowing the provider to clarify details. At this point, the clinical staff switches to a scribe role, documenting the provider’s physical exam, assessment, and plan. After the provider moves on to the next patient encounter, the clinical staff reviews the care plan and provides appropriate education with the patient.

11. If you have used a percentage of the physician intra-service work time other then 100 or 67 percent for the intra-service (of service period) clinical activity, please indicate the percentage and explain why the alternate percentage is needed and how it was derived.

   N/A

12. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (please see second worksheet in PE spreadsheet workbook):

   N/A

13. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov.
AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)

PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

14. □ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

15. □ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

16. If you wish to include a supply that is not on the list (please see fourth worksheet in PE spreadsheet workbook) please provide a paid invoice. Identify and explain the invoice here:

N/A

17. Are you recommending a PE supply pack for this recommendation? Yes or No.
   If Yes, please indicate if the pack is an established package of supplies as defined by CMS (eg, SA047 pack, E/M visit) or a pack that is commercially available?

N/A

18. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation. Please include the description, CMS supply code, unit, item quantity and unit price (if available). See documents two and three under PE reference materials on the RUC Collaboration Website for information on the contents of kits, packs and trays.

N/A

19. If you wish to include an equipment item that is not on the list (please see fifth worksheet in PE spreadsheet workbook) please provide a paid invoice and the useful life. Identify and explain the invoice here:

N/A

20. Have you recommended equipment minutes for a computer or equivalent laptop/integrated computer, equipment item computer, desktop, w-monitor, ED021 or notebook (Dell Latitute D600), ED038?
   a. If yes, please explain how the computer is used for this service(s).
   b. Is the computer used exclusively as an integral component of the service or is it also used for other purposes not specific to the code?
   c. Does the computer include code specific software that is typically used to provide the service(s)?

N/A

21. List all the equipment included in your recommendation and the equipment formula chosen (please see document titled Calculating equipment time). If you have selected “other formula” for any of the equipment please explain here:

ITEMIZED LIST OF CHANGES (FOLLOWING THE PE SUBCOMMITTEE MEETING)

During and immediately following the review of this tab at the PE Subcommittee meeting, please revise the summary of recommendation (PE SOR) based on modifications made during the meeting. Please submit the revised form electronically to Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org immediately following the close of business the same day that the tab is reviewed. On the PE spreadsheet, please highlight the cells and/or use red font to show the changes made during the PE Subcommittee meeting (if you have provided any of this highlighting based on changes from the reference code prior to the PE Subcommittee meeting please remove it, so not to be confused with changes made during the meeting). In addition to those revisions please also provide an itemized list of the modifications made to the PE spreadsheet during the PE Subcommittee meeting in the space below (e.g. clinical activity CA010 obtain vital signs was reduced from 5 minutes to 3 minutes).

NOTE: The virtual meetings have provided for real-time updates to the PE spreadsheets. PE SORs must still be updated and resubmitted asap.

CPT 2023 E/M Guidelines

Category I
Evaluation and Management (E/M) Services Guidelines

In addition to the information presented in the Introduction, several other items unique to this section are defined or identified here.

E/M Guidelines Overview

The E/M guidelines have sections that are common to all E/M categories and sections that are category specific. Most of the categories and many of the subcategories of service have special guidelines or instructions unique to that category or subcategory. Where these are indicated, eg, “Hospital Inpatient and Observation Care,” special instructions are presented before the listing of the specific E/M services codes. It is important to review the instructions for each category or subcategory. These guidelines are to be used by the reporting physician or other qualified health care professional to select the appropriate level of service. These guidelines do not establish documentation requirements or standards of care. The main purpose of documentation is to support care of the patient by current and future health care team(s). These guidelines are for services that require a face-to-face encounter. (For 99211 and 99281 the face-to-face services may be performed by clinical staff).

In the Evaluation and Management section (99202-99499) there are many code categories. Each category may have specific guidelines, or the codes may include specific details. These E/M guidelines are written for the following categories:

- Office or Other Outpatient Services
- Hospital Inpatient and Observation Care Services
- Consultations
- Emergency Department Services
- Nursing Facility Services
- Home and Residence Services
- Prolonged Service With or Without Direct Contact on the Date of an Evaluation and Management Service

Classification of Evaluation and Management (E/M) Services

The E/M section is divided into broad categories such as office visits, hospital inpatient or observation care visits, and consultations. Most of the categories are further divided into two or more subcategories of E/M services. For example, there are two subcategories of office visits (new patient and established patient) and there are two subcategories of hospital inpatient and observation care visits (initial and subsequent). The subcategories of E/M services are further classified into levels of E/M services that are identified by specific codes.

The basic format of codes with levels of E/M services based on medical decision making (MDM) or time is the same. First, a unique code number is listed. Second, the place and/or type of service is specified, eg, office or other outpatient visit. Third, the content of the service is defined. Fourth, time is specified. (A detailed discussion of time is provided following the Decision Tree for New vs Established Patients.)

The place of service and service type is defined by the location where the face-to-face encounter occurs. For example, service provided to a nursing facility resident brought to the office is reported with an office or other outpatient code.
New and Established Patients

Solely for the purpose of distinguishing between new and established patients, professional services are those face-to-face services rendered by physicians and other qualified health care professionals who may report evaluation and management services. A new patient is one who has not received any professional services from the physician or other qualified health care professional or another physician or other qualified health care professional of the exact same specialty and subspecialty who belongs to the same group practice, within the past three years.

An established patient is one who has received professional services from the physician or other qualified health care professional or another physician or other qualified health care professional of the exact same specialty and subspecialty who belongs to the same group practice, within the past three years. See Decision Tree for New vs Established Patients.

In the instance where a physician or other qualified health care professional is on call for or covering for another physician or other qualified health care professional, the patient’s encounter will be classified as it would have been by the physician or other qualified health care professional who is not available. When advanced practice nurses and physician assistants are working with physicians, they are considered as working in the exact same specialty and subspecialty as the physician.

No distinction is made between new and established patients in the emergency department. E/M services in the emergency department category may be reported for any new or established patient who presents for treatment in the emergency department.

The Decision Tree for New vs Established Patients is provided to aid in determining whether to report the E/M service provided as a new or an established patient encounter.

Coding Tip

Instructions for Use of the CPT Codebook

When advanced practice nurses and physician assistants are working with physicians, they are considered as working in the exact same specialty and exact same subspecialty as the physician. A “physician or other qualified health care professional” is an individual who is qualified by education, training, licensure/regulation (when applicable), and facility privileging (when applicable) who performs a professional service within his or her scope of practice and independently reports that professional service. These professionals are distinct from “clinical staff.” A clinical staff member is a person who works under the supervision of a physician or other qualified health care professional, and who is allowed by law, regulation and facility policy to perform or assist in the performance of a specific professional service but does not individually report that professional service. Other policies may also affect who may report specific services.

CPT Coding Guidelines, Introduction, Instructions for Use of the CPT Codebook

Decision Tree for New vs Established Patients
Initial and Subsequent Services

Some categories apply to both new and established patients (e.g., hospital inpatient or observation care). These categories differentiate services by whether the service is the initial service or a subsequent service. For the purpose of distinguishing between initial or subsequent visits, professional services are those face-to-face services rendered by physicians and other qualified health care professionals who may report evaluation and management services. An initial service is when the patient has not received any professional services from the physician or other qualified health care professional or another physician or other qualified health care professional of the exact same specialty and subspecialty who belongs to the same group practice, during the inpatient or observation or nursing facility admission and stay.

A subsequent service is when the patient has received professional service(s) from the physician or other qualified health care professional or another physician or other qualified health care professional of the exact same specialty and subspecialty who belongs to the same group practice, during the admission and stay.

In the instance where a physician or other qualified health care professional is on call for or covering for another physician or other qualified health care professional, the patient’s encounter will be classified as it would have been by the physician or other qualified health care professional who is not available. When advanced practice nurses and physician assistants are working with physicians, they are considered as working in the exact same specialty and subspecialty as the physician.

For reporting hospital inpatient or observation care services, a stay that includes a transition from observation to inpatient is a single stay. For reporting nursing facility services, a stay that includes transition(s) between skilled nursing facility and nursing facility level of care is the same stay.

Services Reported Separately

Any specifically identifiable procedure or service (i.e., identified with a specific CPT code) performed on the date of E/M services may be reported separately.

The ordering and actual performance and/or interpretation of diagnostic tests/studies during a patient encounter are not included in determining the levels of E/M services when the professional interpretation...
of those tests/studies is reported separately by the physician or other qualified health care professional reporting the E/M service. Tests that do not require separate interpretation (e.g., tests that are results only) and are analyzed as part of MDM do not count as an independent interpretation and may be counted as ordered or reviewed for selecting an MDM level.

The performance of diagnostic tests/studies for which specific CPT codes are available may be reported separately, in addition to the appropriate E/M code. The interpretation of the results of diagnostic tests/studies (i.e., professional component) with preparation of a separate distinctly identifiable signed written report may also be reported separately, using the appropriate CPT code and, if required, with modifier 26 appended.

See Instructions for Selecting a Level Based on MDM or Time.

The physician or other qualified health care professional may need to indicate that on the day a procedure or service identified by a CPT code was performed, the patient's condition required a significant separately identifiable E/M service. The E/M service may be caused or prompted by the symptoms or condition for which the procedure and/or service was provided. This circumstance may be reported by adding modifier 25 to the appropriate level of E/M service. As such, different diagnoses are not required for reporting of the procedure and the E/M services on the same date.

History and/or Examination

These E/M services include a medically appropriate history and/or physical examination, when performed. The nature and extent of the history and/or physical examination are determined by the treating physician or other qualified health care professional reporting the service. The care team may collect information, and the patient or caregiver may supply information directly (e.g., by electronic health record [EHR] portal or questionnaire) that is reviewed by the reporting physician or other qualified health care professional. The extent of history and physical examination is not an element in selection of the level of these E/M service codes.

Levels of E/M Services

Select the appropriate level of E/M services based on the following:

1. The level of the MDM as defined for each service, or
2. The total time for E/M services performed on the date of the encounter.

Within each category or subcategory of E/M service based on MDM or time, there are three to five levels of E/M services available for reporting purposes. Levels of E/M services are not interchangeable among the different categories or subcategories of service. For example, the first level of E/M services in the subcategory of office visit, new patient, does not have the same definition as the first level of E/M services in the subcategory of office visit, established patient. Each level of E/M services may be used by all physicians or other qualified health care professionals.

Guidelines for Selecting a level service based on Medical Decision Making

Four types of MDM are recognized: straightforward, low, moderate, and high. The concept of the level of MDM does not apply to 99211 or 99281.

MDM includes establishing diagnoses, assessing the status of a condition, and/or selecting a management option. MDM is defined by three elements. The elements are:

- **The number and complexity of problem(s) that are addressed during the encounter.**
- **The amount and/or complexity of data to be reviewed and analyzed.** These data include medical records, tests, and/or other information that must be obtained, ordered, reviewed, and analyzed for the encounter. This includes information obtained from multiple sources or interprofessional communications that are not reported separately and interpretation of tests that are not reported.
separately. Ordering a test is included in the category of test result(s) and the review of the test result is part of the encounter and not a subsequent encounter. Ordering a test may include those considered, but not selected after shared decision making. For example, a patient may request diagnostic imaging that is not necessary for their condition and discussion of the lack of benefit may be required. Alternatively, a test may normally be performed, but due to risk for a specific patient is not ordered. These considerations must be documented. Data are divided into three categories:

- Tests, documents, orders, or independent historian(s). (Each unique test, order, or document is counted to meet a threshold number.)
- Independent interpretation of tests (not separately reported)
- Discussion of management or test interpretation with external physician or other qualified health care professional or appropriate source (not separately reported)

- **The risk of complications and/or morbidity or mortality of patient management:** This includes decisions made at the encounter associated with the diagnostic procedure(s) and treatment(s). This includes the possible management options selected and those considered but not selected, after shared decision making with the patient and/or family. For example, a decision about hospitalization includes consideration of alternative levels of care. Examples may include a psychiatric patient with a sufficient degree of support in the outpatient setting or the decision to not hospitalize a patient with advanced dementia with an acute condition that would generally warrant inpatient care, but for whom the goal is palliative treatment.

Shared decision making involves eliciting patient and/or family preferences, patient and/or family education, and explaining risks and benefits of management options.

**MDM may be impacted by role and management responsibility.**

When the physician or other qualified health care professional is reporting a separate CPT code that includes interpretation and/or report, the interpretation and/or report is not counted toward the MDM when selecting a level of E/M services.

When the physician or other qualified health care professional is reporting a separate service for discussion of management with a physician or another qualified health care professional, the discussion is not counted toward the MDM when selecting a level of E/M services.

The Levels of Medical Decision Making (MDM) table (Table 2) is a guide to assist in selecting the level of MDM for reporting an E/M services code. The table includes the four levels of MDM (ie, straightforward, low, moderate, high) and the three elements of MDM (ie, number and complexity of problems addressed at the encounter, amount and/or complexity of data reviewed and analyzed, and risk of complications and/or morbidity or mortality of patient management). To qualify for a particular level of MDM, two of the three elements for that level of MDM must be met or exceeded.

Examples in the table may be more or less applicable to specific settings of care. For example, the decision to hospitalize applies to the outpatient or nursing facility encounters, whereas the decision to escalate hospital level of care (eg, transfer to ICU) applies to the hospitalized or observation care patient.

See also the introductory guidelines of each code family section.

• Independent interpretation of a test performed by another physician/other qualified health care professional (not separately reported); or  
Category 3: Discussion of management or test interpretation  
• Discussion of management or test interpretation with external physician/other qualified health care professional/appropriate source (not separately reported) |  
High risk of morbidity from additional diagnostic testing or treatment  
Examples only:  
• Drug therapy requiring intensive monitoring for toxicity  
• Decision regarding elective major surgery with identified patient or procedure risk factors  
• Decision regarding emergency major surgery  
• Decision regarding hospitalization or escalation of hospital-level of care  
• Decision not to resuscitate or to de-escalate care because of poor prognosis  
• Parenteral controlled substances |
**Number and Complexity of Problems Addressed at the Encounter**

One element used in selecting the level of services is the number and complexity of the problems that are addressed at the encounter. Multiple new or established conditions may be addressed at the same time and may affect MDM. Symptoms may cluster around a specific diagnosis and each symptom is not necessarily a unique condition. Comorbidities and underlying diseases, in and of themselves, are not considered in selecting a level of E/M services unless they are addressed, and their presence increases the amount and/or complexity of data to be reviewed and analyzed or the risk of complications and/or morbidity or mortality of patient management. The final diagnosis for a condition does not, in and of itself, determine the complexity or risk, as extensive evaluation may be required to reach the conclusion that the signs or symptoms do not represent a highly morbid condition. Therefore, presenting symptoms which are likely to represent a highly morbid condition may drive MDM even when the ultimate diagnosis is not highly morbid. The evaluation and/or treatment should be consistent with the likely nature of the condition. Multiple problems of a lower severity may, in the aggregate, create higher risk due to interaction.

The term “risk” as used in these definitions relates to risk from the condition. While condition risk and management risk may often correlate, the risk from the condition is distinct from the risk of the management.

Definitions for the elements of MDM (see Table 2, Levels of Medical Decision Making) are:

- **Problem:** A problem is a disease, condition, illness, injury, symptom, sign, finding, complaint, or other matter addressed at the encounter, with or without a diagnosis being established at the time of the encounter.

- **Problem addressed:** A problem is addressed or managed when it is evaluated or treated at the encounter by the physician or other qualified health care professional reporting the service. This includes consideration of further testing or treatment that may not be elected by virtue of risk/benefit analysis or patient/parent/guardian/surrogate choice. Notation in the patient’s medical record that another professional is managing the problem without additional assessment or care coordination documented does not qualify as being addressed or managed by the physician or other qualified health care professional reporting the service. Referral without evaluation (by history, examination, or diagnostic study[ies]) or consideration of treatment does not qualify as being addressed or managed by the physician or other qualified health care professional reporting the service. For hospital inpatient and observation care services, the problem addressed is the problem status on the date of the encounter, which may be significantly different than on admission. It is the problem being managed or co-managed by the reporting physician or qualified health care professional and may not be the cause of admission or continued stay.

- **Minimal problem:** A problem that may not require the presence of the physician or other qualified health care professional, but the service is provided under the physician’s or other qualified health care professional’s supervision (see 99211, 99281).

- **Self-limited or minor problem:** A problem that runs a definite and prescribed course, is transient in nature, and is not likely to permanently alter health status.

- **Stable, chronic illness:** A problem with an expected duration of at least one year or until the death of the patient. For the purpose of defining chronicity, conditions are treated as chronic whether or not stage or severity changes (eg, uncontrolled diabetes and controlled diabetes are a single chronic condition). “Stable” for the purposes of categorizing MDM is defined by the specific treatment goals for an individual patient. A patient who is not at his or her treatment goal is not stable, even if the condition has not changed and there is no short-term threat to life or function. For example, a patient with persistently poorly controlled blood pressure for whom better control is a goal is not stable, even if the pressures are not changing and the patient is asymptomatic. The risk of morbidity without treatment is significant.
Acute, uncomplicated illness or injury: A recent or new short-term problem with low risk of morbidity for which treatment is considered. There is little to no risk of mortality with treatment, and full recovery without functional impairment is expected. A problem that is normally self-limited or minor but is not resolving consistent with a definite and prescribed course is an acute, uncomplicated illness.

Acute, uncomplicated illness or injury requiring hospital inpatient or observation level care: A recent or new short-term problem with low risk of morbidity for which treatment is required. There is little to no risk of mortality with treatment, and full recovery without functional impairment is expected. The treatment required is delivered in a hospital inpatient or observation level setting.

Stable, acute illness: A problem that is new or recent for which treatment has been initiated. The patient is improved and while resolution may not be complete is stable with respect to this condition.

Chronic illness with exacerbation, progression, or side effects of treatment: A chronic illness that is acutely worsening, poorly controlled, or progressing with an intent to control progression and requiring additional supportive care or requiring attention to treatment for side effects.

Undiagnosed new problem with uncertain prognosis: A problem in the differential diagnosis that represents a condition likely to result in a high risk of morbidity without treatment.

Acute illness with systemic symptoms: An illness that causes systemic symptoms and has a high risk of morbidity without treatment. For systemic general symptoms, such as fever, body aches, or fatigue in a minor illness that may be treated to alleviate symptoms, see the definitions for self-limited or minor problem or acute, uncomplicated illness or injury. Systemic symptoms may not be general but may be single system.

Acute, complicated injury: An injury which requires treatment that includes evaluation of body systems that are not directly part of the injured organ, the injury is extensive, or the treatment options are multiple and/or associated with risk of morbidity.

Chronic illness with severe exacerbation, progression, or side effects of treatment: The severe exacerbation or progression of a chronic illness or severe side effects of treatment that have significant risk of morbidity and may require escalation in level of care.

Acute or chronic illness or injury that poses a threat to life or bodily function: An acute illness with systemic symptoms, an acute complicated injury, or a chronic illness or injury with exacerbation and/or progression or side effects of treatment, that poses a threat to life or bodily function in the near term without treatment. Some symptoms may represent a condition that is significantly probable and poses a potential threat to life or bodily function. These may be included in this category when the evaluation and treatment is consistent with this degree of potential severity.

Amount and/or Complexity of Data to be Reviewed and Analyzed

One element used in selecting the level of services is the amount and/or complexity of data to be reviewed or analyzed at an encounter.

Analyzed: Analyzed is a term describing the process of using the data as part of the MDM. The data element itself may not be subject to analysis (eg, glucose), but it is instead included in the thought processes for diagnosis, evaluation, or treatment. Tests ordered are presumed to be analyzed when the results are reported. Therefore, when they are ordered during an encounter, they are counted in that encounter. Tests that are ordered outside of an encounter may be counted in the encounter where they are analyzed. In the case of a recurring order, each new result may be counted in the encounter at which it is analyzed. For example, an encounter that includes an order for monthly prothrombin times would count for one prothrombin time ordered and reviewed. Additional future results, if analyzed in a subsequent encounter, may be counted as a single test in that subsequent encounter. Any service for which the professional component is separately reported by the physician or other qualified health care professional
reporting the E/M services is not counted as a data element ordered, reviewed, analyzed, or independently interpreted for the purposes of determining the level of MDM.

**Test:** Tests are imaging, laboratory, psychometric, or physiologic data. A clinical laboratory panel (e.g., basic metabolic panel [80047]) is a single test. The differentiation between single or multiple tests is defined in accordance with the CPT code set. For the purposes of data reviewed and analyzed, pulse oximetry is not a test.

**Unique:** A unique test is defined by the CPT code set. When multiple results of the same unique test (e.g., serial blood glucose values) are compared during an E/M service, only count one unique test. Tests that have overlapping elements are not unique, even if they are identified with distinct CPT codes. For example, a CBC with differential would incorporate the set of hemoglobin, CBC without differential, and platelet count. A unique source is defined as a physician or qualified health care professional in a distinct group or different specialty or subspecialty, or a unique entity. Review of all materials from any unique source counts as one element towards MDM.

**Combination of Data Elements:** A combination of different data elements, for example a combination of notes reviewed, tests ordered, tests reviewed, or independent historian, allows these elements to be summed. It does not require each item type or category to be represented. A unique test ordered, plus a note reviewed and an independent historian would be a combination of three elements.

**External:** External records, communications and/or test results are from an external physician, other qualified health care professional, facility, or health care organization.

**External physician or other qualified health care professional:** An external physician or other qualified health care professional who is not in the same group practice or is of a different specialty or subspecialty. This includes licensed professionals who are practicing independently. The individual may also be a facility or organizational provider such as from a hospital, nursing facility, or home health care agency.

**Discussion:** Discussion requires an interactive exchange. The exchange must be direct and not through intermediaries (e.g., clinical staff or trainees). Sending chart notes or written exchanges that are within progress notes does not qualify as an interactive exchange. The discussion does not need to be on the date of the encounter but is counted only once and only when it is used in the decision making of the encounter. It may be asynchronous (i.e., does not need to be in person), but it must be initiated and completed within a short time period (e.g., within a day or two).

**Independent historian(s):** An individual (e.g., parent, guardian, surrogate, spouse, witness) who provides a history in addition to a history provided by the patient who is unable to provide a complete or reliable history (e.g., due to developmental stage, dementia, or psychosis) or because a confirmatory history is judged to be necessary. In the case where there may be conflict or poor communication between multiple historians and more than one historian is needed, the independent historian requirement is met. It does not include translation services. The independent history does not need to be obtained in person but does need to be obtained directly from the historian providing the independent information.

**Independent interpretation:** The interpretation of a test for which there is a CPT code, and an interpretation or report is customary. This does not apply when the physician or other qualified health care professional who reports the E/M service is reporting or has previously reported the test. A form of interpretation should be documented but need not conform to the usual standards of a complete report for the test.

**Appropriate source:** For the purpose of the discussion of management data element (see Table 2, Levels of Medical Decision Making), an appropriate source includes professionals who are not health care professionals but may be involved in the management of the patient (e.g., lawyer, parole officer, case manager, teacher). It does not include discussion with family or informal caregivers.
Risk of Complications and/or Morbidity or Mortality of Patient Management

One element used in selecting the level of services is the risk of complications and/or morbidity or mortality of patient management at an encounter. This is distinct from the risk of the condition itself.

Risk: The probability and/or consequences of an event. The assessment of the level of risk is affected by the nature of the event under consideration. For example, a low probability of death may be high risk, whereas a high chance of a minor, self-limited adverse effect of treatment may be low risk. Definitions of risk are based upon the usual behavior and thought processes of a physician or other qualified health care professional in the same specialty. Trained clinicians apply common language usage meanings to terms such as high, medium, low, or minimal risk and do not require quantification for these definitions (though quantification may be provided when evidence-based medicine has established probabilities). For the purposes of MDM, level of risk is based upon consequences of the problem(s) addressed at the encounter when appropriately treated. Risk also includes MDM related to the need to initiate or forego further testing, treatment, and/or hospitalization. The risk of patient management criteria applies to the patient management decisions made by the reporting physician or other qualified health care professional as part of the reported encounter.

Morbidity: A state of illness or functional impairment that is expected to be of substantial duration during which function is limited, quality of life is impaired, or there is organ damage that may not be transient despite treatment.

Social determinants of health: Economic and social conditions that influence the health of people and communities. Examples may include food or housing insecurity.

Surgery (minor or major, elective, emergency, procedure or patient risk):

Surgery-Minor or Major: The classification of surgery into minor or major is based upon the common meaning of such terms when used by trained clinicians, similar to the use of the term “risk”. These terms are not defined by a surgical package classification.

Surgery-Elective or Emergency: Elective procedures and emergent or urgent procedures describe the timing of a procedure when the timing is related to the patient’s condition. An elective procedure is typically planned in advance (e.g., scheduled for weeks later), while an emergent procedure is typically performed immediately or with minimal delay to allow for patient stabilization. Both elective and emergent procedures may be minor or major procedures.

Surgery-Risk Factors, Patient or Procedure: Risk factors are those that are relevant to the patient and procedure. Evidence-based risk calculators may be used, but are not required, in assessing patient and procedure risk.

Drug therapy requiring intensive monitoring for toxicity: A drug that requires intensive monitoring is a therapeutic agent that has the potential to cause serious morbidity or death. The monitoring is performed for assessment of these adverse effects and not primarily for assessment of therapeutic efficacy. The monitoring should be that which is generally accepted practice for the agent but may be patient-specific in some cases. Intensive monitoring may be long-term or short-term. Long-term intensive monitoring is not performed less than quarterly. The monitoring may be performed with a laboratory test, a physiologic test, or imaging. Monitoring by history or examination does not qualify. The monitoring affects the level of MDM in an encounter in which it is considered in the management of the patient. An example may be monitoring for cytopenia in the use of an antineoplastic agent between dose cycles. Examples of monitoring that do not qualify include monitoring glucose levels during insulin therapy, as the primary reason is the therapeutic effect (unless severe hypoglycemia is a current, significant concern); or annual electrolytes and renal function for a patient on a diuretic, as the frequency does not meet the threshold.
Guidelines for Selecting Level of Service Based on Time

Certain categories of time-based E/M codes that do not have levels of services based on MDM (eg, Critical Care Services) in the E/M section use time differently. It is important to review the instructions for each category.

Time is not a descriptive component for the emergency department levels of E/M services because emergency department services are typically provided on a variable intensity basis, often involving multiple encounters with several patients over an extended period of time.

When time is used for reporting E/M services codes, the time defined in the service descriptors is used for selecting the appropriate level of services. The E/M services for which these guidelines apply require a face-to-face encounter with the physician or other qualified health care professional. For office or other outpatient services, if the physician’s or other qualified health care professional’s time is spent in the supervision of clinical staff who perform the face-to-face services of the encounter, use 99211.

For coding purposes, time for these services is the total time on the date of the encounter. It includes both the face-to-face and non-face-to-face time personally spent by the physician and/or other qualified health care professional(s) on the day of the encounter (includes time in activities that require the physician or other qualified health care professional and does not include time in activities normally performed by clinical staff). It does not include any time spent in the performance of other separately reported service(s).

A shared or split visit is defined as a visit in which a physician and other qualified health care professional(s) both provide the face-to-face and non-face-to-face work related to the visit. When time is being used to select the appropriate level of services for which time-based reporting of shared or split visits is allowed, the time personally spent by the physician and other qualified health care professional(s) assessing and managing the patient on the date of the encounter is summed to define total time. Only distinct time should be summed for shared or split visits (ie, when two or more individuals jointly meet with or discuss the patient, only the time of one individual should be counted).

When prolonged time occurs, the appropriate prolonged services code may be reported. The total time on the date of the encounter spent caring for the patient should be documented in the medical record when it is used as the basis for code selection.

Physician or other other qualified health care professional time includes the following activities, when performed:

- preparing to see the patient (eg, review of tests)
- obtaining and/or reviewing separately obtained history
- performing a medically appropriate examination and/or evaluation
- counseling and educating the patient/family/caregiver
- ordering medications, tests, or procedures
- referring and communicating with other health care professionals (when not separately reported)
- documenting clinical information in the electronic or other health record
- independently interpreting results (when not separately reported) and communicating results to the patient family/caregiver
- care coordination (when not separately reported)

Do not count time spent on the following:

- the performance of other services reported separately
▪ travel
▪ teaching that is general and not limited to discussion that is required for the management of the specific patient

Unlisted Service

An E/M service may be provided that is not listed in this section of the CPT codebook. When reporting such a service, the appropriate unlisted code may be used to indicate the service, identifying it by “Special Report,” as discussed in the following paragraph. The “Unlisted Services” and accompanying codes for the E/M section are as follows:

99429 Unlisted preventive medicine service

99499 Unlisted evaluation and management service

Special Report

An unlisted service or one that is unusual, variable, or new may require a special report demonstrating the medical appropriateness of the service. Pertinent information should include an adequate definition or description of the nature, extent, and need for the procedure and the time, effort, and equipment necessary to provide the service. Additional items that may be included are complexity of symptoms, final diagnosis, pertinent physical findings, diagnostic and therapeutic procedures, concurrent problems, and follow-up care.
Following the implementation of the revisions to the Evaluation and Management (E/M) office visits (99201-99215) for the CPT 2021 code set, the CPT/RUC Workgroup on E/M met twelve times in 2020 and early 2021 to standardize the rest of the E/M sections in the CPT code set. The CPT/RUC Workgroup on E/M was committed to changing the current coding and documentation requirements for E/M visits to simplify the work of the health care provider and improve the health of the patient. To achieve these goals, the Workgroup set forth the following guiding principles related to the group’s ongoing work product:

1. To decrease administrative burden of documentation and coding and align CPT and CMS whenever possible
2. To decrease the need for audits
3. To decrease unnecessary documentation in the medical record that is not needed for patient care
4. To ensure that payment for E/M is resource-based and that there is no direct goal for payment redistribution between specialties.

In February 2021, the CPT Editorial Panel revised code 99483 to replace “50 minutes” from its descriptor with “XX minutes of total time is spent on the date of the encounter”, as determined by the RUC survey, to align with the principles included in the E/M office visits.

Due to the increase in office visits for 2021, CMS finalized a proposal to increase CPT code 99483 from 3.44 to 3.80 work RVUs. CMS indicated that 99483 includes an evaluation of a patient’s cognitive functioning and requires collecting pertinent history and current cognitive status, all of which require medical decision making of moderate or high complexity. To not create a rank order anomaly with 99205 Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and high level of medical decision making. When using time for code selection, 60-74 minutes of total time is spent on the date of the encounter (work RVU = 3.50), CMS increased 99483 by using the ratio of the increase between the CY 2020 and CY 2021 values for 99205 to commensurate with the increase to CPT code 99205.

99483 Assessment of and care planning for a patient with cognitive impairment, requiring an independent historian, in the office or other outpatient, home or domiciliary or rest home, with all of the following required elements:

- Cognition-focused evaluation including a pertinent history and examination,
- Medical decision making of moderate or high complexity,
- Functional assessment (eg, basic and instrumental activities of daily living), including decision-making capacity,
- Use of standardized instruments for staging of dementia (eg, functional assessment staging test [FAST], clinical dementia rating [CDR]),
- Medication reconciliation and review for high-risk medications,
- Evaluation for neuropsychiatric and behavioral symptoms, including depression, including use of standardized screening instrument(s),

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.
• Evaluation of safety (eg, home), including motor vehicle operation,
• Identification of caregiver(s), caregiver knowledge, caregiver needs, social supports, and the willingness of caregiver to take on caregiving tasks,
• Development, updating or revision, or review of an Advance Care Plan,
• Creation of a written care plan, including initial plans to address any neuropsychiatric symptoms, neurocognitive symptoms, functional limitations, and referral to community resources as needed (eg, rehabilitation services, adult day programs, support groups) shared with the patient and/or caregiver with initial education and support.

Typically, 60 minutes of total time is spent on the date of the encounter.

The RUC reviewed the survey results from 74 neurologists, geriatricians and internal medicine physicians and determined that the survey 25th percentile work RVU of 3.50 appropriately accounts for the work required to perform this service. The RUC recommends 11 minutes of pre-service time, 60 minutes of intra-service time and 15 minutes of post-service time.

The RUC compared the surveyed code to the top key reference service 99205 Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and high level of medical decision making. When using time for code selection, 60-74 minutes of total time is spent on the date of the encounter (work RVU = 3.50, 59 minutes intra-service time and 88 minutes total time) and determined the surveyed code is appropriately valued the same because the vignette for 99205 describes a new patient with a chronic illness with severe exacerbation that poses a threat to life or bodily function, or an acute illness/injury that poses a threat to life or bodily function, which is an extremely intense patient. The RUC did not believe that the typical patient for 99483, a patient with hypertension, diabetes, arthritis, and coronary artery, disease presents with confusion, weight loss, and failure to maintain her house, where she lives alone, is more intense. Additionally, the medical decision making (MDM) for CPT code 99205 is at a high level, whereas for CPT code 99483 the MDM is at a moderate/high level of complexity. Lastly, the physician time required for these services is almost identical, 86 minutes (99483) and 88 minutes (99205) total time. Therefore, the RUC determined 99483 should be valued the same as 99205.

The RUC compared 99483 to the second top key reference service 90792 Psychiatric diagnostic evaluation with medical services (work RVU = 4.16, 60 minutes intra-service time and 90 minutes total time) and determined that the surveyed code requires less physician time and work and thus is appropriately valued lower.

For additional support, the RUC referenced MPC code 90962 End-stage renal disease (ESRD) related services monthly, for patients 20 years of age and older; with 1 face-to-face visit by a physician or other qualified health care professional per month (work RVU = 3.57 and 70 minutes intra-service and total time). The RUC concluded that CPT code 99483 should be valued at the 25th percentile work RVU as supported by the survey. The RUC recommends a work RVU of 3.50 for CPT code 99483.

CPT Descriptor Time
The RUC recommends that the CPT Editorial Panel insert the “60 minutes of total time is spent on the date of the encounter” based on the survey median.
Practice Expense
The Practice Expense (PE) Subcommittee reviewed the direct practice expense inputs as submitted by the specialty societies and modified the clinical staff time, moving 6 minutes of CA006 Confirm availability of prior images/studies to CA048 Identify need for imaging, lab or other test result(s) and ensure information has been obtained - three days prior (to be used with E/M only). The specialty societies consolidated and reduced the clinical staff time for CA021 Perform procedure/service---NOT directly related to physician work time to 45 minutes, as outlined in the PE summary of recommendation (SOR) form. The PE Subcommittee adjusted the equipment calculation to the default formula for EQ189 otoscope-ophthalmoscope (wall unit) and EF023 table, exam. The RUC recommends the direct practice expense inputs as modified by the PE Subcommittee.

Work Neutrality
The RUC’s recommendation for this code will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

Typically, 50-60 minutes of total time are spent on the date of the encounter face-to-face with the patient and/or family or caregiver.

(For services of 75 minutes or longer, use 99417)

(Do not report 99483 in conjunction with E/M services [99202, 99203, 99204, 99205, 99211, 99212, 99213, 99214, 99215, 99241, 99242, 99243, 99244, 99245, 99324, 99325, 99326, 99327, 99328, 99334, 99335, 99336, 99337, 99341, 99342, 99343, 99344, 99345, 99347, 99348, 99349, 99350, 99366, 99367, 99368, 99497, 99498]; psychiatric diagnostic procedures [90785, 90791, 90792]; brief emotional/behavioral assessment [96127]; psychological or neuropsychological test administration [96146]; health risk assessment administration [96160, 96161]; medication therapy management services [99605, 99606, 99607])
CPT 2023 E/M Guidelines

Category I
Evaluation and Management (E/M) Services Guidelines

In addition to the information presented in the Introduction, several other items unique to this section are defined or identified here.

E/M Guidelines Overview

The E/M guidelines have sections that are common to all E/M categories and sections that are category specific. Most of the categories and many of the subcategories of service have special guidelines or instructions unique to that category or subcategory. Where these are indicated, eg, “Hospital Inpatient and Observation Care,” special instructions are presented before the listing of the specific E/M services codes. It is important to review the instructions for each category or subcategory. These guidelines are to be used by the reporting physician or other qualified health care professional to select the appropriate level of service. These guidelines do not establish documentation requirements or standards of care. The main purpose of documentation is to support care of the patient by current and future health care team(s). These guidelines are for services that require a face-to-face encounter. (For 99211 and 99281 the face-to-face services may be performed by clinical staff).

In the Evaluation and Management section (99202-99499) there are many code categories. Each category may have specific guidelines, or the codes may include specific details. These E/M guidelines are written for the following categories:

- Office or Other Outpatient Services
- Hospital Inpatient and Observation Care Services
- Consultations
- Emergency Department Services
- Nursing Facility Services
- Home and Residence Services
- Prolonged Service With or Without Direct Contact on the Date of an Evaluation and Management Service

Classification of Evaluation and Management (E/M) Services

The E/M section is divided into broad categories such as office visits, hospital inpatient or observation care visits, and consultations. Most of the categories are further divided into two or more subcategories of E/M services. For example, there are two subcategories of office visits (new patient and established patient) and there are two subcategories of hospital inpatient and observation care visits (initial and subsequent). The subcategories of E/M services are further classified into levels of E/M services that are identified by specific codes.

The basic format of codes with levels of E/M services based on medical decision making (MDM) or time is the same. First, a unique code number is listed. Second, the place and/or type of service is specified, eg, office or other outpatient visit. Third, the content of the service is defined. Fourth, time is specified. (A detailed discussion of time is provided following the Decision Tree for New vs Established Patients.)

The place of service and service type is defined by the location where the face-to-face encounter occurs. For example, service provided to a nursing facility resident brought to the office is reported with an office or other outpatient code.
New and Established Patients

Solely for the purpose of distinguishing between new and established patients, professional services are those face-to-face services rendered by physicians and other qualified health care professionals who may report evaluation and management services. A new patient is one who has not received any professional services from the physician or other qualified health care professional or another physician or other qualified health care professional of the exact same specialty and subspecialty who belongs to the same group practice, within the past three years.

An established patient is one who has received professional services from the physician or other qualified health care professional or another physician or other qualified health care professional of the exact same specialty and subspecialty who belongs to the same group practice, within the past three years. See Decision Tree for New vs Established Patients.

In the instance where a physician or other qualified health care professional is on call for or covering for another physician or other qualified health care professional, the patient’s encounter will be classified as it would have been by the physician or other qualified health care professional who is not available. When advanced practice nurses and physician assistants are working with physicians, they are considered as working in the exact same specialty and subspecialty as the physician.

No distinction is made between new and established patients in the emergency department. E/M services in the emergency department category may be reported for any new or established patient who presents for treatment in the emergency department.

The Decision Tree for New vs Established Patients is provided to aid in determining whether to report the E/M service provided as a new or an established patient encounter.

Coding Tip

Instructions for Use of the CPT Codebook

When advanced practice nurses and physician assistants are working with physicians, they are considered as working in the exact same specialty and exact same subspecialty as the physician. A “physician or other qualified health care professional” is an individual who is qualified by education, training, licensure/regulation (when applicable), and facility privileging (when applicable) who performs a professional service within his or her scope of practice and independently reports that professional service. These professionals are distinct from “clinical staff.” A clinical staff member is a person who works under the supervision of a physician or other qualified health care professional, and who is allowed by law, regulation and facility policy to perform or assist in the performance of a specific professional service but does not individually report that professional service. Other policies may also affect who may report specific services.

CPT Coding Guidelines, Introduction, Instructions for Use of the CPT Codebook

Decision Tree for New vs Established Patients
Initial and Subsequent Services

Some categories apply to both new and established patients (e.g., hospital inpatient or observation care). These categories differentiate services by whether the service is the initial service or a subsequent service. For the purpose of distinguishing between initial or subsequent visits, professional services are those face-to-face services rendered by physicians and other qualified health care professionals who may report evaluation and management services. An initial service is when the patient has not received any professional services from the physician or other qualified health care professional or another physician or other qualified health care professional of the exact same specialty and subspecialty who belongs to the same group practice, during the inpatient or observation or nursing facility admission and stay.

A subsequent service is when the patient has received professional service(s) from the physician or other qualified health care professional or another physician or other qualified health care professional of the exact same specialty and subspecialty who belongs to the same group practice, during the admission and stay.

In the instance where a physician or other qualified health care professional is on call for or covering for another physician or other qualified health care professional, the patient’s encounter will be classified as it would have been by the physician or other qualified health care professional who is not available. When advanced practice nurses and physician assistants are working with physicians, they are considered as working in the exact same specialty and subspecialty as the physician.

For reporting hospital inpatient or observation care services, a stay that includes a transition from observation to inpatient is a single stay. For reporting nursing facility services, a stay that includes transition(s) between skilled nursing facility and nursing facility level of care is the same stay.

Services Reported Separately

Any specifically identifiable procedure or service (i.e., identified with a specific CPT code) performed on the date of E/M services may be reported separately.

The ordering and actual performance and/or interpretation of diagnostic tests/studies during a patient encounter are not included in determining the levels of E/M services when the professional interpretation
of those tests/studies is reported separately by the physician or other qualified health care professional reporting the E/M service. Tests that do not require separate interpretation (eg, tests that are results only) and are analyzed as part of MDM do not count as an independent interpretation and may be counted as ordered or reviewed for selecting an MDM level.

The performance of diagnostic tests/studies for which specific CPT codes are available may be reported separately, in addition to the appropriate E/M code. The interpretation of the results of diagnostic tests/studies (ie, professional component) with preparation of a separate distinctly identifiable signed written report may also be reported separately, using the appropriate CPT code and, if required, with modifier 26 appended.

See Instructions for Selecting a Level Based on MDM or Time.

The physician or other qualified health care professional may need to indicate that on the day a procedure or service identified by a CPT code was performed, the patient’s condition required a significant separately identifiable E/M service. The E/M service may be caused or prompted by the symptoms or condition for which the procedure and/or service was provided. This circumstance may be reported by adding modifier 25 to the appropriate level of E/M service. As such, different diagnoses are not required for reporting of the procedure and the E/M services on the same date.

**History and/or Examination**

These E/M services include a medically appropriate history and/or physical examination, when performed. The nature and extent of the history and/or physical examination are determined by the treating physician or other qualified health care professional reporting the service. The care team may collect information, and the patient or caregiver may supply information directly (eg, by electronic health record [EHR] portal or questionnaire) that is reviewed by the reporting physician or other qualified health care professional. The extent of history and physical examination is not an element in selection of the level of these E/M service codes.

**Levels of E/M Services**

Select the appropriate level of E/M services based on the following:

1. The level of the MDM as defined for each service, or
2. The total time for E/M services performed on the date of the encounter.

Within each category or subcategory of E/M service based on MDM or time, there are three to five levels of E/M services available for reporting purposes. Levels of E/M services are not interchangeable among the different categories or subcategories of service. For example, the first level of E/M services in the subcategory of office visit, new patient, does not have the same definition as the first level of E/M services in the subcategory of office visit, established patient. Each level of E/M services may be used by all physicians or other qualified health care professionals.

**Guidelines for Selecting a level service based on Medical Decision Making**

Four types of MDM are recognized: straightforward, low, moderate, and high. The concept of the level of MDM does not apply to 99211 or 99281.

MDM includes establishing diagnoses, assessing the status of a condition, and/or selecting a management option. MDM is defined by three elements. The elements are:

- **The number and complexity of problem(s) that are addressed during the encounter.**
- **The amount and/or complexity of data to be reviewed and analyzed.** These data include medical records, tests, and/or other information that must be obtained, ordered, reviewed, and analyzed for the encounter. This includes information obtained from multiple sources or interprofessional communications that are not reported separately and interpretation of tests that are not reported...
separately. Ordering a test is included in the category of test result(s) and the review of the test result is part of the encounter and not a subsequent encounter. Ordering a test may include those considered, but not selected after shared decision making. For example, a patient may request diagnostic imaging that is not necessary for their condition and discussion of the lack of benefit may be required. Alternatively, a test may normally be performed, but due to risk for a specific patient is not ordered. These considerations must be documented. Data are divided into three categories:

- **Tests, documents, orders, or independent historian(s).** (Each unique test, order, or document is counted to meet a threshold number.)
- Independent interpretation of tests (not separately reported)
- Discussion of management or test interpretation with external physician or other qualified health care professional or appropriate source (not separately reported)

- **The risk of complications and/or morbidity or mortality of patient management:** This includes decisions made at the *encounter* associated with the diagnostic procedure(s) and treatment(s). This includes the possible management options selected and those considered but not selected, after shared decision making with the patient and/or family. For example, a decision about hospitalization includes consideration of alternative levels of care. Examples may include a psychiatric patient with a sufficient degree of support in the outpatient setting or the decision to not hospitalize a patient with advanced dementia with an acute condition that would generally warrant inpatient care, but for whom the goal is palliative treatment.

  Shared decision making involves eliciting patient and/or family preferences, patient and/or family education, and explaining risks and benefits of management options.

  **MDM may be impacted by role and management responsibility.**

  When the physician or other qualified health care professional is reporting a separate CPT code that includes interpretation and/or report, the interpretation and/or report is not counted toward the MDM when selecting a level of E/M services.

  When the physician or other qualified health care professional is reporting a separate service for discussion of management with a physician or another qualified health care professional, the discussion is not counted toward the MDM when selecting a level of E/M services.

  The Levels of Medical Decision Making (MDM) table (Table 2) is a guide to assist in selecting the level of MDM for reporting an E/M services code. The table includes the four levels of MDM (ie, straightforward, low, moderate, high) and the three elements of MDM (ie, number and complexity of problems addressed at the encounter, amount and/or complexity of data reviewed and analyzed, and risk of complications and/or morbidity or mortality of patient management). To qualify for a particular level of MDM, two of the three elements for that level of MDM must be met or exceeded.

  Examples in the table may be more or less applicable to specific settings of care. For example, the decision to hospitalize applies to the outpatient or nursing facility encounters, whereas the decision to escalate hospital level of care (eg, transfer to ICU) applies to the hospitalized or observation care patient.

  See also the introductory guidelines of each code family section.

**Category 1: Tests, documents, or independent historian(s)**

- Any combination of 3 from the following:
  - Review of prior external note(s) from each unique source*;
  - Review of the result(s) of each unique test*;
  - Ordering of each unique test*;
  - Assessment requiring an independent historian(s)

**Category 2: Independent interpretation of tests**

- Independent interpretation of a test performed by another physician/other qualified health care professional (not separately reported);

**Category 3: Discussion of management or test interpretation**

- Discussion of management or test interpretation with external physician/other qualified health care professional/appropriate source (not separately reported)

**Moderate risk of morbidity from additional diagnostic testing or treatment**

*Examples only:*

- Prescription drug management
- Decision regarding minor surgery with identified patient or procedure risk factors
- Decision regarding elective major surgery without identified patient or procedure risk factors
- Diagnosis or treatment significantly limited by social determinants of health

**Category 1: Tests, documents, or independent historian(s)**

- Any combination of 3 from the following:
  - Review of prior external note(s) from each unique source*;
  - Review of the result(s) of each unique test*;
  - Ordering of each unique test*;
  - Assessment requiring an independent historian(s)

**Category 2: Independent interpretation of tests**

- Independent interpretation of a test performed by another physician/other qualified health care professional (not separately reported);

**Category 3: Discussion of management or test interpretation**

- Discussion of management or test interpretation with external physician/other qualified health care professional/appropriate source (not separately reported)

| High risk of morbidity from additional diagnostic testing or treatment |

**Examples only:**

- Drug therapy requiring intensive monitoring for toxicity
- Decision regarding elective major surgery with identified patient or procedure risk factors
- Decision regarding emergency major surgery
- Decision regarding hospitalization or escalation of hospital-level of care
- Decision not to resuscitate or to de-escalate care because of poor prognosis
- Parenteral controlled substances
Number and Complexity of Problems Addressed at the Encounter

One element used in selecting the level of services is the number and complexity of the problems that are addressed at the encounter. Multiple new or established conditions may be addressed at the same time and may affect MDM. Symptoms may cluster around a specific diagnosis and each symptom is not necessarily a unique condition. Comorbidities and underlying diseases, in and of themselves, are not considered in selecting a level of E/M services unless they are addressed, and their presence increases the amount and/or complexity of data to be reviewed and analyzed or the risk of complications and/or morbidity or mortality of patient management. The final diagnosis for a condition does not, in and of itself, determine the complexity or risk, as extensive evaluation may be required to reach the conclusion that the signs or symptoms do not represent a highly morbid condition. Therefore, presenting symptoms which are likely to represent a highly morbid condition may drive MDM even when the ultimate diagnosis is not highly morbid. The evaluation and/or treatment should be consistent with the likely nature of the condition. Multiple problems of a lower severity may, in the aggregate, create higher risk due to interaction.

The term “risk” as used in these definitions relates to risk from the condition. While condition risk and management risk may often correlate, the risk from the condition is distinct from the risk of the management.

Definitions for the elements of MDM (see Table 2, Levels of Medical Decision Making) are:

**Problem:** A problem is a disease, condition, illness, injury, symptom, sign, finding, complaint, or other matter addressed at the encounter, with or without a diagnosis being established at the time of the encounter.

**Problem addressed:** A problem is addressed or managed when it is evaluated or treated at the encounter by the physician or other qualified health care professional reporting the service. This includes consideration of further testing or treatment that may not be elected by virtue of risk/benefit analysis or patient/parent/guardian/surrogate choice. Notation in the patient’s medical record that another professional is managing the problem without additional assessment or care coordination documented does not qualify as being addressed or managed by the physician or other qualified health care professional reporting the service. Referral without evaluation (by history, examination, or diagnostic study[ies]) or consideration of treatment does not qualify as being addressed or managed by the physician or other qualified health care professional reporting the service. For hospital inpatient and observation care services, the problem addressed is the problem status on the date of the encounter, which may be significantly different than on admission. It is the problem being managed or co-managed by the reporting physician or qualified health care professional and may not be the cause of admission or continued stay.

**Minimal problem:** A problem that may not require the presence of the physician or other qualified health care professional, but the service is provided under the physician’s or other qualified health care professional’s supervision (see 99211, 99281).

**Self-limited or minor problem:** A problem that runs a definite and prescribed course, is transient in nature, and is not likely to permanently alter health status.

**Stable, chronic illness:** A problem with an expected duration of at least one year or until the death of the patient. For the purpose of defining chronicity, conditions are treated as chronic whether or not stage or severity changes (eg, uncontrolled diabetes and controlled diabetes are a single chronic condition). “Stable” for the purposes of categorizing MDM is defined by the specific treatment goals for an individual patient. A patient who is not at his or her treatment goal is not stable, even if the condition has not changed and there is no short-term threat to life or function. For example, a patient with persistently poorly controlled blood pressure for whom better control is a goal is not stable, even if the pressures are not changing and the patient is asymptomatic. The risk of morbidity without treatment is significant.
**Acute, uncomplicated illness or injury:** A recent or new short-term problem with low risk of morbidity for which treatment is considered. There is little to no risk of mortality with treatment, and full recovery without functional impairment is expected. A problem that is normally self-limited or minor but is not resolving consistent with a definite and prescribed course is an acute, uncomplicated illness.

**Acute, uncomplicated illness or injury requiring hospital inpatient or observation level care:** A recent or new short-term problem with low risk of morbidity for which treatment is required. There is little to no risk of mortality with treatment, and full recovery without functional impairment is expected. The treatment required is delivered in a hospital inpatient or observation level setting.

**Stable, acute illness:** A problem that is new or recent for which treatment has been initiated. The patient is improved and while resolution may not be complete is stable with respect to this condition.

**Chronic illness with exacerbation, progression, or side effects of treatment:** A chronic illness that is acutely worsening, poorly controlled, or progressing with an intent to control progression and requiring additional supportive care or requiring attention to treatment for side effects.

**Undiagnosed new problem with uncertain prognosis:** A problem in the differential diagnosis that represents a condition likely to result in a high risk of morbidity without treatment.

**Acute illness with systemic symptoms:** An illness that causes systemic symptoms and has a high risk of morbidity without treatment. For systemic general symptoms, such as fever, body aches, or fatigue in a minor illness that may be treated to alleviate symptoms, see the definitions for self-limited or minor problem or acute, uncomplicated illness or injury. Systemic symptoms may not be general but may be single system.

**Acute, complicated injury:** An injury which requires treatment that includes evaluation of body systems that are not directly part of the injured organ, the injury is extensive, or the treatment options are multiple and/or associated with risk of morbidity.

**Chronic illness with severe exacerbation, progression, or side effects of treatment:** The severe exacerbation or progression of a chronic illness or severe side effects of treatment that have significant risk of morbidity and may require escalation in level of care.

**Acute or chronic illness or injury that poses a threat to life or bodily function:** An acute illness with systemic symptoms, an acute complicated injury, or a chronic illness or injury with exacerbation and/or progression or side effects of treatment, that poses a threat to life or bodily function in the near term without treatment. Some symptoms may represent a condition that is significantly probable and poses a potential threat to life or bodily function. These may be included in this category when the evaluation and treatment is consistent with this degree of potential severity.

**Amount and/or Complexity of Data to be Reviewed and Analyzed**

One element used in selecting the level of services is the amount and/or complexity of data to be reviewed or analyzed at an encounter.

**Analyzed:** Analyzed is a term describing the process of using the data as part of the MDM. The data element itself may not be subject to analysis (eg, glucose), but it is instead included in the thought processes for diagnosis, evaluation, or treatment. Tests ordered are presumed to be analyzed when the results are reported. Therefore, when they are ordered during an encounter, they are counted in that encounter. Tests that are ordered outside of an encounter may be counted in the encounter where they are analyzed. In the case of a recurring order, each new result may be counted in the encounter at which it is analyzed. For example, an encounter that includes an order for monthly prothrombin times would count for one prothrombin time ordered and reviewed. Additional future results, if analyzed in a subsequent encounter, may be counted as a single test in that subsequent encounter. Any service for which the professional component is separately reported by the physician or other qualified health care professional.
reporting the E/M services is not counted as a data element ordered, reviewed, analyzed, or independently interpreted for the purposes of determining the level of MDM.

Test: Tests are imaging, laboratory, psychometric, or physiologic data. A clinical laboratory panel (eg, basic metabolic panel [80047]) is a single test. The differentiation between single or multiple tests is defined in accordance with the CPT code set. For the purposes of data reviewed and analyzed, pulse oximetry is not a test.

Unique: A unique test is defined by the CPT code set. When multiple results of the same unique test (eg, serial blood glucose values) are compared during an E/M service, only count one unique test. Tests that have overlapping elements are not unique, even if they are identified with distinct CPT codes. For example, a CBC with differential would incorporate the set of hemoglobin, CBC without differential, and platelet count. A unique source is defined as a physician or qualified health care professional in a distinct group or different specialty or subspecialty, or a unique entity. Review of all materials from any unique source counts as one element towards MDM.

Combination of Data Elements: A combination of different data elements, for example a combination of notes reviewed, tests ordered, tests reviewed, or independent historian, allows these elements to be summed. It does not require each item type or category to be represented. A unique test ordered, plus a note reviewed and an independent historian would be a combination of three elements.

External: External records, communications and/or test results are from an external physician, other qualified health care professional, facility, or health care organization.

External physician or other qualified health care professional: An external physician or other qualified health care professional who is not in the same group practice or is of a different specialty or subspecialty. This includes licensed professionals who are practicing independently. The individual may also be a facility or organizational provider such as from a hospital, nursing facility, or home health care agency.

Discussion: Discussion requires an interactive exchange. The exchange must be direct and not through intermediaries (eg, clinical staff or trainees). Sending chart notes or written exchanges that are within progress notes does not qualify as an interactive exchange. The discussion does not need to be on the date of the encounter but is counted only once and only when it is used in the decision making of the encounter. It may be asynchronous (ie, does not need to be in person), but it must be initiated and completed within a short time period (eg, within a day or two).

Independent historian(s): An individual (eg, parent, guardian, surrogate, spouse, witness) who provides a history in addition to a history provided by the patient who is unable to provide a complete or reliable history (eg, due to developmental stage, dementia, or psychosis) or because a confirmatory history is judged to be necessary. In the case where there may be conflict or poor communication between multiple historians and more than one historian is needed, the independent historian requirement is met. It does not include translation services. The independent history does not need to be obtained in person but does need to be obtained directly from the historian providing the independent information.

Independent interpretation: The interpretation of a test for which there is a CPT code, and an interpretation or report is customary. This does not apply when the physician or other qualified health care professional who reports the E/M service is reporting or has previously reported the test. A form of interpretation should be documented but need not conform to the usual standards of a complete report for the test.

Appropriate source: For the purpose of the discussion of management data element (see Table 2, Levels of Medical Decision Making), an appropriate source includes professionals who are not health care professionals but may be involved in the management of the patient (eg, lawyer, parole officer, case manager, teacher). It does not include discussion with family or informal caregivers.
**Risk of Complications and/or Morbidity or Mortality of Patient Management**

One element used in selecting the level of services is the risk of complications and/or morbidity or mortality of patient management at an encounter. This is distinct from the risk of the condition itself.

**Risk:** The probability and/or consequences of an event. The assessment of the level of risk is affected by the nature of the event under consideration. For example, a low probability of death may be high risk, whereas a high chance of a minor, self-limited adverse effect of treatment may be low risk. Definitions of risk are based upon the usual behavior and thought processes of a physician or other qualified health care professional in the same specialty. Trained clinicians apply common language usage meanings to terms such as high, medium, low, or minimal risk and do not require quantification for these definitions (though quantification may be provided when evidence-based medicine has established probabilities). For the purposes of MDM, level of risk is based upon consequences of the problem(s) addressed at the encounter when appropriately treated. Risk also includes MDM related to the need to initiate or forego further testing, treatment, and/or hospitalization. The risk of patient management criteria applies to the patient management decisions made by the reporting physician or other qualified health care professional as part of the reported encounter.

**Morbidity:** A state of illness or functional impairment that is expected to be of substantial duration during which function is limited, quality of life is impaired, or there is organ damage that may not be transient despite treatment.

**Social determinants of health:** Economic and social conditions that influence the health of people and communities. Examples may include food or housing insecurity.

**Surgery (minor or major, elective, emergency, procedure or patient risk):**

- **Surgery-Minor or Major:** The classification of surgery into minor or major is based upon the common meaning of such terms when used by trained clinicians, similar to the use of the term “risk”. These terms are not defined by a surgical package classification.

- **Surgery-Elective or Emergency:** Elective procedures and emergent or urgent procedures describe the timing of a procedure when the timing is related to the patient’s condition. An elective procedure is typically planned in advance (e.g., scheduled for weeks later), while an emergent procedure is typically performed immediately or with minimal delay to allow for patient stabilization. Both elective and emergent procedures may be minor or major procedures.

- **Surgery-Risk Factors, Patient or Procedure:** Risk factors are those that are relevant to the patient and procedure. Evidence-based risk calculators may be used, but are not required, in assessing patient and procedure risk.

**Drug therapy requiring intensive monitoring for toxicity:** A drug that requires intensive monitoring is a therapeutic agent that has the potential to cause serious morbidity or death. The monitoring is performed for assessment of these adverse effects and not primarily for assessment of therapeutic efficacy. The monitoring should be that which is generally accepted practice for the agent but may be patient-specific in some cases. Intensive monitoring may be long-term or short-term. Long-term intensive monitoring is not performed less than quarterly. The monitoring may be performed with a laboratory test, a physiologic test, or imaging. Monitoring by history or examination does not qualify. The monitoring affects the level of MDM in an encounter in which it is considered in the management of the patient. An example may be monitoring for cytopenia in the use of an antineoplastic agent between dose cycles. Examples of monitoring that do not qualify include monitoring glucose levels during insulin therapy, as the primary reason is the therapeutic effect (unless severe hypoglycemia is a current, significant concern); or annual electrolytes and renal function for a patient on a diuretic, as the frequency does not meet the threshold.
Guidelines for Selecting Level of Service Based on Time

Certain categories of time-based E/M codes that do not have levels of services based on MDM (eg, Critical Care Services) in the E/M section use time differently. It is important to review the instructions for each category.

Time is not a descriptive component for the emergency department levels of E/M services because emergency department services are typically provided on a variable intensity basis, often involving multiple encounters with several patients over an extended period of time.

When time is used for reporting E/M services codes, the time defined in the service descriptors is used for selecting the appropriate level of services. The E/M services for which these guidelines apply require a face-to-face encounter with the physician or other qualified health care professional. For office or other outpatient services, if the physician’s or other qualified health care professional’s time is spent in the supervision of clinical staff who perform the face-to-face services of the encounter, use 99211.

For coding purposes, time for these services is the total time on the date of the encounter. It includes both the face-to-face and non-face-to-face time personally spent by the physician and/or other qualified health care professional(s) on the day of the encounter (includes time in activities that require the physician or other qualified health care professional and does not include time in activities normally performed by clinical staff). It does not include any time spent in the performance of other separately reported service(s).

A shared or split visit is defined as a visit in which a physician and other qualified health care professional(s) both provide the face-to-face and non-face-to-face work related to the visit. When time is being used to select the appropriate level of services for which time-based reporting of shared or split visits is allowed, the time personally spent by the physician and other qualified health care professional(s) assessing and managing the patient on the date of the encounter is summed to define total time. Only distinct time should be summed for shared or split visits (ie, when two or more individuals jointly meet with or discuss the patient, only the time of one individual should be counted).

When prolonged time occurs, the appropriate prolonged services code may be reported. The total time on the date of the encounter spent caring for the patient should be documented in the medical record when it is used as the basis for code selection.

Physician or other other qualified health care professional time includes the following activities, when performed:

- preparing to see the patient (eg, review of tests)
- obtaining and/or reviewing separately obtained history
- performing a medically appropriate examination and/or evaluation
- counseling and educating the patient/family/caregiver
- ordering medications, tests, or procedures
- referring and communicating with other health care professionals (when not separately reported)
- documenting clinical information in the electronic or other health record
- independently interpreting results (when not separately reported) and communicating results to the patient family/caregiver
- care coordination (when not separately reported)

Do not count time spent on the following:

- the performance of other services reported separately
- travel
- teaching that is general and not limited to discussion that is required for the management of the specific patient

Unlisted Service

An E/M service may be provided that is not listed in this section of the CPT codebook. When reporting such a service, the appropriate unlisted code may be used to indicate the service, identifying it by “Special Report,” as discussed in the following paragraph. The “Unlisted Services” and accompanying codes for the E/M section are as follows:

99429 Unlisted preventive medicine service

99499 Unlisted evaluation and management service

Special Report

An unlisted service or one that is unusual, variable, or new may require a special report demonstrating the medical appropriateness of the service. Pertinent information should include an adequate definition or description of the nature, extent, and need for the procedure and the time, effort, and equipment necessary to provide the service. Additional items that may be included are complexity of symptoms, final diagnosis, pertinent physical findings, diagnostic and therapeutic procedures, concurrent problems, and follow-up care.
CPT Code: 99483

Tracking Number L1

Original Specialty Recommended RVU: 3.80
Presented Recommended RVU: 3.50
RUC Recommended RVU: 3.50

CPT Descriptor: Assessment of and care planning for a patient with cognitive impairment, requiring an independent historian, in the office or other outpatient, home or domiciliary or rest home, with all of the following required elements:
- Cognition-focused evaluation including a pertinent history and examination;
- Medical decision making of moderate or high complexity,
- Functional assessment (eg, basic and instrumental activities of daily living), including decision-making capacity,
- Use of standardized instruments for staging of dementia (eg, functional assessment staging test [FAST], clinical dementia rating [CDR]),
- Medication reconciliation and review for high-risk medications,
- Evaluation for neuropsychiatric and behavioral symptoms, including depression, including use of standardized screening instrument(s),
- Evaluation of safety (eg, home), including motor vehicle operation,
- Identification of caregiver(s), caregiver knowledge, caregiver needs, social supports, and the willingness of caregiver to take on caregiving tasks,
- Development, updating or revision, or review of an Advance Care Plan,
- Creation of a written care plan, including initial plans to address any neuropsychiatric symptoms, neuro-cognitive symptoms, functional limitations, and referral to community resources as needed (eg, rehabilitation services, adult day programs, support groups) shared with the patient and/or caregiver with initial education and support.

Typically, 60 minutes of total time is spent on the date of the encounter.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: An 83-year-old female with hypertension, diabetes, arthritis, and coronary artery disease presents with confusion, weight loss, and failure to maintain her house, where she lives alone.

Percentage of Survey Respondents who found Vignette to be Typical: 93%

Description of Pre-Service Work: The medical history form is reviewed, and rating scales are completed by the patient and/or family or caregiver. Any medical records obtained from other physicians and other sources (eg, caregiver) are reviewed. Other healthcare professionals are contacted, as necessary.

Description of Intra-Service Work: A complete history, including a focus on the patient's decline, is obtained from the patient, family, and/or caregiver to include identification of potential symptoms that may indicate confounding underlying disease. Vital signs are reviewed. A pertinent physical examination and assessment of affect, cognition, and functional status (basic activities of daily living and instrumental activities of daily living) are performed, including decision-making capacity, mobility, balance, vision, hearing, psychosocial function, and safety (ie, at home and/or driving). The patient is evaluated for neuropsychiatric and behavioral symptoms, including depression, mood instability, psychotic symptoms,
aggression, apathy, and other behavioral disturbance. The stage of dementia is assessed using standardized instruments. A medication reconciliation is completed, and a review for high-risk medications that may affect cognition (separate from rating scales noted in preservice) is performed. The values and preferences of the patient and caregiver for care and goals of care (eg, quality of life, advance care planning) are discussed. The caregivers’ relationship to the patient, availability, knowledge, general capability (eg, any physician limitation), and ability and willingness to implement a care plan are evaluated and discussed. Relevant data, options, and risks are considered. A diagnosis is formulated, and a care plan (moderate to high-complexity medical decision making) is developed. A meeting with the clinical care team is held to review findings and develop a care plan. Based on medication reconciliation, a prescription(s) is written, and arrangements for diagnostic testing or referral are made, as necessary. The written care plan is created, and a copy is provided to the patient and/or family or caregiver. Findings and the care plan are reviewed with the patient and/or family or caregiver, to include the etiology and severity of the cognitive impairment, goals of treatment, changes in medication, and recommendations for physical and/or occupational therapy. Safety issues are addressed, caregiving issues are discussed, and recommendations for appropriate community services (eg, rehabilitation services, adult day programs, support groups) are made.

Description of Post-Service Work: Medical record documentation is completed. Other physicians are contacted as necessary to review findings and the care plan. If requested by clinical staff, the patient and/or caregiver are contacted to discuss test results, adverse reactions to medication, and new clinical issues. The care plan is revised, if needed, based on test results.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC’s rationale, please review the separate RUC recommendation document.
CPT code 99483 was surveyed as the code description was revised by the CPT Editorial Panel to replace “50” from its descriptor with “XX minutes (to be determined via RUC survey) of total time on the date of the encounter is spent on the date of the encounter” to align with the principles included in the office or other outpatient E/M services (99202-99215).

The code was surveyed by the American Academy of Neurology (AAN), the American Geriatrics Society (AGS), and the American College of Physicians (ACP). The survey results were reviewed by an expert panel comprised of the surveying specialties which formulated its recommendations based on that review.

There were 74 respondents, of whom 93% found the vignette to be typical. The survey median RVU was 4.00 with a pre-time of 11 minutes, intra-time of 60 minutes, and post-time of 15 minutes and total time of 86 minutes. The 25th percentile work RVU was 3.5. The first key reference service (chosen by 45 respondents) was 99205, Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and high level of medical decision making. When using time for code selection, 60-74 minutes of total time is spent on the date of the encounter, with times and work RVU of 14/59/15/88/3.5. The second key reference service was 90792, Psychiatric diagnostic evaluation with medical services, with times and work RVU of 10/60/20/90/4.16.

As a threshold matter, the expert panel agreed that the QHP work for 99483 is still greater than the work of 99205 and agreed with CMS that the increase in work for 99205 (from 3.17 to 3.5) required an increase in work to maintain appropriate rank order. Then the expert panel reviewed the survey data and noted that while the total time went up by one minute, the intra-service time increased by 10 minutes (20%) which supports maintaining the current work RVU of 3.8. The expert panel also noted that while the survey times were very similar to the times for 99205, the current work RVU of 3.8, which is between the 25th percentile and the median, places 99483 in proper rank order with 99205. The panel also noted that 90792 has the same intra-service time as the survey median and four minutes more total time with a work RVU of 4.16 which places it in the correct rank order with 99483 at a work RVU of 3.8.

The expert panel reviewed other RUC reviewed XXX global codes with intra-time between 40 and 75 minutes, total time between 75 and 100 minutes, and work RVU between 3.4 and 4.1. Sixteen codes fit these parameters. Several were codes that are currently undergoing RUC review. The expert panel noted that the other codes supported maintaining the current work RVU. Specifically, 99496, Transitional Care Management Services with the following required elements: Communication (direct contact, telephone, electronic) with the patient and/or caregiver within 2 business days of discharge Medical decision making of high complexity during the service period Face-to-face visit, within 7 calendar days of discharge, was RUC reviewed in 2018, and has times and work RVU of 0/75/0/75/3.79 and 95720, Electroencephalogram (EEG), continuous recording, physician or other qualified health care professional review of recorded events, analysis of spike and seizure detection, each increment of greater than 12 hours, up to 26 hours of EEG recording, interpretation and report after each 24-hour period; with video (VEEG), which was RUC reviewed in 2018, has times and work RVU of 10/55/10/75/3.86.

Therefore, the expert panel recommends the survey times: pre-service time of 11 minutes, intra-service time of 60 minutes, and post-service time of 15 minutes and to maintain the current work RVU of 3.8.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   □ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   □ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   □ Multiple codes allow flexibility to describe exactly what components the procedure included.
   □ Multiple codes are used to maintain consistency with similar codes.
   □ Historical precedents.
2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. N/A

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 99483

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

- Specialty Neurology: How often? Sometimes
- Specialty Internal Medicine: How often? Sometimes
- Specialty Nurse Practitioner: How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 136935
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. We anticipate 3 times the annual Medicare utilization; based on 2019 utilization data.

<table>
<thead>
<tr>

Do many physicians perform this service across the United States? Yes

Berenson-Eggers Type of Service (BETOS) Assignment
Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Evaluation Management

BETOS Sub-classification:
Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 99483.

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

   The practice expense survey tool was approved by the AMA Research Subcommittee. 58 respondents completed Survey Part 2 “Direct practice expense detail” of the 98943 RUC survey.
Advisors and subject matter experts from AAN, ACP and AGS met by phone and via email to review the survey data and existing PE inputs to develop final recommendations presented in the PE spreadsheet. The expert panel agreed that the service has not significantly changed since last surveyed in 2018 and as such agreed it is appropriate to maintain the existing PE inputs. 3 clinical activities that were part of the PE Survey have been added:

- CA049 (identify need for imaging, lab or other test result(s) and ensure information has been obtained – day of
- CA050 (review and document history, systems, and medications
- CA052 (coordinate home or outpatient care)

70% of PE survey respondents listed 0 minutes of clinical staff time as typical for the intra-service (of the service period.) The expert panel did not agree with the survey median time of 0 as there are numerous activities performed by clinical staff as explained in detail in Question #10. As such, the expert panel agreed some PE survey respondents may have interpreted the question asking about “other clinical activity on the calendar day of the cognitive assessment and care plan services visit” to mean duties outside of 99483, and 0 minutes is not typical.

In response to questions from the pre-facilitation PE Reviewers, the specialty societies further clarified with survey participants if clinical staff are present with the physician or QHP when performing their duties and the feedback was no. The expert panel asserts CA021 is the appropriate clinical staff activity for the intra service period and are recommending 45 minutes (as outlined in question #10).

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code, but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here (for service reviewed prior to the implementation of clinical activity codes, detail is not provided in the RUC database, please contact Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org for PE spreadsheets for your reference codes):

<table>
<thead>
<tr>
<th>Reference Code</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>99205</td>
<td>99205 was selected as the reference code for practice expense as it was the key reference service chosen by respondents on the RUC survey.</td>
</tr>
</tbody>
</table>

3. Is this code(s) typically reported with an E/M service?
   Is this code(s) typically reported with the E/M service in the nonfacility?
   (Please see provided data titled Medicare Same Day NF EM Billed Together - NF Dom Spec in the RUC Review Resource Materials)

<table>
<thead>
<tr>
<th>Yes/No</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td></td>
</tr>
</tbody>
</table>

4. What specialty is the dominant provider in the nonfacility?
   What percent of the time does the dominant provider provide the service(s) in the nonfacility?
   Is the dominant provider in the nonfacility different than for the global?
   (Please see provided data titled Medicare Same Day NF EM Billed Together - NF Dom Spec in the RUC Review Resource Materials)

<table>
<thead>
<tr>
<th>Specialty</th>
<th>Percent</th>
</tr>
</thead>
<tbody>
<tr>
<td>Neurology</td>
<td>32%</td>
</tr>
</tbody>
</table>

Neurology is dominant provide for global as well.
5. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time:

   CA006-confirm availability of prior images / studies. 
   Standard time is 2 minutes for use in imaging services. The current RUC approved input is 6 minutes and includes gathering medical records obtained from other sources (including history, x-rays and labs if applicable) and referral (where applicable) and prepare for physician review prior to visit. It is typical that a patient being seen for this service will have previous CT and/or MRI scan(s) given the extent of their cognitive impairment. 
   Also gathering any pre-existing advance care directives and surrogate decision maker forms. 
   During the RUC PE Subcommittee meeting there was a suggestion to move the 6 minutes to CA048 (Identify need for imaging, lab or other test result(s) and ensure information has been obtained - three days prior (to be used with E/M only)) as CA006 is for imaging services only. The specialty societies agreed CA048 more accurately describes the activities.

6. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies for the code family, please provide compelling evidence (please see PE compelling evidence guidelines) Please explain if the increase can be entirely accounted for because of an increase in physician time:

   N/A

7. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (please see second worksheet in PE spreadsheet workbook), please explain the difference here:

   N/A

8. How much time was allocated to clinical activity, obtain vital signs (CA010) prior to CMS increasing the clinical activity to 5 minutes for calendar year 2018? The standard for clinical activity, obtains vital signs remains 0, 3 and 5 based on the number of vital signs taken. Please provide a rationale for the clinical staff time that you are requesting for obtain vital signs here:

   N/A – code was established in 2018. The current RUC approved input for CA010 for 99483 is 3 minutes. Vitals obtained when performing the service include weight, blood pressure, heart rate and respiratory rate.

9. Please provide a brief description of the clinical staff work for the following:
   a. Pre-Service period:
      • Conduct initial phone call for preliminary assessment of cognitive function to determine if cognitive assessment is appropriate, identify caregivers, who should be present at the visit to provide additional information and with whom the care plan should be shared, and explain what the assessment entails, schedule the visit (and convince patient to come, if necessary).
      • Gather medical records obtained from other sources (including history, x-rays and labs if applicable) and referral (where applicable) and prepare for physician review prior to visit.
      • Gather any pre-existing advance care directives, surrogate decision maker forms.
   b. Service period (includes pre, intra and post):
**AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)**

**PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)**

### Pre-Service Clinical Labor Activities (of Service Period):
- Greet patient (and caregiver, if applicable) and direct to exam room.
- Administer and collate forms for assessing mood, cognitive status, nutrition, functional status for the provider to use.
- Obtain vital signs.

### Intra-Service Clinical Labor Activities (of Service Period):
- Gather additional history from caregiver when patient is being examined in a different room including assessing nutritional status, additional caregiver history, ability to participate in activities of daily living, ability to participate in social activities (e.g., adult day memory care center.)
- Administer initial dementia staging screen with standardized instrument prior to physician review.
- Initial medication reconciliation and preparation for physician review
- Administer screen for behavioral symptoms including depression (e.g., PHQ9) for physician review.
- Conduct initial safety screen (e.g., home) including motor vehicle operation.
- Meet with physician and clinical care team to develop written care plan. Compile written care plan inputs from provider include advance care documents. (conveyed in results / outcomes of activities above)
- Meet with family to share and discuss care plan and to educate patient and caregiver on care plan including use of community resources.

### Post-Service Clinical Labor Activities (of Service Period):
- Clean room and any utilized equipment

### Post-service period:
- Follow up phone calls between visits with patient, family, community resources, pharmacy.
- Coordinate future care including home or outpatient care.

10. Please provide granular detail regarding what the clinical staff is doing during the intra-service (of service period) clinical activity, *assist physician or other qualified healthcare professional—directly related to physician work time* or *Perform procedure/service—NOT directly related to physician work time*:

### Intra-Service Clinical Labor Activities (of Service Period):
- Gather additional history from caregiver when patient is being examined in a different room including assessing nutritional status, additional caregiver history, ability to participate in activities of daily living, ability to participate in social activities (e.g., adult day memory care center.) (10 min)
- Administer initial dementia staging screen with standardized instrument prior to physician review (5 min)
- Initial medication reconciliation and preparation for physician review (10 min)
- Administer screen for behavioral symptoms including depression (e.g., PHQ9) for physician review (10 min)
- Conduct initial safety screen (e.g., home) including motor vehicle operation (5 mins)
11. If you have used a percentage of the physician intra-service work time other than 100 or 67 percent for the intra-service (of service period) clinical activity, please indicate the percentage and explain why the alternate percentage is needed and how it was derived.

N/A

12. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (please see second worksheet in PE spreadsheet workbook):

N/A

13. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov.

N/A

INVOICES

14. ☐ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

15. ☐ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

16. If you wish to include a supply that is not on the list (please see fourth worksheet in PE spreadsheet workbook) please provide a paid invoice. Identify and explain the invoice here:

N/A

17. Are you recommending a PE supply pack for this recommendation? Yes or No.
   If Yes, please indicate if the pack is an established package of supplies as defined by CMS (eg, SA047 pack, E/M visit) or a pack that is commercially available?

   Yes – SA047

18. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation. Please include the description, CMS supply code, unit, item quantity and unit price (if available). See documents two and three under PE reference materials on the RUC Collaboration Website for information on the contents of kits, packs and trays.

SA047

(% indicates percentage of survey responses that found supply typical)

19. If you wish to include an equipment item that is not on the list (please see fifth worksheet in PE spreadsheet workbook) please provide a paid invoice and the useful life. Identify and explain the invoice here:

N/A

20. Have you recommended equipment minutes for a computer or equivalent laptop/integrated computer, equipment item computer, desktop, w-monitor, ED021 or notebook (Dell Latitute D600), ED038?
   a. If yes, please explain how the computer is used for this service(s).
   b. Is the computer used exclusively as an integral component of the service or is it also used for other purposes not specific to the code?
   c. Does the computer include code specific software that is typically used to provide the service(s)?

N/A

21. List all the equipment included in your recommendation and the equipment formula chosen (please see document titled Calculating equipment time). If you have selected “other formula” for any of the equipment please explain here:

   EQ189 otoscope-ophthalmoscope (wall unit): “office visits” equipment formula
   EF023 table, exam: “office visits” equipment formula
   EF048 portable stand-on scale: “other” equipment formula

22. If there is any other item(s) on your spreadsheet not covered in the categories above that require greater detail/explanation, please include here:

PROFESSIONAL LIABILITY INSURANCE (PLI) INFORMATION

23. If this is a PE only code please select a crosswalk based on a similar specialty mix:

N/A

ITEMIZED LIST OF CHANGES (FOLLOWING THE PE SUBCOMMITTEE MEETING)
During and immediately following the review of this tab at the PE Subcommittee meeting, please revise the summary of recommendation (PE SOR) based on modifications made during the meeting. Please submit the revised form electronically to Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org immediately following the close of business the same day that the tab is reviewed. On the PE spreadsheet, please highlight the cells and/or use red font to show the changes made during the PE Subcommittee meeting (if you have provided any of this highlighting based on changes from the reference code prior to the PE Subcommittee meeting please remove it, so not to be confused with changes made during the meeting). In addition to those revisions please also provide an itemized list of the modifications made to the PE spreadsheet during the PE Subcommittee meeting in the space below (e.g. clinical activity CA010 obtain vital signs was reduced from 5 minutes to 3 minutes).

NOTE: The virtual meetings have provided for real-time updates to the PE spreadsheets. PE SORs must still be updated and resubmitted asap.

Insertion of Spinal Stability Distractive Device – Tab 17

In July 2020, the Relativity Assessment Workgroup reviewed an action plan for 22867 and 22868 and recommended to remove them from new technology list because there was no demonstrated technology diffusion that impacts work or practice expense. The primary performers of these services did not comment on 22869/22870, as those services are typically performed by other providers. The Workgroup requested an action plan from the primary performers of code 22869 and 22870 (interventional pain management, pain management, anesthesiology and physical medicine and rehabilitation) for review. In December 2020, the Relativity Assessment Workgroup noted that these services are now performed predominantly by a specialty(s) other than the specialty(s) that initially surveyed making the review for new technology difficult to assess. The RUC recommended that CPT codes 22869 and 22870 be surveyed for the April 2021 RUC meeting.

22869 Insertion of interlaminar/interspinous process stabilization/distraction device, without open decompression or fusion, including image guidance when performed, lumbar; single level

The RUC reviewed the survey results from 75 physicians and determined that a value between the survey 25th percentile of 6.75 and survey median of 8.00 would most accurately reflect the typical physician work necessary to perform this service. Therefore, the RUC recommends maintaining the current work value for this service of 7.03. The RUC recommends 33 minutes of pre-service evaluation, 12 minutes of pre-service positioning, 10 minutes of pre-service scrub/dress/wait time, 45 minutes of intra-service time, 17 minutes of immediate post-service time, a ½ 99238 discharge visit, 1-99213 and 1-99212 post-operative office visits. The specialties noted that the current work for the procedure, as well as the typical patient, has not changed since the previous survey in 2016, only the dominant specialty has changed from surgeon to anesthesiologist and pain physician.

To justify a value of 7.03, the RUC compared 22869 to CPT code 22511 Percutaneous vertebroplasty (bone biopsy included when performed), 1 vertebral body, unilateral or bilateral injection, inclusive of all imaging guidance; lumbosacral (work RVU= 7.33, intra-service time of 45 minutes, total time of 150 minutes) and noted that both services have identical intra-service times, though the survey code involves more total time. The RUC also compared the survey code to 2nd key reference code 29880 Arthroscopy, knee, surgical; with meniscectomy (medial AND lateral, including any meniscal shaving) including debridement/shaving of articular cartilage (chondroplasty), same or separate compartment(s), when performed (work RVU= 7.39, intra-service time of 45 minutes, total time of 199 minutes) and noted that both services are typically outpatient, involve an identical amount of intra-service time and a similar overall amount of physician work. The RUC concluded that the value of CPT code 22869 should be maintained at 7.03 work RVUs, between the 25th percentile and median of the survey. The RUC recommends a work RVU of 7.03 for CPT code 22869.
22870 Insertion of interlaminar/interspinous process stabilization/distraction device, without open decompression or fusion, including image guidance when performed, lumbar; second level (List separately in addition to code for primary procedure)

The RUC reviewed the survey results from 75 physicians and concurred that maintaining the current work value of 2.34 appropriately accounts for the work required to perform this service and is substantially below the survey 25th percentile. The RUC noted that the survey 25th percentile work value of 3.63 supports this recommendation. The RUC recommends 45 minutes of intra-service time for this add-on code.

The RUC compared the survey code to CPT code 15772 Grafting of autologous fat harvested by liposuction technique to trunk, breasts, scalp, arms, and/or legs; each additional 50 cc injectate, or part thereof (List separately in addition to code for primary procedure) (work RVU= 2.50, intra-service and total time of 45 minutes) and noted that both add-on services involve the same amount of time to perform. The RUC also compared the survey code to CPT code 13153 Repair, complex, eyelids, nose, ears and/or lips; each additional 5 cm or less (List separately in addition to code for primary procedure) (work RVU= 2.38, intra-service and total time of 45 minutes), which also requires the same amount of physician time to further support a value of 2.34 for the survey code. The RUC concluded that the current value of CPT code 22870, which falls below the 25th percentile of the survey, should be maintained. **The RUC recommends a work RVU of 2.34 for CPT code 22870.**

Practice Expense
The RUC recommends the direct practice expense inputs as submitted by the specialty society.

**RUC Database Flag**
The RUC noted that CPT code 22870 should be flagged as “Do not use to validate for physician work.”

SUMMARY OF RECOMMENDATION

CPT Code: 22869  Tracking Number  
Global Period: 090  Current Work RVU:  7.03

Original Specialty Recommended RVU: 7.03
Presented Recommended RVU: 7.03
RUC Recommended RVU: 7.03

CPT Descriptor: Insertion of interlaminar/interspinous process stabilization/distraction device, without open decompression or fusion, including image guidance when performed, lumbar; single level

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A skeletally mature adult with progressive low-back pain and leg pain due to a history of neurogenic claudication is unresponsive to conservative treatments. The patient achieves some relief from symptoms in flexion. Imaging confirms mild to moderate spinal stenosis at the L4-L5 level, with approximately 50% reduction in spinal canal area. The implantation of a posterior interspinous process distraction device at one level without an open decompression or a fusion is recommended.

Percentage of Survey Respondents who found Vignette to be Typical: 92%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 32% , In the ASC 67%, In the office 1%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 92% , Overnight stay-less than 24 hours 8% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Perform a targeted H&P. Write orders for preoperative medications and performance standards. Review the surgical procedure, postoperative recovery in and out of the hospital, and expected outcome(s) with the patient and family. Sign and mark the operative site. Obtain informed consent. Verify that all necessary surgical instruments, supplies, and devices are available in the operative suite. Review imaging, and select and display appropriate pictures. Review the length and type of anesthesia with the anesthesiologist. Monitor initial patient positioning for induction of anesthesia. Following induction of anesthesia, assist with repositioning of patient prone with the lumbar spine in flexion. Verify and/or assist with padding of patient to prevent pressure on neurovascular structures and placement of chin straps and arm traction devices to facilitate intraoperative imaging. Supervise prepping/draping of the patient. Scrub and gown. Perform a time out to confirm patient and procedure with the OR staff.

Description of Intra-Service Work: Intraoperative imaging is used to identify the correct level and plan the surgical incision. A posterior lumbar incision is made through the skin, subcutaneous tissue, and lumbosacral fascia. A dilator is inserted through the incision and advanced between the spinous processes and into the interspinous process space under fluoroscopic guidance to confirm levels, position and depth. Additional larger dilators are inserted until the space is distracted to the correct degree. A gauge is used to determine the distance between the two spinous processes, and determine the appropriate implant size. The implant is selected and size verified. The implant is inserted and fixed into place. Final imaging (AP and lateral fluoroscopy) is obtained to confirm proper implant position. Copious irrigation is used and the wound is closed in layers.

Description of Post-Service Work: Hospital: Apply sterile dressings. Monitor patient during reversal of anesthesia. Assist in transfer of patient from operating table to gurney. Monitor transport of patient from operating room to recovery room. Discuss postoperative recovery care with anesthesia and nursing staff. Discuss procedure and outcome with family in
waiting area. Write brief operative note or complete final operative note in chart. Write postoperative note in the recovery room. Dictate operative report and copy referring physician(s). Write orders for transferring to surgical floor and discuss ongoing care with floor nurses.

Later same day and on each day patient is in the facility, monitor and document patient progress. Assess pain scores and adequacy of analgesia. Review nursing/other staff patient chart notes. Write orders for labs, imaging, medications, diet, and patient activity. Chart patient progress notes. Answer patient and family questions. Answer nursing/other staff questions.

Next day or several days later. Write orders for follow-up, post-discharge labs, imaging, home care, and physical therapy. Write prescriptions for medications needed post-discharge. Home restrictions (ie, diet, activity, bathing) are discussed with the patient, family members and discharging nurse. All appropriate medical records are completed, including day of discharge progress notes, discharge summary and discharge instructions, and insurance forms.

SURVEY DATA

RUC Meeting Date (mm/yyyy) 04/2021

Presenter(s): David Reece, DO, Richard Rosenquist, MD, Michael Lubrano, MD, Damean Freas, MD, Kano Mayer, MD, Karin Swartz, MD

Specialty Society(ies): AAPM&R, ASA, ASIPP, NANS, NASS

CPT Code: 22869

Sample Size: 1746 Resp N: 75

Description of Sample: Targeted vendor sample and random society sample

### Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

*The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC’s rationale, please review the separate RUC recommendation document.*

### Background
In June 2020, the RUC’s Relativity Assessment Workgroup (RAW) flagged four CPT codes (22867, 22868, 22869 and 22870) for review under the New Technology Screen. The four codes were originally surveyed in 2015 for inclusion in the 2016 CPT and the Medicare Physician Fee Schedule (PFS). In 2015, the RUC recommended 7.39 work RVUs for 22869 and 2.34 wRVUs for 22870. Subsequently, in the 2016 Medicare PFS CMS finalized a reduced value of 7.03 work RVUs for 22869 but accepted the RUC recommendation of 2.34 work RVUs for 22870.

The initial RAW Action Plan for the four codes was developed by the specialty societies that surveyed the codes in 2015: the American Academy of Neurological Surgeons/Congress of Neurological Surgeons (AANS/CNS), the American Academy of Orthopaedic Surgeons (AAOS), the North American Spine Society (NASS) and the International Society for the Advancement of Spine Surgery (ISASS). In their action plan the original surveying societies noted that codes 22869 (Insertion of interlaminar/interspinous process stabilization/distraction device, without open decompression or fusion, including image guidance when performed, lumbar; single level) and 22870 (Insertion of interlaminar/interspinous process stabilization/distraction device, without open decompression or fusion, including image guidance when performed, lumbar; second level (List separately in addition to code for primary procedure)) were performed predominately by interventional pain physicians and anesthesiologists; and therefore recommended these societies review the codes and present an action plan for the next RAW meeting.

For the RAW’s December 2020 meeting, anesthesiology and the interventional pain societies (American Society of Anesthesiologists-ASA, American Academy of Physical Medicine and Rehabilitation –(AAPM&R), North American Spine Society (NASS), and the American Society of Interventional Pain Physicians (ASIPP)) presented an action plan recommending no action and maintaining current value. The RUC disagreed and requested the societies resurvey the codes.

The societies, along with the North American Neuromodulation Society (NANS) proceeded with a survey of the two codes. In preparing the survey, the societies submitted a request to the RUC Research Subcommittee (RSC) to use a list from the vendor of physicians trained to perform the service as well as random samples of members from the surveying societies. The RSC approved the request at their February 2021 meeting. The surveying societies noted that their members do not report other 90-day global codes so would have a difficult time using one as an accurate reference code. The societies requested approval to include 10-day global codes in the RSL. The RSC did not approve this request and advised the specialties to use 90-day global codes that their members may be familiar with from training. The societies followed this guidance and the RSL that was used did not include any 010 global codes per the RSC guidance.

The societies conducted their survey in March 2021, using the approved vendor contact list and blending this with random samples from respective societies.

There were a total of 75 non-conflicted responses, of which 56 were from the vendor list and 19 were from society lists. The median experience in the previous 12 months for all respondents was 10 for 22869 and 5 for 22870. For the trained physicians who responded the median experience in the previous 12 months was 10 for 22869 and 2 for 22870.

**Recommendation – 22869**

*Work RVU*

The Survey median work RVU was 8.00 and the survey 25th % was 6.75.

We recommend maintaining the current work RVU of 7.03 which sits in-between the survey 25th % and the median.

*Pre-Service Time*

The societies recommend package 3 for pre-service package time which was also the recommended package in the original survey.

We recommend 33 minutes of pre-service evaluation time with no change from package 3.

We recommend 12 minutes of pre-service positioning time, which is the survey median. As this is a spine procedure/prone position 9 minutes are recommended in addition to the 3 minutes package time. Current positioning time is 15 minutes.

We recommend 10 minutes of pre-service Scrub, Dress and Wait (SDW) time, which is 5 minutes less than the SDW time for package 3 and 5 minutes less than the current SDW time. 10 minutes was the median time from the survey.
Intra-Service Time

The societies recommend 45 minutes intra-service time, which is the survey median. This is nearly identical to the current/previous intra-service time of 43 minutes.

Immediate Post-Service Time

The societies recommend Immediate Post-Service package 9a but recommend subtracting 12 minutes to equal the 17 minutes median survey time. This is less than the current post-service time of 30 minutes, but the previous survey median immediate post-service time was 20 minutes. An additional 10 minutes of immediate post-service time was added by recommendation to reflect the previous survey respondents indicating the primary site-of-service as outpatient with a follow-up E/M visit on the same day as the procedure. The RUC database billed together data indicates that no other services (other than the add-on code 22870) are billed on the same day.

Post-Service Visits and Site-of-Service

Survey respondents indicated the primary site-of-service as ASC, with 67% indicating they typically perform the procedure in this facility setting. 32% indicated they typically perform the procedure in a hospital setting and 1% indicated office as their typical site of service.

Societies recommend a half-day discharge for the facility ASC setting with no additional time for a visit on the same day of service.

Survey respondents indicated a median of 3 level 3 post-operative office visits. The societies, however, recommend maintaining the current post-operative office visits at 1-99213 and 1-99212 to maintain consistency with the current values and times.

Key Reference Code Comparison

KRS1: The most typical KRS was CPT code 63655 (Laminectomy for implantation of neurostimulator electrodes, plate/paddle, epidural) with respondents who chose 63655 as a reference indicated the intensity/complexity of 63655 as less or much less than 22867.

KRS2: The second most common KRS was CPT code 29880 (Arthroscopy, knee, surgical; with meniscectomy (medial AND lateral, including any meniscal shaving) including debridement/shaving of articular cartilage (chondroplasty), same or separate compartment(s), when performed). 29880 has the same intra-service time as 22867 at 45 minutes and a very similar work RVU at 7.39. 29880 was also the code the RUC used to crosswalk 22867 to in the 2015 RUC review and is equal to the 2015 RUC recommended value. Survey respondents indicated its intensity and complexity to be less than the survey code of 22867.

MPC Codes

22869’s current value and our recommended work RVU of 7.03 is well bracketed by MPC codes with the same intra-service time and similar intensities and total times. The two MPC codes are CPT 15823 with a work RVU of 6.82 and CPT 26115 with a work RVU of 7.07.
CPT Code: 22869

Other Code Comparison

CPT code 29881 (Arthroscopy, knee, surgical; with meniscectomy (medial OR lateral, including any meniscal shaving) including debridement/shaving of articular cartilage (chondroplasty), same or separate compartment(s), when performed) represents the CMS crosswalk code for 22867 and the societies believe is currently a good crosswalk to support the current 7.03 work RVU. The two codes have identical intra-service time, similar pre-service times, and 22867 is appropriately slightly higher in intensity.

Summary

The societies recommend for CPT code 22869 (Insertion of interlaminar/interspinous process stabilization/distraction device, without open decompression or fusion, including image guidance when performed, lumbar; single level) the following:

Work RVU: 7.03 (current value)

Pre-Service Package: 3
- Evaluation: 33 minutes
- Positioning: 12 minutes (spine/prone)
- SDW: 10 minutes

Intra-Service Time: 45 minutes

Immediate Post Service Package: 9A -13 minutes to equal 17 minutes (survey median SDW time)

Hospital Discharge: 0.5 - 99238

Office Visits: 1-99213, 1-99212

Total Time: 178 minutes

The societies believe the survey data supports the current value and shows that the work performed by anesthesiology and interventional pain physicians to be identical to the previous work survey performed by spine surgeons in 2015 and
recommend current value with time inputs either remaining the same as current or adjusted to median survey results when appropriate.

The current work for the procedure, as well as the typical patient, has not changed since the previous survey, only the dominant specialty has changed from surgeon to anesthesiologist and pain physician. It is also not surprising for there to be shifts in the type of physician performing a procedure that is relatively new such as 22869 and 22870 while the patient and work remains the same. Furthermore, there would be no reason to expect the pre-service or post-service physician work to change substantially based on the type of physician performing the service. The survey data, showing the same or slightly more time in the pre, intra, and post-service periods, confirms this relative consistency even as the type of physician performing the procedure has changed.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
☐ Different specialties work together to accomplish the procedure; each specialty codes part of the physician work using different codes.
☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
☐ Multiple codes are used to maintain consistency with similar codes.
☐ Historical precedents.
☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) Existing code 22869

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Interventional Pain Management How often? Rarely
Specialty Pain Management How often? Rarely
Specialty Anesthesiology How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 20385
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on relative volume of Medicare utilization

Specialty Interventional Pain Management Frequency 6279 Percentage 30.80%
Specialty Pain Management Frequency 5688 Percentage 27.90%
Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 6,795
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2019 Medicare utilization data

CPT Descriptor: Insertion of interlaminar/interspinous process stabilization/distraction device, without open decompression or fusion, including image guidance when performed, lumbar; second level (List separately in addition to code for primary procedure)

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A skeletally mature adult with progressive low-back pain and leg pain due to a history of neurogenic claudication is unresponsive to conservative treatments. The patient achieves some relief from symptoms while in flexion. Imaging confirms mild to moderate spinal stenosis at the L3-L4 level with 25% reduction in the canal area and at L4-L5 with a 50% reduction. The implantation of a posterior interspinous process distraction device without an open decompression or a fusion at both levels is recommended.

Percentage of Survey Respondents who found Vignette to be Typical: 92%

**Site of Service (Complete for 010 and 090 Globals Only)**

| Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0% |
| Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0% |
| Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0% |

**Description of Pre-Service Work: N/A**

**Description of Intra-Service Work: After insertion of the initial lumbar interlaminar/interspinous process stabilization/distraction device with decompression (reported separately), the incision is extended to expose the adjacent level. A dilator is inserted through the incision and advanced between the spinous processes and into the interspinous process space under fluoroscopic guidance to confirm position and depth. Additional larger dilators are inserted until the space is distracted to the correct degree. A gauge is used to determine the distance between the two spinous processes, and determine the appropriate implant size. The implant is selected and size verified. The implant is inserted and fixed into place. Final imaging (AP and lateral fluoroscopy) is obtained to confirm proper implant position. Copious irrigation is used and the wound is closed in layers.**

**Description of Post-Service Work: N/A**

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.
The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC’s rationale, please review the separate RUC recommendation document.

Background

In June 2020, the RUC’s Relativity Assessment Workgroup (RAW) flagged four CPT codes (22867, 22868, 22869 and 22870) for review under the New Technology Screen. The four codes were originally surveyed in 2015 for inclusion in the 2016 CPT and the Medicare Physician Fee Schedule (PFS). In 2015, the RUC recommended 7.39 work RVUs for 22869 and 2.34 wRVUs for 22870. Subsequently, in the 2016 Medicare PFS CMS finalized a reduced value of 7.03 work RVUs for 22869 but accepted the RUC recommendation of 2.34 work RVUs for 22870.

The initial RAW Action Plan for the four codes was developed by the specialty societies that surveyed the codes in 2015: the American Academy of Neurological Surgeons/Congress of Neurological Surgeons (AANS/CNS), the American Academy of Orthopaedic Surgeons (AAOS), the North American Spine Society (NASS) and the International Society for the Advancement of Spine Surgery (ISASS). In their action plan the original surveying societies noted that codes 22869 (Insertion of interlaminar/interspinous process stabilization/distraction device, without open decompression or fusion, including image guidance when performed, lumbar; single level) and 22870 (Insertion of interlaminar/interspinous process stabilization/distraction device, without open decompression or fusion, including image guidance when performed, lumbar; second level (List separately in addition to code for primary procedure)) were performed predominately by interventional pain physicians and anesthesiologists; and therefore recommended these societies review the codes and present an action plan for the next RAW meeting.

For the RAW’s December 2020 meeting, anesthesiology and the interventional pain societies (American Society of Anesthesiologists-ASA, American Academy of Physical Medicine and Rehabilitation –(AAPM&R), North American Spine Society (NASS), and the American Society of Interventional Pain Physicians (ASIPP)) presented an action plan recommending no action and maintaining current value. The RUC disagreed and requested the societies resurvey the codes.

The societies, along with the North American Neuromodulation Society (NANS) proceeded with a survey of the two codes. In preparing the survey, the societies submitted a request to the RUC Research Subcommittee (RSC) to use a list from the vendor of physicians trained to perform the service as well as random samples of members from the surveying societies. The RSC approved the request at their February 2021 meeting. The surveying societies noted that their members do not report other 90-day global codes so would have a difficult time using one as an accurate reference code. The societies requested approval to include 10-day global codes in the RSL. The RSC did not approve this request and advised the specialties to use 90-day global codes that their members may be familiar with from training. The societies followed this guidance and the RSL that was used did not include any 010 global codes per the RSC guidance.

The societies conducted their survey in March 2021, using the approved vendor contact list and blending this with random samples from respective societies.

There were a total of 75 non-conflicted responses, of which 56 were from the vendor list and 19 were from society lists. The median experience in the previous 12 months for all respondents was 10 for 22869 and 5 for 22870. For the trained physicians who responded the median experience in the previous 12 months was 10 for 22869 and 2 for 22870.

Recommendation – 22870

Work RVU

The survey median work RVU was 5.00 and the survey 25th% work RVU was 3.63.

We recommend maintaining the current work RVU of 2.34 which is substantially below the 25th% survey work RVU.

Pre-Service Time

N/A, 22870 is a ZZZ code

Intra-Service Time
The societies recommend 45 minutes intra-service time, which is the survey median. This is an increase from the previous survey median and current time of 30 minutes.

**Immediate Post-Service Time**

N/A, 22870 is a ZZZ code

**Post-Service Visits and Site-of-Service**

N/A, 22870 is a ZZZ code

**Key Reference Code Comparison**

**KRS1:** The most typical KRS was CPT code 22515 (*Percutaneous vertebral augmentation, including cavity creation (fracture reduction and bone biopsy included when performed) using mechanical device (eg, kyphoplasty), 1 vertebral body, unilateral or bilateral cannulation, inclusive of all imaging guidance; each additional thoracic or lumbar vertebral body (List separately in addition to code for primary procedure)).*

**KRS2:** The second most common KRS was CPT code 63048 (*Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; each additional segment, cervical, thoracic, or lumbar (List separately in addition to code for primary procedure)).*

**MPC Codes**

There is a dearth of ZZZ codes on the MPC list and only one code with the same intra-service time and under 4.00 which is 63048, one of the survey key reference codes.

Other Code Comparison

CPT code 15772 (Grafting of autologous fat harvested by liposuction technique to trunk, breasts, scalp, arms, and/or legs; each additional 50 cc injectate, or part thereof (List separately in addition to code for primary procedure)) is one of several ZZZ codes that has the same or lower time but a similar or higher work RVU and support the recommended value of 2.34.

Summary

The societies recommend for CPT code 22870 (insertion of interlaminar/interspinous process stabilization/distraction device, without open decompression or fusion, including image guidance when performed, lumbar; second level (List separately in addition to code for primary procedure)) the following:

Work RVU: 2.34 (current value)
Intra-Service Time: 45 minutes
Total Time: 45 minutes

The societies believe the survey data supports the current value and shows that the work performed by anesthesiology and interventional pain physicians to be identical to the previous work survey performed by spine surgeons in 2015 and recommend current value with time inputs adjusted to median survey intra-service time of 45 minutes.
Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- Multiple codes allow flexibility to describe exactly what components the procedure included.
- Multiple codes are used to maintain consistency with similar codes.
- Historical precedents.
- Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. Report with code 22869.

**FREQUENCY INFORMATION**

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) Existing code 22870

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

<table>
<thead>
<tr>
<th>Specialty</th>
<th>How often?</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interventional Pain Management</td>
<td>Rarely</td>
</tr>
<tr>
<td>Pain Management</td>
<td>Rarely</td>
</tr>
<tr>
<td>Anesthesiology</td>
<td>Rarely</td>
</tr>
</tbody>
</table>

Estimate the number of times this service might be provided nationally in a one-year period? 8652

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on relative volume of Medicare utilization

<table>
<thead>
<tr>

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

   The specialty societies convened an expert panel of advisors from the presenting specialties via telephone to discuss recommendations for practice expense for codes 22869 and 22870. The panel reviewed existing inputs for these codes and considered any necessary modifications.

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code, but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here (for service reviewed prior to the implementation of clinical activity codes, detail is not provided in the RUC database, please contact Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org for PE spreadsheets for your reference codes):

   The expert panel used the existing inputs for codes 22869 and 22870 as reference for the new recommendations.

3. Is this code(s) typically reported with an E/M service?

   No

4. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time:

   N/A
5. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies for the **code family**, please provide compelling evidence (please see **PE compelling evidence guidelines**) Please explain if the increase can be entirely accounted for because of an increase in physician time:

| **N/A** |

6. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (**please see second worksheet in PE spreadsheet workbook**), please explain the difference here:

| **N/A** |

7. Please provide a brief description of the clinical staff work for the following:
   a. Pre-Service period:

<table>
<thead>
<tr>
<th><strong>For code 22869</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Complete pre-service diagnostic and referral forms</strong></td>
</tr>
<tr>
<td><strong>Coordinate pre-surgery services (including test results)</strong></td>
</tr>
<tr>
<td><strong>Schedule space and equipment in facility</strong></td>
</tr>
<tr>
<td><strong>Provide pre-service education/obtain consent</strong></td>
</tr>
<tr>
<td><strong>Complete pre-procedure phone calls and prescription</strong></td>
</tr>
</tbody>
</table>

b. Service period (includes pre, intra and post):

<table>
<thead>
<tr>
<th><strong>6 minutes (standard)</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Prior to discharge, office clinical staff will assist with necessary post-discharge care coordination, such as:</td>
</tr>
<tr>
<td>• Responding to patient/family questions about home activity restrictions/WB status, therapy questions</td>
</tr>
<tr>
<td>• Telephonic or electronic communication assistance with the office, and other necessary management assistance related to the hospitalization.</td>
</tr>
</tbody>
</table>
• Transitioning discharge information to the office medical record, including correspondence and imaging or lab results pending at discharge

c. Post-service period:

63 minutes – standard clinical staff time for current office visit E/Ms (one 99213, one 99212)
Clinical staff will greet the patient, provide gowning, and ensure that all appropriate medical records are available including interval imaging and labs, physical therapy reports, and chart notes from other physicians. Clinical staff will obtain vital signs, prepare the room and necessary supplies, assist with patient positioning for exam, review and document history, systems and medications. Clinical staff will assist the physician during the exam which may include wound and drain (if present) assessment, neurovascular assessment, and ROM assessment. Clinical staff will clean the room and answer any patient/family questions about home care including activity limitations and reinforcement of physical therapy activities. Clinical staff will assist the physician with orders for medication and physical therapy changes. Clinical staff will assist with answering patient, family, caregiver, therapist, other clinician questions and help process changes in care.

8. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (please see second worksheet in PE spreadsheet workbook):
N/A

9. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov.
N/A

INVOICES

10. ☐ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

11. ☐ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

12. If you wish to include a supply that is not on the list (please see fourth worksheet in PE spreadsheet workbook) please provide a paid invoice. Identify and explain the invoice here:
N/A

13. Are you recommending a PE supply pack for this recommendation? Yes or No.
If Yes, please indicate if the pack is an established package of supplies as defined by CMS (eg, SA047 pack, E/M visit) or a pack that is commercially available?
Yes, two supply packs are used.
The supply packs are established packs as defined by CMS.

14. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation. Please include the description, CMS supply code, unit, item quantity and unit price (if
available). See documents two and three under PE reference materials on the [RUC Collaboration Website](#) for information on the contents of kits, packs and trays.

ITEMIZED LIST OF CHANGES (FOLLOWING THE PE SUBCOMMITTEE MEETING)

During and immediately following the review of this tab at the PE Subcommittee meeting please revise
the summary of recommendation (PE SOR) based on modifications made during the meeting. Please
submit the revised form electronically to Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org
immediately following the close of business the same day that the tab is reviewed. On the PE spreadsheet,
please highlight the cells and/or use red font to show the changes made during the PE Subcommittee
meeting (if you have provided any of this highlighting based on changes from the reference code prior to
the PE Subcommittee meeting please remove it, so not to be confused with changes made during the
meeting). In addition to those revisions please also provide an itemized list of the modifications made to
the PE spreadsheet during the PE Subcommittee meeting in the space below (e.g. clinical activity CA010
obtain vital signs was reduced from 5 minutes to 3 minutes).

NOTE: The virtual meetings have provided for real-time updates to the PE spreadsheets. PE SORs must
still be updated and resubmitted asap.

In October 2020, the Relativity Assessment Workgroup identified CPT code 27446 with Medicare data from 2017-2019 that was performed less than 50% of the time in the inpatient setting yet included inpatient hospital Evaluation and Management (E/M) services within the global period and 2019e Medicare utilization over 10,000. The Workgroup concluded that CPT code 27446 represents a site of service anomaly since visits are currently included in the valuation of this service that are not typically occurring. The RUC recommended that CPT code 27446 be surveyed for January 2021 with the appropriate code family. At the January 2021 meeting, the specialty societies submitted a request to defer survey until April 2021 due to logistical reasons including timing and a desire to be placed on the Research Subcommittee agenda “to review a proposed revised survey instrument to ask about additional pre-operative time and resources spent on pre-optimization patient work.” The RUC recommended that CPT code 27446 be surveyed for April 2021 with the appropriate code family.

**Pre-Service Work**

In October 2019 during review of CPT code 27447 *Arthroplasty, knee, condyle and plateau; medial AND lateral compartments with or without patella resurfacing (total knee arthroplasty)*, the specialties noted that considerable work by the clinical staff, surgeons, and qualified healthcare providers (QHPs) is required to facilitate, coordinate, validate and document the assessment and optimization of patients prior to total joint replacement surgery. The service has also evolved in that patients are more frequently discharged home rather than to inpatient rehabilitation or skilled nursing facilities. This deliberate reduction in post-acute care service requires considerable work by the surgeon and QHPs prior to surgery. The RUC agreed that the pre-service planning activities are being performed on a routine basis for the typical patient; however, the 090-day global period structure does not allow inclusion of this work. In addition, the current code does not include this additional work in the descriptor. The RUC discussed options on how to capture these pre-service activities performed by the physician or QHP. The RUC indicated that separate planning codes may be developed, or current codes such as the prolonged service codes may be reported for these activities. It was recognized that such codes are intended to capture a single episode of time and that the added work in the preoperative period does not occur in such units of time (e.g., 30 minutes in one session as opposed to over the course of a few days/calls).

The RUC affirmed the October 2019 recommendation for CPT code 27447 and noted that the pre-service time discussion also applies to family code 27446. The RUC recommends that the specialty, and other interested parties, consider developing a CPT coding application to address this preoperative period issue.
27446 Arthroplasty, knee, condyle and plateau; medial OR lateral compartment

The RUC reviewed the survey results from 126 orthopaedic and hip/knee surgeons and concurred that the survey median (19.60) and 25th percentile (18.60) work RVU overvalued the physician work for this service. Therefore, the RUC determined that a direct work RVU crosswalk to CPT code 67108 Repair of retinal detachment; with vitrectomy, any method, including, when performed, air or gas tamponade, focal endolaser photocoagulation, cryotherapy, drainage of subretinal fluid, scleral buckling, and/or removal of lens by same technique (work RVU= 17.13, 90 minutes intra-service time and 295 minutes total time) appropriately accounts for relative physician work. The crosswalk code was surveyed in 2015 and has identical intra-service time as 27446 and similar total time and intensity. The RUC notes that the crosswalk value of 17.13 work RVUs includes three key considerations: no change in intraoperative time, one day less of hospital E/M work, and an increase in level of postoperative office work.

The RUC recommends the following physician time components: 40 minutes pre-service evaluation, 15 minutes pre-service positioning, 15 minutes pre-service scrub/dress/wait time, 90 minutes intra-service time, and 45 minutes immediate post-service time, 0.5-99238 discharge visit, 2-99213 and 1-99214 office visits, 310 minutes total time. Pre-service time package 4 is recommended with an increase of 12 minutes to positioning time (total = 15 minutes) to account for assisting with appropriately positioning the patient, padding bony prominences, and applying thermal regulation drapes; assessing position of the extremities and head and adjusting as needed; placing the patient's leg properly on the table and positioning with proper bolstering to aid surgical exposure; placing a tourniquet on the proximal thigh; confirming tourniquet settings and validating function. This is consistent with both the survey median and historical RUC precedent for many similar orthopaedic extremity surgical codes. In addition, the package time for scrub/dress/wait was reduced to 15 minutes to be consistent with the survey median.

The RUC discussed the CMS 23-Hour Stay Outpatient Surgical Services with Subsequent Hospital Visits Policy as it relates to the post-service time for the survey code. This policy excludes inclusion of inpatient visit codes in the global payment for services that are typically reported as outpatient services. CMS labels surgical services that are typically performed in the outpatient setting and require a hospital stay of less than 24-hours as 23-hour stay outpatient services. In the CY2011 Final Rule, CMS finalized a policy to no longer allow codes with outpatient claims status to include bundled subsequent inpatient hospital visits (eg 99231-99233) into the surgical global payment. Instead, the Agency permits the allocation of the intra-service portion of the typically performed subsequent hospital visit to the immediate post-service time of the procedure. For code 27446, per the CMS policy, the intra-service time is reallocated from the same-day E/M code 99232 to the immediate post-service time of the outpatient service (adding 20 minutes of intra-service time from 99232). Though the median survey immediate post-service time was 25 minutes, the CMS 23-hour stay policy was applied resulting in 45 total post-service minutes. The RUC recommends post-service time package 9b and, following the CMS 23-hour policy, the E/M same day visit is not shown and instead the intra-service time of 20 minutes has been added to the median survey post time of 25 minutes (total=45 minutes). In addition, following the CMS 23-hour policy, the next day final evaluation of the patient and discharge management work is indicated as a discounted 0.5 x 99238 – or one-half of an E/M service (0.64 RVUs; 19 min).

For the post-service office visits, the RUC recommends the survey median response of three total office visits: 1-99214 and 2-99213. The first office visit is typically at 2 weeks following surgery; both the estimated total time and medical decision-making support 99214. The subsequent office visits are typically at 6 weeks and 10 weeks after surgery; both the estimated total time and medical decision-making support 99214 for both.
visits. Discussion around the 99214-visit clarified that there is management of medication, particularly at that first visit when there is often increased pain that necessitates an opioid adjustment and justifies the level 4 office visit.

To justify the crosswalk value of 17.13 work RVUs, the RUC compared the survey code to the key reference service codes 27130 Arthroplasty, acetabular and proximal femoral prosthetic replacement (total hip arthroplasty), with or without autograft or allograft (work RVU = 19.60, 100 minutes intra-service time and 377 minutes total time) and 23472 Arthroplasty, glenohumeral joint; total shoulder (glenoid and proximal humeral replacement (eg, total shoulder)) (work RVU = 22.13, 140 minutes intra-service time and 448 minutes total time) and noted that the physician work and intra-service and total time of the survey code are lower than the two reference services while the intensity of the survey code is slightly higher than either reference service. The RUC further noted that the CMS 23-hour policy impacts the intensity of work per unit time and may falsely elevate the IWPUT because, if the recommendation included the full discharge day visit time of 38 minutes rather than 19 minutes (0.5-99238) and if the 99232 hospital visit remained at the full time (40 minutes), rather than adding only 20 minutes to the immediate post service time, the total time would have been 349 minutes (similar to current value of 345), with a final IWPUT of 0.101 and WPUT of 0.049, both of which are below the current values.

In addition to the comparison to total hip arthroplasty, the RUC also compared CPT code 27446 to CPT code 27447 Arthroplasty, knee, condyle and plateau; medial AND lateral compartments with or without patella resurfacing (total knee arthroplasty) (work RVU = 19.60, 97 minutes intra-service time and 374 minutes total time) which was recently approved by the RUC in October 2019 and re-affirmed at this meeting. The RUC noted that a value below 17.13 RVUs would create a rank order anomaly between 27446 unicompartmental knee arthroplasty (UKA) and 27447 total knee replacement (TKA). Below is a comparison of CPT codes 27446 to 27447:

</tbody>
</table>

The RUC agreed that UKA is more complex and intense than TKA for several reasons:

1. UKA is less common than TKA; default is total knee, while preserving natural structure with a partial knee when appropriate is more complex.
2. UKA has higher failure and revision rate compared to TKA (~ 2X) requiring more complex considerations for repair.
3. Smaller incisions are employed to limit injury to the quadriceps mechanism, but must still allow visualization of the other compartments to assess articular cartilage damage (which might preclude UKA and require TKA).

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.
4. The cruciate ligaments (ACL and PCL) are retained, compared to TKA where the ACL +/- PCL are resected; this makes exposure and stability/balancing more difficult.

5. Although basic alignment devices and cutting guides are used for the bone resection, like TKA, free-hand refinements and/or use of additional technology (e.g., computer-aided, robotic assisted) that add complexity to the procedure are typically employed.

6. In a TKA, the entire articular surface of both tibia and femur are resected and replaced; in a UKA, only part of the joint is resected and replaced; alignment of the prosthetic surface with the native articular cartilage is required which adds complexity.

For additional support, the RUC compared CPT code 27446 to MPC codes 19303 Mastectomy, simple, complete (work RVU = 15.00, 90 minutes intra-service time and 283 minutes total time) and 37215 Transcatheter placement of intravascular stent(s), cervical carotid artery, open or percutaneous, including angioplasty, when performed, and radiological supervision and interpretation; with distal embolic protection (work RVU = 17.75, 103 minutes intra-service time and 337 minutes total time) and noted that the multi-specialty points of comparison code values appropriately bracket the survey code recommendation. The RUC concluded that CPT code 27446 should be valued based on a direct work RVU crosswalk to CPT code 67108 which falls below the survey 25th percentile. The RUC recommends a work RVU of 17.13 for CPT code 27446.

Affirm RUC Recommendations
The RUC affirms its October 2019 work RVU recommendation of 19.60 for CPT code 27447.

Office Visits Included in Codes with a Surgical Global Period
The RUC strongly believes that it is appropriate to apply the increased valuation of the office visits to the visits incorporated in the surgical global packages. The RUC recommends that CMS apply the office visit increases uniformly across all services and specialties. CMS should not hold specific specialties to a different standard. The RUC urges CMS to apply the 2021 office visit increases to the office visits included in surgical global payment, as it has done historically.

Practice Expense
The Practice Expense (PE) Subcommittee discussed and accepted the compelling evidence argument that the clinical work involved in the service had changed. Based on acceptance of compelling evidence, the PE Subcommittee carefully considered the clinical staff activities and discussed the specialty society recommendation of an additional 15 minutes for CA002 Coordinate pre-surgery services (including test results) and CA004 Provide pre-service education/obtain consent. The PE Subcommittee noted that the standard pre-service time package is 60 minutes for 090-day global period services and questioned the justification for the additional preclinical time. After thorough discussion, the PE Subcommittee reduced the recommendation to the standard 090-day pre-service clinical staff times for CPT code 27446 and affirmed the standard times for 27447. The PE Subcommittee with guidance from the CPT Editorial Panel representative also provided some potential options for the specialties to consider capturing any additional preclinical staff time, including possibly using existing codes including the 99415 prolonged services clinical staff code (under consideration at this meeting) or alternatively, generating a new CPT code description to truly capture the additional work. The RUC recommends the direct practice expense inputs for CPT code 27446 as modified by the PE Subcommittee.
The Practice Expense Subcommittee reviewed and affirmed the direct practice inputs for CPT code 27447 from October 2019 without modification. **The RUC recommends the direct practice expense inputs for CPT code 27447 as affirmed by the Practice Expense Subcommittee.**

**Work Neutrality**

The RUC's recommendation for these codes will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

CPT Code: 27446

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:27446 Tracking Number Original Specialty Recommended RVU: 17.13
Global Period: 090 Current Work RVU: 17.48 Presented Recommended RVU: 17.13
RUC Recommended RVU: 17.13

CPT Descriptor: Arthroplasty, knee, condyle and plateau; medial OR lateral compartment

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 67-year-old obese female (BMI > 30) with osteoarthritis of the knee joint presents with increased varus of the right knee affecting activities of daily living. She is a non-insulin-dependent diabetic. At operation, she undergoes a unicompartmental knee replacement.

Percentage of Survey Respondents who found Vignette to be Typical: 67%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 87% , In the ASC 13%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 27% , Overnight stay-less than 24 hours 64% , Overnight stay-more than 24 hours 9%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 94%

Description of Pre-Service Work: The appropriate antibiotic(s) are selected and ordered; timing and administration are confirmed. Appropriate selection, timing and administration of DVT prophylaxis are assured. Appropriate selection of preemptive multimodal analgesic medications performed and timing and administration are confirmed in conjunction with coordination of supplemental regional blocks and/or planned local anesthetic infiltration. Results of preadmission testing are reviewed, including laboratory tests, X rays, CT scans, and/or MRIs, with special attention to radiographs and scaled radiographs that were used for sizing and ordering of special implants. The patient is re-examined to make sure that physical findings have not changed and history and physical are updated. The patient and family are met with to review planned procedure and postoperative management, including an opioid sparing pain management protocol. Informed consent is reviewed with the patient. It is verified that all required instruments and supplies are available, including intraoperative imaging/fluoroscopy. It is ensured that an array of implants is available for possible use in the operating room. An estimate of the appropriate-size component is determined by templating with radiographs. The patient is positioned, bony prominences are padded, and thermal regulation drapes are applied. The position of the extremities and head are assessed and adjusted as needed. The patient's leg is placed properly on the table and positioned with proper bolstering to aid surgical exposure. A tourniquet is placed on the proximal thigh. Areas of skin to be prepared are indicated, and surgical incisions are marked. A surgical "time out" is performed with the operating surgical team.

Description of Intra-Service Work: After limb exsanguination, the tourniquet is elevated. An appropriate incision for unicompartmental knee arthroplasty is used. After exposure, the knee is carefully inspected visually for the presence of arthritis in the two nonoperative compartments. The ACL is inspected and tested. The remnant meniscus and the osteophytes of the operative compartment are removed. The tibia is exposed sufficiently to allow proximal (usually medial) resection of the tibia without injury to the ACL, PCL, or MCL. After adequate distal femoral resection has been made, the femur is sized, and the appropriate jig to complete the posterior and posterior chamfer cut is used to cut and drill the femur. Posterior femoral osteophytes can then be removed. Then the improved visualization allows proper sizing and preparation of the tibial surface. Once the trial implants have been placed, a complete examination of the alignment, ligamentous balance, range of motion, and patellar tracking is done. The appropriate implants are then selected. The knee is prepared for cementing with careful retractor placement, pulsatile lavage, and suction to dry the cut bony surface. Cement is applied to the tibial surface, and the tibial component is impacted. Excess cement is then removed from the posterior tibial recess. Then the femoral component is cemented as well. A trial polyethylene is used to pressurize the components onto the bony surface. After the cement has cured, excess cement is carefully removed from around the components. Then the correct
polyethylene is placed, the knee is again tested, the tourniquet is deflated, and hemostasis is achieved. The knee wound is closed in layers.

Description of Post-Service Work:

Immediate postoperative work through discharge from recovery room includes: Application of sterile dressings; removal of drapes; assessing limb alignment compared to the opposite extremity; assessing limb perfusion and pulses; waiting for reversal of anesthesia and extubation; assisting in transfer of the patient from the OR table to a stretcher or bed; assisting in transport of patient from operating room to recovery room; monitoring patient stabilization in the recovery room; completing a careful neurologic and vascular examination of the extremity; discussing postoperative recovery care with anesthesia and nursing staff, including regional blocks discussing procedure and outcome with patient and family and answering questions; entering a brief operative note and a full operative report in the medical record; calling referring physician and/or sending a copy of the operative note; writing comprehensive orders for PACU and floor care; completing medication reconciliation; ordering and reviewing postoperative radiographs; and entering procedure data, including implant details, into longitudinal outcome registries (eg, NSQIP, AJRR, and/or local registry).

Hospital visit #1 (day of surgery later in the day) includes the following work: Reviewing nursing notes; discussing status and progress with nursing staff; reviewing vital signs, I/O, labs, and other related data; reviewing findings and outcome with patient and/or family; assessing pain control and response to current medications; modify orders accordingly; assessing urinary function; examining the surgical site; reinforce dressing as needed; assessing limb position and alignment, repositioning the limb needed; checking neurovascular status; counseling the patient and/or family regarding therapy protocol; answer questions; counseling the patient and/or family regarding OOB/ambulation, incentive spirometry, upright position in bed and use of sequential compressive devices; communicating and coordinating care with medical consult and other physicians; communicating and coordinating pain control with anesthesia, including status of current modalities (eg, blocks); updating orders; and writing “postoperative check” progress note.

Hospital discharge management (postoperative day #1) includes the following work: Reviewing nursing notes; discussing status and progress with nursing staff; reviewing PT/OT notes; discussing status and progress with PT/OT staff; reviewing discharge plan notes; discussing status and progress with case management; finalizing and confirming discharge plans; reviewing notes from other physicians and discussing as appropriate; reviewing vital signs, I/O, labs and other related data; interviewing patient and obtaining interval history; assessing pain control and response to current medications; assessing gastrointestinal and urinary function; examining surgical site; changing dressing as needed; assessing limb alignment and ROM; checking neurovascular status; repositioning limb as needed; finalizing and confirming discharge plans with patient and/or family; counselling patient and/or family regarding therapy protocol and activity limitations after discharge; reviewing postoperative instructions (eg, wound care, pain medications, VTE prophylaxis); completing daily progress note; completing discharge summary and associated forms and documents; writing prescriptions for medications and devices (eg, walker, wheelchair, bedside commode, raised toilet seat); checking narcotic prescription registries; writing orders for discharge home.; completing medication reconciliation; coordinate postoperative appointment with patient and/or family and office staff; communicating and coordinating follow-up care with other physicians; and entering postoperative data into longitudinal outcome databases or registries (eg, NSQIP, AJRR).

Post-operative office visits: the work is performed by the physician and QHP; the detailed times are provided in the supplementary table.

Office visit #1 (99214): this visit typically occurs 2 weeks after surgery.

Review PT/OT and/or rehab/SNF/VNA notes to assess progress with therapy; review results of labs related to anticoagulation for DVT prophylaxis (e.g. INR, Hb, Plts); to assess therapeutic response and/or monitor for side effects; discuss findings at surgery, review procedure details and answer questions; review post-operative radiographs with patient and/or family; interview patient and obtain history and/or review data obtained by clinical staff; assess pain control, response to current medications and side-effects; assess function, mobility and progress with ambulation and compare with reports from PT/OT/rehab; discuss gastrointestinal and urinary function to assess for medication side effects; remove dressing; examine surgical site; assess limb alignment, swelling, strength and ROM; check neurovascular status; remove sutures or staples; apply steri-strips, sterile dressing and compressive wrap or stockings; counsel patient and/or family regarding wound care, therapy protocol and activity (e.g. driving, bathing, leg elevation); counsel patient and/or family regarding planned or emergent invasive procedures (e.g. dental, GI) about need for prophylactic antibiotics; review instruction sheet; Counsel patient/family regarding multi-modal pain management and use of narcotic pain medication with tapering; check narcotic prescription registries; write order for narcotic prescription, re-fill or new medication; write order...
for non-narcotic prescription as appropriate (e.g. NSAIDs, gabapentin); write order for prescriptions for continued VTE prophylaxis based on patient risk assessment and mobilization, re-fill or new medication; complete medication reconciliation; counsel patient/family regarding timing of next office visit and communicate interval care plan based on synthesis of interval history, physical exam, wound assessment, pain control and therapy progression; complete forms/referrals for continued PT/OT and/or home care services (e.g. VNA); complete disability, FMLA, out of/return to work and other related forms; communicate and coordinate care with other physicians and health care providers (eg, PT/OT, PCP); enter diagnosis code(s) and office visit codes in the EHR or other similar system; write or dictate and sign progress note; enter post-operative data into longitudinal outcome registries (e.g. NSQIP, AJRR, and/or local registry).

Office visit #1: Level of service determination based upon medical decision making (LOS = 99214)

(1) Number and complexity of problems = MODERATE: 1 chronic illness (osteoarthritis of knee) with side effects (pain and limited mobility) of treatment (surgery) is assessed and managed; OR 1 acute complicated injury (surgical trauma) is assessed and managed, including body systems that are not directly part of the injured organ (e.g. GI, neurologic, vascular); treatment options are associated with morbidity

(2) Amount and complexity of data = LIMITED: review external notes and review results of tests

(3) Risk of complications from testing and/or treatment = MODERATE: (a) prescription drug management - assessment and plan for multi-modal pain management, including use of narcotic pain medication with tapering, as well as non-narcotic medications; renew, adjust and/or change medications; (b) prescription drug management - assessment and plan for VTE prophylaxis; renew, adjust and/or change medications

Post-operative office visit #2 (99213): this visit typically occurs six weeks after surgery

Review PT/OT notes to assess progress with therapy; interview patient and obtain history and/or review data obtained by clinical staff; assess pain control, response to current medications and side-effects; assess function, mobility and progress with ambulation and compare with reports from PT/OT; assess gastrointestinal to assess for medication side effects; examine surgical site to assess wound healing and signs of infection; assess limb alignment, swelling, strength and ROM; counsel patient and/or family regarding wound care, therapy protocol and activity (e.g. driving, bathing, leg elevation); counsel patient and/or family regarding planned or emergent invasive procedures (e.g. dental, GI) about need for prophylactic antibiotics and provide/review instruction sheet; counsel patient/family regarding multi-modal pain management and use of narcotic pain medication with tapering; write order for non-narcotic prescription as appropriate (e.g. NSAIDs); complete medication reconciliation; counsel patient/family regarding timing of next office visit and communicate interval care plan based on synthesis of interval history, physical exam, wound assessment, pain control and therapy progression; complete forms/referrals for continued PT/OT; complete disability, FMLA, out of/return to work and other related forms; enter diagnosis code(s) and office visit codes in the EHR or other similar system; order radiographs for next visit; write or dictate and sign progress note; enter post-operative data into longitudinal outcome registries (e.g. NSQIP, AJRR, and/or local registry).

Office visit #2: Level of service determination based upon medical decision making (LOS = 99213)

(1) Number and complexity of problems = LOW: stable chronic illness (knee osteoarthritis) or acute uncomplicated illness (major surgery)

(2) Amount and complexity of data = LIMITED: review external notes and ordering test (radiographs)

(3) Risk of complications from testing and/or treatment = LOW; non-narcotic medications and PT

Post-operative office visit #3 (99213): this visit typically occurs 10 weeks after surgery

Review PT/OT notes to assess progress with therapy; interview patient and obtain history and/or review data obtained by clinical staff; assess pain control, response to current medications and side-effects; assess function, mobility and progress with ambulation and compare with reports from PT/OT; examine surgical site to assess wound healing and signs of infection; assess limb alignment, swelling, strength and ROM; review radiographs with independent interpretation; counsel patient and/or family regarding therapy protocol and activity (e.g. driving, exercise, sports); counsel patient and/or family regarding planned or emergent invasive procedures (e.g. dental, GI) about need for prophylactic antibiotics and provide/review instruction sheet; counsel patient/family regarding timing of next office visit and communicate interval care plan.
based on synthesis of interval history, physical exam, wound assessment, pain control and therapy progression; complete forms/referrals for continued PT/OT; complete disability, FMLA, out of/return to work and other related forms; enter diagnosis code(s) and office visit codes in the EHR or other similar system; write or dictate and sign progress note; enter post-operative data into longitudinal outcome registries (e.g. NSQIP, AJRR, and/or local registry)

Office visit #3: Level of service determination based upon medical decision making (LOS = 99213)

(1) Number and complexity of problems = LOW: stable chronic illness (knee osteoarthritis) or acute uncomplicated illness (major surgery)

(2) Amount and complexity of data = MODERATE: review external notes, review results of tests (radiographs) and independent interpretation of test (radiographs)

(3) Risk of complications from testing and/or treatment = LOW: non-narcotic medications and PT

### Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

*The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC’s rationale, please review the separate RUC recommendation document.*

### Background

In October 2020, the Relativity Assessment Workgroup (RAW) flagged code 27446 as including inpatient E/M visits from the RUC review in 2013, but 2019 Medicare utilization showed the procedure being performed less than 50% of the time with an inpatient facility status. The RAW recommended that 27446 be surveyed.
At the January 2021 RUC meeting, AAOS and AAHKS submitted a letter indicating code 27446 would be surveyed for the April 2021 meeting after the Research Subcommittee reviewed a revised survey instrument to address additional preoperative time and resources.

During discussion, the RUC also asked the societies to present a recommendation for reaffirmation of code 27447.

The societies instead requested that 27447 be allowed on the reference service list since this code was surveyed in 2019 and the RUC recommendation was accepted and implemented by CMS in 2021.

However, the RUC asked that the code not be listed on the RSL and that the data for the code be included in the recommendation for re-affirmation.

**Recommendation – 27446**

The survey median work RVU of 19.60 and the 25th percentile work RVU of 18.60 are both above the current work RVU of 17.48 for code 27446. There is no compelling evidence to support an increase in work RVU.

The intraoperative time of 90 minutes for this procedure has not changed with the new survey.

Although there is a decrease of one day in the hospital, there is an increase in the level of office visits.

We recommend work RVU of 17.13 using a direct crosswalk to code 67108, Repair of retinal detachment; with vitrectomy, any method, including, when performed, air or gas tamponade, focal endolaser photocoagulation, cryotherapy, drainage of subretinal fluid, scleral buckling, and/or removal of lens by same technique, which was surveyed in 2015 and has the same intra-service time as 27446 and similar total time.

CPT code 27446 requires more pre-service and more same-day post-operative work; while CPT code 67108 has a greater number of post-operative visits. The intra-service times are exactly the same. The total times are quite similar – 310 minutes for 27447 and 295 minutes for 67108.

The following table compares 27446 and 67108:

<table>

</tr>
</tbody>
</table>

**Notes:**
1. Separate hospital E/M visit time discounted and shifted to immediate post-time component
2. Next day (or later) discharge management work discounted by 50%
3. Discharge management work discounted due to overlap with immediate postop time on same day

**Pre-Service Time**

We recommend package 4 for pre-service package time which is the current pre-service package.

Adjustments have been made to the package times for evaluation and scrub/dress/wait time to be consistent with the survey median times.
Twelve minutes have been added to the standard package time of 3 minutes (total of 15 minutes) to assist with positioning the patient, pad bony prominences, and apply thermal regulation drapes; assess position of the extremities and head and adjust as needed; place patient's leg properly on the table and position with proper bolstering to aid surgical exposure; place a tourniquet on the proximal thigh; confirm tourniquet settings and validate function. This is consistent with both the survey median and historical RUC precedent for many similar orthopaedic codes for extremity operations.

**Intraoperative (Intraservice) Time**

The societies recommend 90 minutes intraoperative time, which is the survey median. This is also the current intraoperative time.

**Post-Service Facility Work**

The societies recommend Immediate Post-Service package 9b but following the CMS 23-hour policy, the E/M same day visit is not shown and instead the intraservice time of 20 minutes has been added to the median survey post time of 25 minutes (total=45 minutes). In addition, following the CMS 23-hour policy, the next day final evaluation of the patient and discharge management work is indicated as a discounted 0.5 x 99238 – or one-half of an E/M service.

The RUC has accepted what we believe to be a flawed 23-hour policy for (a) adding only the intra-time for the same day post-operative visit to the immediate post-service time and (b) allowing only 50% of the time for discharge day service code 99238. However, the full and complete E/M work is still provided the day of surgery and the day of discharge. This adjustment of survey data results in an artificial increase in the IWPUT, which alone cannot be the basis for a work RVU recommendation.

A facility E/M visit is not just intra-service time, there is typically pre- and post-service work necessary for review of records, documentation and discussions with family and other health care providers. Similarly, on the next day for an overnight stay after surgery, the final evaluation and discharge management work is not less work compared with a patient on the medicine service. If there were any logic and consistency to this policy, then a physician should only be able to report one-half unit of a discharge code for next day discharge after an overnight stay for observation – but instead the physician reports a full unit of the code. We believe that postoperative work by the surgeon is being inappropriately discounted.

If our recommendation included the full discharge day visit time of 38 minutes rather than 19 minutes (0.5 x 99238) and if we kept the 99232 hospital visit at the full time (40 minutes), rather than deleting it and adding only 20 minutes to the immediate post service time, the final time would have been 349 minutes (similar to current value of 345), with a final IWPUT of 0.101 and WPUT of 0.049, both of which are below the current values.

If we included a full discharge day service for 99238 (38 minutes), but maintained the transfer of only 20 minutes for 99232 to the immediate post-service time, the final time would have been 329 minutes, with an IWPUT of 0.112 and WPUT of 0.052. These values are similar to the current values.

In essence, the increases in IWPUT and WPUT for our recommended value of 17.13, are an artifact of the current RUC methodology and is not reflective of the intrinsic intensity and complexity inherent to the procedure.

**Post-Service Office Visits**

The societies recommend the survey median response of three total office visit; 1 x 99214 and 2 x 99213. These visits are described in the post-service description of work. The work at the post-operative office visits is typically performed by the physician and QHP. The total estimated times listed in the supplementary tables below reflect this combined work.

The first office visit is typically at 2 weeks following surgery; both the estimated total time and medical decision-making support 99214.

The subsequent office visits are typically at 6 weeks and 10 weeks after surgery; both the estimated total time and medical decision-making support 99213 for both visits.

---

**Comparison to Total Knee Arthroplasty (27447)**

Total knee arthroplasty (27447) was recently approved by the RUC in October 2019 and will be re-affirmed at this meeting.

CPT code 27447 was not permitted to be on the RSL, so survey respondents did not compare 27446 to 27447.

The table below compares 27446 (unicompartmental knee arthroplasty) to 27447 (total knee arthroplasty).
The IWPUT of 0.119 for 27446 is greater than 27447 (TKA) of 0.112.

We believe UKA is in fact more complex and intense than TKA for several reasons:

1. UKA is less common than TKA; Medicare volume in 2019 was 20X for TKA v UKA
2. UKA has higher failure and revision rate compared to TKA (~ 2X)
3. Smaller incisions are employed to limit injury to the quadriceps mechanism, but must still allow visualization of the other compartments to assess articular cartilage damage (which might preclude UKA and require TKA)
4. The cruciate ligaments (ACL and PCL) are retained, compared to TKA where the ACL +/-PCL are resected; this makes exposure and stability/balancing more difficult
5. Although basic alignment devices and cutting guides are used for the bone resection, similar to TKA, free-hand refinements and/or use of additional technology (e.g. computer-aided, robotic assisted) are typically employed
6. In a TKA, the entire articular surface of the both tibia and femur are resected and replaced; in a UKA, only part of the joint is resected and replaced; alignment of the prosthetic surface with the native articular cartilage is required

A value below 17.13 would create a rank order anomaly with 27447 (TKA).

Key Reference Code Comparison

Respondents who chose 27130 as a reference indicated the intensity/complexity of 27446 to be similar/more complex and intense than 27130. Respondents who chose 23472 as a reference indicated the intensity/complexity of 27446 to be similar/more than 23472.

</tbody>
</table>

Summary

The survey data is valid and robust.

The current wRVU is greater than the median and 25th percentile; there is no compelling evidence for an increase.

Given the decrease in total time (which we believe has methodological flaws and is artificially low), we do not recommend maintaining the current value.

We recommend the cross walked wRVU of 17.13, which takes into account three key considerations:

(1) No change in intraoperative time
(2) One day less of hospital E/M work
(3) Increase level of postoperative office work

Work RVU below 17.13 would create a rank order anomaly with CPT code 27447 (total knee replacement).

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - Multiple codes allow flexibility to describe exactly what components the procedure included.
   - Multiple codes are used to maintain consistency with similar codes.
   - Historical precedents.
   - Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION
How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 27446

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:
   A panel of clinicians representing each specialty society involved in the RUC survey process for the code collaborated to develop and approve the PE recommendations.

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code, but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here (for service reviewed prior to the implementation of clinical activity codes, detail is not provided in the RUC database, please contact Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org for PE spreadsheets for your reference codes):
   Current codes are used for reference.

3. Is this code(s) typically reported with an E/M service?
   NO

4. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time:
   N/A

5. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies for the code family, please provide compelling evidence (please see PE compelling evidence guidelines) Please explain if the increase can be entirely accounted for because of an increase in physician time:
   N/A

6. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (please see second worksheet in PE spreadsheet workbook), please explain the difference here:
7. Please provide a brief description of the clinical staff work for the following:

   a. Pre-Service period:

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>

   b. Service period (includes pre, intra and post):

   **6 minutes (standard)**
   Office clinical staff will assist with necessary post-discharge care via phone or electronically, such as: responding to patient/family questions about home activity restrictions; confirmation of discharge antibiotics if needed, and pain medication; coordination with other physicians and QHPs involved in the care of the patient for transfer of records; and transitioning discharge information to the surgeon's office medical record, including medication list, correspondence and imaging or lab results pending at discharge.

   c. Post-service period:

   **125 minutes - standard time for current (2021) office visit E/Ms**
   Clinical staff will greet the patient, provide gowning, and ensure that all appropriate medical records are available including interval imaging and labs, physical therapy reports, and chart notes from other physicians. Clinical staff will obtain vital signs, prepare the room and necessary supplies, assist with patient positioning for exam, review and document history, systems and medications. Clinical staff will assist the physician during the exam which may include wound and drain (if present) assessment, neurovascular assessment, ROM assessment, and staple removal when appropriate. Clinical staff will clean the room and answer any patient/family questions about home care including activity limitations and reinforcement of physical therapy activities. Clinical staff will assist the physician...
with orders for medication and physical therapy changes. Clinical staff will assist with answering patient, family, caregiver, therapist, other clinician questions and help process changes in care.

8. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (*please see second worksheet in PE spreadsheet workbook*):

| n/a |

9. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at [http://www.bls.gov](http://www.bls.gov).

| n/a |

**INVOICES**

10. ☐ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

11. ☐ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

12. If you wish to include a supply that is not on the list (*please see fourth worksheet in PE spreadsheet workbook*) please provide a paid invoice. Identify and explain the invoice here:

| n/a |

13. Are you recommending a PE supply pack for this recommendation? Yes or No. If Yes, please indicate if the pack is an established package of supplies as defined by CMS (eg, SA047 *pack, E/M visit*) or a pack that is commercially available?

In October 2020, the Relativity Assessment Workgroup identified CPT code 27446 *Arthroplasty, knee, condyle and plateau; medial OR lateral compartment* with Medicare data from 2017-2019e that was performed less than 50% of the time in the inpatient setting yet included inpatient hospital Evaluation and Management services within the global period and 2019e Medicare utilization over 10,000. The Workgroup reviewed hospital outpatient claims data to confirm that this service is typically performed in the outpatient setting without any observation or overnight stay. Of 414 carrier line items (from the 5% physician claim files) for CPT code 27446 that were matched to a hospital outpatient claim, just 44 (11 percent) appear to have involved observation care with an overnight stay. The Workgroup noted that CPT code 27446 is a site of service anomaly and visits are currently included in this service that are not typical of what is occurring. The RUC recommended that CPT code 27446 be surveyed for January 2021 with the appropriate code family.

At the January 2021 meeting, the specialty societies submitted a request to defer survey until April 2021 due to logistical reasons including timing and a desire to be placed on the Research Subcommittee agenda “to review a proposed revised survey instrument to ask about additional pre-operative time and resources spent on pre-optimization patient work.” It is the RUC’s understanding that the specialty societies will survey the code family and develop recommendations for presentation at the April 2021 RUC meeting. The RUC notes that the family of services should be identified on the level of interest (LOI). **The RUC recommends that CPT code 27446 be surveyed for April 2021 with the appropriate code family.**

December 14, 2020

Peter K. Smith, MD
Chair, AMA Relative Value Update Committee
AMA Plaza
330 N Wabash Avenue, Suite 3930
Chicago, IL 60611-5885

Dear Dr. Smith,

The RUC placed CPT code 27446, Arthroplasty, knee, condyle and plateau; medial OR lateral compartment on the CMS/RAW Level of Interest form for the January 2021 RUC meeting (Tab 27). 27446 was flagged by the RAW in the October 2020 RUC cycle for a site-of-service anomaly with more than 50% of current Medicare utilization outpatient. The RAW report to the full RUC automatically elevated the code to survey, without an action plan, for the January 2021 meeting.

The AAOS and AAHKS have responded to the LOI and indicated we will develop recommendations for the RUC for the code. At this time, our societies recommend survey for presentation at the April 2021 RUC meeting.

We also request at this time that CPT code 27446 be placed on the Research Committee agenda to review a proposed revised survey instrument to ask about additional pre-operative time and resources spent on pre-optimization patient work.

Thank you for your time and attention and please let us know if you have any questions.

Sincerely,

William R. Creevy, MD
AAOS RUC Advisor
Adolph Yates, MD
AAHKS RUC Advisor
In the Final Rule for 2019, CMS indicated that seven CPT codes were nominated by Anthem for review. In its request, Anthem hypothesized a systemic overvaluation of work RVUs in certain procedures and tests based “on a number of GAO and MedPAC reports, media reports regarding time inflation of specific services, and the January 19, 2017 Urban Institute report for CMS.” Anthem suggested that the physician time CMS assumes in estimating work RVUs are inaccurate for procedures, especially due to substantial overestimates of pre-service and post-service time, including follow-up inpatient and outpatient visits that do not take place. According to Anthem, the intra-time estimates for tests and some other procedures are also overstated. Anthem stated that previous RUC reviews of these services did not result in reductions in valuation that adequately reflected reductions in surveyed times. The RUC noted that they recommended reductions in 2013 and CMS did not accept the RUC recommendation. However, the CMS accepted values did result in decreases of 2.53 for 27447 and 1.07 for 27130 from the current values at that time. The RUC placed these services on the LOI for review at the April 2019 RUC meeting. The specialty societies did not survey these services for April 2019 citing a lack of compelling data to justify the request and recommended maintaining the 2013 CMS values and times. At the April RUC, the RUC recommended that these services be surveyed for October 2019 and the specialty surveyed the services in the summer of 2019.

Pre-Service Work
In October 2019, the RUC discussed the change in the way total hip and knee arthroplasties are provided. Total hip and knee arthroplasty are increasingly part of a mandatory Medicare bundled payment program (Comprehensive Care for Joint Replacement [CJR]) or an optional Medicare bundled payment program (Bundled Payment for Care Initiative [BPCI]). Similar alternative payment models are employed in many states by both Medicaid and private insurers. Physicians are also more commonly participating in accountable care organizations (shared savings programs) with Medicare, Medicaid and other payors. All hospitals, regardless of participating in a bundle, are being measured for the 90-day episode of cost for total hip and knee surgery for Medicare patients, affecting both the value based program and hospital quality reporting processes. In all these programs, physicians and hospitals have financial incentives to reduce costs and improve quality.

For total joint replacement, one of the key strategies has been improving preoperative identification and optimization of medical co-morbidities to shorten hospital length of stay and reduce complications, including readmissions. In a 2019 New England Journal of Medicine (NEJM) study on the outcomes of patients in the CJR program, the mean number of chronic medical conditions was seven. Considerable work by the clinical staff, surgeons, and qualified healthcare providers (QHPs) is required to facilitate, coordinate, validate and document the assessment and optimization of patients prior to total joint replacement surgery. The service has also evolved in that patients are more frequently discharged home rather than to inpatient rehabilitation or skilled nursing facilities. This deliberate reduction in post-acute care service requires considerable work by the surgeon and QHPs prior to surgery.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.
The RUC agreed that all this work is not explicitly captured in the standard RUC survey, nor is it included in the current RUC pre-time packages, but the work is certainly being performed on a routine basis for the typical patient.

Prior to surveying, the specialty societies requested to modify the standard 090-day survey to include language regarding pre-operative planning physician time, care coordination time, non-face-to-face post-operative physician time, the impacts of bundled care initiatives (e.g., ACE demonstration, CJR, and BPCI Advanced) and clinical staff time. The specialty societies noted these arthroplasty procedures typically require additional planning time that is often performed more than 24 hours prior to the procedure. The current survey tool and CMS policy defines the pre-operative period as the day before the procedure and, therefore, precludes the survey respondent from being able account for this pre-planning time. The RUC maintains the current CMS pre-service period definition and did not modify the pre-service period question. The RUC noted that the clinical staff pre-service period time in the PE determinations begins after the decision for surgery. Therefore, the Research Subcommittee did approve a question asking how much time the clinical staff (e.g., RN, LPN, MA) spends per patient on planning, preparation, optimization and care coordination activities prior to surgery.

The specialty societies noted that the individual performing the work to prepare the patient for surgery and the processes and protocols is different in various practices or institutions. However, it is typical that the physician/QHP will spend 30 minutes after the decision for surgery but prior to surgery for these planning activities.

The RUC agreed that the pre-service planning activities occur, however the current code and 090-day global period structure is not the way to capture it. The RUC discussed options on how to capture these pre-service activities performed by the physician or QHP. The RUC indicated that separate planning codes may be developed or the current prolonged services, CPT codes 99358 Prolonged evaluation and management service before and/or after direct patient care; first hour or 99359 Prolonged evaluation and management service before and/or after direct patient care; each additional 30 minutes (List separately in addition to code for prolonged service) may be reported for these activities. It was recognized that such codes are intended to capture a single episode of time and that the added work in the preoperative period does not occur in such units of time (e.g., 30 minutes in one session as opposed to over the course of a few days/calls). The RUC also noted that the additional clinical staff activities would not be captured within the prolonged service codes.

The RUC reviewed the current description of pre-service work and acknowledged additional pre-service work may be occurring. However, the specialty societies revised the description of work to include only the work of the physician or QHP on the day of surgery or the day prior to surgery.
Median Intra-Service Time Data
Anthem’s letter to CMS cited an Urban Institute study “Collecting Empirical Physician Time Data Piloting an Approach for Validating Work Relativity Value Units; Zuckerman, 2016” as part of their rationale for nominating these services as potentially misvalued. This study was based on a very limited data set. The study indicated a median of 87 minutes for total hip arthroplasty and a median of 83 minutes for total knee arthroplasty.

The specialty societies quoted three studies from large institutions on over 20,000 total hip and knee arthroplasty services, provided by over 100 surgeons, which support the current and recommended median intra-service time of 100 (THA) and 97 (TKA) minutes.

1. Surgeon Mean Operative Times in Total Knee Arthroplasty in a Variety of Settings in a Health System; Khanuja, 2019
   - Median Operative Time: **103 minutes** (TKA)
   - The Johns Hopkins University – 4 hospitals 2 community centers and 2 academic medical centers
   - 6,003 cases, primary TKA
   - 41 surgeons
   - EHR data from 2015-2018

2. Is operative Time a Predictor for Post-Operative Infection in Primary Total Knee Arthroplasty?; Anis, 2019
   - Median Operative Time: **102 minutes** (TKA)
   - Cleveland Clinic and Lenox Hill: 16 centers
   - 11,840 cases primary TKA
   - EHR data 2014-2017

3. Average Operative Times for 1,313 Primary TKA and 1,300 TKA over 39 Months Are Roughly Equal to Medicare Attributed Operative Times; Shah, 2019
   - Median Operative Time: **113 minutes** (TKA) and **99 minutes** (THA)
   - Columbia University
   - 4 surgeons
   - Data from 2015-March 2019

27130 Arthroplasty, acetabular and proximal femoral prosthetic replacement (total hip arthroplasty), with or without autograft or allograft
The RUC reviewed the survey results from 206 orthopaedic and hip/knee surgeons and determined a work RVU of 19.60 appropriately accounts for the work required to perform 27130. The RUC developed this recommendation by crosswalking 27130 to the work of 63075 Discectomy, anterior, with decompression of spinal cord and/or nerve root(s), including osteophysectomy: cervical, single interspace (work RVU = 19.60 and 90 minutes intra-service time, 355 minutes of total time). These two services require similar total time and complexity. The RUC also noted that the work of 27130 and 27447 require the same physician time and complexity to perform and therefore should be valued the same. For further
support, the RUC reviewed CPT codes 45400 Laparoscopy, surgical; proctopexy (for prolapse) (work RVU = 19.44 and 100 minutes intra-service time), 44188 Laparoscopy, surgical, colostomy or skin level cecostomy (work RVU=19.35 and 90 minutes intra-service time) and CPT code 35650 Bypass graft, with other than vein; axillary-axillary (work RVU = 20.16 and 110 minutes intra-service time) and agreed that these services require similar work and intensity. The RUC also reviewed key reference service 23472 Arthroplasty, glenohumeral joint; total shoulder (glenoid and proximal humeral replacement (eg, total shoulder)) (work RVU=22.13) and agreed that the physician work and time is greater for CPT 23472, thus appropriately valued higher.

The RUC recommends 40 minutes pre-service evaluation time, 15 minutes pre-service positioning, 15 minutes scrub/dress/wait time, 100 minutes intra-service time, 20 minutes immediate post-service time. The RUC indicated that the intra-service time of 100 minutes is confirmed by the RUC survey of 206 physician performing this service as well as the three studies sited above, from three large institutions and over 20,000 total hip/knee arthroplasties.

The RUC reviewed and discussed the appropriate number and level of post-operative visits and determined that two hospital visits (2) 99232, one discharge day (1) 99238, and three office visits (3) 99213 were appropriate. The RUC noted that one of the currently bundled hospital visits (1) 99231 is no longer typical. The RUC noted that the typical length of stay, thus hospital visits, have decreased from four visits prior to 2013 to two visits now in 2019 due to the pre-operative identification and optimization of medical co-morbidities work not explicitly captured in the standard survey or pre-service time. The survey data confirmed that it is typical for the physician to perform an Evaluation and Management (E/M) service later the same day of surgery to evaluate wound, complete neuromuscular exam and assess the need for continued antibiotics. A second hospital visit occurs on post-operative day 1 and the patient is typically discharged on post-operative day 2. The RUC recommends a work RVU of 19.60 for CPT code 27130.

27447 Arthroplasty, knee, condyle and plateau; medial AND lateral compartments with or without patella resurfacing (total knee arthroplasty) The RUC reviewed the survey results from 206 orthopaedic and hip/knee surgeons and determined a work RVU of 19.60 appropriately accounts for the work required to perform 27447. The RUC developed this recommendation by crosswalking 27447 to the work of 63075 Discectomy, anterior, with decompression of spinal cord and/or nerve root(s), including osteophytectomy; cervical, single interspace (work RVU = 19.60, 90 minutes intra-service time, 355 minutes of total time). These two services require similar total time and complexity. The RUC also noted that the work of 27130 and 27447 require the same physician time and complexity to perform and therefore should be valued the same. For further support, the RUC reviewed CPT codes 45400 Laparoscopy, surgical; proctopexy (for prolapse) (work RVU = 19.44 and 100 minutes intra-service time), 44188 Laparoscopy, surgical, colostomy or skin level cecostomy (work RVU=19.35 and 90 minutes intra-service time) and CPT code 35650 Bypass graft, with other than vein; axillary-axillary (work RVU = 20.16 and 110 minutes intra-service time) and agreed that these services require similar work and intensity. The RUC also reviewed key reference service 23472 Arthroplasty, glenohumeral joint; total shoulder (glenoid and proximal humeral replacement (eg, total shoulder)) (work RVU=22.13) and agreed that the physician work and time is greater for CPT 23472, thus appropriately valued higher.
The RUC recommends 40 minutes pre-service evaluation time, 15 minutes pre-service positioning, 15 minutes scrub/dress/wait time, 97 minutes intra-service time, 20 minutes immediate post-service time. The RUC indicated that the intra-service time of 97 minutes is confirmed by the RUC survey of 206 physician performing this service as well as the three studies sited above, from three large institutions and over 20,000 total hip/knee arthroplasties.

The RUC reviewed and discussed the appropriate number and level of post-operative visits and determined that two hospital visits (2) 99232, one discharge day (1) 99238, and three office visits (3) 99213 were appropriate. The RUC noted that one of the currently bundled hospital visits (1) 99231 is no longer typical. The RUC noted that the typical length of stay, thus hospital visits, have decreased from four visits prior to 2013 to two visits now in 2019 due to the pre-operative identification and optimization of medical co-morbidities work not explicitly captured in the standard survey or pre-service time. The survey data confirmed that it is typical for the physician to perform an Evaluation and Management (E/M) service later the same day of surgery to evaluate wound, complete neuromuscular exam and assess the need for continued antibiotics. A second hospital visit occurs on post-operative day 1 and the patient is typically discharged on post-operative day 2. **The RUC recommends a work RVU of 19.60 for CPT code 27447.**

**Practice Expense**

The Practice Expense Subcommittee thoroughly discussed the clinical staff time for pre-service pre-operative planning activities. The survey respondents indicated, and the specialty societies recommended the median of 90 minutes to provide these services. The PE Subcommittee accepted the compelling evidence that the clinical work involved in the services had changed. Based on acceptance of compelling evidence. The PE Subcommittee entertained accepting the specialty society recommendation of an additional 30 minutes or an alternative of 15 minutes for these activities. The PE Subcommittee noted that the standard pre-service time package is 60 minutes for 090-day global period services, which was the survey 25\(^\text{th}\) percentile. The PE Subcommittee entertained accepting the specialty society recommendation of an additional 30 minutes or an alternative of 15 minutes for these activities. The PE Subcommittee questioned who is performing the pre-operative planning work and at what setting: the orthopaedic practice, the consulting physician’s practice or hospital employees. The PE Subcommittee noted that adding additional clinical staff time for these services would create an anomaly and provide discrepancies with other 090-day global services. Ultimately, the PE Subcommittee did not accept additional clinical staff time for these pre-service activities. The RUC also discussed capturing this additional clinical staff time and agreed with the PE Subcommittee not to capture any additional pre-operative planning time for clinical staff. **The RUC recommends the direct practice expense inputs as modified by the PE Subcommittee.**

**Work Neutrality**

The RUC’s recommendation for these codes will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

CPT Code: 27130

Tracking Number

Original Specialty Recommended RVU: 20.72
Presented Recommended RVU: 20.72
RUC Recommended RVU: 19.60

CPT Descriptor: Arthroplasty, acetabular and proximal femoral prosthetic replacement (total hip arthroplasty), with or without autograft or allograft

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 72-year-old female has hip osteoarthritis not responding to non-operative treatment. A total hip arthroplasty (THA) is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 89%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 100%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 83%

Description of Pre-Service Work: On the day before and/or the day of surgery, the surgeon and/or qualified health care provider will complete the following work: Interview and examine the patient to confirm that the medical status and physical findings have not changed; update and sign the H&P; review the planned procedure and postoperative management with the patient and family; confirm or update the consent; sign or mark the operative site; re-review results of preadmission testing, including laboratory studies, X-rays and/or CT scans, with special attention to radiographs that were used for sizing and ordering of special implants or allografts; confirm timing and administration of antibiotics; assure appropriate selection, timing, and administration of DVT prophylaxis; verify all required instruments and supplies are available, including intraoperative fluoroscopy and cell saver; confirm all potential implants are available for possible use in the OR; prior to the induction of anesthesia, complete a comprehensive timeout and checklist review with the surgical team; place Foley catheter when indicated and/or requested by anesthesia; assist with positioning patient (lateral decubitus or supine traction table); pad bony prominences and apply thermal regulation drapes; prep and drape; mark surgical incision; and perform a second brief time out with the surgical team.

Description of Intra-Service Work: After incising the skin and the fascia, dissection is completed for exposure of the femur and acetabulum. The limb length is assessed by placing markers in the pelvis and the femur. A capsulotomy is performed and the femoral head is dislocated. A femoral neck osteotomy at the proper height is performed. The femoral canal is opened and reamed and then sequential rasping is performed with the broach/trial femoral component until correct rotational and axial stability is achieved. A calcar planer is used on the femoral neck osteotomy, when indicated, to fashion the bone. Additional dissection and releases are performed as needed to expose the acetabulum. Appropriate retractors are placed anteriorly as well as posteriorly. All excess capsule and redundant labrum is removed. All osteophytes are removed. The base of the acetabulum identified by utilizing a small reamer. Once the reamer is placed down to the medial wall of the acetabulum, sequential reamers are used in 1-2 mm increments up to the correct size based on the axial and off-center loading of the reamers. Trial acetabular implants are inserted and the hip is reduced. The stability of the leg is checked. The length of the leg is measured and the implants are adjusted as necessary. Once the proper implant sizing and joint stability are confirmed, the final femoral and acetabular components are inserted. The hip joint is reduced. A final check is made for stability, limb length, ROM and impingement. Sponge and needle counts are confirmed. The wound is copiously irrigated with saline and/or other solutions. The wound is closed in multiple layers, being careful to reattach the muscles to the proper structures.
Description of Post-Service Work: Immediate postoperative work through discharge from recovery room includes: application of sterile dressings; removal of drapes; waiting for reversal of anesthesia and extubation; assisting in transfer of the patient from the OR table to a stretcher or bed; assessing limb length and rotational alignment; assisting in transport of patient from operating room to recovery room; monitoring patient stabilization in the recovery room; completing a careful neurologic and vascular examination of the extremity; discussing postoperative recovery care with anesthesia and nursing staff, including regional blocks and/or patient controlled analgesia; discussing procedure and outcome with patient and family and answering questions; entering a brief operative note and a full operative report in the medical record; calling referring physician and/or sending a copy of the operative note; writing comprehensive orders for PACU and floor care; completing medication reconciliation; ordering and reviewing postoperative radiographs; and entering procedure data, including implant details, into longitudinal outcome registries (eg, NSQIP, AJRR, and/or local registry).

Hospital visit #1 (day of surgery later in the day) includes the following work: Reviewing nursing notes; discussing status and progress with nursing staff; reviewing vital signs, I/O, labs, and other related data; reviewing findings and outcome with patient and/or family; assessing pain control and response to current medications; modify orders accordingly; assessing urinary function; examining the surgical site; reinforce dressing as needed; assessing limb length, position and alignment; checking neurovascular status; assessing function of drains; repositioning the limb and/or immobilization devices as needed; counseling the patient and/or family regarding therapy protocol; answer questions; counseling the patient and/or family regarding OOB/ambulation, incentive spirometry, upright position in bed, and use of sequential compressive devices; reviewing postoperative radiographs; communicating and coordinating care with medical consult and other physicians; communicating and coordinating pain control with anesthesia, including status of current modalities (eg, blocks, catheters); updating orders; and writing “postoperative check” progress note.

Hospital visit #2 (postoperative day 1) includes the following work: Reviewing nursing notes; discussing status and progress with nursing staff; reviewing PT/OT notes; discussing status and progress with PT/OT staff; reviewing discharge plan notes; discussing status and progress with case management; coordinating discharge plans; reviewing notes from other physicians; discussing status as appropriate; reviewing vital signs, I/O, labs and other related data; interviewing patient and obtaining interval history; assessing pain control and response to current medications; assessing gastrointestinal and urinary function; examining surgical site; change or reinforce dressing as needed; assessing limb alignment, position and ROM; checking neurovascular status; repositioning limb and/or immobilization devices as needed; assessing function of drain and remove as indicated; counseling patient and/or family regarding therapy protocol and answering questions; counseling patient and/or family regarding OOB/ambulation, incentive spirometry, upright position in bed, and use of sequential compressive devices; discussing discharge plans with patient and/or family as well as case manager and nursing staff; communicating and coordinating care with other physicians (eg, medical consult, anesthesia/pain, critical care); writing daily progress notes; and updating orders.

Hospital discharge management (postoperative day #2) includes the following work: Reviewing nursing notes; discussing status and progress with nursing staff; reviewing PT/OT notes; discussing status and progress with PT/OT staff; reviewing discharge plan notes; discussing status and progress with case management; finalizing and confirming discharge plans; reviewing notes from other physicians and discussing as appropriate; reviewing vital signs, I/O, labs and other related data; interviewing patient and obtaining interval history; assessing pain control and response to current medications; assessing gastrointestinal and urinary function; examining surgical site; changing dressing as needed; assessing limb alignment and ROM; checking neurovascular status; repositioning limb and/or immobilization devices as needed; finalizing and confirming discharge plans with patient and/or family; counselling patient and/or family regarding therapy protocol and activity limitations after discharge; reviewing postoperative instructions (eg, wound care, pain medications, VTE prophylaxis); completing daily progress note; completing discharge summary and associated forms and documents; writing prescriptions for medications and devices (eg, walker, wheelchair, bedside commode, raised toilet seat); checking narcotic prescription registries; writing orders for discharge to an inpatient rehabilitation facility, a skilled nursing facility, or home.; completing medication reconciliation; coordinate postoperative appointment with patient and/or family and office staff; communicating and coordinating follow-up care with other physicians; and entering postoperative data into longitudinal outcome databases or registries (eg, NSQIP, AJRR).

Office visit #1: Review PT/OT and/or rehab/SNF notes; review results of labs (eg, INR, Hb, Plts); interview patient and obtain interval history; assess pain control and response to current medications; assess function, mobility and progress with PT/OT; assess gastrointestinal and urinary function; remove/change dressing; examine surgical site; remove sutures or staples; apply steri-strips; assess limb length, alignment, swelling, strength and ROM; check neurovascular status; review postoperative radiographs with patient and/or family; counsel patient and/or family regarding wound care, therapy protocol and activity limitations; counsel patient and/or family regarding dental procedures and other invasive procedures (eg,
CPT Code: 27130

colonoscopy); counsel patient and/or family regarding medications for DVT prophylaxis; counsel patient and/or family regarding next office visit; write or dictate and sign progress note; complete prescriptions for medications (eg, narcotics, NSAIDs, VTE prophylaxis); check narcotic prescription registries; complete forms for home care services (eg, VNA); complete PT/OT forms, referrals, or prescriptions; complete disability, out of work and other related forms; communicate and coordinate care with other physicians (eg, PCP, rheumatology); and enter postoperative data into longitudinal outcome registries (eg, NSQIP, AJRR, and/or local registry)

Office visit #2: Review PT/OT and/or rehab/SNF notes; interview patient and obtain interval history; assess pain control and response to current medications; assess function, mobility and progress with PT/OT; assess gastrointestinal and urinary function; examine surgical site; assess limb length, alignment swelling, strength and ROM; check neurovascular status; order and review postoperative radiographs with patient and/or family; counsel patient and/or family regarding wound care, therapy protocol and activity limitations; counsel patient and/or family regarding return to driving; complete temporary handicap parking forms; counsel patient and/or family regarding dental procedures and other invasive procedures (eg, colonoscopy); counsel patient and/or family regarding medications for DVT prophylaxis; counsel patient and/or family regarding next office visit; write or dictate and sign progress note; complete prescriptions for medications (eg, narcotics, NSAIDs, VTE prophylaxis); check narcotic prescription registries; complete forms for home care services (eg, VNA); complete PT/OT forms, referrals, or prescriptions; complete disability, back-to-work and other related forms; communicate and coordinate care with other physicians (eg, PCP, rheumatology); and enter postoperative data into longitudinal outcome registries (eg, NSQIP, AJRR, and/or local registry).

Office visits #3: Review PT/OT and/or rehab/SNF notes; interview patient and obtain interval history; assess pain control and response to current medications; assess function, mobility and progress with PT/OT; assess gastrointestinal and urinary function; examine surgical site; assess limb length, alignment swelling, strength and ROM; check neurovascular status; counsel patient and/or family regarding wound care, therapy protocol and activity limitations; counsel patient and/or family regarding dental procedures and other invasive procedures (eg, colonoscopy); counsel patient and/or family regarding medications for DVT prophylaxis; counsel patient and/or family regarding next office visit; write or dictate and sign progress note; complete prescriptions for medications (eg, narcotics, NSAIDs, VTE prophylaxis); check narcotic prescription registries; complete forms for home care services (eg, VNA); complete PT/OT forms, referrals, or prescriptions; complete disability, back-to-work and other related forms; communicate and coordinate care with other physicians (eg, PCP, Rheumatology); and enter postoperative data into longitudinal outcome registries (eg, NSQIP, AJRR, and/or local registry).

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC’s rationale, please review the separate RUC recommendation document.
BACKGROUND

A public nomination was submitted to CMS in February 2018 indicating seven CPT codes as potentially misvalued, including total hip arthroplasty (27130). This nomination was made by Anthem, Inc., the largest for-profit managed care health insurance company in the Blue Cross and Blue Shield Association. Anthem administers Medicare, Medicaid and commercial health insurance plans.

Prior to publication of the CY 2019 MPFS final rule, at the October 2018 RUC meeting, the RAW noted that “this is a process issue and without more information on how these services were identified and rationale to review these services, the Workgroup will wait until the final rule for more information to determine whether to review these services.” In the final rule, CMS stated there is value in consistent and routine review of high-volume services, because a minor adjustment to a high volume code may have a significant financial impact. RUC then placed the codes identified by Anthem on an LOI to survey for the April 2019 RUC meeting.

At the April 2019 RUC meeting, the American Academy of Orthopaedic Surgeons (AAOS) and the American Association of Hip and Knee Surgeons (AAHKS) recommended that the RUC reaffirm the current value of 20.72 for code 27130 and also reaffirm the current time and visits. The RUC voted against this proposal and requested that AAOS and AAHKS conduct a standard RUC survey and present a recommendation at the October 2019 RUC meeting.

June 2019 Request to Research Subcommittee for a Revised Survey Instrument

During preparation for the survey, the AAOS and AAHKS determined that the current standard 90-day global survey instrument does not adequately capture the extent of work performed by surgeons and other qualified health care providers (QHPs) in the pre- and postoperative period for the hip and knee total joint arthroplasty codes (27130, 27447). The societies also provided a compelling argument that there was significant clinical staff preoperative work related to patient optimization. A request was submitted for a revised survey instrument for discussion during the June 4, 2019 Research Subcommittee conference call. Several peer reviewed articles and extensive information on time required for pre- and postoperative work by physicians/QHPs and clinical staff were provided to support this request.

The Research Subcommittee agreed to add a question about clinical staff preoperative time, but did not agree to add questions about preoperative time for planning and optimization and postoperative work independent of hospital and office face-to-face visits. The rationale provided by the subcommittee was that the additional questions requested are not used for other codes with a 90-day global period. However, the Research Subcommittee noted that the specialties can recommend additional time beyond the pre-service package times if they believe it is supported by the literature, the survey, and is typical.

Subsequent to the June 2019 Research Subcommittee, AAOS and AAHKS finalized the approved survey instrument and conducted a random survey of AAOS and AAHKS members.

A total of 2,650 survey requests were sent out and 206 non-conflicted responses were received.

RECOMMENDATIONS

**Work RVU**

The current work RVU of 20.72 is recommended. This is below the survey median of 24.00 and below the survey 25th percentile of 22.50.

**Pre-service time**

Pre-time package 4 is selected: difficult patient / difficult procedure.

**Evaluation time:** We recommend adding 30 minutes to the standard package time of 40 minutes (total of 70 minutes) to account for significant additional preoperative time to optimize a patient prior to total joint replacement surgery.

Total hip arthroplasty is increasingly part of a mandatory Medicare bundled payment program (Comprehensive Care for Joint Replacement [CJR]) or an optional Medicare bundled payment program (Bundled Payment for Care Initiative [BPCI]). Similar alternative payment models are employed in many states by both Medicaid and private insurers. Physicians are also more commonly participating in accountable care organization programs with Medicare, Medicaid and private insurers. In all of these programs, physicians and hospitals have financial incentives to reduce costs and improve quality.
Preoperative identification and optimization of medical co-morbidities has been shown to shorten hospital length of stay and reduce complications, including readmissions. In a 2019 New England Journal of Medicine (NEJM) study on the outcomes of patients in the CJR program, the mean number of chronic medical conditions was seven. Considerable work by the surgeon and QHPs is required to facilitate, coordinate, validate and document the assessment and optimization of patients prior to total joint replacement surgery. Patients are more frequently discharged home rather than to inpatient rehabilitation or skilled nursing facilities. This deliberate reduction in post-acute care service requires considerable work by the surgeon and QHPs prior to surgery.

All of this work is not explicitly captured in the standard RUC survey, nor is it included in the current RUC pre-time packages, but the work is certainly being performed on a routine basis for the typical patient. The specific tasks are noted above in the description of the pre-service work.

**Positioning:** Twelve minutes have been added to the standard package time of 3 minutes (total of 15 minutes) to account for positioning the patient lateral decubitus or supine on a traction top table. This is consistent with both the survey median and historical RUC precedent for many similar orthopaedic codes.

**Scrub, dress and wait:** Five minutes have been subtracted from the standard package of 20 minutes (total time of 15 minutes) to be consistent with the survey median.

**Immediate Post-Service Time**

Immediate post-time package 9b is selected: general anesthesia or complex regional block / complex procedure. Thirteen minutes have been subtracted to be consistent with the survey median.

**Hospital Visits**

We recommend 99232 x 2 and 99238 x 1 which is consistent with the survey median. This is a decrease of one hospital visit compared to the 2013 data which is the result of the considerable pre-service time expended on optimizing the patient for total joint replacement surgery. The first hospital visit occurs later on the same day as surgery; 83% of respondents reported that they completed this E/M encounter. The second hospital visit occurs on postoperative day #1. The specific tasks for both visits are detailed in the section for the description of the post-service work and support a level 99232 for both encounters. The patient is typically discharged on postoperative day #2 which is indicated by the discharge day code 99238. Patients may be seen more than once on these days (eg, morning and afternoon) to coordinate care and facilitate discharge.

**Office Visits**

We recommend 99213 x 3 which is consistent with the survey median.

**Summary**

The transition to value-based alternative payment models has facilitated care delivery redesign for total hip arthroplasty, resulting in a shorter hospital length of stay, diminished utilization of post-acute care facilities, lower rates of hospital readmissions and reduced costs. A key change in this evolution is an increasing emphasis on preoperative optimization of patients prior to surgery with a corresponding shift in resource utilization to the pre-service period.

AAOS and AAHKS recommend the current work RVU of 20.72, which is below the survey 25th percentile; this is well supported by the survey results from a representative and robust survey with 206 respondents.

### ARTICLES SUPPORTING ADDITIONAL PREOPERATIVE PATIENT OPTIMIZATION WORK

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - [ ] The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - [ ] Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - [ ] Multiple codes allow flexibility to describe exactly what components the procedure included.
   - [ ] Multiple codes are used to maintain consistency with similar codes.
   - [ ] Historical precedents.
   - [ ] Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 27130

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

<table>

Do many physicians perform this service across the United States? Yes

**Berenson-Eggers Type of Service (BETOS) Assignment**

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification: Procedures

BETOS Sub-classification: Major procedure

BETOS Sub-classification Level II: Orthopedic - Hip replacement

**Professional Liability Insurance Information (PLI)**

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 27130

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.
CPT Code: 27447

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 27447  Tracking Number  Original Specialty Recommended RVU: 20.72
Global Period: 090  Current Work RVU: 20.72  Presented Recommended RVU: 19.60

RUC Recommended RVU: 19.60

CPT Descriptor: Arthroplasty, knee, condyle and plateau; medial AND lateral compartments with or without patella resurfacing (total knee arthroplasty)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 74-year-old female has knee osteoarthritis not responding to non-operative treatment. A total knee arthroplasty (TKA) is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 90%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 13% , Overnight stay-more than 24 hours 87%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 83%

Description of Pre-Service Work:

On the day before and/or the day of surgery, the surgeon and/or qualified health care provider will complete the following work: Interview and examine the patient to confirm that the medical status and physical findings have not changed; update and sign the H&P; review the planned procedure and postoperative management with the patient and family; confirm or update the consent; sign or mark the operative site; re-review results of preadmission testing, including laboratory studies, X-rays and/or CT scans, with special attention to radiographs that were used for sizing and ordering of special implants or allografts; confirm timing and administration of antibiotics; assure appropriate selection, timing, and administration of DVT prophylaxis; verify all required instruments and supplies are available, including intraoperative fluoroscopy and cell saver; confirm all potential implants are available for possible use in the OR; prior to the induction of anesthesia, complete a comprehensive timeout and checklist review with the surgical team; place Foley catheter when indicated and/or requested by anesthesia; assist with positioning patient, pad bony prominences, and apply thermal regulation drapes; assess position of the extremities and head and adjust as needed; place patient’s leg properly on the table and position with proper bolstering to aid surgical exposure; place a tourniquet on the proximal thigh; prep and drape; mark surgical incision; and perform a second brief time out with the surgical team.

Description of Intra-Service Work: After the tourniquet is elevated and following exsanguination, an acceptable surgical incision is utilized to expose the joint. After evertting or subluxating the patella, appropriate soft tissue elevation and removal is performed to expose and visualize the joint. Care and attention are utilized to evaluate the ligament balance of the knee. Final ligament balancing usually occurs after the bony cuts are performed. The remnant meniscal tissue and overlying osteophytes are removed and if indicated, the cruciate ligaments are released. The patella is measured and then the articular surface is resected at the appropriate depth. The optimal component size is selected and the fixation holes drilled. The femur intramedullary canal is drilled and the distal femoral cutting block is applied. The alignment of the block is confirmed and the distal femoral resection is made. The AP and ML size of the distal femur is evaluated and the appropriate implant size selected following which the remaining chamfer and AP bone cuts of the distal femur are made. The tibia is subluxated forward and the tibial cutting guide is applied, the optimal position in all planes confirmed and the bone cut made. The tibia is sized for the appropriate implant and the bone prepared. The trial components are inserted and a trial reduction of the prosthetic knee is performed. Overall limb alignment, soft tissue and ligamentous balance and prosthetic interactions are assessed. Further refinement of the soft tissue balance, the bone resections for alignment and the
prosthetic implant interaction are performed as indicated to optimize the prosthetic longevity. Trials are then removed. The bony surfaces are cleaned with pulsatile lavage. The final implants are cemented into place. Trial tibial inserts are placed to confirm appropriate sizing. The final polyethylene insert is then placed onto the tibial prosthesis. Knee stability, range of motion and alignment are again confirmed. The tourniquet is released, hemostasis obtained, a deep drain placed and the wound closed in layers.

Description of Post-Service Work:
Immediate postoperative work through discharge from recovery room includes: application of sterile dressings; removal of drapes; waiting for reversal of anesthesia and extubation; assisting in transfer of the patient from the OR table to a stretcher or bed; assessing limb length and rotational alignment; assisting in transport of patient from operating room to recovery room; monitoring patient stabilization in the recovery room; completing a careful neurologic and vascular examination of the extremity; discussing postoperative recovery care with anesthesia and nursing staff, including regional blocks and/or patient controlled analgesia; discussing procedure and outcome with patient and family and answering questions; entering a brief operative note and a full operative report in the medical record; calling referring physician and/or sending a copy of the operative note; writing comprehensive orders for PACU and floor care; completing medication reconciliation; ordering and reviewing postoperative radiographs; and entering procedure data, including implant details, into longitudinal outcome registries (eg, NSQIP, AJRR, and/or local registry).

Hospital visit #1 (day of surgery later in the day) includes the following work: Reviewing nursing notes; discussing status and progress with nursing staff; reviewing vital signs, I/O, labs, and other related data; reviewing findings and outcome with patient and/or family; assessing pain control and response to current medications; modify orders accordingly; assessing urinary function; examining the surgical site; reinforce dressing as needed; assessing limb length, position and alignment; checking neurovascular status; assessing function of drains; repositioning the limb and/or immobilization devices as needed; counseling the patient and/or family regarding therapy protocol; answer questions; counseling the patient and/or family regarding OOB/ambulation, incentive spirometry, upright position in bed, and use of sequential compressive devices; reviewing postoperative radiographs; communicating and coordinating care with medical consult and other physicians; communicating and coordinating pain control with anesthesia, including status of current modalities (eg, blocks, catheters); updating orders; and writing “postoperative check” progress note.

Hospital visit #2 (postoperative day 1) includes the following work: Reviewing nursing notes; discussing status and progress with nursing staff; reviewing PT/OT notes; discussing status and progress with PT/OT staff; reviewing discharge plan notes; discussing status and progress with case management; coordinating discharge plans; reviewing notes from other physicians; discussing status as appropriate; reviewing vital signs, I/O, labs and other related data; interviewing patient and obtaining interval history; assessing pain control and response to current medications; assessing gastrointestinal and urinary function; examining surgical site; change or reinforce dressing as needed; assessing limb alignment, position and ROM; checking neurovascular status; repositioning limb and/or immobilization devices as needed; assessing function of drain and remove as indicated; counseling patient and/or family regarding therapy protocol and answering questions; counselling patient and/or family regarding OOB/ambulation, incentive spirometry, upright position in bed, and use of sequential compressive devices; discussing discharge plans with patient and/or family as well as case manager and nursing staff; communicating and coordinating care with other physicians (eg, medical consult, anesthesia/pain, critical care); writing daily progress notes; and updating orders.

Hospital discharge management (postoperative day #2) includes the following work: Reviewing nursing notes; discussing status and progress with nursing staff; reviewing PT/OT notes; discussing status and progress with PT/OT staff; reviewing discharge plan notes; discussing status and progress with case management; finalizing and confirming discharge plans; reviewing notes from other physicians and discussing as appropriate; reviewing vital signs, I/O, labs and other related data; interviewing patient and obtaining interval history; assessing pain control and response to current medications; assessing gastrointestinal and urinary function; examining surgical site; changing dressing as needed; assessing limb alignment and ROM; checking neurovascular status; repositioning limb and/or immobilization devices as needed; finalizing and confirming discharge plans with patient and/or family; counselling patient and/or family regarding therapy protocol and activity limitations after discharge; reviewing postoperative instructions (eg, wound care, pain medications, VTE prophylaxis); completing daily progress note; completing discharge summary and associated forms and documents; writing prescriptions for medications and devices (eg, walker, wheelchair, bedside commode, raised toilet seat); checking narcotic prescription registries; writing orders for discharge to an inpatient rehabilitation facility, a skilled nursing facility, or home.; completing medication reconciliation; coordinate postoperative appointment with patient and/or family and office staff; communicating and coordinating follow-up care with other physicians; and entering postoperative data into longitudinal outcome databases or registries (eg, NSQIP, AJRR).
Office visit #1: Review PT/OT and/or rehab/SNF notes; review results of labs (eg, INR, Hb, Plts); interview patient and obtain interval history; assess pain control and response to current medications; assess function, mobility and progress with PT/OT; assess gastrointestinal and urinary function; remove/change dressing; examine surgical site; remove sutures or staples; apply steri-strips; assess limb length, alignment, swelling, strength and ROM; check neurovascular status; review postoperative radiographs with patient and/or family; counsel patient and/or family regarding wound care, therapy protocol and activity limitations; counsel patient and/or family regarding dental procedures and other invasive procedures (eg, colonoscopy); counsel patient and/or family regarding medications for DVT prophylaxis; counsel patient and/or family regarding next office visit; write or dictate and sign progress note; complete prescriptions for medications (eg, narcotics, NSAIDs, VTE prophylaxis); check narcotic prescription registries; complete forms for home care services (eg, VNA); complete PT/OT forms, referrals, or prescriptions; complete disability, out of work and other related forms; communicate and coordinate care with other physicians (eg, PCP, rheumatology); and enter postoperative data into longitudinal outcome registries (eg, NSQIP, AJRR, and/or local registry).

Office visit #2: Review PT/OT and/or rehab/SNF notes; interview patient and obtain interval history; assess pain control and response to current medications; assess function, mobility and progress with PT/OT; assess gastrointestinal and urinary function; examine surgical site; assess limb length, alignment swelling, strength and ROM; check neurovascular status; order and review postoperative radiographs with patient and/or family; counsel patient and/or family regarding wound care, therapy protocol and activity limitations; counsel patient and/or family regarding return to driving; complete temporary handicap parking forms; counsel patient and/or family regarding dental procedures and other invasive procedures (eg, colonoscopy); counsel patient and/or family regarding medications for DVT prophylaxis; counsel patient and/or family regarding next office visit; write or dictate and sign progress note; complete prescriptions for medications (eg, narcotics, NSAIDs, VTE prophylaxis); check narcotic prescription registries; complete forms for home care services (eg, VNA); complete PT/OT forms, referrals, or prescriptions; complete disability, back-to-work and other related forms; communicate and coordinate care with other physicians (eg, PCP, rheumatology); and enter postoperative data into longitudinal outcome registries (eg, NSQIP, AJRR, and/or local registry).

Office visits #3: Review PT/OT and/or rehab/SNF notes; interview patient and obtain interval history; assess pain control and response to current medications; assess function, mobility and progress with PT/OT; assess gastrointestinal and urinary function; examine surgical site; assess limb length, alignment swelling, strength and ROM; check neurovascular status; counsel patient and/or family regarding wound care, therapy protocol and activity limitations; counsel patient and/or family regarding dental procedures and other invasive procedures (eg, colonoscopy); counsel patient and/or family regarding medications for DVT prophylaxis; counsel patient and/or family regarding next office visit; write or dictate and sign progress note; complete prescriptions for medications (eg, narcotics, NSAIDs, VTE prophylaxis); check narcotic prescription registries; complete forms for home care services (eg, VNA); complete PT/OT forms, referrals, or prescriptions; complete disability, back-to-work and other related forms; communicate and coordinate care with other physicians (eg, PCP, Rheumatology); and enter postoperative data into longitudinal outcome registries (eg, NSQIP, AJRR, and/or local registry).

### Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC’s rationale, please review the separate RUC recommendation document.

### BACKGROUND
A public nomination was submitted to CMS in February 2018 indicating seven CPT codes as potentially misvalued, including total knee arthroplasty (27447). This nomination was made by Anthem, Inc., the largest for-profit managed care health insurance company in the Blue Cross and Blue Shield Association. Anthem administers Medicare, Medicaid and commercial health insurance plans.

Prior to publication of the CY 2019 MPFS final rule, at the October 2018 RUC meeting, the RAW noted that “this is a process issue and without more information on how these services were identified and rationale to review these services, the Workgroup will wait until the final rule for more information to determine whether to review these services.” In the final rule, CMS stated there is value in consistent and routine review of high-volume services, because a minor adjustment to a high volume code may have a significant financial impact. RUC then placed the codes identified by Anthem on an LOI to survey for the April 2019 RUC meeting.

At the April 2019 RUC meeting, the American Academy of Orthopaedic Surgeons (AAOS) and the American Association of Hip and Knee Surgeons (AAHKS) recommended that the RUC reaffirm the current value of 20.72 and also reaffirm the current time and visits. The RUC voted against this proposal and requested that AAOS and AAHKS conduct a standard RUC survey and present a recommendation at the October 2019 RUC meeting.

June 2019 Request to Research Subcommittee for a Revised Survey Instrument
During preparation for the survey, the AAOS and AAHKS determined that the current standard 90-day global period survey instrument does not adequately capture the extent of work performed by physicians and qualified health care providers (QHPs) in the pre- and post-operative period for the hip and knee total joint arthroplasty codes (27130, 27447). The societies also provided a compelling argument that there was significant clinical staff pre-service work related to patient optimization. A request was submitted for a revised survey instrument for discussion during the June 4, 2019 Research Subcommittee conference call.

Several peer reviewed articles and extensive information on time required for pre- and post-operative work by physicians/QHPs and clinical staff were provided to support this recommendation. The Research Subcommittee agreed to add a question about clinical staff pre-service time but did not agree to add questions about pre-service time for planning and optimization and post-operative work independent of hospital and office face-to-face visits. The rationale was that the same questions are not used for other codes with a 90-day global period. However, the Research Subcommittee noted that the specialties can recommend additional time beyond the pre-service package times, if they believe it is supported by the literature, the survey, and is typical.

Subsequent to the June 2019 Research Subcommittee, AAOS and AAHKS finalized the approved survey instrument and conducted a random survey of AAOS and AAHKS members.

A total of 2,650 survey requests were sent out and 206 non-conflicted responses were received.

RECOMMENDATIONS

Work RVU:
The current work RVU of 20.72 is recommended. This is below the survey median of 24.00 and below the survey 25th percentile of 22.14.

Pre-service time:
Pre-time package 4 is selected: difficult patient / difficult procedure.

Evaluation time: We recommend adding 30 minutes to the standard package time of 40 minutes (total of 70 minutes) to account for significant additional pre-operative time to optimize a patient prior to total joint replacement surgery.

Total knee arthroplasty is increasingly part of a mandatory Medicare bundled payment program (Comprehensive Care for Joint Replacement [CJR]) or an optional Medicare bundled payment program (Bundled Payment for Care Initiative [BPCI]). Similar alternative payment models are employed in many states by both Medicaid and private insurers. Physicians are also more commonly participating in accountable care organization programs with Medicare, Medicaid and private insurers. In all of these programs, physicians and hospitals have financial incentives to reduce costs and improve quality.
Pre-operative identification and optimization of medical co-morbidities has been shown to shorten hospital length of stay and reduce complications, including readmissions. In a 2019 New England Journal of Medicine (NEJM) study on the outcomes of patients in the CJR program, the mean number of chronic medical conditions was seven. Considerable work by the surgeon and QHPs is required to facilitate, coordinate, validate and document the assessment and optimization of patients prior to total joint replacement surgery. Patients are more frequently discharged home rather than to inpatient rehabilitation or skilled nursing facilities. This deliberate reduction in post-acute care service requires considerable work by the surgeon and QHPs prior to surgery.

All of this work is not explicitly captured in the standard RUC survey, nor is it included in the current RUC pre-time packages, but the work is certainly being performed on a routine basis for the typical patient. The specific tasks are noted above in the description of the pre-service work.

Positioning: Twelve minutes have been added to the standard package time of 3 minutes (total of 15 minutes) to account for positioning the patient supine; apply a tourniquet; confirm tourniquet settings and validate function. This is consistent with both the survey median and historical RUC precedent for many similar orthopaedic codes.

Scrub, dress and wait: Five minutes have been subtracted from the standard package of 20 minutes (total time of 15 minutes) to be consistent with the survey median.

**Immediate Post-Service Time**

Immediate post-time package 9b is selected: general anesthesia or complex regional block / complex procedure. Thirteen minutes have been subtracted to be consistent with the survey median.

**Hospital Visits**

We recommend 99232 x 2 and 99238 x 1 which is consistent with the survey median. This is a decrease of one hospital visit compared to the 2013 data which is the result of the considerable pre-service time expended on optimizing the patient for total joint replacement surgery. The first hospital visit occurs later on the same day as surgery; 83% of respondents reported that they completed this E/M encounter. The second hospital visits occurs on post-operative day #1. The specific tasks for both visits are detailed in the section for the description of the post-service work and support a level 99232 for both encounters. The patient is typically discharged on post-operative day #2 which is indicated by the discharge day code 99238. Patients may be seen more than once on these days (e.g. morning and afternoon) to coordinate care and facilitate discharge.

**Office Visits**

We recommend 99213 x 3 which is consistent with the survey median.

**SUMMARY**

The transition to value-based alternative payment models has facilitated care delivery redesign for total hip arthroplasty, resulting in a shorter hospital length of stay, diminished utilization of post-acute care facilities, lower rates of hospital readmissions and reduced costs. A key change in this evolution is an increasing emphasis on pre-operative optimization of patients prior to surgery with a corresponding shift in resource utilization to the pre-service period.

AAOS and AAHKS recommend the current work RVU of 20.72, which is below the survey 25th percentile; this is well supported by the survey results from a representative and robust survey with 206 respondents.

### ARTICLES SUPPORTING ADDITIONAL PREOPERATIVE PATIENT OPTIMIZATION WORK

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)
   - The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - Multiple codes allow flexibility to describe exactly what components the procedure included.
   - Multiple codes are used to maintain consistency with similar codes.
   - Historical precedents.
   - Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 27447

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty orthopaedic surgery   How often?  Commonly

Specialty How often?
Estimate the number of times this service might be provided nationally in a one-year period? If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National data not available.

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

A panel of clinicians representing each specialty society involved in the RUC survey process for the code collaborated to develop and approve the PE recommendations. The specialty societies also submitted a request to the RUC Research Subcommittee to add an additional question to the standard RUC survey regarding pre-service clinical staff time. The Research Subcommittee approved the request and the following question was added to the survey:

Background for Question 7: Clinical Staff Time

The purpose of this question is to capture the clinical staff time provided by health care professionals who are paid by your practice and cannot bill separately, such as registered nurses (RNs), licensed practical nurses (LPNs), and certified medical assistants (MA), or other clinical staff employed in your practice. Do not count the clinical staff time for any separately reported services performed on the same date or other dates (eg, chronic care management services performed during the month).

Clinical staff activities DO NOT INCLUDE time for any administrative activities no matter who performs these services, including:
- Obtain referral documents
- Schedule patient/remind patient of appointment
- Obtain medical records/manage patient database/develop chart
- Pre-certify patient/conduct pre-service billing
- Verify insurance/register patient
- Transcribe results/file and manage patient records
- Schedule subsequent post service follow-up visits
- Conduct billing and collection activities

QUESTION 7: Pre-operative CLINICAL STAFF TIME: How much total time does your clinical staff (eg, RN, LPN, MA) spend per patient on the following planning, preparation, optimization and care coordination activities prior to surgery?

Please include the CLINICAL STAFF TIME for planning the case and preparation of the patient prior to the procedure, but separate and after the decision-for-surgery visit, which may include the following activities:
AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION

- Schedule space and equipment in the operating room.
- Coordinate pre-operative services (including test results).
- Coordinate pre-operative assessment with anesthesia.
- Coordinate pre-operative services with physical therapy, case manager and/or social worker.
- Provide pre-operative education.
- Coordinate final clearance assessment.
- Complete pre-operative phone calls, e-mails, or other communications with patient, family and other providers to coordinate care and optimization.
- Complete pre-operative phone calls, e-mails, or other communications with patient or family to review preparation and instructions (e.g., NPO, medications, antibiotic shower).

TOTAL Pre-operative CLINICAL STAFF TIME (minutes)

<table>
<thead>
<tr>
<th>Code</th>
<th>Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>27447</td>
<td>27130</td>
</tr>
</tbody>
</table>

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code, but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here (for service reviewed prior to the implementation of clinical activity codes, detail is not provided in the RUC database, please contact Samantha Ashley at samantha.ashley@ama-assn.org for PE spreadsheets for your reference codes):

Current codes are used for reference.

3. Is this code(s) typically reported with an E/M service?

No

4. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time:

The clinical staff time involved in providing total joint arthroplasty has changed considerably in the past six plus years since 27130 and 27447 were last surveyed (2012/2013). Since 2013 the use of pre-operative optimization protocols for Total Joint patients has become typical and involves a considerable change in work done by clinical staff prior to surgery.

These activities include

- Schedule space and equipment in OR.
- Coordinate pre-surgery services (including test results).
- Coordinate pre-operative assessment with anesthesia.
- Coordinate pre-operative services with physical therapy, case manager and/or social worker.
- Provide pre-operative education.
- Coordinate final clearance assessment.
- Complete pre-operative phone calls, e-mails, or other communications with patient, family and other providers to coordinate care and optimization.
- Complete pre-operative phone calls, e-mails, or other communications with patient or family to review preparation and instructions (e.g., NPO, medications, antibiotic shower).

Previous surveys did not address this work, and we believe the additional work merited survey, which compelled the societies to request the additional question. We believe the survey results illustrate that indeed the clinical work is greater in the pre-service period than in previous years and is
sufficiently different from the clinical standard. Please see the following literature on pre and post-service work done non face-to-face in Total Hip Arthroplasty and Total Knee Arthroplasty.

ARTICLES SUPPORTING ADDITIONAL PREOPERATIVE PATIENT OPTIMIZATION WORK

5. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies for the code family, please provide compelling evidence (please see PE compelling evidence guidelines) Please explain if the increase can be entirely accounted for because of an increase in physician time:

See response to Question 4. Increase in aggregate cost is reflective of increase in pre-service patient optimization time.

6. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (please see second worksheet in PE spreadsheet workbook), please explain the difference here:

#### b. Service period (includes pre, intra and post):

**12 minutes (standard)**

Prior to discharge, office clinical staff will assist with necessary post-discharge care coordination, such as:

- Responding to patient/family questions about home activity restrictions/WB status, therapy questions
- Answer questions regarding dressing/wound management, showering/bathing, personal grooming
- Confirmation of home equipment
- Confirmation of discharge ABX if needed, pain medication, use of anticoagulation
- Coordination with PCP’s office for transfer of records
- Telephonic or electronic communication assistance with the office, and other necessary management assistance related to the hospitalization.
- Transitioning discharge information to the office medical record, including correspondence and imaging or lab results pending at discharge

#### c. Post-service period:

**108 minutes - standard time for current (2019) office visit E/Ms**

Clinical staff will greet the patient, provide gowing, and ensure that all appropriate medical records are available including interval imaging and labs, physical therapy reports, and chart notes from other
physicians. Clinical staff will obtain vital signs, prepare the room and necessary supplies, assist with patient positioning for exam, review and document history, systems and medications. Clinical staff will assist the physician during the exam which may include wound and drain (if present) assessment, neurovascular assessment, ROM assessment, and staple removal when appropriate. Clinical staff will clean the room and answer any patient/family questions about home care including activity limitations and reinforcement of physical therapy activities. Clinical staff will assist the physician with orders for medication and physical therapy changes. Clinical staff will assist with answering patient, family, caregiver, therapist, other clinician questions and help process changes in care.

8. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (please see second worksheet in PE spreadsheet workbook):

N/A

9. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov.

ITEMIZED LIST OF CHANGES (FOLLOWING THE PE SUBCOMMITTEE MEETING)

During and immediately following the review of this tab at the PE Subcommittee meeting please revise the PE spreadsheet and summary of recommendation (PE SOR) documents based on modifications made during the meeting. Please submit the revised documents electronically to Samantha Ashley at samantha.ashley@ama-assn.org immediately following the close of business the same day that the tab is reviewed. On the PE spreadsheet, please highlight the cells and/or use red font to show the changes made during the meeting. In addition to those revisions please also provide an itemized list of the modifications made to the PE spreadsheet during the PE Subcommittee meeting in the space below (e.g. clinical activity CA010 obtain vital signs was reduced from 5 minutes to 3 minutes).

**Clinical Staff Type:**

- **AAOS, AAHKS**
After considering public comments to the Proposed Rule for the CY 2021 Medicare Physician Payment Schedule, CMS did not finalize the proposal to crosswalk the valuation of CPT codes 90460, 90471, 90473 and HCPCS codes G0008, G0009, and G0010 to CPT code 36000 *Introduction of needle or intracatheter, vein* (work RVU = 0.18). CMS instead finalized a policy to maintain the CY 2019 payment for nine of the services in the immunization administration family, including the add-on codes. Maintaining the CY 2019 rates for these services also maintained the historical relationship between the base administration codes and the add-on CPT codes 90461, 90472, and 90474, instead of the proposal to value the add-on codes at 50 percent of the base codes. As previously discussed in the Proposed Rule, CMS approximated a cost for these services, but acknowledged the concerns that were raised in the public rulemaking comments received and will continue to seek additional information that specifically reflects the resource costs and inputs that should be considered to establish payment for these services on a long-term basis. CMS welcomes the results of an updated formal review of these services as well as any additional information that may be helpful for valuation in the immediate future. Based on CMS’ comments, the RUC reviewed these services at the April 2021 RUC meeting.

**Compelling Evidence**

The specialties provided compelling evidence that the current values for these services were derived via flawed methodology. The pediatric immunization administration codes, 90460 and 90461, were developed to promote physician counseling of hesitant parents and use of combination vaccines to address decline in national immunization rates and subsequently valued by the RUC in October 2009. However, in the 2011 Medicare Physician Payment Schedule, CMS did not accept the RUC recommendations for 90460 and 90461. Instead, CMS applied the same methodology used for the existing immunization administration codes (90471-90474) to establish the values for 90460 and 90461. CMS valued codes 90471 and 90473 (base) codes by hard coding them to code 96372 *Therapeutic, prophylactic, or diagnostic injection (specify substance or drug); subcutaneous or intramuscular* and then setting the RVUs for the add-on codes (90472 and 90474) at approximately half the value of the base codes. While the CMS values in and of themselves do not create flawed methodology, the process associated with valuing these codes is flawed for several reasons.

In contrast from how the RUC uses crosswalks to recommend a one-time value for a service for physician work, CMS hard-coded the physician work, PE and PLI RVUs for 90460 to 96372. As a result, when PE inputs for code 96372 were subsequently reduced by the RUC in January 2017, CMS automatically reduced the PE values for 90460 even though the same reductions in clinical staff time did not pertain to 90460. These reductions threatened the US national vaccination program by reducing the value below the Medicaid minimum payment rate for immunization administration. The specialties then began working with CMS to identify an alternative crosswalk methodology to reflect the physician counseling work and practice expense inherent in the service.

As noted above, code 96372 was the same code used by CMS years earlier to value immunization administration code 90471. Both 96372 and 90471 describe the physician work of direct supervision whereas 90460 and 90461 describe a more intense level of physician work involving patient counseling.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.
In addition to flawed methodology, there is a change in the patient population reflecting growing vaccine hesitancy. Although coverage levels for most childhood vaccines remain relatively high in the United States, numerous studies have documented that vaccine-related confidence has been decreasing among US parents over the past several years\(^1\). In 2011, only one in five physicians reported that a significant percentage of parents asked to spread out vaccines in a typical month. By 2014, that percentage had grown to 58\% of respondents who reported frequent requests for alternative vaccination schedules\(^2\). Because altered vaccine schedules are associated with reduced vaccine rates and increase in vaccine administration errors, physician counseling is required to confront requests for alternative scheduling. The RUC agreed that there is compelling evidence that the physician work has changed for these services due to flawed methodology in the recent CMS valuation and the patient population has changed.

**90460 Immunization administration through 18 years of age via any route of administration, with counseling by physician or other qualified health care professional; first or only component of each vaccine or toxoid administered**

The RUC reviewed the survey results from 94 physicians and nurse practitioners and determined that the 25\(^{th}\) percentile work RVU of 0.24 appropriately accounts for the work required to perform this service. The RUC recommends 7 minutes of intra-service time as supported by the survey. The RUC noted that the immunization administration services are typically performed on the same day as an Evaluation and Management (E/M) office visit and the recommended work and time recommended is not duplicative from that which is included in the E/M visit.

The pediatric immunization administration codes, 90460 and 90461, require more physician work than the adult immunization administration codes 90471-90474, because they require physician/qualified health care professional counseling. Counseling is typically provided with the adult codes, but it is not required. Secondly, as indicated in the compelling evidence statement, there has been an increase in vaccination hesitancy, which requires counseling with the parents by reviewing a 5-page vaccination information sheet (VIS), discussing the safety, efficacy and health benefits of the vaccinations.

The specialty societies indicated that CPT code 90460 requires slightly more work and is more intense than the recent COVID-19 immunization administration services (work RVU = 0.20 and 7 minutes intra-service time). There are currently four COVID-19 vaccinations in the market, whereas there are approximately 30 different preparations of childhood vaccines on the market. Due to concerns that are often product specific, it increases the intensity and the breadth of the discussion/counseling with the parent for CPT codes 90460 and 90461.

The RUC compared the surveyed code to the top key reference service 99406 *Smoking and tobacco use cessation counseling visit; intermediate, greater than 3 minutes up to 10 minutes* (work RVU = 0.24 and 7 minutes intra-service time) and determined that these services both involve counseling on health risks for patients, require the exact same physician work and time, and therefore should be valued the same.

The RUC also compared 90460 to the second top key reference service 99212 *Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and straightforward medical decision making. When*

\(^1\) [https://www.tandfonline.com/doi/full/10.4161/hv.25085](https://www.tandfonline.com/doi/full/10.4161/hv.25085)

\(^2\) [https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7242184/](https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7242184/)

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.
using time for code selection, 10-19 minutes of total time is spent on the date of the encounter (work RVU = 0.70, 11 minutes intra-service time and 16 minutes total time) and determined 90460 requires much less physician work and time to perform, thus is appropriately valued lower.

For additional support, the RUC referenced MPC codes 74019 Radiologic examination, abdomen; 2 views (work RVU = 0.23, 4 minutes of intra-service time and 6 minutes total time) and 93922 Limited bilateral noninvasive physiologic studies of upper or lower extremity arteries, (eg, for lower extremity: ankle/brachial indices at distal posterior tibial and anterior tibial/dorsalis pedis arteries plus bidirectional, Doppler waveform recording and analysis at 1-2 levels, or ankle/brachial indices at distal posterior tibial and anterior tibial/dorsalis pedis arteries plus volume plethysmography at 1-2 levels, or ankle/brachial indices at distal posterior tibial and anterior tibial/dorsalis pedis arteries with, transcutaneous oxygen tension measurement at 1-2 levels) (work RVU = 0.25, 5 minutes of intra-service time and 10 minutes of total time), which require similar physician work and time. The RUC concluded that CPT code 90460 should be valued at the 25th percentile work RVU as supported by the survey.

The RUC recommends a work RVU of 0.24 for CPT code 90460.

90461 Immunization administration through 18 years of age via any route of administration, with counseling by physician or other qualified health care professional; each additional vaccine or toxoid component administered (List separately in addition to code for primary procedure)
The RUC reviewed the survey results from 91 physicians and nurse practitioners and determined that the 25th percentile work RVU of 0.18 appropriately accounts for the work required to perform this add-on service. The RUC recommends 5 minutes of intra-service time as supported by the survey. The RUC noted that the immunization administration services are typically performed on the same day as an Evaluation and Management (E/M) office visit and the recommended work and time recommended is not duplicative from what is included in the E/M visit.

The pediatric immunization administration codes, 90460 and 90461, require more physician work than the adult immunization administration codes 90471-90474, because they require physician/qualified health care professional counseling. Counseling is typically provided with the adult codes, but it is not required. Secondly, as indicated in the compelling evidence statement, there has been an increase in vaccination hesitancy, which requires counseling with the parents by reviewing a 5-page VIS, discussing the safety, efficacy and health benefits of the vaccinations.

The RUC compared the surveyed code to the top key reference service 96375 Therapeutic, prophylactic, or diagnostic injection (specify substance or drug); each additional sequential intravenous push of a new substance/drug (List separately in addition to code for primary procedure) (work RVU = 0.10- and 4-minutes intra-service time) and determined 90461 requires more physician work, time and intensity, thus should be valued higher.

The RUC also compared 90461 to the second top key reference service 96411 Chemotherapy administration; intravenous, push technique, each additional substance/drug (List separately in addition to code for primary procedure) (work RVU = 0.20, 4 minutes intra-service time and 7 minutes total time) and determined 90461 requires slightly less physician work and time to perform.

For additional support, the RUC referenced MPC codes 93010 Electrocardiogram, routine ECG with at least 12 leads; interpretation and report only (work RVU = 0.17, 3 minutes of intra-service time and 6 minutes total time) and 96367 Intravenous infusion, for therapy, prophylaxis, or diagnosis (specify substance or drug); additional sequential infusion of a new drug/substance, up to 1 hour (List separately in addition to code for primary procedure) (work RVU = 0.19, 5 minutes of intra-service time and 6 minutes of total time), which require similar physician work and

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.
The RUC concluded that CPT code 90461 should be valued at the 25th percentile work RVU as supported by the survey. **The RUC recommends a work RVU of 0.18 for CPT code 90461.**

90471 Immunization administration (includes percutaneous, intradermal, subcutaneous, or intramuscular injections; 1 vaccine (single or combination vaccine/toxoid)

The RUC reviewed the survey results from 100 physicians and nurse practitioners and determined that the current work RVU of 0.17 appropriately accounts for the work required to perform this service. The RUC recommends 7 minutes of intra-service time. The RUC discussed that the survey respondents indicated the median time had decreased. However, after further inspection of the survey results, the specialty societies indicated that the survey median time was skewed by those who completed the survey because it was not representative of those who typically perform this service. Of the 100 survey responses, 83 were from pediatrics and only 17 were from other primary care organizations. The pediatricians are atypical users of the adult codes and do not spend the same amount of time counseling since they would report 90460 and 90461 in those instances. The 17 responses from other primary care organizations support the current time of 7 minutes, thus the RUC agreed there is no evidence to change the physician time. The specialty societies indicated that counseling is typical and provided in over 50% of the adult immunization administration codes 90471 and 90472; however, it is not required.

The RUC determined that the surveyed was flawed because the respondents who are not the predominant performers of this service skewed the results and further, there is no evidence that the current physician work or time has changed. The RUC concurred that the current work RVU of 0.17 and 7 minutes of intra-service time appropriately account for the work and time required to perform CPT code 90471. This valuation maintains the relativity and rank order with the pediatric immunization administration code, with 90471 being appropriately lower, as there is slightly less education and discussion about vaccination hesitancy that is required for CPT code 90460. The RUC noted that the immunization administration services are typically performed on the same day as an Evaluation and Management (E/M) office visit and the recommended work and time recommended is not duplicative from what is included in the E/M visit.

For additional support, the RUC referenced CPT codes 96372 *Therapeutic, prophylactic, or diagnostic injection (specify substance or drug); subcutaneous or intramuscular* (work RVU = 0.17, 3 minutes intra-service time and 7 minutes total time), 99211 *Office or other outpatient visit*
for the evaluation and management of an established patient, that may not require the presence of a physician or other qualified health care professional. Usually, the presenting problem(s) are minimal. (work RVU = 0.18, 5 minutes intra-service and 7 minutes total time) and MPC code 73120 Radiologic examination, hand; 2 views (work RVU = 0.16, 4 minutes of intra-service time and 6 minutes total time), all which require similar physician work and total time. The RUC concluded that the current value and time of CPT code 90471 should be maintained. **The RUC recommends a work RVU of 0.17 for CPT code 90471.**

90472 Immunization administration (includes percutaneous, intradermal, subcutaneous, or intramuscular injections); each additional vaccine (single or combination vaccine/toxoid) (List separately in addition to code for primary procedure)

The RUC discussed CPT code 90472 and came to the same determination, as for 90471, that the survey was flawed because the respondents who are not the predominant performers of this service skewed the results. Of the 97 survey responses, 81 were from pediatrics and only 16 were from other primary care organizations. The pediatricians are atypical users of the adult codes and do not spend the same amount of time counseling since they would report 90460 and 90461 in those instances. The 16 responses from other primary care organizations support the current time of 7 minutes, thus the RUC agreed there is no evidence to change the physician time. The specialty societies indicated that counseling is typical and provided in over 50% of the adult immunization administration codes 90471 and 90472; however, it is not required.

The RUC determined that there is no evidence that the current physician work or time has changed. The RUC concurred that the current work RVU of 0.15 appropriately accounts for the work required to perform this add-on service. The RUC recommends 7 minutes of intra-service time. This valuation maintains the relativity with the pediatric immunization administration code, with 90472 being appropriately lower as there is slightly less education and discussion about vaccination hesitancy that is required for CPT code 90461. The RUC noted that the immunization administration services are typically performed on the same day as an Evaluation and Management (E/M) office visit and the recommended work and time recommended is not duplicative from what is included in the E/M visit.

For additional support, the RUC referenced 78730 Urinary bladder residual study (List separately in addition to code for primary procedure) (work RVU = 0.15 and 5 minutes of intra-service and total time) and MPC code 73120 Radiologic examination, hand; 2 views (work RVU = 0.16, 4 minutes of intra-service time and 6 minutes total time). The RUC concluded that the current value and time of CPT code 90472 should be maintained. **The RUC recommends a work RVU of 0.15 for CPT code 90472.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.
90473 Immunization administration by intranasal or oral route; 1 vaccine (single or combination vaccine/toxoid)
The RUC determined that the survey was flawed because the respondents who are not the predominant performers of this service skewed the results and there is no evidence that the physician work and time has changed for this service.

The RUC agreed with the specialty societies that the work required for the intranasal/oral immunization administration is the same as the intramuscular immunization administration services. The RUC determined that the current work RVU of 0.17 appropriately accounts for the work required to perform this service. The RUC recommends 7 minutes of intra-service time. This valuation maintains the relativity and rank order with the pediatric immunization administration code, with 90473 being appropriately lower, as there is slightly less education and discussion about vaccination hesitancy as is required for CPT code 90460. The RUC noted that the immunization administration services are typically performed on the same day as an Evaluation and Management (E/M) office visit and the recommended work and time recommended is not duplicative from what is included in the E/M visit.

For additional support, the RUC referenced CPT codes 96372 Therapeutic, prophylactic, or diagnostic injection (specify substance or drug); subcutaneous or intramuscular (work RVU = 0.17, 3 minutes intra-service time and 7 minutes total time), 99211 Office or other outpatient visit for the evaluation and management of an established patient, that may not require the presence of a physician or other qualified health care professional. Usually, the presenting problem(s) are minimal. (work RVU = 0.18, 5 minutes intra-service and 7 minutes total time) and MPC code 73120 Radiologic examination, hand; 2 views (work RVU = 0.16, 4 minutes of intra-service time and 6 minutes total time), all which require similar physician work and time. The RUC concluded that the current value and time of CPT code 90473 should be maintained. The RUC recommends a work RVU of 0.17 for CPT code 90473.

90474 Immunization administration by intranasal or oral route; each additional vaccine (single or combination vaccine/toxoid) (List separately in addition to code for primary procedure)
The RUC determined that the survey was flawed because the respondents who are not the predominant performers of this service skewed the results and there is no evidence that the physician work and time has changed for this service.

The RUC agreed with the specialty societies that the work required for the intranasal/oral immunization administration services are the same as the intramuscular immunization administration services. The RUC determined that the current work RVU of 0.15 appropriately accounts for the work required to perform this add-on service. The RUC recommends 7 minutes of intra-service time. This valuation maintains the relativity with the pediatric immunization administration code, with 90474 being appropriately lower as there is slightly less education and discussion about vaccination hesitancy as is required for CPT code 90461.

For additional support, the RUC referenced 78730 Urinary bladder residual study (List separately in addition to code for primary procedure) (work RVU = 0.15 and 5 minutes of intra-service/total time) and MPC code 73120 Radiologic examination, hand; 2 views (work RVU = 0.16, 4 minutes of intra-service time and 6 minutes total time). The RUC concluded that the current value and time of CPT code 90474 should be maintained. The RUC recommends a work RVU of 0.15 for CPT code 90474.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.
G0008 Administration of influenza virus vaccine  
G0009 Administration of pneumococcal vaccine  
G0010 Administration of hepatitis b vaccine

HCPCS codes G0008, G0009 and G0010 for the administration of the vaccines are not paid on the Medicare Physician Fee Schedule. The Medicare Claims Processing Manual instructs that beginning March 1, 2003, HCPCS codes G0008, G0009, and G0010 are to be reimbursed at the same rate as HCPCS code 90471 Immunization administration (includes percutaneous, intradermal, subcutaneous, or intramuscular injections); 1 vaccine (single or combination vaccine/toxoid) (recommended work RVU = 0.17 and 7 minutes intra-service time). The specialty societies indicated, and the RUC recommends maintaining that link. The RUC recommends 7 minutes intra-service time and a work RVU of 0.17 for codes G0008, G0009 and G0010.

Practice Expense
The Practice Expense (PE) Subcommittee discussed and accepted compelling evidence based on flawed methodology due to CMS hard coding as well as change in technique, as detailed in the PE summary of recommendation (SOR). Based on acceptance of compelling evidence, the PE Subcommittee reviewed the direct practice expenses for these services. It was clarified that 3 minutes of CA011 Provide education/obtain consent is typical for all these immunization administration services. The specialty societies explained, and the PE Subcommittee agreed, that a vaccination information statement (VIS) is required by Federal law to be presented and reviewed with patients for every vaccine administered. Even if it is a yearly vaccination, individuals must be presented and informed of both the benefits and risks of the vaccine. The PE Subcommittee approved the direct practice expense inputs as recommended by the specialty societies without modification. The RUC recommends the direct practice expense inputs as submitted by the specialty society.

| Immunization Administration for Vaccines/Toxoids  
Report vaccine immunization administration codes 90460, 90461, 90471-90474 in addition to the vaccine and toxoid code(s) 90476-90749.  
Report codes 90460 and 90461 only when the physician or qualified health care professional provides face-to-face counseling of the patient/family during the administration of a vaccine. For immunization administration of any vaccine that is not accompanied by face-to-face physician or qualified health care professional counseling to the patient/family or for administration of vaccines to patients over 18 years of age, report codes 90471-90474. (See also Instructions for Use of the CPT Codebook for definition of reporting qualifications.)  
If a significant separately identifiable evaluation and management service (eg, new or established patient office or other outpatient services [99202-99215], office or other outpatient consultations [99241-99245], emergency department services [99281-99285], preventive medicine services [99381-99429]) is performed, the appropriate E/M service code should be reported in addition to the vaccine and toxoid administration codes.  

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.
A component refers to all antigens in a vaccine that prevent disease(s) caused by one organism (90460 and 90461). Multi-valent antigens or multiple serotypes of antigens against a single organism are considered a single component of vaccines. Combination vaccines are those vaccines that contain multiple vaccine components. Conjugates or adjuvants contained in vaccines are not considered to be component parts of the vaccine as defined above.

Chicago, IL 60611-5885

RE: Tab 19: Immunization Administration (90460, 90461, 90471, 90472, 90473, 90474, G0008, G0009, G0010): G Code Recommendations

Dear Doctor Silva:

Thank you for the opportunity to survey and provide recommendations for Tab 19 Immunization Administration. The undersigned specialties provide this letter as informational background, an explanation of our decision not to survey certain codes, as well as our valuation recommendations for codes G0008 (Administration of influenza virus vaccine), G0009 (Administration of pneumococcal vaccine), and G0010 (Administration of hepatitis b vaccine).

As you know, as of March 1, 2003, the Medicare Claims Processing Manual instructs carriers to reimburse HCPCS codes G0008, G0009, and G0010 at the same rate as CPT code 90471 (Immunization administration (includes percutaneous, intradermal, subcutaneous, or intramuscular injections); one vaccine (single or combination vaccine/toxoid)).

The specific language from page 49 of the manual states:

“The HCPCS codes G0008 and G0009 for the administration of the vaccines are not paid on the MPFS. However, prior to March 1, 2003, they must be paid at the same rate as HCPCS code 90782, which is on the MPFS. The designated contractor must pay per the correct MPFS file for each calendar year based on the date of service of the claim. Beginning March 1, 2003, HCPCS codes G0008, G0009, and G0010 are to be reimbursed at the same rate as HCPCS code 90471.”

As a result of this explicit Medicare payment policy, the undersigned specialties do not believe it is necessary to survey or develop direct practice expense input recommendations for codes G0008, G0009, and G0010.

Our specialties support the current crosswalk between 90471 and these codes and believe that this crosswalk should be maintained. As such, following a robust survey response, our specialties are recommending a work RVU of 0.17 for CPT code 90471. Given existing Medicare payment policy, we encourage the RUC to also recommend to CMS a work RVU of 0.17 and identical direct practice expense inputs for codes G0008, G0009, and G0010.

Thank you,

American Academy of Family Physicians
American Academy of Pediatrics
American College of Obstetricians and Gynecologists
American College of Physicians
American Nurses Association
CPT Code: 90460

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 90460  Tracking Number  Original Specialty Recommended RVU: 0.24
Presented Recommended RVU: 0.24
Global Period: XXX  Current Work RVU: 0.17  RUC Recommended RVU: 0.24

CPT Descriptor: Immunization administration through 18 years of age via any route of administration, with counseling by physician or other qualified health care professional; first or only component of each vaccine or toxoid administered

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: Counseling is provided when a 15-year-old patient is administered the Human Papilloma virus (HPV) vaccine.

Percentage of Survey Respondents who found Vignette to be Typical: 97%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work:

Description of Intra-Service Work: The physician or other qualified healthcare professional (QHP) discusses the specific risks/benefits of the first vaccine component including the risks associated with this component and the risks of not receiving it. Concepts related to herd immunity, relative risk, Vaccine Adverse Event Reporting System, and vaccine safety are discussed. The physician or other QHP addresses the parent’s questions regarding the safety and efficacy of this vaccine component. The physician or other QHP then discusses the care plan for the child in the days to follow specific to the anticipated or possible side effects of the vaccine (e.g. soreness and pain at the injection site, fever) and reviews the signs or symptoms that warrant a call back.

Description of Post-Service Work:
### CPT Code: 90460

</table>

CPT Descriptor Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and straightforward medical decision making. When using time for code selection, 10-19 minutes of total time is spent on the date of the encounter.

**KEY MPC COMPARISON CODES:**
Compare the surveyed code to codes on the RUC’s MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

### Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC’s rationale, please review the separate RUC recommendation document.
Compelling Evidence
For code 90460, the specialties recommend the survey 25th percentile of 0.24 work RVUs, which is greater than the current value of 0.17. In support of consideration of this higher work RVU, the specialties offer the following compelling evidence arguments.

First, the specialties believe the current value was arrived at via flawed methodology. The pediatric Immunization Administration codes 90460 and 90461 were developed to promote physician counseling of hesitant parents and use of combination vaccines to address decline in national immunization rates and subsequently valued by the RUC in October 2009. However, in the 2011 MPFS, CMS did not accept the RUC recommendations for 90460 and 90461. Instead, CMS applied the same methodology used for the existing Immunization Administration codes (90471-90474) to establish the values for 90460 and 90461. CMS valued codes 90471 and 90473 (base) codes by hard-coding them to code 96372 (Therapeutic, prophylactic, or diagnostic injection (specify substance or drug); subcutaneous or intramuscular) and then setting the RVUs for the add-on codes (90472 and 90474) at approximately half the value of the base codes. While CMS the values in and of themselves do not create flawed methodology, the process associated with valuing these codes is flawed for several reasons.

Unlike RUC crosswalking of codes to determine a one-time value, CMS hard-coded 90460 to 96372, meaning that when PE inputs for code 96372 were subsequently reduced by the RUC in January 2017, CMS automatically reduced the PE values for 90460 even though the same reductions in clinical staff time did not apply to 90460. These reductions threatened the US national vaccination program by reducing the value below the Medicaid minimum payment rate for immunization administration. The specialties then began working with CMS to identify an alternative crosswalk methodology to reflect the physician counseling work and practice expense inherent in the service.

In the 2021 MPFS proposed rule, CMS stated its belief that the hard-coding of 90460 to 96372 does not reflect the relative resource costs associated with these services (Source: CMS-1734-P (pages 266-270). Although CMS chose to maintain the hard-coding for 2021, it stated in the final rule that “we would welcome the results of an updated formal review of these services as well as any additional information that may be helpful for improved valuation” (Source: CMS 1734-F (page 157)). This statement and CMS’s comments in the proposed rule indicate the current values are based on a flawed methodology.

In addition, the fact that both the RUC and CMS recently accepted the October 2009 RUC recommendations for code 90460 as the basis of a RUC crosswalk for all COVID Immunization Administration with physician counseling codes further supports that the hard coding of the Immunization Administration codes with counseling to 96372 was flawed and no longer an appropriate valuation.

As noted above, code 96372 was the same code used by CMS years earlier to value Immunization Administration code 90471. Both 96372 and 90471 describe the physician work of direct supervision whereas 90460 and 90461 describe a more intense type of physician work of patient counseling.

In addition to flawed methodology, there is a change in the patient population reflecting growing vaccine hesitancy. Although coverage levels for most childhood vaccines remain relatively high in the United States, numerous studies have documented that vaccine-related confidence has been decreasing among US parents over the past several years (Source: https://www.tandfonline.com/doi/full/10.4161/hv.25085). In 2011, only one in five physicians reported that a significant percentage of parents asked to spread out vaccines in a typical month. By 2014, that had grown to 58% of respondents who reported frequent requests for alternative vaccination schedules (Source: https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7242184/). Because altered vaccine schedules are associated with reduced vaccine rates and increase in vaccine administration errors, physician counseling is required to confront requests for alternative scheduling.

Additional rationale to support recommended value
For code 90460, the specialties recommend the survey 25th percentile of 0.24 work RVUs and the survey median of 7 minutes intra-service time, which also serves as the total time. While the recommended RVW is higher than the current CMS hard-coded value of 0.17, the source code 96372 has only 3 minutes of intraservice time which supports that the RVW for 90460, with more than double the IST, should be higher than 0.17.

The recommended increase in work RVUs is also supported by increased intensity when providing this counseling service, because of the increase in number of vaccines recommended and the options presented and the details/footnotes on the
Advisory Committee on Immunization Practices’ recommended schedule that must be considered with each vaccine component that is counseled in comparison to the last time this service was valued.

The recommended time and work are supported by the primary key reference service, 99406 (Smoking and tobacco use cessation counseling visit; intermediate, greater than 3 minutes up to 10 minutes), which has the same time and work RVUs as are recommended for code 90460. As with 90460, the bulk of the physician/QHP work for 99406 is counseling.

There are multiple other RUC-reviewed services with an XXX global period that have comparable times and work RVUs:

</table>

These examples illustrate that the recommended value and time for code 90460 are comparable to other services of other specialties in the resource-based relative value scale.

**SERVICES REPORTED WITH MULTIPLE CPT CODES**

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   □ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.

Multiple codes allow flexibility to describe exactly what components the procedure included.

Multiple codes are used to maintain consistency with similar codes.

Historical precedents.

Other reason (please explain) Code 90460 is typically reported in addition to an office visit E/M

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 90460

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Family Medicine  How often? Commonly
Specialty Pediatric Medicine How often? Commonly
Specialty Internal Medicine How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 109614651
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate.

Specialty Pediatrics  Frequency 75853338  Percentage 69.19 %
Specialty Nurse Practitioner  Frequency 15126822  Percentage 13.80 %
Specialty Family Medicine  Frequency 9755704  Percentage 8.90 %

Estimate the number of times this service might be provided to Medicare patients nationally in a one-year period? 301  If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2019 Medicare utilization in the RUC database.

Specialty Family Medicine  Frequency 136  Percentage 45.18 %
Specialty Pediatrics  Frequency 45  Percentage 14.95 %
Specialty Internal Medicine  Frequency 40  Percentage 13.28 %

Do many physicians perform this service across the United States? Yes

CPT Descriptor: Immunization administration through 18 years of age via any route of administration, with counseling by physician or other qualified health care professional; each additional vaccine or toxoid component administered (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: Counseling is provided when a twelve-month-old patient is administered the measles, mumps, rubella (MMR) combination vaccine.
(Note: This is an add-on code for the additional physician/other qualified health care professional work related to the administration of one additional vaccine or toxoid component. The physician or other qualified health care professional work related to the administration of the first vaccine or toxoid component is reported separately with code 90460.)

Percentage of Survey Respondents who found Vignette to be Typical: 98%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work:

Description of Intra-Service Work: The physician or other qualified healthcare professional (QHP) discusses the specific risks/benefits of each additional vaccine component including the risks associated with each additional component and the risk of not receiving each one. Concepts related to herd immunity, relative risk, Vaccine Adverse Event Reporting System, and vaccine safety are discussed. The physician or other QHP addresses the parent’s questions regarding the safety and efficacy of this vaccine component. The physician or other QHP then discusses the care plan for the child in the days to follow specific to the anticipated or possible side effects of each vaccine component and reviews the signs or symptoms that warrant a call back.

Description of Post-Service Work:

### Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC’s rationale, please review the separate RUC recommendation document.

### Compelling Evidence

For code 90461, the specialties recommend the survey 25th percentile of 0.18 work RVUs, which is greater than the current value of 0.15. In support of consideration of this higher work RVU, the specialties offer the following compelling evidence arguments.

*Additional rationale and comments*
First, the current values for the Immunization Administration codes are based on a CMS hard-coding to code 96372 (Therapeutic, prophylactic, or diagnostic injection (specify substance or drug); subcutaneous or intramuscular) rather than using the RUC recommended value. Unlike code 90461, 96372 does not include patient counseling.

Code 96372 was reviewed by the RUC in January 2017. CMS subsequently accepted changes to the practice expense inputs that led to steadily decreasing practice expense RVUs for that code and, by extension, the Immunization Administration codes that were hard-coded to 96372.

In the 2021 MPFS proposed rule, CMS stated its belief that that this valuation methodology does not reflect the relative resource costs associated with these services (Source: CMS-1734-P (pages 266-270). Although CMS chose to maintain the hard-coding for 2021, it stated in the final rule that “we would welcome the results of an updated formal review of these services as well as any additional information that may be helpful for improved valuation” (Source: CMS 1734-F (page 157). This statement and CMS’s comments in the proposed rule indicate the current values are based on a flawed methodology. Additional evidence of the methodological flaw in hard-coding 96372 to 90461 is found in the fact that it resulted in the assignment of direct practice expenses to 90461 despite the fact the code only describes the work of physician/QHP vaccine counseling.

In addition to flawed methodology, there is a change in the patient population reflecting growing vaccine hesitancy. Although coverage levels for most childhood vaccines remain relatively high in the United States, numerous studies have documented that vaccine-related confidence has been decreasing among US parents over the past several years (Source: https://www.tandfonline.com/doi/full/10.4161/hv.25085). In 2011, only one in five physicians reported that a significant percentage of parents asked to spread out vaccines in a typical month. By 2014, that had grown to 58% of respondents who reported frequent requests for alternative vaccination schedules (Source: https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7242184/). Because altered vaccine schedules are associated with reduced vaccine rates and increase in vaccine administration errors, physician counseling is required to confront requests for alternative scheduling.

Additional rationale to support recommended value
For code 90461, the specialties recommend the survey 25th percentile of 0.18 work RVUs and the survey median of 5 minutes intra-service time, which also serves as the total time, because there is no pre- or post-service time associated with this code.

The recommended increase in work RVUs is supported by increased intensity when providing this counseling service, because of the increase in number of vaccines recommended and the options presented and the details/footnotes on the Advisory Committee on Immunization Practices’ recommended schedule that must be considered with each vaccine component that is counseled in comparison to the last time this service was valued.

Other RUC-reviewed codes with a ZZZ global period and comparable time and work RVUs include:

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- [x] The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- [ ] Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- [ ] Multiple codes allow flexibility to describe exactly what components the procedure included.
- [ ] Multiple codes are used to maintain consistency with similar codes.
2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

**FREQUENCY INFORMATION**

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 90461

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

- Specialty Pediatric Medicine: How often? Commonly
- Specialty Family Medicine: How often? Sometimes
- Specialty Nurse Practitioner: How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 79173313
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate.

- Specialty Pediatrics: Frequency 54787933, Percentage 69.20%
- Specialty Nurse Practitioner: Frequency 10925917, Percentage 13.79%
- Specialty Family Medicine: Frequency 7046425, Percentage 8.90%

Estimate the number of times this service might be provided to Medicare patients nationally in a one-year period? 58
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. (RUC database.)

- Specialty Pediatrics: Frequency 31, Percentage 53.44%
- Specialty Family Medicine: Frequency 17, Percentage 29.31%
- Specialty Nurse Practitioner: Frequency 6, Percentage 10.34%

Do many physicians perform this service across the United States? Yes

**Berenson-Eggers Type of Service (BETOS) Assignment**

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
BETOS Sub-classification:
Immunizations/Vaccinations

BETOS Sub-classification Level II:
NA

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 90461.

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.
CPT Code: 90471  Tracking Number

Global Period: XXX  Current Work RVU: 0.17

CPT Code: 90471

Original Specialty Recommended RVU: 0.17
Presented Recommended RVU: 0.17
RUC Recommended RVU: 0.17

CPT Descriptor: Immunization administration (includes percutaneous, intradermal, subcutaneous, or intramuscular injections); 1 vaccine (single or combination vaccine/toxoid)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A patient seeks immunization against seasonal influenza. The patient is offered and accepts an intramuscular injection of seasonal influenza vaccine.

Percentage of Survey Respondents who found Vignette to be Typical: 94%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0%, In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0%, Overnight stay-less than 24 hours 0%, Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work:

Description of Intra-Service Work: In accordance with national recommendations for immunizations, determine the patient should receive recommended vaccination. Communicate vaccine order to clinical staff.

Description of Post-Service Work:

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC’s rationale, please review the separate RUC recommendation document.

Additional rationale to support recommended value

The specialties recommend maintaining the current work RVUs of 0.17 for this service, which is less than the 25th percentile of our survey. We recommend the survey median of 4 minutes for intra-service and total time.
While the recommended intra-service time of 4 minutes is nominally less than the intra-service time currently shown for this code, it is greater than the 3 minutes of intra-service time for 96372, to which the value of 90471 is currently hard-coded. Despite that greater intra-service time, we are recommending maintaining the current value of 0.17, which is the same as 96372.

The recommended value is less than the 0.18 work RVUs assigned to key reference service 99211 (Level 1 established patient office visit), which has 5 minutes of intra-service time. It is also less than the 0.18 work RVUs assigned to code 90970 (End-stage renal disease (ESRD) related services for dialysis less than a full month of service, per day; for patients 20 years of age and older), which has only 3.2 minutes of intra-service and total time.

A comparison of the recommended value and time with the key reference services and other services follows:

<table>

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)
   - The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - Multiple codes allow flexibility to describe exactly what components the procedure included.
   - Multiple codes are used to maintain consistency with similar codes.
   - Historical precedents.
   - Other reason (please explain) Code 90471 is typically reported in addition to an office visit E/M

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

</tr>
</thead>
<tbody>
<tr>
<td>96375</td>
<td>ZZZ</td>
<td>0.10</td>
<td>RUC Time</td>
</tr>
</tbody>
</table>

**CPT Descriptor**: Therapeutic, prophylactic, or diagnostic injection (specify substance or drug); each additional sequential intravenous push of a new substance/drug (List separately in addition to code for primary procedure)

### SECOND HIGHEST KEY REFERENCE SERVICE:

<table>
<thead>
<tr>
<th>Key CPT Code</th>
<th>Global</th>
<th>Work RVU</th>
<th>Time Source</th>
</tr>
</thead>
<tbody>
<tr>
<td>96411</td>
<td>ZZZ</td>
<td>0.20</td>
<td>RUC Time</td>
</tr>
</tbody>
</table>

**CPT Descriptor**: Chemotherapy administration; intravenous, push technique, each additional substance/drug (List separately in addition to code for primary procedure)

### KEY MPC COMPARISON CODES:

Compare the surveyed code to codes on the RUC’s MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

<table>
<thead>
<tr>
<th>MPC CPT Code 1</th>
<th>Global</th>
<th>Work RVU</th>
<th>Time Source</th>
<th>Medicare Utilization</th>
</tr>
</thead>
<tbody>
<tr>
<td>96375</td>
<td>ZZZ</td>

</tr>
</tbody>
</table>

**CPT Descriptor 2**: Radiologic examination, hand; 2 views

### RELATIONSHIP OF CODE BEING REVIEWED TO TOP TWO KEY REFERENCE SERVICES:
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by percent distribution) of the service you are rating to the top two chosen key reference services listed above. Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.

**Number of respondents who choose Top Key Reference Code:** 40  
**% of respondents:** 41.2%

**Number of respondents who choose 2nd Key Reference Code:** 17  
**% of respondents:** 17.5%

</table>
Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC’s rationale, please review the separate RUC recommendation document.

Additional rationale to support recommended value
The specialties recommend maintaining the current work RVUs of 0.15 for this service, which is also the 25th percentile of our survey. We recommend the survey median of 3 minutes for intra-service and total time.
While the recommended intra-service time of 3 minutes is nominally less than the intra-service time currently shown for this code, it is equal to the 3 minutes of intra-service time for 96372, to which 90472 is currently hard-coded. Despite that equal intra-service time, we are recommending maintaining the current value of 0.15, which is less than the value of 0.17 assigned to 96372.

A comparison of the recommended value and time with the key reference services and other services follows:

<table>

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☒ Other reason (please explain) The base code (90471) is typically reported in addition to an office visit E/M

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC’s rationale, please review the separate RUC recommendation document.

**Additional rationale to support recommended value**

The specialties recommend maintaining the current work RVUs of 0.17 for this service, which is less than the 25th percentile of our survey. We recommend the survey median of 3 minutes for intra-service and total time.
While the recommended intra-service time of 3 minutes is nominally less than the intra-service time currently shown for this code, it is equal to the 3 minutes of intra-service time for 96372, to which the value of 90473 is currently hard-coded. Consistent with the equal intra-service time, we are recommending maintaining the current value of 0.17, which is equal to the value of 0.17 assigned to 96372.

The recommended value is less than the 0.18 work RVUs assigned to key reference service 99211 (Level 1 established patient office visit), which has 5 minutes of intra-service time. It is also less than the 0.18 work RVUs assigned to code 90970 (End-stage renal disease (ESRD) related services for dialysis less than a full month of service, per day; for patients 20 years of age and older), which has 3.2 minutes of intra-service and total time.

A comparison of the recommended value and time with the key reference services and other services follows:

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- Multiple codes allow flexibility to describe exactly what components the procedure included.
- Multiple codes are used to maintain consistency with similar codes.
- Historical precedents.
- Other reason (please explain) We expect code 90473 would typically be reported in addition to an office visit E/M

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

RELATIONSHIP OF CODE BEING REVIEWED TO TOP TWO KEY REFERENCE SERVICES:

Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by percent distribution) of the service you are rating to the top two chosen key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Top Key Reference Code: 33  % of respondents: 41.2 %

Number of respondents who choose 2nd Key Reference Code: 14  % of respondents: 17.5 %

**TIME ESTIMATES (Median)**

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC’s rationale, please review the separate RUC recommendation document.
**Additional rationale to support recommended value**
The specialties recommend maintaining the current work RVUs of 0.15 for this service, which is also the 25\textsuperscript{th} percentile of our survey. We recommend the survey median of 3 minutes for intra-service and total time.

While the recommended intra-service time of 3 minutes is nominally less than the intra-service time currently shown for this code, it is equal to the 3 minutes of intra-service time for 96372, to which 90474 is currently hard-coded. Despite that equal intra-service time, we are recommending maintaining the current value of 0.15, which is less than the value of 0.17 assigned to 96372.

A comparison of the recommended value and time with the key reference services and other services follows:

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)
   - The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - Multiple codes allow flexibility to describe exactly what components the procedure included.
   - Multiple codes are used to maintain consistency with similar codes.
   - Historical precedents.
   - Other reason (please explain) We expect the base code (90473) is typically reported in addition to an office visit E/M

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 90474

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Family Medicine   How often? Rarely
Specialty Internal Medicine  How often? Rarely
Specialty Nurse Practitioner How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 1003452
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate.

Specialty Pediatrics   Frequency 694389   Percentage 69.20 %
CPT Code: 90474

Specialty Nurse Practitioner  Frequency 138476  Percentage  13.79 %
Specialty Family Medicine  Frequency 89307   Percentage  8.89 %

Estimate the number of times this service might be provided to Medicare patients nationally in a one-year period?  1 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. (See attached spreadsheet; frequency and percentages are from the 2019 Medicare utilization in the RUC database.)

Do many physicians perform this service across the United States?

**Berson-Eggers Type of Service (BETOS) Assignment**

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Other

BETOS Sub-classification:
Immunizations/Vaccinations

BETOS Sub-classification Level II:
NA

**Professional Liability Insurance Information (PLI)**

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 90474.

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

We convened a Practice Expense (PE) Expert Panel consisting of 15 individuals representing AAFP (RUC Advisor and Alternate RUC Advisor), ACOG (RUC Advisor), ANA (Alternate RUC/HCPAC Advisor and PE Subcommittee member), and AAP (RUC Advisor and members of the AAP Section on Administration & Practice Management and the AAP Pediatric Practice Management Alliance). After an initial virtual kick-off meeting, we surveyed Panel members on typical clinical activities, medical supplies, and medical equipment utilized in the service of immunization administration (IA). Survey results were compiled and shared via email, allowing Panel members to reach consensus on direct PE input recommendations for the IA codes.

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code, but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here (for service reviewed prior to the implementation of clinical activity codes, detail is not provided in the RUC database, please contact Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org for PE spreadsheets for your reference codes):

90460 and 90461 are existing codes; therefore, we are using their current direct PE inputs as their reference codes. However, we are also offering COVID IA code 0031A as a reference code. While
administration of the COVID-19 vaccine is unique, the fact that the RUC recently reviewed seven (7) new COVID IA codes imparts relevance on the inclusion of 0031A as a reference for the IA codes.

3. Is this code(s) typically reported with an E/M service?
   Is this code(s) typically reported with the E/M service in the nonfacility?
   (Please see provided data titled Medicare Same Day NF EM Billed Together - NF Dom Spec in the RUC Review Resource Materials)
   Codes 90460 and 90461 are typically reported with an E/M service. Codes 90460 and 90461 are typically reported with the E/M service in the nonfacility.

4. What specialty is the dominant provider in the nonfacility?
   What percent of the time does the dominant provider provide the service(s) in the nonfacility?
   Is the dominant provider in the nonfacility different than for the global?
   (Please see provided data titled Medicare Same Day NF EM Billed Together - NF Dom Spec in the RUC Review Resource Materials)
   90460: nonfacility Family Medicine (45.5%); for all sites Family Medicine (45.2%)
   90461: nonfacility Pediatric Medicine (53.4%); for all sites Pediatric Medicine (53.4%)

5. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time:
   N/A

6. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies for the code family, please provide compelling evidence (please see PE compelling evidence guidelines) Please explain if the increase can be entirely accounted for because of an increase in physician time:
   We are recommending a net decrease of $0.76 for the Immunization Administration (IA) code family:
   Current inputs for family = $35.49
   Recommended inputs for family = $34.73
   Net decrease = $0.76

   Please note that this calculation includes the current projected inputs ($3.98) for code 90461 based upon the current CMS crosswalk for this code. Code 90461 should not have any direct PE inputs and, therefore, negligible PE RVUs (due entirely to indirect PE). This is due to the fact that 90461 represents the physician/QHP counseling (ie, work only) required for each additional component in a multicomponent vaccine.

   However, based on the fact that the IA family has been hard-coded since its inception, CMS has assigned it PE RVUs equivalent with 90472 (0.21). Therefore, we have replicated the current direct PE inputs for code 90472 for code 90461. [PLEASE SEE PINK COLUMN IN PE SPREADSHEET.]
In light of the above, we are technically not required to offer PE compelling evidence arguments. However, we provide the following information in support of our direct PE input recommendations.

Flawed Methodology
Since the Immunization Administration (IA) codes’ inception, the Centers for Medicare and Medicaid Services (CMS) has valued them by hard-coding them to 96372 (Therapeutic, prophylactic, or diagnostic injection (specify substance or drug); subcutaneous or intramuscular) (formerly code 90772 and then code 90782), rather than by utilizing RUC-recommendations to establish their values. CMS’ decision to hard-code the base IA codes (90460, 90471, 90473) to 96372 and then value the add-on IA codes (90461, 90472, 90474) at approximately half of the base IA codes was flawed. This is illustrated by the fact 90461 is currently valued the same as 90472 and 90474, even though 90461 does contain any direct PE inputs. Code 90461 only reflects the physician/QHP work of vaccine counseling on each additional vaccine component.

Change in Clinical Staff Immunization Protocols
Immunization confirmation protocols have changed since the Immunization Administration codes were last valued due to the explosion in the number of new vaccines introduced since 2009. For example, there are 15 difference influenza vaccine presentations available today. This perhaps explains why 20% of all vaccine error reports have to do with influenza vaccine.

While electronic health records (EHRs) offer vaccine clinical decision support to predict (although not 100% accurately) the antigens required, they do not give decision support on the brand and presentation of a vaccine. Physicians/QHPs typically give orders for the antigen (eg, DTaP), but not the particular brand and presentation (eg, Daptacel, Infanrix, Kinrix, Pediatrix, Pentacel, or Quadracel). Determining which of these vaccine products to use is a clinical staff decision, based on the patient’s age and vaccination history.

This is further complicated by the fact that combination vaccines may only be used in some instances (eg, Kinrix (DTaP-IPV) can be given to patients who need both DTaP and IPV, but only if the patient is between ages 4-6, has had four prior doses of DTaP, and at least two prior doses of IPV). Additionally, some vaccines have different dosing requirements based on age (Hep A, Hep B, influenza), while others are the same regardless of patient age.

Finally, while the Advisory Committee on Immunization Practices (ACIP) recommends that a vaccine series be completed with the same brand whenever possible, in some cases it is acceptable to use the alternative brand in stock if the original brand is not known (DTaP), while, in other cases, using only the brand from the original dose is acceptable (MenB).

Change in ACIP Immunization Monitoring Time Recommendations (CA022)
The Advisory Committee on Immunization Practices (ACIP) recommends that “vaccine providers, particularly when vaccinating adolescents, should consider observing patients (with patients seated or lying down) for 15 minutes after vaccination to decrease the risk for injury should they faint” (please see https://www.cdc.gov/vaccines/hcp/acip-recs/general-recs/downloads/general-recs.pdf (page 71)). The ACIP recommendation has become more specific (in terms of time, description of patients who are at-risk for syncope, and position) since the IA codes were last valued.
Use of Total Clinical Staff Time in Calculating Equipment Usage
In February 2008, the RUC established a precedent for the Immunization Administration codes in that it recommended the total vaccine clinical staff time as the time of refrigerator/freezer use, rather than just the intra-service clinical staff time used in CMS’ PE methodology. Our use of total clinical staff time to establish equipment recommendations accounts for a portion of the increase in the aggregate cost of direct PE inputs for the Immunization Administration codes.

7. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (please see second worksheet in PE spreadsheet workbook), please explain the difference here:
   N/A

8. How much time was allocated to clinical activity, obtain vital signs (CA010) prior to CMS increasing the clinical activity to 5 minutes for calendar year 2018? The standard for clinical activity, obtains vital signs remains 0, 3 and 5 based on the number of vital signs taken. Please provide a rationale for the clinical staff time that you are requesting for obtain vital signs here:
   We allocated 0 minutes to obtain vital signs and, therefore, are requesting no CST.

9. Please provide a brief description of the clinical staff work for the following:
   a. Pre-Service period:
      CA007: Confirming vaccine order/checking appropriateness for patient
      CA008: Checking historical and current temperatures for vaccine refrigerator; recording temperatures; reporting temperatures; vaccine inventorying; ordering vaccines; completing required Vaccines for Children (VFC) paperwork; receiving vaccines; inspecting/logging vaccines and putting them in the vaccine refrigerator; creating lot numbers in EHR
   b. Service period (includes pre, intra and post):
      CA011: Giving Vaccine Information Sheet (VIS) to patient/family; getting informed consent and signature if applicable
      CA014: Going to laboratory and taking vaccine vials out of vaccine refrigerator; drawing up vaccine into syringe; going back to patient room and preparing patient/parent, confirming that this is correct patient-correct vaccine
      CA021: Actual administration of vaccine; bandage application
      CA022: Watching patient after vaccine is administered
      CA024: Disposal of vaccine-specific medical waste
      CA034: Charting administered immunizations in the patient chart and EMR; preparing patient record/immunization card
   c. Post-service period:
      CA037: Contacting patient/parent to follow up on immunization administration

10. Please provide granular detail regarding what the clinical staff is doing during the intra-service (of service period) clinical activity, assist physician or other qualified healthcare professional—directly related to physician work time or Perform procedure/service—NOT directly related to physician work time:
CA021: RN/LPN/MTA prepares the vaccine, instructs the patient (or parent) on proper positioning, selects and prepares the injection site, administers the vaccine, and applies a bandage to the injection site. The patient is then monitored for potential anaphylaxis response to the vaccine.

11. If you have used a percentage of the physician intra-service work time other then 100 or 67 percent for the intra-service (of service period) clinical activity, please indicate the percentage and explain why the alternate percentage is needed and how it was derived. 
N/A

12. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (*please see second worksheet in PE spreadsheet workbook*):
N/A

13. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at [http://www.bls.gov](http://www.bls.gov).
N/A

INVOICES

14. ☒ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

15. ☒ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

16. If you wish to include a supply that is not on the list (*please see fourth worksheet in PE spreadsheet workbook*) please provide a paid invoice. Identify and explain the invoice here:
N/A

17. Are you recommending a PE supply pack for this recommendation? Yes or No. If Yes, please indicate if the pack is an established package of supplies as defined by CMS (eg, SA047 pack, E/M visit) or a pack that is commercially available?
No, we are not recommending a PE supply pack.

18. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation. Please include the description, CMS supply code, unit, item quantity and unit price (if available). See documents two and three under PE reference materials on the [RUC Collaboration Website](http://www.bls.gov) for information on the contents of kits, packs and trays.
N/A

19. If you wish to include an equipment item that is not on the list (*please see fifth worksheet in PE spreadsheet workbook*) please provide a paid invoice. Identify and explain the invoice here:

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)

PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SoR)

Table:

| McKesson redacted invoice attached, includes estimate for refrigerator, vaccine medical grade, w-data logger single glass door ($7,674.43) (NEW, line 113) |

20. Please provide an estimate of the useful life of the new equipment item as required to calculate the equipment cost per minute (please see fifth worksheet in PE spreadsheet workbook):

10 years

21. Have you recommended equipment minutes for a computer or equivalent laptop/integrated computer, equipment item computer, desktop, w-monitor, ED021 or notebook (Dell Latitude D600), ED038?
   a. If yes, please explain how the computer is used for this service(s).
   b. Is the computer used exclusively as an integral component of the service or is it also used for other purposes not specific to the code?
   c. Does the computer include code specific software that is typically used to provide the service(s)?

   N/A

22. List all the equipment included in your recommendation and the equipment formula chosen (please see document titled Calculating equipment time). If you have selected “other formula” for any of the equipment please explain here:

   Formula: Default
   Refrigerator, vaccine, temperature monitor w-alarm, security mounting w-sensors, NIST certificates (SD043)
   Refrigerator, vaccine medical grade, w-data logger single glass door (NEW) ($7,674.43)

23. If there is any other item(s) on your spreadsheet not covered in the categories above that require greater detail/explanation, please include here:

   Please note that we are recommending zero direct PE inputs for code 90461. This is due to the fact that it represents the physician/QHP counseling (ie, work only) required for each additional component in a multicomponent vaccine.

   Please note under Medical Equipment:
   Line 111 (ED043): While its description begins with “refrigerator, vaccine,” it is the temperature monitor with alarm for the vaccine medical grade refrigerator (NEW, line 113). We do not have two vaccine refrigerators included as part of our recommended medical equipment.

PROFESSIONAL LIABILITY INSURANCE (PLI) INFORMATION

24. If this is a PE only code please select a crosswalk based on a similar specialty mix:

   N/A
ITEMIZED LIST OF CHANGES (FOLLOWING THE PE SUBCOMMITTEE MEETING)

During and immediately following the review of this tab at the PE Subcommittee meeting, please revise the summary of recommendation (PE SOR) based on modifications made during the meeting. Please submit the revised form electronically to Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org immediately following the close of business the same day that the tab is reviewed. On the PE spreadsheet, please highlight the cells and/or use red font to show the changes made during the PE Subcommittee meeting (if you have provided any of this highlighting based on changes from the reference code prior to the PE Subcommittee meeting please remove it, so not to be confused with changes made during the meeting). In addition to those revisions please also provide an itemized list of the modifications made to the PE spreadsheet during the PE Subcommittee meeting in the space below (e.g. clinical activity CA010 obtain vital signs was reduced from 5 minutes to 3 minutes).

NOTE: The virtual meetings have provided for real-time updates to the PE spreadsheets. PE SORs must still be updated and resubmitted asap.

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

We convened a Practice Expense (PE) Expert Panel consisting of 15 individuals representing AAFP (RUC Advisor and Alternate RUC Advisor), ACOG (RUC Advisor), ANA (Alternate RUC/HCPAC Advisor and PE Subcommittee member), and AAP (RUC Advisor and members of the AAP Section on Administration & Practice Management and the AAP Pediatric Practice Management Alliance). After an initial virtual kick-off meeting, we surveyed Panel members on typical clinical activities, medical supplies, and medical equipment utilized in the service of immunization administration (IA). Survey results were compiled and shared via email, allowing Panel members to reach consensus on direct PE input recommendations for the IA codes.

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code, but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here (for service reviewed prior to the implementation of clinical activity codes, detail is not provided in the RUC database, please contact Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org for PE spreadsheets for your reference codes):

90471 and 90472 are existing codes; therefore, we are using their current direct PE inputs as their reference codes. However, we are also offering COVID IA code 0031A as a reference code. While administration of the COVID-19 vaccine is unique, the fact that the RUC recently reviewed seven (7) new COVID IA codes imparts relevance on the inclusion of 0031A as a reference for the IA codes.
3. Is this code(s) typically reported with an E/M service?
   Is this code(s) typically reported with the E/M service in the nonfacility?
   (Please see provided data titled Medicare Same Day NF EM Billed Together - NF Dom Spec in the RUC Review Resource Materials)

   Codes 90471 and 90472 are typically reported with an E/M service. Codes 90471 and 90472 are typically reported with the E/M service in the nonfacility.

4. What specialty is the dominant provider in the nonfacility?
   What percent of the time does the dominant provider provide the service(s) in the nonfacility?
   Is the dominant provider in the nonfacility different than for the global?
   (Please see provided data titled Medicare Same Day NF EM Billed Together - NF Dom Spec in the RUC Review Resource Materials)

   90471: nonfacility Family Medicine (35.3%); for all sites Family Medicine (35.3%)
   90472: nonfacility Family Medicine (41.8%); for all sites Family Medicine (41.8%)

5. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time:

   N/A

6. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies for the code family, please provide compelling evidence (please see PE compelling evidence guidelines) Please explain if the increase can be entirely accounted for because of an increase in physician time:

   We are recommending a net decrease of $0.76 for the Immunization Administration (IA) code family:
   Current inputs for family = $35.49
   Recommended inputs for family = $34.73
   Net decrease = $0.76

   Please note that this calculation includes the current projected inputs ($3.98) for code 90461 based upon the current CMS crosswalk for this code. Code 90461 should not have any direct PE inputs and, therefore, negligible PE RVUs (due entirely to indirect PE). This is due to the fact that 90461 represents the physician/QHP counseling (ie, work only) required for each additional component in a multicomponent vaccine.

   However, based on the fact that the IA family has been hard-coded since its inception, CMS has assigned it PE RVUs equivalent with 90472 (0.21). Therefore, we have replicated the current direct PE inputs for code 90472 for code 90461. [PLEASE SEE PINK COLUMN IN PE SPREADSHEET.]
In light of the above, we are technically not required to offer PE compelling evidence arguments. However, we provide the following information in support of our direct PE input recommendations.

**Flawed Methodology**
Since the Immunization Administration (IA) codes’ inception, the Centers for Medicare and Medicaid Services (CMS) has valued them by hard-coding them to 96372 (Therapeutic, prophylactic, or diagnostic injection (specify substance or drug); subcutaneous or intramuscular) (formerly code 90772 and then code 90782), rather than by utilizing RUC-recommendations to establish their values. CMS’ decision to hard-code the base IA codes (90460, 90471, 90473) to 96372 and then value the add-on IA codes (90461, 90472, 90474) at approximately half of the base IA codes was flawed. This is illustrated by the fact 90461 is currently valued the same as 90472 and 90474, even though 90461 does contain any direct PE inputs. Code 90461 only reflects the physician/QHP work of vaccine counseling on each additional vaccine component.

**Change in Clinical Staff Immunization Protocols**
Immunization confirmation protocols have changed since the Immunization Administration codes were last valued due to the explosion in the number of new vaccines introduced since 2009. For example, there are 15 difference influenza vaccine presentations available today. This perhaps explains why 20% of all vaccine error reports have to do with influenza vaccine.

While electronic health records (EHRs) offer vaccine clinical decision support to predict (although not 100% accurately) the antigens required, they do not give decision support on the brand and presentation of a vaccine. Physicians/QHPs typically give orders for the antigen (eg, DTaP), but not the particular brand and presentation (eg, Daptacel, Infanrix, Kinrix, Pediarex, Pentacel, or Quadracel). Determining which of these vaccine products to use is a clinical staff decision, based on the patient’s age and vaccination history.

This is further complicated by the fact that combination vaccines may only be used in some instances (eg, Kinrix (DTaP-IPV) can be given to patients who need both DTaP and IPV, but only if the patient is between ages 4-6, has had four prior doses of DTaP, and at least two prior doses of IPV). Additionally, some vaccines have different dosing requirements based on age (Hep A, Hep B, influenza), while others are the same regardless of patient age.

Finally, while the Advisory Committee on Immunization Practices (ACIP) recommends that a vaccine series be completed with the same brand whenever possible, in some cases it is acceptable to use the alternative brand in stock if the original brand is not known (DTaP), while, in other cases, using only the brand from the original dose is acceptable (MenB).

**Change in ACIP Immunization Monitoring Time Recommendations (CA022)**
The Advisory Committee on Immunization Practices (ACIP) recommends that “vaccine providers, particularly when vaccinating adolescents, should consider observing patients (with patients seated or lying down) for 15 minutes after vaccination to decrease the risk for injury should they faint” (please see https://www.cdc.gov/vaccines/hcp/acip-recs/general-recs/downloads/general-recs.pdf (page 71)). The ACIP recommendation has become more specific (in terms of time, description of patients who are at-risk for syncope, and position) since the IA codes were last valued.
Use of Total Clinical Staff Time in Calculating Equipment Usage

In February 2008, the RUC established a precedent for the Immunization Administration codes in that it recommended the total vaccine clinical staff time as the time of refrigerator/freezer use, rather than just the intra-service clinical staff time used in CMS’ PE methodology. Our use of total clinical staff time to establish equipment recommendations accounts for a portion of the increase in the aggregate cost of direct PE inputs for the Immunization Administration codes.

7. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (please see second worksheet in PE spreadsheet workbook), please explain the difference here:

   N/A

8. How much time was allocated to clinical activity, obtain vital signs (CA010) prior to CMS increasing the clinical activity to 5 minutes for calendar year 2018? The standard for clinical activity, obtains vital signs remains 0, 3 and 5 based on the number of vital signs taken. Please provide a rationale for the clinical staff time that you are requesting for obtain vital signs here:

   We allocated 0 minutes to obtain vital signs and, therefore, are requesting no CST.

9. Please provide a brief description of the clinical staff work for the following:
   a. Pre-Service period:
      - CA007: Confirming vaccine order/checking appropriateness for patient
      - CA008: Checking historical and current temperatures for vaccine refrigerator; recording temperatures; reporting temperatures; vaccine inventorying; ordering vaccines; completing required Vaccines for Children (VFC) paperwork; receiving vaccines; inspecting/logging vaccines and putting them in the vaccine refrigerator; creating lot numbers in EHR
   b. Service period (includes pre, intra and post):
      - CA011: Giving Vaccine Information Sheet (VIS) to patient/family; getting informed consent and signature if applicable
      - CA014: Going to laboratory and taking vaccine vials out of vaccine refrigerator; drawing up vaccine into syringe; going back to patient room and preparing patient/parent, confirming that this is correct patient-correct vaccine
      - CA021: Actual administration of vaccine; bandage application
      - CA022: Watching patient after vaccine is administered
      - CA024: Disposal of vaccine-specific medical waste
      - CA034: Charting administered immunizations in the patient chart and EMR; preparing patient record/immunization card
   c. Post-service period:
      - CA037: Contacting patient/parent to follow up on immunization administration

10. Please provide granular detail regarding what the clinical staff is doing during the intra-service (of service period) clinical activity, assist physician or other qualified healthcare professional---directly related to physician work time or Perform procedure/service---NOT directly related to physician work time:
CA021: RN/LPN/MTA prepares the vaccine, instructs the patient (or parent) on proper positioning, selects and prepares the injection site, administers the vaccine, and applies a bandage to the injection site. The patient is then monitored for potential anaphylaxis response to the vaccine.

11. If you have used a percentage of the physician intra-service work time other than 100 or 67 percent for the intra-service (of service period) clinical activity, please indicate the percentage and explain why the alternate percentage is needed and how it was derived.

N/A

12. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (please see second worksheet in PE spreadsheet workbook):

N/A

13. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov.

N/A

INVOICES

14. ☒ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

15. ☒ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

16. If you wish to include a supply that is not on the list (please see fourth worksheet in PE spreadsheet workbook) please provide a paid invoice. Identify and explain the invoice here:

N/A

17. Are you recommending a PE supply pack for this recommendation? Yes or No. If Yes, please indicate if the pack is an established package of supplies as defined by CMS (eg, SA047 pack, E/M visit) or a pack that is commercially available?

No, we are not recommending a PE supply pack.

18. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation. Please include the description, CMS supply code, unit, item quantity and unit price (if available). See documents two and three under PE reference materials on the RUC Collaboration Website for information on the contents of kits, packs and trays.

N/A

19. If you wish to include an equipment item that is not on the list (please see fifth worksheet in PE spreadsheet workbook) please provide a paid invoice. Identify and explain the invoice here:
20. Please provide an estimate of the useful life of the new equipment item as required to calculate the equipment cost per minute (please see fifth worksheet in PE spreadsheet workbook):
   10 years

21. Have you recommended equipment minutes for a computer or equivalent laptop/integrated computer, equipment item computer, desktop, w-monitor, ED021 or notebook (Dell Latitude D600), ED038?
   a. If yes, please explain how the computer is used for this service(s).
   b. Is the computer used exclusively as an integral component of the service or is it also used for other purposes not specific to the code?
   c. Does the computer include code specific software that is typically used to provide the service(s)?

   N/A

22. List all the equipment included in your recommendation and the equipment formula chosen (please see document titled Calculating equipment time). If you have selected “other formula” for any of the equipment please explain here:

   | Formula: Default | Refrigerator, vaccine, temperature monitor w-alarm, security mounting w-sensors, NIST certificates (SD043) | Refrigerator, vaccine medical grade, w-data logger sngl glass door (NEW) ($7,674.43) |

23. If there is any other item(s) on your spreadsheet not covered in the categories above that require greater detail/explanation, please include here:

   Please note under Medical Equipment: Line 111 (ED043): While its description begins with “refrigerator, vaccine,” it is the temperature monitor with alarm for the vaccine medical grade refrigerator (NEW, line 113). We do not have two vaccine refrigerators included as part of our recommended medical equipment.

PROFESSIONAL LIABILITY INSURANCE (PLI) INFORMATION

24. If this is a PE only code please select a crosswalk based on a similar specialty mix:

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

   We convened a Practice Expense (PE) Expert Panel consisting of 15 individuals representing AAFP (RUC Advisor and Alternate RUC Advisor), ACOG (RUC Advisor), ANA (Alternate RUC/HCPAC Advisor and PE Subcommittee member), and AAP (RUC Advisor and members of the AAP Section on Administration & Practice Management and the AAP Pediatric Practice Management Alliance). After an initial virtual kick-off meeting, we surveyed Panel members on typical clinical activities, medical supplies, and medical equipment utilized in the service of immunization administration (IA). Survey results were compiled and shared via email, allowing Panel members to reach consensus on direct PE input recommendations for the IA codes.

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code, but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here (for service reviewed prior to the implementation of clinical activity codes, detail is not provided in the RUC database, please contact Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org for PE spreadsheets for your reference codes):

   90473 and 90474 are existing codes; therefore, we are using their current direct PE inputs as their reference codes. However, we are also offering COVID IA code 0031A as a reference code. While administration of the COVID-19 vaccine is unique, the fact that the RUC recently reviewed seven (7) new COVID IA codes imparts relevance on the inclusion of 0031A as a reference for the IA codes.
3. Is this code(s) typically reported with an E/M service?
   Is this code(s) typically reported with the E/M service in the nonfacility?
   (Please see provided data titled Medicare Same Day NF EM Billed Together - NF Dom Spec in the RUC Review Resource Materials)
   Codes 90473 and 90474 are typically reported with an E/M service. Codes 90473 and 90474 are typically reported with the E/M service in the nonfacility.

4. What specialty is the dominant provider in the nonfacility?
   What percent of the time does the dominant provider provide the service(s) in the nonfacility?
   Is the dominant provider in the nonfacility different than for the global?
   (Please see provided data titled Medicare Same Day NF EM Billed Together - NF Dom Spec in the RUC Review Resource Materials)
   90473: nonfacility General Practice (33.3%); for all sites General Practice (33.3%)
   90474: nonfacility Family Medicine (100%); for all sites Family Medicine (100%)

5. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time:
   N/A

6. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies for the code family, please provide compelling evidence (please see PE compelling evidence guidelines) Please explain if the increase can be entirely accounted for because of an increase in physician time:

   We are recommending a net decrease of $0.76 for the Immunization Administration (IA) code family:
   Current inputs for family = $35.49
   Recommended inputs for family = $34.73
   Net decrease = $0.76

   Please note that this calculation includes the current projected inputs ($3.98) for code 90461 based upon the current CMS crosswalk for this code. Code 90461 should not have any direct PE inputs and, therefore, negligible PE RVUs (due entirely to indirect PE). This is due to the fact that 90461 represents the physician/QHP counseling (ie, work only) required for each additional component in a multicomponent vaccine.

   However, based on the fact that the IA family has been hard-coded since its inception, CMS has assigned it PE RVUs equivalent with 90472 (0.21). Therefore, we have replicated the current direct PE inputs for code 90472 for code 90461. [PLEASE SEE PINK COLUMN IN PE SPREADSHEET.]
In light of the above, we are technically not required to offer PE compelling evidence arguments. However, we provide the following information in support of our direct PE input recommendations.

Flawed Methodology
Since the Immunization Administration (IA) codes’ inception, the Centers for Medicare and Medicaid Services (CMS) has valued them by hard-coding them to 96372 (Therapeutic, prophylactic, or diagnostic injection (specify substance or drug); subcutaneous or intramuscular) (formerly code 90772 and then code 90782), rather than by utilizing RUC-recommendations to establish their values. CMS’ decision to hard-code the base IA codes (90460, 90471, 90473) to 96372 and then value the add-on IA codes (90461, 90472, 90474) at approximately half of the base IA codes was flawed. This is illustrated by the fact 90461 is currently valued the same as 90472 and 90474, even though 90461 does contain any direct PE inputs. Code 90461 only reflects the physician/QHP work of vaccine counseling on each additional vaccine component.

Change in Clinical Staff Immunization Protocols
Immunization confirmation protocols have changed since the Immunization Administration codes were last valued due to the explosion in the number of new vaccines introduced since 2009. For example, there are 15 difference influenza vaccine presentations available today. This perhaps explains why 20% of all vaccine error reports have to do with influenza vaccine.

While electronic health records (EHRs) offer vaccine clinical decision support to predict (although not 100% accurately) the antigens required, they do not give decision support on the brand and presentation of a vaccine. Physicians/QHPs typically give orders for the antigen (eg, DTaP), but not the particular brand and presentation (eg, Daptacel, Infanrix, Kinrix, Pediarix, Pentacel, or Quadracel). Determining which of these vaccine products to use is a clinical staff decision, based on the patient’s age and vaccination history.

This is further complicated by the fact that combination vaccines may only be used in some instances (eg, Kinrix (DTaP-IPV) can be given to patients who need both DTaP and IPV, but only if the patient is between ages 4-6, has had four prior doses of DTaP, and at least two prior doses of IPV). Additionally, some vaccines have different dosing requirements based on age (Hep A, Hep B, influenza), while others are the same regardless of patient age.

Finally, while the Advisory Committee on Immunization Practices (ACIP) recommends that a vaccine series be completed with the same brand whenever possible, in some cases it is acceptable to use the alternative brand in stock if the original brand is not known (DTaP), while, in other cases, using only the brand from the original dose is acceptable (MenB).

Change in ACIP Immunization Monitoring Time Recommendations (CA022)
The Advisory Committee on Immunization Practices (ACIP) recommends that “vaccine providers, particularly when vaccinating adolescents, should consider observing patients (with patients seated or lying down) for 15 minutes after vaccination to decrease the risk for injury should they faint” (please see https://www.cdc.gov/vaccines/hcp/acip-recs/general--recs/downloads/general-recs.pdf (page 71)). The ACIP recommendation has become more specific (in terms of time, description of patients who are at-risk for syncope, and position) since the IA codes were last valued.
Use of Total Clinical Staff Time in Calculating Equipment Usage

In February 2008, the RUC established a precedent for the Immunization Administration codes in that it recommended the total vaccine clinical staff time as the time of refrigerator/freezer use, rather than just the intra-service clinical staff time used in CMS’ PE methodology. Our use of total clinical staff time to establish equipment recommendations accounts for a portion of the increase in the aggregate cost of direct PE inputs for the Immunization Administration codes.

7. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (please see second worksheet in PE spreadsheet workbook), please explain the difference here:

N/A

8. How much time was allocated to clinical activity, obtain vital signs (CA010) prior to CMS increasing the clinical activity to 5 minutes for calendar year 2018? The standard for clinical activity, obtains vital signs remains 0, 3 and 5 based on the number of vital signs taken. Please provide a rationale for the clinical staff time that you are requesting for obtain vital signs here:

We allocated 0 minutes to obtain vital signs and, therefore, are requesting no CST.

9. Please provide a brief description of the clinical staff work for the following:
   a. Pre-Service period:
      CA007: Confirming vaccine order/checking appropriateness for patient
      CA008: Checking historical and current temperatures for vaccine refrigerator; recording temperatures; reporting temperatures; vaccine inventorying; ordering vaccines; completing required Vaccines for Children (VFC) paperwork; receiving vaccines; inspecting/logging vaccines and putting them in the vaccine refrigerator; creating lot numbers in EHR
   b. Service period (includes pre, intra and post):
      CA011: Giving Vaccine Information Sheet (VIS) to patient/family; getting informed consent and signature if applicable
      CA014: Going to laboratory and taking vaccine vials out of vaccine refrigerator; preparing vaccine; going back to patient room and preparing patient/parent, confirming that this is correct patient-correct vaccine
      CA021: Actual administration of vaccine
      CA022: Watching patient after vaccine is administered
      CA024: Disposal of vaccine-specific medical waste
      CA034: Charting administered immunizations in the patient chart and EMR; preparing patient record/immunization card
   c. Post-service period:
      CA037: Contacting patient/parent to follow up on immunization administration

10. Please provide granular detail regarding what the clinical staff is doing during the intra-service (of service period) clinical activity, assist physician or other qualified healthcare professional---directly related to physician work time or Perform procedure/service---NOT directly related to physician work time:
CA021: RN/LPN/MTA prepares the vaccine, instructs the patient (or parent) on proper positioning, and administers the vaccine. The patient is then monitored for potential anaphylaxis response to the vaccine.

11. If you have used a percentage of the physician intra-service work time other than 100 or 67 percent for the intra-service (of service period) clinical activity, please indicate the percentage and explain why the alternate percentage is needed and how it was derived.
   N/A

12. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (please see second worksheet in PE spreadsheet workbook):
   N/A

13. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov.
   N/A

INVOICES

14. ☐ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

15. ☐ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

16. If you wish to include a supply that is not on the list (please see fourth worksheet in PE spreadsheet workbook) please provide a paid invoice. Identify and explain the invoice here:
   N/A

17. Are you recommending a PE supply pack for this recommendation? Yes or No. If Yes, please indicate if the pack is an established package of supplies as defined by CMS (eg, SA047 pack, E/M visit) or a pack that is commercially available?
   No, we are not recommending a PE supply pack.

18. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation. Please include the description, CMS supply code, unit, item quantity and unit price (if available). See documents two and three under PE reference materials on the RUC Collaboration Website for information on the contents of kits, packs and trays.
   N/A

19. If you wish to include an equipment item that is not on the list (please see fifth worksheet in PE spreadsheet workbook) please provide a paid invoice. Identify and explain the invoice here:
NONFACILITY DIRECT PE INPUTS

**February 2008 RUC recommended, and CMS accepted**, use of total vaccine clinical staff time as the time of refrigerator/freezer use, rather than just the intra-service clinical staff time as typically used in CMS’ PE methodology.
In July 2020, the Relativity Assessment Workgroup identified one CPT code 92284 *Dark adaptation examination with interpretation and report* with 2019e Medicare utilization over 30,000. The Workgroup requested that the specialty societies submit an action plan addressing CPT code 92284 for January 2021. In January 2021, the RUC agreed with the specialty society that this service be surveyed for the April 2021 RUC meeting. The RUC noted that the family of services should be identified on the level of interest (LOI). The specialty societies indicated that there are no additional codes in this family. CPT 92284 is in a section of CPT labeled “Other Specialized Services” which contains several unrelated services performed using different techniques with different and unrelated physician work.

**92284 Dark adaptation examination with interpretation and report**

The RUC reviewed the survey results from 45 ophthalmologists, retina specialists and optometrists for CPT code 92284 and determined that a direct work RVU crosswalk to CPT code 76514 *Ophthalmic ultrasound, diagnostic; corneal pachymetry, unilateral or bilateral (determination of corneal thickness)* (work RVU = 0.14, 5 minutes of total time) appropriately accounts for the work required to perform this service. The RUC recommends 1 minute of pre-service time, 3 minutes of intra-service time, 1 minute of immediate post-service time, totaling 5 minutes for CPT code 92284. The specialty societies agreed that the recommended physician work and total time is more representative of the physician or other qualified healthcare professional (QHP) work associated with this procedure than the survey 25th percentile work RVU value of 0.45. The specialty society also noted that the recommended reduction in total time (from the current 36 minutes of total time) is due in part to the fact that CPT code 92284 is typically performed on the same date of an office or eye visit service.

The RUC discussed that CPT code 92284 is a diagnostic service but noted the manufacturer of the device used to perform this service markets the new model of this device to be used for both screening and diagnosis. The specialty societies confirmed that the work associated with CPT code 92284 is diagnostic in nature and that CPT code 92284 was not intended to be utilized for screening services. The specialty societies explained that intra-service work associated with CPT code 92284 involves physician or QHP interpretation and analysis of a machine generated data display to make a differential diagnosis. The RUC recommends that CPT code 92284 be referred to CPT to editorially revise and include the word “diagnostic” in the code descriptor.

The RUC compared CPT code 92284 to MPC code 93010 *Electrocardiogram, routine ECG with at least 12 leads; interpretation and report only* (work RVU = 0.17, 6 minutes of total time) and discussed the similarity in the type of work with respect to interpretation and reporting while also noting the more complex nature of ECG interpretation which justifies a slightly higher work RVU value and 1 minute of additional total time. The RUC noted that both services would appropriately have an identical work per unit time of 0.028. The RUC also compared CPT code 92284 to CPT code 93000 *Electrocardiogram, routine ECG with at least 12 leads; with interpretation and report* (work RVU = 0.17, 6 minutes of total time). The RUC recommends a work RVU of 0.14 for CPT code 92284.
Work Neutrality
The RUC’s recommendation for this CPT code will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

New Technology
This service will be placed on the New Technology list and be re-reviewed by the RUC to ensure correct valuation and utilization assumptions. The RUC will review the typical technology used to perform this service when it is next re-evaluated, acknowledging that the device included in proposed direct practice costs recently was very recently replaced with a newer technology.

Practice Expense
The Practice Expense Subcommittee approved the direct practice expense inputs as recommended by the specialty societies without modification and noted that the recommended reduction in practice expense inputs represents a greater than 50 percent decrease in direct practice expense costs. The RUC recommends the direct practice expense inputs as submitted by the specialty societies.

RUC Referral to CPT
The RUC recommends CPT code 92284 be referred to CPT to editorially revise and include the word “diagnostic” in the code descriptor. “Diagnostic dark adaptation examination with interpretation and report.”

CPT Code: 92284

AMERICAN MEDICAL ASSOCIATION

SUMMARY OF RECOMMENDATION

CPT Code: 92284

Tracking Number

Original Specialty Recommended RVU: 0.24

Presented Recommended RVU: 0.17

RUC Recommended RVU: 0.14

CPT Descriptor: Dark adaptation examination with interpretation and report

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 55-year-old female with poor night vision has no identifiable cause on examination. Dark adaptation testing is performed to assess retinal function.

Percentage of Survey Respondents who found Vignette to be Typical: 80%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0%, In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0%, Overnight stay-less than 24 hours 0%, Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Explain the indications, risks, benefits, and nature of the dark adaptation test to the patient and/or family. Determine the appropriate testing strategy and place an order in the electronic health record.

Description of Intra-Service Work: Review the test results for each eye to determine reliability and interocular consistency. Interpret results, correlating the dark adaptation plot with age-adjusted norms, physical findings, and prior test results. Prepare a report and enter it into the medical record.

Description of Post-Service Work: Sign the report. Enter the findings in the electronic health record and send a letter to the referring physician.

RELATIONSHIP OF CODE BEING REVIEWED TO TOP TWO KEY REFERENCE SERVICES:

Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by percent distribution) of the service you are rating to the top two chosen key reference services listed above. Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.

Number of respondents who choose Top Key Reference Code: 22 % of respondents: 48.8%
Number of respondents who choose 2nd Key Reference Code: 8 % of respondents: 17.7%

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC’s rationale, please review the separate RUC recommendation document.

CPT 92284, *Dark adaptation examination with interpretation and report* is an XXX-global code that was identified as Harvard-valued with utilization over 30,000. The test is performed on patients with visual loss, typically poor night vision, and no identifiable cause on physical examination. Newer test protocols and machines have been introduced since the test...
was first valued, and the patient population has expanded to include those with macular degeneration, resulting in increasing claims volume. The test has moved from being largely a research tool in academic medical centers to widespread clinical use.

Although CPT 92284 is in a section of CPT labeled “Other Specialized Services,” it is not part of a family with any of the other 8 codes in that section (CPT 92265, 92270, 92273, 92274, 92283, 92285, 92286, and 92287). “Other Specialized Services” is a category for a diverse array of ophthalmic tests that do not fit elsewhere in CPT. They range from tests that measure muscle and retinal electrical responses, to subjective tests of color vision, and to imaging of different parts of the eye using different imaging techniques for management of different diseases by different subspecialists.

For CPT 92284, a dark adaptation test protocol is selected by the physician or other qualified health professional which is tailored to the patient’s symptoms and findings. The new equipment used to administer the test is typically a desktop model that was introduced a few years ago. An even newer head-worn model offering greater convenience has recently been introduced. Marketing for this new model highlights a screening protocol that is not typical and that reports a single number indicating whether the test is normal or abnormal. For the diagnostic test in patients with nyctalopia or complaints of poor night vision, which is typical, a dark adaptation plot of sensitivity vs. time for each eye is interpreted by correlating to age-adjusted norms, physical findings, comorbidities known to affect night vision (e.g., vitamin deficiencies, cataracts, presence of treatments such as panretinal photocoagulation), and, if available, prior test results. Findings are entered into the medical record and a report is generated.

It remains to be determined whether the newest equipment and the shorter testing protocol are clinically useful or achieve sufficient market penetration to become typical. The technology remains in a state of flux. For that reason, this procedure should be placed on the New Technology list.

The procedure is typically performed on the same day as an office visit.

A survey was sent to a random selection of American Academy of Ophthalmology (AAO), American Optometric Association (AOA), and American Society of Retinal Specialists (ASRS) members. There were 45 responses. The vignette was considered typical by 80% of respondents. The median WRVU was 0.50, and the 25th percentile was 0.45. The current value of the code is 0.24 WRVU. The survey median IST was 15 minutes, pre-service evaluation time was 5 minutes, and immediate post-service time was 10 minutes. The current (Harvard) IST and total time are 36 minutes.

The top key reference service, chosen by 49% of respondents, was CPT 92083, Visual field examination, unilateral or bilateral, with interpretation and report; extended examination (eg, Goldmann visual fields with at least 3 isopters plotted and static determination within the central 30 deg, or quantitative, automated threshold perimetry, Octopus program G-1, 32 or 42, Humphrey visual field analyzer full threshold programs 30-2, 24-2, or 30/60-2) (RUC 2012), with a WRVU of 0.50, an IST of 10 minutes, and a total time of 13 minutes. The second reference service, chosen by 18% of respondents, was CPT 92134, Scanning computerized ophthalmic diagnostic imaging, posterior segment, with interpretation and report, unilateral or bilateral; retina (RUC 2015), with a WRVU of 0.45, an IST of 10 minutes, and total time of 11 minutes. A plurality or majority of the respondents ranked the surveyed code identical to the top key reference service on overall intensity and complexity and each of the submeasures. Half of the respondents ranked the surveyed code higher than the second reference service on the overall intensity and complexity measure and on the technical skill submeasure. The ranking of the remaining submeasures was distributed evenly.

The expert panel, which is familiar with the procedure and the RUC process, reviewed the survey findings. The median intraservice time of 15 minutes is significantly shorter than the current IST, but longer than expected for interpretation of test results. This IST would correlate to the physician participating in the administration of the test in addition to interpreting the results.

The panel therefore analyzed the survey data by specialty to determine if there was a specialty-specific difference. The panel noted that 64% of respondents were MDs, while 80% of claims are from ODs. The median performance rate was low (2), with a significant number of respondents who reported a zero-performance rate (21/45, 47%). We therefore also analyzed the data by performers vs. non-performers. The subgroup data are listed in separate rows of the revised Summary Spreadsheet. There were no remarkable differences in IST or WRVU estimates between the overall result and any of the subgroups.
The panel’s expectation that a technician would administer the test appeared inconsistent with the survey data, which suggested that the provider administered the test. We therefore queried the 45 respondents, asking them to answer the following question: “When performing the test, who typically (over 50% of the time) acquires the data? You or a technician/staff member?” We received 29 responses, with 23 (79%) stating that a technician or staff member acquires the data and 6 (21%) stating that the provider acquires the data. We also analyzed these responses by provider type and performers vs. non-performers.

<table>
<thead>
<tr>
<th>Data Acquisition</th>
<th>All (n=29)</th>
<th>MD (n=16)</th>
<th>OD (n=13)</th>
<th>Performers (n=18)</th>
<th>Non Performers (n=11)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tech/Staff</td>
<td>23</td>
<td>15</td>
<td>8</td>
<td>13</td>
<td>10</td>
</tr>
<tr>
<td>Provider</td>
<td>6</td>
<td>1</td>
<td>5</td>
<td>5</td>
<td>1</td>
</tr>
</tbody>
</table>

In all groups, staff acquisition of data was typical. Based on this response, the panel rejected the survey IST and chose an IST consistent with the amount of time required for the provider to analyze the validity of the test by evaluating fixation losses and then interpret the plots of retinal sensitivity over time for the two eyes: 4 minutes.

Because the procedure is typically performed on the same day as an office visit, we reduced the pre-time from the survey value of 5 minutes to 1 minute. This time is required to explain the test to the patient and enter an order into the EHR. The testing device is not integrated with the EHR. We reduced the survey post-time from 10 minutes to 1 minute, which is necessary to sign the report, enter the results into the EHR, and send a letter to the referring physician. The total time for the procedure is 6 minutes, with a 4-minute IST.

The survey 25th percentile work value estimate of 0.45 is greater than the code’s current value. Although there have been technological advances in the instrumentation used to perform the test and the patient population has expanded to include patients with macular degeneration, we were unable to find compelling evidence that this increased the physician work of the procedure. The physician work remains unchanged for the typical case with the legacy machine currently in use in the typical practice.

After discussion following pre-facilitation, we further considered the impact of the introduction of the newest instrument, which generates an automated report. It can be used to screen patients without nyctalopia or macular degeneration as well as performing diagnostic testing with a plot of sensitivity over time. We chose to value the code for patients with an existing diagnosis as a test in which a physician interprets a machine-generated data display and prepares a report as the typical service in 2021.

A similar procedure in which a physician interprets a machine-generated report is MPC code 93010, Electrocardiogram, routine ECG with at least 12 leads; interpretation and report only (RUC 2019). This code has a work value of 0.17 RVU, a 3-minute IST (1 minute shorter than our recommendation), and 6 minutes of total time (identical to our recommendation). We chose this code as a crosswalk and therefore recommend a work value for CPT 92284 of 0.17 WRVU.

This value is also supported by CPT 93000, Electrocardiogram, routine ECG with at least 12 leads; with interpretation and report (RUC 2019), with 0.17 WRVU and pre/intra/post times of 2/3/1, and a total time of 6 minutes.

This is as accurate a representation of the physician work as it currently stands as we can recommend with the data we have in light of the evolving nature of the technology. Because of that evolving technology, we recommend that this code be placed on the New Technology list for review in 3 years.

We recommend a work value for CPT 92284 of 0.17 WRVU with times of 1/4/1, a total time of 6 minutes, and a crosswalk to CPT 93010.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes
Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
☐ Multiple codes are used to maintain consistency with similar codes.
☐ Historical precedents.
☐ Other reason (please explain) Typically reported with an office visit.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 92284

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Ophthalmology   How often? Commonly
Specialty Optometry   How often? Commonly
Specialty   How often?

Estimate the number of times this service might be provided nationally in a one-year period? 100000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimate.

Specialty Ophthalmology   Frequency 20000   Percentage 20.00 %
Specialty Optometry   Frequency 80000   Percentage 80.00 %
Specialty   Frequency   Percentage   %

Estimate the number of times this service might be provided to Medicare patients nationally in a one-year period? 55,000
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimate based on recent annual growth in RUC DB claims.

Specialty Ophthalmology   Frequency 11000   Percentage 20.00 %
Specialty Optometry   Frequency 44000   Percentage 80.00 %
Specialty   Frequency 0   Percentage %
Do many physicians perform this service across the United States? Yes

**Berenson-Eggers Type of Service (BETOS) Assignment**
Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Tests

BETOS Sub-classification:
Other tests

BETOS Sub-classification Level II:
Other

**Professional Liability Insurance Information (PLI)**

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 92284

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. N/A

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

   The Academy convenes a consensus subcommittee utilizing the appropriate subspecialty representatives who sit on our Health Policy Committee that oversees our activities at RUC and CPT. Additionally, we use other healthcare providers who have the appropriate expertise as needed. The consensus committee considered the survey data and PE details in order to determine clinical time and applicable standard packages were also applied. The healthcare providers on the consensus panel familiar with the service provided input on whether or not any changes were needed for the existing supplies and equipment.

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code, but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here (for service reviewed prior to the implementation of clinical activity codes, detail is not provided in the RUC database, please contact Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org for PE spreadsheets for your reference codes):

   The current code was used as a reference.

3. Is this code(s) typically reported with an E/M service?
   Is this code(s) typically reported with the E/M service in the nonfacility?
   (Please see provided data titled Medicare Same Day NF EM Billed Together - NF Dom Spec in the RUC Review Resource Materials)

   Yes.
   Yes.

4. What specialty is the dominant provider in the nonfacility?
   What percent of the time does the dominant provider provide the service(s) in the nonfacility?
   Is the dominant provider in the nonfacility different than for the global?
   (Please see provided data titled Medicare Same Day NF EM Billed Together - NF Dom Spec in the RUC Review Resource Materials)

   Optometry (80%)
   Non-facility Performance (100%)

5. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time:

   N/A
6. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies for the **code family**, please provide compelling evidence (please see **PE compelling evidence guidelines**). Please explain if the increase can be entirely accounted for because of an increase in physician time:

   N/A

7. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (please see second worksheet in **PE spreadsheet workbook**), please explain the difference here:

   N/A

8. How much time was allocated to clinical activity, **obtain vital signs** (CA010) prior to CMS increasing the clinical activity to 5 minutes for calendar year 2018? The standard for clinical activity, obtains vital signs remains 0, 3 and 5 based on the number of vital signs taken. Please provide a rationale for the clinical staff time that you are requesting for obtain vital signs here:

   N/A

9. Please provide a brief description of the clinical staff work for the following:
   a. Pre-Service period:

   N/A

   b. Service period (includes pre, intra and post):

   Standard times were used with care to eliminate duplication given the same day office visit.

   Granular detail is provided below. Standard input times used for pre, intra, and post activities.

   **Pre:** (Standard Inputs)
   Line CA011 – The technician provides education and obtains consent for the procedure.
   Line CA013 – The technician prepares the room, equipment, and supplies.
   Line CA016 – The patient is positioned, occlude is patched over the fellow eye.

   **Intra:**
   Line CA021 – The time listed includes time to occlude the non-tested eye, place trial lenses in front of the eye being tested as well as run the actual test on the dark adaptation device. The same procedure is repeated for the fellow eye. The technician is in the room the whole time providing real time coaching/feedback as the test is performed.

   **Post:** (Standard Inputs)
   Line CA024 – The technician will clean the room and pack up the equipment utilized.
   Line CA031 – The technician will review with the healthcare provider the patient’s performance on the activities, before the provider comes up with a finalize plan.

   c. Post-service period:

   N/A

10. Please provide granular detail regarding what the clinical staff is doing during the intra-service (of service period) clinical activity, **assist physician or other qualified healthcare professional**---directly related to physician work time or **Perform procedure/service**---NOT directly related to physician work time:

   During the intra-service period the technician will start by placing a series of trial lenses over the tested eye to account for their optimal prescription. This can often include multiple lenses with trial
and error to determine the optimal lenses. Next the patient’s head is placed into the tabletop device and the test is run. During the test the technician remains in the room with the patient 100% of the time and provides real time feedback/coaching as the test is performed.

11. If you have used a percentage of the physician intra-service work time other then 100 or 67 percent for the intra-service (of service period) clinical activity, please indicate the percentage and explain why the alternate percentage is needed and how it was derived.

\[N/A\]

12. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (*please see second worksheet in PE spreadsheet workbook*:)

\[N/A\]

13. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at [http://www.bls.gov](http://www.bls.gov).

\[N/A\]

**INVOICES**

14. ☒ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

15. ☒ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

16. If you wish to include a supply that is not on the list (*please see fourth worksheet in PE spreadsheet workbook*) please provide a paid invoice. Identify and explain the invoice here:

\[N/A\]

17. Are you recommending a PE supply pack for this recommendation? Yes or No. If Yes, please indicate if the pack is an established package of supplies as defined by CMS (eg, SA047 pack, E/M visit) or a pack that is commercially available?

\[No.\]

18. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation. Please include the description, CMS supply code, unit, item quantity and unit price (if available). See documents two and three under PE reference materials on the [RUC Collaboration Website](http://www.bls.gov) for information on the contents of kits, packs and trays.

**Supplies:**
- Line SG043 Dressing, eye pad – Added - used to cover the fellow eye during testing
- Line SJ053 Swab-pad, alcohol – Was omitted in error, but is utilized to sterilize equipment prior to patient use.

19. If you wish to include an equipment item that is not on the list (*please see fifth worksheet in PE spreadsheet workbook*) please provide a paid invoice. Identify and explain the invoice here:

Invoices will be provided for new supplies with standard/default formulas.
Dark Adaptometer – device used to bleach and subsequently test the ability of the patient to dark adapt.

20. Please provide an estimate of the useful life of the new equipment item as required to calculate the equipment cost per minute (please see fifth worksheet in PE spreadsheet workbook):
   5 years

21. Have you recommended equipment minutes for a computer or equivalent laptop/integrated computer, equipment item computer, desktop, w-monitor, ED021 or notebook (Dell Latitude D600), ED038?
   a. If yes, please explain how the computer is used for this service(s).
   b. Is the computer used exclusively as an integral component of the service or is it also used for other purposes not specific to the code?
   c. Does the computer include code specific software that is typically used to provide the service(s)?
   N/A

22. List all the equipment included in your recommendation and the equipment formula chosen (please see document titled Calculating equipment time). If you have selected “other formula” for any of the equipment please explain here:
   Default formulas were used for all equipment, as there is no highly technical equipment.
   EQ029 – Humphrey field analyzer – Removed – no longer used.
   EL006 – lane, screening (oph) – Removed from Initial Recommendation – this test is now typically performed in a screening lane, trial lenses are included in this lane which are necessary for performing this test.
   EQ165 – lens set, trial – Added - utilized to place appropriate prescription before testing is performed.
   EF030 – table, motorized – Added - utilized to raise/lower the dark adaptometer device

23. If there is any other item(s) on your spreadsheet not covered in the categories above that require greater detail/explanation, please include here:
   The updates reflect the change to a different dark adaptometer which is now more typical. The current form of the device that is typical is the tabletop version (AdaptDx). We anticipate this to remain the typical version for this test for the next several years despite a newer version that became available in 2020 but at a significantly higher cost.

PROFESSIONAL LIABILITY INSURANCE (PLI) INFORMATION

24. If this is a PE only code please select a crosswalk based on a similar specialty mix:

ITEMIZED LIST OF CHANGES (FOLLOWING THE PE SUBCOMMITTEE MEETING)

During and immediately following the review of this tab at the PE Subcommittee meeting, please revise the summary of recommendation (PE SOR) based on modifications made during the meeting. Please submit the revised form electronically to Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org
immediately following the close of business the same day that the tab is reviewed. On the PE spreadsheet, please highlight the cells and/or use red font to show the changes made during the PE Subcommittee meeting (if you have provided any of this highlighting based on changes from the reference code prior to the PE Subcommittee meeting please remove it, so not to be confused with changes made during the meeting). In addition to those revisions please also provide an itemized list of the modifications made to the PE spreadsheet during the PE Subcommittee meeting in the space below (e.g. clinical activity CA010 obtain vital signs was reduced from 5 minutes to 3 minutes).

NOTE: The virtual meetings have provided for real-time updates to the PE spreadsheets. PE SORs must still be updated and resubmitted asap.

April 24, 2021

Zach Hochstetler
Director, CPT Editorial Panel
American Medical Association
AMA Plaza
330 N. Wabash Ave, Suite 39300
Chicago, IL 60611-5885

Dear Mr. Hochstetler,

As a result of the April 2021 RUC meeting, it is now necessary to revise the descriptor for CPT 92284. The discussion at the RUC concluded to have a CPT editorial revision that specifies 92284 as a diagnostic code. As a result, the American Academy of Ophthalmology, the American Society of Retina Specialists, and the American Optometric Association propose the following editorial revision:

▲ 92284 Diagnostic dark adaptation examination with interpretation and report

If there are additional questions or comments regarding this revision, please contact Kayla L. Amodeo, AAO Director of Health Policy, via email at kamodeo@aaao.org.

Sincerely,

Michael X. Repka, MD, MBA
AAO Medical Director for Government Affairs
Anterior Segment Imaging – Tab 21

In 2011, CPT code 92286 was originally identified via the Harvard Valued – Medicare Utilization over 30,000 screen and code 92287 was added as part of the family for review. The American Academy of Ophthalmology (AAO) indicated that apart from utilizing an image, codes 92286 and 92287 have completely different clinical indications and conditions. CPT code 92286 is used primarily to follow patients with corneal endothelial dystrophy for progression of their disease, pre-cataract surgery to assess the need for possible corneal transplant at the same time and for follow-up care of post corneal transplant patients. The specialty societies believed that coding education and publication of a CPT Assistant article may help clarify the difference between codes 92287 and 92235. The RUC recommended that the specialty society develop a CPT Assistant article to clarify the difference between CPT codes 92287 and 92235.

In October 2018, the Relativity Assessment Workgroup reviewed a list of RUC referrals for CPT Assistant articles from 2013-2016. The Workgroup requested action plans for January 2019. In January 2019, the RUC recommended to review this service in two years to determine if the article and CPT changes were effective. In December 2020, the specialty societies noted that the CPT Assistant article addressed concerns with the appropriate reporting of macular degeneration. Medicare claims data for 2018 indicated that there is no confusion between 92287, 92286 or 92132. The diagnoses associated with claims for CPT 92287 do not include the glaucoma, cornea, or lens diagnoses which would be associated with CPT 92286 or 92132. However, the specialty societies noted that this service is Harvard valued and would benefit to be surveyed to include a vignette, description of work, updated physician time and valuation. A Workgroup member also commented that 92287 is frequently reported with fluorescein angiography of retina (92235). The RUC recommended that CPT code 92287 be surveyed for the April 2021 RUC meeting. The specialty societies indicated that despite its appearance as a “child” code of 92286, these are two wholly unrelated services in terms of instrumentation, diagnoses, and physician work.

92287 Anterior segment imaging with interpretation and report; with fluorescein angiography
The RUC reviewed the survey results from 30 ophthalmologists and retina specialists for CPT code 92287 and determined that a direct work RVU crosswalk to MPC code 92250 Fundus photography with interpretation and report (work RVU = 0.40, 10 minutes of intra-service and 12 minutes total time) appropriately accounts for the work required to perform this service. The RUC recommends 1 minute of pre-service time, 10 minutes of intra-service time, and 1 minute of immediate post-service time. The RUC noted that 92287 is performed with an office or eye visit 95 percent of the time. The RUC ensured that its work and time recommendations represent work that is distinct and separate from the same-day office or eye visit services.

The RUC noted that both CPT code 92287 and CPT code 92250 are performed on both eyes and that the 1 minute of pre-service time is associated with entry of patient data into the electronic health record. The RUC also noted that the recommendation to decrease the valuation of 92287 reflects the marginal decrease in time.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.
The RUC compared CPT code 92287 to CPT code 92201 *Ophthalmoscopy, extended; with retinal drawing and scleral depression of peripheral retinal disease (eg, for retinal tear, retinal detachment, retinal tumor) with interpretation and report, unilateral or bilateral* (work RVU = 0.40, 10 minutes of intra-service and 12 minutes of total time) determined that both services require nearly identical physician work, time and intensity, which supports the RUC recommended work RVU valuation of 92287. The RUC also compared CPT code 92287 to MPC code 92082 *Visual field examination, unilateral or bilateral, with interpretation and report; intermediate examination (eg, at least 2 isopters on Goldmann perimeter, or semiquantitative, automated suprathreshold screening program, Humphrey suprathreshold automatic diagnostic test, Octopus program 33)* (work RVU = 0.40, 8 minutes of intra-service and 11 minutes of total time). The RUC concluded that CPT code 92287 should be valued based on a direct work RVU crosswalk to MPC code 92250. **The RUC recommends a work RVU of 0.40 for CPT code 92287.**

**Work Neutrality**

The RUC’s recommendation for this CPT code will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

**Practice Expense**

The Practice Expense (PE) Subcommittee approved the direct practice expense inputs as recommended by the specialty societies without modification. The RUC discussed whether a butterfly needle (SC030) and Bandaid (SG021) are included in this procedure even though this is often performed with retinal fluorescein angiography. The specialty societies clarified that it is typical to remove the butterfly needle and bandage the arm after the initial push rather than attempting to reuse the needle. **The RUC recommends the direct practice expense inputs as submitted by the specialty societies.**

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 92287  Tracking Number
Global Period: XXX  Current Work RVU: 0.81

Original Specialty Recommended RVU: 0.40
Presented Recommended RVU: 0.40
RUC Recommended RVU: 0.40

CPT Descriptor: Anterior segment imaging with interpretation and report; with fluorescein angiography

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 67-year-old diabetic male has possible iris neovascularization. Fluorescein angiography is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 93%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0%, In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0%, Overnight stay-less than 24 hours 0%, Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Explain the indications, risks, and benefits of iris angiography to the patient and/or family. Enter order into the electronic health record.

Description of Intra-Service Work: The quality of the study is evaluated. The fluorescein angiogram images from both eyes are compared and interpreted. Findings are compared with previous studies and other diagnostic modalities and a diagnosis is determined. The results are reviewed and discussed with the patient. Representative images are selected for archiving for future comparison. A report is prepared and dictated for entry into the medical record. The referring physician is informed of the results.

Description of Post-Service Work: The report is signed. Findings are included in a letter that accompanies the report and is sent to the referring physician.

### Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

*The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC’s rationale, please review the separate RUC recommendation document.*

CPT 92287, *Anterior segment imaging with interpretation and report; with fluorescein angiography*, is a Harvard-valued code in a section of CPT labeled “Other Specialized Services” containing a number of unrelated diagnostic testing services. It was originally, and incorrectly, identified as in a family with CPT 92286, *Anterior segment imaging with interpretation and report; with specular microscopy and endothelial cell analysis*, because of its location in CPT following the listing for
CPT 92287 is performed for evaluation of patients for iris neovascularization (rubeosis iridis) due to diabetes, retinal vascular occlusion, or ocular ischemic syndrome. It involves intravenous injection of fluorescein dye and imaging of the iris and is typically performed by a retina or ocular oncology subspecialist. In contrast, CPT 92286 is performed for determination of corneal endothelial cell density in patients with corneal endothelial dystrophy, corneal edema, or cataract to assess endothelial function prior to surgery. It involves a photograph of the cornea with no use of dye and is typically performed by a cornea subspecialist. The procedures themselves, the data and images generated, the interpretation processes, the diagnoses for which they are performed, the subspecialists that typically perform them, and the physician work are all unrelated.

Similarly, CPT 92287 is not in a family with any of the other ophthalmic angiography services (CPT 92230, 92235, 92240, 92242) listed under the “Ophthalmoscopy” heading in CPT. It is segregated under the “Other Specialized Services” heading because it images the iris for diagnosis of iris neovascularization, while the others image the retina for diagnosis and management of a variety of unrelated retinal diseases. Thus many of the differences which distinguish CPT 92287 from 92286 also apply to CPT 92230-92242: the data, images, interpretation processes, and diagnoses are all unrelated.

CPT 92287 is now being reviewed as a Harvard-valued code with modestly increasing claims volume (from 4,117 in 2016 to 7,182 in 2019). The procedure is typically performed on the same day as an office visit. Fluorescein angiography of the retina (CPT 92235) and fundus photography (CPT 92250) are also typically performed on the same day because the most common use of CPT 92287 is in the setting of diabetic eye disease which affects both posterior and anterior segments of the eye.

A survey was sent to a random selection of American Academy of Ophthalmology (AAO) and American Society of Retinal Specialists (ASRS) members. There were 30 responses. The vignette was considered typical by 93% of respondents. The median WRVU was 0.75, and the 25th percentile was 0.70. The current value of the code is 0.81 WRVU. The survey median IST was 10 minutes, pre-service evaluation time was 6 minutes, and immediate post-service time was 10 minutes. The current (Harvard) IST and total time are 23 minutes.

The top key reference service, chosen by 60% of respondents, was CPT 92235, Fluorescein angiography (includes multiframe imaging) with interpretation and report, unilateral or bilateral (RUC 2016), with 0.75 WRVU, an IST of 15 minutes, and a total time of 17 minutes. The second reference service, chosen by 17% of respondents, was CPT 92240, Indocyanine-green angiography (includes multiframe imaging) with interpretation and report, unilateral or bilateral (RUC 2016), with a WRVU of 0.80, an IST of 20 minutes, and total time of 22 minutes. Most respondents ranked the surveyed code identical to both reference services on overall intensity and complexity and each of the submeasures.

The expert panel, which is familiar with the procedure and the RUC process, reviewed the survey findings. The median intraservice time of 10 minutes was accepted as appropriate for the number of images and amount of data to analyze and interpret. Because the procedure is typically performed on the same day as an office visit, we reduced the pre-time from the survey value of 6 minutes to 1 minutes. We reduced the survey post-time from 10 minutes to 1 minutes. The total time for the procedure is 12 minutes, with a 10-minute IST.

The survey 25th percentile work value estimate of 0.70 appeared high in comparison to the key reference services which have similar work values and lower ISTs given the identical intensity and complexity rankings. We recommend instead a work value of 0.40 WRVU with a crosswalk to MPC code 92250, Fundus photography with interpretation and report (RUC 2016). The crosswalk code has 0.40 WRVU, an identical IST of 10 minutes, and an identical total time of 12 minutes. Although equal to the survey low estimate, this is an accurate representation of the physician work associated with CPT 92287. While IWPUTs are often unreliable for short services, the IWPUT at this value (0.036) is similar to that of both reference services which were ranked identical on the intensity/complexity measures.

The recommended value is also supported by CPT 92201, Ophthalmoscopy, extended; with retinal drawing and scleral depression of peripheral retinal disease (eg, for retinal tear, retinal detachment, retinal tumor) with interpretation and report, unilateral or bilateral (RUC 2018), with 0.40 WRU and an identical IST (10 minutes) and total time (12 minutes).

Based on a crosswalk to MPC code 92250, we recommend a work value for CPT 92287 of 0.40 RVU with times of 1/10/1 and a total time of 12 minutes.
SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)
   - The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - Multiple codes allow flexibility to describe exactly what components the procedure included.
   - Multiple codes are used to maintain consistency with similar codes.
   - Historical precedents.
   - Other reason (please explain) Typically performed with an office visit and retinal imaging.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

**Berenson-Eggers Type of Service (BETOS) Assignment**

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Imaging

BETOS Sub-classification:
Other

BETOS Sub-classification Level II:
NA

---

**Professional Liability Insurance Information (PLI)**

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 92287

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. N/A

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:
   The Academy convenes a consensus subcommittee utilizing the appropriate subspecialty representatives who sit on our Health Policy Committee that oversees our activities at RUC and CPT. Additionally we use other healthcare providers who have the appropriate expertise as needed. The consensus committee considered the survey data and PE details in order to determine clinical time and applicable standard packages were also applied. The healthcare providers on the consensus panel familiar with the service provided input on whether or not any changes were needed for the existing supplies and equipment.

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code, but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here (for service reviewed prior to the implementation of clinical activity codes, detail is not provided in the RUC database, please contact Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org for PE spreadsheets for your reference codes):
   The current code was used as a reference.

3. Is this code(s) typically reported with an E/M service?
   Is this code(s) typically reported with the E/M service in the nonfacility?
   (Please see provided data titled Medicare Same Day NF EM Billed Together - NF Dom Spec in the RUC Review Resource Materials)
   Yes.
   Yes.

4. What specialty is the dominant provider in the nonfacility?
   What percent of the time does the dominant provider provide the service(s) in the nonfacility?
   Is the dominant provider in the nonfacility different than for the global?
   (Please see provided data titled Medicare Same Day NF EM Billed Together - NF Dom Spec in the RUC Review Resource Materials)
   Ophthalmology (100%)
   Non-facility Performance (100%)

5. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time:
   N/A
6. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies for the code family, please provide compelling evidence (please see PE compelling evidence guidelines) Please explain if the increase can be entirely accounted for because of an increase in physician time:

N/A

7. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (please see second worksheet in PE spreadsheet workbook), please explain the difference here:

N/A

8. How much time was allocated to clinical activity, obtain vital signs (CA010) prior to CMS increasing the clinical activity to 5 minutes for calendar year 2018? The standard for clinical activity, obtains vital signs remains 0, 3 and 5 based on the number of vital signs taken. Please provide a rationale for the clinical staff time that you are requesting for obtain vital signs here:

N/A

9. Please provide a brief description of the clinical staff work for the following:
   a. Pre-Service period:

N/A
   b. Service period (includes pre, intra and post):

   Standard times were used with care to eliminate duplication given the same day office visit.

   Granular detail is provided below. Standard input times used for pre, intra, and post activities. Su

   Pre: (Standard Inputs)
   Line CA011 (Line 37)– The technician provides education and obtains consent for the procedure. The input has been changed from RN to CRA (lowering cost) to reflect how the test is typically performed.
   Line CA013 – The CRA prepares the room, equipment, and supplies.
   Line CA016 – The CRA cleans the arm and connects a butterfly needle for IV push of the fluorescein dye.

    Intra:
   Line CA021 – The CRA injects the dye and begins taking pictures. Several pictures are taken of each eye at early and late phases which conveys different information about the iris vasculature.

    Post: (Standard Inputs)
   Line CA024 – The CRA will clean the room and pack up the equipment utilized.
   Line CA031 – The CRA will review with the healthcare provider the patient’s performance on the activities, before the provider comes up with a finalize plan.
   c. Post-service period:

N/A

10. Please provide granular detail regarding what the clinical staff is doing during the intra-service (of service period) clinical activity, assist physician or other qualified healthcare professional—directly related to physician work time or Perform procedure/service—NOT directly related to physician work time:

   The CRA will inject the fluorescein dye into the patients vein. The patient will then undergo a series of photos taken at different time intervals for each eye. A number of early and late photos are taken to visualize the iris vasculature. Throughout the test the CRA will reassess and reposition the patient as needed to obtain adequate photos.
11. If you have used a percentage of the physician intra-service work time other than 100 or 67 percent for the intra-service (of service period) clinical activity, please indicate the percentage and explain why the alternate percentage is needed and how it was derived.

   N/A

12. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (please see second worksheet in PE spreadsheet workbook):

   N/A

13. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov.

   N/A

INVOICES

14. ☐ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

15. ☐ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

16. If you wish to include a supply that is not on the list (please see fourth worksheet in PE spreadsheet workbook) please provide a paid invoice. Identify and explain the invoice here:

   N/A

17. Are you recommending a PE supply pack for this recommendation? Yes or No. If Yes, please indicate if the pack is an established package of supplies as defined by CMS (eg, SA047 pack, E/M visit) or a pack that is commercially available?

   No.

18. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation. Please include the description, CMS supply code, unit, item quantity and unit price (if available). See documents two and three under PE reference materials on the RUC Collaboration Website for information on the contents of kits, packs and trays.

*Supplies:
Line SA050 pack, ophthalmology - Removed
Line SJ043 povidone swabsticks (3 pack) - Removed
Line SG021 Bandages – Maintained as before – cover wound post procedure
Line SC029 needles 18-27G - Removed
Line SC057 syringe 5-6ml - Maintained as before – load the fluorescein dye
Line SC030 butterfly needle - Maintained as before – inject the fluorescein dye
Line SH033 fluorescein inj - Maintained as before – actual dye utilized
Line SK058 paper photo - Removed
Line SK030 film - Removed
Line SC018 IV infusion set - Removed
19. If you wish to include an equipment item that is not on the list (please see fifth worksheet in PE spreadsheet workbook) please provide a paid invoice. Identify and explain the invoice here:

N/A

20. Please provide an estimate of the useful life of the new equipment item as required to calculate the equipment cost per minute (please see fifth worksheet in PE spreadsheet workbook):

N/A

21. Have you recommended equipment minutes for a computer or equivalent laptop/integrated computer, equipment item computer, desktop, w-monitor, ED021 or notebook (Dell Latitude D600), ED038?
   a. If yes, please explain how the computer is used for this service(s).
   b. Is the computer used exclusively as an integral component of the service or is it also used for other purposes not specific to the code?
   c. Does the computer include code specific software that is typically used to provide the service(s)?

N/A

22. List all the equipment included in your recommendation and the equipment formula chosen (please see document titled Calculating equipment time). If you have selected “other formula” for any of the equipment please explain here:

Default formulas were used for all equipment, as there is no highly technical equipment.

- EL005 – lane, exam – Removed – no longer used.
- EQ168 – light, exam – Added – more typical of what is used in the room photos are taken
- EF030 – motorized table – Maintained – used to adjust patient height/position
- EQ029 – Humphrey field analyzer – Removed – no longer used.
- EF027 – table, instrument – Added – typical of the room now used, required for equipment placement
- ED003 – camera – Maintained – utilized for photo acquisition.

23. If there is any other item(s) on your spreadsheet not covered in the categories above that require greater detail/explanation, please include here:

A butterfly needle and Band-Aid are included in this procedure despite the fact that this is often performed with retinal fluorescein angiography. This is because it is typical to remove the butterfly needle and bandage the arm after the initial push, rather than attempting to reuse the needle which would likely blow the vein during the 15-20 minutes of movement while taking the photo as well as the movement to a separate camera. We accordingly have no input for an IV, tape, tegaderm, or heparin flush, etc that would be required to keep the butterfly needle patent for the 20-30 minutes of the first angiographic procedure when done on the same day as another procedure. Thus we believe there are no duplicative supplies.

PROFESSIONAL LIABILITY INSURANCE (PLI) INFORMATION

24. If this is a PE only code please select a crosswalk based on a similar specialty mix:
ITEMIZED LIST OF CHANGES (FOLLOWING THE PE SUBCOMMITTEE MEETING)

During and immediately following the review of this tab at the PE Subcommittee meeting, please revise the summary of recommendation (PE SOR) based on modifications made during the meeting. Please submit the revised form electronically to Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org immediately following the close of business the same day that the tab is reviewed. On the PE spreadsheet, please highlight the cells and/or use red font to show the changes made during the PE Subcommittee meeting (if you have provided any of this highlighting based on changes from the reference code prior to the PE Subcommittee meeting please remove it, so not to be confused with changes made during the meeting). In addition to those revisions please also provide an itemized list of the modifications made to the PE spreadsheet during the PE Subcommittee meeting in the space below (e.g. clinical activity CA010 *obtain vital signs* was reduced from 5 minutes to 3 minutes).

<table>
<thead>
<tr>
<th>Itemized List of Changes</th>
</tr>
</thead>
<tbody>
<tr>
<td><em>obtain vital signs</em> was reduced from 5 minutes to 3 minutes</td>
</tr>
</tbody>
</table>

**NOTE:** The virtual meetings have provided for real-time updates to the PE spreadsheets. PE SORs must still be updated and resubmitted asap.
