---

**Description:**

Emergency department visit for the evaluation and management of a patient, which requires these 3 key components: a detailed history; a detailed examination; and medical decision making of moderate complexity. Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of high severity, and require urgent evaluation by the physician, or other qualified health care professionals but do not pose an immediate significant threat to life or physiologic function.

**Background:** In October 2018, 37225, 37227 and 37229 services were identified by the PE High Cost Supplies screen for services with non-facility Medicare utilization over 10,000, not reviewed in the last five years and include a supply item greater than $500. The RUC requests an action plan for the January 2019 on how to address these services. The Workgroup reviewed the action plan for these services, noting that CMS repriced these supply items for 2019. The specialty societies indicated that they agreed these supply items were essential to perform CPT codes 37225, 37227 and 37229 and that the current repricing was appropriate. The Workgroup noted that CPT code 37229 was identified on the High Volume Growth screen at this meeting and the Workgroup agreed with the specialty societies to refer this entire family of services to CPT for revision to accommodate new technologies.

RUC Meeting  
January 2021  
Specialty Society:  
AANS, AAOS, NASS  
CPT Meeting  
September 2021

Background:  
CPT code 63030 was identified via the site of service anomaly screen. In December 2020, the Relativity Assessment Workgroup noted that CPT code 63030 continues to be primarily reported in the outpatient setting yet still includes inpatient hospital visits. The specialty society indicated that there is still confusion, and 63030 is inappropriately being reporting in the outpatient setting. The RUC recommends that CPT code 63030 be referred to CPT (May 2021) to revise the descriptor to exclude the types of procedures that are thought to be causing the incorrect reporting in the outpatient setting, such as explicitly stating the types of situations for which CPT code 63030 should not be used. The RUC understands that this service will be surveyed after the CPT revisions and reviewed by the RUC.
**RUC Referrals to CPT Editorial Panel - Outstanding Issues**

</tr>
</tbody>
</table>

**Background:** In October 2020, the RUC recommends that CPT codes 99358 and 99459 be referred to the CPT Editorial Panel for February 2021, to be examined and surveyed along with the other E/M services for the CPT 2023 and the 2023 Medicare Physician Payment Schedule (February 2021, CPT Tab 11). At the April 2021 review, there was discussion at both the PE Subcommittee meeting and the RUC regarding discrepancies between the long descriptors for these codes and the introductory CPT language. The descriptors for 99415 and 99416 state “direct patient contact with physician supervision;” while the preparatory paragraph for these codes describes “face-to-face time.” Given these inconsistencies, there was confusion as to whether the two codes could be used for non-face-to-face (asynchronous) patient encounters. The CPT representative stated that the CPT Editorial Panel is working to reconcile the language. Regardless, the PE Subcommittee agreed that the practice expense inputs for CPT codes 99415 and 99416 were appropriate and that the recommended clinical staff times are correctly valued.

**99416 Prolonged clinical staff service (the service beyond the typical service time) during an evaluation and management service in the office or outpatient setting, direct patient contact with physician supervision; each additional 30 minutes (List separately in addition to code for outpatient Evaluation and Management service)**

<td>January 2018</td>
<td>AAFP, ASA, ASAM</td>
<td>Time Uncertain</td>
</tr>
</tbody>
</table>

**Background:** In October 2017, the RAW requested that AMA staff compile a list of CMS/Other codes with Medicare utilization of 30,000 or more. This list resulted in 34 services and the RAW requested action plans to be reviewed at the January 2018 meeting. In January 2018, the RUC recommended to maintain the physician work and refer to CPT to editorially remove “screening” from 99408 and 99409 to “assessment” to mirror G0396. At the February 2018 CPT meeting, the Panel postponed until time uncertain this request to revise codes 99408-99409 to identify assessment of alcohol and/or substance abuse. As a rationale for postponement, the Panel said that the service described in this application did not meet the General Criteria for Category I because the proposed service is not unique or well defined, and does not describe a service that is clearly identified and distinguished from existing services already described in CPT by other codes. The Panel’s additional rationale for postponement of this item was to allow the relevant specialty societies an opportunity to submit a new code change application to address the differences between assessment and screening services.

**Background:** The RUC identified G6001 via the CMS/Other Source Utilization over 20,000 screen. In January 2021, the RUC recommended to refer to CPT to develop new code(s) that reflect the different process of care between the two specialties (dermatology and radiation oncology).

### Background:
- 63685: Oct 2010 re-reviewed site of service issue. In October 2020, the RUC identified six codes with Medicare utilization of 10,000 or more that have increased by at least 100% from 2014 through 2019c. CPT codes 00918, 63685, 75561, 75572, 75574 and 93655. The Workgroup requested that the specialty societies submit an action plan for codes CPT codes 00918, 63685, 75561, 75572, 75574 and 93655 for January 2021. In January 2021, the RUC recommended to refer to CPT Assistant. A CPT Assistant article has already been submitted. The RUC will review after 2 years of data are available after article is published.
- 75710: In the NPRM for 2016 CMS re-ran the high expenditure services across specialties with Medicare allowed charges of $10 million or more. CMS identified the top 20 codes by specialty in terms of allowed charges, excluding 010 and 090-day global services, anesthesia and Evaluation and Management services and services reviewed since CY 2010. In October 2016 the RUC noted that with the newly bundled dialysis access maintenance codes that were approved in January 2016 as part of Dialysis Circuit code family 36901-36909, the specialties project that a significant portion of the nephrology volume for 75710 will instead be reported with applicable Dialysis Circuit codes. Nephrology represented 17.8 percent of the 2015 Medicare claims for 75710. The RUC will add a flag for review to confirm that nephrology utilization volume has decreased since 2017 Medicare utilization data is available for review. The RUC noted the nephrology utilization is slightly decreasing. The RUC recommended to review utilization again in 2 years (Oct 2020). In October 2020, the Workgroup reviewed the history of this code and the action plan submitted by SVS, SIR, ACR and ACC. Noting that the 2019c utilization by nephrologists was gradually decreasing (13%) (global & -26 modifier). The Workgroup questioned if the gradual decrease in utilization by nephrologists is appropriate or if nephrologists should not be performing this service at all. The Workgroup noted that RPA was not involved in the development of this action plan. The Workgroup requested the input from Nephrology regarding the reporting of code 75710 and review at the January 2021 meeting. In January 2021, the Relativity Assessment Workgroup noted that the utilization of nephrology continues to decrease but not at the rate the specialty societies thought it would. The specialty societies indicated that they would submit a CPT Assistant article to address the appropriate reporting of this service. The Workgroup recommends that this service be referred to CPT Assistant and reviewed after 2 years of data is available after the publication of the article. The specialty societies noted that the expected utilization for Nephrology would be under 10%.
- G0407: In October 2020, the RUC identified 11 codes with 2019 estimated Medicare utilization over 20,000. Codes G0407, G0408, G0422, G0423, G0500, G0506, G6001, G6012, G6013, G6015 and G6017. The Workgroup requests that action plans be reviewed for these services at the January 2021 meeting to determine if current CPT codes exist to report these services, new CPT codes should be created, or the G code should be surveyed. At the December 2020 RAW meeting, the Workgroup recommended to postpone until April 2021 RAW for input from ANA and APA. In April 2021, the RUC the recommended these services be reviewed in 2 years (April 2023) after additional data are available. Second, there should be a CPT Assistant article, if appropriate, or other CMS education regarding who should be reporting these services. The RAW also would like to inform CMS of possible misreporting of these services. Based on the Medicare Provider Utilization and Payment Data Physician and Other Supplier PUF CY 2018 data, seven to eight individual Nurse Practitioners account for approximately 50% of G0407 and G0408 services provided.

<td>CPT 2017</td>
<td>January 2024</td>
<td>Review in 3 years (January 2024). The initial RUC survey was insufficient in number of respondents and RUC recommended re-surveying when volume is sufficient. Even though the typical patient is below Medicare age, society believes volumes remain low. Utilization of the removal code 43285 is higher than expected suggesting the services may be reported inappropriately.</td>

</table>

The specialty societies indicated that they tried to develop a category I code to replace 44705 which is not currently covered by Medicare, but the CPT Editorial Panel did not accept the coding change proposal due to a lack in literature provided. The Workgroup recommended that these services be reviewed in 2 years after additional utilization data is available (October 2018). In October 2018, the RUC recommended to remove from list, no demonstrated technology diffusion that impacts work or practice expense.

In October 2018, RUC recommended to review again after 3 more years of data and to determine what specialties are performing this service (2022).

In April 2011, CPT Code 78007, Thyroid imaging, with uptake; multiple determinations was identified in the Harvard Valued-Utilization over 30,000 screen. As part of the review of the entire endocrine family, the specialty societies determined that revisions to the parathyroid imaging procedures were necessary to reflect current bundling policies, guideline changes and new technology. AMA Staff reviewed the work neutrality impacts for codes reviewed in the CPT 2013 cycle. It appeared that was only one issue where there was a large growth in utilization in the first year. For CPT 2013 the Parathyroid Imaging codes were not work neutral, and it was initially estimated as a savings overall. It appears that there was 40% increase from what was projected. The specialty societies submitted an action plan indicating that literature supporting parathyroid scintigraphy as an
effective diagnostic study for parathyroid disease has recently emerged and supports the clinical utility thus increasing utilization. Secondly, the availability of SPECT/CT cameras has increased and is greater than initially predicted, allowing for a higher utilization. The Workgroup agreed and also noted that these services are conducted on patients who are referred to the radiologists or nuclear medicine physicians. The physicians providing these services do not control the number of patients referred to them who receive these services. The Workgroup recommends that the specialty societies develop a CPT Assistant article to address potential current use of 78803 rather than the new codes 78071 and 78072. The Workgroup noted that these services are on the new technology list for review later this year and should be postponed and reviewed in 2 years.

</table>

In January 2020, the RUC identified Psychiatric Collaborative Care Management Services (CPT codes 99492, 99493 and 99494) via the work neutrality process. These codes show a 468% increase in work RVUs for 2018. In reviewing the utilization data for these services, it appears one independent clinic is performing most of these services in the pediatric population. The Workgroup recommends that CMS investigate the reporting of services by this specific independent clinic. The specialty society indicated, and the Workgroup agreed, that a new CPT Assistant article on the appropriate usage of these codes be developed in 2020. This family is also scheduled on the new technology/new services list for review at the January 2023 Relativity Assessment Workgroup meeting. The Workgroup recommends postponing the new

New Technology/Services Timeline

1. Code is identified as a new technology/service at the RUC meeting in which it is initially reviewed.
2. Code is flagged in the next version of the RUC database with date to be reviewed.
3. Code will be reviewed in 5 years (depending on what meeting in the CPT/RUC cycle it is initially reviewed) after at least three years of data are available.

**Example**

- **Apr 2020, Oct 2020, Jan 2021 RUC Mtgs**
  - Code Flagged as New Technology/Service and submitted to CMS with recommendations

- **January 2022**
  - Codes published in CPT 2021 available to be reported

- **January 2022 – December 2024**
  - Three years of data

- **January 2026**
  - 2022-2024 Data available for review (AMA staff will provide data). Specialty societies have the opportunity to discuss whether there has been a diffusion of technology for this service.

- **RUC determines that the service does not need to be evaluated**
  - Code is removed from the New Technology/Services list and will be addressed with all other codes through the potentially misvalued code process if applicable.

- **RUC determines that the service requires additional claims data (more than the first 3 years)**
  - RUC will determine on case-by-case basis when the service should be reviewed again through the New Technology/New Services process

- **RUC determines that the service does need to be evaluated**
  - January 2026 – April 2026
    - Survey New Technology/Service Code
  - April 2026
    - Present New Technology/Service Code to the RUC
  - January 2028
    - New RVU published if approved by the RUC and CMS

*Revised May 2021*

</table>
In October 2020, the CPT Editorial Panel approved the revision of four codes describing arthrodesis, addition of two codes to report laminectomy, facetectomy, or foraminotomy during posterior interbody arthrodesis, lumbar to more appropriately identify the decompression that may be separately reported. A CPT coding change application (CCA) was created to assist with coding confusion for reporting additional decompression performed at the same interspace as a lumbar interbody fusion procedure. The coding confusion stemmed from language ("other than for decompression") included in the descriptors for CPT codes 22630-22634. To clarify correct coding, the CCA created two new add-on codes (63052 and 63053) to report decompression when performed in conjunction with posterior interbody arthrodesis at the same interspace, and revised definitions, guidelines, and parenthetical instructions. The terms corpectomy, facetectomy, foraminotomy, hemilaminectomy, lamina, laminectomy, and laminotomy were defined and editorial changes were made to several codes to consistently use the term "interspace" instead of "level" or "segment." In January 2021, the specialty societies surveyed the two new add-on codes and indicated that the revisions to existing codes were editorial precluding survey. The RUC disagreed and recommended that the entire family (CPT codes 22630, 22632, 22633, 22634, 63052 and 63053) be surveyed together for review at the April 2021 RUC meeting and interim values were established for CPT codes 63052 and 63053 until these two new codes could be reviewed again with the entire family in April.

**22630 Arthrodesis, posterior interbody technique, including laminectomy and/or discectomy to prepare interspace (other than for decompression), single interspace; lumbar**

The RUC reviewed the survey results from 111 neurosurgeons, orthopaedic surgeons and spine surgeons and determined that maintaining the current work RVU of 22.09, which falls well below the survey 25th percentile, appropriately accounts for the physician work involved in this service. The RUC recommends the following physician time components as supported by the survey: 40 minutes pre-service evaluation, 20 minutes pre-service positioning, 15 minutes pre-service scrub/dress/wait time, 150 minutes intra-service time, and 30 minutes immediate post-service time, 1-99238 discharge visit, 1-99231 and 2-99232 post-operative visits and 2-99213 and 1-99214 office visits, 479 minutes total time. The scrub/dress/wait time was reduced from Pre-time Package 4 so as not to exceed survey median data. The positioning time was increased from the pre-time package to account for the additional work related to prone positioning.

The RUC noted that the total recommended time of 479 minutes is nearly identical to the total time of both the survey and the current code (487 minutes) which was initially valued in 1995. The post-operative visits have decreased by one, but the level of the visits has changed, practically resulting in a net change of zero in overall physician time despite the decrease of one visit. The RUC discussed the significant decrease in intra-service time of 30 minutes and considered crosswalk code alternatives; however, none of the crosswalk code options were deemed clinically comparable or sufficiently matched to the difficulty of the procedure. The change in time for the survey code, since it was valued in 1995, is attributed intra-operatively to the use of more effective drills, better X-rays, and several steps that streamline the procedure and make it more efficient. However, the RUC noted that while the procedure may be more efficient, it is not safer or less difficult. The elements that remain are...
intense, such that the risk of the procedure, remains the same as it was originally; therefore, the RUC agreed that the current value should be maintained.

To justify the current work RVU of 22.09, the RUC compared the survey code to the top key reference service codes 22533 *Arthrodesis, lateral extracavitary technique, including minimal discectomy to prepare interspace (other than for decompression); lumbar* (work RVU = 24.79, 180 minutes intra-service time and 549 minutes total time) and 22612 *Arthrodesis, posterior or posterolateral technique, single level; lumbar (with lateral transverse technique, when performed)* (work RVU = 23.53, 150 minutes intra-service time and 482 minutes total time) and noted that the majority of respondents who chose 22533 as a key reference service indicated that the intensity/complexity of 22630 is similar to or somewhat more than 22533. Also, the respondents who chose 22612 as a key reference service indicated the intensity/complexity of 22630 is more than 22612.

The RUC also compared CPT code 22630 to MPC codes 35301 *Thromboendarterectomy, including patch graft, if performed; carotid, vertebral, subclavian, by neck incision* (work RVU = 21.16, 120 minutes intra-service time and 404 minutes total time) and 32669 *Thoracoscopic, surgical; with removal of a single lung segment (segmentectomy)* (work RVU = 23.53, 150 minutes intra-service time and 502 minutes total time) and noted that the multi-specialty points of comparison code values appropriately bracket the survey code recommendation. For additional support, the RUC noted that the survey code is further bracketed by comparator codes 38720 *Cervical lymphadenectomy (complete)* (work RVU = 21.95, 150 minutes intra-service time and 482 minutes total time) and 44140 *Colectomy, partial; with anastomosis* (work RVU = 22.59, 150 minutes intra-service time and 480 minutes total time). The RUC concluded that the value of CPT code 22630 should be maintained at 22.09 work RVUs, which is below the 25th percentile of the survey. **The RUC recommends a work RVU of 22.09 for CPT code 22630.**

*22632 Arthrodesis, posterior interbody technique, including laminectomy and/or discectomy to prepare interspace (other than for decompression), single interspace; each additional interspace (List separately in addition to code for primary procedure)*

The RUC reviewed the survey results from 111 neurosurgeons, orthopaedic surgeons and spine surgeons and determined that maintaining the current work RVU of 5.22, which falls well below the survey 25th percentile, appropriately accounts for the physician work involved in this add-on service. The RUC recommends 60 minutes of intra-service time and noted that the intraoperative time has not changed since the code was initially valued in 1995. At that time, the value of this code was calculated based on 25% of the base code.

The specialties noted that a comparison to the key reference service codes 22614 *Arthrodesis, posterior or posterolateral technique, single level; each additional vertebral segment (List separately in addition to code for primary procedure)* (work RVU = 6.43, 40 minutes intra-service and total time) and 22552 *Arthrodesis, anterior interbody, including disc space preparation, discectomy, osteophytectomy and decompression of spinal cord and/or nerve roots; cervical below C2, each additional interspace (List separately in addition to code for primary procedure)* (work RVU = 6.50, 45 minutes intra-service time and 50 minutes total time) might support a higher work RVU, however, there was no compelling evidence that the work had changed. The RUC agreed that work had not changed.

The RUC also compared CPT code 22632 to MPC code 34812 *Open femoral artery exposure for delivery of endovascular prosthesis, by groin incision, unilateral (List separately in addition to code for primary procedure)* (work RVU = 4.13, 40 minutes intra-service and total time) and
noted that the comparator code has less intra-service and total time and is appropriately valued lower than the survey code. The specialties noted that the MPC code involves open femoral artery exposure by groin incision and closure of the wound, typically for separately reported percutaneous delivery of an endovascular prosthesis for an asymptomatic infrarenal abdominal aortic aneurysm (AAA) while, in comparison, the lower intensity exposure and closure for the survey code are performed as part of the primary arthrodesis code.

For additional support, the RUC noted that the survey code is appropriately bracketed by comparator codes with the same time and similar intensity: 11008 *Removal of prosthetic material or mesh, abdominal wall for infection (eg, for chronic or recurrent mesh infection or necrotizing soft tissue infection) (List separately in addition to code for primary procedure)* (work RVU = 5.00, 60 minutes intra-service and total time) and 22854 *Insertion of intervertebral biomechanical device(s) (eg, synthetic cage, mesh) with integral anterior instrumentation for device anchoring (eg, screws, flanges), when performed, to vertebral corpectomy(ies) (vertebral body resection, partial or complete) defect, in conjunction with interbody arthrodesis, each contiguous defect (List separately in addition to code for primary procedure)* (work RVU = 5.50, 60 minutes intra-service and total time). The RUC concluded that the value of CPT code 22632 should be maintained at 5.22 work RVUs which is below the 25th percentile of the survey. The RUC recommends a work RVU of 5.22 for CPT code 22632.

22633 *Arthrodesis, combined posterior or posterolateral technique with posterior interbody technique including laminectomy and/or discectomy sufficient to prepare interspace (other than for decompression), single interspace; lumbar*

The RUC reviewed the survey results from 111 neurosurgeons, orthopaedic surgeons and spine surgeons and concurred that the survey respondents overvalued the physician work involved in performing this service. The RUC determined that changes in intra-service and total time for the procedure warranted a direct work RVU crosswalk to MPC code 55866 *Laparoscopy, surgical prostatectomy, retropubic radical, including nerve sparing, includes robotic assistance, when performed* (work RVU = 26.80, 180 minutes intra-service and 442 minutes total time) which falls below the survey 25th percentile and has identical intra-service time that appropriately accounts for the total physician work involved in this service.

The RUC recommends the following physician time components as supported by the survey: 40 minutes pre-service evaluation, 20 minutes pre-service positioning, 15 minutes pre-service scrub/dress/wait time, 180 minutes intra-service time, and 30 minutes immediate post-service time, 1-99238 discharge visit, 1-99231 and 2-99232 post-operative visits and 2-99213 and 1-99214 office visits, 509 minutes total time. The scrub/dress/wait time was reduced from Pre-time Package 4 so as not to exceed survey median data. The positioning time was increased from the pre-time package to account for the additional work related to prone positioning. The RUC used a crosswalk due to the changes in visits that caused a decrease in total time, primarily due to a change in inpatient care. Previously, there were two level-3 hospital visits and one level-2 hospital visit, this has been decreased to two level-2 and one level-1 inpatient visit along with a discharge day visit causing a substantial decrease in total time for the procedure, greater than the decrease in intra-service time; thus, a crosswalk was selected rather than recommending maintaining current value. The RUC discussed the recommended crosswalk code 55866 and noted that it is recently reviewed and performed 20,000/year and places the intraoperative intensity appropriately within this family of codes.

To justify the crosswalk value of 26.80 work RVUs, the RUC compared the survey code to the top key reference service code 22612 *Arthrodesis, posterior or posterolateral technique, single level; lumbar (with lateral transverse technique, when performed)* (work RVU = 23.53, 150 minutes

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.
intra-service time and 482 minutes total time) and 2nd key reference code 22857 Total disc arthroplasty (artificial disc), anterior approach, including discectomy to prepare interspace (other than for decompression), single interspace, lumbar (work RVU = 27.13, 180 minutes intra-service time and 550 minutes total time) and noted that the physician work and total time of the survey code is appropriately bracketed between the two reference services using magnitude estimation.

For additional support, the RUC noted that the survey code is appropriately bracketed by comparator codes with the same intraoperative time and similar intensity: 43281 Laparoscopy, surgical, repair of paraesophageal hernia, includes fundoplasting, when performed; without implantation of mesh (complete) (work RVU = 26.60, 180 minutes intra-service time and 424 minutes total time). The RUC concluded that, given changes in intra-service and total time for the procedure, CPT code 22633 should be valued based on a direct work RVU crosswalk to CPT code 55866 which falls below the survey 25th percentile and preserves rank order within the family. The RUC recommends a work RVU of 26.80 for CPT code 22633.

22634 Arthrodesis, combined posterior or posterolateral technique with posterior interbody technique including laminectomy and/or discectomy sufficient to prepare interspace (other than for decompression), single interspace; each additional interspace and segment (List separately in addition to code for primary procedure)

The RUC reviewed the survey results from 111 neurosurgeons, orthopaedic surgeons and spine surgeons and determined that the survey 25th percentile work RVU of 7.96 appropriately accounts for the physician work involved in this add-on service and is less than the current value. The RUC noted that the current value for 22634 is based on a calculation in 2011 that estimated the new add-on code was 70% of the survey 25th percentile work RVU. Although the current survey median work RVU would suggest an increase is warranted, the specialty did not present compelling evidence for an increase and the RUC recommends a decrease in the work RVU to account for the five minute decrease in median intra-service time. The RUC recommends 65 minutes of intra-service time as supported by the survey. The RUC noted that this service is more difficult and complex than CPT code 22632 due to the more complex patient undergoing this procedure and considerable additional steps that are not included in 22630 and 22632.

To justify a work RVU of 7.96, the RUC compared the survey code to the top key reference service code 22614 Arthrodesis, posterior or posterolateral technique, single level; each additional vertebral segment (List separately in addition to code for primary procedure) (work RVU = 6.43, 40 minutes intra-service and total time) and noted that the survey code has greater intra-service and total time and involves more physician work than the reference service. It was also rated as more intense/complex overall than the key reference service by 88% of survey respondents who selected the KRS. The RUC also compared CPT code 22634 to MPC code 34812 Open femoral artery exposure for delivery of endovascular prosthesis, by groin incision, unilateral (List separately in addition to code for primary procedure) (work RVU = 4.13, 40 minutes intra-service and total time) and noted that the MPC code has much less intra-service and total time and is appropriately valued lower than the survey code.

For additional support, the RUC noted that the survey code is bracketed by comparator codes 34820 Open iliac artery exposure for delivery of endovascular prosthesis or iliac occlusion during endovascular therapy, by abdominal or retroperitoneal incision, unilateral (List separately in addition to code for primary procedure) (work RVU = 7.00, 60 minutes intra-service and total time) and 33746 Transcatheter intracardiac shunt (TIS) creation by stent placement for congenital cardiac anomalies to establish effective intracardiac flow, including all imaging guidance by the proceduralist, when performed, left and right heart diagnostic cardiac catherization for congenital cardiac anomalies, and target zone

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.
angioplasty, when performed (eg, atrial septum, Fontan fenestration, right ventricular outflow tract, Mustard/Senning/Warden baffles); each additional intracardiac shunt location (List separately in addition to code for primary procedure) (work RVU = 8.00, 60 minutes intra-service and total time). The RUC concluded that CPT code 22634 should be valued at the 25th percentile work RVU as supported by the survey and comparator codes. The RUC recommends a work RVU of 7.96 for CPT code 22634.

63052 Laminectomy, facetectomy, or foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s] [eg, spinal or lateral recess stenosis]), during posterior interbody arthrodesis, lumbar; single vertebral segment (List separately in addition to code for primary procedure)

The RUC reviewed the survey results from 111 neurosurgeons, orthopaedic surgeons and spine surgeons and determined that the survey 25th percentile work RVU of 5.70 appropriately accounts for the physician work involved in this add-on service. The RUC recommends 45 minutes intra-service time and noted that the time has increased by five minutes compared to the previous survey and that the recommendation is slightly higher than the interim recommendation. This code was initially surveyed in January of 2021. At that time, the RUC concluded that the survey was flawed because the add-on codes were not surveyed in conjunction with the base codes. The RUC was concerned that without the base codes and add-on codes being surveyed together, that the survey for the add-on codes may have included work from the primary codes. For this reason, an interim value was assigned with guidance to the specialties to perform a new survey to include the add-on codes and the base codes. The current survey included all six codes on one survey instrument. Additionally, the overall experience of the survey respondents is greater for the new survey of six codes when compared to the prior survey of only the new add-on codes. The RUC determined that the value of 5.70 is more accurate as it is based on the survey of the entire code family and further noted that compelling evidence is not necessary for increases over interim values since interim values are, by definition, temporary. The RUC also noted that the time included in this add-on service is essentially all high-risk. The lower intensity surgical exposure activities have already been completed with the base code, so the physician work of 63052 involves the actual higher intensity decompression as clarified by CPT.

To justify a work RVU of 5.70, the RUC compared the survey code to the top key reference service code 22840 Posterior non-segmental instrumentation (eg, Harrington rod technique, pedicle fixation across 1 interspace, atlantoaxial transarticular screw fixation, sublaminar wiring at C1, facet screw fixation) (List separately in addition to code for primary procedure) (work RVU = 12.52, 60 minutes intra-service and total time) and noted that the reference code has both more physician work and intra-service time and is therefore valued higher.

The RUC also compared the survey code to MPC code 34812 Open femoral artery exposure for delivery of endovascular prosthesis, by groin incision, unilateral (List separately in addition to code for primary procedure) (work RVU = 4.13, 40 minutes intra-service and total time) and noted that the MPC code involves open femoral artery exposure by groin incision and closure of the wound, typically for separately reported delivery of an endovascular prosthesis for an asymptomatic infrarenal abdominal aortic aneurysm (AAA). In comparison, exposure and closure for the survey code are performed as part of the primary arthrodesis code and the intra-service time includes bony and soft tissue resection (typically pathologic and not normal in nature) and decompression of neural elements in immediate high-risk proximity of the pathologic anatomy. Therefore, the physician work, time, and intensity of 63052 is greater than 34812.
For additional support, the RUC noted that the survey code is appropriately bracketed by comparator codes with the same intraoperative time and similar intensity: 22552 Arthrodesis, anterior interbody, including disc space preparation, discectomy, osteophytectomy and decompression of spinal cord and/or nerve roots; cervical below C2, each additional interspace (List separately in addition to code for primary procedure) (work RVU = 6.50, 45 minutes intra-service time and 50 minutes total time) and code 22585 Arthrodesis, anterior interbody technique, including minimal discectomy to prepare interspace (other than for decompression); each additional interspace (List separately in addition to code for primary procedure) (work RVU = 5.52, 45 minutes intra-service and total time). The RUC concluded that CPT code 63052 should be valued at the 25th percentile work RVU as supported by the survey and comparator codes using magnitude estimation. The RUC recommends a work RVU of 5.70 for CPT code 63052.

63053 Laminectomy, facetectomy, or foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s]/eg, spinal or lateral recess stenosis/), during posterior interbody arthrodesis, lumbar; each additional segment (List separately in addition to code for primary procedure)

The RUC reviewed the survey results from 111 neurosurgeons, orthopaedic and spine surgeons and determined that the survey 25th percentile work RVU of 5.00 appropriately accounts for the physician work involved in this add-on service. The RUC recommends 40 minutes intra-service time and noted that the time has increased by ten minutes compared to the previous survey. This code was initially surveyed in January of 2021. At that time, the RUC concluded that the survey was flawed because the add-on codes were not surveyed in conjunction with the base codes. For this reason, an interim value was assigned with guidance to the specialties to perform a new survey to include the add-on codes and the base codes. The new survey, which included all six codes, elicited a time that is only five minutes less than the work related to 63052 and is believed to be a more accurate reflection of the difference in work between laminectomy/facetectomy/foraminotomy with decompression of the first segment and of an additional segment. The RUC determined that the new value is more accurate as it is based on the survey of the entire code family and further noted that compelling evidence is not necessary for increases over interim values since interim values are, by definition, temporary.

To justify a work RVU of 5.00, the RUC compared the survey code to the top key reference service code 22614 Arthrodesis, posterior or posterolateral technique, single level; each additional vertebral segment (List separately in addition to code for primary procedure) (work RVU = 6.43, 40 minutes intra-service and total time) and noted that the codes have the same intra-service time, but the reference code is more intense and is appropriately valued higher than the survey code using magnitude estimate. The RUC also compared the survey code to the second key reference service code 22840 Posterior non-segmental instrumentation (eg, Harrington rod technique, pedicle fixation across 1 interspace, atlantoaxial transarticular screw fixation, sublaminar wiring at C1, facet screw fixation) (List separately in addition to code for primary procedure) (work RVU = 12.52, 60 minutes intra-service and total time) and noted that this reference code has more physician work and intra-service time and is therefore valued higher than the survey code.

The RUC also compared the survey code to MPC code 34812 Open femoral artery exposure for delivery of endovascular prosthesis, by groin incision, unilateral (List separately in addition to code for primary procedure) (work RVU = 4.13, 40 minutes intra-service and total time) and noted that the MPC code involves open femoral artery exposure by groin incision and closure of the wound, typically for separately reported delivery of an endovascular prosthesis for an asymptomatic infrarenal abdominal aortic aneurysm (AAA). In comparison, exposure and closure for the survey code are performed as part of the primary arthrodesis code and the intra-service time for 63053 includes bony and soft tissue resection.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.
(typically pathologic and not normal in nature) and decompression of neural elements in immediate high-risk proximity of the pathologic anatomy. Therefore, the physician work and intensity of 63053 is appropriately greater than 34812.

For additional support, the RUC noted that the survey code is appropriately bracketed by comparator codes with the similar intraoperative time and similar intensity: 44128 Enterectomy, resection of small intestine for congenital atresia, single resection and anastomosis of proximal segment of intestine; each additional resection and anastomosis (List separately in addition to code for primary procedure) (work RVU = 4.44, 40 minutes intra-service and total time) and 22585 Arthrodesis, anterior interbody technique, including minimal discectomy to prepare interspace (other than for decompression); each additional interspace (List separately in addition to code for primary procedure) (work RVU = 5.52, 45 minutes intra-service and total time). The RUC concluded that CPT code 63053 should be valued at the 25th percentile work RVU as supported by the survey and comparator codes using magnitude estimation. The RUC recommends a work RVU of 5.00 for CPT code 63053.

**Practice Expense**

The Practice Expense Subcommittee removed the EQ168 light, exam for CPT codes 22630 and 22633. No direct practice expense inputs were recommended for the facility-only add-on codes 22632, 22634, 63052 and 63053. The RUC recommends the direct practice expense inputs as modified by the Practice Expense Subcommittee.

**Hemilaminectomy** is removal of a portion of a vertebral lamina, usually performed for exploration of, access to, or decompression of the intraspinal contents.

**Lamina** pertains to the vertebral arch, the flattened posterior portion of the vertebral arch extending between the pedicles and the midline, forming the dorsal wall of the vertebral foramen, and from the midline junction of which the spinous process extends.

**Laminectomy** is excision of a vertebral lamina; commonly used to denote removal of the posterior arch.

**Laminotomy** is excision of a portion of the vertebral lamina, resulting in enlargement of the intervertebral foramen for the purpose of relieving pressure in on a spinal nerve root.

*A vertebral segment describes the basic constituent part into which the spine may be divided. It represents a single complete vertebral bone with its associated articular processes and laminae. A vertebral interspace is the nonbony compartment between two adjacent vertebral bodies which contains the intervertebral disc, and includes the nucleus pulposus, annulus fibrosus, and two cartilaginous endplates.*

Decompression performed on the same vertebral segment(s) and/or interspace[s] as posterior lumbar interbody fusion that includes laminectomy, facetectomy, and/or foraminotomy may be separately reported using 63052, 63053.

Decompression solely to prepare the interspace for fusion is not separately reported.

   (Do not report 63040, 63042, 63043, 63044, in conjunction with 22630, 22632, 22633, 22634 for laminotomy to prepare the
   interspace for fusion on the same interspace and vertebral segment[s])

   (To report decompression performed on the same vertebral segments and/or interspace[s] as posterior interbody fusion that
   includes laminectomy, removal of facets, and/or opening/widening of the foramen for decompression of nerves or spinal
   components such as spinal cord, cauda equina, or nerve roots, see 63052, 63053)
   (For bilateral procedure, report 63044 twice. Do not report modifier 50 in conjunction with 63044)

Decompression performed on the same vertebral segments and/or interspace[s] as posterior interbody fusion that includes laminectomy,
facetectomy, or foraminotomy may be separately reported using 63052.

Codes 63052, 63053 may only be reported for decompression at the same anatomic site(s) when posterior interbody fusion (eg, 22630) requires
decompression beyond preparation of the interspace(s) for fusion.

63045  Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or
       nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; cervical

63046  thoracic
63047  lumbar
+▲63048  each additional vertebral segment, cervical, thoracic or lumbar (List separately in addition to code for primary
        procedure

   (Use 63048 in conjunction with 63045-63047)
   (Do not report 63047, 63048 in conjunction with 22630, 22632, 22633, 22634 for laminectomy performed to prepare the
   interspace for fusion on the same vertebral segments and/or interspace[s])

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.
(To report decompression performed on the same vertebral segments and/or interspace[s] as posterior interbody fusion that includes laminectomy, removal of facets, and/or opening/widening of the foramen for decompression of nerves or spinal components such as spinal cord, cauda equina, or nerve roots, see 63052, 63053)

CPT Descriptor: Arthrodesis, posterior interbody technique, including laminectomy and/or discectomy to prepare interspace (other than for decompression), single interspace; lumbar

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 48-year-old male with a history of previous discectomy at L4-L5 presents with a spondylolisthesis and intractable back pain that improves with recumbency or back bracing. Non-operative treatments have failed to control his symptoms. Arthrodesis via a unilateral or bilateral approach of L4-L5 is performed using a posterior interbody technique. (Note: Decompression, instrumentation and/or bone preparation or harvesting, when performed, is separately reported.)

Percentage of Survey Respondents who found Vignette to be Typical: 85%

**Site of Service (Complete for 010 and 090 Globals Only)**

</tbody>
</table>

**Description of Pre-Service Work:** Review preoperative laboratory workup. Write preoperative orders for perioperative medications. Review MRI and/or other spinal imaging studies. Review planned incisions and procedure. Update H&P, review current medications, review surgical procedure, postoperative recovery in and out of the hospital, and the expected outcome(s) with patient and family. Sign and mark operative site. Obtain informed consent. Verify all necessary surgical instruments, supplies, and devices are available in the operative suite. Review length and type of anesthesia with the anesthesiologist. Perform preoperative time out, confirming patient identity, surgical site, procedure, indicated intraoperative medications, and antibiotic and DVT prophylaxis, as necessary. Monitor initial patient positioning for induction of anesthesia. Monitor initial patient positioning for placement of neuromonitoring electrodes. Following induction of anesthesia, assist with positioning of the patient prone. Verify and/or assist with padding of the patient to prevent pressure on neurovascular structures and placement of any traction devices to facilitate intraoperative imaging. Scrub and gown. Supervise preparing and draping of the patient. Perform surgical time out.

**Description of Intra-Service Work:** Following skin incision, dissection is carried out through the subcutaneous tissue and fascia to the posterior spinal elements. The subcutaneous and muscular tissues are reflected to expose the posterior surface of the lamina and over the facet(s) and/or transverse processes of the segment to be fused. Verification of the levels is confirmed with imaging. Bone cutting tools are used to remove as much of the lamina above and below the facets and to remove as much of the medial edges of the facets as is necessary for adequate exposure of the disc space. The nerve root is carefully mobilized from adhesions and/or peridural membrane. Epidural veins are cauterized and cut. The nerve root(s) and thecal sac are protected by packing and retraction. The annulus is incised, and an ample section of it is removed by sharp dissection. The nucleus is removed within the disc space with rongeurs and curettes. Bone cutting instruments are used to remove cartilaginous and subchondral end-plates of the vertebrae above and below the disc to be fused. The bone dissection is fashioned to accept the graft in a way that will provide for contact, maintenance of disc space height, and stability. The spacer (graft and/or device with graft) is impacted into the recipient site. When appropriate, the entire exposure, bone preparation, and spacer insertion and impaction are repeated from the other side of the table. The neural elements are inspected to confirm that they are free of any impingement from the implants in the canal and neuroforamen. An
interposition membrane, as by free fat graft, may be used to cover the exposed dura and nerve root. Muscles and fascia are sutured. A drain is inserted through a separate stab wound and secured. The subcutaneous tissues and skin are closed. (Note: Decompression of neural elements, instrumentation, and/or bone preparation or harvesting, when performed, are separately reported.)

Description of Post-Service Work:
Facility: Apply sterile dressings. Assist with repositioning patient supine. When anesthesia has been reversed, transfer the patient to the recovery room. Write an operative note in the patient’s record. Monitor patient for abnormal neurological findings prior to discharge from recovery to the surgical floor. Sign the OR forms, including pre- and postoperative diagnosis and operations performed. Discuss procedure outcome with family. Dictate postoperative report. Dictate procedure outcome and expected recovery letter for referring physician and/or insurance company. Order and review films to check the alignment of the lumbar spine. Later the same day, review nursing and other provider chart notes, assess patient neurovascular status and pain. Write orders or update orders, as necessary, for medications, diet, and patient activity. Chart patient progress notes. On subsequent days, examine the patient, check wounds and neurovascular status. Review nursing and other provider chart notes. Chart patient progress notes. Discuss (oral/written) patient progress with referring physician. Answer (oral/written) questions from patient and/or family, nursing and other staff, and insurance staff. When safe to discharge patient to home, conduct final exam, including neurovascular and pain status, write orders for follow-up visits, post-discharge laboratory tests, imaging, home care, and physical therapy. Order medications needed post-discharge. Discuss home restrictions and activity levels (i.e., diet, bathing, driving, exercise) and follow-up planning with patient/family. Complete all appropriate medical records, including day of discharge progress notes, discharge summary, discharge instructions, and insurance forms.

Office: Examine patient and perform neurological exam and pain assessment. Write orders for medications. Order and review periodic imaging, as appropriate. Monitor wounds and remove sutures and staples when appropriate. Review physical therapy progress and revise orders as needed. Dictate patient progress notes for the medical chart. Answer patient and/or family questions and insurance staff questions. Discuss (oral/written) patient progress with referring physician.

---

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC’s rationale, please review the separate RUC recommendation document.
Background

In October 2020, the CPT Editorial Panel approved the revision of four codes describing arthrodesis, addition of two codes to report laminectomy, facetectomy, or foraminotomy during posterior interbody arthrodesis, lumbar to more appropriately identify the decompression that may be separately reported. A coding change application was created to assist with coding confusion for reporting additional decompression performed at the same interspace as a lumbar interbody fusion procedure. The coding confusion stemmed from language ("other than for decompression") included in the descriptors for codes 22630-22634. To clarify correct coding, the CCA created two new add-on codes (63052 and 63053) to report decompression when performed in conjunction with posterior interbody arthrodesis at the same interspace, along with definitions, guidelines, and parenthetical instructions. The terms corpectomy, facetectomy, foraminotomy, hemilaminectomy, lamina, laminectomy, and laminotomy were defined and editorial changes were made to several codes to consistently use the term "interspace" instead of "level" or "segment."

In January 2021, the specialty societies surveyed the two new codes and indicated the existing code changes were editorial. The RUC expressed concern that the base codes were not surveyed with the two new add-on codes. Two of the codes (22630 and 22632) are from 1995 and the other two codes were last RUC reviewed in 2011 (22633 and 22634). The RUC could not accept the specialties' justification for only surveying the new codes. They questioned how, without the base codes being surveyed, there would be assurance the respondents followed instruction to only consider the work of the add-on codes. Moreover, CMS has made it clear that the Agency expects the base codes and add-on codes to be reviewed at the same time. The RUC recommends that the entire family (CPT codes 22630, 22632, 22633, 22634, 63052, 63053) be resurveyed for review at the April 2021 RUC meeting and that interim values be established for CPT codes 63052 and 63053 for CY 2022.

Recommendation – 22630

We recommend maintaining the current work RVU of 22.09. Although the intraoperative time decreased, the postoperative work increased and the total time is nearly identical.

Positioning time

Additional time was added to the package time of 3 minutes for supine positioning. These patients will typically be positioned prone.

Key Reference Code Comparison

KRS1: The respondents who chose 22533 as a reference indicated the intensity/complexity of 22630 is similar to somewhat more than 22533.

KRS2: The respondents who chose 22612 as a reference indicated the intensity/complexity of 22630 is more than 22612.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)
   - The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - Multiple codes allow flexibility to describe exactly what components the procedure included.
   - Multiple codes are used to maintain consistency with similar codes.
   - Historical precedents.
   - Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. Decompression, instrumentation and/or bone preparation or harvesting, when performed, is separately reported.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 22630

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty neurosurgery         How often? Sometimes
Specialty orthopaedic surgery   How often? Sometimes
Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period?
CPT Code: 22630

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National data not available.

Do many physicians perform this service across the United States? Yes

**Berenson-Eggers Type of Service (BETOS) Assignment**

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Explor/Decompr/Excis disc

**Professional Liability Insurance Information (PLI)**

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 22630.

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.
CPT Code: 22632

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 22632 Tracking Number J2 Original Specialty Recommended RVU: 5.22
Presented Recommended RVU: 5.22
RUC Recommended RVU: 5.22

Global Period: ZZZ Current Work RVU: 5.22

CPT Descriptor: Arthrodesis, posterior interbody technique, including laminectomy and/or discectomy to prepare interspace (other than for decompression), single interspace; each additional interspace (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 70-year-old male with a history of previous discectomy and posterolateral fusion of L4-L5, presents with pseudarthrosis of L4-L5, progressive spondylolisthesis of L5-S1, minimal signs of nerve root dysfunction, and intractable back pain that improves with recumbency or back bracing. Non-operative treatments have failed to control his symptoms. During (separately reported) posterior lumbar interbody arthrodesis of L4-L5, he undergoes additional interspace arthrodesis of L5-S1 via a unilateral or bilateral approach using a posterior interbody technique. (Note: This is an add-on procedure. Decompression, instrumentation and/or bone preparation or harvesting, when performed, is separately reported. Only consider the additional work related to the posterior interbody arthrodesis of the additional L5-S1 interspace.)

Percentage of Survey Respondents who found Vignette to be Typical: 81%

Site of Service (Complete for 010 and 090 Globals Only)
Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: n/a

Description of Intra-Service Work: Skin, muscle, and fascia incisions are extended to provide for enough retraction to safely expose the additional interspace. The ligamentum flavum and/or scar is removed from between the laminae of the additional interspace. The laminae and medial edges of the facets are removed with bone cutting instruments to a degree sufficient to allow safe exposure of the disc space. The nerve root is carefully mobilized from adhesions and/or peridural membrane. Epidural veins are cauterized and cut. The nerve root(s) and thecal sac are protected by packing and retraction. The annulus is incised, and an ample section of it is removed by sharp dissection. The nucleus is removed within the disc space with rongeurs and curettes. Bone cutting instruments are used to remove cartilaginous and subchondral end-plates of the vertebrae above and below the disc to be fused. The bone dissection is fashioned to accept the graft in a way that will provide for contact, maintenance of disc space height, and stability. The spacer (graft and/or device) is impacted into the recipient site. When appropriate, the entire exposure, bone preparation, and spacer insertion and impaction are repeated from the other side of the table. The neural elements are inspected to confirm that they are free of any impingement from the implant(s) in the canal and neuroforamen. An interposition membrane, as by fat graft, is applied over the exposed dura and nerve roots of the additional space. (Note: Decompression of neural elements, instrumentation, and/or bone preparation or harvesting, when performed, are separately reported.)

Description of Post-Service Work: n/a

### Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC’s rationale, please review the separate RUC recommendation document.

**Background**

In October 2020, the CPT Editorial Panel approved the revision of four codes describing arthrodesis, addition of two codes to report laminectomy, facetectomy, or foraminotomy during posterior interbody arthrodesis, lumbar to more...
appropriately identify the decompression that may be separately reported. A coding change application was created to assist with coding confusion for reporting additional decompression performed at the same interspace as a lumbar interbody fusion procedure. The coding confusion stemmed from language ("other than for decompression") included in the descriptors for codes 22630-22634. To clarify correct coding, the CCA created two new add-on codes (63052 and 63053) to report decompression when performed in conjunction with posterior interbody arthrodesis at the same interspace, along with definitions, guidelines, and parenthetical instructions. The terms corpectomy, facetectomy, foraminotomy, hemilaminectomy, lamina, laminectomy, and laminotomy were defined and editorial changes were made to several codes to consistently use the term "interspace" instead of "level" or "segment."

In January 2021, the specialty societies surveyed the two new codes and indicated the existing code changes were editorial. The RUC expressed concern that the base codes were not surveyed with the two new add-on codes. Two of the codes (22630 and 22632) are from 1995 and the other two codes were last RUC reviewed in 2011 (22633 and 22634). The RUC could not accept the specialties’ justification for only surveying the new codes. They questioned how, without the base codes being surveyed, there would be assurance the respondents followed instruction to only consider the work of the add-on codes. Moreover, CMS has made it clear that the Agency expects the base codes and add-on codes to be reviewed at the same time. The RUC recommends that the entire family (CPT codes 22630, 22632, 22633, 22634, 63052, 63053) be resurveyed for review at the April 2021 RUC meeting and that interim values be established for CPT codes 63052 and 63053 for CY 2022.

**Recommendation – 22632**

The current value for 22632 is based on a calculation in 1995 that estimated the add-on code was 25% of the primary procedure for an additional interspace. Although the current survey would suggest an increase is warranted in comparison to other similar codes, we do not have compelling evidence for an increase. Therefore, we recommend maintaining the current work RVU of 5.22. Intraoperative time has not changed.

**Key Reference Code Comparison**

*KRS1:* The respondents who chose 22614 as a reference indicated the intensity/complexity of 22632 is more/much more than 22614.

*KRS2:* The respondents who chose 22552 as a reference indicated the intensity/complexity of 22632 is similar/more than 22552.

**MPC Code Comparison**

There are few MPC codes with a ZZZ global assignment which makes finding appropriate MPC codes with similar intensity/complexity difficult. MPC code 34812 (with the highest wRVU) involves open femoral artery exposure by groin incision and closure of the wound, typically for separately reported percutaneous delivery of an endovascular prosthesis for an asymptomatic infrarenal AAA. In comparison, the lower intensity exposure and closure for the survey code are performed as part of the primary arthrodesis code.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☑ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 22632
How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

<table>
<thead>
<tr>
<th>Specialty</th>
<th>How often?</th>
</tr>
</thead>
<tbody>
<tr>
<td>Neurosurgery</td>

Do many physicians perform this service across the United States? Yes

**Berenson-Eggers Type of Service (BETOS) Assignment**
Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

- **Main BETOS Classification:** Procedures
- **BETOS Sub-classification:** Major procedure
- **BETOS Sub-classification Level II:** Explor/Decompr/Excis disc

**Professional Liability Insurance Information (PLI)**
If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 22632

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.
CPT Code: 22633

SUMMARY OF RECOMMENDATION

CPT Code: 22633 Tracking Number J3 Original Specialty Recommended RVU: 26.80

Presented Recommended RVU: 26.80

RUC Recommended RVU: 26.80

Global Period: 090 Current Work RVU: 27.75

CPT Descriptor: Arthrodesis, combined posterior or posterolateral technique with posterior interbody technique including laminectomy and/or discectomy sufficient to prepare interspace (other than for decompression), single interspace; lumbar

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 68-year-old female presents with a degenerative spondylolisthesis of L4-L5 causing mechanical low back pain. Non-operative treatments have failed to control her symptoms. Via unilateral or bilateral approach to the L4-L5 interspace, arthrodesis is performed using a posterolateral technique with posterior interbody technique. (Note: Decompression, instrumentation, and/or bone preparation or harvesting, when performed, is separately reported.)

Percentage of Survey Respondents who found Vignette to be Typical: 88%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 7% , Overnight stay-more than 24 hours 93%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 94%

Description of Pre-Service Work: Review preoperative laboratory workup. Write preoperative orders for perioperative medications. Review MRI and/or other spinal imaging studies. Review planned incisions and procedure. Update H&P, review current medications, review surgical procedure, postoperative recovery in and out of the hospital, and the expected outcome(s) with patient and family. Sign and mark operative site. Obtain informed consent. Verify all necessary surgical instruments, supplies, and devices are available in the operative suite. Review length and type of anesthesia with the anesthesiologist. Perform preoperative time out, confirming patient identity, surgical site, procedure, indicated intraoperative medications, and antibiotic and DVT prophylaxis, as necessary. Monitor initial patient positioning for induction of anesthesia. Monitor initial patient positioning for placement of neuromonitoring electrodes. Following induction of anesthesia, assist with positioning of the patient prone. Verify and/or assist with padding of the patient to prevent pressure on neurovascular structures and placement of any traction devices to facilitate intraoperative imaging. Scrub and gown. Supervise preparing and draping of the patient. Perform surgical time out.

Description of Intra-Service Work: Following skin incision, dissection is undertaken through the subcutaneous tissue and fascia to the posterior spinal elements. The subcutaneous and muscular tissues are reflected to expose the posterior surface of the lamina and over the facet(s) and/or transverse processes of the segment to be fused. Verification of the levels is undertaken with imaging. Bone cutting tools are used to remove as much of the lamina above and below and as much of the medial edges of the facets as is necessary for adequate exposure of the disc space. The nerve root is carefully mobilized from adhesions and/or peridural membrane. Epidural veins are cauterized and cut. The nerve root(s) and thecal sac are protected by packing and retraction. The annulus is incised, and an ample section of it is removed by sharp dissection. The nucleus is removed within the disc space with rongeurs and curettes. Bone cutting instruments are used to remove cartilaginous and subchondral end-plates of the vertebrae above and below the disc to be fused. The bone dissection is fashioned to accept the graft in a way that will provide for contact, maintenance of disc space height, and stability. The spacer (graft and/or device) is impacted into the recipient site. When appropriate, the entire exposure, bone preparation, and spacer insertion and impaction are repeated from the other side of the table. Decortication of the posterolateral elements (transverse process, any remaining lamina, and/or facets) is undertaken, and graft material is packed posterolaterally to complete the arthrodesis preparations for the fusion. The neural elements are inspected to confirm that they are free of any
impingement from the implants in the canal and neuroforamen. An interposition membrane, as by free fat graft, may be used to cover the exposed dura and nerve root. Muscles and fascia are sutured. A drain is inserted through a separate stab wound and secured. The subcutaneous tissues and skin are closed. (Note: Decompression of neural elements, instrumentation, and/or bone preparation or harvesting, when performed, are separately reported.)

Description of Post-Service Work:
Facility: Apply sterile dressings. Assist with repositioning patient supine. When anesthesia has been reversed, transfer the patient to the recovery room. Write an operative note in the patient’s record. Monitor patient for abnormal neurological findings prior to discharge from recovery to the surgical floor. Sign the OR forms, including pre- and postoperative diagnosis and operations performed. Discuss procedure outcome with family. Dictate postoperative report. Dictate procedure outcome and expected recovery letter for referring physician and/or insurance company. Order and review films to check the alignment of the cervical spine. Later the same day, review nursing and other provider chart notes, assess patient neurovascular status and pain. Write orders or update orders, as necessary, for medications, diet, and patient activity. Chart patient progress notes. On subsequent days, examine the patient, check wounds and neurovascular status. Review nursing and other provider chart notes. Chart patient progress notes. Discuss (oral/written) patient progress with referring physician. Answer (oral/written) questions from patient and/or family, nursing and other staff, and insurance staff. When safe to discharge patient to home, conduct final exam, including neurovascular and pain status, write orders for follow-up visits, post-discharge laboratory tests, imaging, home care, and physical therapy. Order medications needed post-discharge. Discuss home restrictions and activity levels (ie, diet, bathing, driving, exercise) with patient/family. Complete all appropriate medical records, including day of discharge progress notes, discharge summary, discharge instructions, and insurance forms.

Office: Examine patient and perform neurological exam and pain assessment. Write orders for medications. Order and review periodic imaging, as appropriate. Monitor wounds and remove sutures and staples when appropriate. Review physical therapy progress and revise orders as needed. Dictate patient progress notes for the medical chart. Answer patient and/or family questions and insurance staff questions. Discuss (oral/written) patient progress with referring physician.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC’s rationale, please review the separate RUC recommendation document.
Background

In October 2020, the CPT Editorial Panel approved the revision of four codes describing arthrodesis, addition of two codes to report laminectomy, facetectomy, or foraminotomy during posterior interbody arthrodesis, lumbar to more appropriately identify the decompression that may be separately reported. A coding change application was created to assist with coding confusion for reporting additional decompression performed at the same interspace as a lumbar interbody fusion procedure. The coding confusion stemmed from language ("other than for decompression") included in the descriptors for codes 22630-22634. To clarify correct coding, the CCA created two new add-on codes (63052 and 63053) to report decompression when performed in conjunction with posterior interbody arthrodesis at the same interspace, along with definitions, guidelines, and parenthetical instructions. The terms corpectomy, facetectomy, foraminotomy, hemilaminectomy, lamina, laminectomy, and laminotomy were defined and editorial changes were made to several codes to consistently use the term "interspace" instead of "level" or "segment."

In January 2021, the specialty societies surveyed the two new codes and indicated the existing code changes were editorial. The RUC expressed concern that the base codes were not surveyed with the two new add-on codes. Two of the codes (22630 and 22632) are from 1995 and the other two codes were last RUC reviewed in 2011 (22633 and 22634). The RUC could not accept the specialties' justification for only surveying the new codes. They questioned how, without the base codes being surveyed, there would be assurance the respondents followed instruction to only consider the work of the add-on codes. Moreover, CMS has made it clear that the Agency expects the base codes and add-on codes to be reviewed at the same time. The RUC recommends that the entire family (CPT codes 22630, 22632, 22633, 22634, 63052, 63053) be resurveyed for review at the April 2021 RUC meeting and that interim values be established for CPT codes 63052 and 63053 for CY 2022.

Recommendation – 22633

We recommend crosswalking the work RVU of 26.80 for MPC code 55866 to 22633 to account for the slight decrease in intraoperative and total time. This value is less than the 25th percentile.

Positioning time

Additional time was added to the package time of 3 minutes for supine positioning. These patients will typically be positioned prone.

Key Reference Code Comparison

KRS1: The respondents who chose 22612 as a reference indicated the intensity/complexity of 22633 is more than 22612.

KRS2: The respondents who chose 22857 as a reference indicated the intensity/complexity of 22633 is similar to somewhat more than 22857.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☑ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☑ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☑ ☑ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☑ Multiple codes are used to maintain consistency with similar codes.
   - ☑ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. Decompression, instrumentation and/or bone preparation or harvesting, when performed, is separately reported.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 22633

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty neurosurgery How often? Commonly

Specialty orthopaedic surgery How often? Commonly
Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National data not available

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.
CPT Code: 22634

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 22634    Tracking Number: J4    Original Specialty Recommended RVU: 7.96

Global Period: ZZZ    Current Work RVU: 8.16    Presented Recommended RVU: 7.96

CPT Descriptor: Arthrodesis, combined posterior or posterolateral technique with posterior interbody technique including laminectomy and/or discectomy sufficient to prepare interspace (other than for decompression), single interspace; each additional interspace and segment (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 68-year-old female presents with severe disc degeneration with lateral listhesis of L4-L5 above a L5-S1 lytic or isthmic spondylolisthesis. She has significant low back pain that has not responded to non-operative treatment. During (separately reported) interbody arthrodesis of L4-L5, she undergoes additional interspace arthrodesis of L5-S1 via a unilateral or bilateral approach using a posterolateral technique with posterior interbody technique. (Note: This is an add-on service. Decompression, instrumentation, and/or bone preparation or harvesting, when performed, is separately reported. Only consider the additional work related to the arthrodesis of the additional L5-S1 interspace.)

Percentage of Survey Respondents who found Vignette to be Typical: 90%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0%, In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0%, Overnight stay-less than 24 hours 0%, Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: n/a

Description of Intra-Service Work: Skin, muscle, and fascia incisions are extended to provide for enough retraction to safely expose the additional interspace. The ligamentum flavum and/or scar is removed from between the laminae of the additional interspace. The laminae and medial edges of the facets are removed with bone cutting instruments to a degree sufficient to allow safe exposure of the disc space. The nerve root is carefully mobilized from adhesions and/or peridural membrane. Epidural veins are cauterized and cut. The nerve root(s) and thecal sac are protected by packing and retraction. The annulus is incised, and an ample section of it is removed by sharp dissection. The nucleus is removed within the disc space with rongeurs and curettes. Bone cutting instruments are used to remove cartilaginous and subchondral end-plates of the vertebrae above and below the disc to be fused. The bone dissection is fashioned to accept the graft in a way that will provide for contact, maintenance of disc space height, and stability. The spacer (graft and/or device) is impacted into the recipient site. When appropriate, the entire exposure, bone preparation, and spacer insertion and impaction are repeated from the other side of the table. Decortication of the posterolateral elements (transverse process, any remaining lamina, and/or facets) is undertaken, and graft material is packed posterolaterally to complete the arthrodesis preparations for the fusion. The neural elements are inspected to confirm that they are free of any impingement from the implant(s) in the canal and neuroforamen. An interposition membrane, as by fat graft, is applied over the exposed dura and nerve roots of the additional space. (Note: Decompression of neural elements instrumentation, and/or bone preparation or harvesting, when performed, are separately reported.)

Description of Post-Service Work: n/a

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC’s rationale, please review the separate RUC recommendation document.
Background

In October 2020, the CPT Editorial Panel approved the revision of four codes describing arthrodesis, addition of two codes to report laminectomy, facetectomy, or foraminotomy during posterior interbody arthrodesis, lumbar to more appropriately identify the decompression that may be separately reported. A coding change application was created to assist with coding confusion for reporting additional decompression performed at the same interspace as a lumbar interbody fusion procedure. The coding confusion stemmed from language ("other than for decompression") included in the descriptors for codes 22630-22634. To clarify correct coding, the CCA created two new add-on codes (63052 and 63053) to report decompression when performed in conjunction with posterior interbody arthrodesis at the same interspace, along with definitions, guidelines, and parenthetical instructions. The terms corpectomy, facetectomy, foraminotomy, hemilaminectomy, lamina, laminctomy, and laminotomy were defined and editorial changes were made to several codes to consistently use the term "interspace" instead of "level" or "segment."

In January 2021, the specialty societies surveyed the two new codes and indicated the existing code changes were editorial. The RUC expressed concern that the base codes were not surveyed with the two new add-on codes. Two of the codes (22630 and 22632) are from 1995 and the other two codes were last RUC reviewed in 2011 (22633 and 22634). The RUC could not accept the specialties’ justification for only surveying the new codes. They questioned how, without the base codes being surveyed, there would be assurance the respondents followed instruction to only consider the work of the add-on codes. Moreover, CMS has made it clear that the Agency expects the base codes and add-on codes to be reviewed at the same time. The RUC recommends that the entire family (CPT codes 22630, 22632, 22633, 22634, 63052, 63053) be resurveyed for review at the April 2021 RUC meeting and that interim values be established for CPT codes 63052 and 63053 for CY 2022.

Recommendation – 22634

The current value for 22634 is based on a calculation in 2011 that estimated the new add-on code was 70% of the survey 25th percentile work RVU. Although the current survey median work RVU would suggest an increase is warranted, we do not have compelling evidence for an increase. We recommend the survey 25th percentile work RVU of 7.96 to account for the slight 5 minute decrease in median intraoperative time.

Key Reference Code Comparison

KRS1: The respondents who chose 22614 as a reference indicated the intensity/complexity of 22634 is more/much more than 22614.

KRS2: The respondents who chose 22840 as a reference indicated the intensity/complexity of 22634 is more than 22840.

MPC Code Comparison

There are few MPC codes with a ZZZ global assignment which makes finding appropriate MPC codes with similar intensity/complexity difficult. MPC code 34812 (with the highest wRVU) involves open femoral artery exposure by groin incision and closure of the wound, typically for separately reported percutaneous delivery of an endovascular
prosthesis for an asymptomatic infrarenal AAA. In comparison, the lower intensity exposure and closure for the survey code are performed as part of the primary arthrodesis code.

**SERVICES REPORTED WITH MULTIPLE CPT CODES**

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
CPT Code: 22634

Multiple codes are used to maintain consistency with similar codes. Historical precedents. Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 22634

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty neurosurgery How often? Commonly
Specialty orthopaedic surgery How often? Commonly

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. national data not available

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 22634

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.
CPT Code: 63052

Tracking Number: J5

Original Specialty Recommended RVU: 5.70

Presented Recommended RVU: 5.70

RUC Recommended RVU: 5.70

CPT Descriptor: Laminectomy, facetectomy, or foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s] [eg, spinal or lateral recess stenosis]), during posterior interbody arthrodesis, lumbar; single vertebral segment (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: During (separately reported) posterior lumbar interbody arthrodesis for L4-5 spondylolisthesis with axial mechanical back pain and worsening neurogenic claudication and/or radiculopathy (extremity symptoms), refractory to nonoperative treatment, a 63-year-old female with advanced imaging that demonstrated central canal and bilateral lateral recess and foraminal stenosis at the L4-5 level, requires bilateral laminectomy with extensive decompression of the cauda equina and/or nerve root[s]. This more extensive decompression is beyond the typical dissection needed to complete the interbody arthrodesis approach and intervention. (Note: This is an add-on service. Only consider the additional work related to bilateral laminectomy with decompression of the cauda equina and/or nerve root[s].)

Percentage of Survey Respondents who found Vignette to be Typical: 99%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: n/a

Description of Intra-Service Work: Following bony and soft tissue resection and exposure of the L4-5 disc space for the interbody access and preparation for interbody arthrodesis, attention is turned to the additional bone and nervous system work required for decompression beyond what is required to access the disc space for the interbody arthrodesis. Additional portions of the laminae at the L4 and L5 vertebral segments are removed with a drill or bone biting instruments, and the inferior and superior facets are resected. The neural foraminae are expanded with bone biting instruments. The ligamentum flavum is dissected off the dura and completely removed, decompressing and mobilizing the neural elements. The neural elements are confirmed to be mobilized and decompressed. The additional intraoperative work is documented in the medical record.

Description of Post-Service Work: n/a

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC’s rationale, please review the separate RUC recommendation document.

Background

In October 2020, the CPT Editorial Panel approved the revision of four codes describing arthrodesis, addition of two codes to report laminectomy, facetectomy, or foraminotomy during posterior interbody arthrodesis, lumbar to more
appropriately identify the decompression that may be separately reported. A coding change application was created to
assist with coding confusion for reporting additional decompression performed at the same interspace as a lumbar
interbody fusion procedure. The coding confusion stemmed from language ("other than for decompression") included in
the descriptors for codes 22630-22634. To clarify correct coding, the CCA created two new add-on codes (63052 and
63053) to report decompression when performed in conjunction with posterior interbody arthrodesis at the same
interspace, along with definitions, guidelines, and parenthetical instructions. The terms corpectomy, facetectomy,
foraminotomy, hemilaminectomy, lamina, laminectomy, and laminotomy were defined and editorial changes were made
to several codes to consistently use the term "interspace" instead of "level" or "segment."

In January 2021, the specialty societies surveyed the two new codes and indicated the existing code changes were
editorial. The RUC expressed concern that the base codes were not surveyed with the two new add-on codes. Two of the
codes (22630 and 22632) are from 1995 and the other two codes were last RUC reviewed in 2011 (22633 and 22634).
The RUC could not accept the specialties’ justification for only surveying the new codes. They questioned how, without
the base codes being surveyed, there would be assurance the respondents followed instruction to only consider the work
of the add-on codes. Moreover, CMS has made it clear that the Agency expects the base codes and add-on codes to be
reviewed at the same time. The RUC recommends that the entire family (CPT codes 22630, 22632, 22633, 22634,
63052, 63053) be resurveyed for review at the April 2021 RUC meeting and that interim values be established for CPT
codes 63052 and 63053 for CY 2022.

Recommendation – 63052

We recommend a work RVU of 5.70 (survey 25th percentile) and total time of 45 minutes. This RVW is higher than the
interim recommendation of 5.55 which was the prior survey 25th percentile for a total time of 40 minutes.

Rationale: The RUC previously accepted the survey 25th percentile as interim, but believed the survey was flawed
because the add-on codes were not surveyed in conjunction with the base codes. This new survey included all six codes.
In addition, the overall experience of the survey respondents is greater for the new survey of 6 codes when compared to
the prior survey of the add on codes (ie, although the median is still 50, there is a shift to the right).

Key Reference Code Comparison

KRS1: The respondents who chose 22840 as a reference indicated the intensity/complexity of 63052 is more/much more
than 22840.

KRS2: The respondents who chose 22208 as a reference indicated the intensity/complexity of 63052 is overall similar to
22208.

MPC Code Comparison

There are few MPC codes with a ZZZ global assignment which makes finding appropriate MPC codes with similar
intensity/complexity difficult. MPC code 34812 (with the highest wRVU) involves open femoral artery exposure by
groin incision and closure of the wound, typically for separately reported percutaneous delivery of an endovascular
prosthesis for an asymptomatic infrarenal AAA. In comparison, the lower intensity exposure and closure for the survey
code are performed as part of the primary arthrodesis code.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☑ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION
How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) There has been no reporting mechanism for this work since 2015. Please see supplemental file with an historical reporting overview.

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty neurosurgery How often? Sometimes
Specialty orthopaedic surgery How often? Sometimes
Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National data not available

Do many physicians perform this service across the United States? Yes

Berenson-Eggers Type of Service (BETOS) Assignment
Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Explor/Decompr/Excis disc

Professional Liability Insurance Information (PLI)
If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 63066
CPT Code: 63053

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 63053
Tracking Number J6
Original Specialty Recommended RVU: 5.00
Presented Recommended RVU: 5.00
Global Period: ZZZ
Current Work RVU:
RUC Recommended RVU: 5.00

CPT Descriptor: Laminectomy, facetectomy, or foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s] [eg, spinal or lateral recess stenosis]), during posterior interbody arthrodesis, lumbar; each additional segment (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: During (separately reported) posterior lumbar interbody arthrodesis for L4-5 and L5-S1 spondylolisthesis with axial mechanical back pain and worsening neurogenic claudication and/or radiculopathy (extremity symptoms), refractory to nonoperative treatment, a 68-year-old male with advanced imaging that demonstrated central canal and bilateral lateral recess and foraminal stenosis at the L4-5 and L5-S1 levels requires bilateral laminectomy with extensive decompression of the cauda equina and/or nerve root[s]. This more extensive decompression is beyond the typical dissection needed to complete the interbody arthrodesis approach and intervention at each level. The first segment laminectomy has been completed (separately reported) and now the additional segment is addressed. (Note: This is an add-on service. Only consider the additional work related to bilateral laminectomy with decompression of the cauda equina and/or nerve root[s] of the additional segment.)

Percentage of Survey Respondents who found Vignette to be Typical: 97%

Site of Service (Complete for 010 and 090 Global Only)
Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%
Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%
Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: n/a

Description of Intra-Service Work: After (separately reported) bony and soft tissue resection and exposure of the L4-L5 and L5-S1 disc spaces for the interbody access and preparation for arthrodesis is completed, along with the (separately reported) decompression of neural elements at the L4-L5 interspace, attention is turned to the additional bone and nervous system work required for decompression of the L5-S1 interspace beyond what is required to access the disc space for the interbody arthrodesis. Additional portions of the laminae at the L5 and S1 vertebral segments are removed with the drill or bone biting instruments, and the inferior and superior facets are resected. The neural foraminae are expanded with bone biting instruments. The ligamentum flavum is dissected off the dura and completely removed, allowing for decompression and mobilization of the neural elements are mobilized. The neural elements are confirmed to be mobilized and decompressed. The additional intraoperative work is documented in the medical record.

Description of Post-Service Work: n/a

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC’s rationale, please review the separate RUC recommendation document.
Background

In October 2020, the CPT Editorial Panel approved the revision of four codes describing arthrodesis, addition of two codes to report laminectomy, facetectomy, or foraminotomy during posterior interbody arthrodesis, lumbar to more appropriately identify the decompression that may be separately reported. A coding change application was created to assist with coding confusion for reporting additional decompression performed at the same interspace as a lumbar interbody fusion procedure. The coding confusion stemmed from language ("other than for decompression") included in the descriptors for codes 22630-22634. To clarify correct coding, the CCA created two new add-on codes (63052 and 63053) to report decompression when performed in conjunction with posterior interbody arthrodesis at the same interspace, along with definitions, guidelines, and parenthetical instructions. The terms corpectomy, facetectomy, foraminotomy, hemilaminectomy, lamina, laminectomy, and laminotomy were defined and editorial changes were made to several codes to consistently use the term "interspace" instead of "level" or "segment."

In January 2021, the specialty societies surveyed the two new codes and indicated the existing code changes were editorial. The RUC expressed concern that the base codes were not surveyed with the two new add-on codes. Two of the codes (22630 and 22632) are from 1995 and the other two codes were last RUC reviewed in 2011 (22633 and 22634). The RUC could not accept the specialties’ justification for only surveying the new codes. They questioned how, without the base codes being surveyed, there would be assurance the respondents followed instruction to only consider the work of the add-on codes. Moreover, CMS has made it clear that the Agency expects the base codes and add-on codes to be reviewed at the same time. The RUC recommends that the entire family (CPT codes 22630, 22632, 22633, 22634, 63052, 63053) be resurveyed for review at the April 2021 RUC meeting and that interim values be established for CPT codes 63052 and 63053 for CY 2022.

Recommendation – 63053

We recommend a work RVU of 5.00 (survey 25th percentile) and total time of 40 minutes. This RVW is higher than the interim recommendation of 4.44 which was crosswalked to code 33572 with total time = 30 minutes).

Rationale: The RUC previously crosswalked a value that was less than the survey 25th percentile based on total time as interim, but believed the survey was flawed because the add-on codes were not surveyed in conjunction with the base codes. This new survey included all six codes. In addition, the overall experience of the survey respondents is greater for the new survey of 6 codes when compared to the prior survey of the add on codes (ie, the 25th pctl, median, 75th pctl, and max 12-month experience is all greater). The new survey, which included all codes, elicited a time that is only 5 minutes less than the work related to 63052 and that we believe is a more accurate reflection of the difference in work between laminectomy/facetectomy/foraminotomy with decompression of the first segment and of an additional segment.

Key Reference Code Comparison

KRS1: The respondents who chose 22614 as a reference indicated the intensity/complexity of 63053 is more than 22614.

KRS2: The respondents who chose 22840 as a reference indicated the intensity/complexity of 63053 is more/much more than 22840.

There are few MPC codes with a ZZZ global assignment which makes finding appropriate MPC codes with similar intensity/complexity difficult. MPC code 34812 (with the highest wRVU) involves open femoral artery exposure by groin incision and closure of the wound, typically for separately reported percutaneous delivery of an endovascular prosthesis for an asymptomatic infrarenal AAA. In comparison, the lower intensity exposure and closure for the survey code are performed as part of the primary arthrodesis code.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the
CPT Code: 63053

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) There has been no reporting mechanism for this work since 2015. Please see supplemental file with an historical reporting overview.

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty neurosurgery How often? Sometimes
Specialty orthopaedic surgery How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate.

+63052 and +63053: Historical Reporting Overview

**Coding History**

**In the 1990's**, the work for arthrodesis and decompression was typically performed jointly by an orthopedic surgeon who would perform the arthrodesis and a neurosurgeon who would perform the decompression. Perhaps the single most important aspect of this coding was that the decompression and arthrodesis was being coded at the same spinal level. The codes were surveyed in that manner, and wRVUs were based on each surgeon's work.

**In 1998**, an AMA CPT workgroup that convened to discuss reporting correct coding for spine procedures via an anterior approach, also reviewed the lumbar interbody fusion code (22630) and decompression code (63047) and determined that each code may be separately and discretely performed and that there was no overlap in intra-service work. The workgroup also agreed that each code was valued based on the specific work of each code (ie, interbody fusion versus decompression). For CPT 2000, the CPT Panel introduced language into code 22630 which made this point clear: “minimal laminectomy and/or discectomy to prepare the interspace.” The spirit of that language continues to this day in the parenthetical “other than for decompression.” That particular position was reinforced in the January 2001 *CPT Assistant* where a case illustration of a patient requiring a decompression and an interbody fusion was presented and the statement made, “63047-51 should be reported in addition to the code 22630.”

**In 2012**, in recognition that posterolateral fusions were commonly performed along with interbody fusions, a new bundled code (22633) was established to include the work of interbody fusions (22630) and posterolateral fusions (22612) being bundled together into 22633. It is important to note that the decompression element of the operation (63047) remained a separate entity as intended by the initial valuation of that code and the inclusion of ("other than for decompression") in the code descriptor.

**In 2014**, confusion, both at education seminars and in print, about correct coding of the additional work of laminectomy persisted, with societies not agreeing on appropriate coding for the additional work of decompression performed concurrently with interbody fusion.

**In January 2015**, due to misinformed educational materials, CMS took a drastic departure from the application of the CPT codes that had been in place for decades; specifically, the evolution of the codes, the validated surveys for each of the separate codes, and valuation of separate work, by establishing NCCI edits: "CMS payment policy does not allow separate payment for CPT codes 63042 (laminotomy...; lumbar) or 63047 (laminectomy...; lumbar) with CPT codes 22630 or 22633 (arthrodesis; lumbar) when performed at the same interspace. If the two procedures are performed at different interspaces, the two codes of an edit pair may be reported with modifier 59 appended to CPT code 63042 or 63047." [Chapter 4 of the NCCI manual]

**In September 2015**, the stakeholder societies conducted discussions with NCCI (CMS) about the history and valuation of codes 22630-22634. NCCI staff communicated that CMS had no intention to modify its position on these code pairs and instead recommended proposing an add-on code for use with arthrodesis codes that would describe additional decompression when performed.
After the coding changes for CPT 2000, the following CPT Assistant article was published that describes correct reporting of 22630 and 63047 for the same interspace.

January 2001 page 12
Coding Consultation
Musculoskeletal System, Surgery, 22554, 22630, 63001-63048, 63075-63078 (Q&A)

**Question:** The descriptors of codes 22554 and 22630 describe anterior (22554) or posterior (22630) interbody technique arthrodeses to include laminectomy, and/or discectomy to prepare the interspace (other than for decompression). In what procedural circumstance would the 63001-63048 code(s) be reported in addition to code 22630? Similarly, in what procedural circumstance would code(s) 63075-63078 be reported in addition to code 22554?

**AMA Comment**

For both codes 22554 and 22630...
To report code 22554...
To report code 22630, *Arthrodesis, posterior interbody technique, including laminectomy and/or discectomy to prepare interspace (other than for decompression), single interspace; lumbar,* in addition to code 63047-51, *Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; lumbar,* again additional procedure(s) must have been performed. For example, in spinal procedures performed on patients having lateral lumbar stenosis, the surgeon may need to perform additional work above and beyond that described by the PLIF, including facetectomy(ies) and/or foraminotomy(ies), to adequately decompress the nerve roots. For the purpose of this example, code 63047-51 should be reported in addition to code 22630.

*Regarding the issue of laterality...*
To further clarify, code 22630 may also require the additional performance of a posterior fusion, which involves bone grafting and placement of posterior instrumentation. These procedures should be additionally reported. If the surgeon uses a threaded bone dowel or prosthetic device in the disk space, then code +22851 should be reported. If any other type of bone graft is performed, the appropriate bone graft code should be reported.

The anterior fusion procedure described by code 22554...

In 2016, AMA CPTA staff drafted a FAQ based on the NCCI edit that was established. The stakeholder societies were not contacted about this FAQ. If we had been contacted, we would have informed AMA staff that we were in the process of discussions with CMS about coding misinformation.

October 2016 page 11
Frequently Asked Questions: Surgery: Nervous System

**Question:** The procedures described in code 63047 was performed for decompression, which was documented in the operative note. In addition, the procedure described in code 22633 was also performed at the same interspace. How should this be reported?

**Answer:** Codes 63047 and 22633 cannot be reported for the same interspace. However, it is appropriate to report codes 63047, Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; lumbar, and 22633, *Arthrodesis, combined posterior or posterolateral technique with posterior interbody technique including laminectomy and/or discectomy sufficient to prepare interspace (other than for decompression), single interspace and segment; lumbar,* if the two procedures are performed at different interspaces. Modifier 59, Distinct Procedural Service, should be appended to indicate that these are two distinct procedures.
The October 2016 FAQ added considerable coding confusion and after much effort by the stakeholder societies, including presentation of the historical information in this document, CPTA published a coding correction.

May 2018 page 9
Coding Correction: Reporting Codes 22633 and 63047

In the Frequently Asked Questions (FAQ) section (page 11) of the October 2016 issue of CPT® Assistant, the Surgery: Nervous System answer incorrectly stated that codes 22633, Arthrodesis, combined posterior or posterolateral technique with posterior interbody technique including laminectomy and/or discectomy sufficient to prepare interspace (other than for decompression), single interspace and segment; lumbar, and 63047, Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; lumbar, may not be reported for the same interspace. On further analysis of this issue, it was demonstrated that this recommendation was inconsistent with previously published CPT® Assistant advice, which is that codes 22633 and 63047 may be reported for the same interspace when additional work is required to complete a decompression at a single spinal level. It is also appropriate to report codes 22633 and 63047, if the two procedures are performed at different interspaces. Modifier 59, Distinct Procedural Service, should then be appended to indicate that these are two distinct procedures.

This correction aligns the coding advice with historical precedent published prior to the incorrect revisions in advice given in the October 2016 FAQ.

The following is the corrected coding advice:

Surgery: Nervous System

Question: The procedure described in code 63047 was performed for decompression, which was documented in the operative note. In addition, the procedure described in code 22633 was also performed at the same interspace. How should this be reported?

Answer: Codes 22633 and 63047 may be reported for the same interspace when additional work is required to complete a decompression at a single spinal level. It is also appropriate to report codes 22633 and 63047, if the two procedures are performed at different interspaces. Modifier 59, Distinct Procedural Service, should then be appended to indicate that these are two distinct procedures.

We appreciate that CPT recognized and corrected an errant FAQ.

Summary

Since the establishment of the CCI edits in 2015, surgeons have not been allowed to report 63047 with 22630-22634 for the same interspace. This document is meant to explain why the current utilization for decompression at the same interspace is "zero."

The new add-on codes respond to CMS's direction (via NCCI correspondence) that recommends establishing an add-on code for use with arthrodesis codes that would describe additional decompression when performed.

In addition to creation of the add-on codes, numerous new definitions and two instructional guidelines specify when 63052 and 63053 correctly apply:

Decompression performed on the same vertebral segment(s) and/or interspace[s] as posterior lumbar interbody fusion that includes laminectomy, facetectomy, and/or foraminotomy may be separately reported using 630XX, 630X1.

Decompression solely to prepare the interspace for fusion is not separately reported.
**ISSUE:** Arthrodesis Decompression

the selection of reference code(s) here (for service reviewed prior to the implementation of clinical activity codes, detail is not provided in the RUC database, please contact Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org for PE spreadsheets for your reference codes):

Current codes were used as references

3. Is this code(s) typically reported with an E/M service?
   no

4. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time:
   n/a

5. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies for the code family, please provide compelling evidence (please see PE compelling evidence guidelines) Please explain if the increase can be entirely accounted for because of an increase in physician time:
   For code 22630, an exam light has been added for one visit at which the surgical wounds will be assessed and drain and suture/staple removal will occur.

6. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (please see second worksheet in PE spreadsheet workbook), please explain the difference here:
   n/a

7. Please provide a brief description of the clinical staff work for the following:
   a. Pre-Service period:
      Complete pre-service diagnostic and referral forms
      Coordinator pre-service diagnostic and referral forms
      Coordinate pre-surgery services (including test results)
      Schedule space and equipment in facility
      Provide pre-service education/obtain consent
      Complete pre-procedure phone calls and prescription
      Staff reviews all forms with patient and family to ensure all relevant history and diagnostic information is included.
      Staff coordinates collection and documentation of imaging/lab results, patient specific information and other relevant patient information for surgical procedure including conducting requisite pre-surgery assessment with anesthesiologist. Enter and record all clinical updates in EHR.
      Staff interacts with facility to schedule space, supplies, equipment, and review checklists.
      Staff reviews procedure, complication risk, process of recovery, and answers patient/family questions.
      Staff reviews preoperative medication changes, reviews patient medical status and answers final pre-admission questions.
   b. Service period (includes pre, intra and post):
      Prior to discharge, office clinical staff will assist with necessary post-discharge care coordination, such as: Responding to patient/family questions about home activity restrictions and care of drains. Confirmation of discharge antibiotics if needed, and pain medication. Coordination with other physicians and QHPs involved in the care of the patient for transfer of records. Transitioning discharge information to the surgeon's office medical record, including medication list, correspondence and imaging or lab results pending at discharge.
   c. Post-service period:
      The clinical staff work includes the standard activities involved in any E/M visit including ensuring the appropriate
supplies are available in the room, ensuring imaging and lab reports are available, rooming the patient, gowning, reviewing current medications/allergies in EHR, obtaining vital signs, assisting with wound care, coordination of care, and cleaning of the room.

8. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (please see second worksheet in PE spreadsheet workbook):

n/a

9. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov.

n/a

INVOICES

10. □ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

11. □ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

12. If you wish to include a supply that is not on the list (please see fourth worksheet in PE spreadsheet workbook) please provide a paid invoice. Identify and explain the invoice here:

n/a

13. Are you recommending a PE supply pack for this recommendation? Yes or No.
   If Yes, please indicate if the pack is an established package of supplies as defined by CMS (eg, SA047 pack, E/M visit) or a pack that is commercially available?

   yes, SA048 and SA053

14. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation. Please include the description, CMS supply code, unit, item quantity and unit price (if available). See documents two and three under PE reference materials on the RUC Collaboration Website for information on the contents of kits, packs and trays.

15. If you wish to include an equipment item that is not on the list (please see fifth worksheet in PE spreadsheet workbook) please provide a paid invoice and the useful life. Identify and explain the invoice here:

n/a

16. Have you recommended equipment minutes for a computer or equivalent laptop/integrated computer, equipment item computer, desktop, w-monitor, ED021 or notebook (Dell Latitute D600), ED038?
   a. If yes, please explain how the computer is used for this service(s).
   b. Is the computer used exclusively as an integral component of the service or is it also used for other purposes not specific to the code?
   c. Does the computer include code specific software that is typically used to provide the service(s)?

n/a

17. List all the equipment included in your recommendation and the equipment formula chosen (please see document titled Calculating equipment time). If you have selected “other formula” for any of the equipment please explain here:

EF 031 table, power – required for all postop office visits
EQ168 light, exam – required for one postop office visit

18. If there is any other item(s) on your spreadsheet not covered in the categories above that require greater detail/explanation, please include here:

n/a

PROFESSIONAL LIABILITY INSURANCE (PLI) INFORMATION

19. If this is a PE only code please select a crosswalk based on a similar specialty mix:

n/a
ITEMIZED LIST OF CHANGES (FOLLOWING THE PE SUBCOMMITTEE MEETING)

During and immediately following the review of this tab at the PE Subcommittee meeting please revise the summary of recommendation (PE SOR) based on modifications made during the meeting. Please submit the revised form electronically to Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org immediately following the close of business the same day that the tab is reviewed. On the PE spreadsheet, please highlight the cells and/or use red font to show the changes made during the PE Subcommittee meeting (if you have provided any of this highlighting based on changes from the reference code prior to the PE Subcommittee meeting please remove it, so not to be confused with changes made during the meeting). In addition to those revisions please also provide an itemized list of the modifications made to the PE spreadsheet during the PE Subcommittee meeting in the space below (e.g. clinical activity CA010 obtain vital signs was reduced from 5 minutes to 3 minutes).

NOTE: The virtual meetings have provided for real-time updates to the PE spreadsheets. PE SORs must still be updated and resubmitted asap.

In October 2020, the CPT Editorial Panel created a new code to report drug induced sleep endoscopy (DISE) flexible, diagnostic. At the January 2021 RUC Meeting, the RUC requested that this service be resurveyed for the April 2021 RUC Meeting using a standard 000-day survey template.

42975 Drug induced sleep endoscopy, with dynamic evaluation of velum, pharynx, tongue base, and larynx for evaluation of sleep disordered breathing, flexible, diagnostic

The RUC reviewed the survey results from 89 otolaryngologists for CPT code 42975 and determined that the survey 25th percentile work RVU of 1.95 appropriately accounts for the physician work required to perform this service. The RUC recommends 18 minutes of pre-service evaluation time, 1 minute of pre-service positioning time, 6 minutes of pre-service scrub/dress/wait time, 15 minutes of intra-service time, and 10 minutes of immediate post-service time, and 50 minutes of total time for CPT code 42975. The specialty society noted that this procedure involves endoscopic evaluation of the upper airway for sleep apnea from the tip of the nose down to the larynx to identify the type and location of the airway obstruction and to determine specific maneuvers that would alleviate the obstruction and the effect that interventions have on the collapse. The specialty society noted that the sedation involved in this procedure mimics the conditions of sleep and that the accompanying muscle and tissue collapse of the airway make endoscopic visualization more difficult.

The RUC compared CPT code 42975 to the top key reference service CPT code 31579 Laryngoscopy, flexible or rigid telescopic, with stroboscopy (work RVU = 1.88, 10 minutes intra-service and 34 minutes of total time) and noted that 80 percent of survey respondents determined 42975 to be more complex than key reference service 31579 and that the recommended intra-service time and total time for 42975 support a work RVU of 1.95 in appropriate rank order compared with 31579.

The RUC also compared the survey code with CPT code 62321 Injection(s), of diagnostic or therapeutic substance(s) (eg, anesthetic, antispasmodic, opioid, steroid, other solution), not including neurolytic substances, including needle or catheter placement, interlaminar epidural or subarachnoid, cervical or thoracic; with imaging guidance (ie, fluoroscopy or CT) (work RVU = 1.95, 15 minutes of intra-service and 45 minutes of total time), MPC code 64483 Injection(s), anesthetic agent(s) and/or steroid; transformamal epidural, with imaging guidance (fluoroscopy or CT), lumbar or sacral, single level (work RVU = 1.90, 15 minutes of intra-service and 49 minutes of total time), and CPT code 36555 Insertion of non-tunneled centrally inserted central venous catheter; younger than 5 years of age (work RVU = 1.93, 15 minutes of intra-service and 48 minutes of total time) and noted that the recommended total time and work RVU fits appropriately within this range of codes. The RUC recommends a work RVU of 1.95 for CPT code 42975.

Practice Expense
The Practice Expense Subcommittee affirmed the practice expense inputs from the January 2021 RUC meeting. The RUC recommends the direct practice expense inputs as submitted by the specialty society.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code: 42975

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 42975  Tracking Number  Original Specialty Recommended RVU: 1.95
Global Period: 000  Current Work RVU:  Presented Recommended RVU: 1.95
RUC Recommended RVU: 1.95

CPT Descriptor: Drug induced sleep endoscopy; with dynamic evaluation of velum, pharynx, tongue base, and larynx for evaluation of sleep disordered breathing; flexible, diagnostic

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 45-year old male with moderate to severe obstructive sleep apnea has been unable to tolerate positive airway pressure therapy, sleep endoscopy is performed to identify anatomic and physiologic factors contributing to his obstructive sleep apnea and the selection of non-continuous positive airway pressure (cpap) treatment options

Percentage of Survey Respondents who found Vignette to be Typical: 87%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0%, In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0%, Overnight stay-less than 24 hours 0%, Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Meet with patients and family to describe and discuss in detail the planned procedure. Review and update the medical history. Perform a current physical exam. Reconcile medications and allergies. Address NPO status and timing. Discuss the patient's expected convalescence and educate the patient and caregivers regarding the signs and symptoms of the most common complications. Discussion with the anesthesiologist regarding the level of sedation required and the approximate length of the case. Review and obtain informed consent. The availability of all required instruments and supplies is verified. A timeout is performed with entire surgical team, including confirmation of the procedure, locations, allergies, antibiotic prophylaxis, anesthesia and fire risks, expected duration, and any concerns related to the procedure. The patient is positioned. The surgeon scrubs, gowns and preps the patient for the procedure.

Description of Intra-Service Work: The nasal passages are prepared with application of a decongestant and/or topical anesthesia. Light intravenous sedation is given, which typically is provided by a separate provider, to a point where the patient is non-responsive to verbal stimuli, has snoring or partial upper airway flow limitation, and observed oxygen desaturations. The performing physician then places a flexible endoscope through the nose and advances it to the pharynx. Endoscopic evaluation of the nasopharynx, oropharynx, hypopharynx, and larynx is performed during sleep or sedation over multiple cycles of airway narrowing and/or obstruction. The velopharynx is the term for the distal (no muscular) component of the soft palate and uvula. This is the predominant site of upper pharyngeal collapse. The physician will note the anatomic site of obstruction (velopharynx, oropharynx, tongue, epiglottis), the severity of the obstruction (non, partial, complete), and pattern of obstruction (anteroposterior, circular, lateral).The physician then repositions the patient and/or performs manipulation of the head and neck and repeat endoscopy to determine effect of body position (supine versus lateral); jaw lift, tongue protrusion, or hyoid lift on airway obstruction. A patient’s existing oral appliance (mandibular advancement device) is placed and titrated to optimal effect. In certain cases, a continuous positive airway pressure (CPAP) mask may be applied to determine sites on ongoing obstruction in regular CPAP users who fail to improve with CPAP therapy.

Description of Post-Service Work: The patient is observed during emergence from anesthesia. The procedure is dictated. Discharge medications are reconciled. The prescription drug monitoring database is reviewed. Postoperative orders,
medications and instructions are written. There is a discussion with the family and patient regarding the procedure and findings. There is reiteration of the convalescence, precautions, follow up appointments, expected postoperative course, signs and symptoms of complications, and review of the written postoperative instructions. Instructions, appropriate discharge timing, follow up, and precautions are discussed with the postoperative nursing team.

</tr>
</tbody>
</table>

CPT Descriptor 2 Injection(s), anesthetic agent and/or steroid, transforaminal epidural, with imaging guidance (fluoroscopy or CT); lumbar or sacral, single level

**RELATIONSHIP OF CODE BEING REVIEWED TO TOP TWO KEY REFERENCE SERVICES:**

CPT Descriptor Injection(s), of diagnostic or therapeutic substance(s) (eg, anesthetic, antispasmodic, opioid, steroid, other solution), not including neurolytic substances, including needle or catheter placement, interlaminar epidural or subarachnoid, cervical or thoracic; with imaging guidance (ie, fluoroscopy or CT)
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by percent distribution) of the service you are rating to the top two chosen key reference services listed above. Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.

### Number of respondents who choose Top Key Reference Code: 30  % of respondents: 33.7 %

### Number of respondents who choose 2nd Key Reference Code: 12  % of respondents: 13.4 %

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC’s rationale, please review the separate RUC recommendation document.

Background:
In October 2020, the Academy brought forward a Code Change Application requesting new code 42975. The Panel approved the CCA and the code is now being valued by the RUC. The new code will be published in the 2022 edition of the CPT Book. The new code was then surveyed for the January 2021 RUC meeting using the 000 global template with a visit. During the January RUC meeting, it was noted that the specialty should not have been able to use the 000 template with a visit, and the RUC voted to require AAO-HNS to resurvey the code for the April 2021 meeting.

**Survey Sample and Process:**

A survey request was sent to a targeted, random selection of 3963 members from the American Academy of Otolaryngology – Head and Neck Surgery who self-designated as one or more of the following sub-specialties: General Otolaryngology, Sleep Medicine, or Pediatric Otolaryngology.

**Recommendation (Work and Intra Time):**

We are recommending a work RVU of **1.95 and 15 minutes of intra service time**, based on our survey’s 25th percentile RVW.

**Time package selection:** We have selected pre-time package 2 and post-time package 8B due to this procedure currently being done predominantly in the hospital outpatient setting using conscious sedation.

**Pre-time Package 2 Difficult Patient / Straightforward Procedure (No anesthesia care)**

Evaluation Time – We are recommending 18 minutes of evaluation time which is one minute less than our median survey time, but identical to the pre-service package time.

Positioning Time – We are recommending 1 minute of positioning time which is a decrease of 4 minutes from the median survey time, but consistent with the pre-service package time for this activity.

Scrub, Dress, Wait Time – We are recommending 6 minutes of scrub, dress and wait time which is a decrease of one minute from the median survey time, but consistent with the pre-service package time for this activity.

*This results in a total recommended pre time of 25 minutes, taking the lesser of surveyed time or the pre-service package time.*

**Post-time Package 8B IV Sedation/ Complex Procedure**

Our recommended post time is 10 minutes consistent with the survey’s immediate post time of 10 minutes indicated by respondents. This is 18 minutes less than the post-package time, but consistent with our survey results for post work.

**SERVICES REPORTED WITH MULTIPLE CPT CODES**

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)
The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
Multiple codes allow flexibility to describe exactly what components the procedure included.
Multiple codes are used to maintain consistency with similar codes.
Historical precedents.
Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. N/A

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 31599

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

<table>
<thead>
<tr>
<th>Specialty</th>
<th>How often?</th>
</tr>
</thead>

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

Our specialty formed a panel of experts to develop practice expense recommendations for this family of codes. The panel was comprised of our RUC Advisor and multiple clinical experts who practice in the areas of general otolaryngology, sleep medicine and pediatric otolaryngology. The expert panel members also practice across in settings that vary by size, geography, and represent both private and academic settings.

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code, but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here (for service reviewed prior to the implementation of clinical activity codes, detail is not provided in the RUC database, please contact Samantha Ashley at samantha.ashley@ama-assn.org for PE spreadsheets for your reference codes):

42975 is a new CPT code, therefore, reference code 31576 was selected. The reference code was chosen based on the fact that it was recently valued by the RUC by our specialty, and is also a 000 global service that is typically performed in the hospital outpatient setting.

3. Is this code(s) typically reported with an E/M service?

No, however, a discharge management visit is typical based on the typical site of service being the hospital.

4. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time:

We are recommending clinical staff pre-time above the standard for 000 globals of 0 minutes. This represents extensive use of clinical staff per the PE Subcommittee standards and is consistent with the PE approved in the January 2017 and January 2020 for otolaryngology services typically performed in the hospital setting. The rationale for this time is that staff are essential to scheduling, and completing paperwork necessary, to schedule these procedures in the facility setting. The recommendation for the new code is consistent with these recommendations and includes the standard time for clinical staff activities for endoscopy procedures time in the pre-service.
5. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies for the code family, please provide compelling evidence (please see PE compelling evidence guidelines) Please explain if the increase can be entirely accounted for because of an increase in physician time:

N/A, this is a new code. No new inputs are being requested / invoices provided.

6. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (please see second worksheet in PE spreadsheet workbook), please explain the difference here:

N/A

7. Please provide a brief description of the clinical staff work for the following:
   a. Pre-Service period:

   During the pre-service period the clinical staff are conducting the typical activities for endoscopy procedures, when performed in the facility setting. Those include:
   - Completing pre-service diagnostic and referral forms
   - Coordinating pre-surgery services (including test results, medical evaluations)
   - Scheduling the space and equipment in the facility
   - Providing pre-service education and obtaining consent
   - Completing pre-procedure phone calls and prescriptions

   b. Service period (includes pre, intra and post):
   - There are no clinical staff activities during the service period.

   c. Post-service period:

   During the post-service period the clinical staff call the patient to check in and see how they’re doing post-procedure. They also inquire about use of CPAP post procedure.

8. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (please see second worksheet in PE spreadsheet workbook):

N/A

9. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov.

N/A

INVOICES

10. ☐ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

11. ☐ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

12. If you wish to include a supply that is not on the list (please see fourth worksheet in PE spreadsheet workbook) please provide a paid invoice. Identify and explain the invoice here:

No supplies, only making facility recommendations at this time.
13. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation. Please include the description, CMS supply code, unit, item quantity and unit price (if available). See documents two and three under PE reference materials on the RUC Collaboration Website for information on the contents of kits, packs and trays.

No supplies, only making facility recommendations at this time.

14. If you wish to include an equipment item that is not on the list (please see fifth worksheet in PE spreadsheet workbook) please provide a paid invoice. Identify and explain the invoice here:

No equipment, only making facility recommendations at this time.

15. Have you recommended equipment minutes for a computer or equivalent laptop/integrated computer, equipment item computer, desktop, w-monitor, ED021 or notebook (Dell Latitude D600), ED038?
   a. If yes, please explain how the computer is used for this service(s).
   b. Is the computer used exclusively as an integral component of the service or is it also used for other purposes not specific to the code?
   c. Does the computer include code specific software that is typically used to provide the service(s)?

N/A

16. List all the equipment included in your recommendation and the equipment formula chosen (please see document titled Calculating equipment time). If you have selected “other formula” for any of the equipment please explain here:

No equipment, only making facility recommendations at this time.

17. If there is any other item(s) on your spreadsheet not covered in the categories above that require greater detail/explanation, please include here:

N/A

PROFESSIONAL LIABILITY INSURANCE (PLI) INFORMATION

18. If this is a PE only code please select a crosswalk based on a similar specialty mix:

N/A

ITEMIZED LIST OF CHANGES (FOLLOWING THE PE SUBCOMMITTEE MEETING)

During and immediately following the review of this tab at the PE Subcommittee meeting please revise the PE spreadsheet and summary of recommendation (PE SOR) documents based on modifications made during the meeting. Please submit the revised documents electronically to Samantha Ashley at samantha.ashley@ama-assn.org immediately following the close of business the same day that the tab is reviewed. On the PE spreadsheet, please highlight the cells and/or use red font to show the changes made during the PE Subcommittee meeting (if you have provided any of this highlighting based on changes from the reference code prior to the PE Subcommittee meeting please remove it, so not to be confused with changes made during the meeting). In addition to those revisions please also provide an itemized list of the modifications made to the PE spreadsheet during the PE Subcommittee meeting in the space below (e.g. clinical activity CA010 obtain vital signs was reduced from 5 minutes to 3 minutes).
N/A new code.

Transcutaneous Passive Implant-Temporal Bone – Tab 6

In October 2020, the CPT Editorial Panel revised two codes to replace “temporal bone” with “skull” and delete “or transcutaneous” and “cochlear stimulator: without mastoidectomy” from the descriptors. The Panel also replaced two codes for mastoidectomy with new codes for magnetic transcutaneous attachment to external speech processor. Additional revisions and codes were added to differentiate implantation, removal, and replacement of the implants.

At the January 2021 RUC Meeting, the RUC reviewed these services and determined that they need to be resurveyed for the April 2021 RUC Meeting with a revised Reference Service List (RSL) to encompass a larger range of relative values, specifically the lower end of the RVU spectrum. The specialty society submitted a letter to the RUC requesting that this service be referred to CPT in May 2021 to clarify the percutaneous implant removal by describing the procedure as removal of the entire implant, add a parenthetical to report removal of the abutment alone to be an included component of the evaluation and management visit and to bifurcate the transcutaneous codes into placement within the mastoid and/or resulting in removal of less than 100 mm² surface area of cranium beyond its outer cortex versus those that are placed outside of the mastoid and resulting in removal of greater than or equal to 100 mm² surface area of cranium beyond its outer cortex. The specialty society will survey these codes for the October 2021 RUC Meeting.

The RUC recommends affirming the January 2021 interim RUC recommendations for work and practice expense inputs for CPT codes 69714, 69716, 69717, 69719, 69726, and 69727 and resurveying these codes for the October 2021 RUC meeting following revisions at the May 2021 CPT Editorial Panel meeting.

The following codes are for implantation of an osseointegrated implant into the skull. These devices treat hearing loss through surgical placement of an abutment or device into the skull that facilitates transduction of acoustic energy to be received by the better-hearing inner ear or both inner ears when the implant is coupled to a speech processor and vibratory element. This coupling may occur in a percutaneous or a transcutaneous fashion. Other reparative middle ear and mastoid procedures (69501-69676) may be performed for different indications and may be reported separately when performed.

Ezequiel Silva III, MD
Chair, Relative Value Scale Update Committee (RUC)
American Medical Association
AMA Plaza
330 N. Wabash Ave., Suite 39300
Chicago, IL 60611-5885

RE: Referral of Transcutaneous Passive Implant – Temporal Bone family of codes (CPT 69714, 69717, 69716, 69719, 69726, and 69727) to the CPT Editorial Panel

Dear Dr. Silva,

On behalf of the American Academy of Otolaryngology - Head and Neck Surgery (AAO-HNS), we would like to respectfully request that the Transcutaneous Passive Implant – Temporal Bone family of codes (CPT 69714, 69717, 69716, 69719, 69726, and 69727) be referred to the CPT Editorial Panel for the May 2021 meeting. As you know, these codes were surveyed and presented to the RUC for valuation at the January 2021 meeting. After a lengthy facilitation meeting, it was determined that there was an issue with the survey responses for at least one code in the family, due to resulting rank order anomalies in intra-service time. In response, the RUC assigned interim values for the codes, and requested that the family be resurveyed for the April 2021 RUC meeting.

The Academy agreed with this recommendation, and indicated our intent to resurvey for the April meeting in the recently released LOIs. After discussing the possible issues with the survey responses with Academy leadership, as well as our otology colleagues and sister-societies, we believe there may be problems with the way the code family was revised at CPT in October 2020, resulting in the anomalous survey responses. Specifically, the 69726 code survey, removal of the percutaneous device, created a rank order anomaly. We discussed this dilemma with representatives from American Otological Society (AOS)/American Neurotology Society (ANS) and determined that the variation in the removal of the percutaneous device, 69726, was likely due to misinterpretation of the descriptor.

A frequent clinical scenario that occurs in removing the percutaneous device is that the implant is not truly removed. Very commonly with percutaneous
implant wound problems, an appendage to the implant, known as the bone anchored implant abutment, which is the component that traverses the scalp, is simply uncoupled from the implant in the office setting. The resulting wound is subsequently left to heal by primary intention. The intent of CPT 69726 is for total removal of the implant and abutment which requires an operative environment and, most commonly, an otologic drill. Therefore, we are submitting a CCA that clarifies the percutaneous implant removal by describing the procedure as removal of the entire implant and have added a parenthetical to report removal of the abutment alone to be an included component of the evaluation and management visit.

Additionally, there is variation in the method of transcutaneous implant placement, and we noted problems with the distribution of the intraservice times in the 69716 code that is intended to report this procedure. Discussion with the AOS/ANS leadership revealed that there are different techniques that vary in time and intensity depending on the indication for the procedure, device chosen, and patient anatomy. A patient with chronic ear infection and resulting mixed or conductive hearing loss will often require placement of the device outside the mastoid to allow for adequate physical space for the device as well as mitigating infection risk. In these cases, some transcutaneous implants require removal of a significant amount of cranium down to or sometimes beyond the inner cortex in the retrosigmoid area or temporal squama. These cases are technically more difficult, time consuming, and risky. In other cases, such as single-sided deafness, conductive, or mixed hearing loss not resulting from chronic ear inflammatory disease, when the mastoid is well pneumatized, placement of a transcutaneous device in the mastoid is the preferred, less time consuming and less risky location for device placement. We have chosen to bifurcate the transcutaneous codes into placement within the mastoid and/or resulting in removal of less than 100 mm² surface area of cranium beyond its outer cortex versus those that are placed outside of the mastoid and resulting in removal of greater than or equal to 100 mm² surface area of cranium beyond its outer cortex as an effort to clarify the intraservice work for CPT 69716. Mirroring replacement and removal codes are also being proposed.

Given this additional information, we think it best to refer the family back to the CPT Editorial Panel for further clarification prior to resurvey. We therefore, request that the RUC approve referral of the family to CPT at the next opportunity in May 2021, and allow resurvey of the revised code set at the October 2021 RUC meeting.
Thank you in advance for your consideration of this request. If you have any questions, please contact Jenna Minton, AAO-HNS RUC staff, at jenna@proactivestrategies.net or 517.927.8696.

Sincerely,

R. Peter Manes, MD
AAO-HNS RUC Advisor
In October 2020, the CPT Editorial replaced two codes for mastoidectomy with new codes for magnetic transcutaneous attachment to external speech processor. Additional revisions and codes were added to differentiate implantation, removal, and replacement of the implants.

**69714 Implantation, osseointegrated implant, skull; with percutaneous attachment to external speech processor**

The RUC reviewed the survey results from 73 physicians and determined that a work RVU of 8.69 accurately reflects the typical physician work necessary to perform this service. The RUC recommends 33 minutes of pre-service evaluation time, 3 minutes of pre-service positioning time, 10 minutes of pre-service scrub/dress/wait time, 40 minutes of intra-service time, 15 minutes of immediate post-service time, ½ discharge day management (99238), one office visit(s) (1x 99212), and two office visit(s) (2x 99213).

The RUC recommends a direct work RVU crosswalk to CPT code 52400 *Cystourethroscopy with incision, fulguration, or resection of congenital posterior urethral valves, or congenital obstructive hypertrophic mucosal folds* (work RVU= 8.69, intra-service time of 40 minutes and 197.5 minutes of total time) and noted that both codes have identical intra-service time, similar total time, and should be valued identically. The RUC agreed that due to the lack of 090-day global codes with 40 minutes of intra-service time, CPT code 52400 is an appropriate crosswalk for the work value, resulting in a work intensity that closely aligns with the revision/replacement of implant code 69717 (0.110 and 0.100 IWPUT respectively). The RUC agreed that code 52400 and the survey code have similar intra-service and total times and should be valued identically, below the survey’s 25th percentile. **The RUC recommends an interim work RVU of 8.69 for CPT code 69714.**

**69716 Implantation, osseointegrated implant, skull; with magnetic transcutaneous attachment to external speech processor**

The RUC reviewed the survey results from 67 physicians and determined that a work RVU of 9.77 accurately reflects the typical physician work necessary to perform this service. The RUC recommends 32 minutes of pre-service evaluation time, 3 minutes of pre-service positioning time, 10 minutes of pre-service scrub/dress/wait time, 60 minutes of intra-service time, 15 minutes of immediate post-service time, ½ discharge day management (99238), and two office visit(s) (2x 99213).

After thorough discussion, the RUC recommends a direct work RVU crosswalk to MPC code 50590 *Lithotripsy, extracorporeal shock wave* (work RVU= 9.77, intra-service time of 60, immediate post service time of 15 minutes and total time of 207 minutes) and noted that both codes have identical intra-service time, identical post-service time and similar total time, and should be valued identically. The RUC agreed that an IWPUT of 0.100 is appropriate and that the recommended work value of 9.77 places the survey code well within the relativity of the family.

Additionally, the RUC agreed that the work value of 9.77 for code 69716 is appropriately bracketed by codes 43180 *Esophagoscopy, rigid, transoral with diverticulectomy of hypopharynx or cervical esophagus (eg, Zenker's diverticulum), with cricopharyngeal myotomy, includes use of telescope or operating microscope and repair, when performed* (work RVU = 9.03 and total time of 201 minutes) and 57240 *Anterior CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.*
colporrhaphy, repair of cystocele with or without repair of urethrocele, including cystourethroscopy, when performed (work RVU = 10.08 and total time of 211 minutes), further supporting a recommended work RVU of 9.77 for code 69716. The RUC recommends an interim work RVU of 9.77 for CPT code 69716.

69717 Revision/replacement (including removal of existing device), osseointegrated implant, skull; with percutaneous attachment to external speech processor
The RUC reviewed the survey results from 64 physicians and determined that a work RVU of 8.80 accurately reflects the typical physician work necessary to perform this service. The RUC recommends 33 minutes of pre-service evaluation time, 3 minutes of pre-service positioning time, 10 minutes of pre-service scrub/dress/wait time, 45 minutes of intra-service time, 15 minutes of immediate post-service time, ½ discharge day management (99238), one office visit(s) (1x 99212), and two office visit(s) (2x 99213).

The RUC recommends a direct work RVU crosswalk to CPT code 27829 Open treatment of distal tibiofibular joint (syndesmosis) disruption, includes internal fixation, when performed (work RVU = 8.80 and intra-service time of 45 minutes) to appropriately account for the physician work involved in this service. The RUC agreed that code 27829 is an appropriate crosswalk, the recommended work value of 8.80 for the survey code results in an IWPUT of 0.100. Additionally, the RUC agreed that the survey code should be valued identically to code 27829 because both services have identical intra-service time. The RUC recommends an interim work RVU of 8.80 for CPT code 69717.

69719 Revision/replacement (including removal of existing device), osseointegrated implant, skull; with magnetic transcutaneous attachment to external speech processor
The RUC reviewed the survey results from 59 physicians and determined that the work RVU of 9.77 accurately reflects the typical physician work necessary to perform this service. The RUC recommends 33 minutes of pre-service evaluation time, 3 minutes of pre-service positioning time, 10 minutes of pre-service scrub/dress/wait time, 60 minutes of intra-service time, 15 minutes of immediate post-service time, ½ discharge day management (99238), and two office visit(s) (2x 99213).

After thorough discussion, the RUC recommends a direct work RVU crosswalk to MPC code 50590 Lithotripsy, extracorporeal shock wave (work RVU = 9.77, intra-service time of 60 minutes and total time of 207 minutes). The RUC agreed that the crosswalk to MPC code 50590 and recommended work value of 9.77 appropriately accounts for the physician work involved in this service because both codes have identical intra-service time, identical post-service time and similar total time. The RUC agreed that an IWPUT of 0.099 is appropriate and that the recommended work value of 9.77 places the survey code well within the relativity of the family.

Additionally, the RUC agreed that the work value of 9.77 for code 69719 is appropriately bracketed by codes 43180 Esophagoscopy, rigid, transoral with diverticulectomy of hypopharynx or cervical esophagus (eg, Zenker's diverticulum), with cricopharyngeal myotomy, includes use of telescope or operating microscope and repair, when performed (work RVU = 9.03 and total time of 201 minutes) and 57240 Anterior colporrhaphy, repair of cystocele with or without repair of urethrocele, including cystourethroscopy, when performed (work RVU = 10.08 and total time of 211 minutes), further warranting a recommended work RVU of 9.77 for code 69719. The RUC recommends an interim work RVU of 9.77 for CPT code 69719.

69726 Removal, osseointegrated implant, skull; with percutaneous attachment to external speech processor
CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.
The RUC reviewed the survey results from 66 physicians and determined that the work RVU of 5.93 accurately reflects the typical physician work necessary to perform this service. The RUC recommends 32 minutes of pre-service evaluation time, 3 minutes of pre-service positioning time, 10 minutes of pre-service scrub/dress/wait time, 30 minutes of intra-service time, and 15 minutes of immediate post-service time, ½ discharge day management (99238), one office visit(s) (1x 99212), and one office visit(s) (1x 99213).

After thorough discussion, the RUC recommends a direct work RVU crosswalk to code 53852 Transurethral destruction of prostate tissue; by radiofrequency thermotherapy (work RVU = 5.93, intra-service time of 30 minutes and total time of 142 minutes). The RUC agreed that the work value of 5.93 appropriately accounts for the physician work involved in this service. The RUC noted that the survey code and crosswalk code 53852 have identical intra-service time and similar total time. The RUC agreed that an IWPUT of 0.088 is appropriate and that the recommended work value of 5.93 places the survey code well within the relativity of the entire family. Additionally, the RUC agreed that the recommended work value of 5.93 is appropriate because this (removal) service has a lower intensity, in comparison to the implantation and revision/replacement services in the family. The RUC recommends an interim work RVU of 5.93 for CPT code 69726.

69727 Removal, osseointegrated implant, skull; with magnetic transcutaneous attachment to external speech processor
The RUC reviewed the survey results from 59 physicians and determined that the work RVU of 7.13 accurately reflects the typical physician work necessary to perform this service. The RUC recommends 33 minutes of pre-service evaluation time, 3 minutes of pre-service positioning time, 10 minutes of pre-service scrub/dress/wait time, 45 minutes of intra-service time, 15 minutes of immediate post-service time, ½ discharge day management (99238), one office visit(s) (1x 99212), and one office visit(s) (1x 99213).

After thorough discussion, the RUC recommends a direct work RVU crosswalk to code 37718 Ligation, division, and stripping, short saphenous vein (work RVU = 7.13, intra-service time of 45 minutes and total time of 178 minutes). The RUC agreed that the crosswalk to code 37718 and recommended value of 7.13 appropriately accounts for the physician work involved in this service because the survey code and crosswalk code have identical intra-service time and similar total time. The RUC agreed that an IWPUT of 0.085 is appropriate and is like (removal) code 69726 (IWPUT = 0.088) in the family, therefore the recommended work value of 7.13 places the survey code well within the relativity of the entire family. Additionally, the RUC agreed that the recommended work value of 7.13 is appropriate because this (removal) service has a lower intensity, in comparison to the implantation and revision/replacement services in the family. The RUC recommends an interim work RVU of 7.13 for CPT code 69727.

Resurvey for April 2021 RUC Meeting
In January 2021, the RUC reviewed these services and determined that they need to be interim and resurveyed for the April 2021 RUC meeting with a revised Reference Service List (RSL) to encompass a larger range of relative values, specifically relative values on the lower end of the spectrum. Additionally, there was concern from the specialty that survey respondents may not have fully understood the new removal codes based on the anomalous intra-service time response for code 69726 which was less than all other codes in the family.
**Practice Expense**
The Practice Expense Subcommittee replaced one SA053 pack, post-op incision care (suture and staple) with one SA054 pack, post-op incision care (suture). The RUC recommends the direct practice expense inputs as modified by the Practice Expense Subcommittee.

**Work Neutrality**
The RUC’s recommendation for this family of codes will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

**Osseointegrated Implants**
The following codes are for implantation of an osseointegrated implant into the skull. These devices treat hearing loss through surgical placement of an abutment or device into the skull that facilitates transduction of acoustic energy to be received by the better-hearing inner ear or both inner ears when the implant is coupled to a speech processor and vibratory element. This coupling may occur in a percutaneous or a transcutaneous fashion. Other reparative middle ear and mastoid procedures (69501-69676) may be performed for different indications and may be reported separately when performed.

CPT Code: 69714 Tracking Number

Original Specialty Recommended RVU: 11.00
Presented Recommended RVU: 8.69
RUC Recommended RVU: 8.69

CPT Descriptor: Implantation, osseointegrated implant, skull; with percutaneous attachment to external speech processor

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 56-year-old male suffers from chronic otitis media resulting in otorrhea and mixed hearing loss. He is unable to wear traditional hearing aids. Implantation of an osseointegrated bone anchored device with a percutaneous attachment to an external speech processor is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 96%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 49% , In the ASC 49%, In the office 1%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 100% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Meet with patient and family to describe and discuss in detail the planned procedure. Review and update the medical history. Review the CT scan to ensure that there is adequate bone quality and quantity in the area of implantation to support a successful implantation. Perform a current physical exam paying special attention to the patient’s skin condition and skin thickness in the area of the actuator and coil to avoid potential post-surgical skin breakdown and implant extrusion. Reconcile medications and allergies. Address NPO status and timing. Discuss preoperative home medications and postoperative prescriptions and check the prescription drug monitoring database, discuss. Plan the patient's expected convalescence and educate the patient and caregivers regarding the signs and symptoms of the most common and serious complications. There is confirmation of site of proposed insertion site, and a detailed description is given of the postoperative changes in wound and incision and the expected cosmetic and functional results. Review and obtain informed consent. Verify that all required instruments and supplies are available. Following induction of anesthesia, the patient is positioned and prepped for the procedure. A timeout is performed with entire surgical team, including confirmation of the procedure, locations, allergies, antibiotic prophylaxis, anesthesia and fire risks, expected duration, and any concerns related to the procedure. The postauricular hair is shaved and the proposed implant recipient site is precisely measured and then marked using the implant template. The location of the implant transducer is marked using a hypodermic needle inserted down to the bone with marking ink, such as Methylene blue. The incision is injected with local anesthetic.

Description of Intra-Service Work: An incision is performed followed by a meticulous dissection to the pericranium. A dissection is performed and the pericranium is incised and dissected away from the cranial bone to expose an area for implant placement. A pilot guide hole through the cranium is drilled, and the deep portion of the guide hole is instrumented to ascertain the possible presence of dural contact and lack of sigmoid sinus exposure. Depending on this deep instrumentation, the pilot hole is possibly deepened. The final guide hole is then widened with spiral drilling to achieve a larger opening to receive the implant. The implanted fixture is installed in the cranial bone to very specific torque settings. This implanted fixture is then secured to the transcutaneous abutment. The overlying flap and surrounding soft tissues are thinned to a maximal thickness to allow for transcutaneous attachment to the processor. A separate incision is made in the overlying skin of the flap to allow the percutaneous abutment to extend through the soft tissue flap. The wound is irrigated and hemostasis is obtained. The wound is closed in a layered fashion. A small bolster is created immediately surrounding the abutment and a locking cap is fixed to the abutment to keep the bolster in place and with appropriate pressure.
Description of Post-Service Work: The prepped area of the recipient site is cleaned. A compression dressing is fashioned and is wrapped around the head to compress the recipient site. The patient is observed during emergence from anesthesia. Dictation and postoperative orders are performed. Discharge medications are reconciled and prescriptions are written. Instructions, appropriate discharge timing, follow up, and precautions are discussed with the postoperative nursing team. Communication with the referring physician is then performed. There is a discussion with the family regarding the procedure and findings. The patient is then seen after emergence from general anesthesia to check the patient’s neurologic status, wound for signs of hematoma, or other complications. There is reiteration of the convalescence, precautions, follow up appointments, expected postoperative course, signs and symptoms of complications, and review the written postoperative instructions.

Post op visit 1: 99213
The mastoid dressing is removed. The patient's convalescence to that point is reviewed and discussed. The neurological status is assessed. The wound is inspected and palpated. Flap viability is assessed. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Patient and family questions and concerns are addressed. Ongoing care is reiterated. Antibiotic ointment is placed on the surgical wound.

Post op visit 2: 99213
The patient's convalescence to that point is reviewed. The small abutment bolster and associated locking cap device are removed. The sutures are removed. The area around the percutaneous abutment is vigorously cleaned and possibly debrided. The wound is again inspected and palpated. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Patient and family questions and concerns are addressed. Ongoing care is reiterated.

Post op visit 3: 99212
The patient's convalescence to that point is reviewed. The wounds are inspected and palpated for full incisional healing prior to fitting the sound processor. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Patient and family questions and concerns are addressed. Long term care, strategies to maximize function, and expected outcomes are discussed in detail. Counseling regarding the device, its function, and signs and symptoms of trouble with the device are discussed with the patient and family.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC’s rationale, please review the separate RUC recommendation document.

Background:

In October 2020, the Academy brought forward a Code Change Application requesting the revision of two existing codes, 69714 and 69717, as well as the addition of four new codes 69716-727. These new codes represent implantation, revision/replacement, and removal of a transcutaneous and percutaneous osseointegrated implants, respectively. The
Panel approved the CCA and the code is now being valued by the RUC. The new codes will be published in the 2022 edition of the CPT Book.

Survey Sample and Process:

A survey request was sent to a targeted, random selection of 533 members from the AAO-HNS, the American Neurotology Society, and the AOS (American Otological Society).

Note re: Key Reference Code #2

We recognize that KRS code 2, 31610, was selected as a KRS for this code, and some others in this family of codes by survey respondents. That code is marked “Do not use to value physician work” in the RUC database. The RUC database further states the following rationale: “The RUC recommends to flag CPT codes 31605 and 31610 as do not use for validation of work as 31605 physician time and work recommendations are based on only the 20 survey respondents who performed this service in the past 12 months and 31610 recommendation was based on the survey 75th percentile work RVU.” We do not agree that simply because the 75th percentile was approved in valuing this service, that it should be viewed as unreliable as a comparison to other services, and therefore, we included it in our RSL as a recently valued, and familiar service that our members would understand.

Recommendation (Work and Intra Time):

We are recommending a work RVU of 8.69 and 40 minutes of intra service time, based on a crosswalk to CPT 52400. This is below the survey’s 25th percentile.

Time package selection: We have selected pre-time package 3 and post-time package 9A due to this procedure currently being done predominantly in the hospital outpatient setting under general anesthesia.

Pre-time Package 3 Straightforward Patient/Difficult Procedure

Evaluation Time – We are recommending 33 minutes of evaluation time which is identical to the pre-service package time, based on our survey median.

Positioning Time – We are recommending 3 minutes of positioning time which is 7 minutes less than the survey median time, but consistent with the preservice package.

Scrub, Dress, Wait Time – We are recommending 10 minutes of scrub, dress and wait time which is 5 minutes less than the pre-service package time, based on our survey median.

This results in a total recommended pre time of 46 minutes, taking the lesser of surveyed time or the pre-service package time.

Post-time Package 9A General Anesthesia or Complex Regional Block/ Straightforward Procedure

Recommended time has been reduced to 15 minutes which is a decrease of 15 minutes from the post package time selected to match our survey time. This results in a total recommended post time of 15 minutes, taking the lesser of surveyed time or the pre-service package time.

Discharge Management / Post-Operative Visits

Given that this procedure is almost exclusively performed in the hospital outpatient or ASC setting, and general anesthesia sedation is utilized, patients must be monitored closely following the procedure. This results in a discharge management visit being performed after the procedure, before the patient is discharged from the hospital. Our survey did not indicate that this was typical, however, it is the RUC standard for 090 global services when performed in the hospital, so we have included .5 discharge management visit in our recommendations for this CPT code.

Survey respondents also indicated that three post-operative office visits are typically conducted after the procedure. Two level three office visits, 99213; and one level two office visit, 99212.

Post op visit 1: 99213
The mastoid dressing is removed. The patient's convalescence to that point is reviewed and discussed. The neurological status is assessed. The wound is inspected and palpated. Flap viability is assessed. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Patient and family questions and concerns are addressed. Ongoing care is reiterated. Antibiotic ointment is placed on the surgical wound.

Post op visit 2: 99213
The patient's convalescence to that point is reviewed. The small abutment bolster and associated locking cap device are removed. The sutures are removed. The area around the percutaneous abutment is vigorously cleaned and possibly debrided. The wound is again inspected and palpated. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Patient and family questions and concerns are addressed. Ongoing care is reiterated.

Post op visit 3: 99212
The patient's convalescence to that point is reviewed. The wounds are inspected and palpated for full incisional healing prior to fitting the sound processor. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Patient and family questions and concerns are addressed. Long term care, strategies to maximize function, and expected outcomes are discussed in detail. Counseling regarding the device, its function, and signs and symptoms of trouble with the device are discussed with the patient and family.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - Multiple codes allow flexibility to describe exactly what components the procedure included.
   - Multiple codes are used to maintain consistency with similar codes.
   - Historical precedents.
   - Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 69714

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Estimate the number of times this service might be provided to Medicare patients nationally in a one-year period? 93  If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The current 2019 volume indicated by the RUC database for this code is 993 cases, however, we anticipate the majority of this volume (94% or so) will transfer to the new X codes.
Specialty Otolaryngology  Frequency 93  Percentage 100.00%

Specialty  Frequency 0  Percentage 0.00%

Specialty  Frequency 0  Percentage 0.00%

Do many physicians perform this service across the United States? Yes

CPT Descriptor: Implantation, osseointegrated implant, skull; with magnetic transcutaneous attachment to external speech processor

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 48-year-old male with left mixed hearing loss seeks intervention for improved quality of life at work and socially. Placement of a magnetic transcutaneous bone anchored hearing device is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 85%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 49%, In the ASC 49%, In the office 1%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 100%, Overnight stay-less than 24 hours 0%, Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Meet with patient and family to describe and discuss in detail the planned procedure. Review and update the medical history. Review the CT scan to ensure that there is adequate bone quality and quantity in the area of implantation to support a successful implantation. Perform a current physical exam paying special attention to the patient’s skin condition and skin thickness in the area of the actuator and coil to avoid potential post-surgical skin breakdown and implant extrusion. Reconcile medications and allergies. Address NPO status and timing. Discuss preoperative home medications and postoperative prescriptions and check the prescription drug monitoring database, discuss. Plan the patient's expected convalescence and educate the patient and caregivers regarding the signs and symptoms of the most common and serious complications. There is confirmation of site of proposed insertion site, and a detailed description is given of the postoperative changes in wound and incision and the expected cosmetic and functional results. Review and obtain informed consent. Verify that all required instruments and supplies are available. Following induction of anesthesia, the patient is positioned and prepped for the procedure. A timeout is performed with entire surgical team, including confirmation of the procedure, locations, allergies, antibiotic prophylaxis, anesthesia and fire risks, expected duration, and any concerns related to the procedure. The postauricular hair is shaved and the proposed implant recipient site is precisely measured and then marked using the implant template. The location of the implant transducer is marked using a hypodermic needle inserted down to the bone with marking ink, such as Methylene blue. The incision is injected with local anesthetic.

Description of Intra-Service Work: An incision is performed followed by a meticulous dissection through the pericranium. A subperiosteal dissection is performed and a subperiosteal pocket for the implant coil and magnet are created. The area for the transducer is then identified using the template and marked on the outer table of the skull in the region of the sinodural angle. Surgical guide and fixation holes are then drilled taking care not to penetrate the sigmoid sinus or the dura overlying the temporal lobe of the brain. This area is measured for appropriate depth to accommodate the fixation screw. The skull overlying the sinodural angle is then drilled to create a well in the bone to accommodate the transducer device, again staying just superficial to the dura and sigmoid sinus. The entire device including the coil, magnet, and transducer portions are then placed. The device is then fixed to the skull using the fixation screw to a specific torque setting. The thickness of the flap overlying the magnet and coil portion of the device is then carefully measure and precisely trimmed to a specific thickness to allow for transcutaneous transmission. The wound is irrigated and hemostasis is obtained. The wound is closed in a layered fashion.
Description of Post-Service Work: The prepped areas of the respective donor and recipient sites are cleaned. A dressing is applied to the donor site. A compression dressing is fashioned and is wrapped around the head to compress the recipient site. The patient is observed during emergence from anesthesia. Dictation and postoperative orders are performed. Discharge medications are reconciled and prescriptions are written. Instructions, appropriate discharge timing, follow up, and precautions are discussed with the postoperative nursing team. Communication with the referring physician is then performed. There is a discussion with the family regarding the procedure and findings. The patient is then seen after emergence from general anesthesia to check the patient’s neurologic status, wound for signs of hematoma, or other complications. There is reiteration of the convalescence, precautions, follow up appointments, expected postoperative course, signs and symptoms of complications, and review the written postoperative instructions.

Post op visit 1: 99213
The dressing is removed. The patient's convalescence to that point is reviewed and discussed. The neurological status is assessed. The wound is inspected and palpated. Flap viability overlying the coil is assessed. The sutures are removed. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Patient and family questions and concerns are addressed. Ongoing care is reiterated. Antibiotic ointment is placed on the surgical wound.

Post op visit 2: 99213
The patient's convalescence to that point is reviewed. The wound is inspected and palpated for full incisional healing prior to fitting the sound processor. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Patient and family questions and concerns are addressed. Long term care, strategies to maximize function, and expected outcomes are discussed in detail. Counseling regarding the device, its function, and signs and symptoms of trouble with the device are discussed with the patient and family.

### Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

*The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC’s rationale, please review the separate RUC recommendation document.*

**Background:**

In October 2020, the Academy brought forward a Code Change Application requesting the revision of two existing codes, 69714 and 69717, as well as the addition of four new codes 69716-727. These new codes represent implantation, revision/replacement, and removal of a transcutaneous and percutaneous osseointegrated implants, respectively. The
Panel approved the CCA and the code is now being valued by the RUC. The new codes will be published in the 2022 edition of the CPT Book.

**Survey Sample and Process:**

A survey request was sent to a targeted, random selection of 533 members from the AAO-HNS, the American Neurotology Society, and the AOS (American Otological Society).

**Note re: Key Reference Code #2**

We recognize that KRS code 2, 31610, was selected as a KRS for this code, and some others in this family of codes by survey respondents. That code is marked “Do not use to value physician work” in the RUC database. The RUC database further states the following rationale: “The RUC recommends to flag CPT codes 31605 and 31610 as do not use for validation of work as 31605 physician time and work recommendations are based on only the 20 survey respondents who performed this service in the past 12 months and 31610 recommendation was based on the survey 75th percentile work RVU.” We do not agree that simply because the 75th percentile was approved in valuing this service that it should be viewed as unreliable as a comparison to other services, and therefore, we included it in our RSL as a recently valued, and familiar service that our members would understand.

**Recommendation (Work and Intra Time):**

We are recommending a work RVU of **9.77 and 60 minutes of intra service time**, based on a crosswalk to CPT 50590. This is below our survey’s 25th percentile RVW.

**Time package selection:** We have selected pre-time package 3 and post-time package 9A due to this procedure currently being done predominantly in the hospital outpatient setting under general anesthesia.

**Pre-time Package 3 Straightforward Patient/Difficult Procedure**

Evaluation Time – We are recommending 32 minutes of evaluation time which is 1 minute less than the pre-service package time, based on our survey median.

Positioning Time – We are recommending 3 minutes of positioning time which is 7 minutes less than the survey median time, but consistent with the preservice package.

Scrub, Dress, Wait Time – We are recommending 10 minutes of scrub, dress and wait time which is 5 minutes less than the pre-service package time, based on our survey median.

*This results in a total recommended pre time of 45 minutes, taking the lesser of surveyed time or the pre-service package time.*

**Post-time Package 9A General Anesthesia or Complex Regional Block/ Straightforward Procedure**

Recommended time has been reduced to 15 minutes which is a decrease of 15 minutes from the post package time selected to match our survey time. *This results in a total recommended post time of 15 minutes, taking the lesser of surveyed time or the pre-service package time.*

**Discharge Management / Post-Operative Visits**

Given that this procedure is almost exclusively performed in the hospital outpatient or ASC setting, and general anesthesia sedation is utilized, patients must be monitored closely following the procedure. This results in a discharge management visit being performed after the procedure, before the patient is discharged from the hospital. Our survey did not indicate that this was typical, however, it is the RUC standard for 090 global services when performed in the hospital, so we have included .5 discharge management visit in our recommendations for this CPT code.

Regarding post-operative visits, our survey respondents indicated that two post-operative visits were needed, two 99213 visits. Our expert panel agreed.

Post op visit 1: 99213
The dressing is removed. The patient's convalescence to that point is reviewed and discussed. The neurological status is assessed. The wound is inspected and palpated. Flap viability overlying the coil is assessed. The sutures are removed. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Patient and family questions and concerns are addressed. Ongoing care is reiterated. Antibiotic ointment is placed on the surgical wound.

Post op visit 2: 99213
The patient's convalescence to that point is reviewed. The wound is inspected and palpated for full incisional healing prior to fitting the sound processor. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Patient and family questions and concerns are addressed. Long term care, strategies to maximize function, and expected outcomes are discussed in detail. Counseling regarding the device, its function, and signs and symptoms of trouble with the device are discussed with the patient and family.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)
   - The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - Multiple codes allow flexibility to describe exactly what components the procedure included.
   - Multiple codes are used to maintain consistency with similar codes.
   - Historical precedents.
   - Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 69714

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely) If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Otoloaryngology How often? Sometimes

Specialty How often?
Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 2979

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This is three times the 2019 volume for 69714 in the AMA RUC database

</table>

Estimate the number of times this service might be provided to Medicare patients nationally in a one-year period? 900

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. We believe the majority (94% or so) of existing volume for the predecessor code 69714 will move to this new code. Volume for 69714 in 2019 was 993 cases.

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 31070
CPT Code: 69717

Tracking Number

Original Specialty Recommended RVU: 11.48

Presented Recommended RVU: 8.80

RUC Recommended RVU: 8.80

CPT Descriptor: Revision/replacement (including removal of existing device), osseointegrated implant, skull; with percutaneous attachment to external speech processor

**AMERICAN MEDICAL ASSOCIATION'S SOCIAL SECURITY WAGE BASE UPDATE PROJECTION**

**SUMMARY OF RECOMMENDATION**

CPT Code: 69717

Global Period: 090

Current Work RVU: 15.43

CPT Descriptor: Revision/replacement (including removal of existing device), osseointegrated implant, skull; with percutaneous attachment to external speech processor

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 16-year-old female with chronic otitis media and conductive hearing loss who previously received a percutaneous bone anchored implant has chronic inflammation at the abutment site that has been unresponsive to medical therapy. The device is removed and a new device is placed at a different site.

Percentage of Survey Respondents who found Vignette to be Typical: 88%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 48%, In the ASC 50%, In the office 2%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is:
Discharged the same day 100%, Overnight stay-less than 24 hours 0%, Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Meet with patient and family to describe and discuss in detail the planned procedure. Review and update the medical history. Review the CT scan to ensure that there is adequate bone quality and quantity in the area of implantation to support a successful implantation. Perform a current physical exam paying special attention to the patient’s skin condition and skin thickness in the area of the actuator and coil to avoid potential post-surgical skin breakdown and implant extrusion. Reconcile medications and allergies. Address NPO status and timing. Discuss preoperative home medications and postoperative prescriptions and check the prescription drug monitoring database, discuss. Plan the patient's expected convalescence and educate the patient and caregivers regarding the signs and symptoms of the most common and serious complications. There is confirmation of site of proposed insertion site, and a detailed description is given of the postoperative changes in wound and incision and the expected cosmetic and functional results. Review and obtain informed consent. Verify that all required instruments and supplies are available. Following induction of anesthesia, the patient is positioned and prepped for the procedure. A timeout is performed with entire surgical team, including confirmation of the procedure, locations, allergies, antibiotic prophylaxis, anesthesia and fire risks, expected duration, and any concerns related to the procedure. The postauricular hair is shaved and the proposed implant recipient site is precisely measured and then marked using the implant template. The location of the implant transducer is marked using a hypodermic needle inserted down to the bone with marking ink, such as Methylene blue. The incision is injected with local anesthetic.

Description of Intra-Service Work: An incision is performed followed by a meticulous dissection to the pericranium. A subpericranial dissection is performed and the previous implant abutment is removed. The cranial bone surrounding the osseointegrated titanium fixture in the patient’s skull is drilled around the implant. The fixture is removed. The wound is thoroughly inspected for the cause of the patient’s original complication related to the implant. The area for the new placement of the implant is then identified, templated, and marked on the outer table of the skull. A dissection is performed and the pericranium is incised and dissected away from the cranial bone to expose an area for implant placement. A new pilot guide hole through the cranium is drilled, and the deep portion of the guide hole is instrumented to ascertain the possible presence of dural contact and lack of sigmoid sinus exposure. Depending on this deep instrumentation, the pilot hole is possibly deepened. The final guide hole is then widened with spiral drilling to achieve a larger opening to receive the implant. The implanted fixture is installed in the cranial bone to very specific torque settings. This implanted fixture is then secured to the transcutaneous abutment. The overlying flap and surrounding soft tissues are thinned to a maximal
thickness to allow for transcutaneous attachment to the processor. A separate incision is made in the overlying skin of the flap to allow the percutaneous abutment to extend through the soft tissue flap. The wound is irrigated and hemostasis is obtained. The wound is closed in a layered fashion. A small bolster is created immediately surrounding the abutment and a locking cap is fixed to the abutment to keep the small abutment bolster in place and with appropriate pressure.

Description of Post-Service Work: the prepped area of the recipient site is cleaned. A compression dressing is fashioned and is wrapped around the head to compress the recipient site. The patient is observed during emergence from anesthesia. Dictation and postoperative orders are performed. Discharge medications are reconciled and prescriptions are written. Instructions, appropriate discharge timing, follow up, and precautions are discussed with the postoperative nursing team. Communication with the referring physician is then performed. There is a discussion with the family regarding the procedure and findings. The patient is then seen after emergence from general anesthesia to check the patient’s neurologic status, wound for signs of hematoma, or other complications. There is reiteration of the convalescence, precautions, follow up appointments, expected postoperative course, signs and symptoms of complications, and review the written postoperative instructions.

Post op visit 1: 99213
The mastoid dressing is removed. The patient's convalescence to that point is reviewed and discussed. The neurological status is assessed. The wound is inspected and palpated. Flap viability is assessed. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Patient and family questions and concerns are addressed. Ongoing care is reiterated. Antibiotic ointment is placed on the surgical wound.

Post op visit 2: 99213
The patient's convalescence to that point is reviewed. The small abutment bolster and associated locking cap device are removed. The sutures are removed. The area around the percutaneous abutment is vigorously cleaned and possibly debrided. The wound is again inspected and palpated. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Patient and family questions and concerns are addressed. Ongoing care is reiterated.

Post op visit 3: 99212
The patient's convalescence to that point is reviewed. The wounds are inspected and palpated for full incisional healing prior to fitting the sound processor. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Patient and family questions and concerns are addressed. Long term care, strategies to maximize function, and expected outcomes are discussed in detail. Counseling regarding the device, its function, and signs and symptoms of trouble with the device are discussed with the patient and family.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC’s rationale, please review the separate RUC recommendation document.

**Background:**

In October 2020, the Academy brought forward a Code Change Application requesting the revision of two existing codes, 69714 and 69717, as well as the addition of four new codes 69716-727. These new codes represent implantation, revision/replacement, and removal of a transcutaneous and percutaneous osseointegrated implants, respectively. The
Panel approved the CCA and the code is now being valued by the RUC. The new codes will be published in the 2022 edition of the CPT Book.

**Survey Sample and Process:**

A survey request was sent to a targeted, random selection of 533 members from the AAO-HNS, the American Neurotology Society, and the AOS (American Otological Society).

**Recommendation (Work and Intra Time):**

We are recommending a work RVU of **8.80 and 45 minutes of intra service time**, based on a crosswalk to CPT 27829. This is below our survey’s 25th percentile RVW.

**Time package selection:** We have selected pre-time package 3 and post-time package 9A due to this procedure currently being done predominantly in the hospital outpatient setting under general anesthesia.

**Pre-time Package 3 Straightforward Patient/Difficult Procedure**

Evaluation Time – We are recommending 33 minutes of evaluation time which is identical to the pre-service package time, based on our survey median.

Positioning Time – We are recommending 3 minutes of positioning time which is 7 minutes less than the survey median time, but consistent with the preservice package.

Scrub, Dress, Wait Time – We are recommending 10 minutes of scrub, dress and wait time which is 5 minutes less than the pre-service package time, based on our survey median.

*This results in a total recommended pre time of 46 minutes, taking the lesser of surveyed time or the pre-service package time.*

**Post-time Package 9A General Anesthesia or Complex Regional Block/ Straightforward Procedure**

Recommended time has been reduced to 15 minutes which is a decrease of 15 minutes from the post package time selected to match our survey time. *This results in a total recommended post time of 15 minutes, taking the lesser of surveyed time or the pre-service package time.*

**Discharge Management / Post-Operative Visits**

Given that this procedure is almost exclusively performed in the hospital outpatient or ASC setting, and general anesthesia sedation is utilized, patients must be monitored closely following the procedure. This results in a discharge management visit being performed after the procedure, before the patient is discharged from the hospital. Our survey did not indicate that this was typical, however, it is the RUC standard for 090 global services when performed in the hospital, so we have included **.5 discharge management visit in our recommendations for this CPT code.**

Survey respondents also indicated that three post-operative office visits are typically conducted after the procedure. Three level three office visits, 99213. Our expert panel agreed that three visits are necessary, but amended them to two level three visits (99213) and one level two office visit (99212) consistent with code 69714.

Post op visit 1: 99213

The mastoid dressing is removed. The patient's convalescence to that point is reviewed and discussed. The neurological status is assessed. The wound is inspected and palpated. Flap viability is assessed. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Patient and family questions and concerns are addressed. Ongoing care is reiterated. Antibiotic ointment is placed on the surgical wound.

Post op visit 2: 99213

The patient's convalescence to that point is reviewed. The small abutment bolster and associated locking cap device are removed. The sutures are removed. The area around the percutaneous abutment is vigorously cleaned and possibly debrided. The wound is again inspected and palpated. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Patient and family questions and concerns are addressed. Ongoing care is reiterated.
Post op visit 3: 99212

The patient's convalescence to that point is reviewed. The wounds are inspected and palpated for full incisional healing prior to fitting the sound processor. The middle ear is inspected. Tuning forks are utilized to evaluate the patient's hearing. Patient and family questions and concerns are addressed. Long term care, strategies to maximize function, and expected outcomes are discussed in detail. Counseling regarding the device, its function, and signs and symptoms of trouble with the device are discussed with the patient and family.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)
   
   - [ ] The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - [ ] Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - [ ] Multiple codes allow flexibility to describe exactly what components the procedure included.
2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 69717

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Otolaryngology How often? Rarely
Specialty How often?
Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 18
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This is three times the Medicare volume estimated below.

Specialty Otolaryngology Frequency 18 Percentage 100.00 %
Specialty Frequency 0 Percentage 0.00 %
Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be provided to Medicare patients nationally in a one-year period? 6 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The current 2019 volume indicated by the RUC database for this code is 68, however, we estimate that only about 7% of existing cases will be reported in the future by the percutaneous codes. We anticipate that the remainder of the volume will transition to the new transcutaneous codes.

Specialty Otolaryngology Frequency 6 Percentage 100.00 %
Specialty Frequency 0 Percentage 0.00 %
Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

Berenson-Eggers Type of Service (BETOS) Assignment
Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification: Procedures

BETOS Sub-classification:
Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix \textit{will not} change, enter the surveyed existing CPT code number 69717

If this code is a new/revised code or an existing code in which the specialty utilization mix \textit{will} change, please select another crosswalk based on a similar specialty mix.
AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 69719
CPT Descriptor: Revision/replacement (including removal of existing device), osseointegrated implant, skull; with magnetic transcutaneous attachment to external speech processor

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 59-year-old female with right mixed hearing loss previously had placement of a magnetic transcutaneous bone anchored implant. It worked well, but she has developed discomfort at the device site. The device is removed and a new device is placed at a different site.

Percentage of Survey Respondents who found Vignette to be Typical: 83%

Site of Service (Complete for 010 and 090 Globals Only)
Percent of survey respondents who stated they perform the procedure; In the hospital 47% , In the ASC 51%, In the office 2%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 100% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Meet with patient and family to describe and discuss in detail the planned procedure. Review and update the medical history. Review the CT scan to ensure that there is adequate bone quality and quantity in the area of implantation to support a successful implantation. Perform a current physical exam paying special attention to the patient’s skin condition and skin thickness in the area of the actuator and coil to avoid potential repeat post-surgical skin breakdown, pain, and possible implant extrusion. Reconcile medications and allergies. Address NPO status and timing. Discuss preoperative home medications and postoperative prescriptions and check the prescription drug monitoring database, discuss. Plan the patient's expected convalescence and educate the patient and caregivers regarding the signs and symptoms of the most common and serious complications. There is confirmation of site of proposed insertion site, and a detailed description is given of the postoperative changes in wound and incision and the expected cosmetic and functional results. Review and obtain informed consent. Verify that all required instruments and supplies are available. Following induction of anesthesia, the patient is positioned and prepped for the procedure. A timeout is performed with entire surgical team, including confirmation of the procedure, locations, allergies, antibiotic prophylaxis, anesthesia and fire risks, expected duration, and any concerns related to the procedure. The postauricular hair is shaved and the proposed NEW implant recipient site is precisely measured and then marked using the implant template. The incision is injected with local anesthetic.

Description of Intra-Service Work: An incision is performed followed by a meticulous dissection through the pericranium. A subpericranial dissection is performed and the previous implant is removed. The wound is thoroughly inspect for the cause of the patient’s original complication related to the implant. A subpericranial pocket for the implant coil and magnet are created. The area for the new placement of the transducer is then identified using the template and marked on the outer table of the skull. Surgical guide and fixation holes are then drilled taking care not to penetrate the dura overlying the temporal lobe of the brain. This area is measured for appropriate depth to accommodate the fixation screw. The skull is then drilled to create a well in the bone to accommodate the transducer device, again staying just superficial to the dura. The entire device including the coil, magnet, and transducer portions are then placed. The device is then fixed to the skull using the fixation screw to a specific torque setting. The thickness of the flap overlying the magnet and coil portion of the device is then carefully measure and precisely trimmed to a specific thickness to allow for transcutaneous transmission. The wound is irrigated and hemostasis is obtained. The wound is closed in a layered fashion.
Description of Post-Service Work: The prepped areas of the respective donor and recipient sites are cleaned. A dressing is applied to the donor site. A compression dressing is fashioned and is wrapped around the head to compress the recipient site. The patient is observed during emergence from anesthesia. Dictation and postoperative orders are performed. Discharge medications are reconciled and prescriptions are written. Instructions, appropriate discharge timing, follow up, and precautions are discussed with the postoperative nursing team. Communication with the referring physician is then performed. There is a discussion with the family regarding the procedure and findings. The patient is then seen after emergence from general anesthesia to check the patient’s neurologic status, wound for signs of hematoma, or other complications. There is reiteration of the convalescence, precautions, follow up appointments, expected postoperative course, signs and symptoms of complications, and review the written postoperative instructions.

Post op visit 1: 99213
The dressing is removed. The patient's convalescence to that point is reviewed and discussed. The neurological status is assessed. The wound is inspected and palpated. Flap viability overlying the coil is assessed. The sutures are removed. The middle ear is inspected. Tuning forks are utilized to evaluate the patient’s hearing. Patient and family questions and concerns are addressed. Ongoing care is reiterated. Antibiotic ointment is placed on the surgical wound.

Post op visit 2: 99213
The patient's convalescence to that point is reviewed. The wound is inspected and palpated for full incisional healing prior to fitting the sound processor. The middle ear is inspected. Tuning forks are utilized to evaluate the patient’s hearing. Patient and family questions and concerns are addressed. Long term care, strategies to maximize function, and expected outcomes are discussed in detail. Counseling regarding the device, its function, and signs and symptoms of trouble with the device are discussed with the patient and family.

### Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC’s rationale, please review the separate RUC recommendation document.

**Background:**

In October 2020, the Academy brought forward a Code Change Application requesting the revision of two existing codes, 69714 and 69717, as well as the addition of four new codes 69716-727. These new codes represent implantation, revision/replacement, and removal of a transcutaneous and percutaneous osseointegrated implants, respectively. The
Panel approved the CCA and the code is now being valued by the RUC. The new codes will be published in the 2022 edition of the CPT Book.

**Survey Sample and Process:**

A survey request was sent to a targeted, random selection of 533 members from the AAO-HNS, the American Neurotology Society, and the AOS (American Otological Society).

**Note re: Key Reference Code #1**

We recognize that KRS code 1, 31610, was selected as a KRS for this code, and some others in this family of codes by survey respondents. That code is marked “Do not use to value physician work” in the RUC database. The RUC database further states the following rationale: “The RUC recommends to flag CPT codes 31605 and 31610 as do not use for validation of work as 31605 physician time and work recommendations are based on only the 20 survey respondents who performed this service in the past 12 months and 31610 recommendation was based on the survey 75th percentile work RVU.” We do not agree that simply because the 75th percentile was approved in valuing this service that it should be viewed as unreliable as a comparison to other services, and therefore, we included it in our RSL as a recently valued, and familiar service that our members would understand.

**Recommendation (Work and Intra Time):**

We are recommending a work RVU of 9.77 and 60 minutes of intra service time, based on a crosswalk to CPT 50590. This is below our survey’s 25th percentile RVW.

**Time package selection:** We have selected pre-time package 3 and post-time package 9A due to this procedure currently being done predominantly in the hospital outpatient setting under general anesthesia.

**Pre-time Package 3 Straightforward Patient/Difficult Procedure**

Evaluation Time – We are recommending 33 minutes of evaluation time which is identical to the pre-service package time, based on our survey median.

Positioning Time – We are recommending 3 minutes of positioning time which is 7 minutes less than the survey median time, but consistent with the preservice package.

Scrub, Dress, Wait Time – We are recommending 10 minutes of scrub, dress and wait time which is 5 minutes less than the pre-service package time, based on our survey median.

This results in a total recommended pre time of 46 minutes, taking the lesser of surveyed time or the pre-service package time.

**Post-time Package 9A General Anesthesia or Complex Regional Block/ Straightforward Procedure**

Recommended time has been reduced to 15 minutes which is a decrease of 15 minutes from the post package time selected to match our survey time. This results in a total recommended post time of 15 minutes, taking the lesser of surveyed time or the pre-service package time.

**Discharge Management / Post-Operative Visits**

Given that this procedure is almost exclusively performed in the hospital outpatient or ASC setting, and general anesthesia sedation is utilized, patients must be monitored closely following the procedure. This results in a discharge management visit being performed after the procedure, before the patient is discharged from the hospital. Our survey did not indicate that this was typical, however, it is the RUC standard for 090 global services when performed in the hospital, so we have included .5 discharge management visit in our recommendations for this CPT code.

Survey respondents also indicated that two post-operative office visits are typically conducted after the procedure. Two level three office visits, 99213.

Post op visit 1: 99213
The dressing is removed. The patient's convalescence to that point is reviewed and discussed. The neurological status is assessed. The wound is inspected and palpated. Flap viability overlying the coil is assessed. The sutures are removed. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Patient and family questions and concerns are addressed. Ongoing care is reiterated. Antibiotic ointment is placed on the surgical wound.

Post op visit 2: 99213
The patient's convalescence to that point is reviewed. The wound is inspected and palpated for full incisional healing prior to fitting the sound processor. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Patient and family questions and concerns are addressed. Long term care, strategies to maximize function, and expected outcomes are discussed in detail. Counseling regarding the device, its function, and signs and symptoms of trouble with the device are discussed with the patient and family.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
☐ Multiple codes are used to maintain consistency with similar codes.
☐ Historical precedents.
☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 69714

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Otolaryngology How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 27
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This is three times the estimated Medicare volume cited below

Estimate the number of times this service might be provided to Medicare patients nationally in a one-year period? 9 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Industry data indicates that approximately .5-1% of cases of 69716 will be revised, we estimate 900 cases per year of 69716, and 9 is 1% of that volume.

CPT Descriptor: Removal, osseointegrated implant, skull; with percutaneous attachment to external speech processor

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 59-year-old female with a right mixed hearing loss had previous placement of a percutaneous bone anchored implant. It worked well, but she has developed discomfort at the device site. The device is removed without replacement.

Percentage of Survey Respondents who found Vignette to be Typical: 95%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 33%, In the ASC 36%, In the office 30%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 100%, Overnight stay-less than 24 hours 0%, Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Meet with patient and family to describe and discuss in detail the planned procedure. Review and update the medical history. Perform a current physical exam paying special attention to the patient’s skin condition adequacy for closure following implant removal. Reconcile medications and allergies. Address NPO status and timing. Discuss preoperative home medications and postoperative prescriptions and check the prescription drug monitoring database, discuss. Plan the patient's expected convalescence and educate the patient and caregivers regarding the signs and symptoms of the most common and serious complications. There is confirmation of site of proposed removal site, and a detailed description is given of the postoperative changes in wound and incision and the expected cosmetic and functional results. Review and obtain informed consent. Verify that all required instruments and supplies are available. Following induction of anesthesia, the patient is positioned and prepped for the procedure. A timeout is performed with entire surgical team, including confirmation of the procedure, locations, allergies, antibiotic prophylaxis, anesthesia and fire risks, expected duration, and any concerns related to the procedure. The postauricular hair is shaved and the incision is marked in the region of the previous incision. The incision is injected with local anesthetic.

Description of Intra-Service Work: An incision is performed followed by a meticulous dissection through the pericranium. A subperiocular dissection is performed and the previous implant is exposed. The cranial bone surrounding the osseointegrated titanium fixture in the patient’s skull is drilled around the implant. The wound is thoroughly inspected for the cause of the patient’s original complication related to the implant. The wound is irrigated and hemostasis is obtained. The wound where the external abutment of the implant is debrided then closed followed by closure of the linear incision anterior to the implant site in a layered fashion.

Description of Post-Service Work: The prepped areas of the respective donor and recipient sites are cleaned. A dressing is applied to the donor site. A compression dressing is fashioned and is wrapped around the head to compress the recipient site. The patient is observed during emergence from anesthesia. Dictation and postoperative orders are performed. Discharge medications are reconciled and prescriptions are written. Instructions, appropriate discharge timing, follow up, and precautions are discussed with the postoperative nursing team. Communication with the referring physician is then performed. There is a discussion with the family regarding the procedure and findings. The patient is then seen after emergence from general anesthesia to check the patient’s neurologic status, wound for signs of hematoma, or other
complications. There is reiteration of the convalescence, precautions, follow up appointments, expected postoperative course, signs and symptoms of complications, and review the written postoperative instructions.

Post op visit 1: 99213
The mastoid dressing is removed. The sutures are removed. The patient's convalescence to that point is reviewed and discussed. The neurological status is assessed. The incisions and wound are inspected and palpated. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Antibiotic ointment is placed on the wound. Patient and family questions and concerns are addressed. Ongoing care is reiterated.

Post op visit 2: 99212
The patient's convalescence to that point is reviewed. The wound is again inspected and palpated to insure full healing. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Patient and family questions and concerns are addressed. Ongoing care is reiterated. A discussion occurs regarding different hearing options now that the previous osseointegrated implant has been removed and not replaced.

### Modifier -51 Exempt Status

Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? **No**

### New Technology/Service

Is this new/revised procedure considered to be a new technology or service? **No**

### TOP KEY REFERENCE SERVICE:

<table>
<thead>
<tr>
<th>Key CPT Code</th>
<th>Global</th>
<th>Work RVU</th>
<th>Time Source</th>
</tr>
</thead>
<tbody>
<tr>
<td>15120</td>
<td>090</td>
<td>10.15</td>
<td>RUC Time</td>
</tr>
</tbody>
</table>

CPT Descriptor: Split-thickness autograft, face, scalp, eyelids, mouth, neck, ears, orbits, genitalia, hands, feet, and/or multiple digits; first 100 sq cm or less, or 1% of body area of infants and children (except 15050)

### SECOND HIGHEST KEY REFERENCE SERVICE:

<table>
<thead>
<tr>
<th>Key CPT Code</th>
<th>Global</th>
<th>Work RVU</th>
<th>Time Source</th>
</tr>
</thead>
<tbody>
<tr>
<td>66185</td>
<td>090</td>
<td>10.58</td>
<td>RUC Time</td>
</tr>
</tbody>
</table>

CPT Descriptor: Revision of aqueous shunt to extraocular equatorial plate reservoir; with graft

### KEY MPC COMPARISON CODES:

Compare the surveyed code to codes on the RUC’s MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

**Most Recent**

<table>
<thead>
<tr>
<th>MPC CPT Code 1</th>
<th>Global</th>
<th>Work RVU</th>
<th>Time Source</th>
<th>Medicare Utilization</th>
</tr>
</thead>
<tbody>
<tr>
<td>67904</td>
<td>090</td>
<td>7.97</td>
<td>RUC Time</td>
<td>54,853</td>
</tr>
</tbody>
</table>

CPT Descriptor 1: Repair of blepharoptosis; (tarso) levator resection or advancement, external approach

**Most Recent**

<table>
<thead>
<tr>
<th>MPC CPT Code 2</th>
<th>Global</th>
<th>Work RVU</th>
<th>Time Source</th>
<th>Medicare Utilization</th>
</tr>
</thead>
<tbody>
<tr>
<td>26615</td>
<td>090</td>
<td>7.07</td>
<td>RUC Time</td>
<td>1,057,533</td>
</tr>
</tbody>
</table>

CPT Descriptor 2: Open treatment of metacarpal fracture, single, includes internal fixation, when performed, each bone

### Other Reference CPT Code

<table>
<thead>
<tr>
<th>CPT Code</th>
<th>Global</th>
<th>Work RVU</th>
<th>Time Source</th>
</tr>
</thead>
<tbody>
<tr>
<td>27829</td>
<td>090</td>
<td>8.80</td>
<td>RUC Time</td>
</tr>
</tbody>
</table>

CPT Descriptor: Open treatment of distal tibiofibular joint (syndesmosis) disruption, includes internal fixation, when performed

### RELATIONSHIP OF CODE BEING REVIEWED TO TOP TWO KEY REFERENCE SERVICES:

Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by percent distribution) of the service you are rating to the top two chosen key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**
Number of respondents who choose Top Key Reference Code: 29 % of respondents: 43.9 %

Number of respondents who choose 2nd Key Reference Code: 8 % of respondents: 12.1 %

TIME ESTIMATES (Median)

### Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC’s rationale, please review the separate RUC recommendation document.

**Background:**

In October 2020, the Academy brought forward a Code Change Application requesting the revision of two existing codes, 69714 and 69717, as well as the addition of four new codes 69716-727. These new codes represent implantation, revision/replacement, and removal of a transcutaneous and percutaneous osseointegrated implants, respectively. The
Panel approved the CCA and the code is now being valued by the RUC. The new codes will be published in the 2022 edition of the CPT Book.

Survey Sample and Process:

A survey request was sent to a targeted, random selection of 533 members from the AAO-HNS, the American Neurotology Society, and the AOS (American Otological Society).

Recommendation (Work and Intra Time):

We are recommending a work RVU of **5.93 and 30 minutes of intra service time**, based on a crosswalk to CPT 53852. This is below our survey’s 25th percentile RVW and utilizes our survey’s median intra-service time.

Time package selection: We have selected pre-time package 3 and post-time package 9A due to this procedure currently being done predominantly in the hospital outpatient setting under general anesthesia.

Pre-time Package 3 Straightforward Patient/Difficult Procedure

Evaluation Time – We are recommending 32 minutes of evaluation time which is identical to the pre-service package time, based on our survey median.

Positioning Time – We are recommending 3 minutes of positioning time which is 7 minutes less than the survey median time, but consistent with the preservice package.

Scrub, Dress, Wait Time – We are recommending 10 minutes of scrub, dress and wait time which is 5 minutes less than the pre-service package time, based on our survey median.

*This results in a total recommended pre time of 45 minutes, taking the lesser of surveyed time or the pre-service package time.*

Post-time Package 9A General Anesthesia or Complex Regional Block/ Straightforward Procedure

Recommended time has been reduced to 15 minutes which is a decrease of 15 minutes from the post package time selected to match our survey time. *This results in a total recommended post time of 15 minutes, taking the lesser of surveyed time or the pre-service package time.*

Discharge Management / Post-Operative Visits

Given that this procedure is almost exclusively performed in the hospital outpatient or ASC setting, and general anesthesia sedation is utilized, patients must be monitored closely following the procedure. This results in a discharge management visit being performed after the procedure, before the patient is discharged from the hospital. Our survey did not indicate that this was typical, however, it is the RUC standard for 090 global services when performed in the hospital, so we have included **.5 discharge management visit in our recommendations for this CPT code.**

Survey respondents also indicated that two post-operative office visits are typically conducted after the procedure. One level three office visit, 99213; and one level two office visit, 99212. Our expert panel agreed.

Post op visit 1: 99213
The mastoid dressing is removed. The sutures are removed. The patient's convalescence to that point is reviewed and discussed. The neurological status is assessed. The incisions and wound are inspected and palpated. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Antibiotic ointment is placed on the wound. Patient and family questions and concerns are addressed. Ongoing care is reiterated.

Post op visit 2: 99212
The patient's convalescence to that point is reviewed. The wound is again inspected and palpated to insure full healing. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Patient and family questions and concerns are addressed. Ongoing care is reiterated. A discussion occurs regarding different hearing options now that the previous osseointegrated implant has been removed and not replaced.

**SERVICES REPORTED WITH MULTIPLE CPT CODES**

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - [ ] The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - [ ] Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - [ ] Multiple codes allow flexibility to describe exactly what components the procedure included.
   - [ ] Multiple codes are used to maintain consistency with similar codes.
   - [ ] Historical precedents.
CPT Code: 69726

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 69714

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

<table>
<thead>
<tr>
<th>Specialty</th>
<th>How often?</th>
</tr>
</thead>

</tr>
</tbody>
</table>

Estimate the number of times this service might be provided to Medicare patients nationally in a one-year period? 1

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. We estimate that 1% of future 69714 volume will have to be removed. The 2019 volume of 69714 was 993 cases, which we anticipate will drop approximately 94% to 93 cases going forward. One percent of 93 is .93, or one case per year.

<table>

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 31070
CPT Code: 69727

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 69727
Tracking Number

Original Specialty Recommended RVU: 10.98
Presented Recommended RVU: 7.13
RUC Recommended RVU: 7.13

CPT Descriptor: Removal, osseointegrated implant, skull; with magnetic transcutaneous attachment to external speech processor

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 62-year-old male with right mixed hearing loss previously had placement of a magnetic transcutaneous bone anchored implant which worked well, but has now become infected. The device is removed without replacement.

Percentage of Survey Respondents who found Vignette to be Typical: 95%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 46%, In the ASC 51%, In the office 3%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 100%, Overnight stay-less than 24 hours 0%, Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Meet with patient and family to describe and discuss in detail the planned procedure. Review and update the medical history. Perform a current physical exam paying special attention to the patient’s skin condition adequacy for closure following implant removal. Reconcile medications and allergies. Address NPO status and timing. Discuss preoperative home medications and postoperative prescriptions and check the prescription drug monitoring database, discuss. Plan the patient's expected convalescence and educate the patient and caregivers regarding the signs and symptoms of the most common and serious complications. There is confirmation of site of proposed removal site, and a detailed description is given of the postoperative changes in wound and incision and the expected cosmetic and functional results. Review and obtain informed consent. Verify that all required instruments and supplies are available. Following induction of anesthesia, the patient is positioned and prepped for the procedure. A timeout is performed with the entire surgical team, including confirmation of the procedure, locations, allergies, antibiotic prophylaxis, anesthesia and fire risks, expected duration, and any concerns related to the procedure. The postauricular hair is shaved and the incision is marked.

Description of Intra-Service Work: An incision is performed followed by a meticulous dissection through the pericranium. A subperiosteal dissection is performed and the previous implant is exposed. The cranial bone surrounding the osseointegrated titanium transducer and the respective fixture screws in the patient's skull is drilled out to free the implant. The wound is thoroughly inspected for the cause of the patient’s original complication related to the implant. The wound is irrigated and hemostasis is obtained. The wound is closed in a layered fashion.

Description of Post-Service Work: The prepped areas of the respective donor and recipient sites are cleaned. A dressing is applied to the donor site. A compression dressing is fashioned and is wrapped around the head to compress the recipient site. The patient is observed during emergence from anesthesia. Dictation and postoperative orders are performed. Discharge medications are reconciled and prescriptions are written. Instructions, appropriate discharge timing, follow up, and precautions are discussed with the postoperative nursing team. Communication with the referring physician is then performed. There is a discussion with the family regarding the procedure and findings. The patient is then seen after emergence from general anesthesia to check the patient’s neurologic status, wound for signs of hematoma, or other complications. There is reiteration of the convalescence, precautions, follow up appointments, expected postoperative course, signs and symptoms of complications, and review the written postoperative instructions.
Post op visit 1: 99213
The mastoid dressing is removed. The sutures are removed. The patient's convalescence to that point is reviewed and discussed. The neurological status is assessed. The wound is inspected and palpated. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Antibiotic ointment is placed on the wound. Patient and family questions and concerns are addressed. Ongoing care is reiterated.

Post op visit 2: 99212
The patient's convalescence to that point is reviewed. The wound is again inspected and palpated to insure full healing. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Patient and family questions and concerns are addressed. Ongoing care is reiterated. A discussion occurs regarding different hearing options now that the previous osseointegrated implant has been removed and not replaced.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC’s rationale, please review the separate RUC recommendation document.

Background:

In October 2020, the Academy brought forward a Code Change Application requesting the revision of two existing codes, 69714 and 69717, as well as the addition of four new codes 69716-727. These new codes represent implantation, revision/replacement, and removal of a transcutaneous and percutaneous osseointegrated implants, respectively. The
Panel approved the CCA and the code is now being valued by the RUC. The new codes will be published in the 2022 edition of the CPT Book.

Survey Sample and Process:

A survey request was sent to a targeted, random selection of 533 members from the AAO-HNS, the American Neurotology Society, and the AOS (American Otological Society).

Recommendation (Work and Intra Time):

We are recommending a work RVU of **7.13 and 45 minutes of intra service time**, based on a crosswalk to CPT 37718. This is below our survey’s 25th percentile RVW.

**Time package selection:** We have selected pre-time package 3 and post-time package 9A due to this procedure currently being done predominantly in the hospital outpatient setting under general anesthesia.

Pre-time Package 3 Straightforward Patient/Difficult Procedure

Evaluation Time – We are recommending 33 minutes of evaluation time which is identical to the pre-service package time, based on our survey median.

Positioning Time – We are recommending 3 minutes of positioning time which is 7 minutes less than the survey median time, but consistent with the preservice package.

Scrub, Dress, Wait Time – We are recommending 10 minutes of scrub, dress and wait time which is 5 minutes less than the pre-service package time, based on our survey median.

This results in a total recommended pre time of 46 minutes, taking the lesser of surveyed time or the pre-service package time.

Post-time Package 9A General Anesthesia or Complex Regional Block/ Straightforward Procedure

Recommended time has been reduced to 15 minutes which is a decrease of 15 minutes from the post package time selected to match our survey time. This results in a total recommended post time of 15 minutes, taking the lesser of surveyed time or the pre-service package time.

Discharge Management / Post-Operative Visits

Given that this procedure is almost exclusively performed in the hospital outpatient or ASC setting, and general anesthesia sedation is utilized, patients must be monitored closely following the procedure. This results in a discharge management visit being performed after the procedure, before the patient is discharged from the hospital. Our survey did not indicate that this was typical, however, it is the RUC standard for 090 global services when performed in the hospital, so we have included **.5 discharge management visit in our recommendations for this CPT code.**

Survey respondents also indicated that two post-operative office visits are typically conducted after the procedure. One level three office visit, 99213 and one level two office visit, 99212. Our expert panel agreed.

**Post op visit 1: 99213**
The mastoid dressing is removed. The sutures are removed. The patient's convalescence to that point is reviewed and discussed. The neurological status is assessed. The wound is inspected and palpated. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Antibiotic ointment is placed on the wound. Patient and family questions and concerns are addressed. Ongoing care is reiterated.

**Post op visit 2: 99212**
The patient's convalescence to that point is reviewed. The wound is again inspected and palpated to insure full healing. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Patient and family questions and concerns are addressed. Ongoing care is reiterated. A discussion occurs regarding different hearing options now that the previous osseointegrated implant has been removed and not replaced.

**SERVICES REPORTED WITH MULTIPLE CPT CODES**

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- [ ] The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- [ ] Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- [ ] Multiple codes allow flexibility to describe exactly what components the procedure included.
- [ ] Multiple codes are used to maintain consistency with similar codes.
Historical precedents.
Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

**FREQUENCY INFORMATION**

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 69714

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

<table>
<thead>
<tr>

A 16-year-old female with chronic otitis media and conductive hearing loss who previously received a percutaneous bone anchored implant has chronic inflammation at the abutment site that has been unresponsive to medical therapy. The device is removed and a new device is placed at a different site.

CPT Code: 69717

A 59-year-old female with a right mixed hearing loss previously had placement of a magnetic transcutaneous bone anchored implant. It worked well, but she has developed discomfort at the device site. The device is removed and a new device is placed at a different site.

CPT Code: 69719

A 59-year-old female with a right mixed hearing loss had previous placement of a percutaneous bone anchored implant. It worked well, but she has developed discomfort at the device site. The device is removed without replacement.

CPT Code: 69726

A 62-year-old male with a right mixed hearing loss previously had placement of a magnetic transcutaneous bone anchored implant which worked well, but has now become infected. The device is removed without replacement.

CPT Code: 69727

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

Our specialty formed a panel of experts to develop practice expense recommendations for this family of codes. The panel was comprised of our RUC Advisor and multiple clinical experts who practice in the areas of general otolaryngology, sleep medicine, and otology. The expert panel members also practice across in settings that vary by size, geography, and represent both private and academic settings.

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code, but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here (for service reviewed prior to the implementation of clinical activity codes, detail is not provided in the RUC database, please contact Samantha Ashley at samantha.ashley@ama-assn.org for PE spreadsheets for your reference codes):

Existing codes 69714 and 69717 were utilized as comparison codes for all new codes in the family.

3. Is this code(s) typically reported with an E/M service?

No

4. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time:

N/A

5. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies for the code family, please provide compelling evidence (please see PE compelling evidence
guidelines) Please explain if the increase can be entirely accounted for because of an increase in physician time:

N/A

6. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (please see second worksheet in PE spreadsheet workbook), please explain the difference here:

N/A

7. Please provide a brief description of the clinical staff work for the following:
   a. Pre-Service period:
      
      During the pre-service clinical staff are completing pre-service diagnostic and referral forms, coordinating pre-surgery services including test results, scheduling space and equipment in the facility, providing pre-service education and obtaining consent from the patient, and completing pre-procedure phone calls and prescriptions.
   
   b. Service period (includes pre, intra and post):
      
      During the service period the clinical staff assist with a half discharge management visit for the patient. This includes post-procedure care instructions. They also clean the instruments used during each post operative visit.
   
   c. Post-service period:
      
      During post operative visits the patient is checked in via front-desk staff. Clinical staff collects vitals from the patient. An exam chair/table and light are required with paper covering for the exam furniture. A postoperative wound kit for removal of sutures/stapes is required. The clinical staff assists the physician with removal of the sutures.

8. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (please see second worksheet in PE spreadsheet workbook):

N/A

9. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov.

N/A

INVOICES

10. ☐ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

11. ☐ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

12. If you wish to include a supply that is not on the list (please see fourth worksheet in PE spreadsheet workbook) please provide a paid invoice. Identify and explain the invoice here:

N/A
13. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation. Please include the description, CMS supply code, unit, item quantity and unit price (if available). See documents two and three under PE reference materials on the RUC Collaboration Website for information on the contents of kits, packs and trays.

14. If you wish to include an equipment item that is not on the list (please see fifth worksheet in PE spreadsheet workbook) please provide a paid invoice. Identify and explain the invoice here:

N/A

15. Have you recommended equipment minutes for a computer or equivalent laptop/integrated computer, equipment item computer, desktop, w-monitor, ED021 or notebook (Dell Latitude D600), ED038?
   a. If yes, please explain how the computer is used for this service(s).
   b. Is the computer used exclusively as an integral component of the service or is it also used for other purposes not specific to the code?
   c. Does the computer include code specific software that is typically used to provide the service(s)?

N/A

16. List all the equipment included in your recommendation and the equipment formula chosen (please see document titled Calculating equipment time). If you have selected “other formula” for any of the equipment please explain here:

EQ234 suction and pressure cabinet, ENT (SMR)
EQ183 microscope, operating
EQ170 light, fiberoptic headlight w-source
EF008 chair with headrest, exam, reclining

The office visit formula was used for all these pieces of equipment.

EQ137 basic instrument pack

The instrument pack formula was used for this item.

17. If there is any other item(s) on your spreadsheet not covered in the categories above that require greater detail/explanation, please include here:

N/A

PROFESSIONAL LIABILITY INSURANCE (PLI) INFORMATION

18. If this is a PE only code please select a crosswalk based on a similar specialty mix:

ITEMIZED LIST OF CHANGES (FOLLOWING THE PE SUBCOMMITTEE MEETING)

During and immediately following the review of this tab at the PE Subcommittee meeting please revise the PE spreadsheet and summary of recommendation (PE SOR) documents based on modifications made during the meeting. Please submit the revised documents electronically to Samantha Ashley at samantha.ashley@ama-assn.org immediately following the close of business the same day that the tab is
reviewed. On the PE spreadsheet, please highlight the cells and/or use red font to show the changes made during the PE Subcommittee meeting (if you have provided any of this highlighting based on changes from the reference code prior to the PE Subcommittee meeting please remove it, so not to be confused with changes made during the meeting). In addition to those revisions please also provide an itemized list of the modifications made to the PE spreadsheet during the PE Subcommittee meeting in the space below (e.g. clinical activity CA010 obtain vital signs was reduced from 5 minutes to 3 minutes).

Clinical staff time in the preservice period remains unchanged for all codes in the family. All codes have cleaning time added in the intra service time period to allocate time to cleaning the instruments used at each post op visit. Post-operative time has changed, commensurate with the survey data and recommended post op visits. Two codes (64714/64717) have 3 post op visits and the rest of the family has 2 post op visits.

Some supplies were reduced commensurate with reducing the post-operative visits per our survey data. Additionally, we added a minimum multi-specialty pack for each post op visit and reduced individual, unnecessary line items. We also added a basic instrument pack and cleaning pack for the instruments which will be used at each post op visit. The items include a tuning fork, Frasier tip suction, and ear curettes. We removed the suture/staple pack and replaced it with just a suture pack.

Equipment times were reduced based on less office visits and lower overall office visit post time. The instrument pack formula was used for the new instrument pack and cleaning time was accounted for.
### Clinical Activity Code: 
**CA001 - Pre-Service Period**

#### Start: When patient enters office/facility for surgery/procedure:

#### End: When patient enters office/facility for surgery/procedure

### Service Period (L037D)

For new equipment items, please include the type of unit (oz, ml, unit). Please note that you must include a purchase price estimate consistent with the paid invoice in column D.
The RUC identified CPT code 93656 with Medicare utilization over 10,000 that have increased by at least 100% from 2014 through 2019. In January 2020, the RUC recommended to refer this issue to the CPT Editorial Panel in May 2020 for revision and bundling. Technology and clinical practice have changed since these codes were developed in 2011. Based on the billed together data for these and related codes, the specialty societies recommended referral to CPT to update code descriptors and likely bundle services now commonly performed together, such as 3D mapping. In October 2020, the CPT Editorial Panel revised one code (93653) to bundle with 3D mapping and to include “induction or attempted induction of an arrhythmia with right atrial pacing and recording, and catheter ablation of arrhythmogenic focus,” and another (93656) to add 3D mapping and “left atrial pacing and recording from coronary sinus or left atrium” and “intracardiac echocardiography including imaging supervision and interpretation” to their descriptors.

The surveying specialties had submitted a letter to the CPT Editorial Panel in December 2020 requesting that the coding changes for these services to be rescinded for CPT 2022 due to the specialty’s concern that the RUC survey respondents may have been confused about the coding changes. In February 2021, the CPT Editorial Panel Executive Committee did not rescind their changes, which were among the coding changes for CPT 2022. Since the request to rescind the changes was not considered by CPT until after the January 2021 RUC meeting and January 2021 was the last RUC meeting of the CPT 2022 cycle, the RUC had recommended for these services to be valued as interim for CPT 2022 and that the codes would be resurveyed and reviewed at the April 2021 RUC meeting.

93653 Comprehensive electrophysiologic evaluation with insertion and repositioning of multiple electrode catheters, induction or attempted induction of an arrhythmia with right atrial pacing and recording, and catheter ablation of arrhythmogenic focus, including intracardiac electrophysiologic 3-dimensional mapping, right ventricular pacing and recording, left atrial pacing and recording from coronary sinus or left atrium, and His bundle recording, when performed; treatment of supraventricular tachycardia by ablation of fast or slow atrioventricular pathway, accessory atrioventricular connection, cavo-tricuspid isthmus or other single atrial focus or source of atrial re-entry

The RUC reviewed the survey results from 62 cardiac electrophysiologists and recommends the survey 25th percentile work RVU of 15.00 for CPT code 93653. The RUC recommends 31 minutes of pre-service evaluation, 3 minutes of pre-service positioning, 15 minutes of pre-service scrub/dress/wait time, 120 minutes of intra-service time and 30 minutes of immediate post-service time. The RUC noted that CPT code 93653 was revised to now bundle the physician work of CPT codes 93613 Intracardiac electrophysiologic 3-dimensional mapping (List separately in addition to code for primary procedure) and 93621 Comprehensive electrophysiologic evaluation including insertion and repositioning of multiple electrode catheters with induction or attempted induction of arrhythmia; with left atrial pacing and recording from coronary sinus or left atrium (List separately in addition to code for primary procedure), which previously were separately reported add-on services.

The specialties noted that the actual ablation portion of the procedure is more intense relative to when this procedure was last valued, since the cardiac electrophysiologist is now receiving much greater feedback from the catheter that is touching the heart and now knows exactly how many grams of force are being applied. When the base procedure was last reviewed, the physician would not have been certain that the tissue was
contacted well enough to be delivering energy, which resulted in the physician delivering repeated ablation on the same spots many times, to produce an effect. The physician now knows exactly how well the catheter is contacting the tissue and is also examining the different impedance and various electrical measurements during the ablation delivery. Due to these recent improvements in technology, the lesions are now much more efficient and effective, but also because of that, the risk of causing collateral injury during the ablation delivery is much higher with each lesion delivery. For instance, the ablation treatment is much more intense in terms of risk of heart block and esophageal injury. Furthermore, while the physician is obtaining many more data points to create the 3-dimensional map, the physician still needs to make sure every one of those points are accurate as review of points is not automated.

The specialties noted that 93653 is typically the most intense service to perform among the three base codes in this family (93653, 93654 and 93656). CPT code 93653 is typically performed on a young patient who does not have other conditions and the ablation site occurs very close to the patient’s innate conduction system. There is an approximately 0.5 percent to 1 percent risk of causing heart block requiring a permanent pacemaker. The time when the physician is applying radiofrequency energy is extraordinarily intense as opposed to the other two ablation services, 93654 and 93656, which are longer procedures on generally sicker patients and the intensity is more spread out over time.

To justify a value of 15.00, the RUC compared the survey code to top key reference code 93580 Percutaneous transcatheater closure of congenital interatrial communication (ie, Fontan fenestration, atrial septal defect) with implant (work RVU= 17.97, intra-service time of 120 minutes, total time of 210 minutes) and noted that both services involve an identical amount of intra-service time and that 80 percent of the survey respondents who selected the top key reference code also indicated that the survey code is a more intense and complex procedure to perform. However, the reference code involves more total time. The RUC also compared the survey code to 2nd key reference code 33340 Percutaneous transcatheater closure of the left atrial appendage with endocardial implant, including fluoroscopy, transseptal puncture, catheter placement(s), left atrial angiography, left atrial appendage angiography, when performed, and radiological supervision and interpretation (work RVU= 14.00, intra-service time of 90 minutes, total time of 183 minutes) and noted that the survey code involves much more intra-service time and somewhat more total time. 75 percent of the survey respondents who selected this reference code indicated the survey code was more intense and complex, however, the RUC recommendation of 15.00 has a lower intensity than the reference code. The specialty noted and the RUC concurred that there are very few major surgical procedures that comprise 000-day or XXX global periods to use as reference codes to compare to the survey code. The RUC concluded that CPT code 93653 should be valued at the 25th percentile work RVU as supported by the resurvey. The RUC recommends a work RVU of 15.00 for CPT code 93653.

93654 Comprehensive electrophysiologic evaluation with insertion and repositioning of multiple electrode catheters, induction or attempted induction of an arrhythmia with right atrial pacing and recording, and catheter ablation of arrhythmogenic focus, including intracardiac electrophysiologie 3-dimensional mapping, right ventricular pacing and recording, left atrial pacing and recording from coronary sinus or left atrium, and His bundle recording, when performed; with treatment of ventricular tachycardia or focus of ventricular ectopy including left ventricular pacing and recording, when performed

The RUC reviewed the survey results from 63 cardiac electrophysiologists and recommends the survey 25th percentile work RVU of 18.10 for CPT code 93654. The RUC recommends 40 minutes of pre-service evaluation, 3 minutes of pre-service positioning, 15 minutes of pre-service scrub/dress/wait time, 200 minutes of intra-service time and 33 minutes of immediate post-service time. The RUC noted that, unlike codes 93653 and 93655, the work of intracardiac electrophysiologic 3D mapping was already bundled into this service prior to the CPT revisions.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.
The specialties noted that the actual ablation portion of the procedure is more intense relative to when this procedure was last valued, since the cardiac electrophysiologist is now receiving much more feedback from the catheter that is touching the heart and now knows exactly how many grams of force are being applied. When the base procedure was last reviewed, the physician would not have been certain that the tissue was contacted well enough to be delivering energy, which resulted in the physician delivering repeated ablation on the same spots many times, to produce an effect. The physician now knows exactly how well the catheter is contacting the tissue and is also examining the different impedance and various electrical measurements during the ablation delivery. Due to these recent improvements in technology, the lesions are now much more efficient and effective, but also because of that, the risk of causing collateral injury during the ablation delivery is much higher with each lesion delivery. The ablation treatment is much more intense in terms of risk of heart block and esophageal injury. Furthermore, while the physician is obtaining many more points to create the 3-dimensional map, they still need to make sure every one of those points are accurate as review of points is not automated.

In addition, the specialties noted that ventricular tachycardia patients are the most complicated, often with recurrent heart failure admissions and these patients typically have with an implantable defibrillator. The defibrillator must be turned off prior to the procedure and the patient requires more pre-service evaluation time to make sure that they are hemodynamically stable prior to and throughout the procedure.

To justify a work value of 18.10, the RUC compared the survey code to CPT code 93581 Percutaneous transcatheater closure of a congenital ventricular septal defect with implant (work RVU= 24.39, intra-service time of 180 minutes, total time of 270 minutes) and noted that the survey code involves 20 more minutes of intra-service time and 21 more minutes of total time. The RUC also compared the survey code to CPT code 33978 Removal of ventricular assist device; extracorporeal, biventricular (work RVU= 25.00, intra-service time of 200 minutes, total time of 355 minutes) and noted that although both services involve an identical amount of intra-service time, it would be appropriate to value the survey code somewhat lower due to the disparity in total time. The specialty noted and the RUC concurred that there are very few major surgical procedures that comprise 000-day or XXX global periods to use as reference codes to compare to the survey code. The RUC concluded that CPT code 93654 should be valued at the 25th percentile work RVU as supported by the resurvey. The RUC recommends a work RVU of 18.10 for CPT code 93654.

93655 Intracardiac catheter ablation of a discrete mechanism of arrhythmia which is distinct from the primary ablated mechanism, including repeat diagnostic maneuvers, to treat a spontaneous or induced arrhythmia (List separately in addition to code for primary procedure)

The RUC reviewed the survey results from 63 cardiac electrophysiologists and recommends the survey 25th percentile work RVU of 7.00 for CPT code 93655. The RUC recommends 60 minutes of intra-service time for this add-on service.

To support a work value of 7.00, the RUC compared the survey code to CPT code 93592 Percutaneous transcatheater closure of paravalvular leak; each additional occlusion device (List separately in addition to code for primary procedure) (work RVU= 8.00, intra-service and total time of 60 minutes) and noted that both add-on codes have identical times, whereas the reference code involves somewhat more intense physician work. The RUC also compared the survey code to CPT code 34820 Open iliac artery exposure for delivery of endovascular prosthesis or iliac occlusion during endovascular therapy, by abdominal or retroperitoneal incision, unilateral (List separately in addition to code for primary procedure) (work RVU= 7.00, intra-service and total time of 60 minutes) and noted that both services have identical times. The RUC concluded that CPT code 93655 should be valued at the 25th percentile work RVU as supported by the resurvey. The RUC recommends a work RVU of 7.00 for CPT code 93655.
93656 Comprehensive electrophysiologic evaluation including transseptal catheterizations, insertion and repositioning of multiple electrode catheters with intracardiac catheter ablation of atrial fibrillation by pulmonary vein isolation, including intracardiac electrophysiologic 3-dimensional mapping, intracardiac echocardiography including imaging supervision and interpretation, induction or attempted induction of an arrhythmia including left or right atrial pacing/recording, right ventricular pacing/recording, and His bundle recording, when performed

The RUC reviewed the survey results from 61 cardiac electrophysiologists and recommends the survey 25th percentile work RVU of 17.00 for CPT code 93656. The RUC recommends 35 minutes of pre-service evaluation, 3 minutes of pre-service positioning, 15 minutes of pre-service scrub/dress/wait time, 180 minutes of intra-service time and 30 minutes of immediate post-service time. The RUC noted that CPT code 93656 was revised to now bundle the physician work of CPT codes 93613 Intracardiac electrophysiologic 3-dimensional mapping (List separately in addition to code for primary procedure) and 93662 Intracardiac echocardiography during therapeutic/diagnostic intervention, including imaging supervision and interpretation (List separately in addition to code for primary procedure), which previously were separately reported add-on services.

The specialties noted that the actual ablation portion of the procedure is more intense relative to when this procedure was last valued, since the cardiac electrophysiologist is now receiving much more feedback from the catheter that is touching the heart and now knows exactly how many grams of force are being applied. When the base procedure was last reviewed, the physician would not have been certain that the tissue was contacted well enough to be delivering energy, which resulted in the physician delivering repeated ablation on the same spots many times, to produce an effect. The physician now knows exactly how well the catheter is contacting the tissue and is also examining the different impedance and various electrical measurements during the ablation delivery. Due to these recent improvements in technology, the lesions are now much more efficient and effective, but also because of that, the risk of causing collateral injury during the ablation delivery is much higher with each lesion delivery. The ablation treatment is much more intense in terms of risk of heart block and esophageal injury. Furthermore, while the physician is obtaining many more points to create the 3-dimensional map, they still need to make sure every one of those points are accurate as review of points is not automated.

To justify a value of 17.00, the RUC compared the survey code to CPT code 93581 Percutaneous transcatheter closure of a congenital ventricular septal defect with implant (work RVU= 24.39, intra-service time of 180 minutes, total time of 270 minutes) and noted that both services involve an identical amount of intra-service time, whereas the reference code involves slightly more total time and is also slightly more intense to perform. The RUC also compared the survey code to CPT code 33978 Removal of ventricular assist device; extracorporeal, biventricular (work RVU= 25.00, intra-service time of 200, total time of 355) and noted that the reference code involves 20 more minutes of intra-service time and 92 more minutes of total time, justifying a lower valuation for the survey code. The specialty noted and the RUC concurred that there are very few major surgical procedures that comprise 000-day or XXX global periods to use as reference codes to compare to this survey code. The RUC concluded that CPT code 93656 should be valued at the 25th percentile work RVU as supported by the resurvey. The RUC recommends a work RVU of 17.00 for CPT code 93656.

93657 Additional linear or focal intracardiac catheter ablation of the left or right atrium for treatment of atrial fibrillation remaining after completion of pulmonary vein isolation (List separately in addition to code for primary procedure)

The RUC reviewed the survey results from 61 cardiac electrophysiologists and recommends the survey 25th percentile work RVU of 7.00 for CPT code 93657. The RUC recommends 60 minutes of intra-service time for this add-on service.
To support a work value of 7.00, the RUC compared the survey code to CPT code 93592 Percutaneous transcatheter closure of paravalvular leak; each additional occlusion device (List separately in addition to code for primary procedure) (work RVU= 8.00, intra-service and total time of 60 minutes) and noted that both add-on codes have identical times, whereas the reference code involves somewhat more intense physician work. The RUC also compared the survey code to CPT code 34820 Open iliac artery exposure for delivery of endovascular prosthesis or iliac occlusion during endovascular therapy, by abdominal or retroperitoneal incision, unilateral (List separately in addition to code for primary procedure) (work RVU= 7.00, intra-service and total time of 60 minutes) and noted that both services have identical times. The RUC concluded that CPT code 93657 should be valued at the 25th percentile work RVU as supported by the resurvey. **The RUC recommends a work RVU of 7.00 for CPT code 93657.**

**Affirmation of RUC Recommendations**

The RUC reviewed the specialty societies’ request to affirm the recent RUC valuations for CPT codes 93613, 93621 and 93662. The RUC noted that for 93613, this is also the code’s current 2021 CMS value. For code 93621, this service was surveyed for the October 2020 RUC meeting for CY 2022 and represents a reduction compared to the current 2021 CMS value.

For code 93662, the RUC recommendation would represent an increase compared to the current 2021 CMS value. In the CY 2021 Medicare Physician Payment Schedule Final Rule, CMS’ rationale for not accepting the RUC recommendation and instead implementing a lower value for 93662 was the 45 percent decrease in total time from when the service was previously surveyed in 2000. The Agency’s 1.44 work value was derived from using a work value crosswalk to code 92979 Endoluminal imaging of coronary vessel or graft using intravascular ultrasound (IVUS) or optical coherence tomography (OCT) during diagnostic evaluation and/or therapeutic intervention including imaging supervision, interpretation and report; each additional vessel (List separately in addition to code for primary procedure). Unfortunately, the coronary IVUS crosswalk code (92979) that CMS had used to determine an alternate valuation was flawed because the nature of the services performed, intensity and work involved are different, with intracardiac echocardiography (ICE) and intravascular ultrasound (IVUS) performed in different parts of the heart for different reasons. Coronary IVUS is performed inside the coronary arteries to guide diagnostic catheterization and/or percutaneous coronary interventions. ICE is used to provide high-resolution real-time visualization of cardiac structures, continuous monitoring of a catheter location within the heart. It commonly guides trans-septal puncture where the operator creates a hole in the septum of the heart to gain access to the other cardiac chambers on the other side of the heart and is useful for early recognition of procedural complications, such as pericardial effusion or thrombus formation. ICE remains highly technical in nature and requires the patient to be anesthetized, which is not required in IVUS use. ICE is most used with atrial fibrillation ablations, a highly technical and challenging service, this reinforces the intensity of ICE.

The RUC recommendation for CPT code 93662 was based on the survey 25th percentile work RVU from robust survey results of 42 cardiologists as well as a favorable comparison to code 34713 Percutaneous access and closure of femoral artery for delivery of endograft through a large sheath (12 French or larger), including ultrasound guidance, when performed, unilateral (List separately in addition to code for primary procedure) (work RVU = 2.50 and intra-service time of 20 minutes) and MPC code 36476 Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; subsequent vein(s) treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure) (work RVU = 2.65 and intra-service time of 30 minutes). Both reference services bracket code 93662 in both physician work and time.

**The RUC recommends affirming the recent RUC-recommended work RVU of 5.23 for CPT code 93613, 1.75 for CPT code 93621 and 2.53 for CPT code 93662.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.
Practice Expense
No direct practice expense inputs are recommended for CPT codes 93653-93657 as they are facility-only services.

Work Neutrality
The RUC’s recommendation for this family of codes will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

Description of Pre-Service Work: The procedure and the risks, benefits, and alternatives associated with electrophysiology testing and supraventricular tachycardia ablation are explained to the patient. Management of antiarrhythmic medications is communicated to the patient. Arrangements are made for the X-ray technician, electrophysiology laboratory technician, and nurse. Informed consent is obtained. The patient is evaluated on the day of the procedure with a history and physical examination. Preprocedure laboratory testing is reviewed as well as current medications and changes in health status.

Description of Intra-Service Work: Local analgesia is administered along with anesthesia appropriate to the patient including moderate sedation. Venous access is obtained. Arterial access to monitor blood pressure and to facilitate retrograde aortic access to the left ventricle may be obtained. Multi-electrode catheters are advanced from the access sheaths and into the respective cardiac chambers where they will be used to pace and record. Pacing and sensing is performed in the right atrium, left atrium, and right ventricle. His bundle recording is obtained. Refractory periods are measured. Attempts at arrhythmia induction are performed via maneuvers that include burst pacing and premature pacing using programmed electrical stimulation at multiple drive cycle lengths from multiple atrial and ventricular sites.

Once the SVT is induced, pacing maneuvers are performed to elucidate the mechanism of the tachycardia. A combination of diagnostic maneuvers is performed and a high definition anatomical map of the chamber(s) of interest is generated. Voltage and electrical activation in the arrhythmia and/or in sinus rhythm is performed to identify normal activation, location of scar, and mechanism of the arrhythmia. 3-dimensional mapping activation and voltage mapping may be performed to assist in identifying the arrhythmia mechanism, substrate, cardiac anatomy, and to guide catheter ablation. Catheter ablation may then be performed. An ablation catheter is maneuvered from the sites of vascular access to the appropriate cardiac location to facilitate delivery of ablative energy. Multiple lesions are delivered to ensure eradication of the arrhythmia focus and to provide consolidation lesions in the surrounding tissue.
During the course of an electrophysiology procedure, an arrhythmia is induced that requires use of advanced 3D computer mapping system to assist in identifying the arrhythmia circuit, localizing the origin (for focal arrhythmias) or the critical isthmus (reentrant arrhythmias). The 3D mapping system is calibrated, and recordings are made during sinus rhythm (to identify normal activation and location of scar) and during each distinct arrhythmia. The physician then analyzes the computer-generated map, ensuring that electrograms are annotated correctly and that the display parameters are correct for the specific arrhythmia being mapped. Based upon the data from the 3D mapping system, endocardial electrograms, surface ECG and the response of the SVT to pacing maneuvers, the ablation catheter is advanced to the point of earliest activation, localized by the mapping system, to identify a mid-diastolic potential, Kent potential, and/or similar paced maps. When a reentrant circuit is identified, entrainment mapping studies are performed and evaluated to confirm the catheter location is within the reentrant circuit. Radiofrequency (or cryo) ablation is then performed. If initial mapping in one chamber does not lead to complete identification of the essential arrhythmia circuit (either based on analysis of the map or based on incomplete ablation result, then the mapping catheter(s) is/are moved into another cardiac chamber and an additional 3D map is generated to aid in diagnosis; this is repeated until the arrhythmia mechanism is fully characterized and ablation is deemed completely successful. A final report that includes the mapping procedure and findings is prepared.

To record left atrial activity, femoral venous access site is already prepared for related procedure. Achieve central venous access, place a sheath in the femoral vein using standard percutaneous techniques, changing to subclavian or jugular access if that fails. Introduce the catheter into the sheath and advance into the right atrium where the ostium of the coronary sinus is engaged. Advance the catheter into the coronary sinus. Use the multielectrode catheter to record electrical activity from the left atrium and, at times, pace the left atrium to attempt arrhythmia induction. Reposition the catheter as necessary throughout the course of the cardiac electrophysiology procedure to optimize recordings and pacing thresholds. At the conclusion of the procedure, remove the catheter. Include a description of this additional work and catheter use and associated findings in the procedure report.

Throughout the ablation the patient is monitored for hemodynamic compromise due to cardiac perforation, - or tachyarrhythmias, embolic phenomena, or damage to cardiac or vascular structures. Following the ablation portion of the procedure, repeat electrophysiologic testing is performed to assess the outcome of ablation using decremental, burst, and premature pacing maneuvers. These are again repeated following a 30-minute waiting period following the conclusion of the final ablation lesion. If the tachycardia demonstrates recovery or incomplete suppression, then repeat mapping and ablation are performed as described above. These steps are repeated until the tachycardia is rendered durably suppressed. Sheaths are removed, appropriate hemostasis is achieved, and follow-up assessment of the patient for any complications is performed.

Description of Post-Service Work: The patient is monitored in the recovery unit for delayed complications. Results of the procedure are discussed with the patient and the patient's family, and postprocedure assessments are performed.

---

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

*The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC’s rationale, please review the separate RUC recommendation document.*

**History Background**

When the Relativity Assessment Workgroup identified CPT code 93656 (atrial fibrillation ablation) due to its rapid increase in growth, the ACC and HRS reviewed the code and determined that certain work should be bundled into the existing code due to their being billed together more than 75% of the time. With continued review of 93656 and the related the volume data, the societies also identified that CPT 93653 (SVT ablation) should have services bundled into it before the codes are
CPT Code: 93653

re-surveyed for upcoming RUC valuation. As a result, in October 2020, the ACC and HRS presented a code change application to the CPT Editorial Panel on codes: 93653, 93654, 93655, 93656, 93657. As indicated in the summary spreadsheet, revised 93653 is now a more comprehensive, bundled service that includes the work of 3D mapping (93613) and left atrial pacing/recording (93621). The societies surveyed members late 2020 and presented data in January 2021. Due to inconsistencies in the survey data and in order to better convey the bundled services to respondents, the ACC and HRS resurveyed members March 2021.

The ACC and HRS randomly surveyed cardiac electrophysiologists, as designated by membership rolls, on the newly created codes and entire family. The 000- and ZZZ-global day survey was completed by physicians who have experience with the service. To remedy the above-described shortcomings, the societies work with the Research Subcommittee to deploy several tactics to obtain more consistent survey results. First, fake/dummy codes were used in the survey so that respondents would not presume to know the code descriptors. Second, additional language noting the bundling was included in the survey invitation. Third, respondents were required to attest they had read and understood the new language before completing the survey.

The key reference code is 93580 for percutaneous transcatheter closure of a congenital interatrial communication. It was selected by approximately 32% of respondents. 80% of the respondents indicated that 93653 was more complex. The second reference code was 33340 for percutaneous transcatheter closure of left atrial appendage with endocardial implant. It was selected by over 25% of respondents. About 75% of the respondents indicated that 93653 was more intense/complex overall.

Rationale

In reviewing the survey data to develop work recommendations, the expert panel believes the data accurate reflects the newly bundled services, 93653 and 93656. The societies believe the technological advances made in patient care indicate survey respondents understood that 3D mapping and left atrial pacing were now inherent to 93653. After nearly a decade and many changes in technology and broader service dispersion have clearly altered the way this service is provided, Over time, the mapping systems have improved, now providing much more detailed and accurate anatomical and electrical activation mapping, often removing the need for fluoroscopy completely. Catheter technology has advanced, providing real-time assessment of the quality of contact between the catheter tip and the endocardial tissue. Last, the 3D mapping systems in conjunction with new catheter technology are now able to provide real-time assessment of the quality of radiofrequency ablation lesion formation. This feature has allowed operators to significantly shorten the duration of each radiofrequency application while also improving the quality of the lesions delivered. The results indicate survey respondents understood that 3D mapping and left atrial pacing were now inherent to 93653. After nearly a decade and many changes in technology and broader service dispersion, a reduction in intraservice times is logical for performing this procedure. The societies support the resurvey data and stand behind the 25th survey value.

While we recognize that in some ways the resurvey may be viewed as a failure, we believe the general consistency with the initial survey—demonstrating reductions in intraservice time—provides insights and a foundation to develop final recommendations for this family. First, with the additional information and tactics taken in the resurvey, we have no reason to believe respondents failed to understand the bundling that has occurred. Rather, we now have confidence that in the survey and the survey-based recommendations we make. Second, in digesting the data from the two surveys, we believe the reductions in time can, in fact, be explained by evolutions in technology and service dispersion, as discussed above. We can speak to this in more detail if helpful. Finally, the resurvey does provide a viable path forward for valuation, as the survey 25th-percentile work RVUs proceed in a reasonable progression that align with other services in the fee schedule. We recognize these recommendations produce an increase in intensity as the drop in time is not 1:1 proportionate with the drop in RVU. We believe that increase is best explained by the fact that several separately reported services are now bundled together, with work being done more quickly and several services being combined in a way that makes meaningful comparison to the prior intensity unhelpful.

Recommendation

During the January meeting, several RUC members questioned whether codes 93613, 93621 and 93662 should also be addressed in the recommendations for cardiac ablation services. These codes are bundled into CPT codes 93653 and/or 93656. Each was recently surveyed by the specialties and the RUC in 2017, 2020, 2019, respectively. As such, the societies recommend affirming the recent times and RVUs of these recently valued codes, as they remain separate in CPT for use in concert with other CPT codes.
Therefore, for code 93653 the societies recommend, the survey 25th of RVW of 15.00 with 49 minutes preservice time from package 4 with 14 minutes removed, 120 minutes intraservice time from the survey median, and 30 minutes postservice time with 3 minutes removed from package 9B. This logically aligns with the KRS 93580 in terms of IWPUT, total time, and intraservice time. Survey respondents felt 93580 was less complex and had a shorter preservice time than 93653. This recommendation also produces a work RVU savings from the current, component-coded services. The survey 25th percentile recommendation is further supported, as results from the original RUC survey and comparison to other codes (37227, 33340) from the fee schedule, as shown in the summary spreadsheet.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)
   - The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - Multiple codes allow flexibility to describe exactly what components the procedure included.
   - Multiple codes are used to maintain consistency with similar codes.
   - Historical precedents.
   - Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 93653, 93613, 93621

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Cardiac Electrophysiology How often? Commonly

Specialty Cardiology How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 63642
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Figure is about twice the Medicare-based claims volume.

Specialty Cardiac electrophysiology Frequency 50022 Percentage 78.59 %

Specialty Cardiology Frequency 11902 Percentage 18.70 %

Specialty Frequency 0 Percentage 0.00 %
Estimate the number of times this service might be provided to Medicare patients nationally in a one-year period? 31,821 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Figure reflects 2019e Medicare-based claims.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 93654 Tracking Number: Y2
Original Specialty Recommended RVU: 18.10
Presented Recommended RVU: 18.10
RUC Recommended RVU: 18.10

Global Period: 000
Current Work RVU: 19.75

CPT Descriptor: Comprehensive electrophysiologic evaluation with insertion and repositioning of multiple electrode catheters, induction or attempted induction of an arrhythmia with right atrial pacing and recording, and catheter ablation of arrhythmogenic focus, including intracardiac electrophysiologic 3-dimensional mapping, right ventricular pacing and recording, left atrial pacing and recording from coronary sinus or left atrium, and His bundle recording, when performed; with treatment of ventricular tachycardia or focus of ventricular ectopy including left ventricular pacing and recording, when performed
(Do not report 93654 in conjunction with 93279-93284, 93286-93289, 93600-93603, 93609, 93610, 93612, 93613, 93618-93620, 93622, 93642, 93653, 93656)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 73-year-old male with a history of New York Heart Association Class III heart failure due to ischemic dilated cardiomyopathy (ef 25%) and prior myocardial infarction presents with recurrent implantable cardioverter-defibrillator (icd) therapies for drug-refractory ventricular tachycardia.

Percentage of Survey Respondents who found Vignette to be Typical: 94%

Percentage of survey respondents who stated they perform the procedure; In the hospital 0%, In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is;
Discharged the same day 0%, Overnight stay-less than 24 hours 0%, Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: The procedure and the risks, benefits, and alternatives associated with electrophysiology testing and ventricular tachycardia ablation are explained to the patient and the patient's family. Arrangements are made for the X-ray technician, electrophysiology laboratory technician, and nurse. The patient is evaluated on the day of the procedure with a history and physical examination and pre-procedure laboratory testing, medications, and changes in health are reviewed. Informed consent is obtained. Direct current cardioversion/defibrillation, electrophysiology (EP), and ablation equipment is confirmed to be present and in proper working order. Fluoroscopic equipment that will be used to visualize catheter movements and location is tested. Three-dimensional mapping equipment is tested and confirmed to be functioning normally.

Description of Intra-Service Work: Local analgesia is administered. Patients with implantable cardioverter-defibrillators will have their devices reprogrammed and/or transiently deactivated at the start of the case so as to minimize adverse consequences resulting from electromagnetic interference from radiofrequency current application.

Venous access is obtained. Arterial access to monitor blood pressure and to facilitate retrograde aortic access to the left ventricle is obtained. Multi-electrode catheters are advanced from the access sheaths and into the respective cardiac chambers where they will be used to pace and record. Papillary muscles are also recorded in the three-dimensional anatomical ultrasound map. Pacing and sensing is performed in the right atrium and right ventricle. His bundle recording is obtained. Refractory periods are measured. Attempts at ventricular tachycardia induction are performed via burst pacing, decremental pacing, and premature pacing using programmed electrical stimulation at multiple drive cycle lengths from multiple ventricular sites.
To record left atrial activity, femoral venous access site is already prepared for related procedure. Achieve central venous access, place a sheath in the femoral vein using standard percutaneous techniques, changing to subclavian or jugular access
if that fails. Introduce the catheter into the sheath and advance into the right atrium where the ostium of the coronary sinus is engaged. Advance the catheter into the coronary sinus. Use the multielectrode catheter to record electrical activity from the left atrium and, at times, pace the left atrium to attempt arrhythmia induction. Reposition the catheter as necessary throughout the course of the cardiac electrophysiology procedure to optimize recordings and pacing thresholds. At the conclusion of the procedure, remove the catheter. Include a description of this additional work and catheter use and associated findings in the procedure report.

Once an arrhythmia is induced, pacing maneuvers are performed to elucidate the mechanism of the ventricular tachycardia. During the course of an electrophysiology procedure, an arrhythmia is induced that requires use of advanced 3D computer mapping system to assist in identifying the arrhythmia circuit, localizing the origin (for focal arrhythmias) or the critical isthmus (reentrant arrhythmias). The 3D mapping system is calibrated, and recordings are made during sinus rhythm (to identify normal activation and location of scar) and during each distinct arrhythmia. The physician then analyzes the computer-generated map, ensuring that electrograms are annotated correctly and that the display parameters are correct for the specific arrhythmia being mapped. Based upon the data from the 3D mapping system, endocardial electrograms, surface ECG and the response of the SVT to pacing maneuvers, the ablation catheter is advanced to the point of earliest activation, localized by the mapping system, to identify a mid-diastolic potential, Kent potential, and/or similar paced maps. When a reentrant circuit is identified, entrainment mapping studies are performed and evaluated to confirm the catheter location is within the reentrant circuit. Radiofrequency (or cryo) ablation is then performed. If initial mapping in one chamber does not lead to complete identification of the essential arrhythmia circuit (either based on analysis of the map or based on incomplete ablation result, then the mapping catheter(s) is/are moved into another cardiac chamber and an additional 3D map is generated to aid in diagnosis; this is repeated until the arrhythmia mechanism is fully characterized and ablation is deemed completely successful. Occasionally mapping of the epicardial surface of the heart is necessary. A final report that includes the mapping procedure and findings is prepared.

The electrical activation sequence is mapped with the three-dimensional electroanatomical mapping system and activation timing is superimposed upon the three-dimensional image previously obtained. Anticoagulation is administered once catheters have been placed on the left side of the heart. Once the ventricular tachycardia circuit is localized, a catheter is moved to the appropriate location or region of abnormal myocardium to deliver ablative energy. Multiple lesions are delivered to ensure eradication of the arrhythmia focus and to provide consolidation lesions in the surrounding tissue. Throughout the ablation the patient is monitored for hemodynamic compromise due to cardiac perforation, - or tachyarrhythmias, embolic phenomena, or damage to cardiac or vascular structures.

Following the ablation portion of the procedure, repeat electrophysiologic testing is performed to assess the outcome of ablation using decremental, burst, and premature pacing maneuvers. These are again repeated following a 30-minute waiting period following the conclusion of the final ablation lesion. If the tachycardia demonstrates recovery or incomplete suppression, then repeat mapping and ablation are performed as described above. These steps are repeated until the tachycardia is rendered durably suppressed. Following the ablation portion of the procedure, further electrophysiologic testing is performed to assess the outcome of ablation using decremental, burst, and premature pacing maneuvers. These are repeated following a 30-minute period following the conclusion of the final ablation lesion. Anticoagulation is reversed. Sheaths are removed, appropriate hemostasis is achieved, and follow-up assessment of the patient for any complications is performed. Patients with implantable cardioverter-defibrillators will have their devices reprogrammed to an active configuration with rates reprogrammed as necessary to treat any remaining arrhythmias.

Description of Post-Service Work: The patient is monitored in the recovery unit and then overnight in a telemetry unit for delayed complications. Results of the procedure are discussed with the patient and the patient's family, and postprocedure assessments are performed.

### Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC’s rationale, please review the separate RUC recommendation document.

### History Background

When the Relativity Assessment Workgroup identified CPT code 93656 (atrial fibrillation ablation) due to its rapid increase in growth, the ACC and HRS reviewed the code and determined that certain work should be bundled into the existing code due to their being billed together more than 75% of the time. With continued review of 93656 and the related volume data, the societies also identified that CPT 93653 (SVT ablation) should have services bundled into it before the codes are
re-surveyed for upcoming RUC valuation. As a result, in October 2020, the ACC and HRS presented a code change application to the CPT Editorial Panel on codes: 93653 and 93656, and were tasked in surveying the other codes in the family: 93654, 93655, and 93657. The societies surveyed members late 2020 and presented data in January 2021. Due to inconsistencies in the survey data and in order to better convey the bundled services to respondents, the ACC and HRS resurveyed members March 2021.

The ACC and HRS randomly surveyed cardiac electrophysiologists, as designated by membership rolls, on the newly created codes and entire family. The 000- and ZZZ-global day survey was completed by physicians who have experience with the service. To remedy the above-described shortcomings, the societies work with the Research Subcommittee to deploy several tactics to obtain more consistent survey results. First, fake/dummy codes were used in the survey so that respondents would not presume to know the code descriptors. Second, additional language noting the bundling was included in the survey invitation. Third, respondents were required to attest they had read and understood the new language before completing the survey.

The key reference code is 93580 for percutaneous transcatheter closure of a congenital interatrial communication. It was selected by approximately 33% of respondents. Approximately 95% of the respondents indicated that 93654 was more complex. The second reference code was 93590 for percutaneous transcatheter closure of paravalvular leak. It was selected by approximately 32% of respondents. About 85% of the respondents indicated that 93654 was more intense/complex overall.

Rationale

In reviewing the resurvey data to develop work recommendations, the expert panel believes the data does accurately reflect the newly bundled services, 93653 and 93656. The societies believe the technological advances made in patient care indicate survey respondents understood that 3D mapping and left atrial pacing were now inherent to 93653. After nearly a decade and many changes in technology and broader service dispersion have clearly altered the way this service is provided. Over time, the mapping systems have improved, now providing much more detailed and accurate anatomical and electrical activation mapping, often removing the need for fluoroscopy completely. Catheter technology has advanced, providing real-time assessment of the quality of contact between the catheter tip and the endocardial tissue. Last, the 3D mapping systems in conjunction with new catheter technology are now able to provide real-time assessment of the quality of radiofrequency ablation lesion formation. This feature has allowed operators to significantly shorten the duration of each radiofrequency application while also improving the quality of the lesions delivered. The results indicate survey respondents understood that 3D mapping and left atrial pacing were now inherent to 93653. After nearly a decade and many changes in technology and broader service dispersion, a reduction in intraservice times is logical for performing this procedure. The societies support the resurvey data and stand behind the 25th survey value.

While we recognize that in some ways the resurvey may be viewed as a failure, we believe the general consistency with the initial survey—demonstrating reductions in intraservice time—provides insights and a foundation to develop final recommendations for this family. First, with the additional information and tactics taken in the resurvey, we have no reason to believe respondents failed to understand the bundling that has occurred. Rather, we now have confidence that in the survey and the survey-based recommendations we make. Second, in digesting the data from the two surveys, we believe the reductions in time can, in fact, be explained by evolutions in technology and service dispersion, as discussed above. We can speak to this in more detail if helpful. Finally, the resurvey does provide a viable path forward for valuation, as the survey 25th-percentile work RVUs proceed in a reasonable progression that align with other services in the fee schedule. We recognize these recommendations produce an increase in intensity as the drop in time is not 1:1 proportionate with the drop in RVU. We believe that increase is best explained by the fact that several separately reported services are now bundled together, with work being done more quickly and several services being combined in a way that makes meaningful comparison to the prior intensity unhelpful.

Recommendation

During the January meeting, several RUC members questioned whether codes 93613, 93621 and 93662 should also be addressed in the recommendations for cardiac ablation services. These codes are bundled into CPT codes 93653 and/or 93656. Each was recently surveyed by the specialties and the RUC in 2017, 2020, 2019, respectively. As such, the societies recommend affirming the recent times and RVUs of these recently valued codes, as they remain separate in CPT for use in concert with other CPT codes.
Therefore, for code 93654 the societies recommend the survey 25th RVU of 18.10 with 58 minutes preservice time from package 4 with five minutes removed, 200 minutes intraservice time from the survey median, and 33 minutes postservice time from Post Service Package 9B. This value builds some increment from 93653 that accounts for longer time. The survey 25th percentile recommendation is further supported by results from the original RUC survey and comparison codes as shown in the summary spreadsheet.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)
   - The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - Multiple codes allow flexibility to describe exactly what components the procedure included.
   - Multiple codes are used to maintain consistency with similar codes.
   - Historical precedents.
   - Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 93654

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Cardiac Electrophysiology How often? Commonly
Specialty Cardiology How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 15500
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Figure is about twice as likely as Medicare based claims.

Specialty Cardiac electrophysiology Frequency 11935 Percentage 77.00%
Specialty Cardiology Frequency 3147 Percentage 20.30%
Specialty Frequency 0 Percentage 0.00%

Estimate the number of times this service might be provided to Medicare patients nationally in a one-year period? 7,750
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Figure reflects 2019 eMedicare based claims.
CPT Code: 93654

Specialty Cardiac electrophysiology  Frequency 5968  Percentage 77.00 %
Specialty Cardiology  Frequency 1573  Percentage 20.29 %
Specialty  Frequency 0  Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

**Berenson-Eggers Type of Service (BETOS) Assignment**
Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Cardiovascular-Other

**Professional Liability Insurance Information (PLI)**

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 93654

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

CPT Code: 93655
Tracking Number: Y3
Original Specialty Recommended RVU: 7.00
Presented Recommended RVU: 7.00
RUC Recommended RVU: 7.00

Global Period: ZZZ
Current Work RVU: 7.50

CPT Descriptor: Intracardiac catheter ablation of a discrete mechanism of arrhythmia which is distinct from the primary ablated mechanism, including repeat diagnostic maneuvers, to treat a spontaneous or induced arrhythmia
(List separately in addition to code for primary procedure)
(Use 93655 in conjunction with 93653, 93654, 93656)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 64-year-old female has undergone successful ablation of her atrial supraventricular tachycardia (SVT) focus (reported separately). Attempts to re-induce that arrhythmia reveal an additional atrial focus (also reported separately). A decision is made to ablate this additional focus following its discovery.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Site of Service (Complete for 010 and 090 Globals Only)
Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work:

Description of Intra-Service Work: A full electrophysiologic study and ablation procedure has been performed. Diagnostic and ablative electrophysiology (EP) catheters are in cardiac chambers. During the course of the post-ablation electrophysiologic evaluation, a second (or greater) arrhythmia is identified. For example, if the primary tachycardia ablated was atrioventricular (AV) nodal reentrant tachycardia and during post ablation testing, an atrial tachycardia, atrial flutter, or accessory pathway with orthotropic reentry tachycardia is identified, this would be considered a separate mechanism of tachycardia. Pacing maneuvers are performed to define the mechanism(s) of the new tachycardia(s). Mapping is performed to define the optimal ablation site or sites that are distinct from the initial ablation site(s). Catheter ablation of this distinct mechanism of tachycardia is performed at its origin. Multiple lesions are delivered to ensure eradication of the arrhythmia focus and to provide consolidation lesions in the surrounding tissue.

During the course of an electrophysiology procedure, an arrhythmia is induced that requires use of advanced 3D computer-assisted mapping system to localize the arrhythmia origin. The mapping system is placed in the cardiac chamber of interest using standard percutaneous techniques. The system is calibrated, and recordings are made during sinus rhythm to identify normal activation and location of scar during each distinct tachycardia. The computer-generated map is displayed, modifications are made in the computer parameters and display, and the tachycardia origin is identified. The ablation catheter is moved to the point of early activation, localized by the mapping system, to identify a mid-diastolic potential, Kent potential, and/or similar paced maps. When a reentrant circuit is identified, entrainment mapping studies are performed and evaluated to confirm the catheter location is within the reentrant circuit. Additional mappings are made to confirm arrhythmia origin and to study additional arrhythmias at the conclusion of the procedure. A final report that includes the mapping procedure and findings is prepared.

To record left atrial activity, femoral venous access site is already prepared for related procedure. Achieve central venous access, place a sheath in the femoral vein using standard percutaneous techniques, changing to subclavian or jugular access if that fails. Introduce the catheter into the sheath and advance into the right atrium where the ostium of the coronary sinus is
engaged. Advance the catheter into the coronary sinus. Use the multielectrode catheter to record electrical activity from the left atrium and, at times, pace the left atrium to attempt arrhythmia induction. Reposition the catheter as necessary throughout the course of the cardiac electrophysiology procedure to optimize recordings and pacing thresholds. At the conclusion of the procedure, remove the catheter. Include a description of this additional work and catheter use and associated findings in the procedure report.

Throughout the ablation the patient is monitored for hemodynamic compromise due to cardiac perforation, tachyarrhythmias, embolic phenomena, or damage to cardiac or vascular structures. Following the ablation portion of the procedure, repeat electrophysiologic testing is performed to assess the outcome of ablation using decremental, burst, and premature pacing maneuvers. These are again repeated following a 30-minute waiting period following the conclusion of the final ablation lesion. If the tachycardia demonstrates recovery or incomplete suppression, then repeat mapping and ablation are performed as described above. These steps are repeated until the tachycardia is rendered durably suppressed.

Description of Post-Service Work:

CPT Descriptor: Transcatheter placement of an intravascular stent(s) (except lower extremity artery(s) for occlusive disease, cervical carotid, extracranial vertebral or intrathoracic carotid, intracranial, or coronary), open or percutaneous, including radiological supervision and interpretation and including all angioplasty within the same vessel, when performed; each additional artery (List separately in addition to code for primary procedure)

**KEY MPC COMPARISON CODES:**
Compare the surveyed code to codes on the RUC’s MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

CPT Descriptor 2

**RELATIONSHIP OF CODE BEING REVIEWED TO TOP TWO KEY REFERENCE SERVICES:**
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by percent distribution) of the service you are rating to the top two chosen key reference services listed above. Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.

Number of respondents who choose Top Key Reference Code: 15 % of respondents: 23.8 %
Number of respondents who choose 2nd Key Reference Code: 13 % of respondents: 20.6 %

### Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

*The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC’s rationale, please review the separate RUC recommendation document.*

### History Background

When the Relativity Assessment Workgroup identified CPT code 93656 (atrial fibrillation ablation) due to its rapid increase in growth, the ACC and HRS reviewed the code and determined that certain work should be bundled into the existing code due to their being billed together more than 75% of the time. With continued review of 93656 and the related volume data, the societies also identified that CPT 93653 (SVT ablation) should have services bundled into it before the codes are
The ACC and HRS randomly surveyed cardiac electrophysiologists, as designated by membership rolls, on the newly created codes and entire family. The 000- and ZZZ-global day survey was completed by physicians who have experience with the service. To remedy the above-described shortcomings, the societies work with the Research Subcommittee to deploy several tactics to obtain more consistent survey results. First, fake/dummy codes were used in the survey so that respondents would not presume to know the code descriptors. Second, additional language noting the bundling was included in the survey invitation. Third, respondents were required to attest they had read and understood the new language before completing the survey.

The key reference code is 35306 for thromboendarterectomy. It was selected by approximately 24% of respondents. 60% of the respondents indicated that 93655 was more complex. The second reference code was 32737 for Transcatheter placement of an intravascular stent(s). It was selected by approximately 20% of respondents. About 46% of the respondents indicated that 93655 was more intense/complex overall.

Rationale

In reviewing the survey data to develop work recommendations, the expert panel believes the data accurate reflects the newly bundled services, 93653 and 93656. The societies believe the technological advances made in patient care indicate survey respondents understood that 3D mapping and left atrial pacing were now inherent to 93653. After nearly a decade and many changes in technology and broader service dispersion have clearly altered the way this service is provided. Over time, the mapping systems have improved, now providing much more detailed and accurate anatomical and electrical activation mapping, often removing the need for fluoroscopy completely. Catheter technology has advanced, providing real-time assessment of the quality of contact between the catheter tip and the endocardial tissue. Last, the 3D mapping systems in conjunction with new catheter technology are now able to provide real-time assessment of the quality of radiofrequency ablation lesion formation. This feature has allowed operators to significantly shorten the duration of each radiofrequency application while also improving the quality of the lesions delivered. The results indicate survey respondents understood that 3D mapping and left atrial pacing were now inherent to 93653. After nearly a decade and many changes in technology and broader service dispersion, a reduction in intraservice times is logical for performing this procedure. The societies support the resurvey data and stand behind the 25th survey value.

While we recognize that in some ways the resurvey may be viewed as a failure, we believe the general consistency with the initial survey—demonstrating reductions in intraservice time—provides insights and a foundation to develop final recommendations for this family. First, with the additional information and tactics taken in the resurvey, we have no reason to believe respondents failed to understand the bundling that has occurred. Rather, we now have confidence that in the survey and the survey-based recommendations we make. Second, in digesting the data from the two surveys, we believe the reductions in time can, in fact, be explained by evolutions in technology and service dispersion, as discussed above. We can speak to this in more detail if helpful. Finally, the resurvey does provide a viable path forward for valuation, as the survey 25th-percentile work RVUs proceed in a reasonable progression that align with other services in the fee schedule. We recognize these recommendations produce an increase in intensity as the drop in time is not 1:1 proportionate with the drop in RVU. We believe that increase is best explained by the fact that several separately reported services are now bundled together, with work being done more quickly and several services being combined in a way that makes meaningful comparison to the prior intensity unhelpful.

Recommendation

During the January meeting, several RUC members questioned whether codes 93613, 93621 and 93662 should also be addressed in the recommendations for cardiac ablation services. These codes are bundled into CPT codes 93653 and/or 93656. Each was recently surveyed by the specialties and the RUC in 2017, 2020, 2019, respectively. As such, the societies recommend affirming the recent times and RVUs of these recently valued codes, as they remain separate in CPT for use in concert with other CPT codes.
While this code descriptor did not change, its use as an additional ablation with a new base code that includes 3D mapping and left-atrial pacing, changing the service. The same 3D mapping and left-atrial pacing elements that were bundled into 93653 should now typically be considered to be included into this service, since those elements occur throughout the additional ablation. Therefore, for code 93655 the societies recommend, the 25th survey value of 7.00 RVW with 60 minutes intraservice time. This is sensibly below the KRS. This value also brings the IWPUT for 93655 in nearly identical alignment with that of 93653. This recommended value can also be supported by comparison to the percutaneous transcatheter closure of paravalvular leak, 93592; open iliac artery exposure, 34820; and transcatheter intracardiac shunt creation, 33746, as seen in the summary spreadsheet.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☑ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 93655

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Cardiac Electrophysiology How often? Commonly
Specialty Cardiology How often? Sometimes
Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 62294
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Figure is about twice as likely as Medicare based claims.

Specialty Cardiac electrophysiology Frequency 50085 Percentage 80.40 %
Specialty Cardiology Frequency 10715 Percentage 17.20 %
Specialty Frequency 0 Percentage 0.00 %
Estimate the number of times this service might be provided to Medicare patients nationally in a one-year period? 31,821. If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Figure reflects Medicare based claims.

CPT Descriptor: Comprehensive electrophysiologic evaluation including transseptal catheterizations, insertion and repositioning of multiple electrode catheters with intracardiac catheter ablation of atrial fibrillation by pulmonary vein isolation, including intracardiac electrophysiologic 3-dimensional mapping, intracardiac echocardiography including imaging supervision and interpretation, induction or attempted induction of an arrhythmia including left or right atrial pacing/ recording, right ventricular pacing/recording, and his bundle recording, when performed
(Do not report 93656 in conjunction with 93279, 93280, 93281, 93282, 93283, 93284, 93286, 93287, 93288, 93289, 93462, 93600, 93602, 93603, 93610, 93612, 93613, 93618, 93619, 93620, 93621, 93653, 93654, 93662)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 62-year-old male with a history of hypertension has recurrent atrial fibrillation. Despite rate and rhythm control with antiarrhythmic drugs, he remains symptomatic. A comprehensive electrophysiologic evaluation with transseptal catheterization and catheter ablation by pulmonary vein isolation for atrial fibrillation is ordered.

Percentage of Survey Respondents who found Vignette to be Typical: 95%

Site of Service (Complete for 010 and 090 Globals Only)
Percent of survey respondents who stated they perform the procedure; In the hospital 0%, In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0%, Overnight stay-less than 24 hours 0%, Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: A three-dimensional imaging study such as cardiac magnetic resonance imaging (MRI) or computed tomography (CT) scanning may be obtained prior to the procedure to assess atrial size and for pulmonary vein anatomic variants. The procedure and the risks, benefits, and alternatives associated with electrophysiology testing and atrial fibrillation ablation are explained to the patient and the patient's family. Management of antiarrhythmic medications is communicated to the patient. Arrangements are made for the X-ray technician, electrophysiology laboratory technician, and nurse. The patient is evaluated on the day of the procedure with a history and physical examination and pre-procedure laboratory, medications, and change in health status are reviewed with careful attention to the degree of anticoagulation. Informed consent is obtained. Direct current cardioversion/defibrillation, electrophysiology (EP), and ablative equipment is confirmed to be present and in proper working order. Fluoroscopic equipment that will be used to visualize catheter movements and location is tested.

Description of Intra-Service Work: Local analgesia is administered. Venous access is obtained. Arterial access to monitor blood pressure and to retrograde aortic access to the left ventricle may be obtained. By means of the venous access sites, multi-electrode catheters are positioned in specific cardiac chambers. An intracardiac echocardiographic probe is advanced into the heart and imaging of the heart and pericardium is performed: specific structures visualized include: right atrium, tricuspid valve, right ventricle, left atrium, aortic valve, left ventricle, pulmonary veins (left upper, left lower, right upper, right lower), pericardium, superior vena cava, coronary sinus. Intracardiac echocardiography may be used to guide catheter manipulation, guide transseptal puncture, provide visualization of catheter contact during mapping and ablation, and observe for complications throughout the procedure. The intracardiac echo catheter may be placed into the left atrium or right ventricle for additional imaging planes. One or two transseptal catheterizations are performed to achieve access and facilitate placement of both a circular mapping catheter and an ablation catheter in the left atrium.
Additional anticoagulation is administered. Level of anticoagulation is monitored throughout the procedure and additional anticoagulation is administered as needed. Conduction intervals and refractory periods are measured and arrhythmia induction attempted. His bundle recording and ventricular pacing and sensing are performed. A mapping catheter is passed into the left atrium and pulmonary vein conduction is assessed and recorded. Selective venography of the pulmonary veins may be performed to define anatomy. A high definition 3D anatomical map of the chamber(s) of interest is generated. Voltage and relative electrical activation in the arrhythmia and/or sinus may be performed to identify normal activation, location of scar, and mechanism of arrhythmia. Importation, segmentation, and/or registration to the three dimensional map of a MRI/CT scan may be performed. High output pacing is performed to prevent and/or monitor for phrenic nerve damage during ablation. Catheter ablation is then performed to achieve pulmonary vein isolation. Point lesions or balloon administered lesions encircling the pulmonary vein region are created that guided by anatomical mapping and electrical signals provided by a circular mapping catheter. Pulmonary vein isolation, as measured by the circular mapping catheter as well as loss of tissue voltage and tissue pacing capture are the measured endpoints.

During the course of an electrophysiology procedure, an arrhythmia is induced that requires use of advanced 3D computer-assisted mapping system to localize the arrhythmia origin. The mapping system is placed in the cardiac chamber of interest using standard percutaneous techniques. The system is calibrated, and recordings are made during sinus rhythm to identify normal activation and location of scar during each distinct tachycardia. The computer-generated map is displayed, modifications are made in the computer parameters and display, and the tachycardia origin is identified. The ablation catheter is moved to the point of early activation, localized by the mapping system, to identify a mid-diastolic potential, Kent potential, and/or similar paced maps. When a reentrant circuit is identified, entrainment mapping studies are performed and evaluated to confirm the catheter location is within the reentrant circuit. Additional mappings are made to confirm arrhythmia origin and to study additional arrhythmias at the conclusion of the procedure. A final report that includes the mapping procedure and findings is prepared.

Throughout the ablation the patient is monitored hemodynamic compromise due to cardiac perforation, - or tachyarrhythmias, embolic phenomena, thrombus formation, or damage to cardiac or vascular structures, including meticulous monitoring for lesion delivery within the pulmonary vein or close to the esophagus. Following the ablation portion of the procedure, further electrophysiological testing is performed to assess the outcome of ablation. These are again repeated following a 30-minute waiting period following the conclusion of the final ablation lesion. If the pulmonary veins demonstrate recovery of conduction, then repeat mapping and ablation are performed as described above. These steps are repeated until the pulmonary veins are rendered durably isolated. Once electrophysiology testing and ablation are completed, anticoagulation is reversed. Post procedure, sheaths are removed, appropriate hemostasis is achieved, and follow-up assessment of the patient for any complications is performed.

Description of Post-Service Work: The patient is monitored in the recovery unit and then overnight in a telemetry unit for delayed complications. Results of the procedure are discussed with the patient and the patient's family and a postprocedure assessment is performed.
