AMA/Specialty Society RVS Update Committee Summary of Recommendations
Harvard Valued – Utilization Over 30,000

April 2016

Injection Anesthetic Agent

In October 2015, AMA staff re-ran the Harvard valued codes with utilization over 30,000 based on 2014 Medicare claims data and this service was identified.

64418 Injection, anesthetic agent; suprascapular nerve
The RUC reviewed the survey results from 139 physicians for CPT code 64418 and determined that the survey median and 25th percentile work RVUs did not adequately account for the work required to perform this service. Therefore, the RUC recommends crosswalking code 64418 to code 20611 *Arthrocentesis, aspiration and/or injection, major joint or bursa (eg, shoulder, hip, knee, subacromial bursa); with ultrasound guidance, with permanent recording and reporting* (work RVU = 1.10 and 10 minutes intra-service time).

The RUC reviewed the pre-service time for CPT code 66418 and agreed that pre-time package 6A (Procedure with local/topical anesthesia care requiring wait time for anesthesia to take effect) is appropriate. However, the RUC did not agree with the specialties recommended pre-time inputs and determined that the pre-time needed to be decreased further to account for overlap in time with an Evaluation and Management service that typically reported with this service. Therefore, the RUC recommends 6 minutes of evaluation time, 3 minutes of positioning time, 3 minutes of scrub dress and wait time, 10 minutes intra-service time and 10 minutes immediate post-service time. The RUC confirmed that 10 minutes of immediate post-service time is required to assess the patient for pain relief, respiratory, hemodynamic, mental orientation, and extremity vascular status changes; required as a result of the risk of intra-vascular injection or pneumothorax. The physician also assesses any impact on the patient's activities of daily living including eating, bathing, brushing teeth and hair and overhead activities. The physician performs both strength testing and functional assessments to evaluate weakness in the limb that was injected as a result of anesthetic response. The RUC noted that the majority of nerve block codes that were recently reviewed include 10 minutes of immediate post-service time.

The RUC noted that the recommended work RVU of 1.10 and 32 minutes of total time for CPT 66418 is relative compared to the top two key reference services 64450 *Injection, anesthetic agent; other peripheral nerve or branch* (work RVU = 0.75 and 20 minutes total time) and 64486 *Transversus abdominis plane (TAP) block (abdominal plane block, rectus sheath block) unilateral; by injection(s) (includes imaging guidance, when performed)* (work RVU = 1.27 and 35 minutes of total time). The RUC noted that the recommendation is comparable to other nerve block codes 64405 *Injection, anesthetic agent; greater occipital nerve* (work RVU = 0.94 and 22 minutes total time) and 64415 *Injection, anesthetic agent; brachial plexus, single* (work RVU = 1.48 and 44 minutes total time). **The RUC recommends a work RVU of 1.10 for CPT code 64418.**

Practice Expense
One minor modification was made to correct the equipment minutes calculation. The Practice Expense Subcommittee reviewed the clinical staff time inputs to ensure that there were no duplicative times with the Evaluation and Management visit. The RUC recommends the direct practice expense inputs as modified by the Practice Expense Subcommittee.

Work Neutrality
The RUC's recommendation for this code will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

CPT Code	CPT Descriptor	Global Period	Work RVU Recommendation
64418	Injection, anesthetic agent; suprascapular nerve	000	1.10

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 64418 Tracking Number

Original Specialty Recommended RVU: **1.20**
Presented Recommended RVU: **1.20**
RUC Recommended RVU: **1.10**

Global Period: 000

CPT Descriptor: Injection, anesthetic agent; suprascapular nerve

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 52-year-old woman with a frozen shoulder is unable to tolerate physical therapy due to pain. She is referred for a suprascapular nerve block to providepain relief so that she can undergo physical therapy.

Percentage of Survey Respondents who found Vignette to be Typical: 83%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 38%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 15%

Description of Pre-Service Work: Review records, communicate with other professionals, patient, and family; and obtain consent. Perform a focused History and Physical examination of the patient to confirm indications for procedure, potential contraindications, existing neurological deficits, and bleeding disorders. The pre-operative work also includes dressing, scrubbing, and waiting before the procedure; preparing the patient and equipment for the procedure; obtaining vital signs and positioning the patient in the sitting position.

Description of Intra-Service Work: Universal protocol is followed with confirmation of patient identifiers, procedure site, and laterality. The injection site overlying the scapular notch is identified. After sterile preparation of the skin, a local anesthetic skin wheal is placed at the site of injection. A needle is inserted toward the scapular notch. Once correct needle position is achieved, the needle is aspirated to confirm the absence of blood or air. Following negative aspiration, a small test-dose of local anesthetic is administered. The patient is queried about symptoms of intravascular local anesthetic injection. If there are no signs or symptoms of intravascular injection, the planned local anesthetic volume is injected in incremental doses with frequent aspiration to avoid intravascular injection. After completion of the injection, the needle is removed. The patient is evaluated for the initial effects of the block by physical examination to determine if the patient is developing weakness or numbness, and is evaluated for relief of pain in the expected nerve distribution.

Description of Post-Service Work: The patient is observed post-procedure for pain relief, respiratory, hemodynamic, mental orientation, or extremity vascular status changes. In addition, the limb that has received the nerve block is protected to prevent injury. The patient is provided education on the signs and symptoms of potential complications and the need to protect the anesthetized extremity. The physician communicates findings with the patient and other professionals (including written and telephone reports and orders).

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.23	0.29
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.26	0.29
Urgency of medical decision making	0.00	-0.03
Technical Skill/Physical Effort (Mean)		
Technical skill required	0.46	0.55
Physical effort required	0.15	0.13
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	0.21	0.19

Outcome depends on the skill and judgment of physician	0.38	0.42
Estimated risk of malpractice suit with poor outcome	0.28	0.29

INTENSITY/COMPLEXITY MEASURES	**Top Key Ref Code**	**2nd Key Ref Code**
Time Segment (Mean)		
Overall intensity/complexity	0.41	0.29

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

In October 2015, AMA staff re-ran the Harvard valued codes with utilization over 30,000 based on 2014 Medicare claims data and this service was identified. The RUC determined that this service was to be placed on the next level of interest form to survey for April 2016.

Survey Sample and Process

The survey request was sent to a random selection from the membership database of the American Academy of Physician Medicine & Rehabilitation (AAPM&R). The American Society of Anesthesiologists (ASA) took a random sample of subspecialty pain medicine doctors from the ASA membership database. The standard RUC survey was conducted using a vignette drafted by the societies involved since 64418 had not previously been RUC reviewed. The Research Subcommittee reviewed and approved the vignette.

Pre-Service Time Package 6A

We recommend pre-time package 6A (NF Procedure w local/topical anesthesia care requiring wait time for anesthesia to take effect) as this procedure is performed in the physician's office 89% of the time according to the 2014 Medicare data. We recommend reducing the package pre-service evaluation time from 17 minutes to 8 minutes to account for overlap in time with an E/M service that is reported more than 50% of the time with 64418 on the same day. We also recommend increasing the package pre-service positioning time from 1 minute to 3 minutes. This is a reduction from the survey respondents' 5 minutes, as the Expert Panel indicated that 5 minutes overstated the positioning time, while the standard 1 minute in the pre-time package underestimates the time needed to position the patient. Additional positioning time is necessary because there is increased difficulty in identifying the target injection site, requiring manipulation of the patient's position to achieve the appropriate outcome. The Expert Panel agreed that the standard 5 minute scrub, dress and wait time in the pre-service package is appropriate.

Post-Service Time Package

We recommend post-service time package 7A (Local/Simple Procedure). We recommend reducing the package post-time from 18 minutes to 10 minutes, which corresponds with our survey data. In the post-service period the physician returns to the room following the initial injection to evaluate the patient for pain relief, respiratory, hemodynamic, mental orientation, and extremity vascular status changes; required as a result of the risk of intra-vascular injection or pneumothorax. The physician must proceed with caution to protect the shoulder post injection as an injury to the suprascapular nerve will have an impact on the patient's activities of daily living including eating, bathing, brushing teeth and hair and overhead activities. Both strength testing and functional assessments are performed to evaluate

weakness in the limb that was injected as a result of anesthetic response. The physician then evaluates for appropriateness of functional bracing of the shoulder.

Key Reference Codes

The recommended work RVU of 1.20 for 64418 fits well above the top key reference service (64450), since 64418 is more difficult to palpate the vessels around the suprascapular notch (compared to the posterior tibial vessels). Also, an injury to the suprascapular nerve will have a much greater impact on the patient than an injury to the posterior tibial nerve at the level of the ankle. It also fits well just below the second key reference code (64486). TAP block includes and is typically performed with image guidance. It also fits well with other injection codes and other codes in the RBRVS with similar IWPUTs, total time, and intra time.

MPC Comparison

MPC	Descriptor	RVW	IWPUT	Total Time	PRE	INTRA	POST
12011	Simple repair of superficial wounds of face, ears, eyelids, nose, lips and/or mucous membranes; 2.5 cm or less	1.07	0.068	24	7	12	5
30901	Control nasal hemorrhage, anterior, simple (limited cautery and/or packing) any method	1.10	0.081	26	11	10	5
64418	**Injection, anesthetic agent; suprascapular nerve**	**1.10**	**0.065**	**32**	**12**	**10**	**10**

Recommendation

We recommend a work RVU of 1.20 for 64418. This value maintains the RUC and specialty accepted intensity/complexity rank order and relativity for code 64418 with many other injections codes requiring 10 minutes of intra-service time.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☒ Other reason (please explain) Typically reported with an E&M service.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. For Medicare patients, 64418 is typically reported with an E&M service.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 64418

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Anesthesiology How often? Sometimes

Specialty Physicial Medicine and Rehabiliation How often? Sometimes

Specialty Intervential Pain Management & Pain Management How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 92955
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National frequency is estimated at 3 times Medicare frequency.

Specialty Anesthesiology Frequency 26588 Percentage 28.60 %

Specialty Physicial Medicine and Rehabilitation Frequency 11807 Percentage 12.70 %

Specialty Interventional Pain Management & Pain Medicine Frequency 20590 Percentage 22.15 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 30,985 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2014 Data RUC Database

Specialty Anesthesiology Frequency 8862 Percentage 28.60 %

Specialty Physicial Medicine and Rehabilitation Frequency 3957 Percentage 12.77 %

Specialty Interventional Pain Management and Pain Medicine Frequency 6865 Percentage 22.15 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment
Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Minor procedure

BETOS Sub-classification Level II:
Musculoskeletal

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 64418

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Facility Direct Inputs

CPT Long Descriptor: Injection, anesthetic agent; suprascapular nerve

Global Period: 000 Meeting Date: April 2016

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee: The Advisors from the participating specialties reviewed the current PE details for 64418 and made adjustments as appropriate.

2. You must provide reference code(s) for comparison on your spreadsheet. **If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes. Reference Code Rationale: Current inputs for 64418 are used as reference.

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time: N/A

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence: N/A

5. Please describe in detail the clinical activities of your staff: N/A

Non Facility Direct Inputs

CPT Long Descriptor: Injection, anesthetic agent; suprascapular nerve

Global Period: 000 Meeting Date: April 2016

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee: The Advisors from the participating specialties reviewed the current PE details for 64418 and made adjustments as appropriate.

2. You must provide reference code(s) for comparison on your spreadsheet. **If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes. Reference Code Rationale: Current inputs for 64418 are used as reference.

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time: Not applicable.

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:

Supplies

The Expert Panel that reviewed the supplies did not believe that this procedure required a pack, minimum multi-specialty visit.

Additionally, the Panel believed that the pack, basic injection, did not accurately reflect the supplies need for this procedure and we are recommending only the inputs that are necessary to perform this procedure in a sterile environment including:

- 5ml - bupivacaine 0.25% inj (Marcaine)
- 1 - cap, surgical
- 1 - mask, surgical
- 1 - gloves, sterile
- 1 - drape, sterile barrier 16in x 29in
- 1 - drape, sterile, for Mayo stand
- 1 - swab, patient prep, 1.5 ml (chloraprep)
- 1 - needle, 18-27g
- 1 - needle, 18-26g 1.5-3.5in, spinal
- 2 - syringe 5-6ml
- 5ml - lidocaine 1%-2% inj (Xylocaine)
- 1 - gauze, sterile 4in x 4in
- 1 - bandage, strip 0.75in x 3in (Bandaid)

Equipment

Mayo stand - The removable instrument tray (mayo stand) is set adjacent to the injection; it provides a place for sterile instruments and supplies used during the injection.

Light, exam – The exam light is used to accurately visualize the injection site.

5. Please describe in detail the clinical activities of your staff:

Pre-Service Period Clinical Labor Activities:

Service Period Clinical Labor Activities:

Pre-service
During the service period clinical staff will provide pre-service education, prepare the room, equipment, and supplies, and prepare and position patient. The 2 minutes included with an E/M service does not include setting up supplies for the injection which will include preparing the exam light and mayo stand with syringes, needles, drapes, and etc. to maintain a sterile field; 5 minutes additional time is recommended for these activities.

Intra-service
Clinical staff assists the physician for 100% of the intra-service time.

Post-service
Clinical staff provides 1:1 monitoring of the patient following the injection to monitor the patient for vasovagal response, mental status, and check vital signs. Clinical staff also fits the patient for the bracing and demonstrate proper use of the device. Finally, clinical staff will check the injection site, provide written and verbal post-injection and follow-up instructions on care of the injection site and activity restrictions.

Post-Service Clinical Labor Activities:

AMA/Specialty Society RVS Update Committee Summary of Recommendations
CMS 000-Day Global Typically Reported with an E/M

April 2017

Injection - Greater Occipital Nerve

In the Final Rule for 2017, CMS finalized the list of 000-day global services reported with an E/M 50 percent of the time or more, on the same day of service, same patient, by the same physician, that have not been reviewed in the last five years with Medicare utilization greater than 20,000. CPT code 64405 was identified on this list.

The RUC reviewed the survey results from 175 physicians from four different specialties and determined that it was appropriate to maintain the current work RVU of 0.94, which also represents the survey 25th percentile. The specialty societies recommended pre-time package 5, but reduced the package evaluation time by one minute to account for overlap because this service is typically reported with an E/M on the same day. The post-service time was reduced by 5 minutes in accordance with the survey results. The RUC carefully examined potential overlap with E/M services included in CPT 64405 and further reduced the pre-service evaluation time by 1 minute to 5 minutes. In addition, the RUC reduced the positioning time by 2 minutes and removed the 3 minutes of pre-service time for scrub/dress/wait because local anesthetic is not typical prior to this procedure but is included in the injection itself. The RUC recommends 5 minutes evaluation time, 1 minute positioning time, 5 minutes of intra-service time, and 5 minutes of immediate post-service time.

The RUC compared the survey code to the top two key reference services 20526 *Injection, therapeutic (eg, local anesthetic, corticosteroid), carpal tunnel* (work RVU = 0.94) and 20552 *Injection(s); single or multiple trigger point(s), 1 or 2 muscle(s)* (work RVU = 0.66) and noted that the current work RVU of the survey code is appropriately equal to carpal tunnel and higher than the other injections. The 2nd key reference code 20526 represents identical overall work and total time. For additional support, the RUC compared the survey code to several multi-specialty point of comparison CPT codes: 67820 *Correction of trichiasis; epilation, by forceps only* (work RVU = 0.71), 12001 *Simple repair of superficial wounds of scalp, neck, axillae, external genitalia, trunk and/or extremities (including hands and feet); 2.5 cm or less* (work RVU = 0.84), 51720 *Bladder instillation of anticarcinogenic agent (including retention time)* (work RVU = 0.87) and 20527 *Injection, enzyme (eg, collagenase), palmar fascial cord (ie, Dupuytren's contracture)* (work RVU = 1.00), and agreed that the survey 25th percentile of 0.94 places survey code 64405 in proper rank order. The RUC determined that the key reference services and comparable MPC codes support maintaining the current value for the survey code.

The RUC further agreed with the consensus of the specialty societies that the physician work for this service has not fundamentally changed since it was last reviewed in 2010 as part of the 4th Five-Year Review and recommends that the work RVU be maintained at the 25th percentile in accordance with the most recent survey. **The RUC recommends a work RVU of 0.94 for CPT code 64405.**

In addition, the RUC observed that there are inconsistencies in the Medicare Claims Processing Manual (Manual) related to reporting an E/M service on the same day as a minor procedure. While acknowledging the CMS staff citation from the manual, Chapter 12, Section 40.1, paragraph B, regarding reporting an E/M visit with a 000-day global code and the expectation that all of the focused evaluation work is included in the global period, the presenters noted that in two other sections of the same Manual chapter, the guidance provided is different. Specifically, Section 40.1 paragraph C and Section 40.2 paragraph A (#8) of the Manual confirm that it is permissible to report an E/M code on the same day as a minor surgical procedure when a significant, separately identifiable service is also performed. It is appropriate to append modifier 25 to the E/M code in instances where a significant, separately identifiable evaluation and management service is performed by same physician on the day of a procedure. The RUC also noted this Section of the Manual corresponds to CPT Modifier 25 instructions which state: "It may be necessary to indicate that on the day a procedure or service identified by a CPT code was performed, the patient's condition required a significant, separately identifiable E/M service above and beyond the other service provided or beyond the usual preoperative and postoperative care associated with the procedure that was performed. A significant, separately identifiable E/M service is defined or substantiated by documentation that satisfies the relevant criteria for the respective E/M service to be reported."

Practice Expense

The Practice Expense Subcommittee eliminated any clinical staff time and supplies that overlap with an evaluation and management service as the code is reported with an E/M more than 50% of the time. Additionally the RUC removed the exam light (EQ168) as it would not typically be used for this service and would not be in a standard room used for evaluation and management. The RUC recommends the direct practice expense inputs with modifications as reviewed and approved by the PE Subcommittee.

CPT Code	CPT Descriptor	Global Period	Work RVU Recommendation
64405	Injection, anesthetic agent; greater occipital nerve	000	0.94 (No Change)

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:64405 Tracking Number Original Specialty Recommended RVU: **0.94**
Presented Recommended RVU: **0.94**
Global Period: 000 Current Work RVU: **0.94** RUC Recommended RVU: **0.94**

CPT Descriptor: Injection, anesthetic agent; greater occipital nerve

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A patient with frequent headaches and a normal neurologic examination has tenderness over the left occipital notch, where palpation triggers the pain. For both diagnostic and therapeutic purposes, an injection of local anesthetic and anti-inflammatory is recommended.

Percentage of Survey Respondents who found Vignette to be Typical: 97%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Review the patient's history to ensure she is suitable for the procedure (eg, not on anticoagulants and no history of allergic reaction to agents being used). Discuss the procedure with the patient, including alternatives and risks. Obtain informed consent. Palpate the upper cervical region near the lower extent of the skull dorsal to the mastoid process along the course of the greater occipital nerve and mark the proposed needle entry site. Examine the area of the scalp closely for infection. Clean the skin overlying the proposed injection site and prepare for injection. Prepare a syringe with a mix of a local anesthetic agent and an anti-inflammatory drug. Don gloves. Perform a pre-procedural time out.

Description of Intra-Service Work: Palpate the upper cervical region along the course of the greater occipital nerve. Penetrate the skin with the needle and inject the contents of the syringe along the course of the nerve following negative aspiration. Because of the significant vascularity of the scalp, make the injection with repeated, intermittent aspirations as the needle is repositioned along the course of the nerve.

Description of Post-Service Work: Apply pressure to the injection site to stop any bleeding after the injection, clean the injection area, and apply a bandage as necessary. Wait for the local anesthetic to work, inquiring if the patient has numbness in the distribution of the occipital nerve and if she has relief of her pain. Monitor the patient for any potential complications from the injection, including syncopal episode, intravascular injection, or evidence of distal particulate steroid injection. Discuss follow-up recommendations with the patient. Complete all appropriate medical records.

INTENSITY/COMPLEXITY MEASURES

(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	2%	48%	43%	7%

Mental Effort and Judgment	Less	Identical	More
The number of possible diagnosis and/or the number of management options that must be considered	1%	34%	65%
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	10%	26%	64%
Urgency of medical decision making	7%	63%	30%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	7%	62%	31%
Physical effort required	1%	76%	23%

Psychological Stress	Less	Identical	More
The risk of significant complications, morbidity and/or mortality	17%	25%	58%
Outcome depends on the skill and judgment of physician	9%	43%	48%
Estimated risk of malpractice suit with poor outcome	27%	32%	41%

2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	5%	42%	47%	5%

Mental Effort and Judgment	Less	Identical	More
The number of possible diagnosis and/or the number of management options that must be considered	16%	32%	53%
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	11%	53%	37%
Urgency of medical decision making	21%	63%	16%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	5%	26%	68%
Physical effort required	5%	74%	21%

Psychological Stress	Less	Identical	More
The risk of significant complications, morbidity and/or mortality	11%	47%	42%
Outcome depends on the skill and judgment of physician	5%	37%	58%
Estimated risk of malpractice suit with poor outcome	16%	53%	32%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

The American Society of Anesthesiologists (ASA), the American Academy of Pain Management (AAPM), the American Association of Physical Medicine & Rehabilitation (AAPM&R), and the American Academy of Neurology (AAN), conducted joint surveys of their memberships in March 2017 for CPT code 66405. A joint ASA, AAPM, AAPM&R and AAN expert panel ("joint panel") consisting of physician advisors reviewed the survey work and time data and developed recommendations through participation in conference calls and e-mail discussions.

There were 175 responses (82 from ASA, 16 from AAPM, 27 from AAPM&R, 50 from AAN) to the survey request with a median performance rate of 25; 97% of the survey respondents found the vignette to be typical. The RUC summary contains a breakout of ASA, AAPM, AAPM&R, and AAN respondents. The number of responses meet RUC criteria and the vast majority of respondents perform this service.

Code 64405 was identified by CMS in the 2017 final rule on a list of 000-day global services reported with an E/M 50 percent of the time or more, on the same day of service, same patient, by the same physician. 2015 data reflect that 64405 is billed with an office E/M 50% of the time. It was last reviewed in 2010 and currently has times of 7/5/10/22 and an RVU of 0.94.

First, the joint panel reviewed the survey data. The survey median and 25th percentile RVU were 1.00 and 0.94 respectively. The total survey time for this service of 22 minutes (12/5/5) which is identical to the current time. The panel agreed this was appropriate because the service has not changed since the last survey. Based on the preservice times, the panel selected preservice time package 5.

Next, the panel reviewed the key reference service 20526, Injection, therapeutic (eg, local anesthetic, corticosteroid), carpal tunnel, which was chosen by more than half the respondents. It has times of 6/5/5/16 and an RVU of 0.94. This RVU is identical to the 25th percentile of the survey.

The panel also reviewed several comparator codes (noted in the table below) and agree that the survey 25 fifth percentile of 0.94 places 64405 in proper rank order to all the codes reviewed. Most importantly, 64405 is most similar to 20526 and 20527 in intensity and has longer total time than both.

CPT Code	Description	RVU	Pre-service time	Intra-service time	Post-service time	Total time	RUC review
20522	Injection(s); single or multiple trigger point(s), 1 or 2 muscle(s)	0.66	11	5	5	21	2016
67820	Correction of trichiasis; epilation, by forceps only	0.71	8	5	2	15	2005
12001	Simple repair of superficial wounds of scalp, neck, axillae, external genitalia, trunk and/or extremities (including hands and feet); 2.5 cm or less	0.84	7	10	5	22	2010
51720	Bladder instillation of anticarcinogenic agent (including retention time)	0.87	9	5	5	19	2016
20526	Injection, therapeutic (eg, local anesthetic, corticosteroid), carpal tunnel	0.94	6	5	5	16	2002
64405	**Injection, anesthetic agent; greater occipital nerve**	**0.94**	**12**	**5**	**5**	**22**	**2010**
20527	Injection, enzyme (eg, collagenase), palmar fascial cord (ie, Dupuytren's contracture)	1.00	8	5	5	18	2011

The joint panel note that 64405 is a more intense procedure than both 12001 and 67802 and has an identical total time to 12001 and is longer than 67820. Furthermore, the intensity / complexity measure responses from the survey further support the expert panel's recommendation of the survey 25th percentile because they are higher than both of the key reference services.

In summary, the main reference service and a review of other services with similar times and intensities, supports the survey 25th percentile RVU of 0.94. This is appropriate because the service has not changed since the last survey. This survey also provides strong validation for the 2010 survey. The joint panel reviewed the survey data by specialty and agreed it was remarkably consistent for both median time and median RVU across all specialties further supporting recommending the 25th percentile, thereby maintaining the current RVU.

Recommendations
In summary, we recommend the 25th percentile RVU of 0.94 and a preservice time of 12 minutes, an intra-service time of 5 minutes and a post-service time of 5 minutes for 64405.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☒ Other reason (please explain) According to the 2015 Medicare same day billing occurrances claims data, 64405 is reported with an office E/M code 50% of the time.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 64405

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Neurology How often? Commonly

Specialty Pain Management / Interventional PM How often? Commonly

Specialty Anesthesiology How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 439188
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. We anticiate 4 times the annual Medicare utilization; based on 2015 utilization data.

Specialty Neurology Frequency 166892 Percentage 38.00 %

Specialty Pain Management / Interventional PM Frequency 101014 Percentage 23.00 %

Specialty Anesthesiology Frequency 65880 Percentage 15.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 109,797 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on 2015 Medicare utilization data from the RUC database.

Specialty Neurology Frequency 41723 Percentage 38.00 %

Specialty Pain Management / Interventional PM Frequency 25254 Percentage 23.00 %

Specialty Anesthesiology Frequency 16470 Percentage 15.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Minor procedure

BETOS Sub-classification Level II:
Musculoskeletal

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 64405

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

CPT Code:__64405_____
Specialty Society _AAN, AAPM, AAPM&R, ASA_____

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation (SoR)
Non Facility Direct Practice Expense (PE) Inputs

CPT Long Descriptor: Injection, anesthetic agent; greater occipital nerve

Global Period:__000___ Meeting Date: ___April 2017_____

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel: The joint societies convened a panel of experts, including advisors who are familiar with the service. The panel of experts reviewed and collaborated via email and phone call to review existing direct practice expense inputs for code 64405 and the key reference code, 20526. Based on this review and its expertise, the panel made modifications as necessary. The panel of experts is recommending a reduced total clinical staff time stemming in large part from the fact that we have reduced the preservice clinical staff time to zero from the current input of 8 minutes. The intraservice time has also been reduced from 36 minutes to 27 minutes. The panel also eliminated a number of the supplies currently attributed to this servce as they were felt to not be necessary.

2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is not new, you must use the current direct PE inputs as your reference code. You can provide one additional reference code if you are required to use the current direct PE inputs. Provide an explanation for the selection of reference code(s) here: The expert panel agreed that using the key reference service, 20526, as a reference code for comparison would provide a helpful reference point for practice expense review. The refence code describes a very similar procedure with identical intraservice clinical staff time.

3. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time: N/A

4. Please provide rationale for the minutes you are recommending for clinical activities that do not have PE Subcommittee standards: The expert panel is recommending 5 minutes for CA018 assist physician or other qualified healthcare professional – directly related to physician work time (100% of physician intra-service time). The clinical staff assists the physician or qualified health care professional during the entirety of the injection in order to ensure the patient remains in the proper position and that the physician or qualified health care professional has access to necessary supplies. The expert panel is recommending 3 minutes for CA023 monitor patient following procedure/service, no multitasking. The patient must be closely monitored in the minutes immediately following the procedure to ensure the patient is not experiencing any abnormal responses to the injection.

5. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence: The expert panel is recommending an increase in the number of needles from 1 to 2. One needle of a larger gauge is needed to draw up medication. A second, smaller gauge needle is used for comfort to perform the injection. The expert panel recommends adding an exam light, EQ168 for the procedure. The injection site for this procedure is often obstructed by hair. A light ensures that the site is visable so the physician can appropriately place the needle for the injection.

6. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Spreadsheet Update Workgroup and listed in tab 2, please explain the difference here: N/A

7. Please describe in detail the clinical activities of your staff below:

Pre-Service Period Clinical Activities: (0 minutes)

There are no clinical activities performed by staff during the pre-service period.

Service Period Clinical Activities: (27 total minutes)

Pre-Service (of Service Period): (13 minutes) Clinical staff greets the patient and provides the patient with gowning. The appropriate medical records in reference to the planned injection are reviewed. Pre-service education is provided Clinical staff reviews the patient's understanding of the risks and benefits of the procedure, then obtains and documents patient consent. The patient's vital signs are taken, including temperature, blood pressure and pulse to ensure that the patient is in appropriate condition to receive the injection. The room is prepared and the appropriate injection equipment (sterile trays, needles and medications) is obtained.

Intra-Service (of Service Period): (5 minutes) The clinical staff is present for the entire procedure, assisting the physician by providing sterile supplies as appropriate. Clinical staff also provides reassurance and distraction to the patient as necessary.

Post-Service (of Service Period): (9 minutes) After the procedure, clinical staff observes the patient to verify that they are comfortable and the injection site is checked a few minutes following the injection to monitor the patient for an allergic reaction or vasovagal event. Following completion of the procedure by the physician, the room is cleaned and the instructions given by the physician are reviewed again with the patient. The patient is escorted out of the office. Relevant forms are completed and replacement supplies are ordered.

Post-Service Period Clinical Activities: (3 minutes) Although this code is a zero-day global service, an average of one phone call is received specific to the injection. The clinical staff answers this call and addresses questions.

8. Please provide granular detail regarding what the clinical staff is doing during the intra-service (of service period) clinical activity, *Assist physician or other qualified healthcare professional---directly related to physician work time* or *Perform procedure/service---NOT directly related to physician work time:* The clinical staff helps to ensure that the patient's positioning remains consistent. The clinical staff also makes certain that all necessary supplies, including injectate and gauze are readily available to the physician or other qualified healthcare professional to ensure that the service can be provided without interruption.

9. If you have used a percentage of the physician intra-service work time other then 100 or 67 percent for the intra-service (of service period) clinical activity, please indicate the percentage and explain why the alternate percentage is needed and how it was derived.
N/A

10. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities:
N/A

11. If you wish to identify a new staff type, please include a very specific staff description, a salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov.
N/A

12. If you wish to include a supply that is not on the list please provide a paid invoice. Identify and explain the invoice here:
N/A

13. If you wish to include an equipment item that is not on the list please provide a paid invoice. Identify and explain the invoice here:
N/A

14. List all the equipment included in your recommendation and the equipment formula chosen (see document titled "Calculating equipment time"). If you have selected "other formula" for any of the equipment please explain here:
N/A

15. If there is any other item(s) on your spreadsheet not covered in the categories above that require greater detail please include here:

Rows 24, 54 and 94 of the PE spreadsheet reflect the current RUC database PE time for code 64405. This PE does not coincide with a RUC review, therefore detailed information about minutes attributed to specific tasks was not available. Please note that line 54 reflects the current PE minutes for the entire service period including pre, intra and post service (of service period).

16. If there is any other item on your spreadsheet that needs further explanation please include here:

AMA/Specialty Society RVS Update Committee Summary of Recommendations

January 2019

Genicular Injection and RFA – Tab 10

In May 2018, the CPT Editorial Panel approved the addition of two codes to report injection of anesthetic and destruction of genicular nerves by neurolytic agent. In October 2018, the RUC thoroughly discussed the issues surrounding the survey of this family of services. The RUC supported the specialty societies' request for CPT codes 64454, 64640, and 64624 to be resurveyed and presented at the January 2019 RUC meeting based on their concern that many survey respondents appeared to be confused about the number of nerve branch injections involved with these three codes. The RUC recommended resurveying these services for January 2019.

Compelling Evidence
The specialty societies presented compelling evidence for this family of codes based on a change in physician work due to changes in technique and change in patient population. CPT codes 64450 and 64640 both describe a single injection/ablation. In contrast, CPT code 64454 involves blocks for three different nerve branches (superomedial, inferomedial, and superolateral genicular nerve branches) at three locations (adjacent to the periosteum on the medial aspect of the tibia, and at both the medial and lateral aspects of the femur) in order to achieve analgesia for the respective knee. CPT code 64624 involves ablation for three different nerve branches (superomedial, inferomedial, and superolateral genicular nerve branches) at three locations (adjacent to the periosteum on the medial aspect of the tibia, and at both the medial and lateral aspects of the femur) in order to achieve analgesia for the respective knee. The two new codes include imaging guidance. Imaging, which is typical and necessary to perform these genicular nerve branch procedures, is bundled into codes 64454 and 64624.

Regarding the change in patient population, when CPT code 64640 was surveyed in 2011, the typical patient had a history of neuritis of the medial calcaneal nerve. The current top diagnosis codes for code 64640 are not related to the calcaneal nerve but to other inflammatory spondylopathies; mononeuropathies of lower limb; other joint disorders; spondylosis; and other unspecified dorsopathies. The change in patient population is a result of coding changes between the 2011 and 2019 surveys where the typical podiatric patient is now reported with a different code. The RUC concluded that the change in the typical patient now made the typical service described by code 64640 more intense and complex. Currently, clinicians are reporting services described by code 64624 with code 64640. Therefore, the typical patient has changed for code 64640. The RUC approved compelling evidence for the family based on change in patient population and a change in technique.

64454 ***Injection(s), anesthetic agent(s) and/or steroid; genicular nerve branches including imaging guidance, when performed***
The RUC reviewed the survey results from 69 physicians and determined that the survey 25th percentile work RVU of 1.52 accurately reflects the physician work necessary for this service for pain management of chronic knee osteoarthritis. The RUC recommends 17 minutes pre-service evaluation time, 1 minute pre-service positioning time, 5 minutes pre-service scrub/dress/wait time, 18 minutes intra-service time and 10 minutes immediate post-service time.

The RUC compared CPT code 64454 to the top key reference code 64493 *Injection(s), diagnostic or therapeutic agent, paravertebral facet (zygapophyseal) joint (or nerves innervating that joint) with image guidance (fluoroscopy or CT), lumbar or sacral; single level* (work RVU = 1.52 and 15 minutes intra-service time) and noted the solid comparison with same amount of physician work and similar intra-service times. Over 3/4 of survey respondents indicated that the surveyed code was identical in overall intensity/complexity to the key reference code. For additional support, the RUC referenced CPT code 43197 *Esophagoscopy, flexible, transnasal; diagnostic, including collection of specimen(s) by brushing or washing, when performed (separate procedure)* (work RVU = 1.52 and 15 minutes intra-service time) and noted similarly that this code has the same amount of physician work and nearly identical intra-service time. Further, the RUC compared the survey code to another injection code 62284 *Injection procedure for myelography and/or computed tomography, lumbar* (work RVU= 1.54 and 15 minutes intra-service time) and noted that this code involves similar physician work and intra-service time.

The RUC concluded that CPT code 64454 should be valued at the 25th percentile work RVU of 1.52 as supported by the survey and top key reference service and which is also consistent with the recommendation for the sacroiliac joint. **The RUC recommends a work RVU of 1.52 for CPT code 64454.**

64640 *Destruction by neurolytic agent; other peripheral nerve or branch*
The RUC reviewed the survey results from 60 physicians and determined that the survey 25th percentile work RVU of 1.98 accurately reflects the physician work necessary for this service which now involves a more complex patient. The RUC questioned the intra-service time which increased from 5 minutes to 20 minutes, and ultimately supported the survey results. It noted that since both the October 2018 and the January 2019 survey resulted in a median intra-service time of 20 minutes, this increase in time was appropriate and reflected the change in the intensity and complexity of the typical patient from the 2011 RUC survey to the current 2019 RUC survey. Furthermore, the increase in intra-service time supports an increase in work RVU. The RUC recommends 13 minutes pre-service evaluation time, 1 minute pre-service positioning time, 5 minutes pre-service scrub/dress/wait time, 20 minutes intra-service time and 9 minutes immediate post-service time, and 1-99212 office visit. While the survey data resulted in 1-99213 office visit, the RUC agreed that a 99212 was more appropriate and better reflected current practice.

The RUC compared CPT code 64640 to the top key reference code 64633 *Destruction by neurolytic agent, paravertebral facet joint nerve(s), with imaging guidance (fluoroscopy or CT); cervical or thoracic, single facet joint* (work RVU = 3.84 and 30 minutes intra-service time) and noted that it was appropriate for the reference code to be valued higher than the surveyed code because code 64633 includes imaging guidance while code 64640 does not. Survey respondents indicated that the survey code was either the same or of greater intensity than the reference code. The RUC also compared the survey code to the second key reference service code 64632 (*Destruction by neurolytic agent; plantar common digital nerve*) (work RVU = 1.23 and 5 minutes intra-service time) and noted that the survey code should be valued higher than code 64632 given the differences in intra-service times. CPT code 64632 has an intra time of 5 minutes versus 20 minutes for the survey code. The typical patient for code 64632 is a patient receiving an injection in the sole of their foot while the typical patient for code 64640 is a patient with severe pain involving the left chest wall. Survey respondents indicated that the survey code was either the same or of greater intensity than the reference code.

For additional support, the RUC referenced CPT code 17272 *Destruction, malignant lesion (eg, laser surgery, electrosurgery, cryosurgery, chemosurgery, surgical curettement), scalp, neck, hands, feet, genitalia; lesion diameter 1.1 to 2.0 cm*) (work RVU = 1.82 and 22 minutes intra-service time) and CPT code 12031 *Repair, intermediate, wounds of scalp, axillae, trunk and/or extremities (excluding hands and feet); 2.5 cm or less*) (work RVU = 2.00 and 20 minutes intra-service time) and agreed that these codes appropriately bracket the survey code. The RUC

concluded that CPT code 64640 should be valued at the 25th percentile work RVU as supported by the survey. **The RUC recommends a work RVU of 1.98 for CPT code 64640.**

64624 ***Destruction by neurolytic agent genicular nerve branches including imaging guidance, when performed***
The RUC reviewed the survey results from 69 physicians and recommends a work RVU of 2.62 which is supported by a direct work RVU crosswalk to MPC code 11642 *Excision, malignant lesion including margins, face, ears, eyelids, nose, lips; excised diameter 1.1 to 2.0 cm* (work RVU = 2.62, 25 minutes intra-service time and 68 minutes total time) and falls slightly above the survey 25th percentile. CPT code 64624 describes the destruction of three different nerve branches at three locations in order to *provide* analgesia for the respective knee. The crosswalked code describes excision of a malignant lesion. The physician work involved in the survey code is slightly more intense in that the destruction of three different nerve branches, if performed incorrectly would have the potential to produce irreversible tissue damage to other motor or sensory nerves in the vicinity of the knee. The RUC determined that the crosswalk is reasonable and appropriate in terms of times, intensity and physician work.

The RUC recommends 17 minutes pre-service evaluation time, 1 minute pre-service positioning time, 5 minutes pre-service scrub/dress/wait time, 25 minutes intra-service time and 10 minutes immediate post-service time, and 1-99212 office visit. The intra-service time of 25 minutes represents an increase of 5 minutes or 25 percent from the October 2018 survey. The RUC concluded that there was better understanding by survey respondents that the code described multiple injections in the more recent survey versus the October 2018 survey. While both the crosswalk code and the survey data had a 1-99213 office visit, the RUC agreed that a 99212 was more appropriate and better reflected current practice.

To further support a work RVU of 2.62, the RUC referenced CPT code 10061 *Incision and drainage of abscess (eg, carbuncle, suppurative hidradenitis, cutaneous or subcutaneous abscess, cyst, furuncle, or paronychia); complicated or multiple* (work RVU = 2.45, 25 minutes intra-service time) and noted that the intra-service times are identical but the reference code has a lower intensity than both the crosswalk and survey code, and the survey code is therefore appropriately valued higher than the reference code. The RUC agrees with the direct crosswalk recommendation of 2.62 work RVUs and believes that it appropriately ranks this procedure within the family. **The RUC recommends a work RVU of 2.62 for CPT code 64624.**

Practice Expense
The Practice Expense Subcommittee accepted compelling evidence and made substantial changes to the equipment and the equipment minutes, corrected intra-service times, added minutes to code 64450 for CA006, and made changes to supplies. PE Subcommittee members questioned including both equipment items: mobile c-ARM room (EL018) at a purchase price of $151,200 and fluoroscopy table (EF024) at a purchase price of $227,650 to perform one service with fluoroscopy. The PE Subcommittee agreed that the C-arm does not include a table, so maintained the room, mobile c-ARM (EL018), removed the table, fluoroscopy (EF024) and added in the table, power (EF031) as a proxy for fluoroscopy table until invoices can be obtained to reprice the fluoroscopy table, which PE Subcommittee members agreed should have a purchase price between $10,000 and $15,000. **The RUC recommends the direct practice expense inputs as modified by the Practice Expense Subcommittee.**

Affirmation of RUC Recommendations
The RUC affirmed the recent RUC recommendation for CPT code *64450 Injection, anesthetic agent; other peripheral nerve or branch* (work RVU= 0.75, 7 minutes pre-service evaluation time, 1 minute pre-service positioning time, 1 minute pre-service scrub/dress/wait time, 5 minutes intra-service time and 5 minutes immediate post-service time). The relativity within the family remains correct. **The RUC affirms the work RVU of 0.75 for CPT code 64450.**

New Technology
The RUC recommends that this family of codes be placed on the New Technology/New Services list and be re-reviewed by the RUC in three years in order to verify utilization assumptions.

CPT Code	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
Nervous System **Extracranial Nerves, Peripheral Nerves, and Autonomic Nervous System** **Introduction/Injection of Anesthetic Agent (Nerve Block), Diagnostic or Therapeutic** *(For destruction by neurolytic agent or chemodenervation, see 62280-62282, 64600-64681)* *(For epidural or subarachnoid injection, see 62320, 62321, 62322, 62323, 62324, 62325, 62326, 62327)* *(64479-64487, 64490-64495 are unilateral procedures. For bilateral procedures, use modifier 50)* **Somatic Nerves** *64400 Injection, anesthetic agent; trigeminal nerve, any division or branch*				
(f)64450	H18	Injection, anesthetic agent; other peripheral nerve or branch	000	0.75 (Affirmed October 2018 RUC recommendation)
●64454	G1	Injection(s), anesthetic agent(s) and/or steroid; genicular nerve branches including imaging guidance, when performed (Do not report 64454 in conjunction with 64624) (64454 requires injecting all of the following genicular nerve branches: superolateral, superomedial, and inferomedial. If all three of these genicular nerve branches are not injected, report 64454 with modifier 52)	000	1.52

Destruction by Neurolytic Agent (eg, Chemical, Thermal, Electrical or Radiofrequency), Chemodenervation

Codes 64600-64681 include the injection of other therapeutic agents (eg, corticosteroids). Do not report diagnostic/therapeutic injections separately. Do not report a code labeled as destruction when using therapies that are not destructive of the target nerve (eg, pulsed radiofrequency), use 64999. For codes labeled as chemodenervation, the supply of the chemodenervation agent is reported separately.

(For chemodenervation of internal anal sphincter, use 46505)

(For chemodenervation of the bladder, use 52287)

(For chemodenervation for strabismus involving the extraocular muscles, use 67345)

(For chemodenervation guided by needle electromyography or muscle electrical stimulation, see 95873, 95874)

Somatic Nerves

64600 Destruction by neurolytic agent, trigeminal nerve; supraorbital, infraorbital, mental, or inferior alveolar branch

(f)64640	G2	Destruction by neurolytic agent; other peripheral nerve or branch	010	1.98
●64624	G3	Destruction by neurolytic agent genicular nerve branches including imaging guidance, when performed (64624 requires the destruction of each of the following genicular nerve branches: superolateral, superomedial, and inferomedial. If a neurolytic agent for the purposes of destruction is not applied to all of these nerve branches, report 64624 with modifier 52) (Do not report 64624 in conjunction with 64454)	010	2.62

Chicago, IL 60611

Re: Code 64450, Injection, anesthetic agent; other peripheral nerve or branch

Dear Dr. Smith:

At the October 2018 RUC meeting the RUC reviewed the survey results for code 64450 (*Injection, anesthetic agent; other peripheral nerve or branch*) from 88 physicians and agreed on the following physician time components: 7 minutes of pre-service evaluation, 1 minute of pre-service positioning, 1 minute of pre-service scrub/dress/wait, 5 minutes of intra-service time and 5 minutes of immediate post-service time. The RUC recommended a work RVU of 0.75 for this code.

At this meeting the RUC also facilitated a tab composed of CPT codes 64XX0 (*Injection(s), anesthetic agent(s) and/or steroid; genicular nerve branches including imaging guidance, when performed*), 64640 (*Destruction by neurolytic agent; other peripheral nerve or branch*), and 64XX1 (*Destruction by neurolytic agent genicular nerve branches (including imaging guidance, when performed*)). The RUC facilitated this tab and thoroughly discussed the issues surrounding the survey of this family of services. The specialties noted their concern that many survey respondents appeared to be confused about the number of nerve branch injections involved with these three codes. The RUC supported the specialty societies' request for CPT codes 64XX0, 64640, and 64XX1 to be resurveyed and recommended resurveying these services for January 2019 RUC meeting.

Since the services described by code 64XX0 are currently reported by code 64450, the RUC requested the specialties to also survey code 64450 for the January 2019 RUC meeting. There has been no change in the physician work for this code since the October 2018 meeting and the issues related to the resurvey of 644X0, 64640 and 64XX1 do not apply to this code. We do not believe a re-survey of code 64450 is necessary. The joint societies therefore recommend that the recently recommended RUC value and inputs for code 64450 (0.75 work RVU) are reaffirmed at the January 2019 RUC meeting.

We look forward to presenting our recommendations for codes 64XX0, 64640 and 64XX1 at the upcoming RUC meeting. Please contact Sharon Merrick, M.S. CCS-P, staff for the American Society of Anesthesiologists at 202-289-2222 or via email at s.merrick@asahq.org. Thank you for your consideration of this request.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 64454 Tracking Number Original Specialty Recommended RVU: **1.90**
Presented Recommended RVU: **1.52**
Global Period: 000 Current Work RVU: RUC Recommended RVU: **1.52**

CPT Descriptor: Injection(s), anesthetic agent(s) and/or steroid; genicular nerve branches including imaging guidance, when performed

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 78-year-old female has a 5-year history of persistent right knee pain that is interfering with her ability to complete activities of daily living. She has had poor control of her pain despite multiple medication trials and physical therapy. Due to her persistent, debilitating pain, a trial of genicular nerve blocks is scheduled to relieve her pain and improve her function.

Percentage of Survey Respondents who found Vignette to be Typical: 97%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: The clinician obtains and reviews the medical record and any pertinent imaging studies, laboratory studies and medical information. The proposed site of the procedure is identified and marked. The patient is moved to the procedure room. The clinician gowns, gloves and prepares supplies. The injection is prepared. The skin is cleansed with an antiseptic solution, sterile drapes are applied. The skin around the planned entry point is injected with local anesthetic. Perform a universal timeout procedure.

Description of Intra-Service Work: The appropriate skin and bony landmarks are identified. The procedure is performed under fluoroscopic guidance. The superolateral, superomedial and inferomedial genicular nerves are targeted adjacent to the periosteum on the medial aspect of the tibia, and at both the medial and lateral aspects of the femur at the junctions of the shaft and the epicondyle. Under imaging guidance, the target areas are approached by introducing a spinal needle from either an anteroposterior or lateral entry point with the final position residing adjacent to the bone. After negative aspiration, local anesthetic is deposited at each of the sites. The needle and stylet are removed.

Description of Post-Service Work: The sites are covered with a sterile occlusive dressing. The patient is observed for bleeding or any adverse effects and for evidence of successful block. A procedure note is dictated/written and medical record entries are made.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Top Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	9%	77%	14%	0%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	9%	80%	11%

Technical Skill/Physical Effort	**Less**	**Identical**	**More**
Technical skill required	17%	74%	9%

Physical effort required	9%	66%	26%

Psychological Stress	**Less**	**Identical**	**More**
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	26%	69%	6%

2nd Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	18%	36%	36%	9%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	18%	45%	36%

Technical Skill/Physical Effort	**Less**	**Identical**	**More**
Technical skill required	9%	55%	36%
Physical effort required	0%	45%	54%

Psychological Stress	**Less**	**Identical**	**More**
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	27%	36%	36%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

CPT code 64454 (*Injection(s), anesthetic agent(s) and/or steroid; genicular nerve branches including imaging guidance, when performed*) is a 0-day global code which was surveyed for the January 2019 RUC meeting by the American Society of Anesthesiologists (ASA), the American Academy of Pain Medicine (AAPM), the American Academy of Physical Medicine & Rehabilitation (AAPM&R), the American Society of Interventional Pain Physicians (ASIPP) and the Spine Intervention Society (SIS).

Code 64454 involves blocks for 3 different nerve branches (superomedial, inferomedial, and superolateral genicular nerve branches) at three locations (adjacent to the periosteum on the medial aspect of the tibia, and at both the medial and lateral aspects of the femur) in order to achieve analgesia for the respective knee. It includes image guidance, when performed. The code was approved at the May 2018 CPT Editorial Panel meeting.

This code was previously surveyed for the October 2018 meeting. At the October 2018 RUC meeting, the specialties noted their concern that many survey respondents appeared to be confused about the number of nerve branch injections involved with two codes in the tab: 64454 and 64624. The RUC recommended resurveying the entire tab for the January 2019 RUC meeting. Unlike the October 2018 survey, the January 2019 survey included the code's parenthetical language which indicated that code 64454 involved blocks of three different nerve branches.

A total of 69 responses were received from a random sample of 7,773 clinicians (0.8% response rate). The survey conducted was robust and captured a wide variety of specialists who regularly perform the procedure and who showed recent experience with the procedure. The societies convened an expert panel to review the survey data. ***The societies are recommending the survey median of 1.90 wRVUs and a time of pre (7/1/1), intra (18 min) and post (10 min).*** This results in an IWPUT of: 0.083.

Survey Data: wRVU and Time

The expert panel reviewed the survey data for the January 2019 RUC meeting.

64454 Highlights from January 2018 Survey Data			
	25th Percentile	**Median**	**75th Percentile**
Work	1.52	1.90	2.20
Pre		17/5/5	
Intra	13	18	22
Post		10	

97 percent of the survey respondents found the vignette to be typical.

The expert panel also reviewed the survey data from the October 2018 survey.

64454 Highlights from October 2018 Survey Data			
	25th Percentile	**Median**	**75th Percentile**
Work	1.40	1.60	2.00
Pre		24/5/5	
Intra	10	15	20
Post		9	

Survey Time Data

The expert panel reviewed the survey data in developing their time recommendations.

- Pre-time: The expert panel is recommending an adjusted Non-Facility Pre Time Package 5 (adjusted) of 7/1/1. This pre-service package is consistent with other recently and/or currently reviewed nerve treatment by injection codes such as the family of somatic nerves reviewed at the October 2018 RUC meeting.
- Intra-time: The expert panel is recommending the survey median intra time of 18 minutes. This represents an increase of 3 minutes or 20 percent from the October 2018 survey which had a median intra time of 15 minutes. The expert panel concluded that there was better understanding by survey respondents that the code described multiple injections in the more recent survey versus the October 2018 survey.
- Post time: The expert panel is recommending the survey median post time of 10 minutes. They felt this was also in-line with the post time of other recently and/or currently reviewed nerve treatment by injection codes such as the family of somatic nerves reviewed at the October 2018 RUC meeting.

wRVU Recommendation

After a robust discussion, the specialties are recommending the survey median of 1.90 wRVUs and physician time of pre (7/1/1), intra (18) and post (10). The expert panel considered a number of factors in determining the appropriateness of the recommendation.

- Reference codes: The top key reference code selected by survey respondents was code **64493** (*Injection(s), diagnostic or therapeutic agent, paravertebral facet (zygapophyseal) joint (or nerves innervating that joint) with image guidance (fluoroscopy or CT), lumbar or sacral; single level*) valued at 1.52 wRVUs and the second key reference code was code **64483** (*Injection(s), anesthetic agent and/or steroid, transforaminal epidural, with imaging guidance (fluoroscopy or CT); lumbar or sacral, single level*) valued at 1.90 wRVUs. The expert panel concluded that the recommended wRVU was supported by the reference codes selected by survey respondents.
    - 64493: The expert panel agreed that it was appropriate for the surveyed code 64454 to be valued more than the top reference code 64493 which was selected by 35 survey respondents. The survey respondents indicated that the surveyed code was either identical or of greater intensity than the reference code. The expert panel also noted that the reference code had intra time of three minutes less than the surveyed code
    - 64483: The expert panel agreed that is was appropriate for the surveyed code to be valued the same as the 2nd top key reference code 64483 which was selected by 11 survey respondents. The typical patient for 64483 presents with recurrent leg pain and the typical patient for 64454 presents with persistent knee pain. They noted that survey respondents indicated that the surveyed code was either the same or of greater intensity than the reference code.

- Building block comparison: The expert panel also considered the appropriateness of the recommendation by considering a building block approach. Code 64454 describes 3 injections which are described by code 64450 (*Injection, anesthetic agent; other peripheral nerve or branch*) valued at 0.75 wRVUs and imaging which is described by 77002 (*Fluoroscopic guidance for needle placement (eg, biopsy, aspiration, injection, localization device) (List separately in addition to code for primary procedure*)) which is valued at 0.54 wRVUs. Applying the multi-procedure reduction policy all of these services add up to 2.04 wRVUs which is more than the recommended value of 1.90 wRVUs. The expert panel concluded that this provided further evidence of the appropriateness of the recommendation.
    - 0.75 + (.5 (0.75 + 0.75)) + 0.54 = 2.04 wRVUs

- Other comparison codes: The expert panel also identified comparison code reference codes which support the recommended value of 1.90 wRVUs.

Code #	Long Descriptor	Global	Work RVU	IWPUT	Intra Time
64490	Injection(s), diagnostic or therapeutic agent, paravertebral facet (zygapophyseal) joint (or nerves innervating that joint) with image guidance (fluoroscopy or CT), cervical or thoracic; single level	000	1.82	0.0858	15
62327	Injection(s), including indwelling catheter placement, continuous infusion or intermittent bolus, of diagnostic or therapeutic substance(s) (eg, anesthetic, antispasmodic, opioid, steroid, other solution), not including neurolytic substances, interlaminar epidural or subarachnoid, lumbar or sacral (caudal); with imaging guidance (ie, fluoroscopy or CT)	000	1.90	0.0866	15
64454	Injection(s), anesthetic agent(s) and/or steroid; genicular nerve branches including imaging guidance, when performed	**000**	**1.90**	**0.083**	**18**
62321	Injection(s), of diagnostic or therapeutic substance(s) (eg, anesthetic, antispasmodic, opioid, steroid, other solution), not including neurolytic substances, including needle or catheter placement, interlaminar epidural or subarachnoid, cervical or thoracic; with imaging guidance (ie, fluoroscopy or CT)	000	1.95	0.0900	15
64479	Injection(s), anesthetic agent and/or steroid, transforaminal epidural, with imaging guidance (fluoroscopy or CT); cervical or thoracic, single level	000	2.29	0.1076	15

In summary, for code 64454 the societies are recommending 1.90 wRVUs and time of pre (7/1/1), intra (18 min) and post (10 min).

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) Code 64450

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Anesthesiology How often? Commonly

Specialty Pain Management How often? Commonly

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 87616
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate.

Specialty Anesthesiology Frequency 29000 Percentage 33.09 %

Specialty Pain Management Frequency 16000 Percentage 18.26 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 35,046 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on 2017 Medicare utilization

Specialty Anesthesiology Frequency 12228 Percentage 34.89 %

Specialty Pain Management Frequency 10556 Percentage 30.12 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States?

Berenson-Eggers Type of Service (BETOS) Assignment
Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Minor procedure

BETOS Sub-classification Level II:

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number N/A

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 64450

CPT Descriptor: Destruction by neurolytic agent; other peripheral nerve or branch

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 60-year-old female presents with severe pain involving the left chest wall due to metastatic lung cancer with invasion of the chest wall. She is nearing the end of life and has failed multiple interventions and management. A diagnostic intercostal nerve block provided short term relief. The decision is made to perform a percutaneous neurolytic procedure of the intercostal nerve in order to obtain more prolonged relief.

Percentage of Survey Respondents who found Vignette to be Typical: 88%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 28% , In the ASC 33%, In the office 38%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Discuss and review the treatment options with the patient. Review X-rays and appropriate diagnostic studies. Review the procedure with the patient and any family members as appropriate, discuss possible complications and obtain patient consent. Apply monitors, obtain and review vital signs, examine proposed injection site and apply a grounding pad. Don hair cover, mask and sterile gloves. Prepare the injection by setting up the sterile tray with the appropriate supplies and drawing up local anesthetics. Place the patient in a prone position, cleanse the site of the proposed injection and place a sterile barrier on the patient. Inject local anesthetic to numb the skin and subcutaneous issues. Perform a universal time-out procedure.

Description of Intra-Service Work: Palpate the ribs to identify the affected intercostal nerve level. Palpate the inferior border of the rib and mark the proposed injection site. Insert a radiofrequency needle and direct it until it contacts the inferior border of the rib. Pull the radiofrequency needle back slightly and advance the needle under the inferior border of the rib. Aspirate carefully prior to injection to assure the absence of blood or air prior to the injection. Inject local anesthetic to numb the intercostal nerve prior to performing the radiofrequency ablation. Radiofrequency ablation is performed. The target tissue should reach 80 degrees for 90 seconds. Remove the needle.

Description of Post-Service Work: Apply a bandage. Obtain and review immediate post injection vital signs. Monitor the patient for any potential complications related to the injection. Instruct the patient and/or care giver on appropriate activities and home care. Discuss future management of the condition. Dictate notes for the patient's medical record. Dictate a procedure note and a letter to the patient's PCP/Referring Physician and/or insurance company. At the follow-up office visit, examine the patient and discuss treatment success or adverse reactions that may have occurred after the procedure. Revise the treatment plan(s) as necessary.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Top Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	2%	70%	23%	5%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	2%	74%	23%

Technical Skill/Physical Effort	**Less**	**Identical**	**More**
Technical skill required	5%	63%	33%
Physical effort required	7%	72%	21%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	16%	51%	34%

2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	50%	33%	17%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	67%	33%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	50%	50%
Physical effort required	0%	67%	33%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	50%	50%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

CPT code 64640 (*Destruction by neurolytic agent; other peripheral nerve or branch*) is a 10-day global code which was surveyed for the January 2019 RUC meeting by the American Society of Anesthesiologists (ASA), the American Academy of Pain Medicine (AAPM), the American Academy of Physical Medicine & Rehabilitation (AAPM&R), the American Society of Interventional Pain Physicians (ASIPP) and the Spine Intervention Society (SIS). This code was previously surveyed for the October 2018 meeting and prior to that was surveyed in 2011.

At the October 2018 RUC meeting, the specialties noted their concern that many survey respondents appeared to be confused about the number of nerve branch injections involved with two of the other codes in the tab: 64454 and 64624. The RUC recommended resurveying the entire tab for the January 2019 RUC meeting.

A total of 60 responses were received from a random sample of 7,773 clinicians (0.7% response rate). The survey conducted was robust and captured a wide variety of specialists who regularly perform the procedure and who showed a significant amount of recent experience with the procedure. The societies convened an expert panel to review the survey data. ***The societies are recommending the survey 25th percentile of 1.98 wRVUs and a time of pre (13/1/5), intra (20 min) and post (8.5 min) and (1) 99212 office visit.*** This results in an IWPUT of: 0.048.

Survey Data: wRVU and Time

The expert panel reviewed the survey data for the January 2019 RUC meeting.

64640 Highlights from January 2018 Survey Data			
	25th Percentile	**Median**	**75th Percentile**
Work	1.98	3.10	3.84
Pre		18/5/5	
Intra	15	20	30
Post		8.50	

The expert panel also reviewed the survey data from the October 2018 survey.

64640 Highlights from October 2018 Survey Data			
	25th Percentile	**Median**	**75th Percentile**
Work	1.88	2.35	3.73
Pre		24.5/6/5	
Intra	15	20	29.25
Post		10	

Survey Time Data

The expert panel reviewed the survey data in developing their time recommendations.

- Pre-time: The expert panel is recommending the adjusted Facility Pre Time Package 1 (adjusted) of 13/1/5. This pre-service package is consistent with other recently and/or currently reviewed nerve treatment by injection codes such as the family of somatic nerves reviewed at the October 2018 RUC meeting.
- Intra-time: The expert panel is recommending the survey median intra time of 20 minutes. This represents an increase from the current intra time of 5 minutes. The expert Panel noted that since both the October 2018 and the January 2019 survey resulted in a median intra time of 20 minutes, they were comfortable that this increase in time was appropriate and reflected the change in the intensity and complexity of the typical patient from the 2011 RUC survey to the current 2019 RUC survey.
- Post time: The expert panel is recommending the survey median post time of 8.5 minutes. They felt this was probably a little low but still in-line with the post time of other recently and/or currently reviewed nerve treatment by injection codes such as the family of Somatic nerves reviewed at the October 2018 RUC meeting.
- Office visit: The expert panel is recommending 1-99212 office visit. While the survey data resulted in 1-99213 office visit, the expert panel concluded that a 99212 was more appropriate and better reflected current practice.

Recommendation

The specialties are recommending the 25th percentile of 1.98 wRVUs and physician time of pre (13/1/5), intra 20 and post (8.5) and 1-99212 office visit. Code 64640 is currently valued at 1.23 wRVUs with physician time of pre (10), intra (5) and post (5) and 1-99212 office visit.

- wRVU: The specialties recognize that their recommendation represents an increase of the current value from 1.23 wRVUs to 1.98 wRVUs. The expert panel concluded that this increase was appropriate because of the change in the typical patient which now made the typical service described by code 64640 more intense and complex.
    - Change in typical patient: The current vignette for the typical patient is a 50-year-old female who has a history of neuritis of the medial calcaneal nerve. This vignette was from the 2011 survey. For the January 2019 survey the typical patient is a 60-year-old female with severe pain involving the left chest wall due to metastatic lung cancer with invasion of the chest wall. The change in patient population is a result of coding changes in the intervening years where the typical podiatric patient is now reported with a different code. The new vignette is based on the current top diagnosis codes listed in the RUC database.
- Intra-service time: The expert panel also noted that the increase of intra-service time from 5 minutes to 20 minutes which likely reflected the change in the typical patient also provided additional justification for the increase in wRVUs. The recommended wRVU resulted in an IWPUT of 0.048 which seemed reasonable to the expert panel and aligns well with other similar codes.

Reference codes: The top key reference code selected by survey respondents was code **64633** (*Destruction by neurolytic agent, paravertebral facet joint nerve(s), with imaging guidance (fluoroscopy or CT); cervical or thoracic, single facet joint*) valued at 3.84 wRVUs and the second key reference code was code **64632** (*Destruction by neurolytic agent; plantar common digital nerve*) valued at 1.23 wRVUs. The expert panel concluded that the recommended wRVU was supported by the reference codes selected by survey respondents.

- 64633: The expert panel agreed that it was appropriate for 64633 to be valued more than the surveyed code 64640. Code 64633 included imaging guidance while 64640 did not. They noted that survey respondents indicated that the surveyed code was either the same or of greater intensity than the reference code.
- 64632: The expert panel agreed that is was appropriate for the surveyed code to be valued higher than code 64632. Code 64632 has an intra time of 5 minutes versus 20 minutes for the surveyed code. The typical patient for code 64632 is someone getting an injection in the sole of their foot while the typical patient for 64640 is someone with severe pain involving the left chest wall. They noted that survey respondents indicated that the surveyed code was either the same or of greater intensity than the reference code.

Other comparison codes: The expert panel also identified comparison code reference codes which support the recommended value of 1.98 wRVUs.

Code #	Long Descriptor	Global	Work RVU	IWPUT	Intra Time
11441	Excision, other benign lesion including margins, except skin tab (unless listed elsewhere) face, ears, eyelids, nose, lips, mucous membrane; excised diameter 0.6 to 1.0 cm	010	1.53	0.0357	20
17272	Destruction, malignant lesion (eg, laser surgery, electrosurgery, cryosurgery, chemosurgery, surgical curettement) scalp, neck, hands, feet, genitalia; lesion diameter 1.1 to 2.0 cm	010	1.82	0.0480	22
64640	**Destruction by neurolytic agent; other peripheral nerve or branch**	**010**	**1.98**	**0.048**	**20**
12031	Repair, intermediate, wounds of scalp, axillae, trun and/or extremities (excluding hands and feet); 2.5 cm or less	010	2.00	0.0572	20
30802	Ablation, soft tissue of inferior turbinates, unilateral or bilateral, any method (eg, electrocautery, radiofrequency ablation, or tissue volume reduction); intramural (ie, submucosal)	010	2.08	0.0576	20
10061	Incision and drainage of abscess (eg, carbuncle, suppurative hidradenitis, cutaneous or subcutaneous abscess, cyst, furuncle, or paronychia); complicated or multiple	010	2.45	0.0392	25

In summary, the societies are recommending 1.98 wRVUs and time of pre (13/1/5), intra (20 min) and post (8.5 min) and (1) 99212 office visit.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) Existing code 64640

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Anesthesiology How often? Commonly

Specialty Pain Management How often? Commonly

Specialty Interventional Pain Management How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 328852
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on relative volume of Medicare utilization

Specialty Anesthesiology Frequency 77050 Percentage 23.42 %

Specialty Pain Management Frequency 74485 Percentage 22.65 %

Specialty Interventional Pain Management Frequency 55313 Percentage 16.82 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 109,617 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on 2017 Medicare utilization

Specialty Anesthesiology Frequency 25683 Percentage 23.42 %

Specialty Pain Management Frequency 24828 Percentage 22.64 %

Specialty Interventional Pain Management Frequency 18438 Percentage 16.82 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 64640

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. N/A

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:64624 Tracking Number Original Specialty Recommended RVU: **3.80**
Presented Recommended RVU: **3.29**
Global Period: 010 Current Work RVU: RUC Recommended RVU: **2.62**

CPT Descriptor: Destruction by neurolytic agent genicular nerve branches (including imaging guidance, when performed)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 78-year-old female has a 5-year history of persistent right knee pain that is interfering with her ability to complete activities of daily living. She has had poor control of her pain despite multiple medication trials and physical therapy. Due to her persistent, debilitating pain, a trial of genicular nerve blocks was conducted and found to temporarily relieve her pain and improve her function. She is now scheduled for genicular nerve radiofrequency lesioning to provide longer term sustained pain relief.

Percentage of Survey Respondents who found Vignette to be Typical: 99%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 29% , In the ASC 36%, In the office 35%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: The clinician obtains and reviews the medical record and any pertinent imaging studies, laboratory studies and medical information. The proposed site of the procedure is identified and marked. The patient is moved to the procedure room. The clinician gowns, gloves and prepares supplies. The injection is prepared. The skin is cleansed with an antiseptic solution, sterile drapes are applied. The skin around the planned entry point is injected with local anesthetic. Perform a universal time-out procedure.

Description of Intra-Service Work: The appropriate skin and bony landmarks are identified. The procedure is performed under fluoroscopic guidance. The superolateral, superomedial and inferomedial genicular nerves are targeted adjacent to the periosteum on the medial aspect of the tibia, and at both the medial and lateral aspects of the femur at the junctions of the shaft and the epicondyle. Under imaging guidance, a radiofrequency cannula is guided from either an anteroposterior or lateral entry point with the final position residing adjacent to the bone. Motor stimulation is also performed to ensure the absence of adjacent motor fibers. After positive confirmation of sensory placement and negative motor testing, local anesthetic is administered adjacent to the nerve to mitigate pain associated with radiofrequency lesioning. Radiofrequency ablation is performed. The target tissue should reach 80 degrees for 90 seconds. The needle and stylet are removed,.

Description of Post-Service Work: The sites are covered with a sterile occlusive dressing. The patient is observed for bleeding or any adverse effects and for evidence of successful block. A procedure note is dictated/written and medical record entries are made. The patient is discharged after a period of monitoring and when there is independent ambulation. At the follow-up office visit, the patient is examined and treatment success or adverse reactions that may have occurred after the procedure are discussed. Revise the treatment plan(s) as necessary. Dictate notes for the patient's medical record.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Top Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	9%	60%	28%	2%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	9%	73%	18%

Technical Skill/Physical Effort	**Less**	**Identical**	**More**
Technical skill required	21%	61%	19%

Physical effort required	13%	57%	30%

Psychological Stress	**Less**	**Identical**	**More**
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	29%	53%	18%

2nd Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	0%	0%	100%	0%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	100%	0%

Technical Skill/Physical Effort	**Less**	**Identical**	**More**
Technical skill required	33%	0%	67%
Physical effort required	0%	0%	100%

Psychological Stress	**Less**	**Identical**	**More**
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	33%	33%	33%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Code 64624 (*Destruction by neurolytic agent genicular nerve branches (includes image guidance, when performed*) is a new 10-day global code which was surveyed for the January 2019 RUC meeting by the American Society of Anesthesiologists (ASA), the American Academy of Pain Medicine (AAPM), the American Academy of Physical Medicine & Rehabilitation (AAPM&R), the American Society of Interventional Pain Physicians (ASIPP) and the Spine Intervention Society (SIS).

Code 64624 describes the destruction of 3 different nerve branches (superomedial, inferomedial, and superolateral genicular nerve branches) at three locations (adjacent to the periosteum on the medial aspect of the tibia, and at both the medial and lateral aspects of the femur) in order to achieve analgesia for the respective knee. The code was approved at the May 2018 CPT Editorial Panel meeting.

At the October 2018 RUC meeting, the specialties noted their concern that many survey respondents appeared to be confused about the number of nerve branch injections involved with two codes in the tab: 64454 and 64624. The RUC recommended resurveying the entire tab for the January 2019 RUC meeting. Unlike the October 2018 survey, the January 2019 survey included the code's parenthetical language which indicated that code 64624 involved destruction of three different nerve branches.

A total of 69 responses were received from a random sample of 7,773 clinicians (0.8% response rate). The survey conducted was robust and captured a wide variety of specialists who regularly perform the procedure and who showed recent experience with the procedure. The societies convened an expert panel to review the survey data. ***The societies are recommending a value of 3.29 wRVUs and a time of pre (13/1/5), intra (25 min), post (10 min) and (1) 99212 office visit.*** This results in an IWPUT of: 0.089. This recommendation is based on a crosswalk to code 36578 (*Replacement, catheter only, of central venous access device, with subcutaneous port or pump, central or peripheral insertion site*).

This recommendation has been reduced in response to reviewer comments from the original recommendation of the survey median of 3.80 wRVUs.

Survey Data: wRVU and Time

The expert panel reviewed the survey data for the January 2019 RUC meeting.

64624 Highlights from January 2018 Survey Data			
	25th Percentile	**Median**	**75th Percentile**
Work	2.50	3.80	4.00
Pre		20/5/5	
Intra	16	25	36
Post		10	

99 percent of the survey respondents found the vignette to be typical.

The expert panel also reviewed the survey data from the October 2018 survey.

64624 Highlights from October 2018 Survey Data			
	25th Percentile	**Median**	**75th Percentile**
Work	2.10	3.50	3.90
Pre		25/6/5	
Intra	15	20	30
Post		10	

Time Recommendations

The expert panel reviewed the survey data in developing their time recommendations.

- Pre-time: The expert panel is recommending an adjusted Facility Pre Time Package 1 (adjusted) of 13/1/5. This pre-service package is consistent with other recently and/or currently reviewed nerve treatment by injection codes such as the family of somatic nerves reviewed at the October 2018 RUC meeting.
- Intra-time: The expert panel is recommending the survey median intra time of 25 minutes. This represents an increase of 5 minutes or 25 percent from the October 2018 survey which had a median intra time of 20 minutes. The expert panel concluded that there was better understanding by survey respondents that the code described multiple injections in the more recent survey versus the October 2018 survey.
- Post time: The expert panel is recommending the survey median post time of 10 minutes. They felt this was also in-line with the post time of other recently and/or currently reviewed nerve treatment by injection codes such as the family of somatic nerves reviewed at the October 2018 RUC meeting.
- Office visit: The expert panel is recommending 1-99212 office visit. While the survey data resulted in 1-99213 office visit, the expert panel concluded that a 99212 was more appropriate and better reflected current practice.

wRVU Recommendation

In response to reviewer comments, the specialties reduced the wRVU recommendation from the original recommendation of 3.80 wRVUs (survey median) to 3.29 wRVUs.

Rationale: Crosswalk

The rationale for the recommendation of 3.29 is a crosswalk to CPT code 36578.

Code	Descriptor	Global	Pre-Time	Intra Time	Post Time	Other Hospital	Office Visits	IWPUT
36578	Replacement, catheter only, of central venous access device, with subcutaneous port or pump, central or peripheral insertion site	10	10/6/10	30	15	.5 - 99238	1-99212	0.0465

In selecting a crosswalk, the expert panel did a thorough review of the RUC database of recently reviewed, 10-day globals with intra time of around 25 minutes and found very few options. While the reviewers found that code 36578 was generally reasonable, they did find some limitations on the comparisons of these two codes. For example, while the surveyed code 64624 included imaging, the crosswalk, code 36578, does not include imaging.

Despite the limitations of this crosswalk, the expert panel did consider a number of factors in determining the reasonableness of this revised recommendation.

Building Block Analysis

In assessing the appropriateness of the value, the expert panel also considered a building block analysis of the service. Code 64624 describes ablation of three nerves (currently reported by code 64640, *Destruction by neurolytic agent; other peripheral nerve or branch*) and image guidance (currently reported by 77002, *Fluoroscopic guidance for needle placement (eg, biopsy, aspiration, injection, localization device) (List separately in addition to code for primary procedure*)).

- The specialties are recommending 1.98 wRVUs for code 64640 at the January 2019 meeting and code 77002 has a current value of 0.54 wRVU.
    - [(1.98) + 0.5(1.98 + 1.98) + 0.54] = 4.50 wRVUs

The building block analysis resulted in a value of 4.50 wRVU. The expert panel felt that this provided further evidence of the appropriateness of the recommendation of 3.29 wRVUs.

Relativity to Other Similar Codes Surveyed at this January 2019 RUC Meeting

In developing this recommendation, the expert panel considered a similar code being presented at this meeting. Code 6XX01 (*Radiofrequency ablation, nerves innervating the sacroiliac joint, with image guidance (ie, fluoroscopy or computed tomography*) is part of Tab 8. The recommendation for this code is 3.91 wRVUs. Code 6XX01 is a 10-day global that describes the ablation of four nerves around the sacroiliac joint. It has intra-time of 30 minutes. Since code 64624 describes the ablation of three nerves in the genicular area, the expert panel agreed that the wRVU difference between the two codes (3.91 versus 3.29) was appropriate.

Reference Codes

The top key reference code which was selected by 43 survey respondents was code **64633** (*Destruction by neurolytic agent, paravertebral facet joint nerve(s), with imaging guidance (fluoroscopy or CT); cervical or thoracic, single facet joint*) valued at 3.84 wRVUs and the second key reference code which was selected by six survey respondents was code **64632** (*Destruction by neurolytic agent; plantar common digital nerve*) valued at 1.23 wRVUs. The expert panel concluded that the recommended wRVU was supported by the reference codes selected by survey respondents.

- 64633: Code 64633 is valued at 0.55 wRVUs more than the recommended value for the surveyed code 64624 and was selected overwhelmingly by survey respondents (43 survey respondents). Code 64633 has 5 minutes more of intra service time than 64624 (30 minutes versus 25 minutes). Both codes include imaging. The expert panel agreed that the relationship between these two codes was appropriate. They noted that survey respondents indicated that the surveyed code was either the same or of greater intensity than the reference code.
- 64632: The expert panel agreed that is was appropriate for the surveyed code to be valued higher than code 64632. Code 64632 has an intra time of 5 minutes versus 25 minutes for the surveyed code. The typical patient for code 64632 is someone getting an injection in the sole of their foot while the typical patient for 64624is someone with a history of persistent knee pain. They noted that 100% of the survey respondents indicated that the surveyed code had somewhat more overall intensity/complexity.

In summary, for code 64624 the societies are recommending 3.29 wRVUs and time of pre (13/1/5), intra (25 min), post (10 min) and (1) 99212 office visit.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 64640

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Anesthesiology	How often? Commonly
Specialty Interventional Pain	How often? Commonly
Specialty Pain Management	How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 52569
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on relative volume of Medicare utilization

Specialty Anesthesiology	Frequency 13842	Percentage 26.33 %
Specialty Interventional Pain	Frequency 6834	Percentage 13.00 %
Specialty Pain Management	Frequency 6429	Percentage 12.22 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 21,028 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on 2017 Medicare utilization

Specialty Anesthesiology	Frequency 5537	Percentage 26.33 %
Specialty Interventional Pain	Frequency 2734	Percentage 13.00 %
Specialty Pain Management	Frequency 2572	Percentage 12.23 %

Do many physicians perform this service across the United States?

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Minor procedure

BETOS Sub-classification Level II:

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number N/A

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 64640

SS Rec Summary

INSTRUCTIONS

Insert information and data into all applicable cells except IWPUT and TOTAL TIME. These cells will automatically calculate.
Hide columns and rows that do not contain data.
1st REF = Top Key Reference code data
2st REF = Second Highest Key Reference code data
CURRENT = Current data (Harvard or RUC) for code being surveyed. If this is a new code, this row will be blank.
SVY = Survey data - as it appears on the Summary of Recommendation form.
REC = Specialty Society recommended data as it appears on the Summary of Recommendation form.

CPT Code:__64454, 64640, 64624_____
Specialty Society__ASA, AAPM&R, AAPM, ASIPP, SIS__

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation (SoR)
Facility Direct Practice Expense (PE) Inputs

CPT Long Descriptor:

- 64454, Injection(s), anesthetic agent(s) and/or steroid; genicular nerve branches including imaging guidance, when performed
- 64624, Destruction by neurolytic agent genicular nerve branches (including imaging guidance, when performed)
- 64640, Destruction by neurolytic agent; other peripheral nerve or branch

Global Period: 0 days (64454) 010 days (64640 and 64624) Meeting Date: January 2019

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

   A panel of clinicians representing each specialty society involved in the RUC survey process for the code collaborated to develop and approve the PE recommendations.

2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is not new, you must use the current direct PE inputs as your reference code. You can provide one additional reference code if you are required to use the current direct PE inputs. Provide an explanation for the selection of reference code(s) here:

   Code 64454: Using the current direct PE inputs of code 64450 as the reference code
   Code 64640 and 64624: Using the current direct PE inputs of code 64640 as the reference code

3. Is this code(s) typically billed with an E/M service? *No*

4. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time: *N/A*

5. If you are requesting an increase over the current total cost for clinical staff time (This does not include minutes to assist physician and the number of post-op visits, as they are directly related to physician work), total cost of supplies, and/or total cost of equipment you must provide compelling evidence: *N/A*

6. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and listed in tab 2, please explain the difference here: *N/A*

7. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities: *N/A*

8. If you wish to identify a new staff type, please include a very specific staff description, a salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov. *N/A*

9. If you wish to include a supply that is not on the list please provide a paid invoice. Identify and explain the invoice here: *N/A*

10. If you wish to include an equipment item that is not on the list please provide a paid invoice. Identify and explain the invoice here: *N/A*

11. List all the equipment included in your recommendation and the equipment formula chosen (see document titled "Calculating equipment time"). If you have selected "other formula" for any of the equipment please explain here:

Codes 64640 and 64624: Table, exam (default formula)

12. If there is any other item(s) on your spreadsheet not covered in the categories above that require greater detail please include here: *N/A*

13. If there is any other item on your spreadsheet that needs further explanation please include here: *N/A*

14. Please include an explanation of each line item:

Code	Description	Explanation
CA002	Coordinate pre-surgery services (including test results)	
CA003	Schedule space and equipment in facility	
CA005	Complete pre-procedure phone calls and prescription	Staff explains where to come for the appointment, checks medications, runs through list of medical conditions, makes sure the patient is off anti-coagulation drugs, confirms if patient uses BP medications, walks the patient through the procedure, confirms whether a driver is available for a ride home and answers patient questions.
CA006	Confirm availability of prior images/studies	
CA039	Post-operative visits (total time)	
EF023	Table, exam	Used during follow-up procedure
EQ354	Radiofrequency kit for destruction by neurolytic agent	Used for the two destruction procedures

- 64640, Destruction by neurolytic agent; other peripheral nerve or branch

Global Period: 0 days (64454) 010 days (64640 and 64624) Meeting Date: January 2019

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

   A panel of clinicians representing each specialty society involved in the RUC survey process for the code collaborated to develop and approve the PE recommendations.

2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is not new, you must use the current direct PE inputs as your reference code. You can provide one additional reference code if you are required to use the current direct PE inputs. Provide an explanation for the selection of reference code(s) here:

   Code 64454: Using the current direct PE inputs of code 64450 as the reference code
   Code 64640 and 64624: Using the current direct PE inputs of code 64640 as the reference code

3. Is this code(s) typically billed with an E/M service? *No.*
   Is this code(s) typically billed with the E/M service in the nonfacility? *No.*
   (Please see provided data in PE Subcommittee folder)

4. What specialty is the dominant provider in the nonfacility?
   Codes 64454 and 64624: New codes- N/A
   Code 64640: Podiatry 27%

   What percent of the time does the dominant provider provide the service(s) in the nonfacility?
   Codes 64454 and 64624: New codes- N/A
   Code 64640: 45%

   Is the dominant provider in the nonfacility different then for the global?
   Codes 64454 and 64624: New codes- N/A
   Code 64640: Yes. For the global, the dominant specialty is Anesthesiology (23%)

   (Please see provided data in PE Subcommittee folder)

5. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time: *N/A*

6. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies (This does not include minutes to assist physician and the number of post-op visits, as they are directly related to physician work), you must provide compelling evidence. Please explain if the increase can be entirely accounted for because of an increase in physician time.

Codes 64454 and 64624: N/A
Code 64640: We are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies. Based on our Expert Panel review we identified a number of direct PE inputs (largely supplies) that are typically used when providing this service in the non-facility environment that are not currently included. We have confirmed that the added PE clinical labor tasks, supplies, and equipment are not included in the current inputs or packages and that there is no duplication.

7. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and listed in tab 2, please explain the difference here: *N/A*

8. How much time was allocated to clinical activity, *obtain vital signs* (CA010) prior to CMS increasing the clinical activity to 5 minutes for calendar year 2018? (please use this time rather than 5 minutes in your reference code)
   The standard for clinical activity, obtains vital signs remains 0, 3 and 5 based on the number of vital signs taken. Please provide a rationale for the clinical staff time that you are requesting for obtain vital signs here:

   We recommend 5 minutes for obtaining vital signs. The following vital signs are collected: BP, RR, Pulse, Temp, O2 sat.

9. Please provide granular detail regarding what the clinical staff is doing during the intra-service (of service period) clinical activity, *Assist physician or other qualified healthcare professional---directly related to physician work time* or *Perform procedure/service---NOT directly related to physician work time:*

   Staff is present and assisting physician during the entire procedure. Staff supports the physician throughout the procedure by handing over the necessary supplies (syringes, gauzes etc.), acts as a second pair of hands during the procedure assisting with supplies/equipment or directly with the patient as needed, helps to make sure patient is comfortable and monitors the patient throughout the procedure.

10. If you have used a percentage of the physician intra-service work time other then 100 or 67 percent for the intra-service (of service period) clinical activity, please indicate the percentage and explain why the alternate percentage is needed and how it was derived. *N/A*

11. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities: *N/A*

12. If you wish to identify a new staff type, please include a very specific staff description, a salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov. *N/A*

13. If you wish to include a supply that is not on the list please provide a paid invoice. Identify and explain the invoice here: *N/A*

14. If you wish to include an equipment item that is not on the list please provide a paid invoice. Identify and explain the invoice here: *N/A*

15. List all the equipment included in your recommendation and the equipment formula chosen (see document titled "Calculating equipment time"). If you have selected "other formula" for any of the equipment please explain here:

Code 64454:

Technologist PACS workstation	*PACS*
mayo stand	*Default*
table, fluoroscopy	*Default*
room, mobile c-ARM	*Highly technical*
ECG, 3-channel (with SpO2, NIBP, temp, resp)	*Other*
light, exam	*Default*

The formula for ECG, 3-channel is the sum of the values included in the default formula, plus the time that the patient is monitored post-service of the service period.

Code 64640

mayo stand	*Default*
Table, power	*Default*
ECG, 3-channel (with SpO2, NIBP, temp, resp)	*Other*
light, exam	*Default*
nerve stimulator (eg, for nerve block)	*Default*
radiofrequency generator (NEURO)	*Default*
radiofrequency kit for destruction by neurolytic agent	*Default*

The formula for ECG, 3-channel is the sum of the values included in the default formula, plus the time that the patient is monitored post-service of the service period.

Code 64624

Technologist PACS workstation	*PACS*
mayo stand	*Default*
table, fluoroscopy	*Default*
room, mobile c-ARM	*Highly technical*
ECG, 3-channel (with SpO2, NIBP, temp, resp)	*Other*
light, exam	*Default*
nerve stimulator (eg, for nerve block)	*Default*
radiofrequency generator (NEURO)	*Default*
radiofrequency kit for destruction by neurolytic agent	*Default*

The formula for ECG, 3-channel is the sum of the values included in the default formula, plus the time that the patient is monitored post-service of the service period.

16. If there is any other item(s) on your spreadsheet not covered in the categories above that require greater detail please include here: *N/A*

17. If there is any other item on your spreadsheet that needs further explanation please include here: *N/A*

18. Please include an explanation of each line item:

Code	Description	Explanation
CA005	Complete pre-procedure phone calls and prescription	Staff explains where to come for the appointment, checks medications, runs through list of medical conditions, makes sure the patient is off anti-coagulation drugs, confirms if patient uses BP medications, walks the patient through the procedure, confirms whether a driver is available for a ride home and answers patient questions.
CA006	Confirm availability of prior images/studies	
CA009	Greet patient, provide gowning, ensure appropriate medical records are available	
CA010	Obtain vital signs	Blood pressure, respiratory rate, pulse, temperature, O2 saturation are all measured
CA011	Provide education/obtain consent	
CA013	Prepare room, equipment and supplies	Separate preparations are made by the nursing and rad tech staff for the X0 and X1 codes
CA014	Confirm order, protocol exam	
CA016	Prepare, set-up and start IV, initial positioning and monitoring of patient	
CA018	Assist physician or other qualified healthcare professional - directly	For the X0 and X1 codes, this is completed by both the nurse and the rad tech
CA022	Monitor the patient following procedure/service, multitasking 1:4	Patient is monitored for 20 minutes while multitasking (total of 5 minutes)
CA024	Clean room/equipment by clinical staff	
CA029	Check dressings, catheters, wounds	
CA030	Technologist QCs images in PACS, checking for all images, reformats, and dose page	Images are required for the X0 and X1 codes
CA031	Review examination with interpreting MD/DO	Images are required for the X0 and X1 codes
CA032	Scan exam documents in PACS. Complete exam in RIS system to populate images into work queue	Images are required for the X0 and X1 codes
CA035	Review home care instructions, coordinate visits/prescriptions	
CA039	Post-operative visits (total time)	
SB001	Cap, surgical	Sterile attire for the MD. For the destruction codes, a cap is also required for the nurse and rad tech.
SB024	Gloves, sterile	Sterile attire for the MD
SB028	Gown, surgical, sterile	Sterile attire for the MD
SB033	Mask, surgical	Sterile attire required for the MD and other staff present in the room
SB027	Gown, staff, impervious	Sterile attire for staff
SB022	Gloves, non-sterile	Sterile attire for staff
SK075	Skin marking pen, sterile (Skin Skribe)	Used to mark injection sites
SB026	Gown, patient	Used to cover patient while allowing access

		to injection site.
SB004	Cover, thermometer probe	Used for taking vitals
SB036	Paper, exam table	
SB044	Underpad 2ft x 3ft (Chux)	Used under patient to collect fluid that may drain during the procedure to the table
SB037	Pillow case	Two pillows are needed for the X0 and X1 procedures – one under the head and one between the knees
SJ081	Swab, patient prep, 1.5 ml (chloraprep)	Used to prep the injection sites
SB011	Drape, sterile, fenestrated 16in x 29in	
SB019	Drape-towel, sterile 18in x 26 in	
SB008	Drape, sterile, c-arm, fluoro	Used only for the X0 and X1 codes that require fluoroscopic guidance
SD269	Grounding pad	
SB012	Drape, sterile, for Mayo stand	Used to hold supplies during the procedures
SC029	Needle, 18-27g	Used for local anesthetic for all codes and used for the injectate for code 64640
SC051	Syringe 10-12ml	Used for the anesthetic and injectate for X0 and X1
SH047	Lidocaine 1%-2% inj (Xylocaine)	Local anesthetic – for 64640 (1 nerve) 5cc are used as well as 3cc for the injectate (8 total), for X0 and X1 (3 nerves) 10cc are used as anesthetic only.
SD050	Electrode needle, injectable (Myoject)	
SD087	Guide, needle, for localization	
SD011	Cannula (radiofrequency denervation) (SMK-C10)	Used for denervation procedures
SC028	Needle, 18-26g, 1.5-3.5in, spinal	Used for injectate for X0 code
SC057	Syringe 5-6ml	Used for anesthetic and injectate for 64640 (lower volume for single injection code)
SH021	Bupivacaine 0.25% inj (Marcaine)	Injectate, increased amount required for X0 and X1 to account for 3 nerves.
SJ001	Alcohol isopropyl 70%	Used to clean skin post-procedure
SG021	Bandage, strip 0.75in x 3in (Bandaid)	Used post-procedure for site(s) of injection
SG055	Gauze, sterile 4in x 4in	Used for the single injection (64640)
SG056	Gauze, sterile 4in x 4in (10 pack)	Used for multiple injections (X0 and X1)
SL259	Bleach cleaning wipe	Used to clean the table
EF024	Table, fluoroscopy	Used for image guided procedures X0 and X1
EF031	Table, power	Used for 64640 since imaging is not performed
EL018	Room, mobile c-Arm	
EQ354	Radiofrequency kit for destruction by neurolytic agent	Used for the two destruction procedures
EQ168	Light, exam	
ED050	Technologist PACS workstation	Used for capturing and storing images for the X0 and X1 codes
EQ214	Radiofrequency generator (NEURO)	Used during denervation procedures
EQ184	Nerve stimulator (eg, for nerve block)	Used during denervation procedures
EF015	Mayo stand	Used to hold supplies for the procedure
EQ011	ECG, 3-channel (with SpO2, NIBP, temp,	Used both during the procedure and during

	resp)	monitoring time

AMA/Specialty Society RVS Update Committee Summary of Recommendations

January 2019

Radiofrequency Neurotomy Sacroiliac Joint – Tab 8

In September 2018, the CPT Editorial Panel created two new codes to describe injection and radiofrequency ablation of the sacroiliac joint with image guidance for somatic nerve procedures.

64451 ***Injection(s), anesthetic agent(s) and/or steroid; nerves innervating the sacroiliac joint, with image guidance (ie, fluoroscopy or computed tomography)***
The RUC reviewed the survey results from 72 physicians and agreed on the following physician time components: 23 minutes of pre-service time, 15 minutes of intra-service time, and 7 minutes of immediate post-service time. This service is performed under fluoroscopic guidance, the dorsal ramus nerve is targeted at the junction of the sacral ala and superior articular process. The nerves are targeted at the posterior lateral foramen and under imaging guidance, the target areas are approached by introducing a spinal needle to each of the appropriate fluoroscopic landmarks. After negative aspiration, local anesthetic is deposited at each of the sites. The RUC thoroughly reviewed the recommended work involved in this service and agreed that the survey 25th percentile of 1.52 correctly estimates the amount of physician work involved.

To justify a work RVU of 1.52, the RUC compared the survey code to the top key reference service 64493 *Injection(s), diagnostic or therapeutic agent, paravertebral facet (zygapophyseal) joint (or nerves innervating that joint) with image guidance (fluoroscopy or CT), lumbar or sacral; single level* (work RVU= 1.52 and intra-service time of 15 minutes) and noted that both codes have identical intra-service time and should be valued identically. The RUC noted that although the survey code has less pre- and post- service time, survey respondents rated the survey code identical to somewhat more intense than the top key reference service, warranting the same work RVU of 1.52. Additionally, the RUC compared the surveyed code to CPT code 43197 *Esophagoscopy, flexible, transnasal; diagnostic, including collection of specimen(s) by brushing or washing, when performed (separate procedure)* (work RVU= 1.52 and intra-service time of 15 minutes), and noted that the survey code has identical pre-service and intra-service time and nearly identical post-service time and should be valued identically. **The RUC recommends a work RVU of 1.52 for CPT code 64451.**

64625 ***Radiofrequency ablation, nerves innervating the sacroiliac joint, with image guidance (ie, fluoroscopy or computed tomography)***
The RUC reviewed the survey results from 73 physicians and agreed on the following physician time components: 19 minutes of pre-service time, 30 minutes of intra-service time, and 7 minutes of immediate post-service time. This service is performed under fluoroscopic guidance, the dorsal ramus nerve is targeted at the junction of the sacral ala and superior articular process. The nerves are targeted at multiple points along the posterior lateral foramen and the skin around the planned entry point is injected with local anesthetic. Following the local anesthetic infiltration and under imaging guidance, a radiofrequency cannula is guided to the appropriate fluoroscopic landmark. Sensory stimulation is performed and after further anesthetic is injected, radiofrequency ablation is performed at 60 degrees for 150 seconds.

The RUC thoroughly reviewed the recommended work involved in this service and agreed that a direct work RVU crosswalk to code 67105 *Repair of retinal detachment, including drainage of subretinal fluid when performed; photocoagulation* (work RVU= 3.39, pre-service time of 11 minutes, intra-service time of 30 minutes, post-service time of 10 minutes) correctly estimates the amount of physician work involved. For additional support, the RUC also referenced CPT code 67227 *Destruction of extensive or progressive retinopathy (eg, diabetic retinopathy), cryotherapy, diathermy* (work RVU= 3.50, pre-service time of 11 minutes, intra-service time of 30 minutes, and post-service time of 10 minutes) and noted that the survey and reference code requires similar physician work to perform and should be valued similarly. **The RUC recommends a work RVU of 3.39 for CPT code 64625.**

Refer to CPT
The RUC refers codes 64451 and 64625 to the CPT Editorial Panel to clarify that these services should not be reported with electrical stimulation codes. The RUC recommends the CPT Editorial Panel editorially add codes 95873 and 95874 to the parenthetical following codes 64451 and 64625. The parenthetical following codes 64451 and 64625 should state the following:

(Do not report 64451 in conjunction with 64493, 64494, 64495, 77002, 77003, 77012, 95873, 95874)

(Do not report 64625 in conjunction with 64635, 77002, 77003, 77012, 95873, 95874)

Practice Expense
The Practice Expense (PE) Subcommittee made modifications, including correcting the clinical activity minutes for CA018, assist physician or other qualified healthcare professional---directly related to physician work time (100%) to match the intra-service time from the physician work survey, as well as to the medical supplies (SD269, SD011). PE Subcommittee members questioned including both equipment items: mobile c-ARM room (EL018) at a purchase price of $151,200 and fluoroscopy table (EF024) at a purchase price of $227,650 to perform one service with fluoroscopy. The PE Subcommittee agreed that the C-arm does not include a table, so maintained the room, mobile c-ARM (EL018), removed the table, fluoroscopy (EF024) and added in the table, power (EF031) as a proxy for fluoroscopy table until invoices can be obtained to reprice the fluoroscopy table, which PE Subcommittee members agreed should have a purchase price between $10,000 and $15,000. **The RUC recommends the direct practice expense inputs as modified by the Practice Expense Subcommittee.**

New Technology/New Services
The RUC recommends that CPT codes 64451 and 64625 be placed on the New Technology list and be re-reviewed by the RUC in three years to ensure correct valuation and utilization assumptions.

CPT Code	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation

Nervous System
Extracranial Nerves, Peripheral Nerves, and Autonomic Nervous System
Introduction/Injection of Anesthetic Agent (Nerve Block), Diagnostic or Therapeutic

(For destruction by neurolytic agent or chemodenervation, see 62280-62282, 64600-64681)

(For epidural or subarachnoid injection, see 62320, 62321, 62322, 62323, 62324, 62325, 62326, 62327)

(64400-64455, 64461, 64462, 64463, 64479, 64480, 64483, 64484, ~~64486, 64487~~, 64490-64495 are unilateral procedures. For bilateral procedures, use modifier 50)

Somatic Nerves

Codes 64400-64489 describe the introduction/injection of an anesthetic agent and/or steroid into the somatic nervous system for diagnostic or therapeutic purposes. For injection or destruction of genicular nerve branches, see 64XX0, 64XX1 respectively.

Codes 64400-64450, 64XX0 describe the injection of an anesthetic agent(s) and/or steroid into a nerve plexus, nerve, or branch. These codes are reported once per nerve plexus, nerve, or branch as described in the descriptor regardless of the number of injections performed along the nerve plexus, nerve, or branch described by the code. Image guidance (ultrasound, fluoroscopy, CT) and localization may be reported separately.

Image guidance (ultrasound, fluoroscopy, CT) and any injection of contrast are inclusive components of 64XX0 and 64451.

Codes 64455, 64479, 64480, 64483, 64484 are reported for single or multiple injections on the same site. For 64479, 64480, 64483, 64484, image guidance (fluoroscopy or CT) and any injection of contrast are inclusive components and are not reported separately. For 64455, image guidance (ultrasound, fluoroscopy, CT) and localization may be reported separately.

Codes 64461, 64462, 64463 describe injection of a paravertebral block (PVB). Codes 64486, 64487, 64488, 64489 describe injection of a transversus abdominis plane (TAP) block. Image guidance and any injection of contrast are inclusive components of 64461, 64462, 64463 and 64486, 64487, 64488, 64489 and are not reported separately.

◢64400	Injection(s), anesthetic agent(s) and/or steroid; trigeminal nerve, each ~~any~~ ~~division or~~ branch (ie, ophthalmic, maxillary, ~~or~~ mandibular)
~~64402~~	~~facial nerve~~
	(64402 has been deleted. To report injection of anesthetic agent and/or steroid to the facial nerve, use 64999)
◢64405	greater occipital nerve
◢64408	vagus nerve
~~64410~~	~~phrenic nerve~~
	(64412 has been deleted. To report, use 64999)
~~64413~~	~~cervical plexus~~
	(64410, 64413 have been deleted. To report injection of anesthetic agent and/or steroid to the phrenic nerve, cervical plexus, use 64999)
◢64415	brachial plexus~~, single~~
◢64416	brachial plexus, continuous infusion by catheter (including catheter placement)
	(Do not report 64416 in conjunction with 01996)
◢64417	axillary nerve
◢64418	suprascapular nerve
◢64420	intercostal nerve, single level
✚◢64421	intercostal nerve~~s~~, ~~multiple, regional block,~~ each additional level (List separately in addition to code for primary procedure)
	(Use 64421 in conjunction with 64420)
◢64425	ilioinguinal, iliohypogastric nerves
◢64430	pudendal nerve
◢64435	paracervical (uterine) nerve
◢64445	sciatic nerve~~, single~~

◢*64446*		*sciatic nerve, continuous infusion by catheter (including catheter placement)*		
		(Do not report 64446 in conjunction with 01996)		
◢*64447*		*femoral nerve~~, single~~*		
		(Do not report 64447 in conjunction with 01996)		
◢*64448*		*femoral nerve, continuous infusion by catheter (including catheter placement)*		
		(Do not report 64448 in conjunction with 01996)		
◢*64449*		*lumbar plexus, posterior approach, continuous infusion by catheter (including catheter placement)*		
		(Do not report 64449 in conjunction with 01996)		
◢*64450*		*other peripheral nerve or branch*		
		(For injection, anesthetic agent, nerves innervating the sacroiliac joint, use 64451)		
●64451	S1	Injection(s), anesthetic agent(s) and/or steroid*;* nerves innervating the sacroiliac joint, with image guidance (ie, fluoroscopy or computed tomography) (Do not report 64451 in conjunction with 64493, 64494, 64495, 77002, 77003, 77012) (For injection, anesthetic agent, nerves innervating the sacroiliac joint with ultrasound, use 76999) (For bilateral procedure, use 64451 with modifier 50)	000	1.52
●*64XX0*		*Injection(s), anesthetic agent(s) and/or steroid; genicular nerve branches including imaging guidance, when performed* *(Do not report 64XX0 in conjunction with 64XX1)* *(64XX0 requires injecting all of the following genicular nerve branches: superolateral, superomedial, and inferomedial. If all three of these genicular nerve branches are not injected, report 64XX0 with modifier 52)*		
Paravertebral Spinal Nerves and Branches				
64493		*Injection(s), diagnostic or therapeutic agent, paravertebral facet (zygapophyseal) joint (or nerves innervating that joint) with image guidance (fluoroscopy or CT), lumbar or sacral; single level* (For injection, anesthetic agent, nerves innervating the sacroiliac joint, use 64451)		

Nervous System
Extracranial Nerves, Peripheral Nerves, and Autonomic Nervous System
Destruction by Neurolytic Agent (eg, Chemical, Thermal, Electrical or Radiofrequency), Chemodenervation

Codes 64600-64681 include the injection of other therapeutic agents (eg, corticosteroids). Do not report diagnostic/therapeutic injections separately. Do not report a code labeled as destruction when using therapies that are not destructive of the target nerve (eg, pulsed radiofrequency), use 64999. For codes labeled as chemodenervation, the supply of the chemodenervation agent is reported separately.

(For chemodenervation of internal anal sphincter, use 46505)

(For chemodenervation of the bladder, use 52287)

(For chemodenervation for strabismus involving the extraocular muscles, use 67345)

(For chemodenervation guided by needle electromyography or muscle electrical stimulation, see 95873, 95874)

Somatic Nerves

64600 *Destruction by neurolytic agent, trigeminal nerve; supraorbital, infraorbital, mental, or inferior alveolar branch*

64605 *second and third division branches at foramen ovale*

64610 *second and third division branches at foramen ovale under the radiologic monitoring*

64625	S2	Radiofrequency ablation, nerves innervating the sacroiliac joint, with image guidance (ie, fluoroscopy or computed tomography) (Do not report 64625 in conjunction with 64635, 77002, 77003, 77012) (For radiofrequency ablation, nerves innervating the sacroiliac joint with ultrasound, use 76999) (For bilateral procedure, use 64625 with modifier 50)	010	3.39

#● *64XX1* *Destruction by neurolytic agent genicular nerve branches ~~(~~includ<u>inges</u>~~es~~ imaging guidance, when performed~~)~~*

<u>(64XX1 requires the destruction of each of the following genicular nerve branches: superolateral, superomedial, and inferomedial. If a neurolytic agent for the purposes of destruction is not applied to all of these nerve branches, report 64XX01 with modifier 52)</u>

<u>(Do not report 64XX1 in conjunction with 64XX0)</u>

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:64451 Tracking Number Original Specialty Recommended RVU: **1.91**
Presented Recommended RVU: **1.91**
Global Period: 000 Current Work RVU: **N/A** RUC Recommended RVU: **1.52**

CPT Descriptor: Injection(s), anesthetic agent(s) and/or steroid; nerves innervating the sacroiliac joint, with image guidance (ie, fluoroscopy or computed tomography)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 68-year-old male has a 5-year history of persistent right sacroiliac pain that is interfering with his ability to complete activities of daily living. He has had poor control of his pain despite multiple medication trials and physical therapy. Due to his persistent, debilitating pain, a trial of diagnostic nerve blocks to the sacroiliac joint is scheduled to relieve his pain and improve his function.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Informed consent is discussed and obtained from the patient. The clinician obtains and reviews the medical record and any pertinent imaging studies, laboratory studies and medical information. The proposed site of the procedure is identified and marked. The patient is moved to the procedure room. The clinician gowns, gloves and prepares supplies. The injection is prepared. The skin is cleansed with an antiseptic solution, sterile drapes are applied. The skin around the planned entry point is injected with local anesthetic. The universal protocol ("time out") is performed with the care team.

Description of Intra-Service Work: The procedure is performed under fluoroscopic guidance. The L5 dorsal ramus nerve is targeted at the junction of the sacral ala and S1 superior articular process. The S1, S2, and S3 nerves are targeted at the posterior lateral foramen of the S1, S2, and S3 foramen respectively. Under imaging guidance, the target areas are approached by introducing a spinal needle to each of the appropriate fluoroscopic landmarks. After negative aspiration, local anesthetic is deposited at each of the sites. The needle and stylet are removed.

Description of Post-Service Work: The sites are covered with a sterile occlusive dressing. The patient is observed for bleeding or any adverse effects and for evidence of successful block. A procedure note is dictated/written and medical record entries are made.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Top Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	7%	46%	44%	3%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	2%	54%	44%

Technical Skill/Physical Effort	**Less**	**Identical**	**More**
Technical skill required	7%	39%	54%
Physical effort required	2%	78%	20%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	2%	46%	52%

2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	29%	57%	14%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	36%	72%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	21%	14%	65%
Physical effort required	29%	50%	21%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	28%	72%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

64451, Injection(s), anesthetic agent(s) and/or steroid*;* nerves innervating the sacroiliac joint, with image guidance (ie, fluoroscopy or computed tomography) and 64625, Radiofrequency ablation, nerves innervating the sacroiliac joint, with image guidance (ie, fluoroscopy or computed tomography) are new codes that describe the work involved in treating the nerves around the Sacroiliac (SI) joint. 64451 describes SI Joint

nerve treatment by injection and was approved as category I at the October 2018 CPT Editorial Panel meeting and is a 000-day global.

Both 64451 and 64625 were surveyed together by the ASA, AAPM&R, AAPM, ASIPP, NANS, NASS, and SIS for the 2019 January RUC meeting via random sampling of all societies.

Survey Results

There were 72 total respondents, and all 72 agreed with the typical patient vignette. Median experience in past 12 months was 22.

Median survey times were as follows: 22.5 minutes for pre-service evaluation, 7 minutes for pre-service positioning, 7 minutes for pre-service scrub, dress, and wait. Median intra-service time was 15 minutes with 7 minutes immediate post-service time.

25th % Work RVU was 1.52 and the Median Work RVU was 1.91.

Key Reference Services

41 of the 72 respondents choose 64493, Injection(s), diagnostic or therapeutic agent, paravertebral facet (zygapophyseal) joint (or nerves innervating that joint) with image guidance (fluoroscopy or CT), lumbar or sacral; single level which has pre-times of 7/5/5, intra-service time of 15 minutes, and immediate post-service time of 10 minutes, a work RUV of 1.52 and an IWPUT of .068 and 14 of the 72 respondents choose 64479, Injection(s), anesthetic agent and/or steroid, transforaminal epidural, with imaging guidance (fluoroscopy or CT); cervical or thoracic, single level which has pre-times of 13/5/6, intra-service time of 15 minutes, and immediate post-service time of 10 minutes, a work RVU of 2.29 and an IWPUT of .108.

Recommended Time and Work RVU

An expert panel from all of the surveying societies reviewed the survey data and key reference services and recommends the following times and Work RVU.

We are recommending pre-service package 5, non-facility no anesthesia time (7, 0, 1), with an additional minute for positioning (7, 1, 1). This pre-service package is consistent with other recently and/or currently reviewed nerve treatment by injection codes such as the family of Somatic nerves and the family of Genicular nerves.

We are recommending the survey median intra-service time of 15 minutes.

We are recommending the survey median immediate post-service time of 7 minutes.

Our recommended total time is 31 minutes.

We are recommending the survey median Work RVU of 1.91. The resulting IWPUT is .104.

Comparison to Key Reference Services

CPT Code	Descriptor	Work RVU	Total Time	Total Pre-Time	Intra-Time	IWPUT
64493	Injection(s), diagnostic or therapeutic agent, paravertebral facet (zygapophyseal) joint (or nerves innervating that joint) with image guidance (fluoroscopy or CT), lumbar or sacral; single level	1.52	42	17	15	0.066
64483	Injection(s), anesthetic agent and/or steroid, transforaminal epidural, with imaging guidance (fluoroscopy or CT); lumbar or sacral, single level	1.9	49	24	15	0.082
6XX00	Injection(s), anesthetic agent(s) and/or steroid; nerves innervating the sacroiliac joint, with image guidance (ie, fluoroscopy or computed tomography)	1.91	31	9	15	0.104
64479	Injection(s), anesthetic agent and/or steroid, transforaminal epidural, with imaging guidance (fluoroscopy or CT); cervical or thoracic, single level	2.29	49	24	15	0.108

We believe the survey conducted was robust and captured a wide variety of specialists who regularly perform the procedure and who showed a significant amount of recent experience with the procedure. We believe the median survey times and Work RVU are well supported by the key reference services like 64493 and 64483 (3rd most commonly chosen reference service from survey), and 64479. The Work RVU is higher than 64493, the most commonly chosen key reference service, but the expert panel believes it is considerably more work to treat the nerves closer to the SI joint as described by the CPT code descriptor than to treat the lumbar facets as described in 64493 which have well defined anatomical landmarks and are located further away from the joint structure and therefore are less difficult to innervate. Further, the time differences between 64451 and 64493 are a result of current RUC standard pre-time packages which not were used when 64493 was last valued when pre-times were typically the same as the median survey times. The median survey pre-times for 64451 were actually greater than the pre-times for 64493 but were adjusted to pre-service time package 5. And the survey intensity/complexity questions indicated that for many of the components, survey respondents felt 64451 to be more complex or intense than 64493.

We are recommended a work RVU that is essentially identical for 64451 as compared to 64483 with a work RVU of 1.90. 64483 has greater pre-service times, but, similar to 64493, the most recent review of 64483 occurred prior to the use of pre-service time packages and the survey median pre-service times for 64451 were actually greater than 64483 but were adjusted to pre-service package 5.

The recommended work RVU of 1.91 is lower than reference service 64479 which has a work RVU of 2.29, and the same intra-time of 15 minutes, but greater pre-service times as 64479 was last valued prior to the use of pre-service time packages. The IWPUT for 64479 -.0108- is slightly greater than the resulting IWPUT for 64451 -.104- although survey respondents indicated they considered 64451 to be more complex and intense than 64479 for most complexity/intensity questions.

These comparators indicate that the survey median Work RVU of 1.91 with pre-service package 5 (with an additional 1 minute for positioning, intra-service time of 15 minutes, and 7 minutes immediate post-service is the correct Work RVU for 64451 with the appropriate time inputs.

As an additional, final comparison, 64451 when currently performed is billed with CPT code 64450, Injection, anesthetic agent; other peripheral nerve or branch with a work RVU of 0.75. Because 64450 describes a single injection and does not include imaging guidance which is separately reportable and 64451 involves a minimum of injecting 4 nerves and includes imaging guidance, the total work RVUs are 2.15 (.75+.375+.375+.375+.27) which is higher than the median survey work RVU.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) Majority of the time 64451 was reported with 64450, Injection, anesthetic agent; other peripheral nerve or branch with a smaller percentage reported with 64493, Injection(s), diagnostic or therapeutic agent, paravertebral facet (zygapophyseal) joint (or nerves innervating that joint) with image guidance (fluoroscopy or CT), lumbar or sacral; single level or 64499, Unlisted procedure, nervous system

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pain Management How often? Commonly

Specialty Inteventional Pain Management How often? Commonly

Specialty Anesthesiology How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 2500
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. estimates crosswalked from CPT code 64493

Specialty Pain Management Frequency 600 Percentage 24.00 %

Specialty Interventional Pain Management Frequency 575 Percentage 23.00 %

Specialty Anesthesiology Frequency 550 Percentage 22.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 2500
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. estimates crosswalked from CPT code 64493

Specialty Pain Management Frequency 600 Percentage 24.00 %

Specialty Interventional Pain Management Frequency 575 Percentage 23.00 %

Specialty Anesthesiology Frequency 550 Percentage 22.00 %

Do many physicians perform this service across the United States? Yes

Berenson-Eggers Type of Service (BETOS) Assignment

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 64493

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:64625 Tracking Number Original Specialty Recommended RVU: **3.91**
Presented Recommended RVU: **3.84**
Global Period: 010 Current Work RVU: **N/A** RUC Recommended RVU: **3.39**

CPT Descriptor: Radiofrequency ablation, nerves innervating the sacroiliac joint, with image guidance (ie, fluoroscopy or computed tomography)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 68-year-old male has a 5-year history of persistent right sacroiliac joint pain and struggles to complete activities of daily living. He has had poor pain control despite multiple medication trials and physical therapy. Subsequently, a trial of diagnostic nerve blocks was conducted which temporarily relieved his pain and improved his function. He is now scheduled for radiofrequency ablation of the nerves innervating the sacroiliac joint to provide longer term, sustained pain relief.

Percentage of Survey Respondents who found Vignette to be Typical: 97%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 29% , In the ASC 38%, In the office 33%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 100% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Informed consent is discussed and obtained from the patient. The clinician obtains and reviews the medical record and any pertinent imaging studies, laboratory studies and medical information. The proposed site of the procedure is identified and marked. The patient is moved to the procedure room. The clinician gowns, gloves and prepares supplies. The injection is prepared. The skin is cleansed with an antiseptic solution, sterile drapes are applied. The skin around the planned entry point is injected with local anesthetic. The universal protocol ("time out") is performed with the care team..

Description of Intra-Service Work: The procedure is performed under fluoroscopic guidance. The L5 dorsal ramus nerve is targeted at the junction of the sacral ala and S1 superior articular process. The S1, S2, and S3 nerves are targeted at multiple points along the posterior lateral foramen of the S1, S2, and S3 foramen respectively. Under imaging guidance, a radiofrequency cannula is guided to the appropriate fluoroscopic landmark. Sensory stimulation is performed. After further anesthetic is injected, radiofrequency ablation is performed at 60 degrees for 150 seconds. The needle and stylet are removed.

Description of Post-Service Work: The sites are covered with a sterile occlusive dressing. The patient is observed for bleeding or any adverse effects and for evidence of successful radiofrequency ablation. A procedure note is dictated/written and medical record entries are made. The patient is discharged after a period of monitoring and when there is independent ambulation. At the follow-up office visit, the patient is examined and treatment success or adverse reactions that may have occurred after the procedure are discussed. Revise the treatment plan(s) as necessary. Dictate notes for the patient’s medical record..

Physical effort required	14%	43%	43%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	43%	43%	14%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

64451, Injection(s), anesthetic agent(s) and/or steroid*;* nerves innervating the sacroiliac joint, with image guidance (ie, fluoroscopy or computed tomography) and 64625, Radiofrequency ablation, nerves innervating the sacroiliac joint, with image guidance (ie, fluoroscopy or computed tomography) are new codes that describe the work involved in treating the nerves around the Sacroiliac (SI) joint. 64625 describes SI Joint

nerve treatment by radiofrequency ablation and was approved as category I at the October 2018 CPT Editorial Panel meeting and is a 010-day global.

Both 64451 and 64625 were surveyed together by the ASA, AAPM&R, AAPM, ASIPP, NANS, NASS, and SIS for the 2019 January RUC meeting via random sampling of all societies.

Survey Results

There were 73 total respondents, and 71 of the 73 respondents agreed with the typical patient vignette. Median experience in past 12 months was 10.

Median survey times were as follows: 22 minutes for pre-service evaluation, 7 minutes for pre-service positioning, 7 minutes for pre-service scrub, dress, and wait. Median intra-service time was 30 minutes with 7 minutes immediate post-service time. Survey respondents indicated the most typical site of service to be the Ambulatory Surgical Center (ASC) with the patient being discharged on the same day in 100% of the cases. Survey respondents indicated one post-operative follow up visit in the office setting in the global period at a 99213 level.

25th % Work RVU was 3.00 and the Median Work RVU was 3.91.

Key Reference Services

57 of the 73 respondents choose 64633, Destruction by neurolytic agent, paravertebral facet joint nerve(s), with imaging guidance (fluoroscopy or CT); cervical or thoracic, single facet joint which has pre-times of 18/5/6, intra-service time of 30 minutes, and immediate post-service time of 15 minutes, half day discharge, 1 post-operative office visit, 99213, a work RUV of 3.84, and an IWPUT of .044.

7 of the 73 respondents choose 64561, Percutaneous implantation of neurostimulator electrode array; sacral nerve (transforaminal placement) including image guidance, if performed which has pre-times of 13/5/6, intra-service time of 45 minutes, immediate post-service time of 19 minutes, one level 99214 post-operative office visit, a work RVU of 5.44 and an IWPUT of .064.

Recommended Time and Work RVU

An expert panel from surveying societies reviewed the survey data and key reference services and recommends the following times and Work RVU.

We are recommending pre-service package 1-Facility, straightforward patient, no general anesthesia, with a reduction of one minute for scrub, dress, and wait to reflect survey median times (13, 1, 5). This pre-service package is consistent with other recently and/or currently reviewed nerve treatment by injection codes such as the family of Somatic nerves and the family of Genicular nerves.

We are recommending the survey median intra-service time of 30 minutes.

We are recommending the survey median immediate post-service time of 7 minutes with a corresponding reduction from post-service package 7A of -11 minutes to reflect median survey responses. We are also recommending a half-day discharge-99238 to reflect the typical site of service from the survey, and one post-operative office visit-99213 to reflect the survey responses.

Our recommended total time is 98 minutes.

We are recommending the survey median Work RVU of 3.91. The resulting IWPUT is .060.

Comparison to Key Reference Services

CPT Code	Descriptor	Work RVU	Total Time	Total Pre-Time	Intra-Time	IWPUT	SVY
64633	Destruction by neurolytic agent, paravertebral facet joint nerve(s), with imaging guidance (fluoroscopy or CT); cervical or thoracic, single facet joint	3.84	116	29	30	0.044	SVY
6XX01	Radiofrequency ablation, nerves innervating the sacroiliac joint, with image guidance (ie, fluoroscopy or computed tomography)	3.91	98	19	30	0.06	SVY
64561	Percutaneous implantation of neurostimulator electrode array; sacral nerve (transforaminal placement) including image guidance, if performed	5.44	136	32	45	0.064	SVY

We believe the survey conducted was robust and captured a wide variety of specialists who regularly perform the procedure and who showed a significant amount of recent experience with the procedure. We believe the median survey times and recommended Work RVU are well supported by the key reference service 64633 which was chosen by 78% of the respondents. The recommended Work RVU is slightly higher than 64633, the most commonly chosen key reference service. The expert panel believes it is more work to treat the nerves closer to the SI joint as described by the CPT code descriptor than to treat the cervical or thoracic medial branch nerves as described in 64633 which are which have well defined anatomical landmarks and are located further away from the joint structure and therefore are less difficult to innervate. Further, the time differences between 64625 and 64633 are a result of current RUC standard pre-time packages which were not used when 64633 was last valued when pre-times were typically the same as the median survey times. The median survey pre-times for 64625 were actually greater than the pre-times for 64633 but were adjusted to pre-service time package 1. And the survey intensity/complexity questions indicated that for most of the components, survey respondents felt 64625 to be more complex or intense than 64633.

These comparators indicate that the survey median Work RVU of 3.91 with pre-service package 1 (with a subtraction of 1 minute for scrub, dress and wait, intra-service time of 15 minutes, post-service package 7a with 11 minutes subtracted, a half-day discharge-99238, and one post-operative office visit 99213 are the correct and appropriate Work RVU and times for 64625.

Compelling Evidence Rationale for 64625

Currently, clinicians are reported services described by code 64625 either with code 64640 Destruction by neurolytic agent; other peripheral nerve or branch) or 64633, Destruction by neurolytic agent, paravertebral facet joint nerve(s), with imaging guidance (fluoroscopy or CT); cervical or thoracic, single facet joint. Code 64640 is currently being surveyed for this meeting as part of a different tab (tab 10). It was previously surveyed back in 2011. The American Society of Anesthesiologists (ASA), the American Academy of Pain Medicine (AAPM), the American Academy of Physical Medicine & Rehabilitation (AAPM&R), the American Society of Interventional Pain Physicians (ISIPP), the North American Neuromodulation Society (NANS), the North American Spine Society (NASS) and the Spine Intervention Society (SIS) are submitting compelling evidence for code 64625.

Change in physician work due to change in patient population

There is a change in physician work due to a change in the typical patient. When 64640 was surveyed in 2011, the typical patient had a history of neuritis of the medial calcaneal nerve.

- 64640 Current Vignette: A 50-year-old female has a history of neuritis of the medial calcaneal nerve. Her symptoms, including paresthesia on percussion and ambulation, have failed to improve following administration of multiple conservative treatment modalities. The decision is made to perform a percutaneous alcohol nerve sclerosing (PANS) injection.

In contrast, the typical patient for 64625 is experiencing persistent SI right sacroiliac joint pain.

- 64625 Vignette: A 68-year-old male has a 5-year history of persistent right sacroiliac joint pain and struggles to complete activities of daily living. He has had poor pain control despite multiple medication trials and physical therapy. Subsequently, a trial of diagnostic nerve blocks was conducted which temporarily relieved his

pain and improved his function. He is now scheduled for radiofrequency ablation of the nerves innervating the sacroiliac joint to provide longer term, sustained pain relief.

Existing codes are not specific to the SI Joint Nerve RFA procedure where the SI Joint Nerve branches are targeted for radiofrequency ablation. This service is performed on a subset of patients who experienced temporary relief from pain from a previous SI Joint Nerve block procedure.

Change in physician work due to change in technique
There is a change in physician work due to change in technique. The work description for code 64640 describes a single ablation. Code 64625, involves ablation for a minimum of 4 SI joint nerve branches in order to achieve analgesia for the SI Joint.

Specialties surveyed
All of the specialties that currently perform the 64625, were not included in the 2011 survey for 64640. The specialties that surveyed the code in 2011 included podiatry, anesthesia, pain management and interventional pain management. For the new code 64625, the specialty of podiatry does not perform the service and their inclusion would not be appropriate. Additionally, physical medicine and rehabilitation was not included in the 2011 survey. They are included in the 2018 survey along with specialists in neuromodulation (NANS), and spine surgery (NASS).

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 64640, 64633

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pain Management How often? Commonly

Specialty Inteventional Pain Management How often? Commonly

Specialty Anesthesiology How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 2000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. estimated crosswalk from 64633

Specialty Pain Management Frequency 560 Percentage 28.00 %

Specialty Interventional Pain Management Frequency 540 Percentage 27.00 %

Specialty Anesthesiology Frequency 520 Percentage 26.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 2,000
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. estimated crosswalk from 64633

Specialty Pain Management Frequency 560 Percentage 28.00 %

Specialty Interventional Pain Management Frequency 540 Percentage 27.00 %

Specialty Ansethsiology Frequency 520 Percentage 26.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Minor procedure

BETOS Sub-classification Level II:
Musculoskeletal

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 64633

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation (SoR)
Facility Direct Practice Expense (PE) Inputs

CPT Long Descriptor:

Global Period: 0 days (64451) 010 days (64625) Meeting Date: January 2019

64451: Injection(s), anesthetic agent(s) and/or steroid*;* nerves innervating the sacroiliac joint, with image guidance (ie, fluoroscopy or computed tomography)

64625: Radiofrequency ablation, nerves innervating the sacroiliac joint, with image guidance (ie, fluoroscopy or computed tomography)

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

   A panel of clinicians representing each specialty society involved in the RUC survey process for the collaborated to develop and approve the PE recommendations.

2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is not new, you must use the current direct PE inputs as your reference code. You can provide one additional reference code if you are required to use the current direct PE inputs. Provide an explanation for the selection of reference code(s) here:

   Code 64451: Using the current direct PE inputs of code 64493 as the reference code. 64493 was the primary reference code from the RUC survey.
   Code 64625: Using the current direct PE inputs of code 64633 as the reference code. 64633 was the primary reference code from the RUC survey.

3. Is this code(s) typically billed with an E/M service? *No*

4. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time: *N/A*

5. If you are requesting an increase over the current total cost for clinical staff time (This does not include minutes to assist physician and the number of post-op visits, as they are directly related to physician work), total cost of supplies, and/or total cost of equipment you must provide compelling evidence: *N/A*

6. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and listed in tab 2, please explain the difference here: *N/A*

7. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities: *N/A*

8. If you wish to identify a new staff type, please include a very specific staff description, a salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov. *N/A*

9. If you wish to include a supply that is not on the list please provide a paid invoice. Identify and explain the invoice here: *N/A*

10. If you wish to include an equipment item that is not on the list please provide a paid invoice. Identify and explain the invoice here: *N/A*

11. List all the equipment included in your recommendation and the equipment formula chosen (see document titled "Calculating equipment time"). If you have selected "other formula" for any of the equipment please explain here:

Code 64625: Table, exam (default formula)

12. If there is any other item(s) on your spreadsheet not covered in the categories above that require greater detail please include here: *N/A*

13. If there is any other item on your spreadsheet that needs further explanation please include here: *N/A*

14. Please include an explanation of each line item:

Code	Description	Explanation
CA002	Coordinate pre-surgery services (including test results)	Staff ensures all clinicians and providers have the relevant test results and other necessary components to delivery service
CA003	Schedule space and equipment in facility	Staff schedules and reviews space in facility as well as necessary equipment for performance of the procedure
CA005	Complete pre-procedure phone calls and prescription	Staff explains where to come for the appointment, checks medications, runs through list of medical conditions, makes sure the patient is off anti-coagulation drugs, confirms if patient uses BP medications, walks the patient through the procedure, confirms whether a driver is available for a ride home and answers patient questions.
CA006	Confirm availability of prior images/studies	Staff review medical records and confirm that all relevant prior images and studies are available for provider and obtains prior images and studies when necessary
CA039	Post-operative visits (total time)	
EF023	Table, exam	Used during follow-up procedure
EQ354	Radiofrequency kit for destruction by neurolytic agent	Used for the destruction procedure

CPT Code:__64451, 64625_____
Specialty Society__ASA, AAPM&R, AAPM, ASIPP, SIS, NASS, NANS__

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation (SoR)
Non Facility Direct Practice Expense (PE) Inputs

CPT Long Descriptor:

64451: Injection(s), anesthetic agent(s) and/or steroid*;* nerves innervating the sacroiliac joint, with image guidance (ie, fluoroscopy or computed tomography)

64625: Radiofrequency ablation, nerves innervating the sacroiliac joint, with image guidance (ie, fluoroscopy or computed tomography)

Global Period: 0 days (64451) 010 days (64625) Meeting Date: January 2019

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

   A panel of clinicians representing each specialty society involved in the RUC survey process for the collaborated to develop and approve the PE recommendations.

2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is not new, you must use the current direct PE inputs as your reference code. You can provide one additional reference code if you are required to use the current direct PE inputs. Provide an explanation for the selection of reference code(s) here:

   Code 64451: Using the current direct PE inputs of code 64493 as the reference code. 64493 was the primary reference code from the RUC survey.
   Code 64625: Using the current direct PE inputs of code 64633 as the reference code. 64633 was the primary reference code from the RUC survey.

3. Is this code(s) typically billed with an E/M service? *No.*
   Is this code(s) typically billed with the E/M service in the nonfacility? *No.*
   (Please see provided data in PE Subcommittee folder)

4. What specialty is the dominant provider in the nonfacility?
   Codes 64451 and 64625: New codes- N/A

   What percent of the time does the dominant provider provide the service(s) in the nonfacility?
   Codes 64451 and 64625: New codes- N/A

   Is the dominant provider in the nonfacility different then for the global?
   Codes 64451 and 64625: New codes- N/A

   (Please see provided data in PE Subcommittee folder)

5. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time: *N/A*

6. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies (This does not include minutes to assist physician and the number of post-op visits, as they are directly related to physician work), you must provide compelling evidence. Please explain if the increase can be entirely accounted for because of an increase in physician time.

   Codes 64451 and 64625: N/A

7. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and listed in tab 2, please explain the difference here: *N/A*

8. How much time was allocated to clinical activity, *obtain vital signs* (CA010) prior to CMS increasing the clinical activity to 5 minutes for calendar year 2018? (please use this time rather than 5 minutes in your reference code)
   The standard for clinical activity, obtains vital signs remains 0, 3 and 5 based on the number of vital signs taken. Please provide a rationale for the clinical staff time that you are requesting for obtain vital signs here:

   We recommend 5 minutes for obtaining vital signs. The following vital signs are collected: BP, RR, Pulse, Temp, O2 sat.

9. Please provide granular detail regarding what the clinical staff is doing during the intra-service (of service period) clinical activity, *Assist physician or other qualified healthcare professional---directly related to physician work time* or *Perform procedure/service---NOT directly related to physician work time:*

   Staff is present and assisting physician during the entire procedure. Staff supports the physician throughout the procedure by handing over the necessary supplies (syringes, gauzes etc.), acts as a second pair of hands during the procedure assisting with supplies/equipment or directly with the patient as needed, helps to make sure patient is comfortable and monitors the patient throughout the procedure.

10. If you have used a percentage of the physician intra-service work time other then 100 or 67 percent for the intra-service (of service period) clinical activity, please indicate the percentage and explain why the alternate percentage is needed and how it was derived. *N/A*

11. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities: *N/A*

12. If you wish to identify a new staff type, please include a very specific staff description, a salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov. *N/A*

13. If you wish to include a supply that is not on the list please provide a paid invoice. Identify and explain the invoice here: *N/A*

14. If you wish to include an equipment item that is not on the list please provide a paid invoice. Identify and explain the invoice here: *N/A*

15. List all the equipment included in your recommendation and the equipment formula chosen (see document titled “Calculating equipment time”). If you have selected “other formula” for any of the equipment please explain here:

Code 64451:

Technologist PACS workstation	*PACS*
mayo stand	*Default*
table, fluoroscopy	*Default*
room, mobile c-ARM	*Highly technical*
ECG, 3-channel (with SpO2, NIBP, temp, resp)	*Other*
light, exam	*Default*

The formula for ECG, 3-channel is the sum of the values included in the default formula, plus the time that the patient is monitored post-service of the service period.

Code 64625

Technologist PACS workstation	*PACS*
mayo stand	*Default*
table, fluoroscopy	*Default*
ECG, 3-channel (with SpO2, NIBP, temp, resp)	*Other*
light, exam	*Default*
nerve stimulator (eg, for nerve block)	*Default*
radiofrequency generator (NEURO)	*Default*
radiofrequency kit for destruction by neurolytic agent	*Default*

The formula for ECG, 3-channel is the sum of the values included in the default formula, plus the time that the patient is monitored post-service of the service period.

16. If there is any other item(s) on your spreadsheet not covered in the categories above that require greater detail please include here: *N/A*

17. If there is any other item on your spreadsheet that needs further explanation please include here: *N/A*

18. Please include an explanation of each line item:

Code	Description	Explanation
CA005	Complete pre-procedure phone calls and prescription	Staff explains where to come for the appointment, checks medications, runs through list of medical conditions, makes sure the patient is off anti-coagulation drugs, confirms if patient uses BP medications, walks the patient through the procedure, confirms whether a driver is available for a ride home and answers patient questions.
CA006	Confirm availability of prior images/studies	
CA009	Greet patient, provide gowning, ensure appropriate medical records are available	
CA010	Obtain vital signs	Blood pressure, respiratory rate, pulse, temperature, O2 saturation are all measured
CA011	Provide education/obtain consent	Patient and/or caregiver education on procedure, risks, complications, and

		requirements; obtain consent signature/approval subsequent to education
CA013	Prepare room, equipment and supplies	Separate preparations are made by the nursing and rad tech staff for the XX00 and XX01 codes
CA014	Confirm order, protocol exam	Confirm order is correct
CA016	Prepare, set-up and start IV, initial positioning and monitoring of patient	For both the XX00 and XX01, initiate IV, assist in patient positioning and monitor patient IV feed, and patient position
CA018	Assist physician or other qualified healthcare professional - directly	For the XX00 and XX01 codes, this is completed by both the nurse and the rad tech
CA022	Monitor the patient following procedure/service, multitasking 1:4	Patient is monitored for 20 minutes while multitasking (total of 5 minutes)
CA024	Clean room/equipment by clinical staff	Room and equipment are cleaned after patient encounter
CA029	Check dressings, catheters, wounds	Patient's dressings and wounds checked
CA030	Technologist QCs images in PACS, checking for all images, reformats, and dose page	Images are required for the XX00 and XX01 codes
CA031	Review examination with interpreting MD/DO	Images are required for the XX00 and XX01 codes
CA032	Scan exam documents in PACS. Complete exam in RIS system to populate images into work queue	Images are required for the XX00 and XX01 codes
CA035	Review home care instructions, coordinate visits/prescriptions	Post procedure review of care instructions with patient and/or caregiver and coordination of future visits and related precriptions
CA039	Post-operative visits (total time)	
SB001	Cap, surgical	Sterile attire for the MD. For the destruction codes, a cap is also required for the nurse and rad tech.
SB024	Gloves, sterile	Sterile attire for the MD
SB028	Gown, surgical, sterile	Sterile attire for the MD
SB033	Mask, surgical	Sterile attire required for the MD and other staff present in the room
SB027	Gown, staff, impervious	Sterile attire for staff
SB022	Gloves, non-sterile	Sterile attire for staff
SK075	Skin marking pen, sterile (Skin Skribe)	Used to mark injection sites
SB026	Gown, patient	Used to cover patient while allowing access to injection site.
SB004	Cover, thermometer probe	Used for taking vitals
SB036	Paper, exam table	
SB044	Underpad 2ft x 3ft (Chux)	Used under patient to collect fluid that may drain during the procedure to the table
SB037	Pillow case	Two pillows are needed for the XX00 and XX01 procedures – one under the head and one between the knees
SJ081	Swab, patient prep, 1.5 ml (chloraprep)	Used to prep the injection sites
SB011	Drape, sterile, fenestrated 16in x 29in	
SB019	Drape-towel, sterile 18in x 26 in	

SB008	Drape, sterile, c-arm, fluoro	Used only for the XX00 and XX01 codes that require fluoroscopic guidance
SD269	Grounding pad	
SB012	Drape, sterile, for Mayo stand	Used to hold supplies during the procedures
SC051	Syringe 10-12ml	Used for the anesthetic and injectate for XX00 and XX01
SH047	Lidocaine 1%-2% inj (Xylocaine)	Local anesthetic –for XXX000 and XXX000 (4 nerves) 10cc are used as anesthetic only.
SD050	Electrode needle, injectable (Myoject)	
SD087	Guide, needle, for localization	
SD011	Cannula (radiofrequency denervation) (SMK-C10)	Used for denervation procedures
SC028	Needle, 18-26g, 1.5-3.5in, spinal	Used for injectate for XX00 code
SH021	Bupivacaine 0.25% inj (Marcaine)	Injectate, increased amount required for XX00 and XX01 to account for 4 nerves.
SJ001	Alcohol isopropyl 70%	Used to clean skin post-procedure
SG021	Bandage, strip 0.75in x 3in (Bandaid)	Used post-procedure for site(s) of injection
SG056	Gauze, sterile 4in x 4in (10 pack)	Used for multiple injections (XX00 and XX01)
SL259	Bleach cleaning wipe	Used to clean the table
EF024	Table, fluoroscopy	Used for image guided procedures XX00 and XX01
EL018	Room, mobile c-Arm	Used for injection procedure XX00
EQ354	Radiofrequency kit for destruction by neurolytic agent	Used for destruction procedure XX01
EQ168	Light, exam	
ED050	Technologist PACS workstation	Used for capturing and storing images for the XX00 and XX01 codes
EQ214	Radiofrequency generator (NEURO)	Used during denervation procedure XX01
EQ184	Nerve stimulator (eg, for nerve block)	Used during denervation procedure XX01
EF015	Mayo stand	Used to hold supplies for the procedures
EQ011	ECG, 3-channel (with SpO2, NIBP, temp, resp)	Used both during the procedures and during monitoring time

AMA/Specialty Society RVS Update Committee Summary of Recommendations

October 2021

Transcutaneous Passive Implant-Temporal Bone – Tab 6

In October 2020, the CPT Editorial Panel revised two codes to replace "temporal bone" with "skull" and delete "or transcutaneous" and "cochlear stimulator: without mastoidectomy" from the descriptors. The Panel also replaced two codes for mastoidectomy with new codes for magnetic transcutaneous attachment to external speech processor. Additional revisions and codes were added to differentiate implantation, removal, and replacement of the implants.

At the January 2021 RUC meeting, the RUC reviewed these services and determined that they needed to be resurveyed for the April 2021 RUC meeting with a revised Reference Service List (RSL) to encompass a larger range of relative values, specifically to include the lower end of the RVU spectrum. The specialty society submitted a letter to the RUC requesting that this service be referred to the CPT Editorial Panel in May 2021 to clarify the percutaneous implant removal by describing the procedure as removal of the entire implant and adding a parenthetical.

At the April 2021 RUC meeting, the RUC recommended temporarily affirming the January 2021 interim RUC recommendations for work and practice expense inputs for CPT codes 69714, 69716, 69717, 69719, 69726, and 69727 and resurveying these codes for the October 2021 RUC meeting following revisions at the May 2021 CPT Editorial Panel meeting. In May 2021, for CPT 2023, the CPT Editorial Panel established three new codes 69XX0, 69XX1, 69XX2 and added a parenthetical note reporting transcutaneous, passive bone anchored implants for bone conduction hearing appliances.

The specialty society surveyed the codes for the October 2021 RUC meeting as planned. However, prior to the meeting, AMA staff discovered that one of the surveyed codes was listed on the RSL and was selected as the top Key Reference Service (KRS) code for every surveyed code. After discussion at the September 2021 pre-facilitation meeting, the specialty society indicated, and the RUC agreed, that the survey results were invalid and that the codes should be resurveyed for the January 2022 RUC meeting with a revised RSL that has been vetted and approved by the Research Subcommittee.

The RUC recommends that CPT codes 69714, 69716, 69717, 69719, 69726, 69727, 69XX0, 69XX1, and 69XX2 be resurveyed for January 2022, and that the specialty society work with the Research Subcommittee to draft a valid survey.

CPT Code	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
Surgery **Auditory System** **Middle Ear** ***Osseointegrated Implants*** *The following codes are for implantation of an osseointegrated implant into the skull. These devices treat hearing loss through surgical placement of an abutment or device into the skull that facilitates transduction of acoustic energy to be received by the better-hearing inner ear or both inner ears when the implant is coupled to a speech processor and vibratory element. This coupling may occur in a percutaneous or a transcutaneous fashion. Other reparative middle ear and mastoid procedures (69501-69676) may be performed for different indications and may be reported separately when performed.*				
▲69714	N1	Implantation, osseointegrated implant, ~~temporal bone~~skull~~, with percutaneous attachment to external speech processor/cochlear stimulator~~; ~~without mastoidectomy~~with percutaneous attachment to external speech processor	090	Resurvey for January 2022 (Interim January 2021 RUC Recommendation = 8.69)
69715	-	~~*with mastoidectomy*~~ (69715 has been deleted. To report mastoidectomy performed at the same operative session as osseointegrated implant placement, revision/replacement, or removal, see 69501-69676)	090	~~N/A~~
▲69716	N2	with magnetic transcutaneous attachment to external speech processor within the mastoid and/or resulting in removal of less than 100 mm^2 surface area of bone deep to the outer cranial cortex	090	Resurvey for January 2022 (Interim January 2021 RUC Recommendation = 9.77)
●69XX0	N3	with magnetic transcutaneous attachment to external speech processor, outside of the mastoid and resulting in removal of greater than or equal to 100 mm^2 surface area of bone deep to the outer cranial cortex	~~090~~	Resurvey for January 2022

▲69717	N4	*Revision/r~~R~~eplacement (including removal of existing device), osseointegrated implant, ~~temporal bone~~skull~~, with percutaneous attachment to external speech processor/cochlear stimulator~~; with percutaneous attachment to external speech processor~~without mastoidectomy~~*	090	Resurvey for January 2022 (Interim January 2021 RUC Recommendation = 8.80)
~~69718~~	-	~~with mastoidectomy~~ (69718 has been deleted. To report mastoidectomy performed at the same operative session as osseointegrated implant placement, revision/replacement, or removal, see 69501-69676)	~~090~~	~~N/A~~
▲69719	N5	*with magnetic transcutaneous attachment to external speech processor*, within the mastoid and/or involving a bony defect less than 100 mm^2 surface area of bone deep to the outer cranial cortex	090	Resurvey for January 2022 (Interim January 2021 RUC Recommendation = 9.77)
●69XX1	N6	with magnetic transcutaneous attachment to external speech processor, outside the mastoid and involving a bony defect greater than or equal to 100 mm^2 surface area of bone deep to the outer cranial cortex	090	Resurvey for January 2022
▲69726	N7	*Removal,* entire *osseointegrated implant, skull; with percutaneous attachment to external speech processor* (To report partial removal of the device [ie, abutment only], use appropriate evaluation and management code)	090	Resurvey for January 2022 (Interim January 2021 RUC Recommendation = 5.93)
▲69727	N8	*with magnetic transcutaneous attachment to external speech processor*, within the mastoid and/or involving a bony defect less than 100 mm^2 surface area of bone deep to the outer cranial cortex	090	Resurvey for January 2022 (Interim January 2021 RUC Recommendation = 7.13)
●69XX2	N9	with magnetic transcutaneous attachment to external speech processor, outside the mastoid and involving a bony defect greater than or equal to 100 mm^2 surface area of bone deep to the outer cranial cortex	090	Resurvey for January 2022

AMERICAN ACADEMY OF
OTOLARYNGOLOGY-
HEAD AND NECK SURGERY®

RE: Request to Resurvey Tab 6, Transcutaneous Passive Implant – Temporal Bone family of codes (CPT 69714, 69717, 69X50, 69X51, 69X52, and 69X53) for the January 2022 RUC Meeting

Dear Dr. Silva,

On behalf of the American Academy of Otolaryngology - Head and Neck Surgery (AAO-HNS), we would like to respectfully request permission to resurvey the Transcutaneous Passive Implant – Temporal Bone family of codes (CPT 69714, 69716, 69717, 69719, 69726, 69727, and 69XX0-X2) for the January 2022 RUC meeting.

As you know, these codes were surveyed and presented to the RUC for valuation at the January 2021 meeting. After a lengthy facilitation meeting, it was determined that there was an issue with the survey responses for at least one code in the family, due to resulting rank order anomalies in intra-service time. In response, the RUC assigned interim values for the codes, and requested that the family be resurveyed for the April 2021 RUC meeting. In preparation for our resurvey of this revised family, we worked diligently to incorporate all the feedback from the January 2021 review. Namely, to add in RSL codes the facilitation committee felt were more appropriate, to only include Otolaryngology procedures that were RUC reviewed (even in cases where that created larger gaps in the RSL work values, or where the RUC reviews were done quite some time ago), and to include a much broader span of values, starting with the 5 RVU range and extending up into the 16 RVU range (another request of our facilitation committee). This required a repull of all available reference codes from the RUC database. Regrettably, one of our survey codes, 69714, was captured within the parameters during that repull, and was not flagged for removal during any of our six rounds of internal review. Additionally, it was not flagged after submission of survey materials by the AMA.

Upon review of our survey responses this error was identified. Our society immediately contacted AMA staff and discussed the best options moving forward. It was agreed that our specialty should flag the issue at the onset of review by the RUC and proceed with presentation of our survey for this large family of codes. During prefacilitation, however, reviewers provided feedback that they felt this error rendered the survey

A: 1650 Diagonal Road, Alexandria, VA 22314

results “unusable” and directed the Academy to resurvey for the January 2022 cycle, since it remains within the same cycle as the October 2021 meeting.

Based on this feedback, we present this letter to the RUC panel and respectfully request permission to resurvey for the January 2022 meeting. We additionally plan to submit this tab for the October 19th Research Subcommittee meeting, for review of our January 2022 Reference Service List, to ensure all parties are comfortable with the comparator codes provided to survey respondents.

Thank you in advance for your consideration of this request. If you have any questions, please contact Jenna Minton, AAO-HNS RUC staff, at jenna@proactivestrategies.net or 517.927.8696.

Sincerely,

R. Peter Manes, MD
AAO-HNS RUC Advisor

AMA/Specialty Society RVS Update Committee Summary of Recommendations

October 2021

Pulmonary Angiography – Tab 8

In May 2021, the CPT Editorial Panel revised CPT code 93568 to include "nonselective" and "arterial" in its long descriptor and created four new Category I CPT Codes to report injection procedure during cardiac catheterization including imaging supervision, interpretation, and reporting for selective pulmonary arterial angiograph (unilateral and bilateral) and for selective pulmonary angiography of each distinct pulmonary vein and from an arterial approach. CPT add-on codes 93563-93567 were surveyed as part of the same code family for the October 2021 RUC meeting.

Compelling Evidence

The RUC reviewed and agreed that there is compelling evidence based on a change in the patient population, prior incorrect assumptions, and a change in technology/technique. The specialty noted that pulmonary angiography for patients with congenital heart defects is a complex mix of services with only a single existing CPT code which fails to capture the variability encountered. The prior version of CPT code 93568, with the long descriptor stating *Injection procedure during cardiac catheterization including imaging supervision, interpretation, and report; for pulmonary angiography (List separately in addition to code for primary procedure),* was created to describe pulmonary angiography with congenital, as well as non-congenital cardiac catheterization. It does not distinguish between pulmonary arterial and pulmonary venous, two completely different structures; the former a right heart structure, and the latter, left heart. Furthermore, this code does not capture the variety of different approaches to pulmonary arterial angiography for congenital heart disease, such as approaching from the venous system, across right heart structures, as compared to pulmonary arteries originating from the arterial system, or in many cases, when both exist in the same patient.

Incorrect Assumptions The prior survey for 93568 included only traditional interventional cardiologists and had a vignette that was not explicitly for a pediatric patient. No pediatric/congenital interventional cardiologists were explicitly included in the prior survey even though the typical patient for selective pulmonary angiography is a pediatric patient. These services are predominantly performed by physicians who were not included in the prior survey.

Change in Technique Complex angiographic techniques have been performed for decades to delineate the pulmonary anatomy yet only a single general pulmonary angiography code was available to capture the work of both non-selective and selective pulmonary angiography. Pulmonary veins and Major Aortopulmonary Collateral Arteries (MAPCAs) were not considered when 93568 was created. For example, the submitted article by Soquet, et al. describes the change in management of pulmonary atresia with ventricular septal defect that require information gleaned by pulmonary angiography, and Adamson, et al. articulate the complexity of managing patients with tetralogy of Fallot and MAPCAs. Additionally, Cory, et al. chronicle the evolution of techniques used to treat pediatric pulmonary vein stenosis.

Change in Patient Population The specialty societies noted, and the RUC agreed, that diagnostic catheter studies were performed in children who were relatively healthier with simpler cardiac defects when the previous code structure was last valued a decade ago; children with more significant cardiac defects had fewer treatment options. As result of improvements in both technique and technology, the specialty has evolved, and the typical patient is now more complex.

The RUC concurred that there is compelling evidence that the physician work for these services has changed due to prior incorrect assumptions, change in technology/technique and a change in patient population.

93563 ***Injection procedure during cardiac catheterization including imaging supervision, interpretation, and report; for selective coronary angiography during congenital heart catheterization (List separately in addition to code for primary procedure)***
The RUC reviewed the survey results from 35 interventional and pediatric interventional cardiologists and recommends maintaining the current work RVU of 1.11 for CPT code 93563, below the survey 25th percentile. The RUC recommends 15 minutes of intra-service and total time for this add-on service.

The RUC noted that when this service was last reviewed in 2010, the RUC recommended 2.00 work RVUs. CMS did not accept the RUC recommendation and instead applied a 10 percent reduction to the sum of the current work RVUs for the component codes, considering any multiple procedure reduction that would apply under CMS policy at that time. CMS implemented a work value that was only slightly more than half the value of the RUC recommendation based on an arbitrary calculation; the recommended physician time was implemented as well. CMS' decision in 2010 fully decoupled the relationship between physician work and physician time and assigned the service an inappropriately low physician work intensity. Although the RUC is now proposing to maintain the current value for this service, it is a large reduction from the RUC's previous recommendation.

To justify a value of 1.11, the RUC compared the surveyed code to the second key reference code 93571 *Intravascular Doppler velocity and/or pressure derived coronary flow reserve measurement (coronary vessel or graft) during coronary angiography including pharmacologically induced stress; initial vessel (List separately in addition to code for primary procedure)* (work RVU= 1.38, intra-service and total time of 15 minutes) and noted that both services involve an identical amount of time. The RUC also compared the surveyed code to MPC code 64480 *Injection(s), anesthetic agent(s) and/or steroid; transforaminal epidural, with imaging guidance (fluoroscopy or CT), lumbar or sacral, each additional level (List separately in addition to code for primary procedure)* (work RVU= 1.20, intra-service and total time of 15 minutes) and noted that both services involve an identical amount of time and involve a similar amount of physician work. The RUC's recommendation assigns this service a physician work intensity that is below both key reference services. **The RUC recommends a work RVU of 1.11 for CPT code 93563.**

93564 ***Injection procedure during cardiac catheterization including imaging supervision, interpretation, and report; for selective opacification of aortocoronary venous or arterial bypass graft(s) (eg, aortocoronary saphenous vein, free radial artery, or free mammary artery graft) to one or more coronary arteries and in situ arterial conduits (eg, internal mammary), whether native or used for bypass to one or more coronary arteries during congenital heart catheterization (List separately in addition to code for primary procedure)***
The RUC reviewed the survey results from 25 interventional and pediatric interventional cardiologists and recommends maintaining the current work RVU of 1.13 for CPT code 93564, below the survey 25th percentile. CPT code 93564 did not reach the 30-survey response threshold and will be re-reviewed in three years by the Relativity Assessment Workgroup. At that time, specialty societies will submit an action plan indicating whether this service should either be resurveyed or referred to the CPT Editorial Panel for subsequent deletion or revision to a Category III code. The RUC recommends 18 minutes of intra-service and total time for this add-on service.

The RUC noted that when this service was last reviewed in 2010, the RUC had recommended 2.10 work RVUs. CMS did not accept the RUC recommendation and instead applied a 10 percent reduction to the sum of the current work RVUs for the component codes, considering any multiple procedure reduction that would apply under CMS policy at the time. CMS implemented a work value that was only slightly more than half the value of the RUC recommendation based on an arbitrary calculation, while at the same time implementing the recommended physician time. CMS' decision in 2010 fully decoupled the relationship between physician work and physician time and assigned the service an inappropriately low physician work intensity. Although the RUC is now proposing to maintain the current value for this service, it is a large reduction from the RUC's previous recommendation.

To justify a value of 1.13, the RUC compared the surveyed code to the second key reference code 93571 *Intravascular Doppler velocity and/or pressure derived coronary flow reserve measurement (coronary vessel or graft) during coronary angiography including pharmacologically induced stress; initial vessel (List separately in addition to code for primary procedure)* (work RVU= 1.38, intra-service and total time of 15 minutes) and noted that the surveyed code involves somewhat more time to perform. The RUC also compared the surveyed code to MPC code 64480 *Injection(s), anesthetic agent(s) and/or steroid; transforaminal epidural, with imaging guidance (fluoroscopy or CT), lumbar or sacral, each additional level (List separately in addition to code for primary procedure)* (work RVU= 1.20, intra-service and total time of 15 minutes) and noted that the surveyed code involves more time, though both services involve a similar amount of physician work. The RUC's recommendation assigns this service a physician work intensity that is below both key reference services. **The RUC recommends a work RVU of 1.13 for CPT code 93564.**

93565 ***Injection procedure during cardiac catheterization including imaging supervision, interpretation, and report; for selective left ventricular or left atrial angiography (List separately in addition to code for primary procedure)***
The RUC reviewed the survey results from 35 interventional and pediatric interventional cardiologists and recommends maintaining the current work RVU of 0.86 for CPT code 93565, below the survey 25th percentile. The RUC recommends 10 minutes of intra-service and total time for this add-on service.

The RUC noted that when this service was last reviewed in 2010, the RUC had recommended 1.90 work RVUs. CMS did not accept the RUC recommendation and instead applied a 10 percent reduction to the sum of the current work RVUs for the component codes, considering any multiple procedure reduction that would apply under CMS policy at the time. CMS implemented a work value that was only slightly more than half the value of the RUC recommendation based on an arbitrary calculation, while at the same time implementing the recommended physician time. CMS' decision in 2010 fully decoupled the relationship between physician work and physician time and assigned the service an inappropriately low physician work intensity. Although the RUC is now proposing to maintain the current value for this service, it is a large reduction from the RUC's previous recommendation.

To justify a value of 0.86, the RUC compared the surveyed code to MPC code 64484 *Injection(s), anesthetic agent(s) and/or steroid; transforaminal epidural, with imaging guidance (fluoroscopy or CT), lumbar or sacral, each additional level (List separately in addition to code for primary procedure)* (work RVU= 1.00, intra-service and total time of 10 minutes) and noted that both services involve an identical amount of time, whereas the reference code is a slightly more intense service. The RUC also compared the surveyed code to CPT code 93572 *Intravascular Doppler velocity and/or pressure derived coronary flow reserve measurement (coronary vessel or graft) during coronary angiography including pharmacologically induced stress; each additional vessel (List separately in addition to code for primary procedure)* (work RVU= 1.00, intra-

service and total time of 11 minutes) and noted that with one less minute of intra-service time, the surveyed code is appropriately valued somewhat lower than this reference code which has a similar work intensity. The RUC's recommendation assigns this service a physician work intensity between the top and second key reference services. **The RUC recommends a work RVU of 0.86 for CPT code 93565.**

93566 ***Injection procedure during cardiac catheterization including imaging supervision, interpretation, and report; for selective right ventricular or right atrial angiography (List separately in addition to code for primary procedure)***
The RUC reviewed the survey results from 34 interventional and pediatric interventional cardiologists and recommends maintaining the current work RVU of 0.86 for CPT code 93566, below the survey 25th percentile. The RUC recommends 10 minutes of intra-service and total time for this add-on service.

The RUC noted that when this service was last reviewed in 2010, the RUC had recommended 0.96 work RVUs. CMS did not accept the RUC recommendation and instead applied a 10 percent reduction to the sum of the current work RVUs for the component codes, considering any multiple procedure reduction that would apply under CMS policy at the time. CMS implemented a work value that was lower than the value of the RUC recommendation based on an arbitrary calculation, while at the same time implementing the recommended physician time. CMS' decision in 2010 fully decoupled the relationship between physician work and physician time and assigned the service an inappropriately low physician work intensity. Although the RUC is now proposing to maintain the current value for this service, it is a large reduction from the RUC's previous recommendation.

To justify a value of 0.86, the RUC compared the surveyed code to MPC code 64484 *Injection(s), anesthetic agent(s) and/or steroid; transforaminal epidural, with imaging guidance (fluoroscopy or CT), lumbar or sacral, each additional level (List separately in addition to code for primary procedure)* (work RVU= 1.00, intra-service and total time of 10 minutes) and noted that both services involve an identical amount of time, whereas the reference code is a slightly more intense service. The RUC also compared the surveyed code to CPT code 93572 *Intravascular Doppler velocity and/or pressure derived coronary flow reserve measurement (coronary vessel or graft) during coronary angiography including pharmacologically induced stress; each additional vessel (List separately in addition to code for primary procedure)* (work RVU= 1.00, intra-service and total time of 11 minutes) and noted that with one less minute of intra-service time, the surveyed code is appropriately valued somewhat lower than this reference code which has a similar work intensity. The RUC's recommendation assigns this service a physician work intensity between the top and second key reference services. **The RUC recommends a work RVU of 0.86 for CPT code 93566.**

93567 ***Injection procedure during cardiac catheterization including imaging supervision, interpretation, and report; for supravalvular aortography (List separately in addition to code for primary procedure)***
The RUC reviewed the survey results from 34 interventional and pediatric interventional cardiologists and recommends maintaining the current work RVU of 0.97 for CPT code 93567, below the survey 25th percentile. The RUC recommends 10 minutes of intra-service and total time for this add-on service.

The specialties noted that, relative to CPT codes 93565 and 93566 which also typically involve 10 minutes of time, 93567 is a more intense service to perform. CPT code 93567 is typically provided to a relatively sicker and older adult population compared to codes 93565 and 93566, due to there being a greater risk of rupture and catheter passes are more tortuous in the senior population. There is a higher likelihood of a calcified

aorta and risk for the dislocation of aortic plaque. Finally, when working in the aorta, extra care must be taken to avoid the iatrogenic introduction of air into the vasculature.

To justify a value of 0.97, the RUC compared the surveyed code to MPC code 64484 *Injection(s), anesthetic agent(s) and/or steroid; transforaminal epidural, with imaging guidance (fluoroscopy or CT), lumbar or sacral, each additional level (List separately in addition to code for primary procedure)* (work RVU= 1.00, intra-service and total time of 10 minutes) and noted that both services involve an identical amount of time, whereas the reference code is a slightly more intense service. The RUC also compared the surveyed code to CPT code 93572 *Intravascular Doppler velocity and/or pressure derived coronary flow reserve measurement (coronary vessel or graft) during coronary angiography including pharmacologically induced stress; each additional vessel (List separately in addition to code for primary procedure)* (work RVU= 1.00, intra-service and total time of 11 minutes) and noted that though the surveyed code typically involves one less minute of intra-service time, it is a slightly more intense service to perform; it is warranted to have both services have a similar valuation. The RUC's recommendation assigns this service a physician work intensity between the top and second key reference services. The RUC concluded that the value of CPT code 93567 should be maintained at 0.97 RVUs as previously accepted by CMS and supported by the current survey. **The RUC recommends a work RVU of 0.97 for CPT code 93567.**

93568 ***Injection procedure during cardiac catheterization including imaging supervision, interpretation, and report; for nonselective pulmonary arterial angiography (List separately in addition to code for primary procedure)***
The RUC reviewed the survey results from 35 interventional and pediatric interventional cardiologists and recommends maintaining the current work RVU of 0.88 for CPT code 93568, below the survey 25th percentile. The RUC recommends 13 minutes of intra-service and total time for this add-on service. The CPT Editorial Panel revised CPT code 93568 to include "nonselective" and "arterial" in its long descriptor. It was noted that although the prior version of 93568 did not specifically state "non-selective" or "arterial", the previous surveyed typical patient with dyspnea and echocardiographic findings would most commonly only require non-selective pulmonary arterial angiography.

The RUC noted that when this service was last reviewed in 2010, the RUC had recommended 0.96 work RVUs. CMS did not accept the RUC recommendation and instead applied a 10 percent reduction to the sum of the current work RVUS for the component codes, considering any multiple procedure reduction that would apply under CMS policy at the time. CMS implemented a work value that was lower than the value of the RUC recommendation based on an arbitrary calculation, while at the same time implementing the recommended physician time. CMS' decision in 2010 fully decoupled the relationship between physician work and physician time and assigned the service an inappropriately low physician work intensity. Although the RUC is now proposing to maintain the current value for this service, it is a large reduction from the RUC's previous recommendation.

To justify a value of 0.88, the RUC compared the surveyed code to the second key reference code 93561 *Indicator dilution studies such as dye or thermodilution, including arterial and/or venous catheterization; with cardiac output measurement (separate procedure)* (work RVU= 0.95, intra-service and total time of 15 minutes) and noted that the surveyed code involves somewhat less time to perform and therefore it would be appropriate to assign it a somewhat lower valuation. The RUC also compared the surveyed code to reference code 15274 *Application of skin substitute graft to trunk, arms, legs, total wound surface area greater than or equal to 100 sq cm; each additional 100 sq cm wound surface area, or part thereof, or each additional 1% of body area of infants and children, or part thereof (List separately in addition to code for primary procedure)* (work RVU= 0.80, intra-service and total time of 10 minutes) and noted that the surveyed code involves 3 more minutes of total time,

justifying the higher valuation. The RUC's recommendation assigns this service a physician work intensity between the top and second key reference services. **The RUC recommends a work RVU of 0.88 for CPT code 93568.**

93569 ***Injection procedure during cardiac catheterization including imaging supervision, interpretation, and report; for selective pulmonary arterial angiography, unilateral (List separately in addition to code for primary procedure)***
The RUC reviewed the survey results from 32 interventional and pediatric interventional cardiologists and recommends the survey 25th percentile work RVU of 1.05 for CPT code 93569. The RUC recommends 11 minutes of intra-service and total time for this new add-on service. As specified in the CPT introductory language, selective pulmonary angiography codes for cardiac catheterization (93569, 93573, 93574, 93575)] include selective angiographic catheter positioning, injection, and radiologic supervision and interpretation. The RUC noted that the typical patient for this service is pediatric, whereas the former general code for reporting pulmonary angiography, 93568 was also used for non-selective pulmonary angiography and was last reviewed in 2010 using a non-pediatric typical patient.

To justify a work RVU of 1.05, the RUC compared the surveyed code to MPC code 64484 *Injection(s), anesthetic agent(s) and/or steroid; transforaminal epidural, with imaging guidance (fluoroscopy or CT), lumbar or sacral, each additional level (List separately in addition to code for primary procedure)* (work RVU= 1.00, intra-service and total time of 10 minutes) and noted that the surveyed code involves one more minute of time and should be assigned a slightly higher work value. The RUC also compared the surveyed code to top key reference code 36227 *Selective catheter placement, external carotid artery, unilateral, with angiography of the ipsilateral external carotid circulation and all associated radiological supervision and interpretation (List separately in addition to code for primary procedure)* (work RVU= 2.09, intra-service and total time of 15 minutes) and noted that the surveyed code involves less time to perform and less physician work, justifying a lower valuation than the top key reference service. The RUC's recommendation assigns this service a physician work intensity between the top and second key reference services. **The RUC recommends a work RVU of 1.05 for CPT code 93569.**

93573 ***Injection procedure during cardiac catheterization including imaging supervision, interpretation, and report; for selective pulmonary arterial angiography, bilateral (List separately in addition to code for primary procedure)***
The RUC reviewed the survey results from 33 interventional and pediatric interventional cardiologists and recommends the survey 25th percentile work RVU of 1.75 for CPT code 93573. The RUC recommends 18 minutes of intra-service and total time for this new add-on service. As specified in the CPT introductory language, selective pulmonary angiography codes for cardiac catheterization (93569, 93573, 93574, 93575) include selective angiographic catheter positioning, injection, and radiologic supervision and interpretation. The RUC noted that the typical patient for this service is pediatric, whereas the former general code for reporting pulmonary angiography 93568 was also used for non-selective pulmonary angiography and was last reviewed in 2010 using a non-pediatric typical patient.

To justify a work RVU of 1.75, the RUC compared the surveyed code to top key reference code 36227 *Selective catheter placement, external carotid artery, unilateral, with angiography of the ipsilateral external carotid circulation and all associated radiological supervision and interpretation (List separately in addition to code for primary procedure)* (work RVU= 2.09, intra-service and total time of 15 minutes) and noted that the surveyed code involves 3 more minutes of total time and is less intense to perform, supporting the proposed value. The RUC also compared the surveyed code to CPT code 36483 *Endovenous ablation therapy of incompetent vein, extremity, by transcatheter delivery of a chemical adhesive (eg, cyanoacrylate) remote from the access site, inclusive of all imaging guidance and monitoring, percutaneous; subsequent vein(s) treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)* (work RVU=

1.75, intra-service and total time of 20 minutes) and noted that although the surveyed code involves less time, it involves a moderately higher physician work intensity. The RUC's recommendation assigns this service a physician work intensity between the top and second key reference services. **The RUC recommends a work RVU of 1.75 for CPT code 93573.**

93574 ***Injection procedure during cardiac catheterization including imaging supervision, interpretation, and report; for selective pulmonary venous angiography of each distinct pulmonary vein during cardiac catheterization. (List separately in addition to code for primary procedure)*** The RUC reviewed the survey results from 32 interventional and pediatric interventional cardiologists and recommends the survey 25th percentile work RVU of 1.84 for CPT code 93574. The RUC recommends 20 minutes of intra-service and total time for this new add-on service. As specified in the CPT introductory language, selective pulmonary angiography codes for cardiac catheterization (93569, 93573, 93574, 93575) include selective angiographic catheter positioning, injection, and radiologic supervision and interpretation. The RUC noted that the typical patient for this service is pediatric, whereas the former general code for reporting pulmonary angiography, 93568 was also used for non-selective pulmonary angiography and was last reviewed in 2010 using a non-pediatric typical patient.

The RUC noted that CPT code 93574 can be reported in multiple units for each distinct pulmonary vein during cardiac catheterization, and that there are typically 4 pulmonary veins, though for some patients it could be 3 or 5 pulmonary veins. The specialty societies noted that each patient would not have angiography performed in all their pulmonary veins, and that typically only veins where the provider has a suspicion from a previous non-invasive study would be studied. The specialty societies also noted that it would be relatively rare to perform this service on 4 or 5 pulmonary veins. In addition, the specialties indicated that the same type of catheter could not be used for multiple pulmonary veins and would need to be switched out for a different shape of catheter or a different wire combination. The specialties noted, and the RUC concurred, that the previous version of code 93568 did not appropriately capture all the time-intensive and relatively intense physician work involved for selective pulmonary venous angiography.

To justify a work RVU of 1.84, the RUC compared the surveyed code to top key reference code 36227 *Selective catheter placement, external carotid artery, unilateral, with angiography of the ipsilateral external carotid circulation and all associated radiological supervision and interpretation (List separately in addition to code for primary procedure)* (work RVU= 2.09, intra-service and total time of 15 minutes) and noted that the surveyed code involves 5 more minutes of total time and less intense physician work, supporting the proposed lower value. The RUC also compared the surveyed code to CPT code 36483 *Endovenous ablation therapy of incompetent vein, extremity, by transcatheter delivery of a chemical adhesive (eg, cyanoacrylate) remote from the access site, inclusive of all imaging guidance and monitoring, percutaneous; subsequent vein(s) treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)* (work RVU= 1.75, intra-service and total time of 20 minutes) and noted that although both services typically involve an identical amount of time, the surveyed code is a more intense service to perform. The reference service is typically performed on an adult patient and under only local anesthesia, whereas the surveyed code is typically performed on a highly complex pediatric patient. The vignette for 93574, that 100 percent of the survey respondents found to be typical, was: "During a diagnostic cardiac catheterization, a 6-month-old male with down syndrome, status post atrioventricular (av) canal repair with new pulmonary hypertension undergoes multiple selective pulmonary venous angiograms to evaluate for presence of any pulmonary vein stenosis". The RUC's recommendation assigns this service a physician work intensity between the top and second key reference services. **The RUC recommends a work RVU of 1.84 for CPT code 93574.**

93575 ***Injection procedure during cardiac catheterization including imaging supervision, interpretation, and report; for selective pulmonary angiography of major aortopulmonary collateral arteries (MAPCAs) arising off the aorta or its systemic branches, each distinct vessel***
The RUC reviewed the survey results from 33 interventional and pediatric interventional cardiologists and recommends the survey 25th percentile work RVU of 1.92 for CPT code 93575. The RUC recommends 20 minutes of intra-service and total time for this new add-on service. As specified in the CPT introductory language, selective pulmonary angiography codes for cardiac catheterization (93569, 93573, 93574, 93575) include selective angiographic catheter positioning, injection, and radiologic supervision and interpretation. The RUC noted that the typical patient for this service is pediatric, whereas the former general code for reporting pulmonary angiography, 93568 was also used for non-selective pulmonary angiography and was last reviewed in 2010 using a non-pediatric typical patient.

Patients with pulmonary atresia and absent connection often have alternate, non-native, sources of pulmonary blood flow, and it becomes important for the pediatric interventional cardiologist to define those and detail those sources of pulmonary blood flow. Major Aortopulmonary Collateral Arteries (or MAPCAs) are arteries that develop to supply blood to the lungs when native pulmonary circulation is underdeveloped. A patient could have anywhere from only 1 to up to 12 MAPCAs. MAPCAs are tortuous and considerable anatomic variety — they can be small or large at their origin. Selecting different catheters going into and out of each one and getting into them is very time-intensive, complicated and involves intense physician work.

To justify a work RVU of 1.92, the RUC compared the surveyed code to top key reference code 36227 *Selective catheter placement, external carotid artery, unilateral, with angiography of the ipsilateral external carotid circulation and all associated radiological supervision and interpretation (List separately in addition to code for primary procedure)* (work RVU= 2.09, intra-service and total time of 15 minutes) and noted that the surveyed code involves 5 more minutes of total time and less intense physician work, supporting the proposed lower value. Similarly, 86 percent of the survey respondents that selected 36227 as their top key reference code indicated that the surveyed code is in fact a more intense service to perform. The RUC also compared the surveyed code to MPC code 99292 *Critical care, evaluation and management of the critically ill or critically injured patient; each additional 30 minutes (List separately in addition to code for primary service)* (work RVU= 2.25, 30 minutes of intra-service and total time) and noted that both services would have appropriate relativity with the RUC's recommendation for 93575. The RUC's recommendation assigns this service a physician work intensity between the top and second key reference services. **The RUC recommends a work RVU of 1.92 for CPT code 93575.**

Practice Expense
No direct practice expense inputs are recommended for CPT codes 93563-93568 and 93569-93575 as they are facility-based add-on services.

New Technology/New Service
The RUC recommends that CPT codes 93569, 93573, 93574 and 93575 be placed on the New Technology list and be re-reviewed by the RUC in three years to ensure correct valuation and utilization assumptions.

RAW Flag for Service with Less than 30 Survey Responses
CPT code 93564 did not reach the 30-survey response threshold and will be re-reviewed in three years by the Relativity Assessment Workgroup. At that time, specialty societies will submit an action plan indicating whether this service should either be resurveyed or referred to the CPT Editorial Panel for subsequent deletion or revision to a Category III code.

Do Not Use to Validate for Physician Work
The RUC agreed that CPT code 93564 should continue to be labeled in the RUC database with a flag that it should not be used to validate physician work, as the survey for this service did not achieve 30 survey respondents.

CPT Code	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
Surgery **Cardiovascular System** **Heart and Pericardium** **Implantable Hemodynamic Monitors**				
33289		*Transcatheter implantation of wireless pulmonary artery pressure sensor for long-term hemodynamic monitoring, including deployment and calibration of the sensor, right heart catheterization, selective pulmonary catheterization, radiological supervision and interpretation, and pulmonary artery angiography, when performed* *(For remote monitoring of an implantable wireless pulmonary artery pressure sensor, use 93264)* (Do not report 33289 in conjunction with 36013, 36014, 36015, 75741, 75743, 75746, 76000, 93451, 93453, 93456, 93457, 93460, 93461, 93530, 93531, 93532, 93533, 93568, 93569, 93573)		
Cardiac Valves **Pulmonary Valve**				
Code 33477 is used to report transcatheter pulmonary valve implantation (TPVI). Code 33477 should only be reported once per session. *Code 33477 includes the work, when performed, of percutaneous access, placing the access sheath, advancing the repair device delivery system into position, repositioning the device as needed, and deploying the device(s). Angiography, radiological supervision, and interpretation performed to guide TPVI (eg, guiding device placement and documenting completion of the intervention) are included in the code.* Code 33477 includes all cardiac catheterization(s), intraprocedural contrast injection(s), fluoroscopic radiological supervision and interpretation, and imaging guidance performed to complete the pulmonary valve procedure. Do not report 33477 in conjunction with 76000, 93451, 93453, 93454, 93455, 93456, 93457, 93458, 93459, 93460, 93461, *93593, 93594, 93596, 93597, 93598* ~~*93530, 93531, 93532, 93533*~~, 93563, 93566, 93567, 93568, 93569, 93573 for angiography intrinsic to the procedure.			

Code 33477 includes percutaneous balloon angioplasty of the conduit/treatment zone, valvuloplasty of the pulmonary valve conduit, and stent deployment within the pulmonary conduit or an existing bioprosthetic pulmonary valve, when performed. Do not report 33477 in conjunction with 37236, 37237, 92997, 92998 for pulmonary artery angioplasty/valvuloplasty or stenting within the prosthetic valve delivery site.

Codes 92997, 92998 may be reported separately when pulmonary artery angioplasty is performed at a site separate from the prosthetic valve delivery site. Codes 37236, 37237 may be reported separately when pulmonary artery stenting is performed at a site separate from the prosthetic valve delivery site.

Diagnostic right heart catheterization and diagnostic ~~coronary~~ angiography codes (93451, 93453, 93454, 93455, 93456, 93457, 93458, 93459, 93460, 93461, 93593*, 93594, 93596, 93597, 93598* ~~*93530, 93531, 93532, 93533*~~, 93563, 93566, 93567, 93568, 93569, 93573) should **not** be used with 33477 to report:

1. Contrast injections, angiography, roadmapping, and/or fluoroscopic guidance for the TPVI,

2. Pulmonary conduit angiography for guidance of TPVI, or

3. Right heart catheterization for hemodynamic measurements before, during, and after TPVI for guidance of TPVI.

Diagnostic right and left heart catheterization codes (93451, 93452, 93453, 93456, 93457, 93458, 93459, 93460, 93461, *93593, 93594, 93595, 93596, 93597, 93598* ~~*93530, 93531, 93532, 93533*~~), diagnostic coronary angiography codes (93454, 93455, 93456, 93457, 93458, 93459, 93460, 93461, 93563, 93564), and diagnostic pulmonary angiography codes (93568, 93569, 93573, 93574, 93575) may be reported with 33477, representing separate and distinct services from TPVI, if:

1. No prior study is available and a full diagnostic study is performed, or

2. A prior study is available, but as documented in the medical record:

   a. There is inadequate visualization of the anatomy and/or pathology, or

   b. The patient's condition with respect to the clinical indication has changed since the prior study, or

   c. There is a clinical change during the procedure that requires new evaluation.

Other cardiac catheterization services may be reported separately when performed for diagnostic purposes not intrinsic to TPVI.

For same session/same day diagnostic cardiac catheterization services, report the appropriate diagnostic cardiac catheterization code(s) appended with modifier 59 to indicate separate and distinct procedural services from TPVI.

Diagnostic coronary angiography performed at a separate session from an interventional procedure may be separately reportable, when performed.

Percutaneous coronary interventional procedures may be reported separately, when performed.

Percutaneous pulmonary artery branch interventions may be reported separately, when performed.

When transcatheter ventricular support is required in conjunction with TPVI, the appropriate code may be reported with the appropriate percutaneous ventricular assist device (VAD) procedure codes (33990, 33991, 33992, 33993, 33995, 33997), extracorporeal membrane oxygenation (ECMO) or extracorporeal life support services (ECLS) procedure codes (33946-33989), or balloon pump insertion codes (33967, 33970, 33973).

When cardiopulmonary bypass is performed in conjunction with TPVI, code 33477 may be reported with the appropriate add-on code for percutaneous peripheral bypass (33367), open peripheral bypass (33368), or central bypass (33369).

33470 Valvotomy, pulmonary valve, closed heart; transventricular

Shunting Procedures

Codes 33741, 33745 are typically used to report creation of effective intracardiac blood flow in the setting of congenital heart defects. Code 33741 (transcatheter atrial septostomy) involves the percutaneous creation of improved atrial blood flow (eg, balloon/blade method), typically in infants ≤4 kg with congenital heart disease. Code 33745 is typically used for intracardiac shunt creation by stent placement to establish improved intracardiac blood flow (eg, atrial septum, Fontan fenestration, right ventricular outflow tract, Mustard/Senning/Warden baffles). Code 33746 is used to describe each additional intracardiac shunt creation by stent placement at a separate location during the same session as the primary intervention (33745).

Code 33741 includes percutaneous access, placing the access sheath(s), advancement of the transcatheter delivery system, and creation of effective intracardiac atrial blood flow. Codes 33741, 33745 include, when performed, ultrasound guidance for vascular access and fluoroscopic guidance for the intervention. Code 33745 additionally includes intracardiac stent placement, target zone angioplasty preceding or after stent implantation, and complete diagnostic right and left heart catheterization, when performed.

Diagnostic cardiac catheterization is not typically performed at the same session as transcatheter atrial septostomy (33741) and, when performed, may be separately reported. Diagnostic cardiac catheterization is typically performed at the same session with 33745 and the code descriptor includes this work, when performed.

Cardiovascular injection procedures for diagnostic angiography reported using 93563, 93565, 93566, 93567, 93568, 93569, 93573, 93574, 93575 are not typically performed at the same session as 33741. Although diagnostic angiography is typically performed during 33745, target vessels and chambers are highly variable and, when performed~~,~~ for an evaluation separate and distinct from the shunt creation, may be reported separately.

Codes 33745, 33746 are used to describe intracardiac stent placement. Multiple stents placed in a single location may only be reported with a single code. When additional, different intracardiac locations are treated in the same session, 33746 may be reported. Codes 33745, 33746 include ~~any and~~ all balloon angioplasty(ies) performed in the target lesion, including any pre-dilation (whether performed as a primary or secondary dilation), post-dilation following stent placement, or use of larger/smaller balloon to achieve therapeutic result. Angioplasty in a separate and distinct intracardiac lesion may be reported separately. Use 33746 in conjunction with 33745.

Diagnostic right and left heart catheterization codes (93451, 93452, 93453, 93456, 93457, 93458, 93459, 93460, 93461, *93593, 93594, 93595, 93596, 93597, 93598* ~~*93530, 93531, 93532, 93533*~~) should not be used in conjunction with 33741, 33745 to report:

1. Fluoroscopic guidance for the intervention, or

2. Limited hemodynamic and angiographic data used solely for purposes of accomplishing the intervention (eg, measurement of atrial pressures before and after septostomy, atrial injections to determine appropriate catheter position)

Diagnostic ~~congenital~~ right and left heart catheterization codes (93451, 93452, 93453, 93456, 93457, 93458, 93459, 93460, 93461, *93593, 93594, 93595, 93596, 93597, 93598* ~~*93530, 93531, 93532, 93533*~~) performed at the same session as 33741, may be separately reported, if:

1. No prior study is available, and a full diagnostic study is performed, or

2. A prior study is available, but as documented in the medical record:

a. There is inadequate visualization of the anatomy and/or pathology, or

b. The patient's condition with respect to the clinical indication has changed since the prior study, or

c. There is a clinical change during the procedure that requires a more thorough evaluation.

~~For same-session diagnostic congenital catheterization services, the appropriate diagnostic cardiac catheterization code(s) for congenital anomalies (*93593, 93594, 93595, 93596, 93597, 93598* *93530, 93531, 93532, 93533*) may be reported by appending modifier 59, indicating separate and distinct procedural service(s) from 33741.~~ For same-session diagnostic cardiac angiography for an evaluation separate and distinct from 33741 or 33745 ~~the shunt creation~~, the appropriate contrast injection(s) performed (93563, 93565, 93566, 93567, 93568, 93569, 93573, 93574, 93575) may be reported ~~by appending modifier 59, indicating separate and distinct procedural service(s) from 33741, 33745~~.

33735 *Atrial septectomy or septostomy; closed heart (Blalock-Hanlon type operation)*

Arteries and Veins
Vascular Injection Procedures

Listed services for injection procedures include necessary local anesthesia, introduction of needles or catheter, injection of contrast media with or without automatic power injection, and/or necessary pre- and postinjection care specifically related to the injection procedure.

Selective vascular catheterization should be coded to include introduction and all lesser order selective catheterization used in the approach (eg, the description for a selective right middle cerebral artery catheterization includes the introduction and placement catheterization of the right common and internal carotid arteries).

Additional second and/or third order arterial catheterization within the same family of arteries or veins supplied by a single first order vessel should be expressed by 36012, 36218, or 36248.

Additional first order or higher catheterization in vascular families supplied by a first order vessel different from a previously selected and coded family should be separately coded using the conventions described above.

*(For radiological supervision and interpretation, see **Radiology**)*

(For injection procedures in conjunction with cardiac catheterization, see 93452-93461, 93563-93568, 93569, 93573, 93574, 93575)

(For chemotherapy of malignant disease, see 96401-96549)

Intravenous

An intracatheter is a sheathed combination of needle and short catheter.

36000 Introduction of needle or intracatheter, vein

Radiology
Diagnostic Radiology (Diagnostic Imaging)
Vascular Procedures
Aorta and Arteries

75743 Angiography, pulmonary, bilateral, selective, radiological supervision and interpretation

(For selective pulmonary arterial angiography during cardiac catheterization see 93569, 93573)

(For selective pulmonary venous angiography during cardiac catheterization, each distinct vein, use 93574)

(For selective pulmonary angiography of major aortopulmonary collateral arteries [MAPCAs] arising off the aorta or its systemic branches use 93575)

75746 Angiography, pulmonary, by nonselective catheter or venous injection, radiological supervision and interpretation

(For nonselective pulmonary arterial angiography by ~~nonselective~~ catheter ~~or venous~~ injection performed at the time of cardiac catheterization, use 93568, which includes imaging supervision, interpretation, and report)

+75774 Angiography, selective, each additional vessel studied after basic examination, radiological supervision and interpretation (List separately in addition to code for primary procedure)

(For cardiac catheterization procedures, see 93452-93462, *93593, 93594, 93595, 93596, 93597*~~*93531-93533*~~, 93563-93568, 93569, 93573, 93574, 93575)

(For radiological supervision and interpretation of dialysis circuit angiography performed through existing access[es] or catheter-based arterial access, use 36901 with modifier 52)

Medicine
Cardiovascular
Cardiac Catheterization

Cardiac catheterization is a diagnostic medical procedure which includes introduction, positioning and repositioning, when necessary, of catheter(s), within the vascular system, recording of intracardiac and/or intravascular pressure(s), and final evaluation and report of procedure. There are two code families for cardiac catheterization: one for congenital heart disease and one for all other conditions. *For cardiac*

catherization for congenital heart defects (93593, 93594, 93595, 93596, 93597, 93598), see the ***Medicine/Cardiovascular/Cardiac Catheterization for Congenital Heart Defects*** *subsection. The following guidelines apply to cardiac catheterization performed for indications other than the evaluation of congenital heart defects. ~~Anomalous coronary arteries, patent foramen ovale, mitral valve prolapse, and bicuspid aortic valve are to be reported with 93451-93464, 93566-93568.~~*

Right ~~h~~Heart ~~c~~Catheterization: *for indications other than the evaluation of congenital heart defects (93453, 93456, 93457, 93460, 93461)* includes catheter placement in one or more right-sided cardiac chamber(s) or structures (ie, the right atrium, right ventricle, pulmonary artery, pulmonary wedge), obtaining blood samples for measurement of blood gases, and cardiac output measurements (Fick or other method), when performed. For placement of a flow directed catheter (eg, Swan-Ganz) performed for hemodynamic monitoring purposes not in conjunction with other catheterization services, use 93503. *Do not report 93503 in conjunction with other diagnostic cardiac catheterization codes.* Right heart catheterization does not include right ventricular or right atrial angiography (93566). ~~*Left heart catheterization involves catheter placement in a left-sided (systemic) cardiac chamber(s) (left ventricle or left atrium) and included left ventricular injection(s) when performed. Do not report 93503 in conjunction with other diagnostic cardiac catheterization codes. When right heart catheterization is performed in conjunction with other cardiac catheterization services, report 93453, 93456, 93457, 93460, or 93461.*~~

For right heart catheterization as part of catheterization to evaluate congenital heart defects, see 93593, 93594, 93596, 93597, 93598. For reporting purposes, when the morphologic left ventricle is in a subpulmonic position (eg, certain cases of transposition of the great arteries) due to congenital heart disease, catheter placement with hemodynamic assessment in this structure during right heart catheterization is considered part of that procedure, and does not constitute left heart catheterization. When the subpulmonic ventricle also connects to the aorta (eg, double outlet right ventricle), catheter placement with hemodynamic assessment of this ventricle during right heart catheterization is considered part of that procedure, while catheter placement with hemodynamic assessment of that same ventricle from the arterial approach is considered left heart catheterization. Report the appropriate code for right and left heart catheterization if catheter placement with hemodynamic assessment of the double outlet ventricle is performed both during the right heart catheterization and separately from the arterial approach. Right heart catheterization for congenital heart defects does not typically involve thermodilution cardiac output assessments. When thermodilution cardiac output is performed in this setting it may be separately reported using 93598). ~~*When left heart catheterization is performed using either transapical puncture of the left ventricle or transseptal puncture of an intact septum, report 93462 in conjunction with 93452, 93453, 93458-93461, 93653, 93654. Catheter placement(s) in coronary artery(ies) involves selective engagement of the origins of the native coronary artery(ies) for the purpose of coronary angiography. Catheter placement(s) in bypass graft(s) (venous, internal mammary, free arterial graft[s]) involve selective engagement of the origins of the graft(s) for the purpose of bypass angiography. It is typically performed only in conjunction with coronary angiography of native vessels.*~~

Left Heart Catheterization: *for indications other than congenital heart defects (93452, 93453, 93458, 93459, 93460, 93461) involves catheter placement in a left-sided (systemic) cardiac chamber(s) (left ventricle or left atrium) and includes left ventricular/left atrial angiography, imaging supervision, and interpretation, when performed. For reporting purposes, when the morphologic right ventricle is in a systemic (subaortic) position due to congenital heart disease (eg, certain cases of transposition of the great arteries), catheter placement with hemodynamic assessment of the subaortic ventricle performed during left heart catheterization is considered part of the procedures and does not constitute right heart catheterization. If additional catheterization of right heart structures (eg, atrium, pulmonary artery) is performed at the same setting, report the appropriate code for right and left heart catheterization. When left heart catheterization is performed using either*

transapical puncture of the left ventricle or transseptal puncture of an intact septum, report 93462 in conjunction with 93452, 93453, 93458-93461, 93596, 93597. For left heart catheterization services for the evaluation of congenital heart defects, see 93595, 93596, 93597, 93565.

Catheter Placement and Injection Procedures: *For a listing of the injection procedures included in specific cardiac catheterization procedures, please refer to the tables on pages (X-X).*

Cardiac catheterization (93451-93461), other than for the evaluation of congenital heart defects, includes: a) all roadmapping angiography in order to place the catheters; b) any injections for angiography of the left ventricle, left atrium, native coronary arteries or bypass grafts listed as inherent to the procedure in the cardiac catheterization table located on pages X-X; and c) imaging supervision, interpretation, and report. Do not report 93563, 93464, 93565 in conjunction with 93452, 93453, 93454, 93455, 93456, 93457, 93458, 93459, 93460, 93461. The cardiac catheterization codes do not include contrast injection(s) and imaging supervision, interpretation, and report for imaging that is separately identified by other specific procedure code(s).

Catheter placement(s) in coronary artery(ies) involves selective engagement of the origins of the native coronary artery(ies) for the purpose of coronary angiography. Catheter placement(s) in bypass graft(s) (venous, internal mammary, free arterial graft[s]) involves selective engagement of the origins of the graft(s) for the purpose of bypass angiography. Bypass graft angiography is typically performed only in conjunction with coronary angiography of native vessels.

~~*The cardiac catheterization codes (93452-93461), other than those for congenital heart disease, include contrast injection(s), imaging supervision, interpretation, and report for imaging typically performed. Codes for left heart catheterization (93452, 93453, 93458-93461), other than those for congenital heart disease, include intraprocedural injection(s) for left ventricular/left atrial angiography, imaging supervision, and interpretation, when performed.*~~ Codes for ~~*coronary*~~ catheter placement(s) *in native coronary arteries* (93454-93461) *and bypass graft(s) (93455, 93457, 93459, 93461)* ~~*, other than those for congenital heart disease,*~~ include intraprocedural injection(s) for coronary*/bypass graft* angiography, imaging supervision, and interpretation*, except when these catheter placements are performed during cardiac catheterization for the evaluation of congenital heart defects.* ~~*Codes for catheter placement(s) in bypass graft(s) (93455, 93457, 93459, 93461), other than those for congenital heart disease, include intraprocedural injection(s) for bypass graft angiography, imaging supervision, and interpretation.*~~ Do not report 93563-93565 in conjunction with 93452-93461.

For right ventricular or right atrial angiography performed in conjunction with right heart catheterization for noncongenital heart disease (93451, 93453, 93456, 93457, 93460, 93461) or for the evaluation of congenital heart defects (93593, 93594, 93596, 93597), use 93566. For reporting purposes, angiography of the morphologic right ventricle or morphologic right atrium is reported with 93566, whether these structures are in the standard prepulmonic position or in a systemic (subaortic) position. Left heart catheterization performed for noncongenital heart disease (93452, 93453, 93458, 93459, 93460, 93461) includes left ventriculography, when performed. For reporting purposes, angiography of the morphologic left ventricle or morphologic left atrium is reported with 93565, whether these structures are in the standard systemic (subaortic) position or in a prepulmonic position. Do not report 93565 with 93452, 93453, 93454, 93455, 93456, 93457, 93458, 93459, 93460, 93461. For cardiac catheterization performed for the evaluation of congenital heart defects, left ventriculography is separately reported with 93565. For cardiac catheterization for *both congenital and noncongenital* heart defects ~~*cardiac catheterization*~~*, supravalvular aortography is reported with 93567. For* cardiac catheterization for *both congenital and noncongenital* heart defects ~~*cardiac*~~

~~catheterization~~, ~~nonselective~~ *pulmonary* arterial *angiography* or selective pulmonary venous angiography *is reported with* the appropriate pulmonary angiography code(s) (*93568,* 93569, 93573, 93574, 93575) *plus the appropriate* ~~right heart~~ cardiac *catheterization code.*

When contrast injection(s) are performed in conjunction with cardiac catheterization for congenital heart *disease (*~~93451, 93453, 93456, 93457, 93460, 93461,~~ *93593, 93594, 93595, 93596, 93597), see 93563, 93564, 93565, 93566, 93567, 93568,* 93569, 93573, 93574, 93575. *Injection procedures 93563, 93564, 93565, 93566, 93567, 93568,* 93569, 93573, 93574, 93575 *represent separate identifiable services and may be reported in conjunction with one another when appropriate. Codes 93563, 93564, 93565, 93566, 93567, 93568,* 93569, 93573,93574, 93575 *include imaging supervision, interpretation, and report.*

For angiography of noncoronary and nonpulmonary *arteries and veins, performed as a distinct service, use appropriate codes from the Radiology section and the Vascular Injection Procedures section.*

~~*For cardiac catheterization for congenital cardiac anomalies, see 93530-93533. When contrast injection(s) are performed in conjunction with cardiac catheterization for congenital anomalies, see 93563-93568*~~

~~*Cardiac catheterization (93451-93461) includes all roadmapping angiography in order to place the catheters, including any injections and imaging supervision, interpretation, and report. It does not include contrast injection(s) and imaging supervision, interpretation, and report for imaging that is separately identified by other specific procedure code(s). For right ventricular or right atrial angiography performed in conjunction with cardiac catheterization for congenital or noncongenital heart disease (93451-93461, 93530-93533), use 93566. For aortography, use 93567. For pulmonary angiography, use 93568. For angiography of noncoronary arteries and veins, performed as a distinct service, use appropriate codes from the Radiology section and the Vascular Injection Procedures section.*~~

For nonselective pulmonary arterial angiography, use 93568. For selective unilateral or bilateral pulmonary arterial angiography, see 93569, 93573. For selective pulmonary venous angiography, use 93574 for each distinct vessel. For selective pulmonary arterial angiography of major aortopulmonary collateral arteries (MAPCAs) arising off the aorta or its systemic branches, use 93575 for each distinct vessel.

Injection procedures 93574, 93575 represent selective venous and arterial angiography, respectively, for each distinct vessel. Codes 93574, 93575 require evaluation of a distinct named vessel (eg, right upper pulmonary vein, left lower pulmonary vein, left pulmonary artery via Blalock-Taussig [BT] shunt access, major aortopulmonary collateral artery [MAPCA] vessel #1 from underside of aortic arch) and may be reported for each distinct named vessel evaluated.

Selective pulmonary angiography codes for cardiac catheterization [93569, 93573, 93574, 93575], include selective angiographic catheter positioning, injection, and radiologic supervision and interpretation)

Adjunctive Hemodynamic Assessments: ~~*W*~~*w*hen cardiac catheterization is combined with pharmacologic agent administration with the specific purpose of repeating hemodynamic measurements to evaluate hemodynamic response, use 93463 in conjunction with 93451-93453, 93456-93461*, 93593, 93594, 93595, 93596, 93597*. Do not report 93463 for intracoronary administration of pharmacologic agents during percutaneous coronary interventional procedures, during intracoronary assessment of coronary pressure, flow or resistance, or during intracoronary imaging procedures. Do not report 93463 in conjunction with 92920-92944, 92975, 92977.

When cardiac catheterization is combined with exercise (eg, walking or arm or leg ergometry protocol) with the specific purpose of repeating hemodynamic measurements to evaluate hemodynamic response, report 93464 in conjunction with 93451-93453, 93456-93461, ~~and~~93593, 93594, 93595, 93596, 93597~~93530-93533~~.

Contrast injection to image the access site(s) for the specific purpose of placing a closure device is inherent to the catheterization procedure and not separately reportable. Closure device placement at the vascular access site is inherent to the catheterization procedure and not separately reportable.

~~*Please see the cardiac catheterization table located on page 684.*~~

93451 Right heart catheterization including measurement(s) of oxygen saturation and cardiac output, when performed

~~***Injection Procedures***~~

~~*All injection codes include radiological supervision, interpretation, and report. Cardiac catheterization codes (93452-93461), other than those for congenital heart disease, include contrast injection(s) for imaging typically performed during these (see Cardiac Catheterization above). Do not report 93563-93565 in conjunction with 93452-93461. When injection procedures for right ventricular, right atrial, aortic, or pulmonary angiography are performed in conjunction with cardiac catheterization, these services are reported separately (93566-93568). When right ventricular or right atrial angiography is performed at the time of heart catheterization, use 93566 with the appropriate catheterization code (93451, 93453, 93456, 93457, 93460, or 93461. Use 93567 when supravalvular ascending aortography is performed at the time of heart catheterization. Use 93568 with the appropriate right heart catheterization code when pulmonary angiography is performed. Separately reported injection procedures do not include introduction of catheters but do include repositioning of catheters when necessary and use of automatic power injectors, when performed.*~~

~~*When contrast injection(s) are performed in conjunction with cardiac catheterization for congenital cardiac anomalies (93530-93533), see 93563-93568. Injection procedure codes 93563-93568 include imaging supervision, interpretation, and report.*~~

~~*Injection procedures 93563-93568 represent separate identifiable services and may be coded in conjunction with one another when appropriate. The technical details of angiography, supervision of imaging and processing, interpretation, and report are included.*~~

~~Injection procedures 93574, 93575 represent selective venous and arterial angiography, respectively, for each distinct vessel. Codes 93574, 93575 require of a distinct named vessel for each location (eg, right upper pulmonary vein, left lower pulmonary vein, left pulmonary artery via Blalock-Taussig [BT] shunt access, major aortopulmonary collateral artery [MAPCA] vessel #1 from underside of aortic arch).~~

~~*93561 Indicator dilution studies such as dye or thermodilution, including arterial and/or venous catheterization; with cardiac output measurement (separate procedure)*~~

~~*93562 subsequent measurement of cardiac output*~~

~~*(Do not report 93561, 93562 in conjunction with 93451-93462, 93582)*~~

(Codes 93561, 93562 have been deleted)

(For cardiac output measurement[s], thermodilution or other indicator dilution method, performed during cardiac catheterization for the evaluation of congenital heart defects, use 93598) *(For radioisotope method of cardiac output, see 78472, 78473, or 78481)*

(93569, 93573, 93574, 93575 include the selective introduction and positioning of the angiographic catheter, injection, and radiologic supervision and interpretation)				

Repair of Structural Heart Defect

93582 *Percutaneous transcatheter closure of patent ductus arteriosus*

(93582 includes congenital right and left heart catheterization, catheter placement in the aorta, and aortic arch angiography, when performed)

(Do not report 93582 in conjunction with 36013, 36014, 36200, 75600, 75605, 93451-93453, 93456, 93457, 93458, 93459, 93460, 93461, 93593, 93594, 93595, 93596, 93597, 93598~~93530, 93531, 93532, 93533~~, 93567)

(For other cardiac angiographic procedures performed at the time of transcatheter PDA closure, see 93563, 93564, 93565, 93566, 93568, 93569, 93573, 93574, 93575 as appropriate)

~~(For left heart catheterization by transseptal puncture through intact septum or by transapical puncture performed at the time of transcatheter PDA closure, use 93462)~~

(For repair of patent ductus arteriosus by ligation, see 33820, 33822, 33824)

(For intracardiac echocardiographic services performed at the time of transcatheter PDA closure, use 93662. Other echocardiographic services provided by a separate individual are reported using the appropriate echocardiography service codes, 93315, 93316, 93317)

93583 *Percutaneous transcatheter septal reduction therapy (eg, alcohol septal ablation) including temporary pacemaker insertion when performed*

(93583 includes insertion of temporary pacemaker, when performed, and left heart catheterization)

(Do not report 93583 in conjunction with 33210, 93452, 93453, 93458, 93459, 93460, 93461, 93595, 93596, 93597~~93531, 93532, 93533~~, 93565)

(93583 includes left anterior descending coronary angiography for the purpose of roadmapping to guide the intervention. Do not report 93454, 93455, 93456, 93457, 93458, 93459, 93460, 93461, 93563 for coronary angiography performed during alcohol septal ablation for the purpose of roadmapping, guidance of the intervention, vessel measurement, and completion angiography)

(Diagnostic cardiac catheterization procedures may be separately reportable when no prior catheter-based diagnostic study of the treatment zone is available, the prior diagnostic study is inadequate, or the patient's condition with respect to the clinical indication has changed since the prior study or during the intervention. Use the appropriate codes from 93451, 93454, 93455, 93456, 93457, 93593, 93594, 93598~~93530,~~ 93563, 93564, 93566, 93567, 93568, 93569, 93573, 93574, 93575)

(Do not report 93583 in conjunction with 33210, 33211)

(Do not report 93463 for the injection of alcohol for this procedure)

(For intracardiac echocardiographic services performed at the time of alcohol septal ablation, use 93662)

(Other echocardiographic services provided by a separate physician are reported using the appropriate echocardiography services codes, 93312, 93313, 93314, 93315, 93316, 93317)

(For surgical ventriculomyotomy [-myectomy] for idiopathic hypertrophic subaortic stenosis, use 33416)

	(For pharmacologic agent administration during cardiac catheterization for congenital heart defect[s], use 93463)
	(For physiological exercise study with cardiac catheterization for congenital heart defect[s], use 93464)
	(For indicator dilution studies such as thermodilution for cardiac output measurement during cardiac catheterization for congenital heart defect[s], use 93598)
	(For contrast injections during cardiac catheterization for congenital heart defect[s], see 93563, 93564, 93565, 93566, 93567, 93568, 93569, 93573, 93574, 93575)
	(For angiography or venography not described in the 90000 series code section, see appropriate codes from the Radiology and the Medicine/Vascular Injection Procedure subsection)
	(For transseptal or transapical access of the left atrium during cardiac catheterization for congenital heart defect[s], use 93462 in conjunction with 93595, 93596, 93597, as appropriate)

Modifiers

CPT Level I Modifiers

63 Procedure Performed on Infants less than 4 kg

Procedures performed on neonates and infants up to a present body weight of 4 kg may involve significantly increased complexity and physician or other qualified health care professional work commonly associated with these patients. This circumstance may be reported by adding modifier 63 to the procedure number. Note: Unless otherwise designated, this modifier may only be appended to procedures/services listed in the 20100-69990 code series and 92920, 92928, 92953, 92960, 92986, 92987, 92990, 92997, 92998, 93312, 93313, 93314, 93315, 93316, 93317, 93318, 93452, 93505, 93593, 93594, 93595, 93596, 93597, 9359893530, 93531, 93532, 93533, 93561, 93562, 93563, 93564, 93568, 93569, 93573, 93574, 93575, 93580, 93581, 93582, 93590, 93591, 93592, 93615, 93616 from the Medicine/Cardiovascular section. Modifier 63 should not be appended to any CPT codes listed in the Evaluation and Management Services, Anesthesia, Radiology, Pathology/Laboratory, or Medicine sections (other than those identified above from the Medicine/Cardiovascular section).

Description of Pre-Service Work:

Description of Intra-Service Work: Diagnostic cardiac catheterization for both congenital as well as non-congenital indications includes the work of passing a diagnostic catheter into the main pulmonary artery. The work of 93569 begins when a wire is introduced through the diagnostic catheter to a more distal segmental pulmonary artery branch for selective catheterization. The diagnostic catheter is then either advanced over the wire and the wire removed for a selective hand injection or the diagnostic catheter is exchanged over the wire for an angiographic catheter to perform an angiogram with a power injector. Fluoroscopic guidance is used to confirm proper catheter position before angiography. Based on the findings from the initial imaging, additional angles may need to be acquired for better definition of suspected defects, and an angiographic injection is repeated. The patient's arterial pressure, electrocardiogram, and oxygen saturation are continuously monitored throughout the procedure. All images are reviewed and described in the procedure report. Per routine, any contrast injection is monitored afterward for complications of allergic reaction, arrhythmia, hemodynamic instability, and contrast-induced nephropathy.

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	40%	60%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

The CPT Panel approved a proposal at the May meeting to create four new codes that accurately describe pulmonary angiography procedures as they are currently performed. The CPT application sought to create the four new codes that would be used to report a significant portion—though not all—of the services now billed using 93568 and to make an editorial revision to 93568. With 93568 and a handful of adjacent angiography codes not reviewed in over a decade, the

societies undertook review of angiography codes 93563-93568 in addition to new codes 93569-93575. The ACC and SCAI randomly surveyed interventional cardiologists and pediatric interventional cardiologists, as designated by membership rolls, on the newly created codes. The ZZZ-global day survey was completed by physicians who have experience with the services.

Compelling Evidence

As submitted, because the newly defined codes will be billed in lieu of one of the existing codes, the recommendations produce additional work RVUs, requiring compelling evidence. We offer three arguments for compelling evidence below that we believe explain differences between prior survey, differences in technique, and differences in patient population that support an estimated total of 613 RVUs for this family.

Pulmonary angiography for patients with congenital heart defects is a complex mix of services with only a single existing CPT code which fails to capture the variability encountered. Existing CPT code 93568 *Injection procedure during cardiac catheterization including imaging supervision, interpretation, and report; for pulmonary angiography (List separately in addition to code for primary procedure)* was created to describe pulmonary angiography with congenital as well as non-congenital cardiac catheterization. Among its inadequacies, it fails to describe any difference between pulmonary arterial and pulmonary venous, two completely different structures; the former a right heart structure, and the latter, left heart. Furthermore, this code fails to capture the variety of different approaches to pulmonary arterial angiography for congenital heart disease, such as approaching from the venous system, across right heart structures, as compared to pulmonary arteries originating from the arterial system, or in many cases, when both exist in the same patient. Availability of only a single CPT code which was supposed to capture these multiple injections was not sufficient and resulted in services being underdefined in CPT.

Incorrect Assumptions The prior survey included only traditional interventional cardiologists. No pediatric/congenital interventional cardiologists were explicitly included in the prior survey. Given the RUC methodology of a decade ago, when there were no pediatric or congenital interventional cardiologists surveyed, the societies believe including the correct comprehensive subsets of specialties and societies in the current survey demonstrates compelling evidence. These services are predominantly performed by physicians who were not included in the prior survey.

Change in Technique Complex angiographic techniques have been performed for decades to delineate the pulmonary anatomy. Yet only a single non-selective pulmonary arterial angiography code was ever available to capture this cumbersome and often, complex work. Code 93568, when created alone of the 4 standard angiograms that were performed in every case in the older days of cardiac catheterization: right ventricle, left ventricle, pulmonary artery, and aorta. Therefore, they created those 4 codes. Since that time, coders took it upon themselves to report this code for other instances, such as pulmonary veins. The term being pulmonary angiogram, seemed vague and they were able too successfully report it. In realty, the code was created for the MPA as a non-selective angiogram. Due to availability of small stents / balloons that can be enlarged to adequate size and can pass through small enough catheters, we now perform angioplasty / stenting on patients that 20 years ago, was not possible. However, angiograms in those patients was never addressed. The new codes are specific codes crafted to address other structures that never existed. Pulmonary veins and MAPCAs were never in the consideration when 93568 was created. For example, the submitted article by Soquet, et al, describes the change in management of pulmonary artresia with ventricular septal defect, that require information gleaned by pulmonary angiography. Adamson, et al, describe the complexity of managing patients with tetralogy of Fallot and major aortopulmonary collateral arteries (MAPCAs). Cory, et al, describe the evolution of techniques used to treat pediatric pulmonary vein stenosis.

Change in Patient Population As we have explained several other times in the congenital cardiac space in recent years, the patients who received these services 10 and 15 years ago were less complex than those we see today, the opposite of technology diffusion in many other areas of medicine where new technology is launched initially for the sickest.

Finally, as the specialty has evolved, several elements of the intra-service simply do not suit the work performed. Code 93568 for pulmonary angiography for cardiac catheterization does not include any catheter placement. That work is covered by the base diagnostic cardiac catheterization codes. For the non-congenital diagnostic catheter codes, further selective catheter placement was never included. For congenital cardiac catheterization, the older set of codes did include catheter positioning, however these codes have since been marked for deletion and are replaced by a new set of codes from May 2020 CPT meeting. In the newer congenital cardiac catheter codes, only non-selective catheter positioning is included for purposes of angiography and clearly stated as such in the DOW. A new code is then needed for selective

catheter placement, injection and RS&I which would be applicable to both congenital as well as non-congenital diagnostic cardiac catheter procedures.

Survey Analysis

As we move through recommendations for this large group of codes, it is important to keep several elements in mind.

- The six existing codes do not include introduction of catheters; that work is billed separately as part of the catheterization code, so the existing codes should have lower values than the newly created codes.
- **The new codes do include catheter placement as well as the injection and radiologic supervision and interpretation, reflecting more work as recommended in this submission.**
- With maturation of technology and a larger congenital population to benefit from interventions, these services are now very commonly provided in the congenital population.
- Prior survey of the existing codes over a decade ago did not include a pool of pediatric interventional cardiologists who are typically treating a different patient population than what was captured in that survey. We believe that difference calls into question the ability to compare the times of the current survey with those of the prior survey.
- **The expert panel finds the values for the new codes appropriate from a magnitude estimation perspective at the 25th-percentile work RVUs.**
- It is not clear to the expert panel from the survey results that survey respondents understood the distinction that the existing codes **do not** include selective catheter placement while new codes **do** incorporate selective catheter placement as part of the service. Therefore, we are recommending the current values for the existing codes, despite the fact they are below the 25th-percentile of the survey. We identify no rationale to argue compelling evidence for higher work RVUs for the existing codes based on the survey results, nor are we aware of changes to these services from the past decade since prior evaluation.
- We believe these recommendations maintain/create a reasonable rank order with most of the existing codes falling below the new codes that more specifically define angiography in the arteries and pulmonary veins.

Survey Results

The key reference code is 36227 for selective catheter placement in the external carotid artery. It was selected by 28% of respondents. 56% of the respondents indicated that 93569 was more complex. The second reference code is 93561 for indicator dilution studies during catheterization. It was selected by 16% of respondents. 80% of the respondents indicated that 93569 was more intense/complex overall.

93569 Recommendation

The societies recommend the survey 25th-percentile work RVW of 1.05 with 11 minutes intraservice time from the survey median. This value correctly falls below KRS, which has a longer intraservice time than 933X0. It also fits between MPC codes 64484 and 64480 that have times and RVUs just above and below the recommendation, as shown in the summary spreadsheet.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.

☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 93568

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Cardiology How often? Sometimes

Specialty Interventional Cardiology How often? Sometimes

Specialty Pediatric Interventional Cardiology How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 0
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National utilization not available

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 334
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 9356

Specialty cardiology Frequency 190 Percentage 56.88 %

Specialty interventional cardiology Frequency 90 Percentage 26.94 %

Specialty Pediatric Interventional Cardiology Frequency 34 Percentage 10.17 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:

Description of Pre-Service Work:

Description of Intra-Service Work: Diagnostic cardiac catheterization for both congenital as well as non-congenital indications includes the work of passing a diagnostic catheter into the main pulmonary artery. The work of 93573 begins when a wire is introduced through the diagnostic catheter to further select a more distal segmental pulmonary artery branch for selective catheterization. The diagnostic catheter is then either advanced over the wire and the wire removed for a selective hand injection or the diagnostic catheter is exchanged over the wire for an angiographic catheter to perform an angiogram with a power injector. Fluoroscopic guidance is used to confirm proper catheter position before angiography. Based on the findings from the initial imaging, additional angles may need to be acquired for better definition of suspected defects, and an angiographic injection is repeated. Using the same or a differently shaped catheter, a wire is reinserted and used to enter the contralateral branch pulmonary artery and selectively position the catheter into another segmental pulmonary artery branch. The process above is repeated for contrast injection of the contralateral branch pulmonary artery. The patient's arterial pressure, electrocardiogram, and oxygen saturation are continuously monitored throughout the procedure. All images are reviewed and described in the procedure report. Per routine, any contrast injection is monitored afterward for complications of allergic reaction, arrhythmia, hemodynamic instability, and contrast-induced nephropathy.

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	20%	80%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

The CPT Panel approved a proposal at the May meeting to create four new codes that accurately describe pulmonary angiography procedures as they are currently performed. Pulmonary angiography for patients with congenital heart defects is a complex mix of services with only a single existing CPT code which fails to capture the variability encountered. Existing CPT code 93568 *Injection procedure during cardiac catheterization including imaging supervision, interpretation, and report; for pulmonary angiography (List separately in addition to code for primary procedure)* was created in the late 1990s to describe pulmonary angiography with congenital as well as non-congenital cardiac catheterization. Among its inadequacies, it fails to describe any difference between pulmonary arterial and pulmonary venous, two completely different structures; the former a right heart structure, and the latter, left heart. Furthermore, this code fails to capture the variety of different approaches to pulmonary arterial angiography for congenital heart disease, such as approaching from the venous system, across right heart structures, as compared to pulmonary arteries originating from the arterial system, or in many cases, when both exist in the same patient. Availability of only a single CPT code intended to capture these multiple injections was not sufficient and resulted in services being underdefined in CPT.

The CPT application sought to create the four new codes that would be used to report a significant portion—though not all—of the services now billed using 93568 and to make an editorial revision to 93568. With 93568 and a handful of adjacent angiography codes not reviewed in over a decade, the societies undertook review of angiography codes 93563-93568 in addition to new codes 93569-93575. The ACC and SCAI randomly surveyed interventional cardiologists and pediatric interventional cardiologists, as designated by membership rolls, on the newly created codes. The ZZZ-global day survey was completed by physicians who have experience with the services.

As we move through recommendations for this large group of codes, it is important to keep several elements in mind.

- The six existing codes **do not** include introduction of catheters; that work is billed separately as part of the catheterization code, so the existing codes should have lower values than the newly created codes.
- The new codes **do** include catheter placement as well as the injection and radiologic supervision and interpretation, reflecting more work as recommended in this submission.
- With maturation of technology and a larger congenital population to benefit from interventions, these services are now very commonly provided in the congenital population.
- Prior survey of the existing codes over a decade ago did not include a pool of pediatric interventional cardiologists who are typically treating a different patient population than what was captured in that survey. We believe that difference calls into question the ability to compare the times of the current survey with those of the prior survey.
- The expert panel finds the values for the new codes appropriate from a magnitude estimation perspective at the 25th-percentile work RVUs.
- It is not clear to the expert panel from the survey results that survey respondents understood the distinction that the existing codes **do not** include selective catheter placement while new codes **do** incorporate selective catheter placement as part of the service. Therefore, we are recommending the current values for the existing codes, despite the fact they are below the 25th-percentile of the survey. We identify no rationale to argue compelling evidence for higher work RVUs for the existing codes based on the survey results, nor are we aware of changes to these services from the past decade since prior evaluation.
- We believe these recommendations maintain/create a reasonable rank order with most of the existing codes falling below the new codes that more specifically define angiography in the arteries and pulmonary veins.

Survey Results

The key reference code is 36227 for selective catheter placement in the external carotid artery. It was selected by 27% of respondents. 78% of the respondents indicated that 93573 was more complex. The second reference code is 93561 for indicator dilution studies during catheterization. It was selected by 15% of respondents. 100% of the respondents indicated that 93573 was more intense/complex overall.

93573 Recommendation

The societies recommend the survey 25th-percentile work RVW of 1.75 with 18 minutes intraservice time from the survey median. It also fits between MPC codes 37253 and 99292 that have times and RVUs just above and below the recommendation, as shown in the summary spreadsheet.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 93568

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Cardiology How often? Sometimes

Specialty Interventional Cardiology How often? Sometimes

Specialty Pediatric Interventional Cardiology How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 0
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National utilization not available

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 334
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The CPT CCA estimates 25% of 93568 will be reported as 93573.

Specialty Cardiology Frequency 190 Percentage 56.88 %

Specialty Interventional Cardiology Frequency 90 Percentage 26.94 %

Specialty Pediatric Interventional Cardiology Frequency 34 Percentage 10.17 %

Do many physicians perform this service across the United States? No

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:

BETOS Sub-classification Level II:
Cardiovascular-Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 93568

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:93574 Tracking Number P9 Original Specialty Recommended RVU: **1.84**
Presented Recommended RVU: **1.84**
Global Period: ZZZ Current Work RVU: RUC Recommended RVU: **1.84**

CPT Descriptor: Injection procedure during cardiac catheterization including imaging supervision, interpretation, and report; for selective pulmonary venous angiography of each distinct pulmonary vein during cardiac catheterization. (list separately in addition to code for primary procedure) (use 93xx2 in conjunction with 33361, 33362, 33363, 33364, 33365, 33366, 33418, 33419, 33477, 33741, 33745, 37236, 37237, 37238, 37246, 37248, 338x1, 338x2, 338x3, 338x4, 338x5, 338x6, 338x7, 37187, 37188, 92997, 92998, 93451, 93453, 93456, 93457, 93460, 93461, 93x1x, 93x2x, 93x3x, 93x4x, 93x5x, 93505, 93580, 93581, 93582, 93583)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: During a diagnostic cardiac catheterization, a 6-month-old male with down syndrome, status post atrioventricular (av) canal repair with new pulmonary hypertension undergoes multiple selective pulmonary venous angiograms to evaluate for presence of any pulmonary vein stenosis. note: this is an add-on service. only consider the additional work related to each additional distinct pulmonary vein angiogram

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work:

Description of Intra-Service Work: Diagnostic cardiac catheterization for both congenital as well as non-congenital indications includes the work of passing a diagnostic catheter into the pulmonary venous atrium. The work of 93574 begins after diagnostic catheterization and after achieving catheter position in the pulmonary venous atrium. An endhole catheter and wire are used to selectively enter a single pulmonary vein ostium. Once a pulmonary vein is securely engaged with the catheter, the wire is removed, observing appropriate de-airing of the catheter. A hand injection angiogram is performed within the vein and reviewed in real time for any abnormalities. After pressure pullback from the pulmonary vein to the atrium, the catheter is disconnected from the transducer, and the guidewire is re-inserted to repeat the process by probing for a different pulmonary vein ostium. Once a 2nd vein is selectively engaged, angiography is repeated to evaluate this vein for any abnormalities. This process may be repeated as many as 4-5 times, selectively entering each distinct pulmonary vein that directly enters the pulmonary venous atrium, and each distinct vessel is additionally reportable. The patient's arterial pressure, electrocardiogram, and oxygen saturation are continuously monitored throughout the procedure. All images are reviewed and described in the procedure report. Per routine, any contrast injection is monitored afterward for complications of allergic reaction, arrhythmia, hemodynamic instability, and contrast-induced nephropathy.

Description of Post-Service Work:

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

The CPT Panel approved a proposal at the May meeting to create four new codes that accurately describe pulmonary angiography procedures as they are currently performed. Pulmonary angiography for patients with congenital heart defects is a complex mix of services with only a single existing CPT code which fails to capture the variability encountered. Existing CPT code 93568 *Injection procedure during cardiac catheterization including imaging supervision, interpretation, and report; for pulmonary angiography (List separately in addition to code for primary procedure)* was created in the late 1990s to describe pulmonary angiography with congenital as well as non-congenital cardiac catheterization. Among its inadequacies, it fails to describe any difference between pulmonary arterial and pulmonary venous, two completely different structures; the former a right heart structure, and the latter, left heart. Furthermore, this code fails to capture the variety of different approaches to pulmonary arterial angiography for congenital heart disease, such as approaching from the venous system, across right heart structures, as compared to pulmonary arteries originating from the arterial system, or in many cases, when both exist in the same patient. Availability of only a single CPT code intended to capture these multiple injections was not sufficient and resulted in services being underdefined in CPT.

The CPT application sought to create the four new codes that would be used to report a significant portion—though not all—of the services now billed using 93568 and to make an editorial revision to 93568. With 93568 and a handful of adjacent angiography codes not reviewed in over a decade, the societies undertook review of angiography codes 93563-93568 in addition to new codes 93569-93575. The ACC and SCAI randomly surveyed interventional cardiologists and pediatric interventional cardiologists, as designated by membership rolls, on the newly created codes. The ZZZ-global day survey was completed by physicians who have experience with the services.

As we move through recommendations for this large group of codes, it is important to keep several elements in mind.

- The six existing codes **do not** include introduction of catheters; that work is billed separately as part of the catheterization code, so the existing codes should have lower values than the newly created codes.
- The new codes **do** include catheter placement as well as the injection and radiologic supervision and interpretation, reflecting more work as recommended in this submission.
- With maturation of technology and a larger congenital population to benefit from interventions, these services are now very commonly provided in the congenital population.
- Prior survey of the existing codes over a decade ago did not include a pool of pediatric interventional cardiologists who are typically treating a different patient population than what was captured in that survey. We believe that difference calls into question the ability to compare the times of the current survey with those of the prior survey.
- The expert panel finds the values for the new codes appropriate from a magnitude estimation perspective at the 25th-percentile work RVUs.
- It is not clear to the expert panel from the survey results that survey respondents understood the distinction that the existing codes **do not** include selective catheter placement while new codes **do** incorporate selective catheter placement as part of the service. Therefore, we are recommending the current values for the existing codes, despite the fact they are below the 25th-percentile of the survey. We identify no rationale to argue compelling evidence for higher work RVUs for the existing codes based on the survey results, nor are we aware of changes to these services from the past decade since prior evaluation.
- We believe these recommendations maintain/create a reasonable rank order with most of the existing codes falling below the new codes that more specifically define angiography in the arteries and pulmonary veins.

Survey Results

The key reference code is 36227 for selective catheter placement in the external carotid artery. It was selected by 37% of respondents. 84% of the respondents indicated that 93574 was more complex. The second reference code is 92978 for IVUS or OCT. It was selected by 15% of respondents. 80% of the respondents indicated that 93574 was more intense/complex overall.

93574 Recommendation

The societies recommend the survey 25th-percentile work RVW of 1.84 with 20 minutes intraservice time from the survey median. It also fits between MPC codes 37253 and 99292 that have times and RVUs just above and below the recommendation, as shown in the summary spreadsheet.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 93568

SUMMARY OF RECOMMENDATION

CPT Code:93575 Tracking Number P10 Original Specialty Recommended RVU: **1.92**
Presented Recommended RVU: **1.92**
Global Period: ZZZ Current Work RVU: RUC Recommended RVU: **1.92**

CPT Descriptor: Injection procedure during cardiac catheterization including imaging supervision, interpretation, and report; for selective pulmonary angiography of major aortopulmonary collateral arteries (mapcas) arising off the aorta or its systemic branches, each distinct vessel (use 93575 in conjunction with 33361, 33362, 33363, 33364, 33365, 33366, 33418, 33419, 33477, 33741, 33745, 37236, 37237, 37238, 37246, 37248, 338x1, 338x2, 338x3, 338x4, 338x5, 338x6, 338x7, 37187, 37188, 92997, 92998, 93451, 93453, 93456, 93457, 93460, 93461, 93x1x, 93x2x, 93x3x, 93x4x, 93x5x, 93505, 93580, 93581, 93582, 93583)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: During a diagnostic cardiac catheterization, a 1-week-old female with pulmonary valve atresia, ventricular septal defect (vsd), and major aortopulmonary collateral arteries (mapcas), undergoes several selective angiograms of mapca vessels supplying pulmonary blood flow from the aorta. note: this is an add-on service. only consider the additional work related to each selective pulmonary artery angiogram from an arterial (left heart) approach.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work:

Description of Intra-Service Work: Diagnostic cardiac catheterization for both congenital as well as non-congenital indications includes the work of passing a diagnostic catheter into the aorta. The work of 93573 begins after diagnostic catheterization. An endhole catheter is passed with the aid of a guidewire from the arterial system and used to probe for and selectively catheterize individual pulmonary arteries, arterial collaterals, or surgical shunts supplying pulmonary blood flow from the aorta. Once the catheter is securely within one of the target vessels, the wire is removed and the catheter is de-aired. A hand injection angiogram is performed within the vessel and reviewed in real time for any abnormalities. A pressure is recorded, as needed. The catheter is withdrawn into the aorta and the guidewire is re-inserted to repeat the process by probing for a different target vessel. Once a second target vessel is selectively engaged, angiography is repeated to evaluate this vessel for any abnormalities. This entire process is repeated as many times as needed until all suspected vessels supplying flow from the aorta to the pulmonary circulation are identified, and each distinct named vessel is additionally reportable. The patient's arterial pressure, electrocardiogram, and oxygen saturation are continuously monitored throughout the procedure. All images are reviewed and described in the procedure report. Per routine, any contrast injection is monitored afterward for complications of allergic reaction, arrhythmia, hemodynamic instability, and contrast-induced nephropathy.

Physical effort required	0%	50%	51%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	25%	75%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

The CPT Panel approved a proposal at the May meeting to create four new codes that accurately describe pulmonary angiography procedures as they are currently performed. Pulmonary angiography for patients with congenital heart defects is a complex mix of services with only a single existing CPT code which fails to capture the variability encountered. Existing CPT code 93568 *Injection procedure during cardiac catheterization including imaging supervision, interpretation, and report; for pulmonary angiography (List separately in addition to code for primary procedure)* was created in the late 1990s to describe pulmonary angiography with congenital as well as non-congenital cardiac catheterization. Among its inadequacies, it fails to describe any difference between pulmonary arterial and pulmonary venous, two completely different structures; the former a right heart structure, and the latter, left heart. Furthermore, this code fails to capture the variety of different approaches to pulmonary arterial angiography for congenital heart disease, such as approaching from the venous system, across right heart structures, as compared to pulmonary arteries originating from the arterial system, or in many cases, when both exist in the same patient. Availability of only a single CPT code intended to capture these multiple injections was not sufficient and resulted in services being underdefined in CPT.

The CPT application sought to create the four new codes that would be used to report a significant portion—though not all—of the services now billed using 93568 and to make an editorial revision to 93568. With 93568 and a handful of adjacent angiography codes not reviewed in over a decade, the societies undertook review of angiography codes 93563-93568 in addition to new codes 93569-93575. The ACC and SCAI randomly surveyed interventional cardiologists and pediatric interventional cardiologists, as designated by membership rolls, on the newly created codes. The ZZZ-global day survey was completed by physicians who have experience with the services.

As we move through recommendations for this large group of codes, it is important to keep several elements in mind.

- The six existing codes **do not** include introduction of catheters; that work is billed separately as part of the catheterization code, so the existing codes should have lower values than the newly created codes.
- The new codes **do** include catheter placement as well as the injection and radiologic supervision and interpretation, reflecting more work as recommended in this submission.
- With maturation of technology and a larger congenital population to benefit from interventions, these services are now very commonly provided in the congenital population.
- Prior survey of the existing codes over a decade ago did not include a pool of pediatric interventional cardiologists who are typically treating a different patient population than what was captured in that survey. We believe that difference calls into question the ability to compare the times of the current survey with those of the prior survey.
- The expert panel finds the values for the new codes appropriate from a magnitude estimation perspective at the 25th-percentile work RVUs.
- It is not clear to the expert panel from the survey results that survey respondents understood the distinction that the existing codes **do not** include selective catheter placement while new codes **do** incorporate selective catheter placement as part of the service. Therefore, we are recommending the current values for the existing codes, despite the fact they are below the 25th-percentile of the survey. We identify no rationale to argue compelling evidence for higher work RVUs for the existing codes based on the survey results, nor are we aware of changes to these services from the past decade since prior evaluation.
- We believe these recommendations maintain/create a reasonable rank order with most of the existing codes falling below the new codes that more specifically define angiography in the arteries and pulmonary veins.

Survey Results

The key reference code is 36227 for selective catheter placement in the external carotid artery. It was selected by 45% of respondents. 86% of the respondents indicated that 93575 was more complex. The second reference code is 92973 for percutaneous transluminal coronary thrombectomy. It was selected by 12% of respondents. 50% of the respondents indicated that 93575 was more intense/complex overall.

93575 Recommendation

The societies recommend the survey 25th-percentile work RVW of 1.92 with 20 minutes intraservice time from the survey median. It also fits between MPC codes 37253 and 99292 that have times and RVUs just above and below the recommendation, as shown in the summary spreadsheet.

In comparison to code prior code 93575 that also has 20 minutes intraservice time, this code is for each distinct pulmonary vein and requires more work, often using different catheter shapes and wires to enter separate pulmonary veins. If 3-5 pulmonary veins branches are separately and selectively entered, there is considerably more work even from a time perspective to complete these tasks. 93754 is for bilateral selective pulmonary artery angiography, which is relatively more straightforward, though challenges can occur with hypoplastic branch pulmonary arteries. Pulmonary veins are generally more predictable in number (~3-5) and drain more predictably to the left atrium, though they may be stenotic or have anomalous drainage, requiring more effort. MAPCA's, on the other hand, have some more common origins from the descending thoracic aorta but can literally come from just about anywhere. They arise from the aorta, but with variable angles, from the arch, from arch vessels, and also abdominal aorta. There may be 1 or 10 or more, depending on the individual. These are quite challenging yet essential to understand for optimal patient management.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

Description of Pre-Service Work:

Description of Intra-Service Work: Diagnostic congenital catheterization codes include the work of passing a catheter into the aortic rootcoronary artery(ies). The work of 93563 begins when after the catheter is manipulated positioned into the ostium of a coronary artery using fluoroscopic guidance into the ostium of a coronary artery. The arterial pressure and waveform are checked to be sure there is no evidence of catheter malposition or impairment of coronary flow due to an ostial stenosis. Test contrast injections under fluoroscopy are performed using fluoroscopy to check confirm catheter position. Multiple coronary injections are performed, with different radiographic angles, as needed, to optimally define coronary anatomy. Panning of the table is usually performed to ensure visualization of the vessels throughout their lengths.each with the imaging system aligned in a different orientation, with simultaneous panning (moving the table) to assess for stenoses. The catheter is then removed over the wire. Additional catheters are introduced over the guide wire and manipulated into the ostium (a) ofused to inject other coronary artery(iess)) in) to inject them in multiple views, as needed. while moving the table in similar fashion. Injections are performed using a power injector device or by hand. Typically, a separate catheter is used for the left and right coronary arteries. The patient's arterial pressure, electrocardiogram, and oxygen saturation are continuouslystantly monitored throughout the procedure. Additional All images obtained by coronary angiography are reviewed and are described in the report of the procedure report. Per routine, any contrast injection is monitored afterward for complications of allergic reaction, arrhythmia, hemodynamic instability, and contrast-induced nephropathy.

Description of Post-Service Work:

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	31%	69%	0%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	6%	31%	63%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	6%	19%	75%
Physical effort required	6%	50%	44%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	38%	62%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	40%	0%	0%	60%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	20%	20%	60%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	40%	0%	600%
Physical effort required	0%	40%	60%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	40%	0%	60%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

The CPT Panel approved a proposal at the May meeting to create four new codes that accurately describe pulmonary angiography procedures as they are currently performed. Pulmonary angiography for patients with congenital heart defects is a complex mix of services with only a single existing CPT code which fails to capture

the variability encountered. Existing CPT code 93568 *Injection procedure during cardiac catheterization including imaging supervision, interpretation, and report; for pulmonary angiography (List separately in addition to code for primary procedure)* was created in the late 1990s to describe pulmonary angiography with congenital as well as non-congenital cardiac catheterization. Among its inadequacies, it fails to describe any difference between pulmonary arterial and pulmonary venous, two completely different structures; the former a right heart structure, and the latter, left heart. Furthermore, this code fails to capture the variety of different approaches to pulmonary arterial angiography for congenital heart disease, such as approaching from the venous system, across right heart structures, as compared to pulmonary arteries originating from the arterial system, or in many cases, when both exist in the same patient. Availability of only a single CPT code intended to capture these multiple injections was not sufficient and resulted in services being underdefined in CPT.

The CPT application sought to create the four new codes that would be used to report a significant portion—though not all—of the services now billed using 93568 and to make an editorial revision to 93568. With 93568 and a handful of adjacent angiography codes not reviewed in over a decade, the societies undertook review of angiography codes 93563-93568 in addition to new codes 93569-93575. The ACC and SCAI randomly surveyed interventional cardiologists and pediatric interventional cardiologists, as designated by membership rolls, on the newly created codes. The ZZZ-global day survey was completed by physicians who have experience with the services.

As we move through recommendations for this large group of codes, it is important to keep several elements in mind.

- The six existing codes **do not** include introduction of catheters; that work is billed separately as part of the catheterization code, so the existing codes should have lower values than the newly created codes.
- The new codes **do** include catheter placement as well as the injection and radiologic supervision and interpretation, reflecting more work as recommended in this submission.
- With maturation of technology and a larger congenital population to benefit from interventions, these services are now very commonly provided in the congenital population.
- Prior survey of the existing codes over a decade ago did not include a pool of pediatric interventional cardiologists who are typically treating a different patient population than what was captured in that survey. We believe that difference calls into question the ability to compare the times of the current survey with those of the prior survey.
- The expert panel finds the values for the new codes appropriate from a magnitude estimation perspective at the 25th-percentile work RVUs.
- It is not clear to the expert panel from the survey results that survey respondents understood the distinction that the existing codes **do not** include selective catheter placement while new codes **do** incorporate selective catheter placement as part of the service. Therefore, we are recommending the current values for the existing codes, despite the fact they are below the 25th-percentile of the survey. We identify no rationale to argue compelling evidence for higher work RVUs for the existing codes based on the survey results, nor are we aware of changes to these services from the past decade since prior evaluation.
- We believe these recommendations maintain/create a reasonable rank order with most of the existing codes falling below the new codes that more specifically define angiography in the arteries and pulmonary veins.

Incorrect Code Descriptor

During review of materials for submission, it was discovered that through a clerical error following the May 2020 CPT Editorial Panel meeting, the code descriptors for 93563 and 93564 errantly included language in the CPT Coding Changes document that stated added "including catheter placement(s) when performed." The language has been corrected in submitted materials here but is still apparent in the CPT Coding Changes document and is shown below for clarity.

93563 Injection procedure during cardiac catheterization including imaging supervision, interpretation, and report; for selective coronary angiography during congenital heart catheterization, including catheter placement(s) when performed (list separately in addition to code for primary procedure)

93564 Injection procedure during cardiac catheterization including imaging supervision, interpretation, and report; for selective opacification of aortocoronary venous or arterial bypass graft(s) (eg, aortocoronary saphenous vein, free radial artery, or free mammary artery graft) to one or more coronary arteries and in situ arterial conduits (eg, internal mammary), whether native or used for bypass to one or more coronary arteries during congenital heart catheterization, including catheter placement(s) when performed (list separately in addition to code for primary procedure)

This language was included in the survey tool and not discovered until soon before submission of materials. This error may partially explain why the survey RVU responses for 93563 and 93564 trended a bit higher than the other existing codes. However, 93563 and 93564 were historically a bit higher than 93565-93568, so it may also be the case that survey respondents responded based on their familiarity of the past decade, thinking that catheter placement is part of the underlying catheterization code. Reviewing the data, it is not clear to us that either is the case or that the error significantly impacted the survey, and in any event, our recommendations are to maintain the values.

Survey Results

The key reference code is 36227 for selective catheter placement in the external carotid artery. It was selected by 46% of respondents. 69% of the respondents indicated that 93563 was somewhat more complex. The second reference code is 93571 for intravascular Doppler velocity and/or pressure flow reserve measurement during angiography. It was selected by 14% of respondents, with a mix of responses indicating more or less intensity.

93563 Recommendation

The societies recommend the existing value of 1.11 work RVUs with 15 minutes intraservice time from the survey median. As noted above, this value falls below the survey 25th-percentile RVU. The expert panel believes this code and other current values for existing codes align with the recommended values at the 25th for the new codes. This value correctly fits between MPC codes 64480 and 52442 that have identical times of 15 minutes with RVUs just above and below the recommendation, as shown in the summary spreadsheet.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the

provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 93563

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Cardiology How often? Sometimes

Specialty Interventional Cardiology How often? Sometimes

Specialty pediatric interventional cardiology How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National estimate not available

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 167
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2019 Medicare utilization

Specialty cardiology Frequency 70 Percentage 41.91 %

Specialty pediatric interventinal cardiology Frequency 60 Percentage 35.92 %

Specialty interventional cardiology Frequency 35 Percentage 20.95 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Cardiovascular-Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 93563

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

CPT Descriptor: Injection procedure during cardiac catheterization including imaging supervision, interpretation, and report; for selective opacification of aortocoronary venous or arterial bypass graft(s) (eg, aortocoronary saphenous vein, free radial artery, or free mammary artery graft) to one or more coronary arteries and in situ arterial conduits (eg, internal mammary), whether native or used for bypass to one or more coronary arteries during congenital heart catheterization, when performed (list separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A patient with history of congenital heart disease and coronary artery bypass surgery now has recurrence of typical angina necessitating diagnostic heart catheterization (reported using congenital catheterization codes 93530-93533) with additional contrast injection(s) for selective opacification of aortocoronary venous or arterial bypass graft(s), one or more coronary arteries and, if indicated, imaging for selective opacification of native/bypass arterial conduits is also performed.

Percentage of Survey Respondents who found Vignette to be Typical: 96%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work:

Description of Intra-Service Work: Diagnostic congenital catheterization codes include the work of passing a catheter into the bypass grafts. Fluoroscopic guidance of catheter manipulation is used throughout the procedure. The work of 93564 begins after the catheter is positioned into the ostium of a bypass graft. The arterial pressure and waveform are checked to be sure there is no evidence of catheter malposition or impairment of graft flow due to an ostial stenosis. Test contrast injections are performed using fluoroscopy to confirm catheter position. Multiple graft or in situ arterial conduit injections are performed with different radiographic angles, as needed, to optimally define graft and coronary anatomy. Panning of the table is usually performed to ensure visualization of the vessels throughout their lengths. Additional catheters are used to inject other aorto-coronary artery grafts or in situ arterial conduits (e.g. internal mammary artery grafts) in multiple views, as needed. Injections are performed using a power injector device or by hand. The patient's arterial pressure, electrocardiogram, and oxygen saturation are continuously monitored throughout the procedure. All images are reviewed and described in the procedure report. Per routine, any contrast injection is monitored afterward for complications of allergic reaction, arrhythmia, hemodynamic instability, and contrast-induced nephropathy.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	21%	79%	0%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	29%	71%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	7%	14%	79%
Physical effort required	7%	43%	50%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	43%	57%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	50%	0%	50%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	25%	75%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	0%	100%
Physical effort required	0%	25%	75%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	50%	50%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

The CPT Panel approved a proposal at the May meeting to create four new codes that accurately describe pulmonary angiography procedures as they are currently performed. Pulmonary angiography for patients with congenital heart defects is a complex mix of services with only a single existing CPT code which fails to capture

the variability encountered. Existing CPT code 93568 *Injection procedure during cardiac catheterization including imaging supervision, interpretation, and report; for pulmonary angiography (List separately in addition to code for primary procedure)* was created in the late 1990s to describe pulmonary angiography with congenital as well as non-congenital cardiac catheterization. Among its inadequacies, it fails to describe any difference between pulmonary arterial and pulmonary venous, two completely different structures; the former a right heart structure, and the latter, left heart. Furthermore, this code fails to capture the variety of different approaches to pulmonary arterial angiography for congenital heart disease, such as approaching from the venous system, across right heart structures, as compared to pulmonary arteries originating from the arterial system, or in many cases, when both exist in the same patient. Availability of only a single CPT code intended to capture these multiple injections was not sufficient and resulted in services being underdefined in CPT.

The CPT application sought to create the four new codes that would be used to report a significant portion—though not all—of the services now billed using 93568 and to make an editorial revision to 93568. With 93568 and a handful of adjacent angiography codes not reviewed in over a decade, the societies undertook review of angiography codes 93563-93568 in addition to new codes 93569-93575. The ACC and SCAI randomly surveyed interventional cardiologists and pediatric interventional cardiologists, as designated by membership rolls, on the newly created codes. The ZZZ-global day survey was completed by physicians who have experience with the services.

As we move through recommendations for this large group of codes, it is important to keep several elements in mind.

- The six existing codes **do not** include introduction of catheters; that work is billed separately as part of the catheterization code, so the existing codes should have lower values than the newly created codes.
- The new codes **do** include catheter placement as well as the injection and radiologic supervision and interpretation, reflecting more work as recommended in this submission.
- With maturation of technology and a larger congenital population to benefit from interventions, these services are now very commonly provided in the congenital population.
- Prior survey of the existing codes over a decade ago did not include a pool of pediatric interventional cardiologists who are typically treating a different patient population than what was captured in that survey. We believe that difference calls into question the ability to compare the times of the current survey with those of the prior survey.
- The expert panel finds the values for the new codes appropriate from a magnitude estimation perspective at the 25th-percentile work RVUs.
- It is not clear to the expert panel from the survey results that survey respondents understood the distinction that the existing codes **do not** include selective catheter placement while new codes **do** incorporate selective catheter placement as part of the service. Therefore, we are recommending the current values for the existing codes, despite the fact they are below the 25th-percentile of the survey. We identify no rationale to argue compelling evidence for higher work RVUs for the existing codes based on the survey results, nor are we aware of changes to these services from the past decade since prior evaluation.
- We believe these recommendations maintain/create a reasonable rank order with most of the existing codes falling below the new codes that more specifically define angiography in the arteries and pulmonary veins.

Incorrect Code Descriptor

During review of materials for submission, it was discovered that through a clerical error following the May 2020 CPT Editorial Panel meeting, the code descriptors for 93563 and 93564 errantly included language in the CPT Coding Changes document that stated added "including catheter placement(s) when performed." The language has been corrected in submitted materials here but is still apparent in the CPT Coding Changes document and is shown below for clarity.

93563 Injection procedure during cardiac catheterization including imaging supervision, interpretation, and report; for selective coronary angiography during congenital heart catheterization, including catheter placement(s) when performed (list separately in addition to code for primary procedure)

93564 Injection procedure during cardiac catheterization including imaging supervision, interpretation, and report; for selective opacification of aortocoronary venous or arterial bypass graft(s) (eg, aortocoronary saphenous vein, free radial artery, or free mammary artery graft) to one or more coronary arteries and in situ arterial conduits (eg, internal mammary), whether native or used for bypass to one or more coronary arteries during congenital heart catheterization, including catheter placement(s) when performed (list separately in addition to code for primary procedure)

This language was included in the survey tool and not discovered until soon before submission of materials. This error may partially explain why the survey RVU responses for 93563 and 93564 trended a bit higher than the other existing codes. However, 93563 and 93564 were historically a bit higher than 93565-93568, so it may also be the case that survey respondents responded based on their familiarity of the past decade, thinking that catheter placement is part of the underlying catheterization code. Reviewing the data, it is not clear to us that either is the case or that the error significantly impacted the survey, and in any event, our recommendations are to maintain the values.

Survey Results

The key reference code is 36227 for selective catheter placement in the external carotid artery. It was selected by 56% of respondents. 79% of the respondents indicated that 93564 was somewhat more complex. The second reference code is 93571 for intravascular Doppler velocity and/or pressure flow reserve measurement during angiography. It was selected by 16% of respondents, with half indicating identical intensity/complexity and half indication more intensity/complexity.

We do note here, and discussed at prefacilitation, that the survey threshold of 30 was not met for this service. In consultation with RUC staff, we re-opened we re-opened the survey and contacted those who skipped 93564 to see if they would go back to complete the survey. This effort produced only 1 additional response, so we have not amended our submission because it is still short. This service is extremely rare—6 units in 2019 MPFS—and the prefacilitation committee did not feel it would be disqualifying in this instance.

93564 Recommendation

The societies recommend the existing value of 1.13 work RVUs with 18 minutes intraservice time from the survey median. As noted above, this value falls below the survey 25th-percentile RVU. The expert panel believes this code and other current values for existing codes align with the recommended values at the 25th for the new codes. This value correctly fits between MPC codes 64480 and 52442 that have slightly shorter times of 15 minutes with RVUs just above and below the recommendation, as shown in the summary spreadsheet.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.

☐ Historical precedents.
☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 93564

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Cardiology How often? Sometimes

Specialty Interventional Cardiology How often? Sometimes

Specialty pediatric interventional cardiology How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 0
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National estimate not available

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 6 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2019 Medicare utilization data

Specialty pediatric interventional cardiology Frequency 4 Percentage 66.66 %

Specialty cardiology Frequency 2 Percentage 33.33 %

Specialty Frequency 0 Percentage %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 93564

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:93565 Tracking Number P3 Original Specialty Recommended RVU: **0.86**
Presented Recommended RVU: **0.86**
Global Period: ZZZ Current Work RVU: **0.86** RUC Recommended RVU: **0.86**

CPT Descriptor: Injection procedure during cardiac catheterization including imaging supervision, interpretation, and report; for selective left ventricular or left atrial angiography (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A patient with a prominent systolic murmur has progressive dyspnea on exertion necessitating diagnostic heart catheterization (reported using congenital catheterization codes 93530-93533) with additional contrast injection(s) for imaging for left ventriculogram/ atrial angiography. [Note: When completing this survey, only consider the "additional" physician work related to 93565.]

Percentage of Survey Respondents who found Vignette to be Typical: 83%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work:

Description of Intra-Service Work: Diagnostic congenital or non-congenital catheterization codes include the work of passing a catheter into the left ventricle. The work of 93565 begins when the catheter is then attached to a power injector with careful removal of air from the tubing. Fluoroscopic guidance is used to ensure proper catheter position. Power injection is then performed in appropriate angiographic views to fully opacify the ventricle, allowing evaluation of systolic function, competence of the mitral valve, ventriculo-arterial connection, and presence and location of any ventricular septal defects or outflow obstruction. The power injector is disconnected from the catheter, the catheter is reattached to the manifold, and any air is again removed. The patient's arterial pressure, electrocardiogram, and oxygen saturation are continuously monitored throughout the procedure. Images are reviewed and described in the procedure report. Per routine, any contrast injection is monitored afterward for complications of allergic reaction, arrhythmia, hemodynamic instability, and contrast-induced nephropathy.

Description of Post-Service Work:

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

The CPT Panel approved a proposal at the May meeting to create four new codes that accurately describe pulmonary angiography procedures as they are currently performed. Pulmonary angiography for patients with congenital heart defects is a complex mix of services with only a single existing CPT code which fails to capture the variability encountered. Existing CPT code 93568 *Injection procedure during cardiac catheterization including imaging supervision, interpretation, and report; for pulmonary angiography (List separately in addition to code for primary procedure)* was created in the late 1990s to describe pulmonary angiography with congenital as well as non-congenital cardiac catheterization. Among its inadequacies, it fails to describe any difference between pulmonary arterial and pulmonary venous, two completely different structures; the former a right heart structure, and the latter, left heart. Furthermore, this code fails to capture the variety of different approaches to pulmonary arterial angiography for congenital heart disease, such as approaching from the venous system, across right heart structures, as compared to pulmonary arteries originating from the arterial system, or in many cases, when both exist in the same patient. Availability of only a single CPT code intended to capture these multiple injections was not sufficient and resulted in services being underdefined in CPT.

The CPT application sought to create the four new codes that would be used to report a significant portion—though not all—of the services now billed using 93568 and to make an editorial revision to 93568. With 93568 and a handful of adjacent angiography codes not reviewed in over a decade, the societies undertook review of angiography codes 93563-93568 in addition to new codes 93569-93575. The ACC and SCAI randomly surveyed interventional cardiologists and pediatric interventional cardiologists, as designated by membership rolls, on the newly created codes. The ZZZ-global day survey was completed by physicians who have experience with the services.

As we move through recommendations for this large group of codes, it is important to keep several elements in mind.

- The six existing codes **do not** include introduction of catheters; that work is billed separately as part of the catheterization code, so the existing codes should have lower values than the newly created codes.
- The new codes **do** include catheter placement as well as the injection and radiologic supervision and interpretation, reflecting more work as recommended in this submission.
- With maturation of technology and a larger congenital population to benefit from interventions, these services are now very commonly provided in the congenital population.
- Prior survey of the existing codes over a decade ago did not include a pool of pediatric interventional cardiologists who are typically treating a different patient population than what was captured in that survey. We believe that difference calls into question the ability to compare the times of the current survey with those of the prior survey.
- The expert panel finds the values for the new codes appropriate from a magnitude estimation perspective at the 25th-percentile work RVUs.
- It is not clear to the expert panel from the survey results that survey respondents understood the distinction that the existing codes **do not** include selective catheter placement while new codes **do** incorporate selective catheter placement as part of the service. Therefore, we are recommending the current values for the existing codes, despite the fact they are below the 25th-percentile of the survey. We identify no rationale to argue compelling evidence for higher work RVUs for the existing codes based on the survey results, nor are we aware of changes to these services from the past decade since prior evaluation.
- We believe these recommendations maintain/create a reasonable rank order with most of the existing codes falling below the new codes that more specifically define angiography in the arteries and pulmonary veins.

Survey Results

The key reference code is 36227 for selective catheter placement in the external carotid artery. It was selected by 24% of respondents. 50% of the respondents indicated that 93565 was of identical intensity/complexity, with the other half split between more and less intense/complex. The second reference code is 93561 for indicator dilution studies. It was selected by 24% of respondents, with a 63% of respondents indicating 93565 to be more intense/complex.

93565 Recommendation

The societies recommend the existing value of 0.86 work RVUs with 10 minutes intraservice time from the survey median. As noted above, this value falls below the survey 25th-percentile RVU. The expert panel believes this code and other current values for existing codes align with the recommended values at the 25th for the new codes. This value falls between MPC codes 64484 and 51797 that have times of 10 and 15 minutes, respectively with RVUs above and below the recommendation, as shown in the summary spreadsheet. This recommendation is also slightly higher than comparison code 15274 for 100 square centimeters of skin graft that also has 10 minutes intraservice time and a lower calculated intensity.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 93565

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work:

Description of Intra-Service Work: Diagnostic congenital or non-congenital catheterization codes include the work of passing a catheter into the right ventricle. The work of 93566 begins when the catheter is then attached to a power injector with careful removal of any air from the tubing. Fluoroscopic guidance is used to ensure proper catheter position. Power injection is then performed in appropriate angiographic views to fully opacify the ventricle, allowing evaluation of systolic function, competence of the tricuspid valve, ventriculo-arterial connection, and presence and location of any ventricular septal defects or outflow obstruction. The power injector is disconnected from the catheter, the catheter is reattached to the manifold, and any air is again removed. The patient's arterial pressure, electrocardiogram, and oxygen saturation are continuously monitored throughout the procedure. Images are reviewed and described in the procedure report. Per routine, any contrast injection is monitored afterward for complications of allergic reaction, arrhythmia, hemodynamic instability, and contrast-induced nephropathy.

Description of Post-Service Work:

• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	29%	42%	29%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

The CPT Panel approved a proposal at the May meeting to create four new codes that accurately describe pulmonary angiography procedures as they are currently performed. Pulmonary angiography for patients with

congenital heart defects is a complex mix of services with only a single existing CPT code which fails to capture the variability encountered. Existing CPT code 93568 *Injection procedure during cardiac catheterization including imaging supervision, interpretation, and report; for pulmonary angiography (List separately in addition to code for primary procedure)* was created in the late 1990s to describe pulmonary angiography with congenital as well as non-congenital cardiac catheterization. Among its inadequacies, it fails to describe any difference between pulmonary arterial and pulmonary venous, two completely different structures; the former a right heart structure, and the latter, left heart. Furthermore, this code fails to capture the variety of different approaches to pulmonary arterial angiography for congenital heart disease, such as approaching from the venous system, across right heart structures, as compared to pulmonary arteries originating from the arterial system, or in many cases, when both exist in the same patient. Availability of only a single CPT code intended to capture these multiple injections was not sufficient and resulted in services being underdefined in CPT.

The CPT application sought to create the four new codes that would be used to report a significant portion—though not all—of the services now billed using 93568 and to make an editorial revision to 93568. With 93568 and a handful of adjacent angiography codes not reviewed in over a decade, the societies undertook review of angiography codes 93563-93568 in addition to new codes 93569-93575. The ACC and SCAI randomly surveyed interventional cardiologists and pediatric interventional cardiologists, as designated by membership rolls, on the newly created codes. The ZZZ-global day survey was completed by physicians who have experience with the services.

As we move through recommendations for this large group of codes, it is important to keep several elements in mind.

- The six existing codes **do not** include introduction of catheters; that work is billed separately as part of the catheterization code, so the existing codes should have lower values than the newly created codes.
- The new codes **do** include catheter placement as well as the injection and radiologic supervision and interpretation, reflecting more work as recommended in this submission.
- With maturation of technology and a larger congenital population to benefit from interventions, these services are now very commonly provided in the congenital population.
- Prior survey of the existing codes over a decade ago did not include a pool of pediatric interventional cardiologists who are typically treating a different patient population than what was captured in that survey. We believe that difference calls into question the ability to compare the times of the current survey with those of the prior survey.
- The expert panel finds the values for the new codes appropriate from a magnitude estimation perspective at the 25th-percentile work RVUs.
- It is not clear to the expert panel from the survey results that survey respondents understood the distinction that the existing codes **do not** include selective catheter placement while new codes **do** incorporate selective catheter placement as part of the service. Therefore, we are recommending the current values for the existing codes, despite the fact they are below the 25th-percentile of the survey. We identify no rationale to argue compelling evidence for higher work RVUs for the existing codes based on the survey results, nor are we aware of changes to these services from the past decade since prior evaluation.
- We believe these recommendations maintain/create a reasonable rank order with most of the existing codes falling below the new codes that more specifically define angiography in the arteries and pulmonary veins.

Survey Results

The key reference code is 93561 for indicator dilution studies. It was selected by 29% of respondents, with 50% of respondents indicating 93566 as similarly intense/complex and 40% indicating it is more intense/complex. The second reference code 36227 for selective catheter placement in the external carotid artery. It was selected by 21% of respondents. 42% of the respondents indicated that 93566 was of similar intensity/complexity, with the remainder split between more and less intense/complex.

93566 Recommendation

The societies recommend the existing value of 0.86 work RVUs with 10 minutes intraservice time from the survey median. As noted above, this value falls below the survey 25th-percentile RVU. The expert panel believes this code and other current values for existing codes align with the recommended values at the 25th for the new codes. This value falls between MPC codes 64484 and 51797 that have times of 10 and 15 minutes, respectively with RVUs above and below the recommendation, as shown in the summary spreadsheet. This recommendation is also slightly higher than comparison code 15274 for 100 square centimeters of skin graft that also has 10 minutes intraservice time with a slightly a lower RVU and calculated intensity.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

Description of Pre-Service Work:

Description of Intra-Service Work: Diagnostic congenital or non-congenital catheterization codes include the work of passing a catheter into the aorta. The work of 93567 begins when the catheter is then attached to a power injector with careful removal of air from the tubing. Fluoroscopic guidance is used to ensure proper catheter position. Power injection is then performed in appropriate angiographic views to fully opacify the aorta, allowing evaluation of aortic valve regurgitation, arch-sidedness, arch vessels, presence of coarctation or patent ductus arteriosus, and other aortic abnormalities. The power injector is disconnected from the catheter, the catheter is reattached to the manifold, and any air is again removed. The patient's arterial pressure, electrocardiogram, and oxygen saturation are continuously monitored throughout the procedure. Images are reviewed and described in the procedure report. Per routine, any contrast injection is monitored afterward for complications of allergic reaction, arrhythmia, hemodynamic instability, and contrast-induced nephropathy.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	75%	13%	12%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	75%	25%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	75%	25%
Physical effort required	0%	75%	25%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	88%	12%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	14%	43%	43%	0%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	71%	29%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	29%	71%	0%
Physical effort required	14%	72%	14%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	71%	29%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

The CPT Panel approved a proposal at the May meeting to create four new codes that accurately describe pulmonary angiography procedures as they are currently performed. Pulmonary angiography for patients with congenital heart defects is a complex mix of services with only a single existing CPT code which fails to capture the variability encountered. Existing CPT code 93568 *Injection procedure during cardiac catheterization including imaging supervision, interpretation, and report; for pulmonary angiography (List separately in addition to code for primary procedure)* was created in the late 1990s to describe pulmonary angiography with congenital as well as non-congenital cardiac catheterization. Among its inadequacies, it fails to describe any difference between pulmonary arterial and pulmonary venous, two completely different structures; the former a right heart structure, and the latter, left heart. Furthermore, this code fails to capture the variety of different approaches to pulmonary arterial angiography for congenital heart disease, such as approaching from the venous system, across right heart structures, as compared to pulmonary arteries originating from the arterial system, or in many cases, when both exist in the same patient. Availability of only a single CPT code intended to capture these multiple injections was not sufficient and resulted in services being underdefined in CPT.

The CPT application sought to create the four new codes that would be used to report a significant portion—though not all—of the services now billed using 93568 and to make an editorial revision to 93568. With 93568 and a handful of adjacent angiography codes not reviewed in over a decade, the societies undertook review of angiography codes 93563-93568 in addition to new codes 93569-93575. The ACC and SCAI randomly surveyed interventional cardiologists and pediatric interventional cardiologists, as designated by membership rolls, on the newly created codes. The ZZZ-global day survey was completed by physicians who have experience with the services.

As we move through recommendations for this large group of codes, it is important to keep several elements in mind.

- The six existing codes **do not** include introduction of catheters; that work is billed separately as part of the catheterization code, so the existing codes should have lower values than the newly created codes.
- The new codes **do** include catheter placement as well as the injection and radiologic supervision and interpretation, reflecting more work as recommended in this submission.
- With maturation of technology and a larger congenital population to benefit from interventions, these services are now very commonly provided in the congenital population.
- Prior survey of the existing codes over a decade ago did not include a pool of pediatric interventional cardiologists who are typically treating a different patient population than what was captured in that survey. We believe that difference calls into question the ability to compare the times of the current survey with those of the prior survey.
- The expert panel finds the values for the new codes appropriate from a magnitude estimation perspective at the 25th-percentile work RVUs.
- It is not clear to the expert panel from the survey results that survey respondents understood the distinction that the existing codes **do not** include selective catheter placement while new codes **do** incorporate selective catheter placement as part of the service. Therefore, we are recommending the current values for the existing codes, despite the fact they are below the 25th-percentile of the survey. We identify no rationale to argue compelling evidence for higher work RVUs for the existing codes based on the survey results, nor are we aware of changes to these services from the past decade since prior evaluation.
- We believe these recommendations maintain/create a reasonable rank order with most of the existing codes falling below the new codes that more specifically define angiography in the arteries and pulmonary veins.

Survey Results

The key reference code is 93562 for indicator dilution studies. It was selected by 24% of respondents, with 75% of respondents indicating 93567 as similarly intense/complex and 25% indicating it is more intense/complex. The second reference code 36227 for selective catheter placement in the external carotid artery. It was selected by 21% of respondents. 43% of the respondents indicated that 93567 was of similar intensity/complexity and 43% said it was more intense/complex.

93567 Recommendation

The societies recommend the existing value of 0.97 work RVUs with 10 minutes intraservice time from the survey median. As noted above, this value falls below the survey 25th-percentile RVU. The expert panel believes this code and other current values for existing codes align with the recommended values at the 25th for the new codes. This value falls between MPC codes 64484 and 52442 that have times of 10 and 15 minutes, respectively with RVUs above and below the recommendation, as shown in the summary spreadsheet. This recommendation is also slightly lower than comparison code 93572 for intravascular Doppler and/or pressure flow reserve measurement with a slightly longer 11 minutes intraservice time with a slightly a higher RVU.

It was noted by reviewers that an explanation for why this service would have slightly RVU but identical time to previous codes 93566 and 93567 would be helpful. We believe this outcome can reasonably be explained by the fact that this service is typically provided to sick adult patients. There is a greater risk of rupture and catheter passes are more tortuous in the senior population. We likely see a calcified aorta, and there is risk of dislocation of aortic plaque. Finally, when working in the aorta, care must be taken to avoid introduction of air into the vasculature where it would be iatrogenic.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 93567

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Cardiology How often? Sometimes

Specialty Interventional Cardiology How often? Sometimes

Specialty Pediatric Interventional Cardology How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 0
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Commercial estimate not avaialable

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 28,640 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2019 Medicare utilization

Specialty Cardiology Frequency 18500 Percentage 64.59 %

Specialty Interventional Cardiology Frequency 9200 Percentage 32.12 %

Specialty Pediatric Interventional Cardiology Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Cardiovascular-Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 93567

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

Global Period: ZZZ Current Work RVU: **0.88** RUC Recommended RVU: **0.88**

CPT Descriptor: Injection procedure during cardiac catheterization including imaging supervision, interpretation, and report; for nonselective pulmonary arterial angiography (list separately in addition to code for primary procedure) (use 93568 in conjunction with 33361, 33362, 33363, 33364, 33365, 33366, 33418, 33419, 33477, 33741, 33745, 338x1, 338x2, 338x3, 338x4, 338x5, 338x6, 338x7, 37187, 37188, 37236, 37237, 37238, 37246, 37248, 92997, 92998, 93451, 93453, 93456, 93457, 93460, 93461, 93x1x, 93x2x, 93x3x, 93x4x, 93x5x, 93580, 93581, 93582, 93583) (for selective unilateral or bilateral pulmonary arterial angiography, use 93xx0, 93xx1, which include catheter placement, injection, and radiologic supervision and interpretation)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: During a diagnostic cardiac catheterization, a 40-year-old female with dyspnea and echocardiographic findings of a dilated right ventricle undergoes a diagnostic right heart catheterization. During the procedure, nonselective pulmonary arterial angiography is performed. Note: This is an add-on service. Only consider the additional work related to the nonselective pulmonary artery angiogram.

Percentage of Survey Respondents who found Vignette to be Typical: 86%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work:

Description of Intra-Service Work: Diagnostic congenital or non-congenital catheterization codes include the work of passing a catheter into the main pulmonary artery. The work of 93568 begins when the catheter is then attached to a power injector with careful removal of air from the tubing. Fluoroscopic guidance is used to ensure proper catheter position. Power injection is then performed in appropriate angiographic views to fully opacify the pulmonary artery, allowing evaluation of pulmonary valve regurgitation, branch pulmonary blood flow, and other vessel abnormalities. The power injector is disconnected from the catheter, the catheter is reattached to the manifold, and any air is again removed. The patient's arterial pressure, electrocardiogram, and oxygen saturation are continuously monitored throughout the procedure. All images are reviewed and described in the procedure report. Per routine, any contrast injection is monitored afterward for complications of allergic reaction, arrhythmia, hemodynamic instability, and contrast-induced nephropathy.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	10%	40%	50%	0%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	20%	10%	70%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	20%	30%	50%
Physical effort required	20%	40%	40%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	20%	60%	20%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	50%	25%	25%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	25%	25%	50%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	37%	63%
Physical effort required	0%	50%	50%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	50%	50%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

The CPT Panel approved a proposal at the May meeting to create four new codes that accurately describe pulmonary angiography procedures as they are currently performed. Pulmonary angiography for patients with congenital heart defects is a complex mix of services with only a single existing CPT code which fails to capture the variability encountered. Existing CPT code 93568 *Injection procedure during cardiac catheterization including imaging supervision, interpretation, and report; for pulmonary angiography (List separately in addition to code for primary procedure)* was created in the late 1990s to describe pulmonary angiography with congenital as well as non-congenital cardiac catheterization. Among its inadequacies, it fails to describe any difference between pulmonary arterial and pulmonary venous, two completely different structures; the former a right heart structure, and the latter, left heart. Furthermore, this code fails to capture the variety of different approaches to pulmonary arterial angiography for congenital heart disease, such as approaching from the venous system, across right heart structures, as compared to pulmonary arteries originating from the arterial system, or in many cases, when both exist in the same patient. Availability of only a single CPT code intended to capture these multiple injections was not sufficient and resulted in services being underdefined in CPT.

The CPT application sought to create the four new codes that would be used to report a significant portion—though not all—of the services now billed using 93568 and to make an editorial revision to 93568. With 93568 and a handful of adjacent angiography codes not reviewed in over a decade, the societies undertook review of angiography codes 93563-93568 in addition to new codes 93569-93575. The ACC and SCAI randomly surveyed interventional cardiologists and pediatric interventional cardiologists, as designated by membership rolls, on the newly created codes. The ZZZ-global day survey was completed by physicians who have experience with the services.

As we move through recommendations for this large group of codes, it is important to keep several elements in mind.

- The six existing codes **do not** include introduction of catheters; that work is billed separately as part of the catheterization code, so the existing codes should have lower values than the newly created codes.
- The new codes **do** include catheter placement as well as the injection and radiologic supervision and interpretation, reflecting more work as recommended in this submission.
- With maturation of technology and a larger congenital population to benefit from interventions, these services are now very commonly provided in the congenital population.
- Prior survey of the existing codes over a decade ago did not include a pool of pediatric interventional cardiologists who are typically treating a different patient population than what was captured in that survey. We believe that difference calls into question the ability to compare the times of the current survey with those of the prior survey.
- The expert panel finds the values for the new codes appropriate from a magnitude estimation perspective at the 25th-percentile work RVUs.
- It is not clear to the expert panel from the survey results that survey respondents understood the distinction that the existing codes **do not** include selective catheter placement while new codes **do** incorporate selective catheter placement as part of the service. Therefore, we are recommending the current values for the existing codes, despite the fact they are below the 25th-percentile of the survey. We identify no rationale to argue compelling evidence for higher work RVUs for the existing codes based on the survey results, nor are we aware of changes to these services from the past decade since prior evaluation.
- We believe these recommendations maintain/create a reasonable rank order with most of the existing codes falling below the new codes that more specifically define angiography in the arteries and pulmonary veins.

Survey Results

The key reference code is 36227 for selective catheter placement in the external carotid artery. It was selected by 29% of respondents. 50% of the respondents indicated that 93568 was of more intense/complex, while 40%

indicated it was similarly intense/complex. The second reference code is 93561 for indicator dilution studies. It was selected by 23% of respondents. 50% of respondents indicating 93568 to be more intense/complex and 50% said it was similarly intense/complex.

93568 Recommendation

The societies recommend the existing value of 0.88 work RVUs with 13 minutes intraservice time from the survey median. As noted above, this value falls below the survey 25th-percentile RVU. The expert panel believes this code and other current values for existing codes align with the recommended values at the 25th for the new codes. This value falls between MPC codes 64484 and 51797 that have times of 10 and 15 minutes, respectively with RVUs above and below the recommendation, as shown in the summary spreadsheet. This recommendation is also slightly higher than comparison code 15274 for 100 square centimeters of skin graft that has 10 minutes intraservice time with a slightly a lower RVU.

It was noted by reviewers that an explanation for why this service would have slightly more time but a slightly lower RVU than previous code 93567 would be helpful. We believe this outcome can reasonably be explained by the fact that it takes more time to navigate the catheter around the right ventricle. That effort is not as difficult/intense as what we just described for 93567 with a typically older, tortuous, calcified landscape. However, it does take some time to advance the catheter through two valves to get into position.

It was noted by reviewers that an explanation for

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 93568

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Cardiology How often? Sometimes

Specialty Interventional Cardiology How often? Sometimes

Specialty Pediatric Interventional Cardiology How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 0
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Commercial estimate unavailable

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 400
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 30% of 2019 93568 utilization, as we predict 70% of the utilization to move to codes 93569-93575

Specialty Cardiology Frequency 225 Percentage 56.25 %

Specialty Interventional Cardiology Frequency 110 Percentage 27.50 %

Specialty Pediatric Interventional Cardiology Frequency 40 Percentage 10.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:

BETOS Sub-classification Level II:

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 93568

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

ORIGINAL RESEARCH

Angiographic Anatomy of Major Aortopulmonary Collateral Arteries and Association With Early Surgical Outcomes in Tetralogy of Fallot

Gregory T. Adamson, MD; Doff B. McElhinney, MD; Yulin Zhang, PhD; Jeffrey A. Feinstein, MD, MPH; Lynn F. Peng, MD; Michael Ma, MD; Claudia A. Algaze, MD; Frank L. Hanley, MD; Stanton B. Perry, MD

BACKGROUND: Due in part to the heterogeneity of the pulmonary circulation in patients with tetralogy of Fallot and major aortopulmonary collateral arteries (MAPCAs), research on this condition has focused on relatively basic anatomic characteristics. We aimed to detail pulmonary artery (PA) and MAPCA anatomy in a large group of infants, assess relationships between anatomy and early surgical outcomes, and consider systems for classifying MAPCAs.

METHODS AND RESULTS: All infants (<1 year of age) undergoing first cardiac surgery for tetralogy of Fallot/MAPCAs from 2001 to 2019 at Stanford University were identified. Preoperative angiograms delineating supply to all 18 pulmonary segments were reviewed for details of each MAPCA and the arborization and size of central PAs. We studied 276 patients with 1068 MAPCAs and the following PA patterns: 152 (55%) incompletely arborizing PAs, 48 (17%) normally arborizing PAs, 45 (16%) absent PAs, and 31 (11%) unilateral MAPCAs. There was extensive anatomic variability, but no difference in early outcomes according to PA arborization or the predominance of PAs or MAPCAs. Patients with low total MAPCA and/or PA cross-sectional area were less likely to undergo complete repair.

CONCLUSIONS: MAPCA anatomy is highly variable and essentially unique for each patient. Though each pulmonary segment can be supplied by a MAPCA, central PA, or both, all anatomic combinations are similarly conducive to a good repair. Total cross-sectional area of central PA and MAPCA material is an important driver of outcome. We elucidate a number of novel associations between anatomic features, but the extreme variability of the pulmonary circulation makes a granular tetralogy of Fallot/MAPCA classification system unrealistic.

Key Words: catheterization ■ DiGeorge syndrome ■ major aortopulmonary collateral arteries ■ pulmonary artery ■ pulmonary atresia ■ tetralogy of Fallot

The complexity of managing patients with tetralogy of Fallot (TOF) and major aortopulmonary collateral arteries (MAPCAs) revolves around the anatomy and function of the pulmonary circulation. Each of the 18 bronchopulmonary segments can be supplied by MAPCAs, central pulmonary artery (PA), or both, with variable location and severity of stenoses.[1] While the spectrum of MAPCA and PA anatomy is generally recognized, there has been no large or comprehensive evaluation of pulmonary vascular anatomy in a clinical cohort with this condition. Because of the challenge of defining and evaluating this variability, the literature on this condition has typically included limited anatomic information related to the pulmonary circulation, such as the presence or absence of intrapericardial PAs, the number of MAPCAs, and/or the number of lung

CLINICAL PERSPECTIVE

What Is New?

- We provide novel insight into the distribution and constellation of anatomic features in infants with tetralogy of Fallot and major aortopulmonary collateral arteries (MAPCAs).
- The distribution of MAPCAs were essentially unique for each patient, making a universal classification scheme unrealistic.
- A predominance of MAPCAs versus central pulmonary arteries, as measured both by cross-sectional area and by number of lung segments supplied, was not associated with early outcomes.

What Are the Clinical Implications?

- Anatomic associations revealed in this work can guide the preoperative evaluation and surgical approach when managing infants with MAPCAs.
- Using a strategy of early complete unifocalization, a good early surgical result can be achieved for essentially any anatomic variation.
- Less total cross-sectional area of usable native MAPCA and pulmonary artery material portends a worse outcome.

segments connected to the central PAs.[2–11] Although we recently reported outcomes in a large cohort of patients with TOF/MAPCAs,[3] we have not analyzed patients according to more detailed anatomic features of the pulmonary circulation. However, we suspect that there are important anatomic aspects that can be elucidated via detailed characterization of the pulmonary circulation. The aims of this study were to detail the PA and MAPCA anatomy in a large group of infants, assess relationships between anatomic variables and early outcomes, and consider systems for classifying patients with MAPCAs in an effort to improve communication, facilitate understanding of risk factors and outcomes, and define subgroups to enhance collaboration and clinical and translational research.

METHODS

The data that support the findings of this study are available from the corresponding author upon reasonable request. This study was approved by the Stanford University Institutional Review Board (Protocol 56280) with a waiver of consent.

Patients

With approval from the Stanford University Institutional Review Board (Protocol 56280), all patients with TOF/MAPCAs undergoing cardiac surgery at Lucile Packard Children's Hospital between November 2001 and August 2019 were identified. Patients were included in this study if preoperative angiograms were available that clearly and completely delineated the native MAPCA and PA anatomy as well as the blood supply to all 18 bronchopulmonary segments. Patients >1 year of age at catheterization were excluded given that MAPCAs left in a native state for a prolonged period can become atretic, and untreated older children may develop acquired collaterals to the pulmonary circulation, both of which can obscure understanding of the native anatomy.

Characterization of MAPCAs

MAPCAs were characterized angiographically according to number, origin, course, and segmental supply, as well as the location of any connection to the central, branch, or lobar PAs (Table S1).

Number

Although MAPCAs can be quantified in several ways, for this anatomic study a vessel was counted if it had an identifiable origin from the systemic circulation. A vessel with a common trunk before branching was counted as a single MAPCA with branches, whereas if no common trunk was seen, branches arising from the same site were counted as separate MAPCAs. This is different from our surgical definition[1] where each branch requiring unifocalization is counted separately.

Origin

Origins were identified as left or right subclavian artery (SCA) (including branches thereof), transverse aorta, descending thoracic aorta, abdominal aorta (at or below the level of the diaphragm), or coronary artery. The presence of a unilateral ductus arteriosus (PDA) or an anomalous PA from the ascending aorta were also documented.

Course

The course of a MAPCA was characterized based on its insertion into the lung parenchyma: leftward (into the left PA), rightward (into the right PA), bilateral (branches to right and left PA), or midline (into the intrapericardial PA).

Nature of supply

Each MAPCA was classified as (1) single-supply (MAPCA serves as the only source of blood flow to the lung segment[s]), with no connection to a central PA, (2) isolated supply to central PAs (the only MAPCA connecting to the central PAs; (3) dual-supply (1 of ≥2 MAPCAs connecting to the central PAs); or (4) mixed-supply (≥1 single-supply and ≥1 dual-supply branches), as demonstrated in Figures 1 and 2.

Unilateral PDA

A unilateral PDA was defined as a patent or involuted vessel arising from the typical location of a PDA (ie, the isthmus or the innominate artery, depending on arch laterality and branching) and supplying a normally arborizing PA, with no MAPCAs to that lung and no intrapericardial PA (Figure 1). Based on our understanding that a PDA and single-supply collaterals should not supply the same lung, and on the observation that the recurrent laryngeal nerve was not anatomically associated with any such vessel on intraoperative inspection, a vessel arising from the same general location as a PDA but supplying only part of 1 or both PAs was considered a MAPCA (Figure 1).

Angiogram Review

Angiograms were reviewed offline by 2 investigators (G.T.A., S.B.P.) masked to clinical details. MAPCAs and PA characteristics were recorded, along with aortic arch sidedness and branching, and coronary anatomy. When present, the proximal intrapericardial PAs were measured in the anteroposterior projection and the average of left and right PAs reported. Because intrapulmonary PAs are often larger than intrapericardial PAs in TOF/MAPCAs (Figure 2), PA diameters were also measured at the first lobar bifurcation in the anteroposterior projection and used to calculate a modified Nakata index, with the assumption of circular cross-section.[12] Single-supply MAPCAs were measured distal to the likely unifocalization site, beyond any central, lobar, and segmental stenoses (Figure 2). The sum of the cross-sectional areas of single-supply MAPCAs and single-supply branches from mixed-supply MAPCAs (Figures 1 and 2) was defined as the MAPCA index. If a single supply MAPCA branch arose proximal

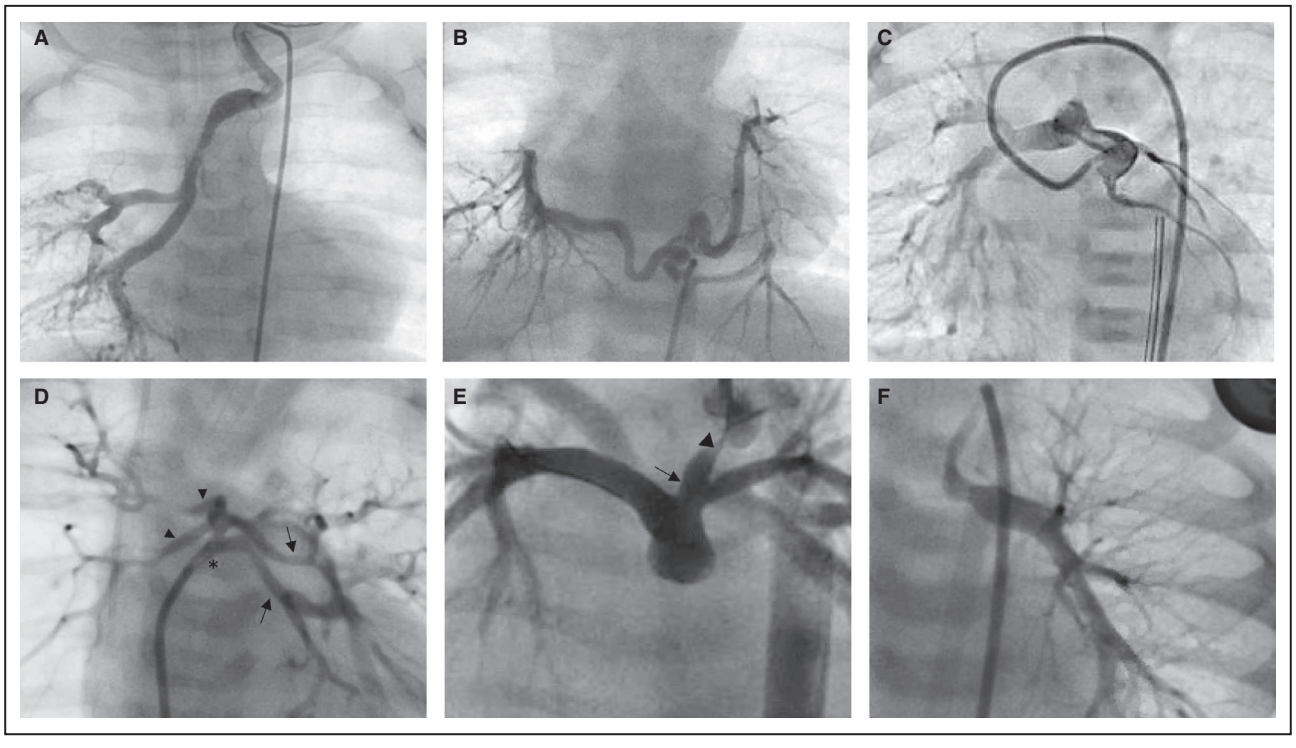

Figure 1. Examples of major aortopulmonary collateral arteries (MAPCA) and a ductus arteriosus in 6 different patients. **A**, Single-supply MAPCA arising from the left subclavian artery and coursing rightward to provide sole supply to a portion of the right lower pulmonary artery (PA). **B**, Abdominal aorta MAPCA giving 2 dual-supply branches, 1 to the right intermediate and 1 to the left PA. **C**, Coronary MAPCA arising from a dilated left main coronary, inserting in the intrapericardial main PA and supplying a normally arborizing right PA. **D**, Mixed-supply MAPCA with a common trunk (*) and multiple branches; 2 (arrow) connect to a central left PA, and 2 (arrowheads) are single-supply to portions of the right PA. **E**, MAPCA with origin (arrowhead) and insertion (arrow) consistent with a ductus arteriosus, but supplying incompletely arborizing intrapericardial PAs, with 10 segments supplied by single-supply MAPCAs. **F**, Prostaglandin-sensitive ductus arteriosus supplying a normally arborizing left PA.

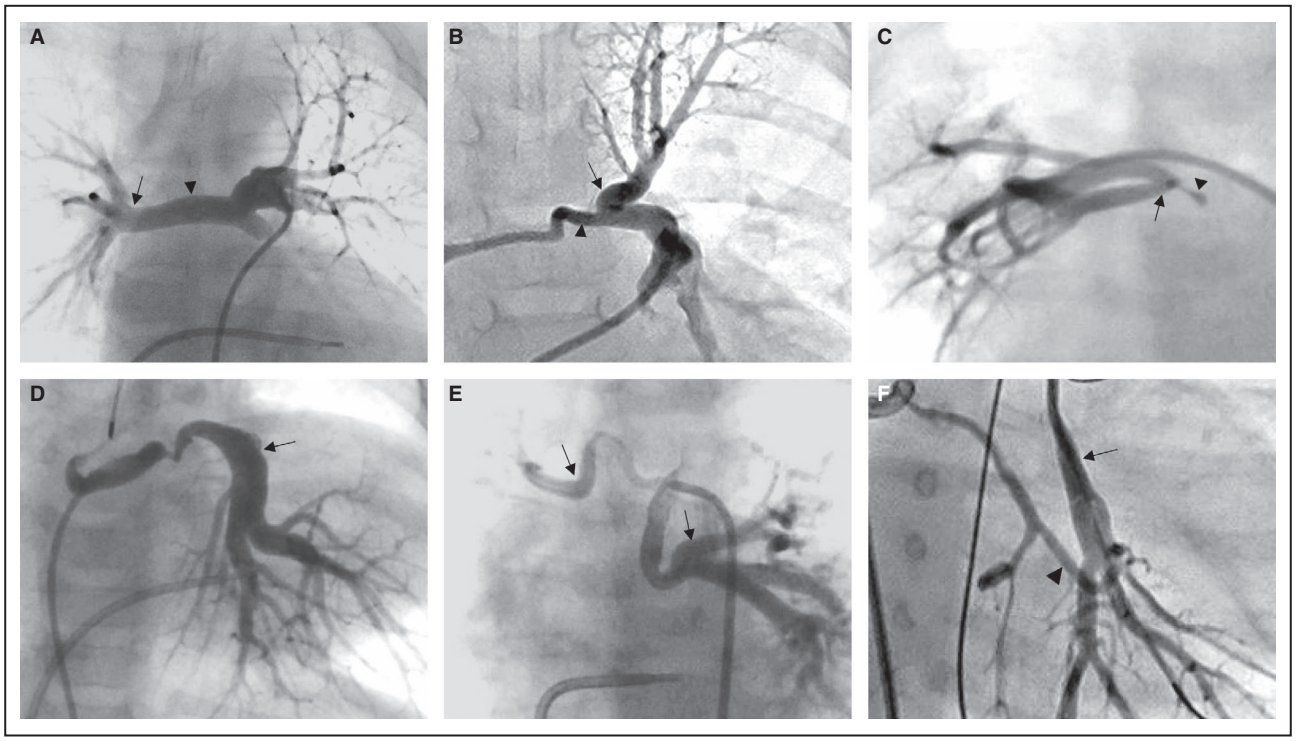

Figure 2. Examples of major aortopulmonary collateral arteries (MAPCA) and central pulmonary arteries (PAs) and location of measurements in 6 different patients.
A, Dual-supply MAPCA connecting at the left hilum and supplying large incompletely arborizing central PAs with intrapericardial (arrowhead) and intrapulmonary (arrow) portions similar in size. **B** and **C**, Dual-supply MAPCAs feeding an incompletely arborizing intrapulmonary PA (arrow) with relatively hypoplastic intrapericardial PAs (arrowhead). **D** and **E**, Single-supply MAPCA with 2 branches, with arrows at the sites of measurement, past all stenoses at the site of anticipated unifocalization. **F**, Dual-supply MAPCA with a small connection to the central PA (arrowhead), which will require unifocalization and be included in the MAPCA index (measured at black arrow).

to a small dual-supply connection to the PAs, it was measured separately and included in the MAPCA index (Figure 2F). The modified Nakata and MAPCA indices were summed to give a total neo-pulmonary artery index (TNPAI), similar to prior work.[13] Patients in whom all measurements could not be made confidently were excluded because of inadequate angiography.

Surgical Management

Our management approach for TOF/MAPCAs has been detailed previously.[1,3] Complete repair refers to unifocalization, ventricular septal defect closure, and placement of a right ventricle (RV) to PA conduit, which are usually performed during the same operation (single-stage repair), and less often in stages. Unifocalization to a central shunt is performed if an intraoperative flow study shows that RV pressure would be too high with ventricular septal defect closure.[13] For patients with hypoplastic normally arborizing central PAs and all dual-supply MAPCAs, an aortopulmonary window is performed early in life as the first surgery.[1,14] Further details about our surgical approach are in Data S1.

Surgical Outcomes

The first surgery was classified as single-stage complete repair, aortopulmonary window, or other palliation (unilateral or bilateral unifocalization to a central shunt, or unilateral PA banding). For patients who did not undergo single-stage complete repair, each subsequent surgery was reviewed, and classified as complete repair (multi-stage) or ongoing palliation (unrepaired). Follow-up was conducted by a combination of medical record review and contact with the primary physician for all patients who did not undergo complete repair at our institution, and patients' current status classified as "unrepaired" or "death without repair". The ratio of right ventricle to aortic pressure (RV:Ao) at time of complete repair was taken in the operating room via intracardiac lines following chest closure, which is routinely recorded in the operative and intensive care unit records.

Patient Grouping and Analysis

One aim of this study was to determine whether an anatomically-based classification system could be derived for patients with MAPCAs. To provide the most detailed analysis possible, we classified patients with

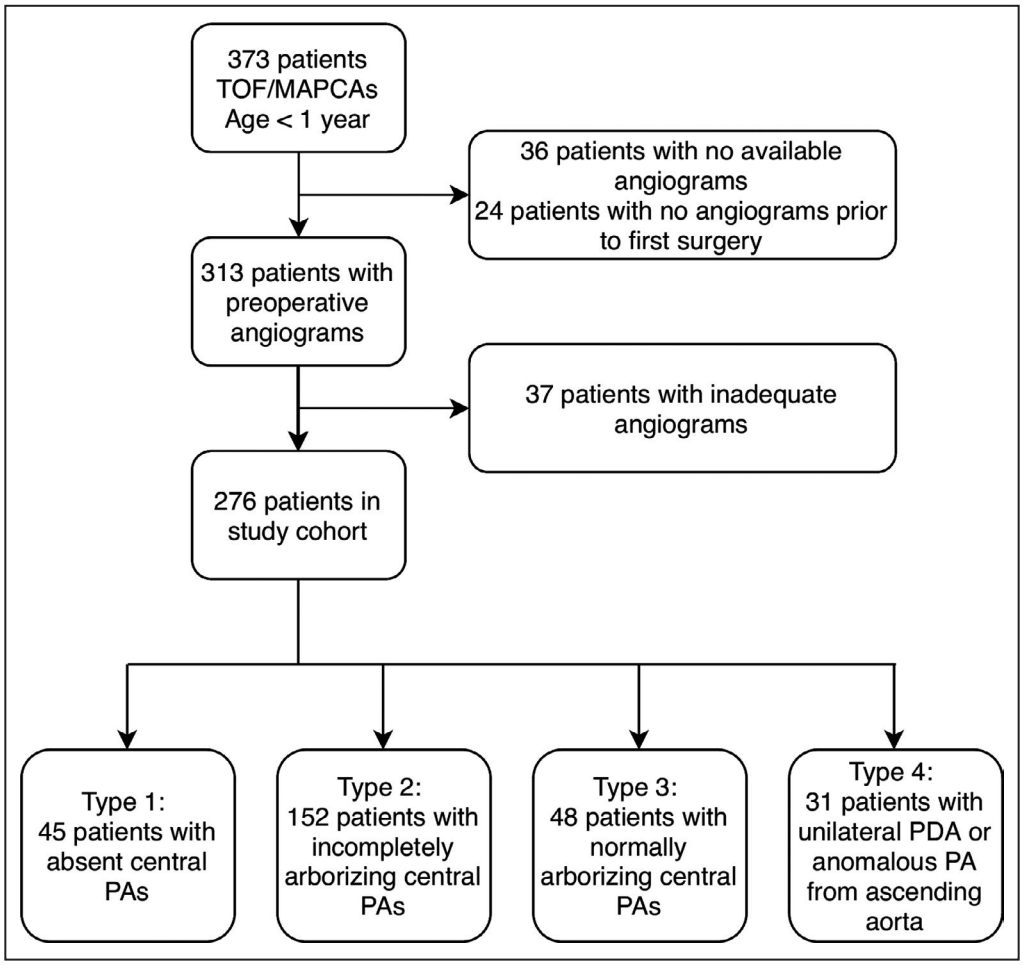

Figure 3. Study flowchart.
Diagram of the exclusion and inclusion criteria and breakdown of included patients by pulmonary artery arborization pattern. PAs indicates pulmonary arteries; PDA, ductus arteriosus; and TOF/MAPCAs, tetralogy of Fallot with major aortopulmonary collateral arteries.

a scheme similar to that proposed by Soquet et al,[15] using features described above plus the number of segments supplied by each MAPCA. Every MAPCA was named according to origin and nature of supply, and patients were organized based on these characteristics, as described in Data S1.

In addition, for the purposes of analysis, patients were grouped according to several criteria: (1) the number of bronchopulmonary segments fed by single-supply MAPCAs (0–3, 4–8, 9–13, and 14–18 segments), (2) the ratio of MAPCA index to TNPAI (0–0.25, 0.25–0.5, 0.5–0.75, and 0.75–1), and (3) the TNPAI (<100, 100–150, 150–200, and >200 mm^2/m^2). Also, based on our management protocol, each patient was assigned to 1 of 4 groups according to central PA arborization and MAPCA supply, similar to the system proposed by Barbero-Marcial[16]:

Type 1: Absent intrapericardial PAs (all single-supply MAPCAs).

Type 2: Incompletely arborizing central PAs (combination of single, dual, and mixed-supply MAPCAs).

Type 3: Normally arborizing central PAs (all dual-supply MAPCAs).

Type 4: Unilateral PDA or anomalous PA arising from the ascending aorta, with MAPCAs to the contralateral PA (with or without an intrapericardial PA segment).

Statistical Analysis

Data were presented as number (%) or median (25th, 75th percentiles). Comparison of categorical variables between groups was performed using Fisher exact test. For numerical variables, Wilcoxon rank sum test or the Kruskal–Wallis test was used. All analyses were performed with R version 3.6.1 and SPSS version 25.0.

RESULTS

Study Cohort

A total of 373 patients <1 year of age with TOF/MAPCAs underwent surgery at our center during the study period. As summarized in Figure 3, 97 of these patients were excluded and the remaining 276 comprised the study cohort. Forty (14%) of the angiograms were performed at outside institutions.

Characteristics of MAPCAs

In these 276 patients, 1068 MAPCAs were identified: 564 (53%) single-supply, 87 (8%) isolated-supply to central PAs, 386 (36%) dual-supply to central PAs, and 31 (3%) mixed-supply. Details are summarized in Table 1. MAPCAs arising from the abdominal aorta were almost always dual-supply (23 of 24), while all 15 MAPCAs from the coronary arteries were dual-supply, and in 6 cases (40%) were the only supply to the central PAs. Nearly all coronary MAPCAs (14 of 15) coursed midline to the intrapericardial PAs. There were 8 MAPCAs with an origin and course suspicious for a PDA that did not supply a normally arborizing unilateral PA and were not associated with the recurrent laryngeal nerve. Other than these 8 MAPCAs and the 14 coronary MAPCAs that coursed to the intrapericardial PAs, all MAPCAs connected at the hilum or more distally in the PA tree. Twenty-six patients had a PDA and 5 had an anomalous PA from the ascending aorta providing full and sole supply to a normally arborizing left (n=29) or right (n=2, 1 PDA, 1 anomalous PA) branch PA.

Patient Details and Anatomy

Demographic, clinical, anatomic, and surgical details of the overall cohort and the 4 anatomic groups are summarized in Table 2.

Anatomy

Patients had 1 to 10 MAPCAs (median 4), with descending thoracic aortic MAPCAs in 99% of patients. The next most common site of origin was the SCA (38%; unilateral in most cases), while MAPCAs from other sites were observed in 5% to 7% of patients each. A right aortic arch was present in 129 (47%) patients and 44 (16%) had an anomalous SCA. Patients with a chromosome 22q11 deletion (n=110, 41%) were more likely to have a right arch, anomalous SCA, and MAPCAs from an SCA, and less likely to have coronary MAPCAs. There were no other differences in MAPCA origins according to 22q11 status or arch sidedness or branching (Table 3 and Table S2). There were several associations between arch sidedness, branching, and SCA origin of MAPCAs; for example, MAPCAs tended to arise from the SCA contralateral to the arch, particularly when anomalous (Table S3). Overall, 31% of SCAs (73 of 232) originating normally from the innominate artery (contralateral to the arch), 12% (33 of 276) of SCAs ipsilateral to the arch, and 41% (18 of 44) of aberrant SCAs had a MAPCA (P<0.001). Coronary anomalies were found in 21% of patients (Table 4).

Intrapericardial PAs were present in 217 (79%) patients. The most common PA pattern was incompletely arborizing central PAs (Type 2; n=152 [55%]), followed

LSCA indicates left subclavian artery; MAPCA, major aortopulmonary collateral artery; PA, pulmonary artery; PDA, ductus arteriosus; Qp:Qs, ratio of pulmonary to systemic blood flow; RV:Ao, ratio of right ventricle to aortic pressure; and TNPAI, total neo-pulmonary artery index.

by normally arborizing PAs (Type 3; n=48 [17%]), and absent central PAs (Type 1; n=45 [16%]), with a PDA or anomalous PA from the ascending aorta and contralateral MAPCAs (Type 4) the least common pattern (n=31, 11%). Among patients with intrapericardial PAs, a median of 12 (9, 17) pulmonary segments were associated with the central PAs. There was remarkable variability in the number, origin, and segmental supply of MAPCAs, and in PA arborization, but some associations were apparent. Patients that were Type 1 were

Only includes patients with known presence or absence of a chromosome 22q11 deletion. Data presented as n (%) or median (Q1, Q3). LSCA indicates left subclavian artery; MAPCA, major aortopulmonary collateral artery; PA, pulmonary artery; RSCA, right subclavian artery; RV:Ao, ratio of right ventricle to aortic pressure; and TNPAI, total neo-pulmonary artery index.

more likely to have exclusively descending thoracic aorta MAPCAs than other types (*P*=0.006), while Type 3 were more likely to have abdominal aorta (*P*<0.001) and bilateral SCA MAPCAs (*P*=0.004).

Pulmonary valve stenosis occurred in about half (n=23, 48%) of patients with Type 3, and rarely in Type 4 (n=4, 13%) or Type 2 (n=6, 4%). In 3 of the 4 patients with Type 4 with pulmonary stenosis, the nearly atretic RV outflow tract supplied a hypoplastic normally arborizing single PA. Thus, of the 33 instances of pulmonary stenosis, 26 (79%) were associated with uni- or bilateral hypoplastic normally arborizing PAs. In the patients with Type 2 with pulmonary stenosis, a majority of bronchopulmonary segments (from 12 to 17) connected to the central PAs.

A MAPCA naming system based on origin, supply type, and number of bronchopulmonary segments supplied is detailed in Data S1. When the names of each MAPCA in a given patient were strung together, there were 222 unique codes among the 276 patients, of which 187 (84%) occurred only once. This scheme did not account for additional factors such as the specific segments supplied, the number or severity of PA stenoses, or the location and size of connections of dual-supply MAPCAs to the PAs. Given this heterogeneity, additional attempts to group patients using this methodology were not pursued.

Table 4. Coronary Artery Anomalies

Coronary Artery Pattern and Anomalies (34 Unknown, n=242)	
Normal pattern and supply	192 (79%)
LAD from the right	11 (4.5%)
Dual LAD	4 (1.7%)
Anomalous right from left main	7 (2.9%)
Anomalous left main from right	8 (3.3%)
Coronary artery fistula	5 (2.1%)
MAPCA	15 (6.2%)

LAD indicates left anterior descending; and MAPCA, major aortopulmonary collateral artery.

MAPCA and PA indices

As documented in Table 2 and Figure 4, the TNPAI was significantly lower in patients with Type 3 (*P*<0.001). Within patients with Type 3, those with pulmonary atresia and pulmonary stenosis had similar TNPAI (86.0 [62.3, 125.8] versus 70.2 [46.2, 98.3], *P*=0.066) and intrapericardial PA diameter (2.6 [2.4, 3.2] versus 2.5 [2.1, 3.3]; *P*=0.71).

Patients with and without a chromosome 22q11 deletion had similar TNPAI, but on average those with a deletion had more cross-sectional area contributed by single-supply MAPCAs (Table 3). Patients with Alagille syndrome had lower TNPAI than those without (89.3 [70.5, 131.0] versus 149.1 [100.4, 197.5] mm^2/m^2; *P*=0.043).

Outcomes

Selected surgical outcomes are summarized in Tables 4 through 7. No patients who underwent complete repair

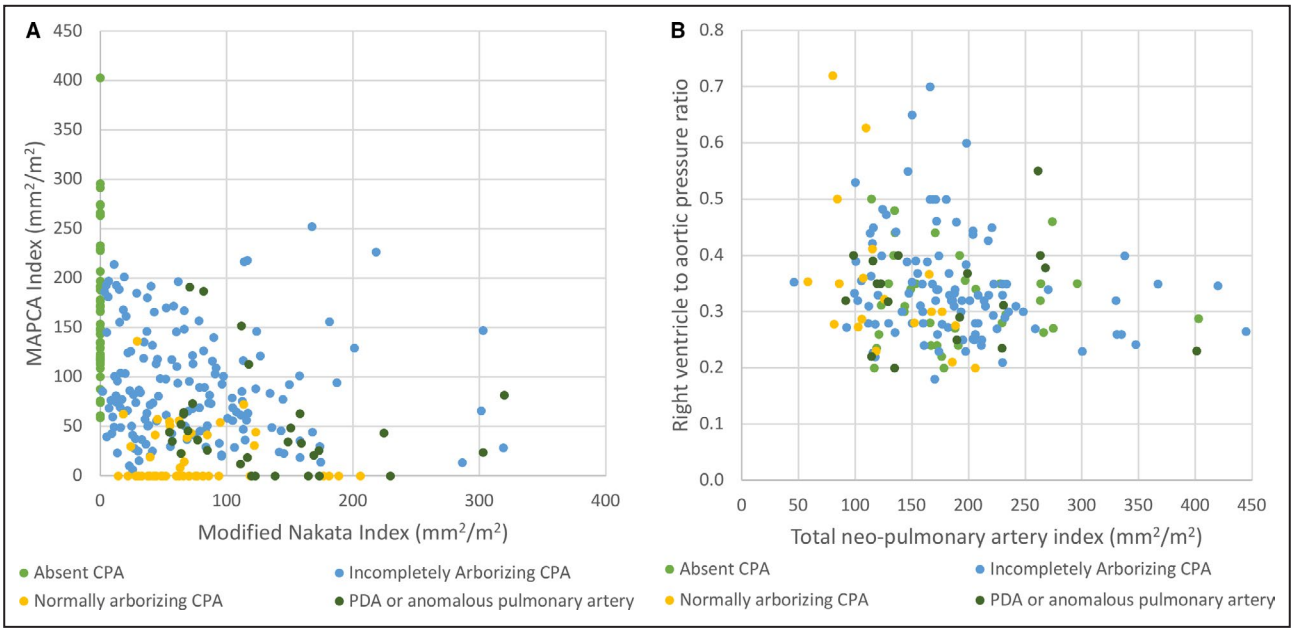

Figure 4. Relationship of pulmonary artery indices and postoperative right ventricle pressure according to pulmonary artery arborization pattern.
Scatterplots showing relationships of (**A**) major aortopulmonary collateral artery index, the modified Nakata index, and patient central pulmonary artery (CPA) arborization pattern (in all patients), and (**B**) postoperative right ventricle to aortic pressure ratio, the total neopulmonary artery index, and the central pulmonary artery arborization pattern (in patients who underwent complete repair). PDA indicates ductus arteriosus; and MAPCAs, major aortopulmonary collateral arteries.

had the ventricular septal defect opened or the RV-PA connection taken down. Patients with Type 3 and Type 4 were more likely to require a staged approach ($P<0.001$), but ultimately there was no significant difference in the proportion of patients reaching complete repair or in the post-repair RV:Ao between anatomic groups or according to the number of bronchopulmonary segments supplied by single-supply MAPCAs (Table 3 and Figure 4).

Patients with a larger TNPAI were more likely to undergo single-stage complete repair (Table 6 and Figure 5). A TNPAI <100 mm²/m² was associated with remaining unrepaired or experiencing death before complete repair, though 55 (77%) of these patients did achieve complete repair with an RV:Ao of 0.35 (0.28, 0.40). Among patients who achieved complete repair, there was no association between TNPAI and the postoperative RV:Ao. A summary figure with selected

central PA angiograms and surgical outcomes is shown in Figure S1.

DISCUSSION

It is challenging to assess and evaluate all of the features of the pulmonary circulation in TOF/MAPCAs in an integrated but straightforward and coherent fashion. This difficulty has potential implications for both treatment and investigation of outcomes and risk factors. In this report, which is the most comprehensive evaluation of pulmonary vascular anatomy in patients with TOF/MAPCAs, we described the highly variable anatomy of >1000 MAPCAs and central PA configurations in 276 infants, providing novel insight into the distribution and constellation of anatomic features in this population. We also attempted to characterize the variations in the pulmonary circulation, but the data revealed that the extensive variability of MAPCA anatomy and supply confounds useful systematic classification. As vexing as that may be, this study also confirmed our empirical impression that if the surgical principles of using all available raw material (all MAPCAs and the central PAs) are adhered to, a good early surgical outcome can be achieved for essentially any anatomic variation.

Anatomy

In this experience, there were minor associations between MAPCA number, origin, supply, arch anatomy, and genetic status, adding to prior smaller reports.[17–20] The presence of a unilateral PDA or anomalous PA from the ascending aorta, for example, should prompt careful evaluation for coronary MAPCAs. Abdominal aorta MAPCAs and MAPCAs from both SCAs were typically, although not always, associated with a normally arborizing PA tree, and awareness of this association may

Table 7. Surgical Outcomes Overall and According to the Ratio of the MAPCA Index to the TNPAI

Data presented as n (%) or median (Q1, Q3). MAPCA indicates ratio of the major aortopulmonary collateral arteries; RV:Ao, ratio of right ventricle to aortic pressure; and TNPAI, total neopulmonary artery index.

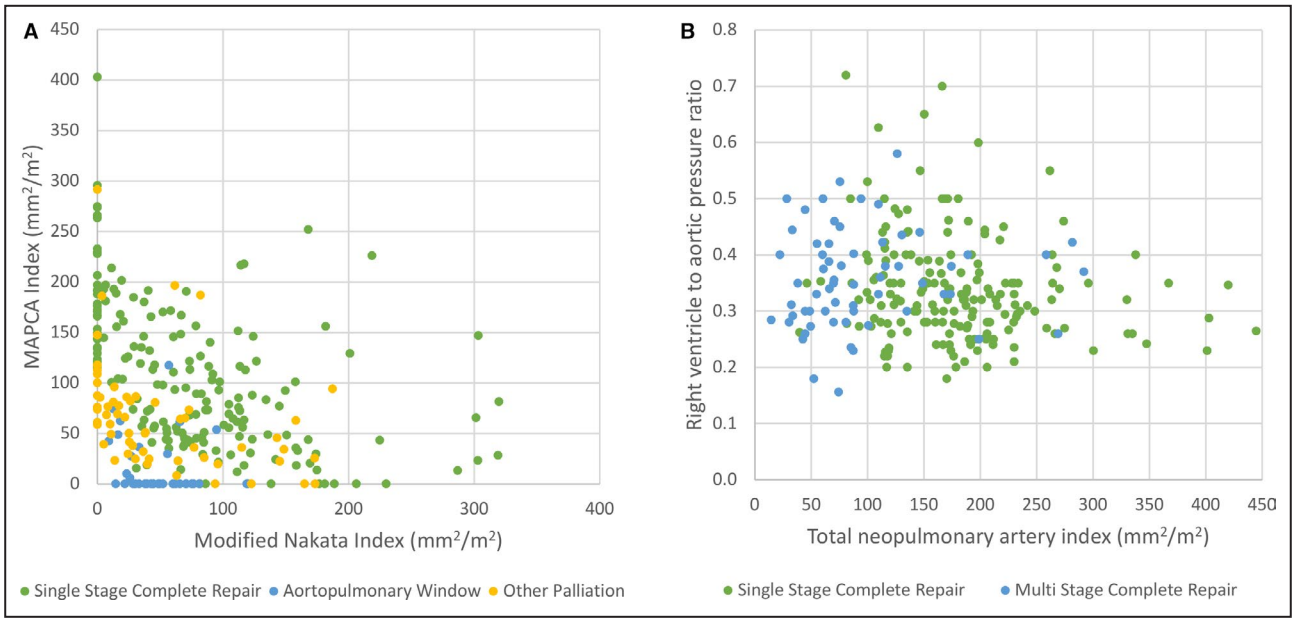

Figure 5. Relationship of pulmonary artery indices and postoperative right ventricle pressure according to surgical approach.
Scatterplots showing relationships of (**A**) major aortopulmonary artery index, modified Nakata index, and the first surgical procedure performed (in all patients), and (**B**) postoperative right ventricle to aortic pressure ratio, the total neopulmonary artery index, and single vs. multi-stage complete repair (in patients who underwent complete repair). In (**A**) patients with the lowest total neopulmonary artery index are closest to the left-lower corner and tended to be managed with a palliative procedure. However, of those who achieved complete repair (**B**), the right ventricle to aortic pressure was similar regardless of initial total neopulmonary artery index. MAPCA indicates major aortopulmonary collateral arteries.

be helpful during the evaluation of these patients. While understanding the associations found in this study are important for case planning, they do not appear to provide extensive insight into other anatomic features or outcomes.

Patients with normal or near-normally arborizing PAs tended to have more MAPCAs but a lower TNPAI compared with those with absent intrapericardial PAs. One possible explanation for this seemingly paradoxical phenomenon is that competitive flow from multiple sources could adversely affect the development of distal vasculature. This observation also suggests that the MAPCAs in this subgroup may have been acquired in fetal life, rather than having developed from early embryologic foregut vessels. The normal arborization of the central PA system, and the occasional patency of the pulmonary valve, also supports this hypothesis of a fetal process occurring after embryogenesis is completed.

Contrary to prior reports,[21,22] there were no significant differences in PA size or anatomy between patients with and without a chromosome 22q11 deletion. The few patients with Alagille in this cohort had markedly less PA/MAPCA cross-sectional area, which we believe is a driver of relatively poor outcome.[1,3] There was a high prevalence of coronary artery anomalies, including MAPCAs and coronaries crossing the RV outflow tract, and therefore preoperative coronary angiography is required.

Outcomes

Patients with large central PAs, large MAPCAs, or both (ie, a large TNPAI) had the highest likelihood of single-stage complete repair and tended to have lower early RV:Ao. Even among patients with the lowest TNPAI (<100 mm²/m²), a majority (>75%) eventually underwent repair with acceptable RV pressure. Few patients with a high TNPAI had a high post-repair RV pressure or did not undergo single-stage repair. Though estimating the TNPAI may help frame expectations about the likelihood of 1-stage repair, we do not use quantitative preoperative estimates of post-reconstruction PA size in surgical decision-making.

Despite the anatomic variability between patients with the different PA arborization patterns (Types 1–4), outcomes did not differ. Nevertheless, we believe that grouping patients based on PA arborization pattern is useful, since it has bearing on the timing and type of surgery.[1,3,23] Patients with Type 3, for example, undergo an elective aortopulmonary window early in life,[14,23] and patients with Type 4 often undergo neonatal intervention to control pulmonary blood flow to the lung without MAPCAs,[1] which helps account for the significant difference in first surgery between patients groups.

There is ongoing debate about the relative effectiveness of unifocalization[3,24,25] versus PA rehabilitative

approaches[10] (or a combination thereof[2,4,26,27]) for patients with incompletely arborizing PAs. The crux of management decisions at certain centers relies on the perceived dominance of central PAs or single-supply MAPCAs in an individual patient. We did not find MAPCA or central PA dominance, based on the number of lung segments supplied by single-supply MAPCAs or by the MAPCA index:TNPAI ratio, to be associated with differences in the rate of complete repair or in the immediate RV:Ao. Though there remains a sentiment that central PAs are a superior platform for repair,[15] the findings of this study suggest that PA segments supplied by single-supply MAPCAs are just as conducive to an overall good immediate repair as PA segments associated with an arborizing central PA. However, absent central PAs were associated with a higher incidence of surgical reintervention for elevated PA pressures,[28] and it is possible that certain PA arborization patterns will fare more poorly over time. Analysis of longer-term outcomes according to patient anatomic groupings described in this article is a subject of ongoing study. Overall, longer-term outcomes are generally favorable.[3]

It is our impression that once a MAPCA reaches the lung parenchyma, lung segments supplied by MAPCAs are indistinguishable from segments arborizing from central PAs, in terms of both quality and distribution. The use of a particular segment in the PA reconstruction does not appear to be related directly to the native course that blood takes to supply that segment. It is necessary that the physiology and anatomy of each lung segment is understood before surgery, such that the surgeon can plan the reconstruction and ensure unobstructed supply to all segments. Complex anatomies are more time intensive and technically challenging but following our approach the RV:Ao generally did not differ.

Although we and others have found worse long-term survival in patients with a chromosome 22q11 deletion than those without,[3,4,29,30] in this study there was no difference in the proportion of patients who achieved complete repair and only marginal differences in the post-repair RV:Ao. These immediate outcome data coupled with the anatomic findings in this study suggest that differences in long-term mortality in patients with a chromosome 22q11 deletion may be unrelated to PA size or anatomy.

Classification

Current classification systems place TOF/MAPCAs as a subset of TOF or ventricular septal defect with pulmonary atresia and/or by presence or absence of intrapericardial PAs.[31] Others have proposed different groupings,[4,15,16,32] but these have not been widely adopted. A system similar to the primary grouping in this study was proposed in 1990 by Barbero-Marcial et al.[16]

Our data suggests that in TOF/MAPCAs essentially every arborization pattern of the PAs, every variation of intrapericardial versus intrapulmonary PA size, and every combination of MAPCA origin and distribution exist on a spectrum, and that none of these variations are strongly associated with early surgical outcomes when using our management strategy and surgical techniques. Although we hoped this study would allow us to discern useful anatomic patterns for classifying patients, we conclude that attempts at a nomenclature system for TOF/MAPCAs will be either too simple or too complicated to be meaningfully tied to clinical outcomes. We continue to group patients (Type 1–4) primarily to facilitate communication about basic PA anatomy and the expected surgical management. Understanding all details, including MAPCA and central PA size, connections, stenoses, and other relationships in each individual case is necessary for the surgeon to achieve a good outcome.

Limitations

Limitations of this study include the single institution retrospective design. The majority of patients were referred from outside our local catchment area, and it is possible that selection bias may limit the generalizability of our findings to the overall population of patients with TOF/MAPCAs. There are significant limitations to using PA indices in patients with TOF/MAPCAs.[4,13] In a minority of cases, there was a degree of subjectivity between what was considered in the modified Nakata Index versus the MAPCA index, but all important cross-sectional PA area was included in the TNPAI, and the fact that these measurements had no influence on surgical decisions increases their power as a retrospective tool. The high repair rate and generally low RV:Ao in this study limits the ability to detect outcome differences between anatomic subtypes, which might be revealed in a larger cohort. There are other anatomic features, particularly the quality of the distal vasculature, that we could not systemically characterize. Therefore, though there are no statistically differences in early outcomes in the majority of analyses, it is possible that other anatomic features may be related to early outcomes in a more complex manner than this analysis could detect. Furthermore, this study was focused on characterization of pulmonary vascular supply, and was limited to early outcomes. Assessment of longer-term outcomes according to detailed PA anatomy is the subject of ongoing study.

CONCLUSIONS

In TOF/MAPCAs, the distribution of MAPCAs is highly variable and essentially unique for each patient. Though each pulmonary segment can be supplied

by a MAPCA, central PA, or both, in our analysis the type of supply was not associated with early surgical outcome, and all anatomic combinations were conducive to a good repair. Of the variables we studied, total cross-sectional area of central PA and MAPCA material (TNPAI) was an important driver of outcome, with those having a paucity of total material being the most challenging patients to manage. We highlighted a number of novel associations between anatomic features as well as genetic associations, but ultimately the extreme variability of the pulmonary circulation makes a granular classification scheme unrealistic. Nevertheless, grouping patients according to PA arborization pattern has clinical utility with regard to the preoperative evaluation and surgical management.

Supplemental Material

Data S1.

Supplemental Methods

Surgical Approach:

Our programmatic management algorithm for TOF/MAPCAs aims for early complete unifocalization and intracardiac repair incorporating all lung segments, with augmentation of PA branches (whether arborizing from the central PAs or supplied by MAPCAs) down to the segmental level. The majority of patients (i.e. those with incompletely arborizing or absent central PAs) are scheduled for elective surgery at 4-6 months of age. Unifocalization is individualized based on the anatomy of the PAs and the MAPCAs, and the angiograms are displayed in the operating room as a roadmap. Distal branches are probed to assess diameter, orientation, and the presence of stenoses, and MAPCAs are dissected out to the segmental level to maximize vessel length. To minimize the likelihood of recurrent stenosis, native tissue is utilized for all anastomoses and PA reconstructions when possible. Patch augmentations are performed with PA homograft, and circumferential patches are avoided in order to preserve the growth of native tissue. Anastomoses between MAPCAs and central PAs are performed with extended side-to-side connections, typically to the posterior aspect of the augmented central PAs. These anastomoses extend into the lung parenchyma where collateral vessels generally are no longer distinguishable from normally arborizing PAs[1].

MAPCA naming system

Methodology:

As described in the manuscript, each MAPCA has an origin (subclavian artery (SCA), transverse arch (TVA), descending thoracic aorta (DTA), abdominal aorta (ABA), or coronary artery (CA)) and supply type (single-supply (SS), isolated supply to central PAs (CSS), dual-supply (DS), or mixed-supply(MS)), and can fully or partially supply 1 to 18 bronchopulmonary segments. Additionally, there are unilateral patent ductus arteriosus (PDA) and anomalous pulmonary arteries arising from the ascending aorta (HT).

Each MAPCA was assigned names based on identifiers of origin, supply type, and segmental supply. There were two names assigned – one based only on MAPCA type and segmental supply, and one based on all three: origin, supply type, and segmental supply. As examples, a single-supply MAPCA arising from the descending thoracic aorta supplying 8 segments was named SS-8 (Type-#Segments) or DTA-SS-8 (Origin-Type-#Segments). A dual-supply MAPCA from the descending thoracic aorta that connects to a normally arborizing PA system was named DS-18 or DTA-DS-18.

Each patient was then coded by stringing together the MAPCA names. For each patient, MAPCAs were listed in order of largest number of segments supplied. For example, a patient with 3 MAPCAs (DTA-SS-5, DTA-SS-7, and DTA-CSS-6) would be named “DTA-SS-7,DTA-CSS-6,DTA-SS-5”. If the number of segments in two MAPCAs were identical, the order was alphabetical.

Results:

A total of 1,068 MAPCAs, 26 PDAs, and 5 HTs were included. By the more basic system (Type-#Segments), there were 57 different MAPCA names, and by Origin-Type-#Segments there were 113 different MAPCA names. By Type-#Segments, out of 276 patients there were 176 different patient codes, 124 (70%) of which occurred only once. By Origin-Type-#Segments, out of 276 patients there were 222 patient codes, 187 (84%) of which occurred only once.

Patient naming by Origin-Type-#Segments is shown below:

# of Patients	Patient Type by MAPCA Origin-Type-#Segments

Table S1. Classification of MAPCAs and unilateral branch PAs.

MAPCA Number	Number of separate MAPCA origins from the systemic circulation
MAPCA Origin	Left or right subclavian artery (including branches thereof) Transverse aortic arch Descending thoracic aorta Abdominal aorta Coronary artery
MAPCA Course	Leftward (into the left PA at the hilum or lobar or segmental branches) Rightward (into the right PA at the hilum or lobar or segmental branches) Midline (into the intrapericardial PA)
Nature of MAPCA supply	Single supply (no connection to the central PAs) Isolated supply to central PA (only MAPCA connecting to the central PAs) Dual supply (1 of at least 2 MAPCAs connecting to the central PAs) Mixed supply (1 or more single-supply and 1 or more dual-supply branches)
MAPCA segmental supply	Specific lung segments (out of 18) supplied by each MAPCA, either in isolation (single-supply) or via the central PAs (dual-supply)
Unilateral PDA	Arising from a typical PDA location and supplying a normally arborizing unilateral PA, with no MAPCAs to that lung and no intrapericardial PA
Anomalous branch PA	Arising from the ascending aorta, supplying a normally arborizing branch PA, with no MAPCAs to that lung

MAPCA: Major aortopulmonary collateral artery; PA: Pulmonary artery; PDA: Ductus arteriosus

Table S2. Relationship of MAPCA origin to aortic arch sidedness and branching.

	Thoracic aorta MAPCAs	Thoracic aorta MAPCAs only	Subclavian MAPCAs	Abdominal MAPCAs	Coronary MAPCAs	Transverse arch MAPCAs	RSCA & LSCA MAPCAs
All Patients (n=276)	274 (99%)	153 (55%)	105 (38%)	20 (7%)	15 (5%)	15 (5%)	26 (9%)

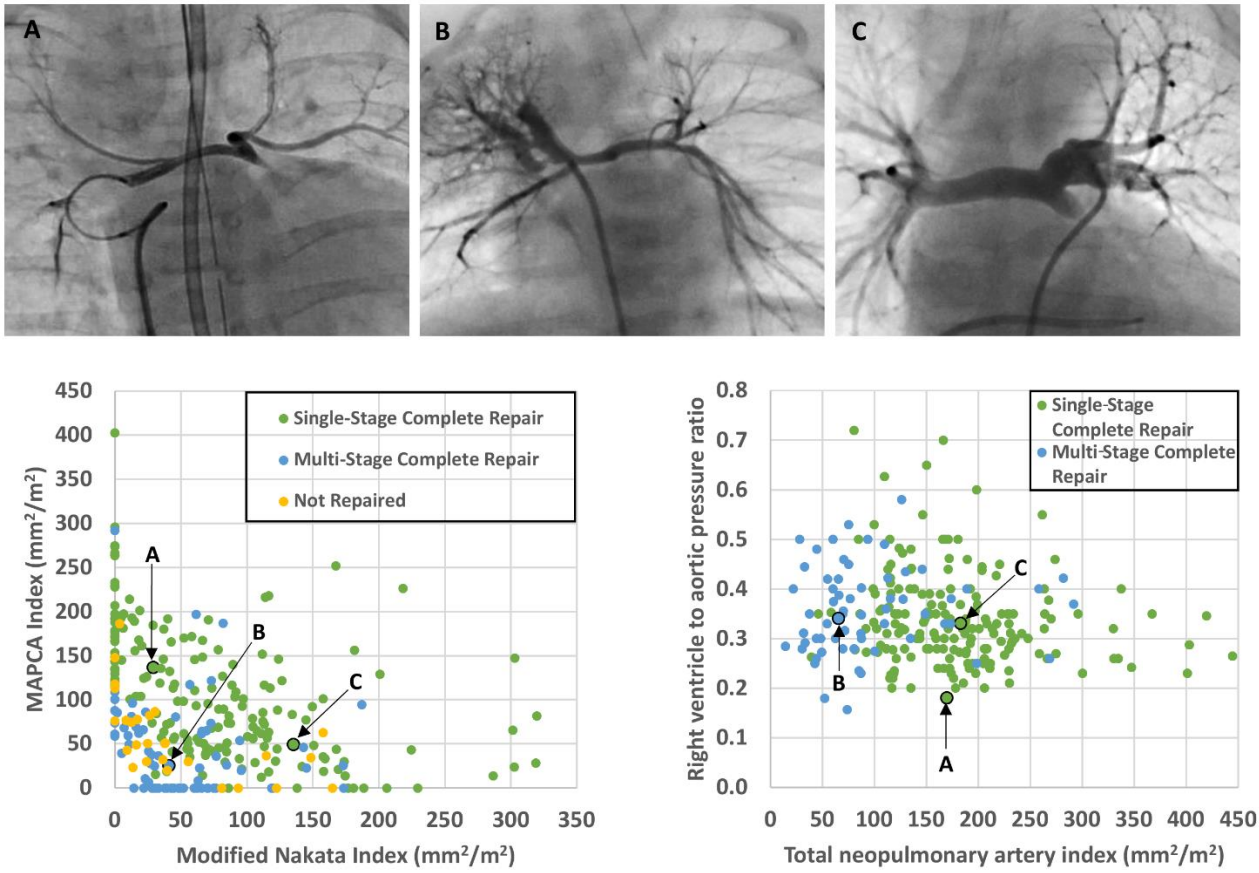
No SCA MAPCAs	85 (66%)	86 (59%)	0.26	20 (57%)	4 (44%)	0.34

Data presented as n (%). SCA=subclavian artery; MAPCA=Major aortopulmonary collateral artery

Figure S1. Summary figure.



Left scatterplot: 249 of 276 (90%) patients underwent complete repair, either in 1 (green) or ≥2 (blue) surgeries, and unrepaired (yellow) patients clustered to the left-lower corner, with a paucity of both cross-sectional central PA (modified Nakata index) and MAPCA (MAPCA-index) material. Right scatterplot: Of 249 repaired patients, 182 (73%) underwent repair in 1-stage, and patients that required ≥2 surgeries clustered to the left (blue), with less total cross-sectional PA and MAPCA (TNPAI) material. Angiograms of 3 patients with incompletely arborizing central PAs are shown, with their corresponding positions on the scatterplots noted. Patients A and B had hypoplastic central PAs (low modified Nakata Index). Patient A had a large MAPCA index and underwent single-stage repair, whereas patient B had hypoplastic single-supply MAPCAs and was first palliated with a unifocalization to a central shunt.

Reintervention Is Associated With Improved Survival in Pediatric Patients With Pulmonary Vein Stenosis

Melinda J. Cory, MD, Yinn K. Ooi, MD, Michael S. Kelleman, MS, MSPH, Robert N. Vincent, MD, Dennis W. Kim, MD, PhD, Christopher J. Petit, MD

ABSTRACT

OBJECTIVES The aim of this study was to evaluate survival following catheter intervention in pediatric patients with pulmonary vein stenosis (PVS).

BACKGROUND Despite aggressive surgical and catheter intervention on PVS in children, recurrence and progression of stenosis can lead to right heart failure and death. Clinicians continue to seek effective treatment options for PVS.

METHODS A single-center, retrospective study was performed including all patients <18 years of age who underwent catheter intervention (balloon angioplasty and bare-metal stent and drug-eluting stent insertion) on PVS. Endpoints included death, vein loss, and rate of reintervention.

RESULTS Thirty patients underwent intervention (balloon angioplasty, n = 9; bare-metal stent, n = 5; drug-eluting stent, n = 16) at a median age of 6.4 months (4.3 to 9.9 months). Median follow-up duration was 30.6 months (77 days to 10.5 years). Fourteen patients (47%) died at a median of 2.0 months (0.4 to 3.2 months) following intervention. There was no association between DES placement and survival ($p = 0.067$). Reintervention (catheter or surgical) was associated with improved survival ($p = 0.001$), with a 1-year survival rate of 84% compared with 25% for no reintervention. Vein loss occurred in 34 of 58 (59%) veins at a median of 3.3 months (1.0 to 5.0 months). One-year vein survival was higher with DES implantation ($p = 0.031$) and with reintervention ($p < 0.001$).

CONCLUSIONS DES implantation at first catheter intervention appears to be associated with improved vein survival but may not result in improved patient survival. However, reintervention appears to be associated with improved patient survival and vein patency, suggesting that despite mode of treatment, frequent surveillance is important in the care of these patients. (J Am Coll Cardiol Intv 2017;10:1788–98)

In children, pulmonary vein stenosis (PVS) is uncommon, presenting either as primary (idiopathic) PVS or secondary (post-surgical) PVS, usually following repair of total or partial anomalous pulmonary venous return. PVS is progressive in nature and can result in secondary pulmonary hypertension, right heart failure, and death (1–4). Surgical intervention at some centers is considered the primary treatment for both types of PVS (4). Despite aggressive surgical intervention, PVS is often recurrent (5).

Transcatheter interventions have been used to treat PVS, although outcomes have been variable. Outcomes following balloon angioplasty (BA) for PVS were reported as early as 1982, with poor long-term pulmonary vein (PV) patency (6–8). Stent implantation has also been reported, although many investigators report a high rate of neointimal proliferation within the implanted PV stents (9). The largest study evaluating stent efficacy for PVS in children found stent diameter to be a predictor of freedom from occlusion and reintervention (10).

From the Division of Pediatric Cardiology, Department of Pediatrics, Children's Healthcare of Atlanta, Sibley Heart Center, Emory University School of Medicine, Atlanta, Georgia. All other authors have reported that they have no relationships relevant to the contents of this paper to disclose.

Manuscript received February 21, 2017; revised manuscript received May 24, 2017, accepted May 24, 2017.

Studies looking at adult patients with acquired PVS found stent placement to be superior to BA, especially when larger stents can be deployed (11,12).

Histologic evaluation of PVS pathology suggests that myofibroblastic proliferation contributes importantly to the disease and may play a role in aggressive recurrence (13). Recent reports have suggested that inhibiting proliferation could temper the progression of disease. As a result, many centers have used antiproliferative and anti-inflammatory strategies when treating PVS. Drug-eluting stents (DES), initially introduced to alleviate coronary artery neointimal hyperplasia (14–17), have been implanted in infants and small children with PVS, who have had particularly poor outcomes (1,3,4,10,18). In a porcine model, DES were found to reduce in-stent stenosis compared with bare-metal stents (BMS) when placed in PVs (19). Outcomes following DES implantation in children with PVS are limited to case reports and small series that constitute a subset of larger reviews. The objective of our study was to compare survival following transcatheter intervention, including BA and BMS and DES implantation, in pediatric patients with PVS.

METHODS

PATIENTS. We retrospectively reviewed data from all patients <18 years of age who underwent catheter intervention for PVS from January 2005 to April 2016 at Children's Healthcare of Atlanta. The patients were identified through review of our database of catheterization procedures. Patient characteristics and demographics were noted, including age and weight at first PV intervention, the presence of associated congenital heart disease, and history of prior PV intervention. PV disease was characterized as: 1) unilateral or bilateral; 2) primary or secondary (defined as post-surgical, either for total or partial anomalous pulmonary venous return or primary PVS); 3) and by the number of PVs intervened upon both at index catheter-based intervention and later. Approval was obtained from the Institutional Review Board at Children's Healthcare of Atlanta.

CARDIAC CATHETERIZATION. Techniques and indications for PV dilation and stent implantation have been described previously (20–24). PVS was confirmed during catheterization with pulmonary artery wedge angiography or with directed injections into each PV. Access to the left atrium was through either a patent foramen ovale, atrial septal defect, or via transseptal puncture. Choice of intervention was determined by the operator. Balloon or stent diameter was also determined by the operator, on the basis of the angiographic size of the vessel. Type of DES (i.e., everolimus eluting vs. paclitaxel eluting vs. zotarolimus eluting) was not chosen by the operator for specific immunomodulatory effect, but rather DES type was selected by availability. All digital angiograms from the index case were reviewed.

ABBREVIATIONS AND ACRONYMS

BA = balloon angioplasty
BMS = bare-metal stent(s)
DES = drug-eluting stent(s)
PV = pulmonary vein
PVS = pulmonary vein stenosis
SMD = standardized mean difference

TABLE 1 Patient Characteristics

Surgery after catheter intervention	8 (14)	5 (17)	0	3 (17)	0.516

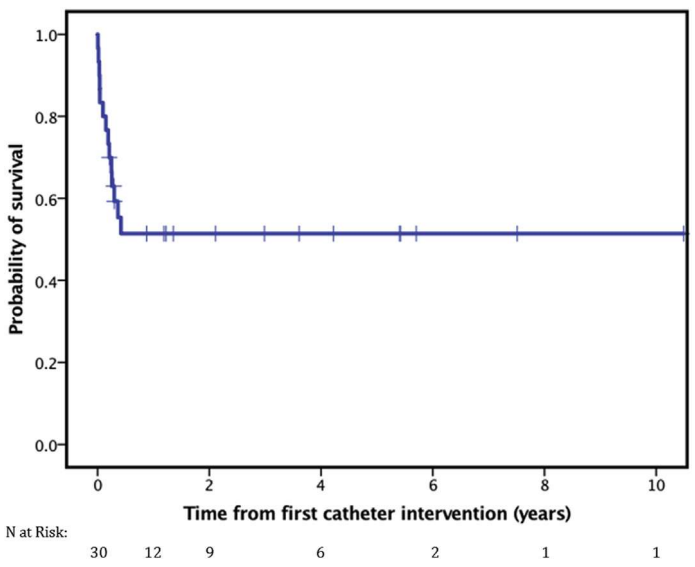
Values are n (%) or median (absolute range). *Includes first catheter intervention and any surgery or catheter intervention following the first catheter intervention.
Abbreviations as in Table 1.

Areas of obstruction were classified as discrete or long segment. Measurement of the area of stenosis was made before and after angioplasty or stent placement. For long-segment stenosis, the location of the balloon or stent waist was used as the site of vessel measurement.

DATA ANALYSIS. Patient demographics, diagnosis, mortality, and total reintervention were reported with each patient (i.e., not each treated PV) as the index unit. Rate of atresia and reintervention on individual veins were reported with the stented or angioplastied vein as the index unit.

The primary outcome assessed was mortality following transcatheter PV intervention. Secondary outcomes included PV reintervention (both transcatheter and surgical) and vein loss (a composite of vein atresia or patient death). For the purpose of testing the hypothesis that immunomodulatory stents (i.e., DES) have superior efficacy, the cohorts undergoing BMS implantation and undergoing BA were combined as the "nonimmunomodulatory" cohort. Data are expressed as median (interquartile range) or as number (percentage). When comparing 2 variables, categorical variables were analyzed using the Fisher exact test, and nonparametric continuous variables were assessed using the Mann-Whitney *U* test. Time-dependent survival analyses were performed using Kaplan-Meier log rank analysis. A p value of <0.05 was considered to indicate statistical significance. Data analysis for 2 variables was performed using SPSS version 23.0 (IBM, Armonk, New York). When comparing 3 variables, standardized mean differences (SMD) were calculated in R version 3.3.2 using the package "tableone" (R Foundation for Statistical Computing, Vienna, Austria). An SMD of <0.49 was considered a slight or small difference, an SMD of 0.50 to 0.79 was considered a moderate difference, and an SMD >0.80 was considered a large difference.

FIGURE 1 Patient Survival



Survival curve for all patients demonstrates rapid decline in survival in the first year post-intervention but stabilization past 1 year.

RESULTS

Between 2005 and 2016, 30 patients underwent catheter-based intervention for PVS at a median age

of 6.4 months (4.3 to 9.9 months). Fifteen of the patients (50%) had undergone previous surgical PV repair, including total or partial anomalous pulmonary venous return repair (n = 12 [40%]) and surgical repair of primary PVS (n = 3 [10%]). The remaining 15 patients (50%) underwent primary catheter intervention, and these patients were all diagnosed with idiopathic PVS.

Among the 30 patients, 9 (30%) underwent BA, 5 (17%) underwent BMS implantation, and 16 (53%) underwent DES implantation. Four patients (13%) had multiple therapies for different PVs at initial catheter-based intervention. Demographic data are summarized in Table 1.

Among the 30 patients, 58 individual veins were intervened upon, with a median of 2 (range 1 to 5) PVs per patient. The veins were characterized as either discrete (n = 42 [72%]) or long segment (n = 16 [28%]). Thirty veins (52%) underwent DES implantation. The DES agents included everolimus (n = 21 [70%]), zotarolimus (n = 7 [23%]), and paclitaxel (n = 2 [7%]). Ten veins (17%) underwent BMS implantation, and 18 (31%) underwent BA alone. Only 1 patient underwent cutting BA of a single PV; the remaining BA interventions used conventional balloons. The DES were smaller in diameter than the BMS and balloons for BA (SMD = 0.890) (Table 2). Although the DES had smaller diameters than the balloons used for BA, veins that underwent BA had smaller immediate post-intervention diameters than veins that underwent DES or BMS implantation (SMD = 0.201) (Table 2). There was no difference in the rate of reintervention by manner of catheter intervention. Vein intervention characteristics are summarized in Table 2. Detailed information on intervention type provided in Online Table 1.

MORTALITY. Follow-up duration for the cohort was a median of 30.6 months (range 77 days to 10.5 years). Fourteen patients (47%) died at a median of 2.0 months (0.4 to 3.2 months) following intervention. The causes of death for all of these patients were directly related to PVS, including right heart failure, pulmonary hypertension, and respiratory failure. Overall survival rates at 1 month and 1 year were 83% and 51%, respectively (Figure 1). Mortality was not associated with age or weight at first catheter-based intervention, single-ventricle physiology, bilateral vein involvement, or prior surgical intervention. There was also no significant association between intervention type and mortality. Survival was better in patients who underwent repeat intervention (surgical or catheter based) following primary catheter

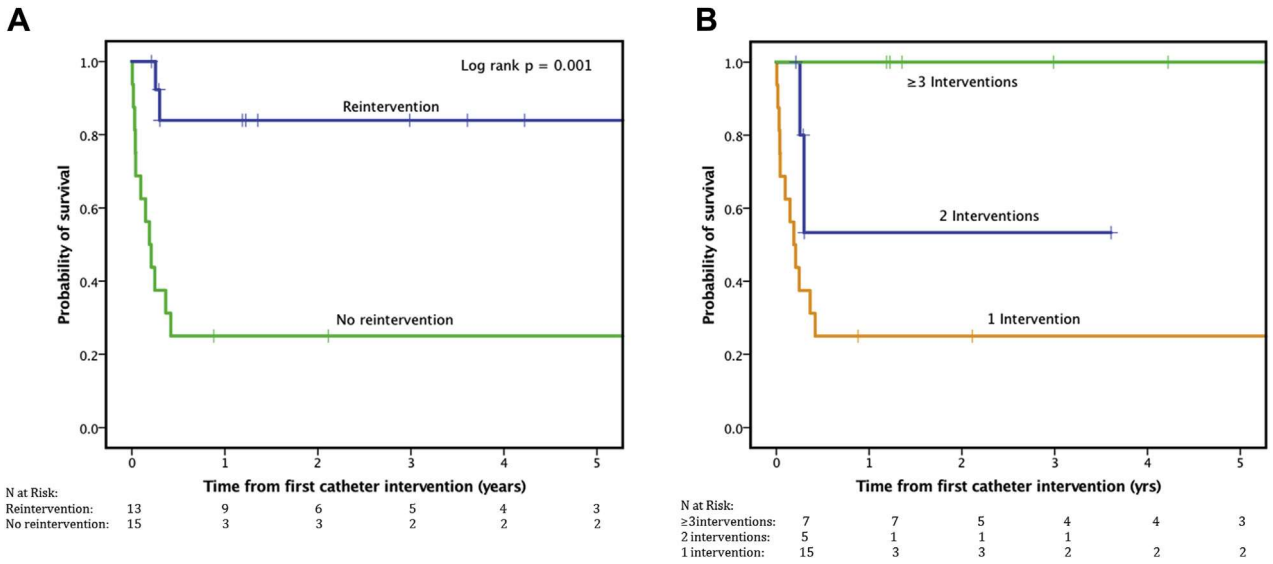
FIGURE 3 Patient Survival: Reintervention



(A) Kaplan-Meier analysis comparing survival between patients who underwent catheter and/or surgical reintervention and patients who did not undergo reintervention demonstrates improved survival with reintervention. **(B)** Kaplan-Meier analysis comparing survival on the basis of the number of catheter and/or surgical interventions from the first catheter intervention. Survival appears to improve with increasing number of interventions.

intervention (p = 0.001). Mortality data are summarized in Table 3.

The DES cohort was compared with patients undergoing BA and BMS placement, who combined were considered the nonimmunomodulatory cohort in a Kaplan-Meier survival analysis. The survival rates at 1 year were 68% for the DES group and 33% for the nonimmunomodulatory group (log-rank p = 0.067) (Figure 2).

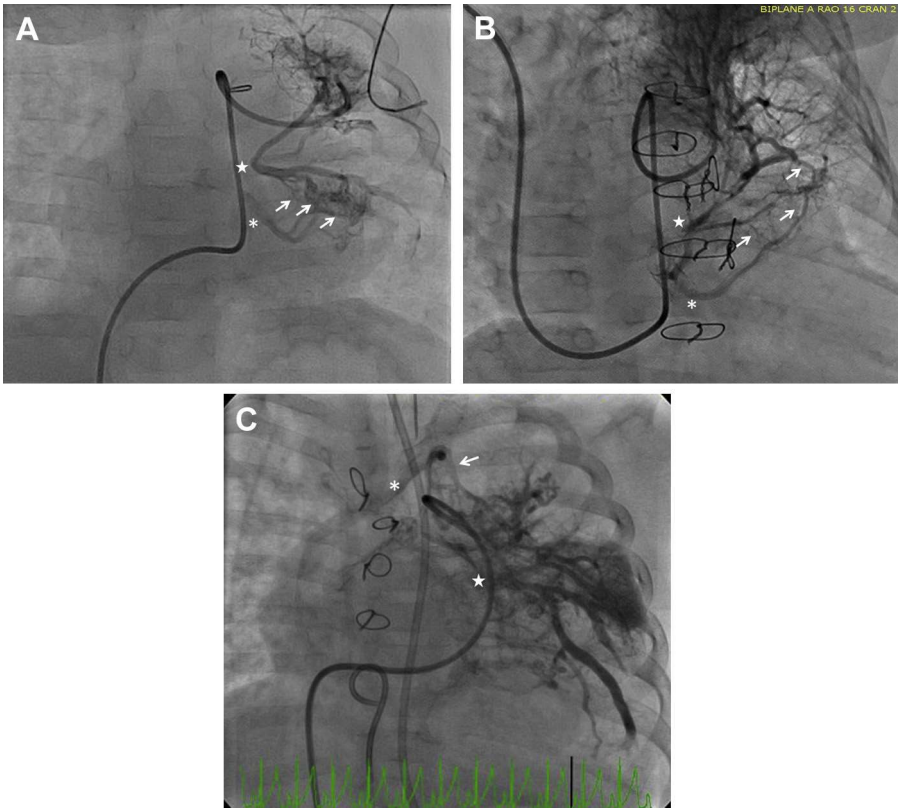
The survival rate at 1 year for patients who underwent reintervention (surgical or catheter) was 84% compared with 25% for patients who did not undergo reintervention (log-rank p = 0.007). The relative risk for 1-year survival in patients who underwent reintervention compared with those who did not was 4.09 (95% confidence interval: 1.43 to 11.69). This survival advantage was found to be greater with increasing number of interventions, with survival rate at 1 year of 100% in patients with ≥3 interventions, 53% in patients with 2 interventions, and 25% in patients with 1 intervention (Figures 3A and 3B).

In an attempt to understand if reintervention was truly protective against mortality or if survivors merely were afforded an opportunity for reintervention, we excluded patients who died within 1 month of primary catheter intervention and performed Kaplan-Meir analysis on the remaining cohort. This was based on our clinical practice of encouraging repeat catheterization 6 weeks after initial intervention. This analysis likewise demonstrated a survival advantage in patients who underwent reintervention, with a 1-year survival rate of 84% compared with 36% in patients who did not undergo reintervention (log-rank p = 0.013).

ATRESIA. Among the 31 veins in 16 survivors, 7 veins (22%) were found to be atretic in 7 patients (44%). Atresia was noted by angiography and occurred at a median time of 12.1 months (7.3 to 31.2 months). One of the patients who developed left upper and lower PV atresia ultimately underwent pneumonectomy because of recurrent, severe hemoptysis. In 2 of the 14 patients who died, 4 of 27 veins (15%) had previously been noted to be atretic by angiography before death. Hence, a total of 11 veins in 9 patients became atretic following intervention; the median time to discovery of atresia in these 11 veins was 7.3 months (2.1 to 14.8 months). Ten patients who died did not undergo repeat catheterization following the intervention and thus had no documentation of the status of the PV at the time of death.

Of the 9 patients with documented atresia, 7 (78%) had evidence of decompressing collateral formation

FIGURE 4 Collateral Formation



(A) Patient #1: angiogram demonstrating left upper pulmonary vein atresia **(star)** with decompressing interlobar pulmonary venovenous collateral vessels **(arrows)** to the patent left lower pulmonary vein **(asterisk). (B)** Patient #2: angiogram demonstrating atresia of the previously stented left upper pulmonary vein **(star)** with decompressing interlobar pulmonary venovenous collateral vessels **(arrows)** to the stenotic left lower pulmonary vein, which had previously been stented **(asterisk). (C)** Patient #3: angiogram demonstrating left upper pulmonary vein atresia **(star)** with a vertical decompressing pulmonary vein–to–systemic vein collateral vessel **(arrow)** to the innominate vein **(asterisk).**

by angiography. Collateral formation included interlobar pulmonary venovenous collateral vessels (n = 4) (Figures 4A and 4B) and PV-to-systemic vein collateral vessels (n = 3) (Figure 4C). Of the 7 patients with collateral formation, 5 (71%) were alive at most recent follow-up.

Vein loss, defined as actual PV atresia or PVs of uncertain status in deceased patients, occurred in 34 veins (59%) at a median time of 3.3 months (1.0 to 5.0 months). Overall vein patency rates at 1 month and 1 year were 86% and 44%, respectively. Vein loss was not associated with type of stenosis (discrete or long segment), intervention type, stent or balloon diameter, or pre-intervention measurement of stenosis. Post-surgical PVS and veins that had larger post-intervention measurements were associated with vein survival ($p = 0.03$ and $p = 0.013$, respectively). Consistent with overall patient mortality, veins that underwent reintervention (catheter based or surgical) had lower rates of vein loss ($p < 0.001$). Vein survival is summarized in Table 4.

The vein survival rate at 1 year for individual veins that underwent more than 1 procedure was 88% compared with a 1-year survival rate of 18% for veins that did not undergo reintervention (log-rank $p < 0.001$). The relative risk for 1-year vein survival when a vein had more than 1 intervention was 5.00 (95% confidence interval: 2.37 to 10.55) compared with the veins that had only 1 catheter intervention. This survival advantage was again noted to be associated with increasing number of interventions, with 1-year survival for veins undergoing ≥3 procedures of 100% compared with 75% for 2 procedures and 18% for 1 procedure (Figures 5A and 5B).

DES = drug-eluting stent(s).

When comparing vein loss by intervention type, 1-year vein survival in PVs treated with primary DES implantation was higher than PVs treated with BA or BMS (nonimmunomodulatory group) (59% vs. 26%, log-rank p = 0.031) (Figure 6).

REINTERVENTION. Fourteen patients (47%) underwent a total of 25 reinterventions, including additional DES placement (n = 5 [20%]), BMS placement (n = 2 [8%]), stent dilation or BA (n = 13 [52%]), and PV surgery (n = 5 [20%]) for recurrent PVS. Among the patients who had surgical reintervention, 3 patients initially had catheter reintervention ultimately followed by surgical PV repair, and 2 patients had surgical PV repair after first catheter-based intervention. Surgery included pericardial well procedure in all 5 patients with stent removal in all 3 patients with existing PV stents. In the 12 patients who underwent catheter reintervention, 19 veins were reintervened upon because of recurrent stenosis, and 5 of these patients had new vein involvement that required intervention. Median time to first reintervention was 3.1 months (2.2 to 7.0 months).

Within the DES cohort, 8 of 16 patients (50%) underwent catheter reintervention, and 3 of 16 patients (18%) had PV surgery, with a median time between interventions of 3.5 months (1.3 to 7.7 months) after DES placement. Within the BMS cohort, 3 of 5 patients (60%) underwent catheter reintervention, with a median of 2.4 months (2.4 to 17.5 months) between interventions. Within the BA cohort, 1 of 9 patient (11%) underwent catheter reintervention, and 2 of 9 patients (22%) underwent PV surgery, with a median time between interventions of 4.8 months (3.9 to 5.7 months). Rates of reintervention are summarized in Table 5. Reintervention rates within individual veins are summarized in Table 6.

When looking at rates of surveillance following the initial catheter intervention, 19 patients (63%) had at least 1 follow-up catheterization at a median of 2.9 months (2.1 to 3.3 months). At first follow-up catheterization, only 8 of 19 patients (42%) underwent a reintervention, and 2 of these 8 patients required intervention on newly affected veins. The remaining 11 patients (58%) did not undergo repeat intervention at first follow-up catheterization. The time to first catheterization was no different in patients who underwent reintervention (2.4 months [2.1 to 3.1 months]) compared with those who only had diagnostic catheterization (2.9 months [2.1 to 5.9 months]) (p = 0.351). There was no difference in mortality among the patients who had an intervention (n = 2 of 8 [25%]) at first follow-up catheterization compared with those who did not have an intervention (n = 2 of 11 [18%]) (p = 0.999); however, vein survival was greater in veins that underwent intervention at first follow-up catheterization (p = 0.04). Rates of reintervention are summarized in Table 5.

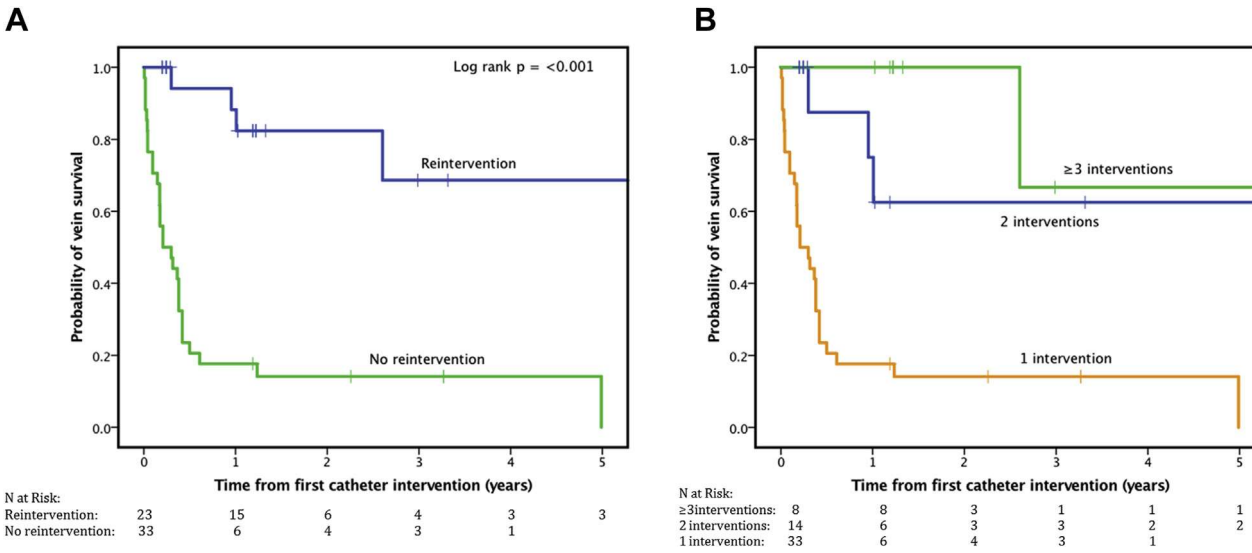
DISCUSSION

This retrospective study was undertaken to evaluate the outcomes of children who underwent catheter-based intervention for PVS. We had a relatively large cohort of pediatric patients at a single institution with both primary and post-surgical PVS. Although many different types of intervention have been attempted for PVS, all of our patients underwent BA, BMS placement, or DES placement.

Our patient population was diagnosed with PVS at a young age, which has been shown in previous studies to be an independent predictor of increased mortality compared with older age at diagnosis (8,18,25). Similar to prior studies, single-ventricle physiology was not associated with increased mortality in our patient population. Interestingly, our data indicated that the presence of bilateral PVS was not associated with mortality. This finding is different from previous publications, which indicate that diffuse, bilateral PVS is a risk factor for mortality (5,18,25).

Although transcatheter procedures for PVS have historically been thought of as primarily palliative (1,4), we have shown reasonable outcomes in our patients who underwent DES placement. Consistent with previous reports, BA alone was shown to be

FIGURE 5 Vein Survival: Reintervention



(A) Kaplan-Meier analysis comparing survival between veins that underwent catheter and/or surgical reintervention and veins that did not undergo reintervention demonstrates improved vein survival in veins that underwent reintervention. **(B)** Kaplan-Meier analysis comparing vein survival on the basis of the number of catheter and/or surgical interventions from the first catheter intervention. Vein survival appears to improve with increasing number of interventions.

acutely successful, but midterm success is limited (6,8,11,20). Our survival analysis shows early mortality with all types of transcatheter interventions and stable survival beyond 6 months from intervention. Once patients reach 1 year post-intervention, survival appears likewise to stabilize. We found that patients who return for surveillance catheterization and undergo reintervention, when indicated, have improved survival than those who do not. Because of this, rates of reintervention in our patient population for all intervention types are high in survivors, which is consistent with previous reports (6,9,10). The early mortality we have seen in all intervention types in combination with the survival advantage we found in patients who receive reintervention, would suggest that early routine surveillance catheterization should be undertaken so that restenosis can be detected and intervened on early. However, our study is not powered to determine the precise relationship between reintervention and survival. That is, reintervention may reasonably be considered an important element in the transcatheter approach to PVS to maintain or optimize PV patency. In contrast, one could argue that the survival bias colors the current analysis and that nonsurvivors never had an opportunity for reintervention. Our focused analysis excluding early post-intervention mortality was aimed at addressing this significant limitation and also showed improved survival in patients who underwent reintervention.

Although mortality rates decreased significantly by 1 year post-intervention, the rates of vein loss persisted beyond 1 year. That vein loss rates do not mirror survival is interesting and, perhaps, indicates

intrinsic compensation to PVS and atresia. The late and possibly gradual development of PV atresia may provide sufficient time for the patient to develop venovenous collateral vessels to compensate for the change in their physiology, as we noted in 5 of our survivors with documented atresia. This collateralization may in fact be protective; however, our study is insufficiently powered to address this question.

Balasubramanian et al. (10) showed that a stent diameter >7 mm was a predictor of patency following stent placement for PVS (10). Accordingly, adult studies have also shown a size-dependent success rate for larger stents (11,12). Although it is likely beneficial, with regard to rates of restenosis and the need for reintervention, to have a larger stent diameter, there are situations in which patients have small vessels that cannot accommodate a larger stent. That was, of course, the case in the majority of our patients. The majority of stents placed in our patient population were coronary stents, with only 1 stent >7 mm in diameter. We were interested in success rates in different types of stents and/or BA. Although we did not evaluate stent diameter as a marker of success, the median stent lumen and balloon diameter among the groups was similar, so the survival rate is primarily showing the difference between the interventions as opposed to size.

There is an inherent limitation to DES due to the small maximum luminal diameter in currently available DES, which have a maximal rated diameter of 4.0 mm. In our study, DES implantation appears to be superior to BMS implantation or BA when assessing the rate of vein loss. This suggests that the immunomodulatory effects of DES may be beneficial for PVS when comparing with BMS of similar diameter. This is consistent with previous reports in adult coronary studies and a porcine model with stented PVs, which demonstrated decreased in-stent stenosis in DES compared with BMS (16,19). Additionally, the pathological evaluation by Sadr et al. (13) showing myofibroblastic proliferation as the etiology of PVS suggests that antiproliferative therapy would provide benefit to patients with PVS. The local release of antiproliferative drugs with DES may attenuate the progression of disease, resulting in improvement in survival. Although the mechanism of PVS in adults is different from that in our pediatric population, De Potter et al. (26) also found DES to be an effective treatment in adults for PVS following radiofrequency ablation despite the limitation in the stent luminal

TABLE 6 Reintervention by Individual Vein

Abbreviations as in Table 1.

diameter. More studies will need to be undertaken to further evaluate the efficacy of DES for inhibiting the progression of PVS. This observation also suggests that it may be warranted to evaluate drug-eluting balloons as a therapy for PVS, as this may provide the benefit of delivering antiproliferative drugs to the site of injury without the inherent limitation of a small luminal diameter with DES.

STUDY LIMITATIONS. As this was a retrospective study, the patients were not randomized to each intervention type. There were no standardized criteria for intervention on the stenotic PVs, and we were unable to control for interoperator variability and decision making, including which veins to intervene on and which method to use; however, at our institution, surgical repair of PVS is usually considered first-line. All post-surgical patients included in our study were discussed with the surgical team regarding candidacy for surgical repair of PVS before undergoing catheter-based intervention. Additionally, we were unable to control for both practitioner- and patient-specific factors that resulted in variations in follow-up time. Our overall sample size was small, but for this rare disease entity, this is a relatively large cohort that has undergone catheter-based intervention for PVS.

CONCLUSIONS

Children with pulmonary vein stenosis are at risk for post-intervention mortality. Reintervention appears to confer a significant survival benefit to this at-risk population. We were unable to find a survival benefit associated with use of drug-eluting stents. Clearly this disease process would benefit from the conductance of a large, multicenter study.

ADDRESS FOR CORRESPONDENCE: Dr. Christopher J. Petit, 2835 Brandywine Road, Suite 300, Atlanta, Georgia 30341. E-mail: petitc@kidsheart.com.

PERSPECTIVES

WHAT IS KNOWN? PVS in pediatric patients is a progressive disease that is difficult to treat. Evaluation of catheter-based intervention has been limited and has shown suboptimal survival in pediatric patients.

WHAT IS NEW? Despite size limitations of DES, this intervention is a reasonable treatment option in pediatric patients with PVS. Frequent surveillance catheterization is important to identify the need for reintervention early when restenosis occurs, as this may help improve survival in these patients.

WHAT IS NEXT? Because of the limited studies available, larger multicenter trials would be beneficial in the further evaluation of catheter-based intervention on PVS in pediatric patients. Additionally, evaluation of newer modalities, including drug-eluting BA, should be further evaluated.

A Review of the Management of Pulmonary Atresia, Ventricular Septal Defect, and Major Aortopulmonary Collateral Arteries

Jerome Soquet, MD, David J. Barron, MD, and Yves d'Udekem, MD, PhD

Department of Cardiac Surgery, Royal Children's Hospital, Parkville, Victoria, Australia; Department of Cardiac Surgery, Birmingham Children's Hospital, Birmingham, United Kingdom; Department of Paediatrics, University of Melbourne, Victoria, Australia; and Murdoch Childrens Research Institute, Parkville, Victoria, Australia

Background. **The management of pulmonary atresia with ventricular septal defect (PA/VSD) and major aortopulmonary collateral arteries (MAPCAs) has significantly changed over the past 20 years. Unifocalization and rehabilitation have been described as diametrically opposed strategies. An updated review focused on the management of this complex and rare condition is needed.**

Methods. **Articles related to PA/VSD/MAPCAs issued until December 2017 were screened. Twelve main studies published in the modern era (since 2000) were selected and analyzed.**

Results. **Unifocalization and rehabilitation respectively focus on the mobilization of collateral arteries and the growth of native pulmonary vessels. A third strategy, called "combined strategy," was distinguished from the review of the literature. Surgical cohorts and methods of data reporting were found to be heterogenous. Outcomes, regardless of the strategy, have transformed the natural history of the condition, with a complete repair rate of approximately 80% and low rates of early and late mortality. Patients with the most unfavorable anatomy (absent central pulmonary arteries and hypoplastic MAPCAs) remain a challenge and are still left palliated.**

Conclusions. **Variable surgical strategies are used in the management of PA/VSD/MAPCAs. Most teams report a repair rate of 70% to 80% and a mortality rate lower than 10%. Standardization in data reporting is necessary to better compare the existing strategies.**

(Ann Thorac Surg 2019;108:601–12)

Pulmonary atresia with ventricular septal defect (PA/VSD) is the extreme form of the spectrum of tetralogy of Fallot (TOF) [1], with an incidence of 0.07 per 1,000 live births that accounts for approximately 2.5% of all congenital heart diseases. The majority of cases have a normally developed pulmonary blood supply, but 20% to 40% of cases will have multifocal blood supply to the lungs—through major aortopulmonary collateral arteries (MAPCAs). This combination of PA/VSD/MAPCAs is sometimes referred to as "complex pulmonary atresia" and has been difficult to classify owing to the wide variation in pulmonary blood supply in this rare condition. The condition is part of the family of conotruncal anomalies (which includes TOF, truncus arteriosus, and transposition), and as many as half the cases are associated with CATCH 22 syndrome (cardiac defects, abnormal facial features, thymic hypoplasia, cleft palate, hypocalcemia, and 22q11 microdeletion) [2].

The recent classification of the Congenital Heart Surgery Nomenclature and Database Project [1] (similar to the one of Barbero-Marcial and Jatene [3] in 1990) distinguishes three types of PA/VSD according to the pulmonary circulation: type A with present native pulmonary arteries (NPAs) and no MAPCAs; type B with present NPAs and MAPCAs; and type C with MAPCAs only. Although that goes some way to recognize the heterogeneity of pulmonary blood flow in this condition, there is a need for a more detailed and specific classification system that can be correlated to the management strategies available.

MAPCAs are most commonly associated with PA/VSD but can also be found in other congenital heart diseases [4]. The first mention is attributed to Macartney and colleagues [5] in 1973. An angiographic study published by the Melbourne team found similarities with bronchial arteries, but the nature and origin of MAPCAs is still debated [6, 7]. Most MAPCAs have a thoracic origin (descending aorta and subclavian arteries), but these collaterals can also more rarely arise from cervical vessels [8], the abdominal aorta, and even from the coronary arteries [9]. The number, size, distribution, and course of

Abbreviations and Acronyms

MAPCA = major aortopulmonary collateral artery
NPA = native pulmonary artery
PA = pulmonary artery
PA/VSD = pulmonary atresia with ventricular septal defect
pLV = left ventricle pressure
pPA = pulmonary artery pressure
pRV = right ventricle pressure
RV = right ventricle
TOF = tetralogy of Fallot

the MAPCAs—as well as their relationship with any NPA system—is at the core of the heterogeneity of the condition. This article seeks to clarify and classify this spectrum.

The successful repair of "simple" PA/VSD was first reported by Lillehei and colleagues [10] in 1955, but the concept of the surgical MAPCAs management did not develop until 3 decades later. Even by 1995, only 25 % of PA/VSD/MAPCAs patients survived to adulthood [11]. However, thanks to the pioneering hemodynamic and histopathologic studies of Macartney, Thiene, Haworth, and their colleagues [12–20] in the 1970s and 1980s, surgical strategies and management have radically changed such that the majority of patients now survive into adulthood with good functional class.

Different philosophies currently exist regarding the best management of this complex and heterogenous group of patients; these will be defined and discussed in this article.

After more than 30 years of surgical experience, an updated review is needed on this difficult and nonconsensual topic. Part of the difficulty comes from the small size of most cohorts and from a confusing terminology. The main objective of this article is to focus on the current surgical management strategies of PA/VSD/MAPCAs (ie, PA/VSD types B and C) and their outcomes. Of note, heart-lung transplantation has been suggested [21, 22] as an option, but this technique will not be discussed in this review as it has been marginally reported and it is not recommended in a routine practice.

REVIEW

Material and Methods

A literature search was performed in December 2017 in PubMed and the Cochrane Library for "pulmonary atresia ventricular septal defect," "aortopulmonary collateral," "pulmonary atresia aortopulmonary collateral," and "tetralogy Fallot aortopulmonary collateral." Only publications in English related to PA/VSD/MAPCAs were analyzed.

Table 1 lists the main studies on the surgical management of patients with PA/VSD/MAPCAs published in the recent era, namely, since year 2000, and constitutes the core of this review. The year 2000 also refers to the year of publication of a landmark article by the Stanford group [23]. This report was an update from another work published 5 years earlier [24] with a cohort of 10 patients that advocated for a midline one-stage repair and unifocalization of PA/VSD/MAPCAs for the first time.

Publications were included in Table 1 according to the following criteria: most recent study by a same institution for a same strategy; consecutive (nonselected) patients with PA/VSD/MAPCAs; overall number of patients in a cohort 30 or more; cohort treated at a single institution; and management toward a biventricular repair.

An exception was made for the article of Bauser-Heaton and colleagues [25]: the study included patients with TOF/pulmonary stenosis and 36% of their patients had previous surgical procedures performed in other institutions. However, the percentage of TOF/pulmonary stenosis was minimal (7.4%), and the management of patients after referral from other institutions was standardized. This exception was also justified by the remarkable size of the cohort (n = 458). Of note, the studied population did not overlap the one from the study of 2000 [23] by the same group (1992 to 1998 versus 2001 to 2016).

Data were extracted when available or calculable (palliation rates).

Results

The largest experiences published for this condition come from Stanford, Birmingham (UK), Melbourne, and Toronto. It has been usual to classify the surgical treatment of PA/VSD/MAPCAs in two dominant and overlapping strategies—unifocalization and rehabilitation—according to the individual pattern and management of MAPCAs. The two concepts are not mutually exclusive, and most researchers recognize a "combined strategy," as introduced by the Melbourne group (Iyer and Mee [26]), that combines the unifocalization and rehabilitation pathways (Fig 1). Most teams have a preferred strategy, although a few groups adopted a mixed management of their patients [27–30].

The Stanford and Birmingham approach has been to incorporate all significant MAPCAs into a policy of early and complete unifocalization—although always utilizing as much of the NPA system as possible. The Melbourne approach has been influenced by the review of the entire historic cohort (n = 82) [31] that found disappointing evolution of unifocalized MAPCAs after a median follow-up of 14.2 years (the longest reported). The consequence was a radical change of the local strategy toward the rehabilitation pathway, focusing on the NPA and avoiding the incorporation of MAPCAs where possible.

The main outcomes are reported in Table 1, which includes 12 studies and their related publications when present. The PA/VSD/MAPCAs were considered repaired when the VSD was closed. One of the key findings from these large series has been the recognition of the heterogeneity in pulmonary blood supply: most patients have a mixed blood supply from a NPA (intrapericardial) system—which is very variable in size and extent—and from a variable number of MAPCAs. The degree to which these two systems overlap is also very

variable, with some areas of the lung having a "dual supply" (ie, fed by both MAPCAs and NPAs) whereas others are supplied exclusively by MAPCAs or exclusively by NPAs. There is a group of 15% to 20% of patients who have complete absence of any NPA [23, 32].

Unifocalization

Unifocalization aims at promoting the growth of MAPCAs without rehabilitating the NPAs. The concept was introduced in 1981 by Haworth and colleagues [18], who suggested to make the "multifocal blood supply unifocal." Unifocalization of MAPCAs was successfully performed only later in the 1980s. The technique consists in anastomosing ipsilateral MAPCAs to each other directly, through patches or through a conduit, and incorporating the ipsilateral native or central pulmonary artery if present (Fig 2A). In a staged procedure, MAPCAs can be unifocalized to a systemic to pulmonary artery shunt (SPS). The procedure can be performed through (postero) lateral thoracotomy or a midline sternotomy. Specific respiratory complications of unifocalization, including airway ischemia [33] and pulmonary reperfusion injury [34], have been reported.

ONE-STAGE UNIFOCALIZATION. The Stanford group (Hanley and colleagues) pioneered the midline unifocalization with repair in a single stage. The first patients underwent this pathway in 1992 [24], after successful case reports by other researchers [35, 36]. In their last publication with 458 patients (the largest cohort to our knowledge), Bauser-Heaton and colleagues [25] reported a repair rate of 88% at a median age of 8.6 months when this strategy was preferentially used for patients. This study showed the highest repair rate and the lowest age at repair of all other experiences combined. Early and late mortality rates were 3.5% and 8.9% respectively. Median right ventricle to left ventricle pressure ratio (pRV/pLV) was 0.40, the lowest reported, expressed as pulmonary artery to aorta pressure ratio (pPA/pAo). However, the median time of measurement of this ratio after repair was uncertain. Estimated survival was 85% at 5 years.

The Birmingham (UK) team [37] have also promoted the one-stage repair with unifocalization as their preferred strategy, using the midline sternotomy approach where possible—but also advocating combined thoracotomy with sternotomy where necessary to access the MAPCAs. Other groups use unifocalization alongside with another strategy: rehabilitation strategy [27] or combined strategy [28, 29].

STAGED UNIFOCALIZATION. The staged unifocalization advocates separate procedures to achieve ipsilateral unifocalization or to recruit vessels in stages to eventually achieve complete unifocalization. That may be helpful when specific vessels are difficult to access through a single approach or if the quality of vessels is poor and a degree of rehabilitation and growth is also required to achieve repair, as will be discussed. An example of this approach is described by Ishibashi and colleagues [38] obtaining an 80% repair rate at a mean age of 8.1 years. Early and late mortality rates were 7% and 15.9%, respectively. This strategy of always using a staged approach is now less popular and no longer followed by many teams [39, 40].

Rehabilitation

Rehabilitation was historically the first strategy applied in PA/VSD/MAPCAs (ie, from the mid 1970s) as an overarching first operation [41–43]. The goal is to promote the growth of hypoplastic NPAs by surgically (or interventionally) generating antegrade blood flow, without intervention on MAPCAs, before reassessing for definitive repair. Rome and colleagues [44] demonstrated in 1993 the feasibility and safety of a rehabilitation strategy only in PA/VSD with hypoplastic pulmonary arteries (excluding patients with absent pulmonary arteries). The concept recognizes the key fact that the NPAs are often hypoplastic in this condition, yet have potentially excellent distribution into the lung parenchyma. Generating good antegrade flow into these native vessels can be uniquely effective in developing growth of the vessels and opening up their distribution.

The recent experience at the Royal Children's Hospital Melbourne [45] showed a repair rate of 82% when the cohort mostly (89%) followed this strategy. There was no early death and 3 (10%) late deaths among 33 patients. After a median follow-up of 4.5 years, the VSD was closed in 73% of patients at a median age of 1.7 years (after a mean of 2 procedures) when patients exclusively underwent the rehabilitation pathway. The median pRV/pLV ratio was 0.64 at a median of 22 months after repair. The concept of rehabilitation has equally been applied to individual MAPCAs where the distribution of the vessel is good but has been deprived of flow (owing to origin stenosis or tortuosity of the vessel, which is often a progressive process). Mobilization of such vessels with or without patch enlargement and then connection to the aorta with a systemic shunt can also be effective in promoting growth. This procedure can be combined with ipsilateral unifocalization, so that the concepts of rehabilitation and unifocalization overlap.

The rehabilitation strategy can be divided into subgroups, according to the first palliation procedure: systemic to pulmonary artery shunt, insertion of the main pulmonary artery in the aorta, or right ventricle to pulmonary artery (RV-PA) connection.

SYSTEMIC TO PULMONARY ARTERY SHUNT. Central shunt (Fig 2B) using a Gore-Tex vascular graft (W. L. Gore & Assoc, Flagstaff, AZ) is the preferred choice in Melbourne, as described by Gates and colleagues [46]. The insertion of a modified Blalock-Taussig shunt represents another option.

INSERTION OF MAIN PA IN AORTA. Iyer and Mee [26] and others [28, 29, 31, 47, 48] originally described an end-to-side anastomosis of the main pulmonary artery to the ascending aorta, the so-called Melbourne shunt (Fig 2C). This type of shunt and strategy was used in reports of selected patients with present native and diminutive central pulmonary arteries, in other words, PA/VSD type

REVIEW

B [49, 50]. The technique has been particularly successful in smaller infants in rehabilitating the NPA system—diminutive-sized central vessels may be more suited to a direct anastomosis as a prosthetic graft can distort or angulate them if they are only 2 mm to 3 mm in size. There is little risk of overcirculation as the vessels are so small that they provide a natural limit on the flow.

RV-PA CONNECTION. The main advantage of this technique is that it sustains diastolic pressure and also delivers predominantly desaturated blood to the lungs (although the VSD is left open, the streaming effect is such that predominantly systemic venous blood will be directed through the conduit) and so achieves more efficient oxygenation than with a systemic shunt. The technique also gives antegrade access to the pulmonary artery tree to perform subsequent interventions such as balloon pulmonary angioplasty. This technique has been promoted by the Birmingham approach [51], and several teams favor this technique as the initial procedure for a rehabilitation strategy [30, 52, 53]. The RV-PA connection can be established in various ways: a transvalvar autologous pericardial patch, a Gore-Tex vascular graft [45, 54], or a homograft or other valved conduits [53]. A valved conduit will reduce the volume load on the ventricle and the use of stiff conduits of fixed size such as the Hancock Dacron conduit (Medtronic, Minneapolis, MN) will maintain predicted flow while preventing the risk of dilation under pressure.

Combined Strategy

Iyer and Mee [26] in Melbourne described a staged approach in 1991, consisting of the promotion

REVIEW

(rehabilitation) of the NPAs, followed by the unifocalization of NPAs and MAPCAs before repair. Gupta and colleagues [48] reported the largest experience with this strategy (104 consecutive patients) in 2003. As discussed previously, many of the reported series that focus on both unifocalization and on rehabilitation will overlap in this combined approach—often needing two or more procedures before repair can be attempted or achieved.

Overlap Between Strategies

There is likely an overlap between the strategies described that may be obvious only to the experienced reader. It is more than likely that patients with small but not extremely diminutive central pulmonary arteries that are connected to most lung segments would have a preparatory procedure to make them grow in all teams. A team operating under a flagship of unifocalization strategy would still categorize this patient as a success of a unifocalization strategy even though the unifocalization involved both MAPCAs and rehabilitated NPAs at the time of repair. Conversely, a patient who underwent a central shunt soon after birth in a team with a flagship of rehabilitation procedure would be classified as a success of this strategy even though an isolated lobar branch perfused by a single MAPCA was connected to the native pulmonary vessels at the time of repair. This patient would be considered a success of unifocalization by the first team.

Concept of Leaving VSD Open

In cases where the quality or distribution of the pulmonary vasculature is poor, then it may not be possible to

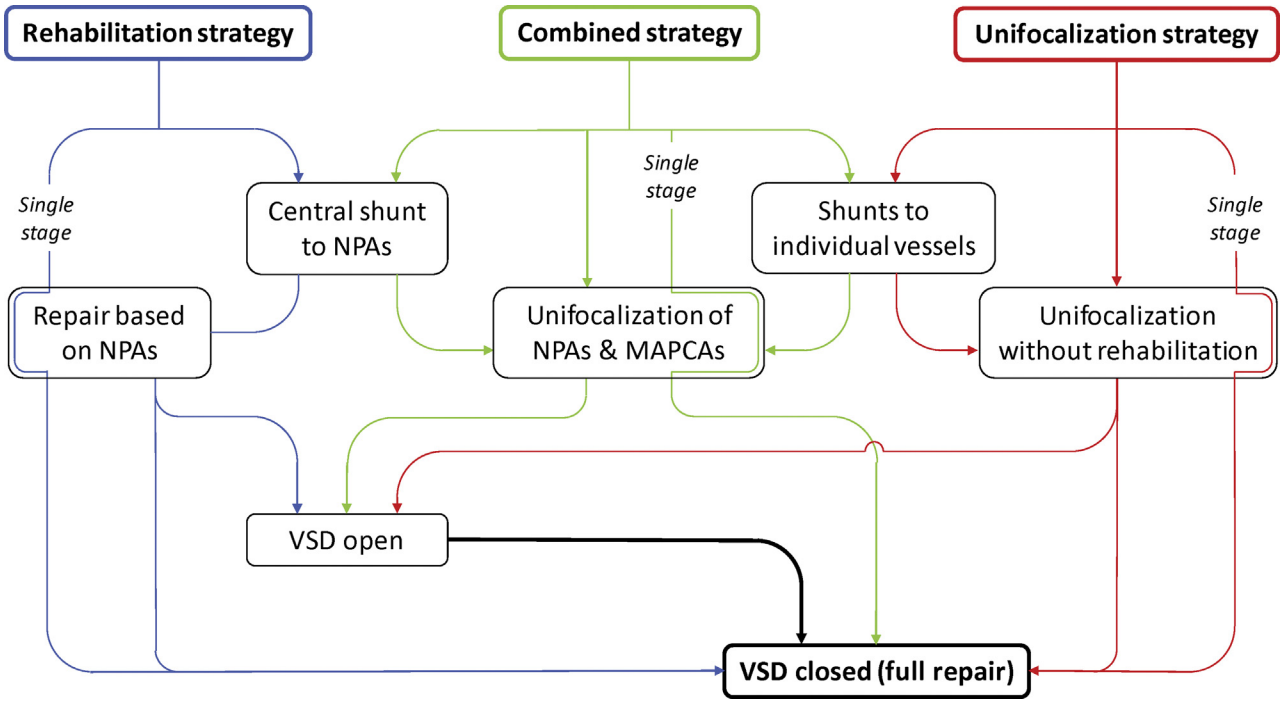

Fig 1. Overview of management strategies for pulmonary atresia with ventricular septal defect (VSD) and major aortopulmonary collateral arteries (MAPCAs). Note: one arrow represents one stage; single-stage repair pathways are represented by a single arrow going through a procedure box before reaching the "VSD closed (full repair)" box. (NPA = native pulmonary artery.)

perform a complete repair (ie, close the VSD and septate the circulation) for risk of suprasystemic RV pressure and RV failure. These decisions are based on the amount of vasculature recruited (minimum 15 of 20 lung segments) or on the intraoperative flow studies. In these situations, there are two options: either the unifocalized vessels are fed by a central shunt, or they can be connected to the heart using an RV-PA conduit that is deliberately restrictive in size. The latter aims to create a situation analogous to a "balanced tetralogy of Fallot" where the restrictive conduit prevents any risk of overcirculation. That has the advantage of sending desaturated blood to the lungs and providing good access for subsequent catheterization—but at the expense of a ventriculotomy. Both approaches have been used successfully, and there is no evidence to suggest one approach is better than the other.

Associated Procedures of PA Enlargement and Interventional Catheterization

All strategies share the necessity of reintervention on pulmonary arteries or MAPCAs by surgery or interventional catheterization procedures. Often hypoplastic before any intervention, pulmonary arteries can show stenosis or hypoplasia in their evolution and may require surgical enlargement with patches or percutaneous dilation and stenting [45]. MAPCAs are also known to stenose or thrombose [15, 16, 31, 36, 39] after unifocalization and can be treated with percutaneous dilation or repeated surgery. In addition, some larger MAPCAs connected to the native pulmonary arteries and causing overcirculation by a dual supply may need to be surgically ligated or coil embolized once antegrade flow has been established [37].

Summary

PATIENTS' CHARACTERISTICS. Studies published since 2000 on PA/VSD/MAPCAs in consecutive series of patients (Table 1) showed a wide range of ages at the time of first surgery (from 3.3 weeks to 6.3 years), depending on the period of treatment and referrals. Of note, the rate of 22q11 microdeletion was reported in approximately half of all cases. The prevalence in recent surgical series was usually 35% to 40%. It has been demonstrated that the anatomy of the pulmonary and systemic-pulmonary vasculature is influenced by 22q11 microdeletion [55, 56] in PA/VSD, generally carrying a negative prognostic value on outcomes [57, 58]. The proportion of patients with absent central pulmonary arteries (PA/VSD type C) varied mostly between 15% and 20%, and rarely exceeded 30% when reported.

STRATEGIES. Unifocalization is currently the most common strategy but the superiority of one strategy over another would be hard to assess at the time of this review. Several teams with extensive published experience have advocated for the one-stage repair [25, 37, 59]. Although earlier referral and earlier unifocalization are associated with the best outcomes, there remains a group of patients at the worst end of the spectrum (10% to 15% of the entire PA/VSD/MAPCAs population) who present with profound cyanosis and poorly developed pulmonary vasculature.

REVIEW

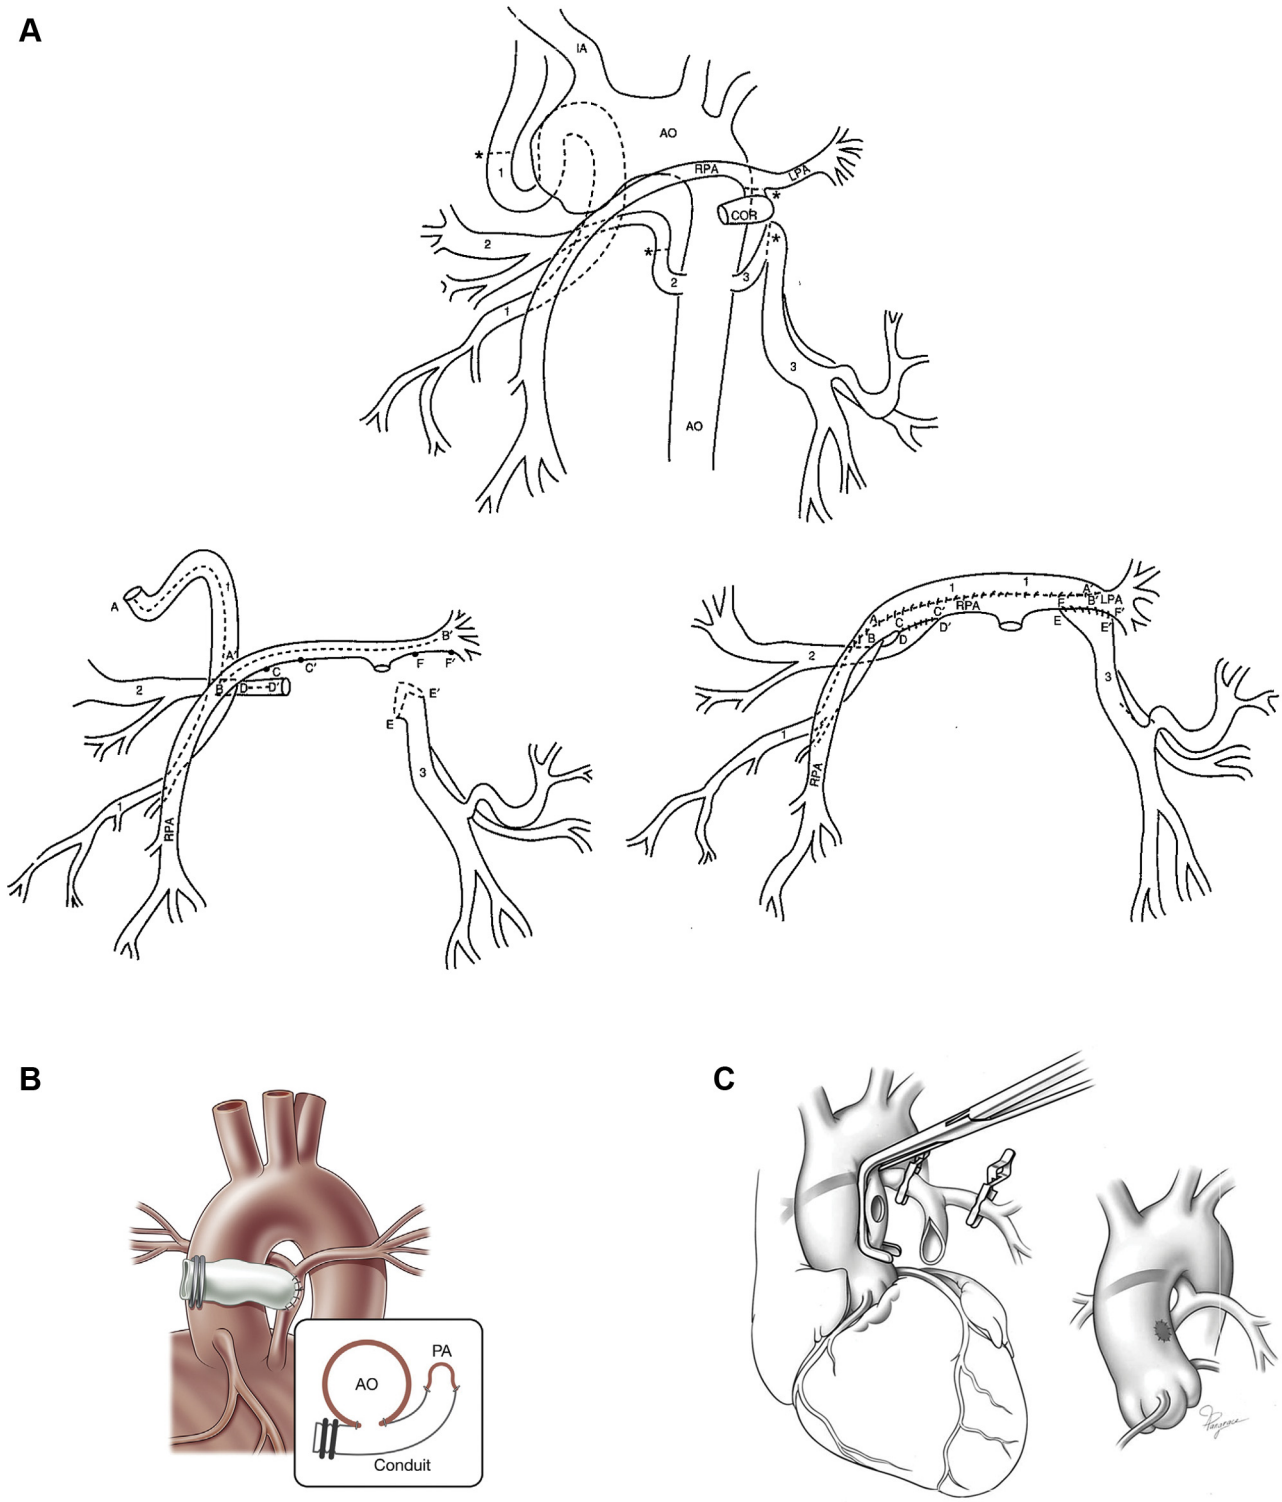

Fig 2. Examples of unifocalization and rehabilitation procedures. (A) Unifocalization of bilateral major aortopulmonary collateral arteries (MAPCAs) directly to the native pulmonary arteries. (Ao = aorta; COR = coronary collateral; IA = innominate artery; LPA = left pulmonary artery; RPA = right pulmonary artery.) (Reproduced from Reddy and colleagues [24] with permission from The American Association for Thoracic Surgery.) (B) Central shunt with a Gore-Tex vascular graft. (Ao = aorta; PA = pulmonary artery.) (Reproduced from Mumtaz and colleagues [49] with permission from The Society of Thoracic Surgeons.)

Single-stage unifocalization can rarely be achieved in these patients, and palliative shunts, ipsilateral unifocalizations, or Melbourne shunt are often all that can be offered initially for this group.

The Stanford group performed repair in 88% of patients at 8.6 months, with a very low early mortality rate (3.5%) [25]. The Birmingham approach reported 2.8% early mortality among 249 patients undergoing unifocalization and repair [51], with a further 22 patients (8.5%) remaining palliated with shunts. The Melbourne study achieved repair in 82% of patients with no operative mortality at an age of 1.7 years, which is early considering that this strategy is staged [45]. With a combined staged strategy involving 60 patients, Babliak and colleagues [29] had a repair rate of 60% with no early mortality.

There is no doubt that NPAs provide the best platform on which to base ultimate repair and that patients who have recruitable (or rehabilitatable) NPAs will have the best long-term results. Nevertheless, there are cases where there is complete absence of NPAs—yet unifocalization and repair has been achieved using MAPCAs exclusively. Furthermore, many cases will have a mixed pulmonary blood supply coming from both NPAs and from MAPCAs, and the results from Stanford and Birmingham would suggest that unifocalization of both components yields excellent results.

Different indexes have been suggested to estimate the size and cross-sectional area of the pulmonary or neopulmonary arborization [60–62]. Although those indexes have been repeatedly reported [28–30,38,39], the recent publications listed in Table 1 interestingly reveal that they have been very rarely involved in the decision-making process [29, 30]. Most groups decided on the progression of their patients according to a suggestive estimation of the size of the pulmonary tree measured by the percentage of segments of the lung perfused (images of angiography or computed tomography) [37, 45] or according to an intraoperative flow study [23, 25, 28, 59].

OUTCOMES. Depending on institutions and strategies, the repair rate varies between 42% and 95%. The age at repair was missing in several of the reported studies. Early mortality for patients with PA/VSD/MAPCAs was acceptable, with a rate of less than 11.5% all institutions, strategies, and procedures combined, and inhospital mortality of less than 5% in the larger series. After repair, pRV/pLV was not always measured, and apart from intraoperative measurements, the time between repair and measurement of the ratio was specified in only two studies (by the Melbourne group). The overall survival rates were mostly between 78% and 85% at a range varying from 3 years to 20 years after the first surgery.

In all series, there is a small number of patients who still cannot be repaired owing to the poor development of NPAs or unifocalized MAPCAs, regardless of the strategy. This category of patients is unlikely to undergo a septation and is left palliated, cyanotic but alive. As seen in Table 1, these data were rarely mentioned. When not available but clearly stated, the proportion of palliated patients was calculated according to the method described in Figure 3 [25, 29] and varied from 1.6% to 10%. The category of patients "awaiting repair" is not included in the calculation process because of the uncertain fate (repair, death, or palliation), even when repair is likely.

Comment

This review offers an updated comparison of the main studies on PA/VSD/MAPCAs published since 2000. Of note, all publications were retrospective. We have demonstrated that the surgical management of PA/VSD/MAPCAs has evolved into three main strategies: unifocalization, rehabilitation, and a combined strategy. This review also shows a great heterogeneity in patients treated and deficiencies in data reporting.

Unifocalization, Rehabilitation, and Combined Strategy

The strategy described by Iyer and Mee was named "staged repair" by the original researchers and others [47, 48], and was classified as being a part of the unifocalization group. After having described the unifocalization and rehabilitation strategies earlier in this review, it seems obvious that the term "staged repair" can be confusing for any reader because it can also refer to a subgroup of the unifocalization strategy [38, 63] as well as to rehabilitation because of the inevitable staged nature of the latter.

Common Themes

The Stanford team highlighted that some neonates require early repair when presenting in heart failure [64]. Heart failure, especially early in life, implies well-developed pulmonary vasculature and suitability for early biventricular repair. In many instances, these patients have a limited number of collateral arteries, and single-stage repair with unifocalization is feasible with excellent results. All teams seem to have accepted this strategy.

Also, when small central pulmonary arteries are present and seem to be distributed to most of both lungs, most teams will grow these pulmonary arteries by either a central shunt, a Melbourne shunt, or restoration of the RV-PA continuity. Although it is not clear from publications by teams who have adopted unifocalization strategies, because the details of the operative procedures are often unreported, this practice is currently common.

A technical aspect that has become clear is that the unifocalized vessels should be dissected from the aorta and mobilized as distally as possible because the collateral segment of these vessels can considerably remodel and become stenotic. This dissection is by far more easily done in a virgin field, and all efforts should be made for that dissection to be performed only once. MAPCAs are frequently located very posteriorly in the mediastinum, and division of their origin with extensive mobilization can help bring the vessels further forward and avoid

REVIEW

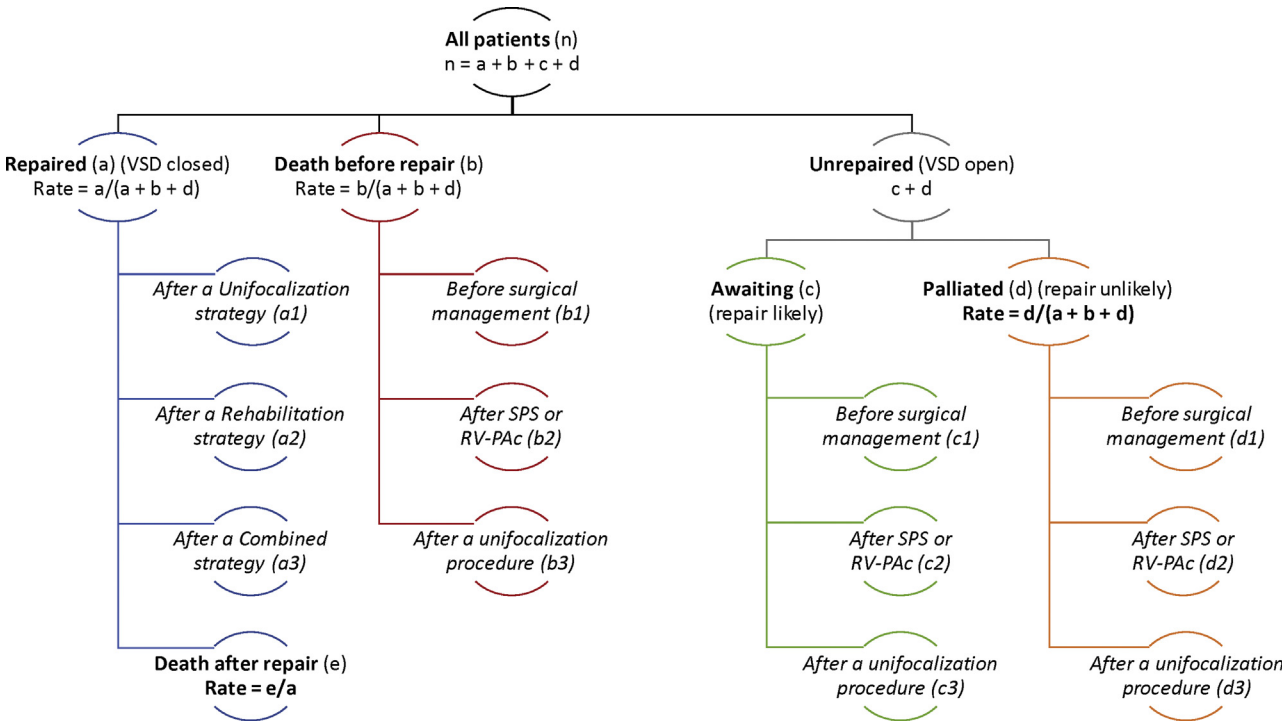

Fig 3. Recommended presentation of outcomes regardless of strategy. (RV-PAc = right ventricle to pulmonary artery connection; SPS = systemic to pulmonary shunt; VSD = ventricular septal defect.)

compression on the neighboring airways. Also, identification of the vessels within the fissures of the lung can provide better access, requiring confident and extensive mobilization of the lungs that is not a feature of most cardiac surgeries and which demands considerable experience and confidence with the anatomy. Detailed three-dimensional imaging with computed tomography and magnetic resonance imaging is essential to define the relationship of the vessels with the main airways and esophagus.

INVESTIGATIONS. An extensive imaging study is necessary at presentation of all patients. Injections of each MAPCA in angiographic studies are essential to define pulmonary blood supply and to establish areas supplied solely by MAPCAs and those with dual supply. Pulmonary vein wedge injections may reveal "orphaned" vessels that had lost their initial blood supply but fill retrogradely and can be recruited. As an alternative, computed tomography scan or magnetic resonance imaging can be performed before surgery and have the advantage over angiographic studies to be able to define the relationship of the vessels to the airways and esophagus.

PALLIATION. Whether some patients are better left palliated at least in the first years of life remains an open question. Patients at the most extreme end of this spectrum of the disease may be those at higher risk of early mortality, such as infants with absent or diminutive central pulmonary arteries and multiple collaterals with no connection to any intrapulmonary vessel and distal near-normal arborization. These patients may survive many years with a good quality of life. Some investigators report that late unifocalization of some of these patients after several years of palliation can be quite successful, alleviating the challenges of performing this surgery in smaller infants [31].

WHEN UNIFOCALIZING, SHOULD WE UNIFOCALIZE EVERYTHING?. Most teams will proceed with unifocalization in a varying proportion of patients. Even those prone to follow a strategy of rehabilitation will unifocalize neonates in heart failure and patients failing the rehabilitation strategy. When faced with diminutive collateral vessels, the question arises as to whether they are best left alone or unifocalized. An area of debate remains as to whether a staged approach to such vessels may be better or whether there is a critical size or area of distribution at which recruitment has no long-term benefit.

Long-Term Outcomes

Aiming to achieve septation wherever possible is a laudable approach but risks leaving some patients with a hypertensive RV and at risk of developing RV dysfunction and failure. Patients with pulmonary vasculature at the poorer end of the spectrum may be better managed by leaving the VSD open and utilizing shunts or limiting RV-PA conduits as long-term palliation. This approach may give very good long-term quality of life in selected patients. Finding the

REVIEW

threshold at which each strategy meets the best long-term outcome for these patients is a further question to be answered through better classification of the spectrum of disease.

Moreover, as survival has nowadays become acceptable, we would be able to compare the various strategies, not only in terms of combined morbidity including number of surgeries and repeated operations or interventional catheterization procedures, but also in terms of functional capacity and quality of life.

Recommendations for Authors

An important observation extracted from this review is the variability in the reporting of data. Without greater standardization of reporting results, it will be difficult to ascertain the superiority of techniques and approaches [65]. Given our analyses, we recommend that all the following data, listed in Table 1, should be reported: prevalence of 22q11 microdeletion, proportion of patients with absent central pulmonary arteries (PA/VSD type C), pre-repair procedures and timing, age at repair, post-repair pRV/pLV ratio and pPA/pLV ratio and their time of measurement, and proportion of patients left palliated indefinitely, calculated according to the described method (Fig 3).

Attention should also be paid to the anatomic characterization of central pulmonary arteries (presence, confluence, size) and MAPCAs (presence and number, size, origin, course and supplied pulmonary segments, connection with the native pulmonary arteries—dual supply).

Most reports today are alluding to the general philosophy of repair followed by each center, but insufficient data are provided to identify the best strategy and procedures in the various subset of patients composing this complex condition.

We propose that every patient be given an individualized code that represents their exact anatomy and a second code that describes the procedures (see Table 2 for definition of MAPCAs and proposed standard format for recording current patient status): (1) MAPCA coding: for each lung, the number of MAPCAs with notation as to whether they are sole supply or dual supply; size is indicated by number of segments supplied. (2) Native PA coding: complete absence as a separate code; if present, then size and distribution to each lung (size: diminutive, small, moderate). (3) Procedure: one-stage complete repair. (4) One-stage unifocalization (to shunt or to RV-PA conduit). (5) Ipsilateral unifocalization or shunt procedure to MAPCA/PA only.

Staged approaches would then list the subsequent procedures with a similar code: second shunt, complete repair, unifocalization only, and so forth. Therefore, a patient could be described as having three MAPCAs: one with dual supply to left lung; one with sole supply to left lung (three segments); and one with dual supply to right lung. The NPAs were present but small to the left and moderate to the right. This patient might have undergone procedure 1, unifocalization with RV-PA conduit (VSD left open) of native PAs plus recruitment of one MAPCA and ligation of two MAPCAs; or procedure 2, complete repair.

Conclusion

The surgical management of PA/VSD/MAPCAs has evolved into three primary surgical strategies. Outcomes are excellent with both the rehabilitation strategy and the unifocalization strategy (more than 80% achieving full septation). There remains some debate over the value of always recruiting all MAPCAs, but the best results are achieved when MAPCAS are recruited in the absence of dual supply or poorly developed native pulmonary arteries. Investigators should be encouraged to

REVIEW

Table 2. Proposed Definition of MAPCAs and Standard Format for Recording Current Patient Status

MAPCA Definition	Example
Each vessel coded by	MAPCA #1, right subclavian artery, RUL, three segments, sole supply
Origin ± bifurcation[a]	MAPCA #2
Position	#2a, descending aorta, RML, two segments, dual supply (with RPA)
Number of segments supplied	#2b, descending aorta, LUL, two segments, sole supply
Sole supply or part of dually supplied segment	MAPCA #3, and so forth
Standard format for recording current patient status	
Shunt procedures to individual vessels	
Can be subclassified into those with subsequent unifocalization anticipated and those seen as final destination	
Shunt or RV-PA connection to native PAs	
Can be subclassified as those with subsequent unifocalization anticipated and those seen as final destination	
Unifocalized but ventricular septal defect left open	
Can be further subclassified by whether subsequent full repair is anticipated	
Can also be subclassified by whether unifocalization was achieved in single stage or after previous shunt	
Unifocalized and ventricular septal defect closed (ie, full repair)	

[a] One major aortopulmonary collateral artery (MAPCA) that bifurcates would be coded #Xa and #Xb.

LUL = left upper lobe; PA = pulmonary artery; RML = right middle lobe; RPA = right pulmonary artery; RUL = right upper lobe; RV = right ventricle.

standardize the reporting of their data to better elucidate optimal strategies and procedures.

REVIEW

September 8, 2021

Scott Manaker, MD
AMA/RVS Update PE Subcommittee
American Medical Association
330 N. Wabash Avenue
Chicago, IL 60611

Re: Tab 8 Pulmonary Angiography

Dear Dr. Manaker:

Tab 8 on the October 2021 RUC agenda addresses four new codes and six existing codes, which describe various pulmonary angiography services. All ten of these ZZZ services will be provided exclusively in the facility setting. As such, the Society for Cardiovascular Angiography and Interventions and the American College of Cardiology recommend no direct practice expense inputs for Tab 8.

Thank you for your consideration of this information as you prepare for the upcoming meeting. Please contact James Vavricek at jvavricek@acc.org if you have any questions.

Sincerely,

Edward Toggart, MD
SCAI RUC Advisor

Richard Wright, MD
ACC RUC Advisor

AMA/Specialty Society RVS Update Committee Summary of Recommendations

October 2021

Quantitative Pupillometry Services – Tab 9

The CPT Editorial Panel approved a new Category I CPT code to replace the sunset Category III CPT code 0341T *Quantitative pupillometry with interpretation and report, unilateral or bilateral* and 92499 *Unlisted ophthalmological service or procedure* for reporting this service. Code 0341T was sunset within the *CPT 2020* code set and instruction was included in a parenthetical cross-reference directing use of unlisted code 92499 when quantitative pupillometry was provided. CPT code 95919 was surveyed for the October 2021 RUC meeting.

Code 95919 identifies unilateral or bilateral quantitative pupillometry. This service provides non-invasive measurements of autonomic nervous system function that inform objective quantification of pupillary response to light. The holistic interpretation of this collected information can be effectively applied to many disorders in adults, children, and infants; a physician can ascertain details of sympathetic and parasympathetic function based on the interpretation and documentation of this service. The specialty societies noted that while the data is collected by a technician, the data is analyzed and assessed by a physician or another qualified health care (QHC) professional.

95919 *Quantitative pupillometry with physician or qualified health care professional interpretation and report, unilateral or bilateral*
The RUC reviewed the survey results from 36 physicians and recommends the survey 25th percentile work RVU of 0.25 for CPT code 95919. The RUC recommends 1 minute of pre-service evaluation time, 5 minutes of intra-service time and 1 minute of immediate post-service time. The specialties noted that the 5 minutes of intra-service time includes time to conduct an extensive review and intrepretation of the collected data; the physician will review individual wave forms, compare each data point to published normative measures by age, check for asymmetric or unique patterns, check for consistency across sympathetic tones, and complete a report that draws in other correlations and intervention recommendations. Therefore, the RUC determined that 5 minutes of intra-service time is appropriate for this comprehensive review and reporting.

The RUC compared the surveyed code to the top key reference service (KRS) 92081 *Visual field examination, unilateral or bilateral, with interpretation and report; limited examination (eg, tangent screen, Autoplot, arc perimeter, or single stimulus level automated test, such as Octopus 3 or 7 equivalent)* (work RVU = 0.30 and 10 minutes total time) and determined that the surveyed code RVU is valued appropriately lower, specifically in terms of the amount of time allocated for intra-service review. The RUC compared the surveyed code to the second top KRS 92083 *Visual field examination, unilateral or bilateral, with interpretation and report; extended examination (eg, Goldmann visual fields with at least 3 isopters plotted and static determination within the central 30 deg, or quantitative, automated threshold perimetry, Octopus program G-1, 32 or 42, Humphrey visual field analyzer full threshold programs 30-2, 24-2, or 30/60-2)* (work RVU = 0.50 and 13 minutes total time) determined that the surveyed code requires less physician work and total time than CPT code 92083, and thus is valued appropriately lower at approximately half the work RVU value.

CPT code 92202 *Ophthalmoscopy, extended; with drawing of optic nerve or macula (eg, for glaucoma, macular pathology, tumor) withinterpretation and report, unilateral or bilateral* (work RVU= 0.26, 5 minutes of intra-service time and 7 minutes total time) was identified as

an optimal comparison to CPT code 95919 due to identical intra-service time and total time. Additionally, the physician work required to perform this service is comparable, and therefore should be valued similarly to maintain relativity. For additional support, the RUC referenced CPT code 72190 *Radiologic examination, pelvis; complete, minimum of 3 views* (work RVU= 0.25, 5 minutes of intra-service time, and 7 minutes of total time) requires the same amount of time and has an identical work RVU and thus should be valued similarly.**The RUC recommends a work RVU of 0.25 for CPT code 95919.**

Practice Expense

The Practice Expense Subcommittee reviewed the direct practice expense inputs and made no modifications. **The RUC recommends the direct practice expense inputs as submitted by the specialty society.**

New Technology/New Service
The RUC recommends that CPT code 95919 be placed on the New Technology list and be re-reviewed by the RUC in three years to ensure correct valuation and utilization assumptions.

CPT Descriptor: Quantitative pupillometry with physician or qualified health care professional interpretation and report, unilateral or bilateral

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 14-year-old boy playing football got tackled and developed a concussion. He now requires a comprehensive neurologic examination to assess for vestibular, balance, and vision problems. To assess the concussion severity, he requires cranial imaging tests such as magnetic resonance imaging or computerized tomography, along with quantitative pupillometry to assess pupillary response to light as an early indicator of increased intracranial pressure.

Percentage of Survey Respondents who found Vignette to be Typical: 47%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Review the referring physician's request. Enter an order into the electronic health record. Describe the test and its purpose to the patient and/or family.

Description of Intra-Service Work: Physician/QHP reviews the measurements and waveforms from both right and left eyes in the context of the patient condition and then compares them to published normative values by age as well as to prior pupillometry measurements in the same patient.

Description of Post-Service Work: Enter results into the electronic health record. Send a report to the referring physician.

SURVEY DATA

RUC Meeting Date (mm/yyyy)	10/2021					
Presenter(s):	David Glasser, MD; Steven Krug, MD; Debra Weese-Mayer, MD					
Specialty Society(ies):	American Academy of Ophthalmology (AAO); American Academy of Pediatrics (AAP)					
CPT Code:	95919					
Sample Size:	2766	**Resp N:**	36			
Description of Sample:	AAO: Random sample of AAO neuro-ophthalmology members and North American Neuro-Ophthalmology Society (NANOS) members AAP: Random sample of members from the following AAP Sections: Ophthalmology, Neurology, Emergency Medicine

Modifier -51 Exempt Status
Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? Yes

TOP KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
92081	XXX	0.30	**RUC Time**

CPT Descriptor Visual field examination, unilateral or bilateral, with interpretation and report; limited examination (eg, tangent screen, Autoplot, arc perimeter, or single stimulus level automated test, such as Octopus 3 or 7 equivalent)

SECOND HIGHEST KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
92083	XXX	0.50	**RUC Time**

CPT Descriptor Visual field examination, unilateral or bilateral, with interpretation and report; extended examination (eg, Goldmann visual fields with at least 3 isopters plotted and static determination within the central 30 deg, or quantitative, automated threshold perimetry, Octopus program G-1, 32 or 42, Humphrey visual field analyzer full threshold programs 30-2, 24-2, or 30/60-2)

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
72081	XXX	0.26	**RUC Time**	9,755

CPT Descriptor 1 Radiologic examination, spine, entire thoracic and lumbar, including skull, cervical and sacral spine if performed (eg, scoliosis evaluation); one view

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
74019	XXX	0.23	**RUC Time**	429,437

CPT Descriptor 2 Radiologic examination, abdomen; 2 views

Other Reference CPT Code	Global	Work RVU	Time Source
72190	XXX	0.25	**RUC Time**

CPT Descriptor Radiologic examination, pelvis; complete, minimum of 3 views

RELATIONSHIP OF CODE BEING REVIEWED TO TOP TWO KEY REFERENCE SERVICES:

Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by percent distribution) of the service you are rating to the top two chosen key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Top Key Reference Code: 15 **% of respondents:** 41.6 **%**

Number of respondents who choose 2nd Key Reference Code: 8 **% of respondents:** 22.2 **%**

TIME ESTIMATES (Median)

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	7%	53%	33%	7%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	13%	53%	34%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	7%	67%	26%
Physical effort required	0%	93%	7%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	7%	47%	46%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	38%	50%	12%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	13%	12%	75%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	38%	62%
Physical effort required	0%	63%	37%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	38%	62%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

The CPT Editorial Panel approved a new Category I CPT code (95919 *Quantitative pupillometry with physician or qualified health care professional interpretation and report, unilateral or bilateral*) to replace the sunset Category III CPT code 0341T (*Quantitative pupillometry with interpretation and report, unilateral or bilateral*) and 92499 (*Unlisted ophthalmological service or procedure*) for reporting this service. Code 0341T was sunset within the *CPT 2020* code set

and instruction was included in a parenthetical cross-reference directing use of an unlisted code (92499) when quantitative pupillometry was provided.

Code 95919 identifies unilateral or bilateral quantitative pupillometry. Pupillometry provides non-invasive measurements of autonomic nervous system function which allows for objective documentation of pupillometry-specific autonomic deficit in a variety of disorders as well as objective measurement of pupillary response to light. No current method outside of quantitative pupillometry exists to provide such information in this manner (non-invasive, objective, accurate). With careful consideration of the multiple factors involved in the pupillary response to light, pupillometry can be effectively applied to many disorders in adults, children, and infants to ascertain details of sympathetic and parasympathetic function and simultaneously objectively document the pupillary response to light. Thus, pupillometry provides a new clinical application with an existing device. Pupillometry data is typically acquired by a technician and the data is analyzed by a physician or other qualified health care professional.

RUC Survey Results

The American Academy of Ophthalmology (AAO) and the American Academy of Pediatrics (AAP) surveyed 2,766 members, receiving 36 completed responses. AAO surveyed a random sample of AAO ophthalmology members and North American Neuro-Ophthalmology Society (NANOS) members, while AAP surveyed a random sample of members from its Sections on Ophthalmology, Neurology, Emergency Medicine.

The first Key Reference Service (KRS) (**92081** *Visual field examination, unilateral or bilateral, with interpretation and report; limited examination (eg, tangent screen, Autoplot, arc perimeter, or single stimulus level automated test, such as Octopus 3 or 7 equivalent)*) (0.30 wRVU; 3/7/0/10) was selected by 15 (42%) of respondents, while the second KRS (**92083** *Visual field examination, unilateral or bilateral, with interpretation and report; extended examination (eg, Goldmann visual fields with at least 3 isopters plotted and static determination within the central 30 deg, or quantitative, automated threshold perimetry, Octopus program G-1, 32 or 42, Humphrey visual field analyzer full threshold programs 30-2, 24-2, or 30/60-2)*) (0.50 wRVU; 3/10/0/13) was selected by 8 (22%) of respondents.

Given the low percentages of respondents who selected either of the Key Reference Services, the fact that both 92081 and 92083 have longer intraservice times (7 minutes and 10 minutes, respectively) than 95919 (survey median intraservice time of 5 minutes), and respondents' ranking of intensity/complexity measures for 95919 (ie, identical to 92081 but higher than 92083), we are not basing our recommendations entirely on either of the Key Reference Services.

Time Recommendations: 1/5/1/7

While our survey median times for pre-service, intraservice, and post-service were each 5 minutes, we are recommending **1 minute pre-service, 5 minutes intraservice, and 1 minute post-service**. We are recommending lower pre- and post-service times to account for the fact that pupillometry is typically performed in conjunction with an Evaluation and Management (E/M) service.

Work Relative Value Unit Recommendation: 0.25 wRVU

We are recommending the survey 25th percentile wRVU of **0.25**, which is half that of the second KRS 92083, which has twice as long an intraservice time.

There are several other RUC-reviewed services that have comparable times and work RVUs:

Code	Descriptor	Global	Work RVU	Pre-Time	Intra-Time	Post-Time	Total Time
74019	Radiologic examination, abdomen; 2 views	XXX	0.23	1	4	1	6
72190	Radiologic examination, pelvis; complete, minimum of 3 views	XXX	0.25	1	5	1	7
95919	Quantitative pupillometry with physician or qualified health care professional interpretation and	XXX	0.25	1	5	1	7

	report, unilateral or bilateral						
92202	Ophthalmoscopy, extended; with drawing of optic nerve or macula (eg, for glaucoma, macular pathology, tumor) with interpretation and report, unilateral or bilateral	XXX	0.26	1	5	1	7
72081	Radiologic examination, spine, entire thoracic and lumbar, including skull, cervical and sacral spine if performed (eg, scoliosis evaluation); one view	XXX	0.26	1	5	1	7

These examples illustrate that the recommended wRVU and times for code 95919 are comparable to services of other specialties in the Medicare Physician Fee Schedule.

The recommended work value of 0.25 RVU is supported by a direct crosswalk to code 72190, *Radiologic examination, pelvis; complete, minimum of 3 views*, last reviewed by the RUC in 2019 and with an identical work value and times.

The Intraservice Work Per Unit of Time (IWPUT) associated with our recommendations (0.041) is minimally greater than that of the first KRS (92081; 0.033). Although comparing IWPUTs between codes with short intraservice times is unreliable, this is consistent with respondents indicating that pupillometry is equally intense/complex as 92081.

We recommend a work value of 0.25 RVU for code 95919 with times of 1/5/1.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☒ Other reason (please explain) Pupillometry is typically provided with a same day E/M service

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

CPT	wRVUs	Global Period	Pre	Intra	Post	Total	Visit Total wRVUs	Visit Total Time
95919	0.25	XXX	1	5	1	7	1.55	37
99213	1.30	XXX	5	20	5	30		

95919	0.25	XXX	1	5	1	7	1.64	47
99232	1.39	XXX	10	20	10	40		

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) Category III CPT Code 0341T (2015-2020) and 92499 (Unlisted ophthalmological service or procedure; 2019 Medicare Frequency = 7,015)

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pediatrics How often? Sometimes

Specialty Ophthalmology How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 7500
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimate based on extrapolation from 2019 Medicare Frequency for 92499 (7,015)

Specialty Pediatrics Frequency 3750 Percentage 50.00 %

Specialty Ophthalmology Frequency 3750 Percentage 50.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 5,000
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimate based on 2019 Medicare Frequency for 92499 (7,015)

Specialty Pediatrics Frequency 250 Percentage 5.00 %

Specialty Ophthalmology Frequency 4750 Percentage 95.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Tests

BETOS Sub-classification:
Other tests

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 92136

SPECIALTY SOCIETY(IES): AAO, AAP
PRESENTER(S): David Glasser, MD; Ankoor Shah, MD; Steven Krug, MD; Debra Weese-Mayer, MD

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC) PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

Meeting Date: October 2021

CPT Code	Long Descriptor	Global Period
95919	Quantitative pupillometry with physician or qualified health care professional interpretation and report, unilateral or bilateral	XXX

Vignette(s) (*vignette required even if PE only code(s)***):**

CPT Code	Vignette
95919	A 14-year-old boy playing football got tackled and developed a concussion. He now requires a comprehensive neurologic examination to assess for vestibular, balance, and vision problems. To assess the concussion severity, he requires cranial imaging tests such as magnetic resonance imaging or computerized tomography, along with quantitative pupillometry to assess pupillary response to light as an early indicator of increased intracranial pressure.

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

   Advisors from AAO, NANOS, and AAP acted as an expert panel, meeting virtually to develop the recommended direct PE inputs.

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here (NOTE: *For services reviewed prior to the implementation of clinical activity codes, detail is not provided in the RUC database, please contact Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org for PE spreadsheets for your reference codes*):

   PE Reference Code: 92082 *Visual field examination, unilateral or bilateral, with interpretation and report; intermediate examination*
   Given the time, patient compliance, and technician work required by quantitative pupillometry, we recommend code 92082 as the PE Reference Code.

3. Is this code(s) typically reported with an E/M service?
   Is this code(s) typically reported with the E/M service in the nonfacility?
   (Please see the *Billed Together* tab in the RUC Database)

   Yes, this code will typically be reported with an E/M service.
   Yes, this code will typically be reported with an E/M service in the nonfacility.

4. What specialty is the dominant provider in the nonfacility?
   What percent of the time does the dominant provider provide the service(s) in the nonfacility?
   Is the dominant provider in the nonfacility different than for the global?
   (Please see the *Billed Together* tab in the RUC Database)

   While this is a new code, we anticipate that ophthalmology will be one of the dominant providers in the nonfacility and for the global.

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

5. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment, and supplies, please provide compelling evidence (please see *PE compelling evidence guidelines*) Please explain if the increase can be entirely accounted for because of an increase in physician time:

N/A (This is a new code)

CLINICAL STAFF ACTIVITIES

The RUC has agreed that there is a presumption of zero pre-service clinical staff time unless the specialty can provide evidence to the PE Subcommittee that any pre-service time is appropriate. The RUC agreed that with evidence some subset of codes may require minimal or extensive use of clinical staff and has allocated time when appropriate (for example when a service describes a major surgical procedure). If the package times are not applicable, alternate times may be presented and should be justified for consideration by the Subcommittee.

6. Are the global periods of the codes transitioning? Information about the amount of pre-service clinical staff time and a rationale for the change from a 090-day global to a 000 or 010 day global should be described below.

N/A (This is a new XXX code)

7. If you are recommending more minutes than the PE Subcommittee standards for clinical activities, you must provide rationale to justify the time:

N/A

8. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (*please see second worksheet in PE spreadsheet workbook*), please explain the difference here:

Reference Code 92082: 5 minutes for "Draw isopters/enter demographics" (Row 41 of April 2012 PE SS) was rolled into CA034 (Document procedure (nonPACS) (eg, mandated reporting, registry logs, EEG file, etc.)).

9. How much time was allocated to clinical activity, *obtain vital signs* (CA010) prior to CMS increasing the clinical activity to 5 minutes for calendar year 2018? The standard for clinical activity, obtains vital signs remains 0, 3 and 5 based on the number of vital signs taken. Please provide a rationale for the clinical staff time that you are requesting for obtain vital signs here:

N/A (This is a new code)

10. Please provide a brief description of the clinical staff work for the following:
    a. Pre-Service period:

N/A

    b. Service period (includes pre, intra and post):

Eyeglasses or contact lenses are removed and the patient is seated in a dark, quiet room for a minimum of one minute before pupillometry begins. Clinical staff instructs the seated patient to stare straight ahead without blinking or moving the eye. [CA016 2 minutes (standard)] Clinical staff holds the pupillometer up to the patient's right eye, then depresses the measurement button to initiate the recording and the light stimulus. Depending on the age and cooperation of the

patient, this may need to be repeated until a complete recording is made. After a minimum of 1 minute break, the previous step is repeated with the left eye. [CA021 3 minutes]

Clinical staff downloads the pupillometry measurements and the waveforms and prepares a report for physician review and interpretation. [CA028 2 minutes]

Clinical staff wipes down pupillometer with an alcohol swab and places it back in the charger [CA024 1 minute] [Note: CA024 standard is 3 minutes but 95919 is typically reported with an E/M service. While pupillometry is typically performed on the same day as an E/M, these are cleaning activities above and beyond what would be performed during an E/M visit alone.]

==========

Total Service Period Clinical Staff Time (CST) = 8 minutes

We included the standard PE clinical staff time survey question in our Physician/QHP work survey, with the following results:

Low	1 minute
25th	3 minutes
Median	6 minutes
Mean	9.27 minutes
75th	12 minutes
High	40 minutes

N = 33 (AAP = 19; AAO = 9; NANOS = 5)

While our recommended CST time (8 minutes) is higher than the survey median (6 minutes), we believe that survey respondents considered only the CST required for the pupillometry service -- and not the CST required for cleaning or downloading images.

c. Post-service period:

N/A

11. Please provide granular detail regarding what the clinical staff is doing during the intra-service (of service period) clinical activity, *assist physician or other qualified healthcare professional---directly related to physician work time* or *Perform procedure/service---NOT directly related to physician work time:*

Clinical staff holds the pupillometer up to the patient's right eye, then depresses the measurement button to initiate the recording and the light stimulus. Depending on the age and cooperation of the patient, this may need to be repeated until a complete recording is made. After a minimum of 1 minute break, the previous step is repeated with the left eye. Depending on the age and cooperation of the patient, this may need to be repeated until a complete recording is made. [CA021 3 minutes]

12. If you have used a percentage of the physician intra-service work time other then 100 or 67 percent for the intra-service (of service period) clinical activity, please indicate the percentage and explain why the alternate percentage is needed and how it was derived.

N/A

13. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (*please see second worksheet in PE spreadsheet*):

N/A

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

14. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov.

N/A

MEDICAL SUPPLIES & EQUIPMENT/INVOICES

15. ☒ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

16. ☒ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

17. If you wish to include a supply that is not on the list (*please see fourth worksheet in PE spreadsheet*) please provide a paid invoice. Identify and explain the supply input and invoice here:

N/A

18. Are you recommending a PE supply pack for this recommendation? Yes or No.
If Yes, please indicate if the pack is an established package of supplies as defined by CMS (eg, SA047 *pack, E/M visit*) or a pack that is commercially available?

No

19. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation. Please include the description, CMS supply code, unit, item quantity and unit price (if available). See documents two and three under PE reference materials on the RUC Collaboration Website for information on the contents of kits, packs and trays.

N/A

20. If you wish to include an equipment item that is not on the list (*please see fifth worksheet in PE spreadsheet*) please provide a paid invoice. Identify and explain the equipment input and invoice here:

Neuroptics Invoice for Pupillometer Kit: Includes a Pupillometer, a charging station, eye cups (2), power supply adapter, instructions for use, carrying case, and Matlab scripts (one for data and one for video).

21. Please provide an estimate of the useful life of the new equipment item as required to calculate the equipment cost per minute (*please see fifth worksheet in PE spreadsheet*):

10 years

22. Have you recommended equipment minutes for a computer or equivalent laptop/integrated computer, equipment item computer, desktop, w-monitor, ED021 or notebook (Dell Latitute D600), ED038?
    a. If yes, please explain how the computer is used for this service(s).
    b. Is the computer used exclusively as an integral component of the service or is it also used for other purposes not specific to the code?
    c. Does the computer include code specific software that is typically used to provide the service(s)?

No

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

23. List all the equipment included in your recommendation and the equipment formula chosen *(*please see document titled *Calculating equipment time).* If you have selected "other formula" for any of the equipment please explain here:

Pupillometer Kit Default equipment formula

24. If this is a PE only code please select a crosswalk based on a similar specialty mix:
    N/A (This is not a PE only code)

ADDITIONAL INFORMATION

25. If there is any other item(s) on your spreadsheet not covered in the categories above that requires greater detail/explanation, please include here:
    N/A

ITEMIZED LIST OF CHANGES (FOLLOWING THE PE SUBCOMMITTEE MEETING)

NOTE: The virtual meetings have provided for real-time updates to the PE spreadsheets. PE SORs must still be updated after the meeting and resubmitted asap.

During and immediately following the review of this tab at the PE Subcommittee meeting, please revise the summary of recommendation (PE SOR) based on modifications made during the meeting. Please submit the revised form electronically to Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org immediately following the close of business. In addition, please also provide an itemized list of the modifications made to the PE spreadsheet during the PE Subcommittee meeting in the space below (e.g. clinical activity CA010 *obtain vital signs* was reduced from 5 minutes to 3 minutes).

AMA/Specialty Society RVS Update Committee Summary of Recommendations

October 2021

Inpatient and Observation Care Services – Tab 10

Following the implementation of the revisions to the Evaluation and Management (E/M) office visits (99201-99215) for the CPT 2021 code set, the CPT/RUC Workgroup on E/M met twelve times in 2020 and early 2021 to standardize the rest of the E/M sections in the CPT code set. The CPT/RUC Workgroup on E/M was committed to changing the current coding and documentation requirements for E/M visits to simplify the work for health care providers and improve health outcomes for patients. To achieve these goals, the Workgroup set forth the following guiding principles related to the group's ongoing work product:

1. To decrease administrative burden of documentation and coding and align CPT and CMS whenever possible
2. To decrease the need for audits
3. To decrease unnecessary documentation in the medical record that is not needed for patient care
4. To ensure that payment for E/M is resource-based and that there is no direct goal for payment redistribution between specialties.

In February 2021, the CPT Editorial Panel deleted seven observation care codes and revised eleven codes to merge inpatient and observation care and to align with the principles included in the office or other outpatient E/M services (99202-99215) by documenting and selecting level of service based on total time or medical decision making.

Similar to the office visits, beginning in 2023, when total time on the date of encounter is used to select the appropriate level of an inpatient hospital or observation care visit code, both the face-to-face and non-face-to-face time personally spent by the physician (or other qualified health care professional that is reporting the office visit) assessing and managing the patient are summed to select the appropriate code. The inpatient and observation care services were surveyed for the October 2021 RUC meeting. The survey time captured the total time on the date of encounter by calendar date.

In October 2021, the RUC referred these services to be resurveyed because the survey did not include a request for distinct time before and after floor/unit time, therefore could not be compared to previous RUC surveys of these services. The specialty societies will revise their survey instrument by working with the Research Subcommittee. **The RUC will review the inpatient and observation care services (99221-99223, 99231-99236 and 99238-99239) at the January 2022 RUC meeting.**

CPT Code	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
Evaluation and Management **Office or Other Outpatient Services** **Established Patient**				
▲99211		**Office or other outpatient visit** for the evaluation and management of an established patient, that may not require the presence of a physician or other qualified health care professional. ~~Usually, the presenting problem(s) are minimal~~		
Hospital Observation Services				
~~The following codes are used to report evaluation and management services provided to patients designated/ admitted as "observation status" in a hospital. It is not necessary that the patient be located in an observation area designated by the hospital.~~				
~~If such an area does exist in a hospital (as a separate unit in the hospital, in the emergency department, etc.), these codes are to be utilized if the patient is placed in such an area.~~				
~~For definitions of key components and commonly used terms, please see **Evaluation and Management Services Guidelines.**~~				
~~***Coding Tip***~~				
~~**The Significance of Time as a Factor in Selection of an Evaluation and Management Code**~~				
~~The inclusion of time as an explicit factor beginning in CPT 1992 was done to assist in selecting the most appropriate level of E/M services included in codes in this section. Beginning with CPT 2021, except for 99211, time alone may be used to select the appropriate code level for the office or other outpatient E/M services codes (99202, 99203, 99204, 99205, 99212, 99213, 99214, 99215). Different categories of services use time differently. It is important to review the instructions for each category.~~				
~~**Unit/floor time (hospital observation services [99218, 99219, 99220, 99224, 99225, 99226, 99234, 99235, 99236], hospital inpatient services [99221, 99222, 99223, 99231, 99232, 99233], inpatient consultations [99251, 99252, 99253, 99254, 99255], nursing facility services [99304, 99305, 99306, 99307, 99308, 99309, 99310, 99315, 99316, 99318]):**~~				
~~For coding purposes, time for these services is defined as unit/floor time, which includes the time present on the patient's hospital unit and at the bedside rendering services for that patient. This includes the time to establish and/or review the patient's chart, examine the patient, write notes, and communicate with other professionals and the patient's family.~~				
~~CPT Coding Guidelines, Evaluation and Management, Guidelines Common to All E/M Services, Time~~				
Observation Care Discharge Services				
~~Observation care discharge of a patient from "observation status" includes final examination of the patient, discussion of the hospital stay, instructions for continuing care, and preparation of discharge records. For observation or inpatient hospital care including the admission and discharge of the patient on the same date, see codes 99234-99236 as appropriate.~~				

~~99217~~	-	~~**Observation care discharge** day management (This code is to be utilized to report all services provided to a patient on discharge from outpatient hospital "observation status" if the discharge is on other than the initial date of "observation status." To report services to a patient designated as "observation status" or "inpatient status" and discharged on the same date, use the codes for Observation or Inpatient Care Services [including Admission and Discharge Services, 99234-99236 as appropriate.])~~ (99217 has been deleted. To report observation care discharge services, see 99238, 99239)	~~XXX~~	~~N/A~~

Initial Observation Care
New or Established Patient

~~The following codes are used to report the encounter(s) by the supervising physician or other qualified health care professional with the patient when designated as outpatient hospital "observation status." This refers to the initiation of observation status, supervision of the care plan for observation and performance of periodic reassessments. For observation encounters by other physicians, see office or other outpatient consultation codes (99241-99245) or subsequent observation care codes (99224-99226) as appropriate.~~

~~To report services provided to a patient who is admitted to the hospital after receiving hospital observation care services on the same date, see the notes for initial hospital inpatient care (page 15). For observation care services on other than the initial or discharge date, see subsequent observation services codes (99224-99226). For a patient admitted to the hospital on a date subsequent to the date of observation status, the hospital admission would be reported with the appropriate initial hospital care code (99221-99223). For a patient admitted and discharged from observation or inpatient status on the same date, the services should be reported with codes 99234-99236 as appropriate. Do not report observation discharge (99217) in conjunction with a hospital admission (99221-99223).~~

~~When "observation status" is initiated in the course of an encounter in another site of service (eg, hospital emergency department, office, nursing facility) all evaluation and management services provided by the supervising physician or other qualified health care professional in conjunction with initiating "observation status" are considered part of the initial observation care when performed on the same date. The observation care level of service reported by the supervising physician or other qualified health care professional should include the services related to initiating "observation status" provided in the other sites of service as well as in the observation setting.~~

~~Evaluation and management services including new or established patient office or other outpatient services (99201-99215), emergency department services (99281-99285), nursing facility services (99304-99318), domiciliary, rest home, or custodial care services (99324-99337), home services (99341-99350), and preventive medicine services (99381-99429) on the same date related to the admission to "observation status" should not be reported separately.~~

~~These codes may not be utilized for post-operative recovery if the procedure is considered part of the surgical "package." These codes apply to all evaluation and management services that are provided on the same date of initiating "observation status."~~

~~99218~~	-	**~~Initial observation care~~**~~, per day, for the evaluation and management of a patient which requires these 3 key components:~~ • **~~A detailed or comprehensive history;~~** • **~~A detailed or comprehensive examination; and~~** • **~~Medical decision making that is straightforward or of low complexity.~~** ~~Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs.~~ ~~Usually, the problem(s) requiring admission to outpatient hospital "observation status" are of low severity. Typically, 30 minutes are spent at the bedside and on the patient's hospital floor or unit.~~	~~XXX~~	~~N/A~~
~~99219~~	-	**~~Initial observation care~~**~~, per day, for the evaluation and management of a patient which requires these 3 key components:~~ • **~~A comprehensive history;~~** • **~~A comprehensive examination; and~~** • **~~Medical decision making of moderate complexity.~~** ~~Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs.~~ ~~Usually, the problem(s) requiring admission to outpatient hospital "observation status" are of moderate severity. Typically, 50 minutes are spent at the bedside and on the patient's hospital floor or unit.~~	~~XXX~~	~~N/A~~

~~99220~~	-	**~~Initial observation care~~**~~, per day, for the evaluation and management of a patient which requires these 3 key components:~~ • ~~**A comprehensive history;**~~ • ~~**A comprehensive examination; and**~~ • ~~**Medical decision making of high complexity.**~~ ~~Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs.~~ ~~Usually, the problem(s) requiring admission to outpatient hospital "observation status" are of high severity. Typically, 70 minutes are spent at the bedside and on the patient's hospital floor or unit.~~ (99218, 99219, 99220 have been deleted. To report initial observation care, new or established patient, see 99221, 99222, 99223)	~~XXX~~	~~N/A~~
Subsequent Observation Care ~~All levels of subsequent observation care include reviewing the medical record and reviewing the results of diagnostic studies and changes in the patient's status (ie, changes in history, physical condition, and response to management) since the last assessment.~~				
~~99224~~	-	**~~Subsequent observation care,~~**~~ per day, for the evaluation and management of a patient, which requires at least 2 of these 3 key components:~~ • ~~**Problem focused interval history;**~~ • ~~**Problem focused examination;**~~ • ~~**Medical decision making that is straightforward or of low complexity.**~~ ~~Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs.~~ ~~Usually, the patient is stable, recovering, or improving. Typically, 15 minutes are spent at the bedside and on the patient's hospital floor or unit.~~	~~XXX~~	~~N/A~~

~~99225~~	-	~~**Subsequent observation care,** per day, for the evaluation and management of a patient, which requires at least 2 of these 3 key components:~~ ~~• **An expanded problem focused interval history;**~~ ~~• **An expanded problem focused examination;**~~ ~~• **Medical decision making of moderate complexity.**~~ ~~Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs.~~ ~~Usually, the patient is responding inadequately to therapy or has developed a minor complication. Typically, 25 minutes are spent at the bedside and on the patient's hospital floor or unit.~~	~~XXX~~	~~N/A~~
~~99226~~	-	~~**Subsequent observation care,** per day, for the evaluation and management of a patient, which requires at least 2 of these 3 key components:~~ ~~• **A detailed interval history;**~~ ~~• **A detailed examination;**~~ ~~• **Medical decision making of high complexity.**~~ ~~Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs.~~ ~~Usually, the patient is unstable or has developed a significant complication or a significant new problem. Typically, 35 minutes are spent at the bedside and on the patient's hospital floor or unit.~~ (99224, 99225, 99226 have been deleted. To report subsequent observation care, see 99231, 99232, 99233)	~~XXX~~	~~N/A~~

Hospital Inpatient and Observation Care Services

The following codes are used to report initial and subsequent evaluation and management services provided to hospital inpatients and to patients designated as hospital outpatient "observation status". ~~Hospital inpatient and observation care services include those services provided to patients in a "partial hospital" setting.~~ Hospital inpatient or observation care codes are to be used to report these partial hospitalization services. ~~These are to be used to report these partial hospitalization services. See also **psychiatry** notes in the full text of the CPT code set~~.

For patients designated/admitted as "observation status" in a hospital, it is not necessary that the patient be located in an observation area designated by the hospital. If such an area does exist in a hospital (as a separate unit in the hospital, in the emergency department, etc), these codes may be utilized if the patient is placed in such an area.

For definitions of ~~key components and~~ commonly used terms, see **Evaluation and Management Services Guidelines.** ~~For Hospital Observation Services, see 99218-99220, 99224-99226.~~ For a patient admitted and discharged from ~~observation or~~ hospital inpatient or observation status on the same date, ~~the services should be~~ report~~ed with codes~~ 99234, 99235, ~~-~~99236 as appropriate.

~~***Coding Tip***~~

~~**The Significance of Time as a Factor in Selection of an Evaluation and Management Code**~~

~~The inclusion of time as an explicit factor beginning in CPT 1992 was done to assist in selecting the most appropriate level of E/M services included in codes in this section. Beginning with CPT 2021, except for 99211, time alone may be used to select the appropriate code level for the office or other outpatient E/M services codes (99202, 99203, 99204, 99205, 99212, 99213, 99214, 99215). Different categories of services use time differently. It is important to review the instructions for each category.~~

~~**Unit/floor time (hospital observation services [99218, 99219, 99220, 99224, 99225, 99226, 99234, 99235, 99236], hospital inpatient services [99221, 99222, 99223, 99231, 99232, 99233], inpatient consultations [99251, 99252, 99253, 99254, 99255], nursing facility services [99304, 99305, 99306, 99307, 99308, 99309, 99310, 99315, 99316, 99318]):**~~

~~For coding purposes, time for these services is defined as unit/floor time, which includes the time present on the patient's hospital unit and at the bedside rendering services for that patient. This includes the time to establish and/or review the patient's chart, examine the patient, write notes, and communicate with other professionals and the patient's family.~~

~~*CPT Coding Guidelines, Evaluation and Management, Guidelines Common to All E/M Services, Time*~~

Total time on the date of the encounter is by calendar date. When using MDM or time for code selection, a continuous service that spans the transition of two calendar dates is a single service and is reported on one date. If the service is continuous before and through midnight, all the time may be applied to the reported date of the service.

Initial Hospital Inpatient or Observation Care
New or Established Patient

The following codes are used to report the first hospital inpatient or observation status encounter with the patient ~~by the admitting physician~~.

~~For initial inpatient encounters by physicians other than the admitting physician, see initial inpatient consultation codes (99251-99255) or subsequent hospital care codes (99231-99233) as appropriate.~~

An initial service may be reported when the patient has not received any professional services from the physician or other qualified health care professional or another physician or other qualified health care professional of the exact same specialty and subspecialty who belongs to the same group practice during the stay. When advanced practice nurses and physician assistants are working with physicians they are considered as working in the exact same specialty and subspecialty as the physician.

For admission services for the neonate (28 days of age or younger) requiring intensive observation, frequent interventions, and other intensive care services, see 99477.

When the patient is admitted to the hospital as an inpatient or to observation status in the course of an encounter in another site of service (eg, hospital emergency department, ~~observation status in a hospital,~~ office, nursing facility), the services in the initial site may be separately reported. Modifier 25 may be added to the other evaluation and management service to indicate a significant, separately identifiable service by the same physician or qualified health care professional was performed on the same date. ~~all evaluation and management services provided by that physician in conjunction with that admission are considered part of the initial hospital care when performed on the same date as the admission. The inpatient care level of service reported by the admitting physician should include the services related to the admission he/she provided in the other sites of service as well as in the inpatient setting.~~

In the case when the services in a separate site are reported and the initial inpatient or observation care service is a consultation service, do not report 99221, 99222, 99223, 99252, 99253, 99254, or 99255. The consultant reports the subsequent hospital inpatient or observation care codes 99231, 99232, 99233 for the second service on the same date.

~~Evaluation and management services including new or established patient office or other outpatient services (99201-99215), emergency department services (99281-99285), nursing facility services (99304-99318), domiciliary, rest home, or custodial care services (99324-99337), home services (99341-99350), and preventive medicine services (99381-99397) on the same date related to the admission to "observation status" should **not** be reported separately.~~

~~For a patient admitted and discharged from observation or inpatient status on the same date, the services should be reported with codes 99234-99236 as appropriate.~~

If a consultation is performed in anticipation of, or related to, an admission by another ~~professional~~ physician or other qualified health care professional, and then the same consultant performs an encounter once the patient is admitted by the other physician or qualified health care professional, report the consultant's inpatient encounter with the appropriate subsequent care code (99231, 99232, 99233) ~~for the initial encounter for the stay~~. This instruction applies whether the consultation occurred on the date of the admission or a date previous to the admission. It also applies for consultations reported with any appropriate code (eg, office or other outpatient visit or office or other outpatient consultation).

For a patient admitted and discharged from observation or inpatient status on the same date, report 99234, 99235, 99236 as appropriate.

For the purposes of reporting an initial hospital or observation care service a transition from observation level to inpatient does not constitute a new stay.

▲99221	F1	**Initial hospital inpatient or observation care,** per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and straightforward or low level medical decision making. ~~these 3 key components:~~ • ~~**A detailed or comprehensive history;**~~ • ~~**A detailed or comprehensive examination; and**~~ • ~~**Medical decision making that is straightforward or of low complexity.**~~ ~~Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs.~~ ~~Usually, the problem(s) requiring admission are of low severity. Typically, 30 minutes are spent at the bedside and on the patient's hospital floor or unit.~~ When using total time on the date of the encounter for code selection, XX minutes must be met or exceeded.	XXX	Resurvey for January 2022 (2021 work RVU = 1.92)
▲99222	F2	**Initial hospital inpatient or observation care,** per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. ~~these 3 key components:~~ • ~~**A comprehensive history;**~~ • ~~**A comprehensive examination; and**~~ • ~~**Medical decision making of moderate complexity.**~~ ~~Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs.~~ ~~Usually, the problem(s) requiring admission are of moderate severity. Typically, 50 minutes are spent at the bedside and on the patient's hospital floor or unit.~~ When using total time on the date of the encounter for code selection, XX minutes must be met or exceeded.	XXX	Resurvey for January 2022 (2021 work RVU = 2.61)

▲99223	F3	**Initial hospital inpatient or observation care,** per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and high level of medical decision making. ~~these 3 key components:~~ • ~~**A comprehensive history;**~~ • ~~**A comprehensive examination; and**~~ • ~~**Medical decision making of high complexity.**~~ ~~Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs.~~ ~~Usually, the problem(s) requiring admission are of high severity. Typically, 70 minutes are spent at the bedside and on the patient's hospital floor or unit.~~ When using total time on the date of the encounter for code selection, XX minutes must be met or exceeded. (For services of ZZ or longer, use prolonged services code 993X0)	XXX	Resurvey for January 2022 (2021 work RVU = 3.86)

Subsequent Hospital Inpatient or Observation Care ~~All levels of subsequent hospital care include reviewing the medical record and reviewing the results of diagnostic studies and changes in the patient's status (ie, changes in history, physical condition and response to management) since the last assessment.~~				
▲99231	F4	**Subsequent hospital inpatient or observation care,** per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and straightforward or low level of medical decision making. ~~at least 2 of these 3 key components:~~ • ~~**A problem focused interval history;**~~ • ~~**A problem focused examination;**~~ • ~~**Medical decision making that is straight forward or of low complexity.**~~ ~~Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs.~~ ~~Usually, the patient is stable, recovering or improving. Typically, 15 minutes are spent at the bedside and on the patient's hospital floor or unit.~~ When using total time on the date of the encounter for code selection, XX minutes must be met or exceeded.	XXX	Resurvey for January 2022 (2021 work RVU = 0.76)

▲99232	F5	**Subsequent hospital inpatient or observation care,** per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. ~~at least 2 of these 3 key components:~~ • ~~**An expanded problem focused interval history;**~~ • ~~**An expanded problem focused examination;**~~ • ~~**Medical decision making of moderate complexity.**~~ ~~Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs.~~ ~~Usually, the patient is responding inadequately to therapy or has developed a minor complication. Typically, 25 minutes are spent at the bedside and on the patient's hospital floor or unit.~~ When using total time on the date of the encounter for code selection, XX minutes must be met or exceeded.	XXX	Resurvey for January 2022 (2021 work RVU = 1.39)
▲99233	F6	**Subsequent hospital inpatient or observation care,** per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and high level of medical decision making. ~~at least 2 of these 3 key components:~~ • ~~**A detailed interval history;**~~ • ~~**A detailed examination;**~~ • ~~**Medical decision making of high complexity.**~~ ~~Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs.~~ ~~Usually, the patient is unstable or has developed a significant complication or a significant new problem. Typically, 35 minutes are spent at the bedside and on the patient's hospital floor or unit.~~ When using total time on the date of the encounter for code selection, XX minutes must be met or exceeded. (For services of ZZ or longer, use prolonged services code 993X0)	XXX	Resurvey for January 2022 (2021 work RVU = 2.00)

Hospital Inpatient or Observation ~~or Inpatient~~ Care Services (Including Admission and Discharge Services)

The following codes are used to report ~~observation or inpatient~~ hospital inpatient or observation care services provided to patients admitted and discharged on the same date of service.

~~When a patient is admitted to the hospital from observation status on the same date, only the initial hospital care code should be reported. The initial hospital care code reported by the admitting physician or other qualified health care professional should include the services related to the observation status services he/she provided on the same date of inpatient admission.~~

~~When "observation status" is initiated in the course of an encounter in another site of service (eg, hospital emergency department, office, nursing facility) all evaluation and management services provided by the supervising physician or other qualified health care professional in conjunction with initiating "observation status" are considered part of the initial observation care when performed on the same date. The observation care level of service should include the services related to initiating "observation status" provided in the other sites of service as well as in the observation setting when provided by the same individual.~~

For patients admitted to hospital inpatient or observation ~~or inpatient~~ care and discharged on a different date, see ~~codes 99217, 99218-99220, 99224-99226, or~~ 99221, 99222, ~~-~~99223, 99231, 99232, 99233, 99238, ~~and~~ 99239.

Codes 99234, 99235, 99236 require two or more encounters on the same date of which one of these encounters is an initial admission encounter and another encounter being a discharge encounter. For a patient admitted and discharged at the same encounter, see 99221, 99222, 99223. Do not report 99238, 99239 in conjunction with 99221, 99222, 99223 for admission and discharge services performed on the same date.

(For discharge services provided to newborns admitted and discharged on the same date, use 99463)

▲99234	F7	**Hospital inpatient or ~~O~~observation ~~or inpatient hospital~~ care,** for the evaluation and management of a patient including admission and discharge on the same date, which requires a medically appropriate history and/or examination and straightforward or low level of medical decision making. ~~these 3 key components:~~ • ~~**A detailed or comprehensive history;**~~ • ~~**A detailed or comprehensive examination; and**~~ • ~~**Medical decision making that is straightforward or of low complexity.**~~ ~~Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs.~~ ~~Usually the presenting problem(s) requiring admission are of low severity. Typically, 40 minutes are spent at the bedside and on the patient's hospital floor or unit.~~	XXX	Resurvey for January 2022 (2021 work RVU = 2.56)

		When using total time on the date of the encounter for code selection, XX minutes must be met or exceeded.		
▲99235	F8	**Hospital inpatient or ~~O~~observation ~~or inpatient hospital~~ care,** for the evaluation and management of a patient including admission and discharge on the same date, which requires a medically appropriate history and/or examination and moderate level of medical decision making. ~~these 3 key components:~~ • ~~**A comprehensive history;**~~ • ~~**A comprehensive examination; and**~~ • ~~**Medical decision making of moderate complexity.**~~ ~~Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs.~~ ~~Usually the presenting problem(s) requiring admission are of moderate severity. Typically, 50 minutes are spent at the bedside and on the patient's hospital floor or unit.~~ When using total time on the date of the encounter for code selection, XX minutes must be met or exceeded.	XXX	Resurvey for January 2022 (2021 work RVU = 3.24)
▲99236	F9	**Hospital inpatient or ~~O~~observation ~~or inpatient hospital~~ care,** for the evaluation and management of a patient including admission and discharge on the same date, which requires a medically appropriate history and/or examination and high level of medical decision making. ~~these 3 key components:~~ • ~~**A comprehensive history;**~~ • ~~**A comprehensive examination; and**~~ • ~~**Medical decision making of high complexity.**~~ ~~Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs.~~ ~~Usually the presenting problem(s) requiring admission are of high severity. Typically, 55 minutes are spent at the bedside and on the patient's hospital floor or unit.~~	XXX	Resurvey for January 2022 (2021 work RVU = 4.20)

		When using total time on the date of the encounter for code selection, XX minutes must be met or exceeded. (For services of ZZ or longer, use prolonged services code 993X0)		
Hospital Inpatient or Observation Discharge Services The hospital inpatient or observation discharge day management codes are to be used to report the total duration of time spent by a physician or other qualified health care professional for final hospital discharge of a patient, even if the time spent by the physician or other qualified health care professional on that date is not continuous. The codes include, as appropriate, final examination of the patient, discussion of the hospital stay, ~~even if the time spent by the physician on that date is not continuous,~~ instructions for continuing care to all relevant caregivers, and preparation of discharge records, prescriptions and referral forms. These codes are to be utilized to report all services provided to a patient on the date of discharge, if other than the initial date of inpatient or observation status. For a patient admitted and discharged from hospital inpatient or observation ~~or inpatient~~ status on the same date, ~~the services should be~~ report~~ed with codes~~ 99234, 99235, ~~-~~99236 as appropriate. Codes 99238, 99239 are to be used by the physician or other qualified health care professional who is responsible for discharge services. Services by other physicians or other qualified health care professionals that may include instructions to the patient and/or family and coordination of post discharge services may be reported with 99231, 99232, 99233.				
▲99238	F10	Hospital inpatient or observation discharge day management**;** 30 minutes or less	XXX	Resurvey for January 2022 (2021 work RVU = 1.28)
▲99239	F11	more than 30 minutes ~~(These codes are to be utilized to report all services provided to a patient on the date of discharge, if other than the initial date of inpatient or observation status. To report services to a patient who is admitted as an inpatient and discharged on the same date, see codes 99234, 99235, 99236 for observation or inpatient hospital care including the admission and discharge of the patient on the same date. To report concurrent care services provided by an individual other than the physician or qualified health care professional performing the discharge day management service, use subsequent hospital care codes [99231-99233] on the day of discharge.)~~ ~~(For Observation Care Discharge, use 99217)~~ (For hospital inpatient or observation ~~or inpatient hospital~~ care including the admission and discharge of the patient on the same date, see 99234-99236) ~~(For Nursing Facility Care Discharge, see 99315, 99316)~~ *(For discharge services provided to newborns admitted and discharged on the same date, use 99463)*	XXX	Resurvey for January 2022 (2021 work RVU = 1.90)

AMA/Specialty Society RVS Update Committee Summary of Recommendations

October 2021

Consultations – Tab 11

Following the implementation of the revisions to the Evaluation and Management (E/M) office visits (99201-99215) for the CPT 2021 code set, the CPT/RUC Workgroup on E/M met twelve times in 2020 and early 2021 to standardize the rest of the E/M sections in the CPT code set. The CPT/RUC Workgroup on E/M was committed to changing the current coding and documentation requirements for E/M visits to simplify the work of the health care provider and improve the health of the patient. To achieve these goals, the Workgroup set forth the following guiding principles related to the group's ongoing work product:

1. To decrease administrative burden of documentation and coding and align CPT and CMS whenever possible
2. To decrease the need for audits
3. To decrease unnecessary documentation in the medical record that is not needed for patient care
4. To ensure that payment for E/M is resource-based and that there is no direct goal for payment redistribution between specialties.

In February 2021, the CPT Editorial Panel deleted two consultation codes and revised eight consultation codes to align with the principles included in the office or other outpatient E/M services (99202-99215) by documenting and selecting level of service based on total time or medical decision making.

Similar to the office visits, beginning in 2023, when total time on the date of encounter is used to select the appropriate level of an inpatient consultation or outpatient consultation code, both the face-to-face and non-face-to-face time personally spent by the physician (or other qualified health care professional that is reporting the office visit) assessing the patient are summed to select the appropriate code. The inpatient consultation and outpatient consultation services were surveyed for the October 2021 RUC meeting. The inpatient consultation survey time captured the total time on the date of encounter by calendar date. Aligning with the 2019 office visit survey process, the office or other outpatient consultation survey time captured includes pre-service time 3-days before the date of encounter, intra-service time is all the time on the date of encounter and post-service time is 7-days after the date of encounter.

Office or Other Outpatient Consultations

Although the recommended work RVUs for codes 99242-99245 are not greater than the current values, the specialty societies noted and the RUC agreed that the compelling evidence of change in technology that supported the increased work RVUs for the office visit codes (99202-99215) also provides support for an increase in intensity of work for office consultation codes. Specifically, According to National Medical Ambulatory Care Survey (NAMCS) data, in 2015, 76% of all practices used electronic health records exclusively, 11% used them partially, and 12% used only paper records. In 2008 the corresponding numbers were 29%, 17%, and 53%. All remarkable differences demonstrating that the technology used to deliver office-based care has changed dramatically. This is confirmed by the CDC, which estimates that use of an EHR increased from 35% in 2007 to 87% in 2015. The EHR contains more data than paper records, most of which must be reviewed including for drug-drug and, with increasing use of homeopathic substances, drug substance interactions. In addition, the presenters provided information that consultations carry

more liability due to the expert opinion provided. Since the inception of the Medicare Physician Fee Schedule, the work RVUs for the office consultation codes have always been higher than the office visit E/M codes; the Harvard study acknowledged a relative difference in work in 1991 and the RUC confirmed a relative difference in work in 2006.

99242 ***Office or other outpatient consultation for a new or established patient, which requires a medically appropriate history and/or examination and straightforward medical decision making. When using total time on the date of the encounter for code selection, 20 minutes must be met or exceeded.***
The RUC reviewed the survey results from 213 physicians and other qualified health care professionals and determined the survey median work RVU of 1.08 appropriately accounts for the physician work required to perform this service. The RUC recommends 30 minutes total time. The RUC noted that CPT code 99241 has been deleted and some or all its previous utilization will now be reported with CPT code 99242. The 2009 Medicare utilization of CPT code 99241 was only 21 percent of that of the Medicare utilization for 99242, thus the typical patient for a 99242 will not change.

The specialties noted, and the RUC concurred, that office or other outpatient consultation codes should be valued somewhat higher than the analogous office or other outpatient new patient visit with the same level of medical decision making to account for the work of generating and sending a written report to the requesting physician. The report would provide recommendations for the management of the patient and identify additional labs, imaging and/or tests.

To justify a work RVU of 1.08, the RUC compared the surveyed code to the top key reference service 99202 *Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and straightforward medical decision making. When using time for code selection, 15-29 minutes of total time is spent on the date of the encounter* (work RVU = 0.93, 20 minutes total time) and determined that CPT code 99242 typically requires more physician work and time, thus would be valued appropriately with a work value of 1.08. The RUC also compared the surveyed code to MPC code 99213 *Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and low level of medical decision making. When using time for code selection, 20-29 minutes of total time is spent on the date of the encounter.* (work RVU= 1.30, 30 minutes total time) and noted that although both services involve an identical amount of total time, the surveyed code involves a lower level of medical decision making relative to the reference code (straightforward vs. low), and therefore would have appropriate relativity with this reference service. **The RUC recommends a work RVU of 1.08 for CPT code 99242.**

99243 ***Office or other outpatient consultation for a new or established patient, which requires a medically appropriate history and/or examination and low level of medical decision making. When using total time on the date of the encounter for code selection, 30 minutes must be met or exceeded.***
The RUC reviewed the survey results from 234 physicians and other qualified health care professionals and determined that the survey median work RVU of 1.80 appropriately accounts for the physician work required to perform this service. The RUC recommends 44 minutes total time.

The specialties noted, and the RUC concurred, that office or other outpatient consultation codes should be valued somewhat higher than the analogous office or other outpatient new patient visit with the same level of medical decision making to account for the work of generating and

sending a written report to the requesting physician. The report would provide recommendations for the management of the patient and identify additional labs, imaging and/or tests.

To justify a work RVU of 1.80, the RUC compared the surveyed code to the top key reference service 99203 *Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and low level of medical decision making. When using time for code selection, 30-44 minutes of total time is spent on the date of the encounter.* (work RVU = 1.60, 35 minutes total time) and determined that CPT code 99243 typically requires more physician work and time, thus would be valued appropriately higher with a work value of 1.80. The RUC also compared the surveyed code to the second top key reference code 99213 *Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and low level of medical decision making. When using time for code selection, 20-29 minutes of total time is spent on the date of the encounter.* (work RVU= 1.30, 30 minutes total time) and noted that the surveyed code involves 14 more minutes of total time and both services are for a low level of medical decision making. In addition, surveyed code 99243 is typically for a new patient, whereas reference code 99213 is for an established patient. The RUC concurred that assigning 99243 a value of 1.80 would maintain relativity with the current value for 99213. **The RUC recommends a work RVU of 1.80 for CPT code 99243.**

99244 ***Office or other outpatient consultation for a new or established patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. When using total time on the date of the encounter for code selection, 40 minutes must be met or exceeded.***

The RUC reviewed the survey results from 248 physicians and other qualified health care professionals and determined that a work RVU of 2.69, a value between the survey 25th percentile and survey median would most appropriately account for the physician work required to perform this service. The RUC recommends 60 minutes total time.

After thorough discussion, the RUC recommends a direct work RVU crosswalk to CPT code 93315 *Transesophageal echocardiography for congenital cardiac anomalies; including probe placement, image acquisition, interpretation and report* (work RVU= 2.69, intra-service time of 40 minutes, total time of 65 minutes), agreeing that both services involve similar total time and similar relative physician work. The RUC also compared the surveyed code to top key reference code 99204 *Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. When using time for code selection, 45-59 minutes of total time is spent on the date of the encounter* (work RVU= 2.60, total time of 60 minutes) and concurred that 99244 should be valued with a slightly higher intensity and higher work RVU relative to 99204 and referenced that 63 percent of the survey respondents that selected this top key reference service had indicated that 99244 is more intense/complex.

The specialties noted, and the RUC concurred, that office or other outpatient consultation codes should be valued somewhat higher than the analogous office or other outpatient new patient visit with the same level of medical decision making to account for the work of generating and sending a written report to the requesting physician. The report would provide recommendations for the management of the patient and identify additional labs, imaging and/or tests. The specialties also noted that a consultation typically involves a greater amount of data to review at the moderate level decision-making level relative to the analogous new patient office visit code 99204. The RUC concluded that CPT code 99244 should be valued based on a direct work RVU crosswalk to CPT code 93315 which falls between the median and 25th percentile as supported by the survey. **The RUC recommends a work RVU of 2.69 for CPT code 99244.**

99245 ***Office or other outpatient consultation for a new or established patient, which requires a medically appropriate history and/or examination and high level of medical decision making. When using total time on the date of the encounter for code selection, 55 minutes must be met or exceeded.***
The RUC reviewed the survey results from 231 physicians and other qualified health care professionals and determined that the survey median work RVU of 3.75 appropriately accounts for the physician work required to perform this service. The RUC recommends 87 minutes total time.

To justify a work RVU of 3.75, the RUC compared the surveyed code to top key reference code 99205 *Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and high level of medical decision making. When using time for code selection, 60-74 minutes of total time is spent on the date of the encounter* (work RVU= 3.50, total time of 88 minutes) and concurred that 99245 should be valued with a slightly higher intensity relative to 99205 and referenced that 67 percent of the survey respondents that selected this top key reference service had indicated that 99245 is more intense/complex. The specialties noted, and the RUC concurred, that office or other outpatient consultation codes should be valued somewhat higher than the analogous office or other outpatient new patient visit with the same level of medical decision making to account for the work of generating and sending a written report to the requesting physician. The report would provide recommendations for the management of the patient and identify additional labs, imaging and/or tests. The specialties also noted that a consultation typically involves a greater amount of data to review at the high-level decision-making level relative to the analogous new patient office visit code 99205.

The RUC referenced CPT code 95720 *Electroencephalogram (EEG), continuous recording, physician or other qualified health care professional review of recorded events, analysis of spike and seizure detection, each increment of greater than 12 hours, up to 26 hours of EEG recording, interpretation and report after each 24-hour period; with video (VEEG)* (work RVU= 3.86, intra-service time of 55 minutes, total time of 75 minutes) and CPT code 44390 *Colonoscopy through stoma; with removal of foreign body(s)* (work RVU= 3.74, intra-service time of 35 minutes, total time of 77 minutes) and noted that the surveyed code involves more total time, though a similar amount of physician work to these reference services. **The RUC recommends a work RVU of 3.75 for CPT code 99245.**

Inpatient and Observation Consultations
In October 2021, the RUC referred the inpatient and observation consultation services to be resurveyed, because the survey did not include a request for distinct time before and after floor/unit time, and therefore could not be compared to previous RUC surveys of these services. The specialty societies will revise their survey instrument by working with the Research Subcommittee. **The RUC will review the inpatient consultation services CPT codes 99252, 99253, 99254 and 99255 at the January 2022 RUC meeting.**

CPT Descriptor Time for Outpatient Consultations
The RUC recommends the following total times on the date of encounter for the outpatient consultation CPT descriptors based on the survey medians. The times in the CPT descriptors are rounded or incremental between this family of services for the ease of those who may report these services based on time.

CPT Code		Time on the Date of Encounter Recommendation to CPT
99242	Office or Other Outpatient Consultation, new or est pt, straightforward MDM	20
99243	Office or Other Outpatient Consultation, new or est pt, low MDM	30
99244	Office or Other Outpatient Consultation, new or est pt, moderate MDM	40
99245	Office or Other Outpatient Consultation, new or est pt, high MDM	55

Practice Expense

The Practice Expense Subcommittee reviewed the direct practice expense inputs for outpatient consultation and made no modifications. **The RUC recommends the outpatient consultation direct practice expense inputs as submitted by the specialty societies.** The practice expense for the inpatient consultation codes will be reviewed at the January 2022 RUC meeting.

Work Neutrality

Based on the 2009 Medicare utilization data from when these services were last covered by Medicare, the RUC's recommendation for this family of codes would have resulted in an overall work savings.

CPT Code	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
Evaluation and Management **Consultations** A consultation is a type of evaluation and management service provided at the request of another physician, other qualified health care professional, or appropriate source to ~~either~~ recommend care for a specific condition or problem ~~or to determine whether to accept responsibility for ongoing management of the patient's entire care or for the care of a specific condition or problem~~. A physician or other qualified health care professional consultant may initiate diagnostic and/or therapeutic services at the same or subsequent visit. A "consultation" initiated by a patient and/or family, and not requested by a physician, other qualified health care professional, or other appropriate source (eg, ~~physician assistant, nurse practitioner, doctor of chiropractic, physical therapist, occupational therapist, speech-language pathologist, psychologist,~~ non-clinical social worker, educator, lawyer, or insurance company), is not reported using the consultation codes ~~but may be reported using the office visit, home service, or domiciliary/rest home care codes as appropriate~~.				

~~The written or verbal request for consult may be made by a physician or other appropriate source and documented in the patient's medical record by either the consulting or requesting physician or appropriate source.~~ The consultant's opinion and any services that were ordered or performed must also be ~~documented in the patient's medical record and~~ communicated by written report to the requesting physician, other qualified health care professional, or other appropriate source.

If a consultation is mandated (eg, by a third-party payer) modifier 32 should also be reported.

~~Any specifically identifiable procedure (ie, identified with a specific CPT code) performed on or subsequent to the date of the initial consultation should be reported separately.~~

~~If subsequent to the completion of a consultation the consultant assumes responsibility for management of a portion or all of the patient's condition(s), the appropriate **Evaluation and Management** services code for the site of service should be reported. In the hospital or nursing facility setting, the consultant should use the appropriate inpatient consultation code for the initial encounter and then subsequent hospital or nursing facility care codes. In the office setting, the consultant should use the appropriate office or other outpatient consultation codes and then the established patient office or other outpatient services codes.~~

To report services when ~~provided to~~ a patient ~~who~~ is admitted to ~~a~~ hospital inpatient, or observation status, or to a nursing facility in the course of an encounter in another setting ~~the office or other ambulatory facility~~, see ~~the notes for~~ **Initial Hospital Inpatient or Observation Care** ~~(page 23)~~ or **Initial Nursing Facility Care** ~~(page 33)~~.

For definitions of ~~key components and~~ commonly used terms, ~~please~~ see **Evaluation and Management Services Guidelines.**

Office or Other Outpatient Consultations
New or Established Patient

The following codes may be ~~are~~ used to report consultations ~~to new patients~~ that are provided in the office or other outpatient site ~~in an outpatient or other ambulatory facility, including hospital observation services~~, including the home or residence, ~~services, domiciliary, rest home,~~ or emergency department ~~(see the preceding consultation definition above)~~. Follow-up visits in the consultant's office or other outpatient facility that are initiated by the consultant or patient are reported using the appropriate codes for established patients in the office ~~visits~~ (99212, 99213, 99214, ~~-~~99215), home, or residence (99347, 99348, 99349, 99350)~~, domiciliary, rest If an additional request for an opinion or advice regarding the same or a new problem is received from another physician, or other appropriate source and documented in the medical record, the office consultation codes may be used again~~.

Services that constitute transfer of care (ie, are provided for the management of the patient's entire care or for the care of a specific condition or problem) are reported with the appropriate new or established patient codes for office or other outpatient visits, ~~domiciliary, rest home services,~~ or home or residence services.

(For an outpatient consultation requiring prolonged services, use 99417)

~~***Coding Tip***~~

~~Definition of Transfer of Care~~

~~Transfer of care is the process whereby a physician or other qualified health care professional who is providing management for some or all of a patient's problems relinquishes this responsibility to another physician or other qualified health care professional who explicitly agrees to accept this responsibility and who, from the initial encounter, is not providing consultative services. The physician or other qualified health care professional transferring care is then no longer providing care for these problems though he or she may continue providing care for other conditions when appropriate. Consultation codes should not be reported by the physician or other qualified health care professional who has agreed to accept transfer of care before an initial evaluation but are appropriate to report if the decision to accept transfer of care cannot be made until after the initial consultation evaluation, regardless of site of service.~~

~~CPT Coding Guidelines, Evaluation and Management, Guidelines Common to All E/M Services, Concurrent Care and Transfer of Care~~

~~99241~~	-	~~**Office consultation** for a new or established patient, which requires these 3 key components:~~ • ~~**A problem focused history;**~~ • ~~**A problem focused examination; and**~~ • ~~**Straightforward medical decision making.**~~ ~~Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs.~~ ~~Usually, the presenting problem(s) are self limited or minor. Typically, 15 minutes are spent face-to-face with the patient and/or family.~~ (99241 has been deleted. To report, use 99242)	~~XXX~~	~~N/A~~
▲99242	G1	**Office or other outpatient consultation** for a new or established patient, which requires a medically appropriate history and/or examination and straightforward medical decision making. ~~these 3 key components:~~ • ~~**An expanded problem focused history;**~~ • ~~**An expanded problem focused examination; and**~~ • ~~**Straightforward medical decision making.**~~ ~~Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs.~~ ~~Usually, the presenting problem(s) are of low severity. Typically, 30 minutes are spent face-to-face with the patient and/or family.~~ When using total time on the date of the encounter for code selection, 20 minutes must be met or exceeded.	XXX	1.08

▲99243	G2	**Office <u>or other outpatient</u> consultation** for a new or established patient, which requires <u>a medically appropriate history and/or examination and low level of medical decision making.</u> ~~these 3 key components:~~ • ~~**A detailed history;**~~ • ~~**A detailed examination; and**~~ • ~~**Medical decision making of low complexity.**~~ ~~Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs.~~ ~~Usually, the presenting problem(s) are of moderate severity. Typically, 40 minutes are spent face-to-face with the patient and/or family.~~ <u>When using total time on the date of the encounter for code selection, 30 minutes must be met or exceeded.</u>	XXX	1.80

▲99244	G3	**Office <u>or other outpatient</u> consultation** for a new or established patient, which requires <u>a medically appropriate history and/or examination and moderate level of medical decision making.</u> ~~these 3 key components:~~ ~~• **A comprehensive history;**~~ ~~• **A comprehensive examination; and**~~ ~~• **Medical decision making of moderate complexity.**~~ ~~Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs.~~ ~~Usually, the presenting problem(s) are of moderate to high severity. Typically, 60 minutes are spent face-to-face with the patient and/or family.~~ <u>When using total time on the date of the encounter for code selection, 40 minutes must be met or exceeded.</u>	XXX	2.69

▲99245	G4	**Office or other outpatient consultation** for a new or established patient, which requires a medically appropriate history and/or examination and high level of medical decision making. ~~these 3 key components:~~ ~~• **A comprehensive history;**~~ ~~• **A comprehensive examination; and**~~ ~~• **Medical decision making of high complexity.**~~ ~~Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs.~~ ~~Usually, the presenting problem(s) are of moderate to high severity. Typically, 80 minutes are spent face-to-face with the patient and/or family.~~ When using total time on the date of the encounter for code selection, 55 minutes must be met or exceeded. (For services 70 minutes or longer, use prolonged services code 99417)	XXX	3.75

Inpatient or Observation Consultations
New or Established Patient

~~The following~~ ~~c~~Codes 99252, 99253, 99254, 99255 are used to report physician or other qualified health care professional consultations provided to hospital inpatients, observation level patients, residents of nursing facilities, or patients in a partial hospital setting and when the patient has not received any face-to-face professional services from the physician or other qualified health care professional or another physician or other qualified health care professional of the exact same specialty and subspecialty who belongs to the same group practice during the stay. When advanced practice nurses and physician assistants are working with physicians they are considered as working in the exact same specialty and subspecialty as the physician.

Only one consultation ~~should~~ may be reported by a consultant per admission. Subsequent consultation services during the same admission are reported using subsequent hospital inpatient or observation care codes (99231-99233) or subsequent nursing facility care codes (99307-99310).~~, including services to complete the initial consultation, monitor progress, revise recommendations, or address a new problem. Use subsequent hospital care codes (99231-99233) or subsequent nursing facility care codes (99307-99310) to report transfer of care services (see page 5, Concurrent Care and Transfer of Care definitions).~~

~~When an inpatient consultation is performed on a date that a patient is admitted to a hospital or nursing facility all evaluation and management services provided by the consultant related to the admission are reported with the inpatient consultation service code (99251-99255). If a patient is admitted after an outpatient consultation (office, emergency department, etc), and the patient is not seen on the unit on the date of admission, only report the outpatient consultation code (99241-99245). If the patient is seen by the consultant on the unit on the date of admission, report all evaluation and management services provided by the consultant related to the admission with either the inpatient consultation code (99251-99255) or with the initial inpatient admission service code (99221-99223). Do not report both an outpatient consultation (99241-99245) and inpatient consultation (99251-99255) for services related to the same inpatient stay. When transfer of care services are provided on a date subsequent to the outpatient consultation, use the subsequent hospital care codes (99231-99233) or subsequent nursing facility care codes (99307-99310).~~

(For an inpatient or observation consultation requiring prolonged services, use 993X0)

~~99251~~	-	**~~Inpatient consultation~~** ~~for a new or established patient, which requires these 3 key components:~~ • ~~**A problem focused history;**~~ • ~~**A problem focused examination; and**~~ • ~~**Straightforward medical decision making.**~~ ~~Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs.~~ ~~Usually, the presenting problem(s) are self limited or minor. Typically, 20 minutes are spent at the bedside and on the patient's hospital floor or unit.~~ (99251 has been deleted. To report, use 99252)	~~XXX~~	~~N/A~~
▲99252	G5	**Inpatient or observation consultation** for a new or established patient, which requires a medically appropriate history and/or examination and straightforward medical decision making. ~~these 3 key components:~~ • ~~**An expanded problem focused history;**~~ • ~~**An expanded problem focused examination; and**~~ • ~~**Straightforward medical decision making.**~~ ~~Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs.~~ ~~Usually, the presenting problem(s) are of low severity. Typically, 40 minutes are spent face-to-face with the patient and/or family.~~ When using total time on the date of the encounter for code selection, XX minutes must be met or exceeded.	XXX	Resurvey for January 2022 (2021 work RVU = 1.50)

▲99253	G6	**Inpatient or observation consultation** for a new or established patient, which requires t a medically appropriate history and/or examination and low level of medical decision making. ~~these 3 key components:~~ • ~~**A detailed history;**~~ • ~~**A detailed examination; and**~~ • ~~**Medical decision making of low complexity.**~~ ~~Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs.~~ ~~Usually, the presenting problem(s) are of moderate severity. Typically, 55 minutes are spent face-to-face with the patient and/or family.~~ When using total time on the date of the encounter for code selection, XX minutes must be met or exceeded.	XXX	Resurvey for January 2022 (2021 work RVU = 2.27)

▲99254	G7	**Inpatient or observation consultation** for a new or established patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. ~~these 3 key components:~~ ~~• **A comprehensive history;**~~ ~~• **A comprehensive examination; and**~~ ~~• **Medical decision making of moderate complexity.**~~ ~~Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs.~~ ~~Usually, the presenting problem(s) are of moderate to high severity. Typically, 80 minutes are spent face-to-face with the patient and/or family.~~ When using total time on the date of the encounter for code selection, XX minutes must be met or exceeded.	XXX	Resurvey for January 2022 (2021 work RVU = 3.29)

▲99255	G8	**Inpatient <u>or observation</u> consultation** for a new or established patient, which requires <u>a medically appropriate history and/or examination and high level of medical decision making.</u> ~~these 3 key components:~~ • ~~**A comprehensive history;**~~ • ~~**A comprehensive examination; and**~~ • ~~**Medical decision making of high complexity.**~~ ~~Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs.~~ ~~Usually, the presenting problem(s) are of moderate to high severity. Typically, 110 minutes are spent face-to-face with the patient and/or family.~~ <u>When using total time on the date of the encounter for code selection, XX minutes must be met or exceeded.</u> <u>(For services ZZ minutes or longer, use prolonged services code 993X0)</u>	XXX	Resurvey for January 2022 (2021 work RVU = 4.00)

CPT 2023 E/M Guidelines

Category I
Evaluation and Management (E/M) Services Guidelines

In addition to the information presented in the Introduction, several other items unique to this section are defined or identified here.

E/M Guidelines Overview

The E/M guidelines have sections that are common to all E/M categories and sections that are category specific. Most of the categories and many of the subcategories of service have special guidelines or instructions unique to that category or subcategory. Where these are indicated, eg, "Hospital Inpatient and Observation Care," special instructions are presented before the listing of the specific E/M services codes. It is important to review the instructions for each category or subcategory. These guidelines are to be used by the reporting physician or other qualified health care professional to select the appropriate level of service. These guidelines do not establish documentation requirements or standards of care. The main purpose of documentation is to support care of the patient by current and future health care team(s). These guidelines are for services that require a face-to-face encounter. (For 99211 and 99281 the face-to-face services may be performed by clinical staff).

In the **Evaluation and Management** section (99202-99499) there are many code categories. Each category may have specific guidelines, or the codes may include specific details. These E/M guidelines are written for the following categories:

- Office or Other Outpatient Services
- Hospital Inpatient and Observation Care Services
- Consultations
- Emergency Department Services
- Nursing Facility Services
- Home and Residence Services
- Prolonged Service With or Without Direct Contact on the Date of an Evaluation and Management Service

Classification of Evaluation and Management (E/M) Services

The E/M section is divided into broad categories such as office visits, hospital inpatient or observation care visits, and consultations. Most of the categories are further divided into two or more subcategories of E/M services. For example, there are two subcategories of office visits (new patient and established patient) and there are two subcategories of hospital inpatient and observation care visits (initial and subsequent). The subcategories of E/M services are further classified into levels of E/M services that are identified by specific codes.

The basic format of codes with levels of E/M services based on medical decision making (MDM) or time is the same. First, a unique code number is listed. Second, the place and/or type of service is specified, eg, office or other outpatient visit. Third, the content of the service is defined. Fourth, time is specified. (A detailed discussion of time is provided following the Decision Tree for New vs Established Patients.)

The place of service and service type is defined by the location where the face-to-face encounter occurs. For example, service provided to a nursing facility resident brought to the office is reported with an office or other outpatient code.

New and Established Patients

Solely for the purposes of distinguishing between new and established patients, professional services are those face-to-face services rendered by physicians and other qualified health care professionals who may report evaluation and management services. A new patient is one who has not received any professional services from the physician or other qualified health care professional or another physician or other qualified health care professional of the exact same specialty and subspecialty who belongs to the same group practice, within the past three years.

An established patient is one who has received professional services from the physician or other qualified health care professional or another physician or other qualified health care professional of the exact same specialty and subspecialty who belongs to the same group practice, within the past three years. See Decision Tree for New vs Established Patients.

In the instance where a physician or other qualified health care professional is on call for or covering for another physician or other qualified health care professional, the patient's encounter will be classified as it would have been by the physician or other qualified health care professional who is not available. When advanced practice nurses and physician assistants are working with physicians, they are considered as working in the exact same specialty and subspecialty as the physician.

No distinction is made between new and established patients in the emergency department. E/M services in the emergency department category may be reported for any new or established patient who presents for treatment in the emergency department.

The Decision Tree for New vs Established Patients is provided to aid in determining whether to report the E/M service provided as a new or an established patient encounter.

Coding Tip

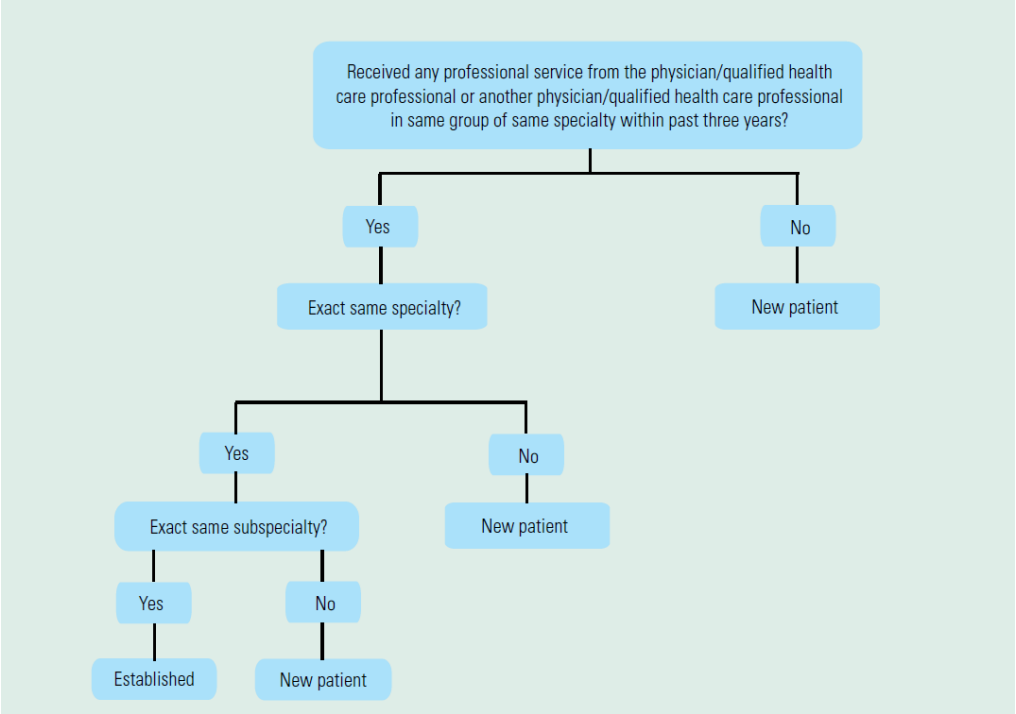
Instructions for Use of the CPT Codebook

When advanced practice nurses and physician assistants are working with physicians, they are considered as working in the exact same specialty and exact same subspecialty as the physician. A "physician or other qualified health care professional" is an individual who is qualified by education, training, licensure/regulation (when applicable), and facility privileging (when applicable) who performs a professional service within his or her scope of practice and independently reports that professional service. These professionals are distinct from "clinical staff." A clinical staff member is a person who works under the supervision of a physician or other qualified health care professional, and who is allowed by law, regulation and facility policy to perform or assist in the performance of a specific professional service but does not individually report that professional service. Other policies may also affect who may report specific services.

CPT Coding Guidelines, Introduction, Instructions for Use of the CPT Codebook

---

Decision Tree for New vs Established Patients



Initial and Subsequent Services

Some categories apply to both new and established patients (eg, hospital inpatient or observation care). These categories differentiate services by whether the service is the initial service or a subsequent service. For the purpose of distinguishing between initial or subsequent visits, professional services are those face-to-face services rendered by physicians and other qualified health care professionals who may report evaluation and management services. An initial service is when the patient has not received any professional services from the physician or other qualified health care professional or another physician or other qualified health care professional of the exact same specialty and subspecialty who belongs to the same group practice, during the inpatient or observation or nursing facility admission and stay.

A subsequent service is when the patient has received professional service(s) from the physician or other qualified health care professional or another physician or other qualified health care professional of the exact same specialty and subspecialty who belongs to the same group practice, during the admission and stay.

In the instance where a physician or other qualified health care professional is on call for or covering for another physician or other qualified health care professional, the patient's encounter will be classified as it would have been by the physician or other qualified health care professional who is not available. When advanced practice nurses and physician assistants are working with physicians, they are considered as working in the exact same specialty and subspecialty as the physician.

For reporting hospital inpatient or observation care services, a stay that includes a transition from observation to inpatient is a single stay. For reporting nursing facility services, a stay that includes transition(s) between skilled nursing facility and nursing facility level of care is the same stay.

Services Reported Separately

Any specifically identifiable procedure or service (ie, identified with a specific CPT code) performed on the date of E/M services may be reported separately.

The ordering and actual performance and/or interpretation of diagnostic tests/studies during a patient encounter are not included in determining the levels of E/M services when the professional interpretation

of those tests/studies is reported separately by the physician or other qualified health care professional reporting the E/M service. Tests that do not require separate interpretation (eg, tests that are results only) and are analyzed as part of MDM do not count as an independent interpretation and may be counted as ordered or reviewed for selecting an MDM level.

The performance of diagnostic tests/studies for which specific CPT codes are available may be reported separately, in addition to the appropriate E/M code. The interpretation of the results of diagnostic tests/studies (ie, professional component) with preparation of a separate distinctly identifiable signed written report may also be reported separately, using the appropriate CPT code and, if required, with modifier 26 appended.

See Instructions for Selecting a Level Based on MDM or Time.

The physician or other qualified health care professional may need to indicate that on the day a procedure or service identified by a CPT code was performed, the patient's condition required a significant separately identifiable E/M service. The E/M service may be caused or prompted by the symptoms or condition for which the procedure and/or service was provided. This circumstance may be reported by adding modifier 25 to the appropriate level of E/M service. As such, different diagnoses are not required for reporting of the procedure and the E/M services on the same date.

History and/or Examination

These E/M services include a medically appropriate history and/or physical examination, when performed. The nature and extent of the history and/or physical examination are determined by the treating physician or other qualified health care professional reporting the service. The care team may collect information, and the patient or caregiver may supply information directly (eg, by electronic health record [EHR] portal or questionnaire) that is reviewed by the reporting physician or other qualified health care professional. The extent of history and physical examination is not an element in selection of the level of these E/M service codes.

Levels of E/M Services

Select the appropriate level of E/M services based on the following:

1. The level of the MDM as defined for each service, **or**

2. The total time for E/M services performed on the date of the encounter.

Within each category or subcategory of E/M service based on MDM or time, there are three to five levels of E/M services available for reporting purposes. Levels of E/M services are **not** interchangeable among the different categories or subcategories of service. For example, the first level of E/M services in the subcategory of office visit, new patient, does not have the same definition as the first level of E/M services in the subcategory of office visit, established patient. Each level of E/M services may be used by all physicians or other qualified health care professionals.

Guidelines for Selecting a level service based on Medical Decision Making

Four types of MDM are recognized: straightforward, low, moderate, and high. The concept of the level of MDM does not apply to 99211 or 99281.

MDM includes establishing diagnoses, assessing the status of a condition, and/or selecting a management option. MDM is defined by three elements. The elements are:

- ***The number and complexity of problem(s) that are addressed during the encounter***.
- ***The amount and/or complexity of data to be reviewed and analyzed.*** These data include medical records, tests, and/or other information that must be obtained, ordered, reviewed, and analyzed for the encounter. This includes information obtained from multiple sources or interprofessional communications that are not reported separately and interpretation of tests that are not reported

separately. Ordering a test is included in the category of test result(s) and the review of the test result is part of the encounter and not a subsequent encounter. Ordering a test may include those considered, but not selected after shared decision making. For example, a patient may request diagnostic imaging that is not necessary for their condition and discussion of the lack of benefit may be required. Alternatively, a test may normally be performed, but due to risk for a specific patient is not ordered. These considerations must be documented. Data are divided into three categories:

- Tests, documents, orders, or independent historian(s). (Each unique test, order, or document is counted to meet a threshold number.)
- Independent interpretation of tests (not separately reported)
- Discussion of management or test interpretation with external physician or other qualified health care professional or appropriate source (not separately reported)

- **The risk of complications and/or morbidity or mortality of patient management:** This includes decisions made at the encounter associated with the diagnostic procedure(s) and treatment(s). This includes the possible management options selected and those considered but not selected, after shared decision making with the patient and/or family. For example, a decision about hospitalization includes consideration of alternative levels of care. Examples may include a psychiatric patient with a sufficient degree of support in the outpatient setting or the decision to not hospitalize a patient with advanced dementia with an acute condition that would generally warrant inpatient care, but for whom the goal is palliative treatment.

Shared decision making involves eliciting patient and/or family preferences, patient and/or family education, and explaining risks and benefits of management options.

MDM may be impacted by role and management responsibility.

When the physician or other qualified health care professional is reporting a separate CPT code that includes interpretation and/or report, the interpretation and/or report is not counted toward the MDM when selecting a level of E/M services.

When the physician or other qualified health care professional is reporting a separate service for discussion of management with a physician or another qualified health care professional, the discussion is not counted toward the MDM when selecting a level of E/M services.

The Levels of Medical Decision Making (MDM) table (Table 2) is a guide to assist in selecting the level of MDM for reporting an E/M services code. The table includes the four levels of MDM (ie, straightforward, low, moderate, high) and the three elements of MDM (ie, number and complexity of problems addressed at the encounter, amount and/or complexity of data reviewed and analyzed, and risk of complications and/or morbidity or mortality of patient management). To qualify for a particular level of MDM, two of the three elements for that level of MDM must be met or exceeded.

Examples in the table may be more or less applicable to specific settings of care. For example, the decision to hospitalize applies to the outpatient or nursing facility encounters, whereas the decision to escalate hospital level of care (eg, transfer to ICU) applies to the hospitalized or observation care patient.

See also the introductory guidelines of each code family section.

Table 2: Levels of Medical Decision Making (MDM)

Level of MDM (Based on 2 out of 3 Elements of MDM)	Elements of Medical Decision Making		
	Number and Complexity of Problems Addressed at the Encounter	Amount and/or Complexity of Data to be Reviewed and Analyzed **Each unique test, order, or document contributes to the combination of 2 or combination of 3 in Category 1 below.*	Risk of Complications and/or Morbidity or Mortality of Patient Management
N/A	N/A	N/A	N/A
Straightforward	Minimal • 1 self-limited or minor problem	Minimal or none	Minimal risk of morbidity from additional diagnostic testing or treatment
Low	Low • 2 or more self-limited or minor problems; or • 1 stable, chronic illness; or • 1 acute, uncomplicated illness or injury or • 1 stable acute illness or • 1 acute, uncomplicated illness or injury requiring hospital inpatient or observation level of care	Limited *(Must meet the requirements of at least 1 of the 2 categories*) Category 1: Tests and documents • Any combination of 2 from the following: ○ Review of prior external note(s) from each unique source*; ○ Review of the result(s) of each unique test*; ○ Ordering of each unique test* or Category 2: Assessment requiring an independent historian(s) *(For the categories of independent interpretation of tests and discussion of management or test interpretation, see moderate or high)*	Low risk of morbidity from additional diagnostic testing or treatment

Moderate	Moderate
	• 1 or more chronic illnesses with exacerbation, progression, or side effects of treatment;
	or
	• 2 or more stable, chronic illnesses;
	or
	• 1 undiagnosed new problem with uncertain prognosis;
	or
	• 1 acute illness with systemic symptoms;
	or
	• 1 acute, complicated injury
		Moderate
		(Must meet the requirements of at least 1 out of 3 categories)
		Category 1: Tests, documents, or independent historian(s)
		• Any combination of 3 from the following:
		  ○ Review of prior external note(s) from each unique source*;
		  ○ Review of the result(s) of each unique test*;
		  ○ Ordering of each unique test*;
		  ○ Assessment requiring an independent historian(s)
		or
		Category 2: Independent interpretation of tests
		• Independent interpretation of a test performed by another physician/other qualified health care professional (not separately reported);
		or
		Category 3: Discussion of management or test interpretation
		• Discussion of management or test interpretation with external physician/other qualified health care professional/appropriate source (not separately reported)
			Moderate risk of morbidity from additional diagnostic testing or treatment
			
			Examples only:
			• Prescription drug management
			• Decision regarding minor surgery with identified patient or procedure risk factors
			• Decision regarding elective major surgery without identified patient or procedure risk factors
			• Diagnosis or treatment significantly limited by social determinants of health

High	High
	• 1 or more chronic illnesses with severe exacerbation, progression, or side effects of treatment;
	or
	• 1 acute or chronic illness or injury that poses a threat to life or bodily function
		Extensive
		(Must meet the requirements of at least 2 out of 3 categories)
		
		Category 1: Tests, documents, or independent historian(s)
		• Any combination of 3 from the following:
		  ○ Review of prior external note(s) from each unique source*;
		  ○ Review of the result(s) of each unique test*;
		  ○ Ordering of each unique test*;
		  ○ Assessment requiring an independent historian(s)
		or
		Category 2: Independent interpretation of tests
		• Independent interpretation of a test performed by another physician/other qualified health care professional (not separately reported);
		or
		Category 3: Discussion of management or test interpretation
		• Discussion of management or test interpretation with external physician/other qualified health care professional/appropriate source (not separately reported)
			High risk of morbidity from additional diagnostic testing or treatment
			
			Examples only:
			• Drug therapy requiring intensive monitoring for toxicity
			• Decision regarding elective major surgery with identified patient or procedure risk factors
			• Decision regarding emergency major surgery
			• Decision regarding hospitalization or escalation of hospital-level of care
			• Decision not to resuscitate or to de-escalate care because of poor prognosis
			• Parenteral controlled substances

Number and Complexity of Problems Addressed at the Encounter

One element used in selecting the level of services is the number and complexity of the problems that are addressed at the encounter. Multiple new or established conditions may be addressed at the same time and may affect MDM. Symptoms may cluster around a specific diagnosis and each symptom is not necessarily a unique condition. Comorbidities and underlying diseases, in and of themselves, are not considered in selecting a level of E/M services **unless** they are addressed, and their presence increases the amount and/or complexity of data to be reviewed and analyzed or the risk of complications and/or morbidity or mortality of patient management. The final diagnosis for a condition does not, in and of itself, determine the complexity or risk, as extensive evaluation may be required to reach the conclusion that the signs or symptoms do not represent a highly morbid condition. Therefore, presenting symptoms which are likely to represent a highly morbid condition may drive MDM even when the ultimate diagnosis is not highly morbid. The evaluation and /or treatment should be consistent with the likely nature of the condition. Multiple problems of a lower severity may, in the aggregate, create higher risk due to interaction.

The term "risk" as used in these definitions relates to risk from the condition. While condition risk and management risk may often correlate, the risk from the condition is distinct from the risk of the management.

Definitions for the elements of MDM (see Table 2, Levels of Medical Decision Making) are:

Problem: *A problem is a disease, condition, illness, injury, symptom, sign, finding, complaint, or other matter addressed at the encounter, with or without a diagnosis being established at the time of the encounter.*

Problem addressed: A problem is addressed or managed when it is evaluated or treated at the encounter by the physician or other qualified health care professional reporting the service. This includes consideration of further testing or treatment that may not be elected by virtue of risk/benefit analysis or patient/parent/guardian/surrogate choice. Notation in the patient's medical record that another professional is managing the problem without additional assessment or care coordination documented does not qualify as being addressed or managed by the physician or other qualified health care professional reporting the service. Referral without evaluation (by history, examination, or diagnostic study[ies]) or consideration of treatment does not qualify as being addressed or managed by the physician or other qualified health care professional reporting the service. For hospital inpatient and observation care services, the problem addressed is the problem status on the date of the encounter, which may be significantly different than on admission. It is the problem being managed or co-managed by the reporting physician or qualified health care professional and may not be the cause of admission or continued stay.

Minimal problem: A problem that may not require the presence of the physician or other qualified health care professional, but the service is provided under the physician's or other qualified health care professional's supervision (see 99211, 99281).

Self-limited or minor problem: *A problem that runs a definite and prescribed course, is transient in nature, and is not likely to permanently alter health status.*

Stable, chronic illness: A problem with an expected duration of at least one year or until the death of the patient. For the purpose of defining chronicity, conditions are treated as chronic whether or not stage or severity changes (eg, uncontrolled diabetes and controlled diabetes are a single chronic condition). "Stable" for the purposes of categorizing MDM is defined by the specific treatment goals for an individual patient. A patient who is not at his or her treatment goal is not stable, even if the condition has not changed and there is no short-term threat to life or function. For example, a patient with persistently poorly controlled blood pressure for whom better control is a goal is not stable, even if the pressures are not changing and the patient is asymptomatic. The risk of morbidity **without** treatment is significant.

Acute, uncomplicated illness or injury: A recent or new short-term problem with low risk of morbidity for which treatment is considered. There is little to no risk of mortality with treatment, and full recovery without functional impairment is expected. A problem that is normally self-limited or minor but is not resolving consistent with a definite and prescribed course is an acute, uncomplicated illness.

Acute, uncomplicated illness or injury requiring hospital inpatient or observation level care: A recent or new short-term problem with low risk of morbidity for which treatment is required. There is little to no risk of mortality with treatment, and full recovery without functional impairment is expected. The treatment required is delivered in a hospital inpatient or observation level setting.

Stable, acute illness: A problem that is new or recent for which treatment has been initiated. The patient is improved and while resolution may not be complete is stable with respect to this condition.

Chronic illness with exacerbation, progression, or side effects of treatment: A chronic illness that is acutely worsening, poorly controlled, or progressing with an intent to control progression and requiring additional supportive care or requiring attention to treatment for side effects.

Undiagnosed new problem with uncertain prognosis: A problem in the differential diagnosis that represents a condition likely to result in a high risk of morbidity without treatment.

Acute illness with systemic symptoms: An illness that causes systemic symptoms and has a high risk of morbidity without treatment. For systemic general symptoms, such as fever, body aches, or fatigue in a minor illness that may be treated to alleviate symptoms, see the definitions for **self-limited or minor problem** or **acute, uncomplicated illness or injury.** Systemic symptoms may not be general but may be single system.

Acute, complicated injury: An injury which requires treatment that includes evaluation of body systems that are not directly part of the injured organ, the injury is extensive, or the treatment options are multiple and/or associated with risk of morbidity.

Chronic illness with severe exacerbation, progression, or side effects of treatment: The severe exacerbation or progression of a chronic illness or severe side effects of treatment that have significant risk of morbidity and may require escalation in level of care.

Acute or chronic illness or injury that poses a threat to life or bodily function: An acute illness with systemic symptoms, an acute complicated injury, or a chronic illness or injury with exacerbation and/or progression or side effects of treatment, that poses a threat to life or bodily function in the near term without treatment. Some symptoms may represent a condition that is significantly probable and poses a potential threat to life or bodily function. These may be included in this category when the evaluation and treatment is consistent with this degree of potential severity.

Amount and/or Complexity of Data to be Reviewed and Analyzed

One element used in selecting the level of services is the amount and/or complexity of data to be reviewed or analyzed at an encounter.

Analyzed: Analyzed is a term describing the process of using the data as part of the MDM. The data element itself may not be subject to analysis (eg, glucose), but it is instead included in the thought processes for diagnosis, evaluation, or treatment. Tests ordered are presumed to be analyzed when the results are reported. Therefore, when they are ordered during an encounter, they are counted in that encounter. Tests that are ordered outside of an encounter may be counted in the encounter where they are analyzed. In the case of a recurring order, each new result may be counted in the encounter at which it is analyzed. For example, an encounter that includes an order for monthly prothrombin times would count for one prothrombin time ordered and reviewed. Additional future results, if analyzed in a subsequent encounter, may be counted as a single test in that subsequent encounter. Any service for which the professional component is separately reported by the physician or other qualified health care professional

reporting the E/M services is not counted as a data element ordered, reviewed, analyzed, or independently interpreted for the purposes of determining the level of MDM.

Test: Tests are imaging, laboratory, psychometric, or physiologic data. A clinical laboratory panel (eg, basic metabolic panel [80047]) is a single test. The differentiation between single or multiple tests is defined in accordance with the CPT code set. For the purposes of data reviewed and analyzed, pulse oximetry is not a test.

Unique: A unique test is defined by the CPT code set. When multiple results of the same unique test (eg, serial blood glucose values) are compared during an E/M service, only count one unique test. Tests that have overlapping elements are not unique, even if they are identified with distinct CPT codes. For example, a CBC with differential would incorporate the set of hemoglobin, CBC without differential, and platelet count. A unique source is defined as a physician or qualified heath care professional in a distinct group or different specialty or subspecialty, or a unique entity. Review of all materials from any unique source counts as one element towards MDM.

Combination of Data Elements: A combination of different data elements, for example a combination of notes reviewed, tests ordered, tests reviewed, or independent historian, allows these elements to be summed. It does not require each item type or category to be represented. A unique test ordered, plus a note reviewed and an independent historian would be a combination of three elements.

External: *External records, communications and/or test results are from an external physician, other qualified health care professional, facility, or health care organization.*

External physician or other qualified health care professional: *An external physician or other qualified health care professional who is not in the same group practice or is of a different specialty or subspecialty. This includes licensed professionals who are practicing independently. The individual may also be a facility or organizational provider such as from a hospital, nursing facility, or home health care agency.*

Discussion: Discussion requires an interactive exchange. The exchange must be direct and not through intermediaries (eg, clinical staff or trainees). Sending chart notes or written exchanges that are within progress notes does not qualify as an interactive exchange. The discussion does not need to be on the date of the encounter but is counted only once and only when it is used in the decision making of the encounter. It may be asynchronous (ie, does not need to be in person), but it must be initiated and completed within a short time period (eg, within a day or two).

Independent historian(s): An individual (eg, parent, guardian, surrogate, spouse, witness) who provides a history in addition to a history provided by the patient who is unable to provide a complete or reliable history (eg, due to developmental stage, dementia, or psychosis) or because a confirmatory history is judged to be necessary. In the case where there may be conflict or poor communication between multiple historians and more than one historian is needed, the independent historian requirement is met. It does not include translation services. The independent history does not need to be obtained in person but does need to be obtained directly from the historian providing the independent information.

Independent interpretation: The interpretation of a test for which there is a CPT code, and an interpretation or report is customary. This does not apply when the physician or other qualified health care professional who reports the E/M service is reporting or has previously reported the test. A form of interpretation should be documented but need not conform to the usual standards of a complete report for the test.

Appropriate source: *For the purpose of the* ***discussion of management*** *data element (see Table 2, Levels of Medical Decision Making), an appropriate source includes professionals who are not health care professionals but may be involved in the management of the patient (eg, lawyer, parole officer, case manager, teacher). It does not include discussion with family or informal caregivers.*

Risk of Complications and/or Morbidity or Mortality of Patient Management

One element used in selecting the level of services is the risk of complications and/or morbidity or mortality of patient management at an encounter. This is distinct from the risk of the condition itself.

Risk: The probability and/or consequences of an event. The assessment of the level of risk is affected by the nature of the event under consideration. For example, a low probability of death may be high risk, whereas a high chance of a minor, self-limited adverse effect of treatment may be low risk. Definitions of risk are based upon the usual behavior and thought processes of a physician or other qualified health care professional in the same specialty. Trained clinicians apply common language usage meanings to terms such as high, medium, low, or minimal risk and do not require quantification for these definitions (though quantification may be provided when evidence-based medicine has established probabilities). For the purposes of MDM, level of risk is based upon consequences of the problem(s) addressed at the encounter when appropriately treated. Risk also includes MDM related to the need to initiate or forego further testing, treatment, and/or hospitalization. The risk of patient management criteria applies to the patient management decisions made by the reporting physician or other qualified health care professional as part of the reported encounter.

Morbidity: *A state of illness or functional impairment that is expected to be of substantial duration during which function is limited, quality of life is impaired, or there is organ damage that may not be transient despite treatment.*

Social determinants of health: *Economic and social conditions that influence the health of people and communities. Examples may include food or housing insecurity.*

Surgery (minor or major, elective, emergency, procedure or patient risk):

> ***Surgery-Minor or Major:*** The classification of surgery into minor or major is based upon the common meaning of such terms when used by trained clinicians, similar to the use of the term "risk". These terms are not defined by a surgical package classification.
>
> ***Surgery-Elective or Emergency:*** Elective procedures and emergent or urgent procedures describe the timing of a procedure when the timing is related to the patient's condition. An elective procedure is typically planned in advance (eg, scheduled for weeks later), while an emergent procedure is typically performed immediately or with minimal delay to allow for patient stabilization. Both elective and emergent procedures may be minor or major procedures.
>
> ***Surgery-Risk Factors, Patient or Procedure:*** Risk factors are those that are relevant to the patient and procedure. Evidence-based risk calculators may be used, but are not required, in assessing patient and procedure risk.

Drug therapy requiring intensive monitoring for toxicity: A drug that requires intensive monitoring is a therapeutic agent that has the potential to cause serious morbidity or death. The monitoring is performed for assessment of these adverse effects and not primarily for assessment of therapeutic efficacy. The monitoring should be that which is generally accepted practice for the agent but may be patient-specific in some cases. Intensive monitoring may be long-term or short-term. Long-term intensive monitoring is not performed less than quarterly. The monitoring may be performed with a laboratory test, a physiologic test, or imaging. Monitoring by history or examination does not qualify. The monitoring affects the level of MDM in an encounter in which it is considered in the management of the patient. An example may be monitoring for cytopenia in the use of an antineoplastic agent between dose cycles. Examples of monitoring that do not qualify include monitoring glucose levels during insulin therapy, as the primary reason is the therapeutic effect (unless severe hypoglycemia is a current, significant concern); or annual electrolytes and renal function for a patient on a diuretic, as the frequency does not meet the threshold.

Guidelines for Selecting Level of Service Based on Time

Certain categories of time-based E/M codes that do not have levels of services based on MDM (eg, Critical Care Services) in the E/M section use time differently. It is important to review the instructions for each category.

Time is **not** a descriptive component for the emergency department levels of E/M services because emergency department services are typically provided on a variable intensity basis, often involving multiple encounters with several patients over an extended period of time.

When time is used for reporting E/M services codes, the time defined in the service descriptors is used for selecting the appropriate level of services. The E/M services for which these guidelines apply require a face-to-face encounter with the physician or other qualified health care professional. For office or other outpatient services, if the physician's or other qualified health care professional's time is spent in the supervision of clinical staff who perform the face-to-face services of the encounter, use 99211.

For coding purposes, time for these services is the total time on the date of the encounter. It includes both the face-to-face and non-face-to-face time personally spent by the physician and/or other qualified health care professional(s) on the day of the encounter (includes time in activities that require the physician or other qualified health care professional and does not include time in activities normally performed by clinical staff). It does not include any time spent in the performance of other separately reported service(s).

A shared or split visit is defined as a visit in which a physician and other qualified health care professional(s) both provide the face-to-face and non-face-to-face work related to the visit. When time is being used to select the appropriate level of services for which time-based reporting of shared or split visits is allowed, the time personally spent by the physician and other qualified health care professional(s) assessing and managing the patient on the date of the encounter is summed to define total time. Only distinct time should be summed for shared or split visits (ie, when two or more individuals jointly meet with or discuss the patient, only the time of one individual should be counted).

When prolonged time occurs, the appropriate prolonged services code may be reported. The total time on the date of the encounter spent caring for the patient should be documented in the medical record when it is used as the basis for code selection.

Physician or other other qualified health care professional time includes the following activities, when performed:

- preparing to see the patient (eg, review of tests)
- obtaining and/or reviewing separately obtained history
- performing a medically appropriate examination and/or evaluation
- counseling and educating the patient/family/caregiver
- ordering medications, tests, or procedures
- referring and communicating with other health care professionals (when not separately reported)
- documenting clinical information in the electronic or other health record
- independently interpreting results (when not separately reported) and communicating results to the patient family/caregiver
- care coordination (when not separately reported)

Do not count time spent on the following:

- the performance of other services reported separately

- travel
- teaching that is general and not limited to discussion that is required for the management of the specific patient

Unlisted Service

An E/M service may be provided that is not listed in this section of the CPT codebook. When reporting such a service, the appropriate unlisted code may be used to indicate the service, identifying it by "Special Report," as discussed in the following paragraph. The "Unlisted Services" and accompanying codes for the E/M section are as follows:

***99429 Unlisted preventive** medicine service*

***99499 Unlisted evaluation and management** service*

Special Report

An unlisted service or one that is unusual, variable, or new may require a special report demonstrating the medical appropriateness of the service. Pertinent information should include an adequate definition or description of the nature, extent, and need for the procedure and the time, effort, and equipment necessary to provide the service. Additional items that may be included are complexity of symptoms, final diagnosis, pertinent physical findings, diagnostic and therapeutic procedures, concurrent problems, and follow-up care.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:99242 Tracking Number G1 Original Specialty Recommended RVU: **1.08**
Presented Recommended RVU: **1.08**
Global Period: XXX Current Work RVU: **1.34** RUC Recommended RVU: **1.08**

CPT Descriptor: Office or other outpatient consultation for a new or established patient, which requires a medically appropriate history and/or examination and straightforward medical decision making.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A requested office consultation, which includes review of the relevant data and a medically appropriate history and/or examination, is performed. The problem is determined to be self-limited. A report is generated and sent to the requesting provider.

Percentage of Survey Respondents who found Vignette to be Typical: 91%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work:

Description of Intra-Service Work: Physician/QHP typical activities performed within 3 calendar days prior to the Office or Outpatient Consultation and within 7 calendar days after the day of the consultation include: Review the referring physician/QHP request for the consultant's expert opinion regarding evaluation and/or management of a specific medical problem. Document the request for the consultation in the medical record. Obtain and review prior medical records, including labs and imaging, if available. Order and review additional diagnostic labs, imaging and/or other tests, as needed. Incorporate pertinent information into the medical record. Review the medical history forms completed by the patient. Review vital signs obtained by clinical staff. Obtain a medically appropriate history. Perform a medically appropriate examination. Synthesize the relevant history, physical examination and tests to formulate a differential diagnosis requiring straightforward MDM. Discuss the findings with the patient and family and respond to patient and family questions. Document the encounter in the medical record. Perform electronic data capture and reporting to comply with quality payment program and other electronic mandates. Generate and a written report that identifies additional labs, imaging and/or tests ordered and reviewed, test findings and expert opinion for management of the patient to the requesting provider. Document the report in the medical record. Communicate with other members of the health care team regarding the visit. Respond to follow-up questions from the requesting physician/QHP and patient/family.

Modifier -51 Exempt Status
Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? No

TOP KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99202	XXX	0.93	**RUC Time**

CPT Descriptor Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and straightforward medical decision making. When using time for code selection, 15-29 minutes of total time is spent on the date of the encounter.

SECOND HIGHEST KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99212	XXX	0.70	**RUC Time**

CPT Descriptor Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and straightforward medical decision making. When using time for code selection, 10-19 minutes of total time is spent on the date of the encounter.

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99202	XXX	0.93	**RUC Time**	2,490,658

CPT Descriptor 1 Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and straightforward medical decision making. When using time for code selection, 15-29 minutes of total time is spent on the date of the encounter.

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99203	XXX	1.60	**RUC Time**	11,452,897

CPT Descriptor 2 Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and low level of medical decision making. When using time for code selection, 30-44 minutes of total time is spent on the date of the encounter.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	2%	3%	64%	30%	1%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	6%	66%	28%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	4%	81%	16%
Physical effort required	5%	79%	17%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	7%	64%	28%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	6%	58%	31%	6%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	6%	58%	36%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	8%	75%	17%
Physical effort required	8%	75%	17%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	6%	69%	25%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background – Office Consultation Services (99242-99245)

CPT 2023 Changes

At the February 4-5, 2021 CPT virtual meeting, the following changes to the office consultation codes were approved:

- Deletion of code 99241
- Revision of codes 99242-99245 to align with changes to office/outpatient visit codes (99202-99215) including:
  - Requiring a medically appropriate history and/or examination
  - Allowing selection of level of service based on total time or medical decision making
- Recommendation to backfill code-level minimum time based on a RUC survey

Survey Process

AMA staff and the co-chairs of the CPT/RUC E/M Workgroup drafted a survey for the office consultation codes that was based on the 2019 office visit survey. This survey template was approved by the Research Subcommittee during a conference call on February 23, 2021. On this same call, the Research Subcommittee reviewed a list of potential reference codes to assist the surveying specialties with development of the office consultation survey RSL. On May 24, 2021, the Research Subcommittee reviewed and approved a request to modify the office consultation vignettes that were drafted by the CPT/RUC E/M Workgroup for the CPT code change application. Twenty-five societies surveyed the office consultation codes. Over 200 responses for physician work were received for each code.

Change in Technology

Although the recommended work RVUs for codes 99242-99245 are not greater than the current values, it is important to point out that the compelling evidence that supported the increased work RVUs for the office visit codes (99202-99215) also provides support for an increase in intensity of work for office consultation codes. This change in technology is described in the RUC database RUC rationale: "*According to National Medical Ambulatory Care Survey (NAMCS) data, in 2015, 76% of all practices used electronic health records exclusively, 11% used them partially, and 12% used only paper records. In 2008 the corresponding numbers were 29%, 17%, and 53%. All remarkable differences demonstrating that the technology used to deliver office-based care has changed dramatically. This is confirmed by the CDC, which estimates that use of an EHR increased from 35% in 2007 to 87% in 2015. The EHR contains more data than paper records, most of which must be reviewed including for drug-drug and, with increasing use of homeopathic substances, drug substance interactions. The use of EHRs has increased physician work by increasing the time*

physician spend documenting the medical record. In 2016, it was estimated that for every hour spent with patients, physicians spend 2 hours on EHR and desk work, according to an Annals of Internal Medicine study. With increased consolidation of hospitals and EHR systems (EPIC and Cerner now have a combined 85% market share of 500+ bed hospitals), physicians have access to more patient information. The centralization of data is in the best interest of patients and will help support quality care. However, this centralization does increase the time that physicians spend reviewing patient information. The presenters argued that EHR adoption has led to a decrease in efficiency, which may never be fully regained."

Office Consultation Work versus Office Visit Work

Office consultation codes are more work than the analogous office visit (non-consultation) E/M codes due to the additional work to generate and send a written report to the requesting physician/QHP that identifies additional labs, imaging and/or tests ordered and reviewed, test findings and expert opinion for management of the patient's problem(s). In addition, consultations carry more liability due to the expert opinion provided. Since the inception of the Medicare Physician Fee Schedule, the work RVUs for the office consultation codes have always been higher than the office visit E/M codes. The Harvard study acknowledged this difference in work.[1] The RUC acknowledged this difference in work in 2006.[2]

When CMS finalized policy to no longer recognize office consultation codes for payment, the Agency noted that: "*Conventional medical practice is that physicians making a referral and physicians accepting a referral would document the request to provide an evaluation for the patient. In order to promote proper coordination of care, these physicians should continue to follow appropriate medical documentation standards and communicate the results of an evaluation to the requesting physician. This is not to be confused with the specific documentation requirements that previously applied to the use of the consultation codes.*"[3]

The AMA responded to the Agency's change in policy noting that the CPT Editorial Panel was revising coding guidelines for consultation codes to reflect instructions in the CMS Carrier Policy Manual. CPT 2010 specifically added the following text: "*The written or verbal request for consult may be made by a physician or other appropriate source and documented in the patient's medical record by either the consulting or requesting physician or appropriate source. The consultant's opinion and any services that were ordered or performed must also be documented in the patient's medical record and communicated by written report to the requesting physician or other appropriate source.*"

Although CMS no longer pays for consultation services, many private payors and patients continue to recognize the consultation codes for payment. The stakeholder societies that provide consultation services recognize the difference in physician work and liability related to documentation and expert opinion and continue to advocate for payment for these services.

Recommendation – 99242

We recommend a work RVU of 1.08, which is the survey median.

- The recommended work RVU of 1.08 is 0.15 work RVUs greater than 99202 to account for the additional work to generate and send a written report to the requesting physician/QHP that identifies additional labs, imaging and/or tests ordered and reviewed, test findings and expert opinion for management of the patient's problem(s).
- Codes 99242 and 99202 both include straightforward medical decision making.
- Code 99242 requires more total time than 99202.
- This recommendation falls between the current work RVUs for codes 99241 and 99242.

Key Reference Code Comparison

Ref 1 99202: The respondents indicated the intensity/complexity of survey code 99242 is similar to somewhat more than reference code 99202.

---

[1] Hsiao WC, et al. A National Study of Resource-Based Relative value Sales for Physician Services: Phase III Final Report. August 20, 1992. Volume 1. Table 7.8, pp 347-348.

[2] RUC Database 2006 RUC Rationale: The work of 99242 is also similar to 99203 New Office Visit, Level III. It was determined 99244 is more intense than 99205 and the recommended relativity appeared appropriate. 99245 is similar in total physician work to 99223 Initial Hospital Visit

[3] CMS MLN Matters Number MM6740. Related CR Release Date December 14, 2009. Related CR Transmittal # R1875CP

Ref 2 99212: The respondents indicated the intensity/complexity of survey code 99242 is somewhat more than reference code 99212.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 99241, 99242

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty dermatology How often? Commonly

Specialty general surgery How often? Commonly

Specialty orthopedic surgery How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National utilization data not available

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 0 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare currently does not pay for office visit consult codes. If CMS agrees to revise its policy, the last page of this SoR includes the 2009 utilization and specialty distribution for code 99242 as information

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? Yes

CPT Descriptor: Office or other outpatient consultation for a new or established patient, which requires a medically appropriate history and/or examination and low level of medical decision making

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A requested office consultation, which includes review of the relevant data and a medically appropriate history and/or examination, is performed. The problem is determined to be an acute uncomplicated illness or injury. A report is generated and sent to the requesting provider.

Percentage of Survey Respondents who found Vignette to be Typical: 90%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work:

Description of Intra-Service Work: Physician/QHP typical activities performed within 3 calendar days prior to the Office or Outpatient Consultation and within 7 calendar days after the day of the consultation include: Review the referring physician/QHP request for the consultant's expert opinion regarding evaluation and/or management of a specific medical problem. Document the request for the consultation in the medical record. Obtain and review prior medical records, including labs and imaging, if available. Order and review additional diagnostic labs, imaging and/or other tests, as needed. Incorporate pertinent information into the medical record. Review the medical history forms completed by the patient. Review vital signs obtained by clinical staff. Obtain a medically appropriate history. Perform a medically appropriate examination. Synthesize the relevant history, physical examination and tests to formulate a differential diagnosis requiring low level complexity MDM. Discuss the findings with the patient and family and respond to patient and family questions. Document the encounter in the medical record. Perform electronic data capture and reporting to comply with quality payment program and other electronic mandates. Generate and a written report that identifies additional labs, imaging and/or tests ordered and reviewed, test findings and expert opinion for management of the patient to the requesting provider. Document the report in the medical record. Communicate with other members of the health care team regarding the visit. Respond to follow-up questions from the requesting physician/QHP and patient/family.

Modifier -51 Exempt Status
Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? No

TOP KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99203	XXX	1.60	**RUC Time**

CPT Descriptor Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and low level of medical decision making. When using time for code selection, 30-44 minutes of total time is spent on the date of the encounter.

SECOND HIGHEST KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99213	XXX	1.30	**RUC Time**

CPT Descriptor Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and low level of medical decision making. When using time for code selection, 20-29 minutes of total time is spent on the date of the encounter.

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99203	XXX	1.60	**RUC Time**	11,452,897

CPT Descriptor 1 Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and low level of medical decision making. When using time for code selection, 30-44 minutes of total time is spent on the date of the encounter.

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99214	XXX	1.92	**RUC Time**	106,900,291

CPT Descriptor 2 Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. When using time for code selection, 30-39 minutes of total time is spent on the date of the encounter.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	3%	55%	41%	2%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	2%	62%	37%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	1%	78%	21%
Physical effort required	3%	74%	24%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	3%	58%	38%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	5%	53%	37%	5%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	7%	51%	42%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	5%	72%	23%
Physical effort required	5%	72%	23%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	5%	60%	35%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background – Office Consultation Services (99242-99245)

CPT 2023 Changes

At the February 4-5, 2021 CPT virtual meeting, the following changes to the office consultation codes were approved:

- Deletion of code 99241
- Revision of codes 99242-99245 to align with changes to office/outpatient visit codes (99202-99215) including:
  - Requiring a medically appropriate history and/or examination
  - Allowing selection of level of service based on total time or medical decision making
- Recommendation to backfill code-level minimum time based on a RUC survey

Survey Process

AMA staff and the co-chairs of the CPT/RUC E/M Workgroup drafted a survey for the office consultation codes that was based on the 2019 office visit survey. This survey template was approved by the Research Subcommittee during a conference call on February 23, 2021. On this same call, the Research Subcommittee reviewed a list of potential reference codes to assist the surveying specialties with development of the office consultation survey RSL. On May 24, 2021, the Research Subcommittee reviewed and approved a request to modify the office consultation vignettes that were drafted by the CPT/RUC E/M Workgroup for the CPT code change application. Twenty-three societies surveyed the office consultation codes. Over 200 responses for physician work were received for each code.

Change in Technology

Although the recommended work RVUs for codes 99242-99245 are not greater than the current values, it is important to point out that the compelling evidence that supported the increased work RVUs for the office visit codes (99202-99215) also provides support for an increase in intensity of work for office consultation codes. This change in technology is described in the RUC database RUC rationale: "*According to National Medical Ambulatory Care Survey (NAMCS) data, in 2015, 76% of all practices used electronic health records exclusively, 11% used them partially, and 12% used only paper records. In 2008 the corresponding numbers were 29%, 17%, and 53%. All remarkable differences demonstrating that the technology used to deliver office-based care has changed dramatically. This is confirmed by the CDC, which estimates that use of an EHR increased from 35% in 2007 to 87% in 2015. The EHR contains more data than paper records, most of which must be reviewed including for drug-drug and, with increasing use of homeopathic substances, drug substance interactions. The use of EHRs has increased physician work by increasing the time*

physician spend documenting the medical record. In 2016, it was estimated that for every hour spent with patients, physicians spend 2 hours on EHR and desk work, according to an Annals of Internal Medicine study. With increased consolidation of hospitals and EHR systems (EPIC and Cerner now have a combined 85% market share of 500+ bed hospitals), physicians have access to more patient information. The centralization of data is in the best interest of patients and will help support quality care. However, this centralization does increase the time that physicians spend reviewing patient information. The presenters argued that EHR adoption has led to a decrease in efficiency, which may never be fully regained."

Office Consultation Work versus Office Visit Work

Office consultation codes are more work than the analogous office visit (non-consultation) E/M codes due to the additional work to generate and send a written report to the requesting physician/QHP that identifies additional labs, imaging and/or tests ordered and reviewed, test findings and expert opinion for management of the patient's problem(s). In addition, consultations carry more liability due to the expert opinion provided. Since the inception of the Medicare Physician Fee Schedule, the work RVUs for the office consultation codes have always been higher than the office visit E/M codes. The Harvard study acknowledged this difference in work.[1] The RUC acknowledged this difference in work in 2006.[2]

When CMS finalized policy to no longer recognize office consultation codes for payment, the Agency noted that: "*Conventional medical practice is that physicians making a referral and physicians accepting a referral would document the request to provide an evaluation for the patient. In order to promote proper coordination of care, these physicians should continue to follow appropriate medical documentation standards and communicate the results of an evaluation to the requesting physician. This is not to be confused with the specific documentation requirements that previously applied to the use of the consultation codes.*"[3]

The AMA responded to the Agency's change in policy noting that the CPT Editorial Panel was revising coding guidelines for consultation codes to reflect instructions in the CMS Carrier Policy Manual. CPT 2010 specifically added the following text: "*The written or verbal request for consult may be made by a physician or other appropriate source and documented in the patient's medical record by either the consulting or requesting physician or appropriate source. The consultant's opinion and any services that were ordered or performed must also be documented in the patient's medical record and communicated by written report to the requesting physician or other appropriate source.*"

Although CMS no longer pays for consultation services, many private payors and patients continue to recognize the consultation codes for payment. The stakeholder societies that provide consultation services recognize the difference in physician work and liability related to documentation and expert opinion and continue to advocate for payment for these services.

Recommendation – 99243

We recommend a work RVU of 1.80, which is the survey median.

- The recommended work RVU of 1.80 is 0.20 work RVUs greater than 99203 to account for the additional work to generate and send a written report to the requesting physician/QHP that identifies additional labs, imaging and/or tests ordered and reviewed, test findings and expert opinion for management of the patient's problem(s).
- Codes 99243 and 99203 both include low complexity medical decision making.
- Code 99243 requires more total time than 99203.

Key Reference Code Comparison

Ref 1 99203: The respondents indicated the intensity/complexity of survey code 99243 is similar to somewhat more than reference code 99203.

Ref 2 99213: The respondents indicated the intensity/complexity of survey code 99243 is similar to somewhat more than reference code 99213.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 99243

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty orthopedic surgery How often? Commonly

Specialty otolaryngology How often? Commonly

Specialty general surgery How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National utilization data not available

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 0 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare currently does not pay for office visit consult codes. If CMS agrees to revise its policy, the last page of this SoR includes the 2009 utilization and specialty distribution as information

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

CPT Descriptor: Office or other outpatient consultation for a new or established patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A requested office consultation, which includes review of the relevant data and a medically appropriate history and/or examination, is performed. The problem is determined to be an undiagnosed new problem with uncertain prognosis or chronic illness with progression. A report is generated and sent to the requesting provider.

Percentage of Survey Respondents who found Vignette to be Typical: 94%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work:

Description of Intra-Service Work: Physician/QHP typical activities performed within 3 calendar days prior to the Office or Outpatient Consultation and within 7 calendar days after the day of the consultation include: Review the referring physician/QHP request for the consultant's expert opinion regarding evaluation and/or management of a specific medical problem. Document the request for the consultation in the medical record. Obtain and review prior medical records, including labs and imaging, if available. Order and review additional diagnostic labs, imaging and/or other tests, as needed. Incorporate pertinent information into the medical record. Review the medical history forms completed by the patient. Review vital signs obtained by clinical staff. Obtain a medically appropriate history. Perform a medically appropriate examination. Synthesize the relevant history, physical examination and tests to formulate a differential diagnosis requiring moderate level complexity MDM). Discuss the findings with the patient and family and respond to patient and family questions. Document the encounter in the medical record. Perform electronic data capture and reporting to comply with quality payment program and other electronic mandates. Generate and a written report that identifies additional labs, imaging and/or tests ordered and reviewed, test findings and expert opinion for management of the patient to the requesting provider. Document the report in the medical record. Communicate with other members of the health care team regarding the visit. Respond to follow-up questions from the requesting physician/QHP and patient/family.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	6%	34%	52%	11%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	3%	47%	50%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	1%	66%	34%
Physical effort required	1%	68%	31%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	3%	38%	59%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	4%	27%	59%	10%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	2%	45%	53%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	4%	59%	37%
Physical effort required	4%	57%	39%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	6%	31%	63%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background – Office Consultation Services (99242-99245)

CPT 2023 Changes

At the February 4-5, 2021 CPT virtual meeting, the following changes to the office consultation codes were approved:

- Deletion of code 99241
- Revision of codes 99242-99245 to align with changes to office/outpatient visit codes (99202-99215) including:
  - Requiring a medically appropriate history and/or examination
  - Allowing selection of level of service based on total time or medical decision making
- Recommendation to backfill code-level minimum time based on a RUC survey

Survey Process

AMA staff and the co-chairs of the CPT/RUC E/M Workgroup drafted a survey for the office consultation codes that was based on the 2019 office visit survey. This survey template was approved by the Research Subcommittee during a conference call on February 23, 2021. On this same call, the Research Subcommittee reviewed a list of potential reference codes to assist the surveying specialties with development of the office consultation survey RSL. On May 24, 2021, the Research Subcommittee reviewed and approved a request to modify the office consultation vignettes that were drafted by the CPT/RUC E/M Workgroup for the CPT code change application. Twenty-three societies surveyed the office consultation codes. Over 200 responses for physician work were received for each code.

Change in Technology

Although the recommended work RVUs for codes 99242-99245 are not greater than the current values, it is important to point out that the compelling evidence that supported the increased work RVUs for the office visit codes (99202-99215) also provides support for an increase in intensity of work for office consultation codes. This change in technology is described in the RUC database RUC rationale: "*According to National Medical Ambulatory Care Survey (NAMCS) data, in 2015, 76% of all practices used electronic health records exclusively, 11% used them partially, and 12% used only paper records. In 2008 the corresponding numbers were 29%, 17%, and 53%. All remarkable differences demonstrating that the technology used to deliver office-based care has changed dramatically. This is confirmed by the CDC, which estimates that use of an EHR increased from 35% in 2007 to 87% in 2015. The EHR contains more data than paper records, most of which must be reviewed including for drug-drug and, with increasing use of homeopathic substances, drug substance interactions. The use of EHRs has increased physician work by increasing the time physician spend documenting the medical record. In 2016, it was estimated that for every hour spent with patients, physicians spend 2 hours on EHR and desk work, according to an Annals of Internal Medicine study. With increased*

consolidation of hospitals and EHR systems (EPIC and Cerner now have a combined 85% market share of 500+ bed hospitals), physicians have access to more patient information. The centralization of data is in the best interest of patients and will help support quality care. However, this centralization does increase the time that physicians spend reviewing patient information. The presenters argued that EHR adoption has led to a decrease in efficiency, which may never be fully regained."

Office Consultation Work versus Office Visit Work

Office consultation codes are more work than the analogous office visit (non-consultation) E/M codes due to the additional work to generate and send a written report to the requesting physician/QHP that identifies additional labs, imaging and/or tests ordered and reviewed, test findings and expert opinion for management of the patient's problem(s). In addition, consultations carry more liability due to the expert opinion provided. Since the inception of the Medicare Physician Fee Schedule, the work RVUs for the office consultation codes have always been higher than the office visit E/M codes. The Harvard study acknowledged this difference in work.[1] The RUC acknowledged this difference in work in 2006.[2]

When CMS finalized policy to no longer recognize office consultation codes for payment, the Agency noted that: "*Conventional medical practice is that physicians making a referral and physicians accepting a referral would document the request to provide an evaluation for the patient. In order to promote proper coordination of care, these physicians should continue to follow appropriate medical documentation standards and communicate the results of an evaluation to the requesting physician. This is not to be confused with the specific documentation requirements that previously applied to the use of the consultation codes.*"[3]

The AMA responded to the Agency's change in policy noting that the CPT Editorial Panel was revising coding guidelines for consultation codes to reflect instructions in the CMS Carrier Policy Manual. CPT 2010 specifically added the following text: "*The written or verbal request for consult may be made by a physician or other appropriate source and documented in the patient's medical record by either the consulting or requesting physician or appropriate source. The consultant's opinion and any services that were ordered or performed must also be documented in the patient's medical record and communicated by written report to the requesting physician or other appropriate source.*"

Although CMS no longer pays for consultation services, many private payors and patients continue to recognize the consultation codes for payment. The stakeholder societies that provide consultation services recognize the difference in physician work and liability related to documentation and expert opinion and continue to advocate for payment for these services.

Recommendation – 99244

We recommend a work RVU of 2.80, which is the survey median.

- The recommended work RVU of 2.80 is 0.20 work RVUs greater than 99204 to account for the additional intensity of work to generate and send a written report to the requesting physician/QHP that identifies additional labs, imaging and/or tests ordered and reviewed, test findings and expert opinion for management of the patient's problem(s).
- Codes 99244 and 99204 both include moderate complexity medical decision making.

Key Reference Code Comparison

Ref 1 99204: The respondents indicated the intensity/complexity of survey code 99244 is somewhat to much more than reference code 99204.

Ref 2 99214: The respondents indicated the intensity/complexity of survey code 99244 is similar to somewhat to much more than reference code 99214.

CPT	DESCRIPTOR	RVW	WPUT	TOTAL TIME	PRE	INTRA	POST
99204	Office or other outpatient visit for the evaluation and management	**2.60**	**0.043**	**60**	**10**	**40**	**10**

[1] Hsiao WC, et al. A National Study of Resource-Based Relative value Sales for Physician Services: Phase III Final Report. August 20, 1992. Volume 1. Table 7.8, pp 347-348.

[2] RUC Database 2006 RUC Rationale: The work of 99242 is also similar to 99203 New Office Visit, Level III. It was determined 99244 is more intense than 99205 and the recommended relativity appeared appropriate. 99245 is similar in total physician work to 99223 Initial Hospital Visit

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 99244

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty cardiology How often? Commonly

Specialty ophthalmology How often? Commonly

Specialty neurology How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National utilization data not available

CPT Descriptor: Office or other outpatient consultation for a new or established patient, which requires a medically appropriate history and/or examination and high level of medical decision making

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A requested office consultation, which includes review of the relevant data and a medically appropriate history and/or examination, is performed. The problem is determined to be a chronic illness with severe exacerbation, progression or side effects of treatment. A report is generated and sent to the requesting provider.

Percentage of Survey Respondents who found Vignette to be Typical: 91%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work:

Description of Intra-Service Work: Physician/QHP typical activities performed within 3 calendar days prior to the Office or Outpatient Consultation and within 7 calendar days after the day of the consultation include: Review the referring physician/QHP request for the consultant's expert opinion regarding evaluation and/or management of a specific medical problem. Document the request for the consultation in the medical record. Obtain and review prior medical records, including labs and imaging, if available. Order and review additional diagnostic labs, imaging and/or other tests, as needed. Incorporate pertinent information into the medical record. Review the medical history forms completed by the patient. Review vital signs obtained by clinical staff. Obtain a medically appropriate history. Perform a medically appropriate examination. Synthesize the relevant history, physical examination and tests to formulate a differential diagnosis requiring high level complexity MDM. Discuss the findings with the patient and family and respond to patient and family questions. Document the encounter in the medical record. Perform electronic data capture and reporting to comply with quality payment program and other electronic mandates. Generate and a written report that identifies additional labs, imaging and/or tests ordered and reviewed, test findings and expert opinion for management of the patient to the requesting provider. Document the report in the medical record. Communicate with other members of the health care team regarding the visit. Respond to follow-up questions from the requesting physician/QHP and patient/family.

Modifier -51 Exempt Status
Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? No

TOP KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99205	XXX	3.50	**RUC Time**

CPT Descriptor Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and high level of medical decision making. When using time for code selection, 60-74 minutes of total time is spent on the date of the encounter.

SECOND HIGHEST KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99215	XXX	2.80	**RUC Time**

CPT Descriptor Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and high level of medical decision making. When using time for code selection, 40-54 minutes of total time is spent on the date of the encounter.

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99205	XXX	3.50	**RUC Time**	2,923,626

CPT Descriptor 1 Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and high level of medical decision making. When using time for code selection, 60-74 minutes of total time is spent on the date of the encounter.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	1%	1%	30%	37%	30%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	4%	39%	57%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	1%	53%	46%

Physical effort required	2%	58%	40%

Psychological Stress	**Less**	**Identical**	**More**
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	5%	33%	62%

Survey Code Compared to 2nd Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	0%	23%	42%	35%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	37%	63%

Technical Skill/Physical Effort	**Less**	**Identical**	**More**
Technical skill required	2%	58%	40%
Physical effort required	2%	56%	42%

Psychological Stress	**Less**	**Identical**	**More**
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	2%	30%	67%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background – Office Consultation Services (99242-99245)

CPT 2023 Changes

At the February 4-5, 2021 CPT virtual meeting, the following changes to the office consultation codes were approved:

- Deletion of code 99241

- Revision of codes 99242-99245 to align with changes to office/outpatient visit codes (99202-99215) including:
  - Requiring a medically appropriate history and/or examination
  - Allowing selection of level of service based on total time or medical decision making
- Recommendation to backfill code-level minimum time based on a RUC survey

Survey Process

AMA staff and the co-chairs of the CPT/RUC E/M Workgroup drafted a survey for the office consultation codes that was based on the 2019 office visit survey. This survey template was approved by the Research Subcommittee during a conference call on February 23, 2021. On this same call, the Research Subcommittee reviewed a list of potential reference codes to assist the surveying specialties with development of the office consultation survey RSL. On May 24, 2021, the Research Subcommittee reviewed and approved a request to modify the office consultation vignettes that were drafted by the CPT/RUC E/M Workgroup for the CPT code change application. Twenty-three societies surveyed the office consultation codes. Over 200 responses for physician work were received for each code.

Change in Technology

Although the recommended work RVUs for codes 99242-99245 are not greater than the current values, it is important to point out that the compelling evidence that supported the increased work RVUs for the office visit codes (99202-99215) also provides support for an increase in intensity of work for office consultation codes. This change in technology is described in the RUC database RUC rationale: "*According to National Medical Ambulatory Care Survey (NAMCS) data, in 2015, 76% of all practices used electronic health records exclusively, 11% used them partially, and 12% used only paper records. In 2008 the corresponding numbers were 29%, 17%, and 53%. All remarkable differences demonstrating that the technology used to deliver office-based care has changed dramatically. This is confirmed by the CDC, which estimates that use of an EHR increased from 35% in 2007 to 87% in 2015. The EHR contains more data than paper records, most of which must be reviewed including for drug-drug and, with increasing use of homeopathic substances, drug substance interactions. The use of EHRs has increased physician work by increasing the time physician spend documenting the medical record. In 2016, it was estimated that for every hour spent with patients, physicians spend 2 hours on EHR and desk work, according to an Annals of Internal Medicine study. With increased consolidation of hospitals and EHR systems (EPIC and Cerner now have a combined 85% market share of 500+ bed hospitals), physicians have access to more patient information. The centralization of data is in the best interest of patients and will help support quality care. However, this centralization does increase the time that physicians spend*

reviewing patient information. The presenters argued that EHR adoption has led to a decrease in efficiency, which may never be fully regained."

Office Consultation Work versus Office Visit Work

Office consultation codes are more work than the analogous office visit (non-consultation) E/M codes due to the additional work to generate and send a written report to the requesting physician/QHP that identifies additional labs, imaging and/or tests ordered and reviewed, test findings and expert opinion for management of the patient's problem(s). In addition, consultations carry more liability due to the expert opinion provided. Since the inception of the Medicare Physician Fee Schedule, the work RVUs for the office consultation codes have always been higher than the office visit E/M codes. The Harvard study acknowledged this difference in work.[1] The RUC acknowledged this difference in work in 2006.[2]

When CMS finalized policy to no longer recognize office consultation codes for payment, the Agency noted that: "*Conventional medical practice is that physicians making a referral and physicians accepting a referral would document the request to provide an evaluation for the patient. In order to promote proper coordination of care, these physicians should continue to follow appropriate medical documentation standards and communicate the results of an evaluation to the requesting physician. This is not to be confused with the specific documentation requirements that previously applied to the use of the consultation codes.*"[3]

The AMA responded to the Agency's change in policy noting that the CPT Editorial Panel was revising coding guidelines for consultation codes to reflect instructions in the CMS Carrier Policy Manual. CPT 2010 specifically added the following text: "*The written or verbal request for consult may be made by a physician or other appropriate source and documented in the patient's medical record by either the consulting or requesting physician or appropriate source. The consultant's opinion and any services that were ordered or performed must also be documented in the patient's medical record and communicated by written report to the requesting physician or other appropriate source.*"

Although CMS no longer pays for consultation services, many private payors and patients continue to recognize the consultation codes for payment. The stakeholder societies that provide consultation services recognize the difference in physician work and liability related to documentation and expert opinion and continue to advocate for payment for these services.

Recommendation – 99245

We recommend a work RVU of 3.75, which is the survey median.

- The recommended work RVU of 3.75 is 0.25 work RVUs greater than 99205 to account for the additional intensity of work to generate and send a written report to the requesting physician/QHP that identifies additional labs, imaging and/or tests ordered and reviewed, test findings and expert opinion for management of the patient's problem(s).
- Codes 99245 and 99205 both include high complexity medical decision making.

Key Reference Code Comparison

Ref 1 99205: The respondents indicated the intensity/complexity of survey code 99245 is somewhat to much more than reference code 99205.

Ref 2 99215: The respondents indicated the intensity/complexity of survey code 99245 is similar to somewhat to much more than reference code 99215.

CPT	DESCRIPTOR	RVW	WPUT	TOTAL TIME	PRE	INTRA	POST
99205	Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and high level of medical decision making. When using time for code selection, 60-74 minutes of total time is spent on the date of the encounter.	**3.50**	**0.040**	**88**	**14**	**59**	**15**

[1] Hsiao WC, et al. A National Study of Resource-Based Relative value Sales for Physician Services: Phase III Final Report. August 20, 1992. Volume 1. Table 7.8, pp 347-348.

[2] RUC Database 2006 RUC Rationale: The work of 99242 is also similar to 99203 New Office Visit, Level III. It was determined 99244 is more intense than 99205 and the recommended relativity appeared appropriate. 99245 is similar in total physician work to 99223 Initial Hospital Visit

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 99245

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty cardiology How often? Commonly

Specialty neurology How often? Commonly

Specialty internal medicine How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National utilization data not available

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 0 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare currently does not pay for office visit consult codes. If CMS agrees to revise its policy, the last page of this SoR includes the 2009 utilization and specialty distribution as information

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? Yes

Meeting Date: October 2021

CPT Code	Long Descriptor	Global Period
99242	Office or other outpatient consultation for a new or established patient, which requires a medically appropriate history and/or examination and straightforward medical decision making.	XXX
99243	Office or other outpatient consultation for a new or established patient, which requires a medically appropriate history and/or examination and low level of medical decision making.	XXX
99244	Office or other outpatient consultation for a new or established patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making.	XXX
99245	Office or other outpatient consultation for a new or established patient, which requires a medically appropriate history and/or examination and high level of medical decision making.	XXX

Vignette(s) (*vignette required even if PE only code(s)***):**

CPT Code	Vignette
99242	A requested office consultation, which includes review of the relevant data and a medically appropriate history and/or examination, is performed. The problem is determined to be self-limited. A report is generated and sent to the requesting provider.
99243	A requested office consultation, which includes review of the relevant data and a medically appropriate history and/or examination, is performed. The problem is determined to an acute uncomplicated illness or injury. A report is generated and sent to the requesting provider.
99244	A requested office consultation, which includes review of the relevant data and a medically appropriate history and/or examination, is performed. The problem is determined to be an undiagnosed new problem with uncertain prognosis or chronic illness with progression. A report is generated and sent to the requesting provider.
99245	A requested office consultation, which includes review of the relevant data and a medically appropriate history and/or examination, is performed. The problem is determined to be a chronic illness with severe exacerbation, progression or side effects of treatment. A report is generated and sent to the requesting provider.

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

Twenty-five societies surveyed for practice expense data via the approved practice expense tool for E/M surveys:
American Academy of Dermatology Association
American Academy of Neurology
American Association of Neurological Surgeons
Congress of Neurological Surgeons
American Academy of Orthopaedic Surgeons
American Academy of Pediatrics
American Academy of Hospice and Palliative Medicine
American College of Cardiology
American College of Gastroenterology

Society for Vascular Surgery

To develop the clinical staff time recommendations, the expert panel followed the process approved by the PE Subcommittee and the RUC in 2019 for the office/outpatient visit codes (see excepted text at the end of this document).

A RUC survey was conducted that included questions about clinical staff times. The same survey questions used for the office visit PE survey were used for the current survey. Respondents were asked to indicate the typical clinical staff time spent for several specific activities. Survey respondents were also allowed to recommend times for "other clinical activity" in all three service-periods (pre service, service period, post service) and include comments.

The society expert panel reviewed the median survey total times in developing the practice expense recommendations. It was acknowledged there is variation among specialties in how they perform consult services; specifically, how a specialty's clinical staff performs some or all of the activities. As such, it made the most sense to use the median survey total time vs. the median of the individual task time as the basis for the recommendation. This is exactly how the clinical staff time recommendations were developed for the office visit codes—based on many conference calls and final PE Subcommittee approval.

Guiding Principals
The specialty societies used the survey median total time as the guiding principal for the recommended times. The consensus panel also took into consideration:

- PE standards for specific activities;
- current clinical staff times from the prior review;
- inter-family relationships; and
- budget neutrality.

Although the total times were higher than the current times for all four codes, the expert panel agreed to be consistent with the policy for review of the office visit codes; specifically the recommended times cannot be greater than the current times. Below is a summary of the clinical staff current time,

recommended time and survey time for each survey code:

Surveyed CPT Code	Current Times	Recommended Times	Median of Total Time
99242	40	40	45
99243	55	52	57
99244	63	63	76
99245	73	73	92

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here (NOTE: *For services reviewed prior to the implementation of clinical activity codes, detail is not provided in the RUC database, please contact Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org for PE spreadsheets for your reference codes*):

Current PE inputs were included on the PE spreadsheet for the existing codes 99242-99245. Codes 99202-99205 were included as additional references.

3. Is this code(s) typically reported with an E/M service?
Is this code(s) typically reported with the E/M service in the nonfacility?
(Please see the *Billed Together* tab in the RUC Database)

N/A

4. What specialty is the dominant provider in the nonfacility?
What percent of the time does the dominant provider provide the service(s) in the nonfacility?
Is the dominant provider in the nonfacility different than for the global?
(Please see the *Billed Together* tab in the RUC Database)

N/A

5. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment, and supplies, please provide compelling evidence (please see *PE compelling evidence guidelines*) Please explain if the increase can be entirely accounted for because of an increase in physician time:

N/A

CLINICAL STAFF ACTIVITIES

The RUC has agreed that there is a presumption of zero pre-service clinical staff time unless the specialty can provide evidence to the PE Subcommittee that any pre-service time is appropriate. The RUC agreed that with evidence some subset of codes may require minimal or extensive use of clinical staff and has allocated time when appropriate (for example when a service describes a major surgical procedure). If the package times are not applicable, alternate times may be presented and should be justified for consideration by the Subcommittee.

PRESENTER(S): Matthew Sideman, MD; Stephen Sentovich, MD

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

6. Are the global periods of the codes transitioning? Information about the amount of pre-service clinical staff time and a rationale for the change from a 090-day global to a 000 or 010 day global should be described below.

N/A

7. If you are recommending more minutes than the PE Subcommittee standards for clinical activities, you must provide rationale to justify the time:

N/A

8. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (*please see second worksheet in PE spreadsheet workbook*), please explain the difference here:

N/A

9. How much time was allocated to clinical activity, *obtain vital signs* (CA010) prior to CMS increasing the clinical activity to 5 minutes for calendar year 2018? The standard for clinical activity, obtains vital signs remains 0, 3 and 5 based on the number of vital signs taken. Please provide a rationale for the clinical staff time that you are requesting for obtain vital signs here:

99242, 99243, 99244. 99245 (5 minutes) weight, height, temperature, blood pressure, heart rate

10. Please provide a brief description of the clinical staff work for the following:
    a. Pre-Service period:

Clinical staff will contact the patient and other sources to obtain pertinent prior imaging, lab and/or other test result(s) and prior medical records. This information will be added to the patient's office chart.

    b. Service period (includes pre, intra and post):

On the day of the consult, clinical staff will ensure that all pertinent information from the patient and other sources is available in the medical record; prepare the exam room; greet and gown the patient; obtain vital signs; review and document history, systems and medications as appropriate; identify prior imaging, labs, and/or tests that were not yet obtained that will be needed by the physicians; assist the physician as needed to position the patient for an exam; answer patient/family/caregiver questions about further imaging, labs and/or tests that are needed; and clean the room.

    c. Post-service period:

Clinical staff will coordinate, obtain and enter into the medical record results of post-encounter additional pertinent imaging, labs and/or other tests as requested by the consulting physician.

11. Please provide granular detail regarding what the clinical staff is doing during the intra-service (of service period) clinical activity, *assist physician or other qualified healthcare professional---directly related to physician work time* or *Perform procedure/service---NOT directly related to physician work time:*

99245 - Clinical staff presents summary of relevant history to physician.

12. If you have used a percentage of the physician intra-service work time other then 100 or 67 percent for the intra-service (of service period) clinical activity, please indicate the percentage and explain why the alternate percentage is needed and how it was derived.

13. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (*please see second worksheet in PE spreadsheet*):

N/A

14. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov.

N/A

MEDICAL SUPPLIES & EQUIPMENT/INVOICES

15. ☐ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

16. ☐ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

17. If you wish to include a supply that is not on the list (*please see fourth worksheet in PE spreadsheet*) please provide a paid invoice. Identify and explain the supply input and invoice here:

N/A

18. Are you recommending a PE supply pack for this recommendation? Yes or No.
If Yes, please indicate if the pack is an established package of supplies as defined by CMS (eg, SA047 *pack, E/M visit*) or a pack that is commercially available?

Established pack: SA047 pack, E/M visit

19. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation. Please include the description, CMS supply code, unit, item quantity and unit price (if available). See documents two and three under PE reference materials on the RUC Collaboration Website for information on the contents of kits, packs and trays.

pack, e/m visit	SA047	pack	5.0372
cover, thermometer probe		item	1
drape, non-sterile, sheet 40in x 60in		item	1
gloves, non-sterile		pair	2
gown, patient		item	1
paper, exam table		foot	7
patient education booklet		item	1
pillow case		item	1
specula tips, otoscope		item	1
swab-pad, alcohol		item	2
tongue depressor		item	1

20. If you wish to include an equipment item that is not on the list (*please see fifth worksheet in PE spreadsheet*) please provide a paid invoice. Identify and explain the equipment input and invoice here:

24. If this is a PE only code please select a crosswalk based on a similar specialty mix:

N/A

ADDITIONAL INFORMATION

25. If there is any other item(s) on your spreadsheet not covered in the categories above that requires greater detail/explanation, please include here:

For Information: **Clinical Staff Time 2019 Recommendation Process for Office Visit E/M Codes (per the RUC Rationale)** The specialty societies used the median total time for each CPT code, summing each respondents' total time recommendation, including times written in for "other clinical activity." The median total time served as the starting point for developing the recommendation to the PE Subcommittee. The specialty societies used the survey data, PE standards and current time inputs as the guiding principles for the recommended times and they also considered inter-family relationships (new versus established) and intra-family relationships (within new, within established). The recommended clinical activity time included in the spreadsheet is the survey times where those times do not exceed standard times or total current times. The PE Subcommittee confirmed that the median of total time from the survey includes time that the survey respondents wrote in for "other clinical activity." The Subcommittee also confirmed that the recommendations for individual clinical activities are the survey times where those times do not exceed standard times or current times and that is the reason that the median of total time from the survey is not identical to the recommended total clinical staff time.

SPECIALTY SOCIETY(IES): AADA, AAN, AANS, CNS, AAOS, AAP, AAHPM, ACC, ACG, AGA, ASGE, ACOG, ACR, ACS, ASCO, ASCRS, ASSH, ACNM, ATS, ACCP, NASS, SNMMI, STS, AATS, SVS
PRESENTER(S): Matthew Sideman, MD; Stephen Sentovich, MD

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

The presenters responded to a question regarding the use of clinical activity, identify need for imaging, lab or other test result(s) and ensure information has been obtained - three days prior (to be used with E/M only) in the pre-service period and then repeating the same clinical activity, identify need for imaging, lab or other test result(s) and ensure information has been obtained - day of (to be used with E/M only) in the service period. This structure was approved by the Research Subcommittee and is repeated to capture the time that clinical staff spend performing this clinical activity regardless of whether they do it three days prior to the office visit or on the same day. For example, one clinical staff might spend 3 minutes preparing to see a patient on the day prior to a visit based on their own workflow pattern. Whereas, another clinical staff may perform all the pre-service work on the morning of the office visit. Therefore, both clinical staff would have responded differently on the survey for the times spent three days prior and on the date of service, but the total time would remain the same and is not duplicative. The specialty societies also explained that in many instances the clinical staff will identify the need for images and labs and find that the test is pending and will then need to go back on the day of the office visit to ensure that the information needed has been obtained. Survey respondents were instructed to include the time they would spend on the activity for a typical patient and were instructed that they should enter 0 if they do not perform any clinical activity in the three days prior to the office visit.

ITEMIZED LIST OF CHANGES (FOLLOWING THE PE SUBCOMMITTEE MEETING)

NOTE: The virtual meetings have provided for real-time updates to the PE spreadsheets. PE SORs must still be updated after the meeting and resubmitted asap.

During and immediately following the review of this tab at the PE Subcommittee meeting, please revise the summary of recommendation (PE SOR) based on modifications made during the meeting. Please submit the revised form electronically to Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org immediately following the close of business. In addition, please also provide an itemized list of the modifications made to the PE spreadsheet during the PE Subcommittee meeting in the space below (e.g. clinical activity CA010 *obtain vital signs* was reduced from 5 minutes to 3 minutes).

AMA/Specialty Society RVS Update Committee Summary of Recommendations

October 2021

Nursing Facility Discharge Day Services – Tab 12

In April 2021, the RUC reviewed the initial and established patient nursing facility care services 99304-99310. At that time, when reviewing nursing facility discharge day services, CPT codes 99315 and 99316, the RUC determined these services should be reviewed with the hospital discharge day management codes, 99238 and 99239, in October 2021. Therefore, the RUC recommended to table review of CPT codes 99315 and 99316 until October 2021. However, at the October 2021 meeting, the hospital discharge day management codes 99238 and 99239 were postponed to be reviewed at the same time as the inpatient hospital and observation care codes, in January 2022. Upon further discussion of nursing facility discharge day services, the RUC determined that these services are distinct from the hospital discharge day management services and could be reviewed separate from the hospital discharge day management codes. As outlined in detail in the compelling evidence below, the nursing facility discharge day services are different due to management of the multiple electronic medical records and changes in nursing home care. These services have clinically distinct workflows and different patient populations. Therefore, the RUC determined that the nursing facility discharge services could be reviewed separately from the inpatient hospital discharge day services.

Compelling Evidence
The specialty societies indicated that there is compelling evidence based on a change in physician work due to changes in technology, patient population, and length of stay.

Change in physician work due to technology, specifically the use of multiple EMRs
Nursing facilities were slow to integrate electronic medical records (EMRs) into their workflow, because EMRs are not well suited for nursing facilities. In addition, the typical EMR system at a nursing facility is not interoperable with EMRs at other places of service. Physicians and other qualified health care professionals (QHPs) need to review and extract data from the nursing facility EMR to integrate into their standard work flow and documentation, usually outpatient based EMRs. Similarly, when orders or other interventions are made, documentation needs to occur in both systems, the nursing facility and outpatient EMR, respectively. There are no EMRs in this space that integrate meaningfully. The typical computer of a physician or QHP working in the nursing facility setting will utilize multiple EMRs depending on the number of nursing facilities or skilled nursing facilities (SNFs) the individual works with. The necessary duplication of documentation across systems creates more provider work, especially on patient discharge, where problems such as medications and follow-up need to be reconciled, documented, and acted upon in two systems.

Change in physician work due to change in patient population and length of stay
Data supports that since the discharge codes were last reviewed in 2010, the length of stay in the nursing home has decreased. According to the March 2021 Medicare Payment Advisory Commission (MedPAC) Report to Congress, the number of covered days per admission in the SNF has decreased from 27.1 in 2010 to 24.8 in 2019, a decrease of 8.5%. This is coupled with shorter hospital stays and faster discharge from the nursing facility. Further, the March 2020 MedPAC Report to Congress includes data documenting mean risk-adjusted rates of community discharge have

increased from 35.7% in 2012 to 41.4% in 2018, during which time readmits during the SNF stay decreased from 11.4 to 10.6%. This supporting evidence signals that more physician work is focused on discharging patients earlier and more often safely to home.
The acuity of patients admitted to nursing home after being discharged from an acute care hospital has increased significantly from 2011 to 2018. Data provided in the summary of recommendation (SOR) shows the increase in patient acuity upon hospital discharge (based on the Elixhauser Comorbidity Index, which is a method of categorizing comorbidities of patients based on the International Classification of Diseases) and the Hierarchical Condition Category (HCC) score on SNF admission. Note that a SNF patient is the typical patient for nursing facility visits. The specialty societies also referenced multiple studies demonstrating changes in physician work due to increased complexity of the patient population.

The RUC concurred that there is compelling evidence that the physician work for these services has changed based on changes in technology and change in patient population and length of stay.

99315 ***Nursing facility discharge day management; 30 minutes or less***
The RUC reviewed the survey results from 185 physicians and other qualified health care professionals and determined that the 25th percentile work RVU of 1.50 appropriately accounts for the work required to perform this service. The RUC recommends 10 minutes of pre-service evaluation time, 25 minutes of intra-service time and 5 minutes of post-service time.

The RUC compared CPT code 99315 to nursing facility visit code 99304 *Initial nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and straightforward or low level of medical decision making. When using total time on the date of the encounter for code selection, 25 minutes must be met or exceeded.* (April 2021 RUC recommended work RVU = 1.50 and 25 minutes intra-service time) and determined that these services were surveyed by the same set of respondents in April 2021 and require the same intra-service time and similar total time, 40 and 36 minutes, respectively. The RUC noted that maintaining code 99315 at the current value of 1.28 would not be appropriate and would cause a rank order anomaly with 99308 *Subsequent nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and low medical decision making. When using total time on the date of the encounter for code selection, 15 minutes must be met or exceeded*. (April 2021 RUC recommended work RVU = 1.30 and 18 minutes intra-service time).

For additional support, the RUC referenced MPC code 99203 *Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and low level of medical decision making. When using time for code selection, 30-44 minutes of total time is spent on the date of the encounter* (work RVU = 1.60 and 25 minutes on the date of encounter time), MPC code 95861 *Needle electromyography; 2 extremities with or without related paraspinal areas* (work RVU = 1.54 and 29 minutes intra-service time), CPT code 74181 *Magnetic resonance (eg, proton) imaging, abdomen; without contrast material(s)* (work RVU = 1.46 and 20 minutes intra-service time), CPT code 78830 *Radiopharmaceutical localization of tumor, inflammatory process or distribution of radiopharmaceutical agent(s) (includes vascular flow and blood pool imaging, when performed); tomographic (SPECT) with concurrently acquired computed tomography (CT) transmission scan for anatomical review, localization and determination/detection of pathology, single area (eg, head, neck, chest, pelvis), single day imaging* (work RVU = 1.49 and 25 minutes intra-service time) and 10005 *Fine needle aspiration biopsy, including ultrasound guidance; first lesion* (work RVU = 1.46 and 20 minutes intra-service time), all which require similar physician work and time. The RUC concluded that CPT code 99315 should be valued at the 25th percentile work RVU as supported by the survey. **The RUC recommends a work RVU of 1.50 for CPT code 99315.**

99316 ***Nursing facility discharge day management; more than 30 minutes***
The RUC reviewed the survey results from 191 physicians and other QHPs and determined that the 25th percentile work RVU of 2.50 appropriately accounts for the work required to perform this service. The RUC recommends 15 minutes of pre-service evaluation time, 40 minutes of intra-service time and 8 minutes of post-service time.

The RUC compared CPT code 99316 to nursing facility visit code 99305 *Initial nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. When using total time on the date of the encounter for code selection, 35 minutes must be met or exceeded.* (April 2021 RUC recommended work RVU = 2.50 and 35 minutes intra-service time) and determined that these services were surveyed by the same set of respondents in April 2021 and require the similar intra-service time of 40 and 35 minutes and similar total time, 63 and 55 minutes, respectively. The RUC also compared 99316 to nursing facility visit code 99309 *Subsequent nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and moderate medical decision making. When using total time on the date of the encounter for code selection, 30 minutes must be met or exceeded.* (April 2021 RUC recommended work RVU = 1.92, 30 minutes intra-service time and 47 minutes total time) and noted that if 99316 was maintained at the current value of 1.90, it would cause a rank order anomaly with the previously recommended value for moderate MDM subsequent nursing facility care code 99309.

For additional support, the RUC referenced MPC code 75635 *Computed tomographic angiography, abdominal aorta and bilateral iliofemoral lower extremity runoff, with contrast material(s), including noncontrast images, if performed, and image postprocessing* (work RVU = 2.40 and 39 minutes intra-service time), CPT code 95810 *Polysomnography; age 6 years or older, sleep staging with 4 or more additional parameters of sleep, attended by a technologist* (work RVU = 2.50 and 36.5 minutes intra-service time) and MPC code 99204 *Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. When using time for code selection, 45-59 minutes of total time is spent on the date of the encounter* (work RVU = 2.60 and 40 minutes intra-service time), all which require similar physician work and time. The RUC concluded that CPT code 99316 should be valued at the 25th percentile work RVU as supported by the survey. **The RUC recommends a work RVU of 2.50 for CPT code 99316.**

Practice Expense
The Practice Expense Subcommittee reviewed the direct practice expense inputs and made no modifications. **The RUC recommends the direct practice expense inputs as submitted by the specialty societies.**

CPT Code	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation

Evaluation and Management

Nursing Facility Services

The following codes are used to report evaluation and management services to patients in nursing facilities and skilled nursing facilities ~~(formerly called skilled nursing facilities [SNFs], intermediate care facilities [ICFs], or long-term care facilities [LTCFs])~~. These codes should also be used to report evaluation and management services provided to a patient in a psychiatric residential treatment center and intermediate care facility for individuals with intellectual disabilities. ~~(a facility or a distinct part of a facility for psychiatric care, which provides a 24-hour therapeutically planned and professionally staffed group living and learning environment). If procedures such as medical psychotherapy are provided in addition to evaluation and management services, these should be reported in addition to the evaluation and management services provided.~~

~~Nursing facilities that provide convalescent, rehabilitative, or long term care are required to conduct comprehensive, accurate, standardized, and reproducible assessments of each resident's functional capacity using a Resident Assessment Instrument (RAI). All RAIs include the Minimum Data Set (MDS), Resident Assessment Protocols (RAPs), and utilization guidelines. The MDS is the primary screening and assessment tool; the RAPs trigger the identification of potential problems and provide guidelines for follow-up assessments.~~

Regulations pertaining to the care of nursing facility residents govern the nature and minimum frequency of assessments and visits. These regulations also govern who may perform the initial comprehensive visits.

These services are performed by the principal physician(s) and other qualified health care professional(s), overseeing the care of the patient in the facility. The principal physician is sometimes referred to as the admitting physician and is the physician who oversees the patient's care as compared to other physicians or other qualified health care professionals who may be furnishing specialty care. These services are also performed by physicians or other qualified health care professionals in the role of a specialist performing a consultation or concurrent care. Modifiers may be required to identify the role of the individual performing the service.

~~Physicians have a central role in assuring that all residents receive thorough assessments and that medical plans of care are instituted or revised to enhance or maintain the residents' physical and psychosocial functioning. This role includes providing input in the development of the MDS and a multi-disciplinary plan of care, as required by regulations pertaining to the care of nursing facility residents.~~

Two major subcategories of nursing facility services are recognized: Initial Nursing Facility Care and Subsequent Nursing Facility Care. Both subcategories apply to new or established patients.

The types of care (eg, skilled nursing facility and nursing facility care) are reported with the same codes. Place of service codes should be reported to specify the type of facility (and care) where the service(s) are performed.

*For definitions of commonly used terms, see **Evaluation and Management Services Guidelines.***

When selecting a level of medical decision making (MDM) for nursing facility services, the Nature and Complexity of Problems Addressed at the Encounter is considered. For this determination, a high level MDM type specific to Initial Nursing Facility Care by the principal physician or other qualified health care professional is recognized. This type is:

Multiple morbidities requiring intensive management: A set of conditions, syndromes or functional impairments that are likely to require frequent medication changes or other treatment changes and/or re-evaluations. The patient is at significant risk of worsening medical (including behavioral) status and risk for (re)admission to a hospital.

The definitions and requirements related to the Amount and Complexity of Data to be Reviewed and Analyzed and the Risk of Complications and/or Morbidity or Mortality of Patient Management are unchanged.

~~(For care plan oversight services provided to nursing facility residents, see 99379-99380)~~

Initial Nursing Facility Care
New or Established Patient

When the patient is admitted to the nursing facility in the course of an encounter in another site of service (eg, hospital emergency department, office), the services in the initial site may be separately reported. Modifier 25 may be added to the other evaluation and management service to indicate a significant, separately identifiable service by the same physician or qualified health care professional was performed on the same date. ~~all evaluation and management services provided by that physician in conjunction with that admission are considered part of the initial nursing facility care when performed on the same date as the admission or readmission. The nursing facility care level of service reported by the admitting physician should include the services related to the admission he/she provided in the other sites of service as well as in the nursing facility setting.~~

In the case when services in a separate site are reported and the initial nursing facility care service is a consultation service by the same physician or other qualified health care professional and reported on the same date, do not report 99304, 99305, 99306, 99252, 99253, 99254, 99255. The consultant reports the subsequent nursing facility care codes 99307, 99308, 99309, 99310 for the second service on the same date.

Hospital inpatient ~~discharge~~ or observation discharge services performed on the same date of nursing facility admission or readmission may be reported separately. For a patient discharged from inpatient or observation status on the same date of nursing facility admission or readmission, the hospital or observation discharge services ~~should~~ may be reported with codes 99238, 99239 as appropriate. ~~For a patient discharged from observation status on the same date of nursing facility admission or readmission, the observation care discharge services should be reported with code 99217.~~ For a patient admitted and discharged from observation or inpatient status on the same date, see codes 99234- 99236. Time related to ~~these~~ hospital inpatient or observation care services may not be used for code selection of any nursing facility service.

~~(For nursing facility care discharge, see 99315, 99316)~~

Initial nursing facility care codes 99304, 99305, 99306 may be used once per admission, per physician or other qualified health care professional, regardless of length of stay. They may be used for the initial comprehensive visit performed by the principal physician or other qualified health care professional. Skilled nursing facility initial comprehensive visits must be performed by a physician. Qualified health care professionals may report initial comprehensive nursing facility visits for nursing facility level of care patients, if allowed by state law or regulation. The principal physician or qualified health care professional may work with others (who may not always be in the same group) but are overseeing the overall medical care of the patient, in order to provide

timely care to the patient. Medically necessary assessments conducted by these professionals prior to the initial comprehensive visit are reported using subsequent care codes (99307, 99308, 99309, 99310).

Initial services by other physicians and other qualified health care professionals who are performing consultations may be reported using initial nursing facility care codes (99304, 99305, 99306) or inpatient consultations (99252, 99253, 99254, 99255). This is not dependent upon the principal care professionals completion of the initial comprehensive services first.

An initial service may be reported when the patient has not received any face-to-face professional services from the physician or other qualified health care professional or another physician or other qualified health care professional of the exact same specialty and subspecialty who belongs to the same group practice during the stay. When advanced practice nurses or physician assistants are working with physicians they are considered as working in the exact same specialty and subspecialty as the physician. An initial service may also be reported if the patient is a new patient as defined in the Evaluation and Management Guidelines.

For reporting initial nursing facility care, transitions between skilled nursing facility level of care ad nursing facility level of care do not constitute a new stay.

~~***Coding Tip***~~

~~**The Significance of Time as a Factor in Selection of an Evaluation and Management Code from This Section**~~

~~The inclusion of time as an explicit factor beginning in CPT 1992 was done to assist in selecting the most appropriate level of E/M services included in codes in this section. Beginning with CPT 2021, except for 99211, time alone may be used to select the appropriate code level for the office or other outpatient E/M services codes (99202, 99203, 99204, 99205, 99212, 99213, 99214, 99215). Different categories of services use time differently. It is important to review the instructions for each category.~~

~~**Unit/floor time (hospital observation services [99218, 99219, 99220, 99224, 99225, 99226, 99234, 99235, 99236], hospital inpatient services [99221, 99222, 99223, 99231, 99232, 99233], inpatient consultations [99251, 99252, 99253, 99254, 99255], nursing facility services [99304, 99305, 99306, 99307, 99308, 99309, 99310, 99315, 99316, 99318]):**~~

~~For coding purposes, time for these services is defined as unit/ floor time, which includes the time present on the patient's hospital unit and at the bedside rendering services for that patient. This includes the time to establish and/or review the patient's chart, examine the patient, write notes, and communicate with other professionals and the patient's family.~~

~~CPT Coding Guidelines, Evaluation and Management, Guidelines Common to All E/M Services, Time~~

▲99304	I1	Initial nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and straightforward or low level of medical decision making. ~~these 3 key components:~~ ~~• **A detailed or comprehensive history;**~~ ~~• **A detailed or comprehensive examination; and**~~ ~~• **Medical decision making that is straightforward or of low complexity.**~~ ~~Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs.~~ ~~Usually, the problem(s) requiring admission are of low severity. Typically, 25 minutes are spent at the bedside and on the patient's facility floor or unit.~~ When using total time on the date of the encounter for code selection, 25 minutes must be met or exceeded.	XXX	1.50 (April 2021 RUC Recommendation)
▲99305	I2	Initial nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. ~~these 3 key components:~~ ~~• **A comprehensive history;**~~ ~~• **A comprehensive examination; and**~~ ~~• **Medical decision making of moderate complexity.**~~ ~~Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs.~~ ~~Usually, the problem(s) requiring admission are of moderate severity. Typically, 35 minutes are spent at the bedside and on the patient's facility floor or unit.~~ When using total time on the date of the encounter for code selection, 35 minutes must be met or exceeded.	XXX	2.50 (April 2021 RUC Recommendation)
▲99306	I3	Initial nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and high level of medical decision making. ~~these 3 key components:~~ ~~• **A comprehensive history;**~~ ~~• **A comprehensive examination; and**~~	XXX	3.50 (April 2021 RUC Recommendation)

		• ~~**Medical decision making of high complexity.**~~ ~~Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs.~~ ~~Usually, the problem(s) requiring admission are of high severity. Typically, 45 minutes are spent at the bedside and on the patient's facility floor or unit.~~ When using total time on the date of the encounter for code selection, 45 minutes must be met or exceeded. (For services 60 minutes or longer, use prolonged services code 993X0)		
Subsequent Nursing Facility Care ~~All levels of subsequent nursing facility care include reviewing the medical record and reviewing the results of diagnostic studies and changes in the patient's status (ie, changes in history, physical condition, and response to management) since the last assessment by the physician or other qualified health care professional.~~				
▲99307	I4	Subsequent nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and straightforward medical decision making. ~~at least 2 of these 3 key components:~~ • ~~**A problem focused interval history;**~~ • ~~**A problem focused examination;**~~ • ~~**Straightforward medical decision making.**~~ ~~Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs.~~ ~~Usually, the patient is stable, recovering, or improving. Typically, 10 minutes are spent at the bedside and on the patient's facility floor or unit.~~ When using total time on the date of the encounter for code selection, 10 minutes must be met or exceeded.	XXX	0.70 (April 2021 RUC Recommendation)
▲99308	I5	Subsequent nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and low level of medical decision making. ~~at least 2 of these 3 key components:~~ • ~~**An expanded problem focused interval history;**~~ • ~~**An expanded problem focused examination;**~~	XXX	1.30 (April 2021 RUC Recommendation)

		~~• **Medical decision making of low complexity.**~~ ~~Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs.~~ ~~Usually, the patient is responding inadequately to therapy or has developed a minor complication. Typically, 15 minutes are spent at the bedside and on the patient's facility floor or unit.~~ When using total time on the date of the encounter for code selection, 15 minutes must be met or exceeded.		
▲99309	I6	Subsequent nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. ~~at least 2 of these 3 key components:~~ ~~• **A detailed interval history;**~~ ~~• **A detailed examination;**~~ ~~• **Medical decision making of moderate complexity**~~ ~~Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs.~~ ~~Usually, the patient has developed a significant complication or a significant new problem. Typically, 25 minutes are spent at the bedside and on the patient's facility floor or unit.~~ When using total time on the date of the encounter for code selection, 30 minutes must be met or exceeded.	XXX	1.92 (April 2021 RUC Recommendation)
▲99310	I7	Subsequent nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and high level of medical decision making. ~~at least 2 of these 3 key components:~~ ~~• **A comprehensive interval history;**~~ ~~• **A comprehensive examination;**~~ ~~• **Medical decision making of high complexity**~~ ~~Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs.~~ ~~The patient may be unstable or may have developed a significant new problem requiring immediate physician attention. Typically, 35 minutes are spent at the bedside and on the patient's facility floor or unit.~~	XXX	2.80 (April 2021 RUC Recommendation)

		When using total time on the date of the encounter for code selection, 45 minutes must be met or exceeded. (For services 60 minutes or longer, use prolonged services code 993X0)		
Nursing Facility Discharge Services The nursing facility discharge day management codes are to be used to report the total duration of time spent by a physician or other qualified health care professional for the final nursing facility discharge of a patient. The codes include, as appropriate, final examination of the patient, discussion of the nursing facility stay, even if the time spent on that date is not continuous. Instructions are given for continuing care to all relevant caregivers, and preparation of discharge records, prescriptions and referral forms. These services require a face-to-face encounter ~~but~~ that may be performed on a calendar date prior to the actual discharge date. The time of the face-to-face encounter performed on a date prior to the discharge date is counted toward 99315, 99316 and not reported separately.				
(f)99315	I8	Nursing facility discharge day management; 30 minutes or less	XXX	1.50
(f)99316	I9	more than 30 minutes	XXX	2.50
Other Nursing Facility Services				
~~D99318~~	-	~~Evaluation and management of a patient involving an annual nursing facility assessment, which requires these 3 key components:~~ • ~~**A detailed interval history;**~~ • ~~**A comprehensive examination; and**~~ • ~~**Medical decision making that is of low to moderate complexity.**~~ ~~Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs.~~ ~~Usually, the patient is stable, recovering, or improving. Typically, 30 minutes are spent at the bedside and on the patient's facility floor or unit.~~ ~~(Do not report 99318 on the same date of service as nursing facility services codes 99304-99316)~~ (99318 has been deleted. To report, see 99307, 99308, 99309, 99310)	~~XXX~~	~~N/A~~ ~~(2021 work RVU = 1.71)~~

CPT 2023 E/M Guidelines

Category I
Evaluation and Management (E/M) Services Guidelines

In addition to the information presented in the Introduction, several other items unique to this section are defined or identified here.

E/M Guidelines Overview

The E/M guidelines have sections that are common to all E/M categories and sections that are category specific. Most of the categories and many of the subcategories of service have special guidelines or instructions unique to that category or subcategory. Where these are indicated, eg, "Hospital Inpatient and Observation Care," special instructions are presented before the listing of the specific E/M services codes. It is important to review the instructions for each category or subcategory. These guidelines are to be used by the reporting physician or other qualified health care professional to select the appropriate level of service. These guidelines do not establish documentation requirements or standards of care. The main purpose of documentation is to support care of the patient by current and future health care team(s). These guidelines are for services that require a face-to-face encounter. (For 99211 and 99281 the face-to-face services may be performed by clinical staff).

In the **Evaluation and Management** section (99202-99499) there are many code categories. Each category may have specific guidelines, or the codes may include specific details. These E/M guidelines are written for the following categories:

- Office or Other Outpatient Services
- Hospital Inpatient and Observation Care Services
- Consultations
- Emergency Department Services
- Nursing Facility Services
- Home and Residence Services
- Prolonged Service With or Without Direct Contact on the Date of an Evaluation and Management Service

Classification of Evaluation and Management (E/M) Services

The E/M section is divided into broad categories such as office visits, hospital inpatient or observation care visits, and consultations. Most of the categories are further divided into two or more subcategories of E/M services. For example, there are two subcategories of office visits (new patient and established patient) and there are two subcategories of hospital inpatient and observation care visits (initial and subsequent). The subcategories of E/M services are further classified into levels of E/M services that are identified by specific codes.

The basic format of codes with levels of E/M services based on medical decision making (MDM) or time is the same. First, a unique code number is listed. Second, the place and/or type of service is specified, eg, office or other outpatient visit. Third, the content of the service is defined. Fourth, time is specified. (A detailed discussion of time is provided following the Decision Tree for New vs Established Patients.)

The place of service and service type is defined by the location where the face-to-face encounter occurs. For example, service provided to a nursing facility resident brought to the office is reported with an office or other outpatient code.

New and Established Patients

Solely for the purposes of distinguishing between new and established patients, professional services are those face-to-face services rendered by physicians and other qualified health care professionals who may report evaluation and management services. A new patient is one who has not received any professional services from the physician or other qualified health care professional or another physician or other qualified health care professional of the exact same specialty and subspecialty who belongs to the same group practice, within the past three years.

An established patient is one who has received professional services from the physician or other qualified health care professional or another physician or other qualified health care professional of the exact same specialty and subspecialty who belongs to the same group practice, within the past three years. See Decision Tree for New vs Established Patients.

In the instance where a physician or other qualified health care professional is on call for or covering for another physician or other qualified health care professional, the patient's encounter will be classified as it would have been by the physician or other qualified health care professional who is not available. When advanced practice nurses and physician assistants are working with physicians, they are considered as working in the exact same specialty and subspecialty as the physician.

No distinction is made between new and established patients in the emergency department. E/M services in the emergency department category may be reported for any new or established patient who presents for treatment in the emergency department.

The Decision Tree for New vs Established Patients is provided to aid in determining whether to report the E/M service provided as a new or an established patient encounter.

Coding Tip

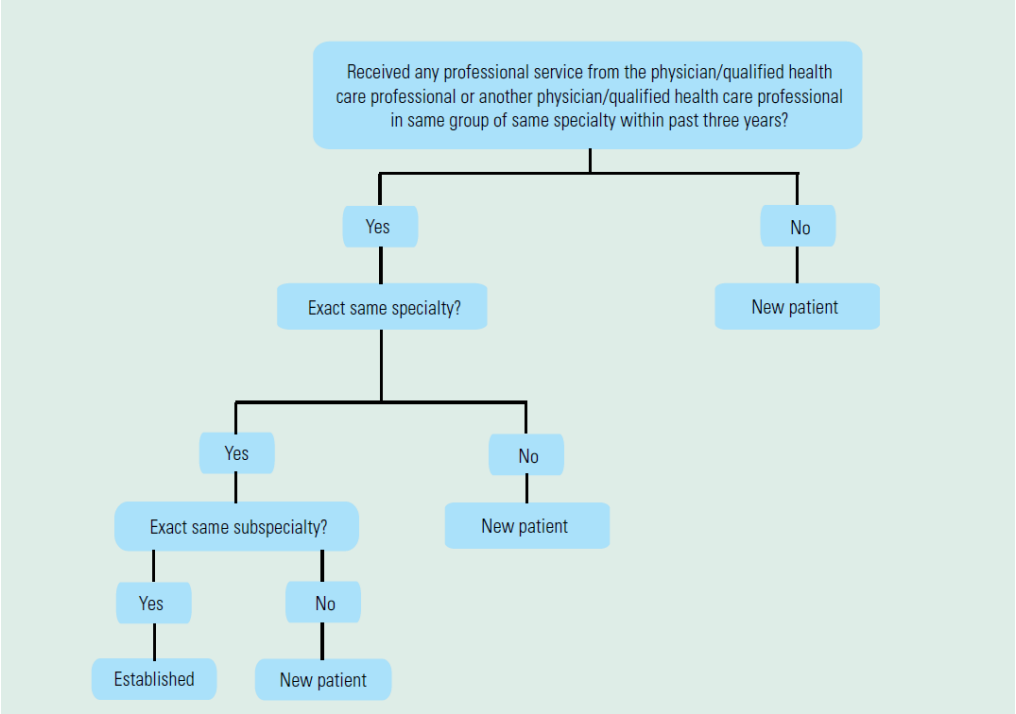
Instructions for Use of the CPT Codebook

When advanced practice nurses and physician assistants are working with physicians, they are considered as working in the exact same specialty and exact same subspecialty as the physician. A "physician or other qualified health care professional" is an individual who is qualified by education, training, licensure/regulation (when applicable), and facility privileging (when applicable) who performs a professional service within his or her scope of practice and independently reports that professional service. These professionals are distinct from "clinical staff." A clinical staff member is a person who works under the supervision of a physician or other qualified health care professional, and who is allowed by law, regulation and facility policy to perform or assist in the performance of a specific professional service but does not individually report that professional service. Other policies may also affect who may report specific services.

CPT Coding Guidelines, Introduction, Instructions for Use of the CPT Codebook

---

Decision Tree for New vs Established Patients



Initial and Subsequent Services

Some categories apply to both new and established patients (eg, hospital inpatient or observation care). These categories differentiate services by whether the service is the initial service or a subsequent service. For the purpose of distinguishing between initial or subsequent visits, professional services are those face-to-face services rendered by physicians and other qualified health care professionals who may report evaluation and management services. An initial service is when the patient has not received any professional services from the physician or other qualified health care professional or another physician or other qualified health care professional of the exact same specialty and subspecialty who belongs to the same group practice, during the inpatient or observation or nursing facility admission and stay.

A subsequent service is when the patient has received professional service(s) from the physician or other qualified health care professional or another physician or other qualified health care professional of the exact same specialty and subspecialty who belongs to the same group practice, during the admission and stay.

In the instance where a physician or other qualified health care professional is on call for or covering for another physician or other qualified health care professional, the patient's encounter will be classified as it would have been by the physician or other qualified health care professional who is not available. When advanced practice nurses and physician assistants are working with physicians, they are considered as working in the exact same specialty and subspecialty as the physician.

For reporting hospital inpatient or observation care services, a stay that includes a transition from observation to inpatient is a single stay. For reporting nursing facility services, a stay that includes transition(s) between skilled nursing facility and nursing facility level of care is the same stay.

Services Reported Separately

Any specifically identifiable procedure or service (ie, identified with a specific CPT code) performed on the date of E/M services may be reported separately.

The ordering and actual performance and/or interpretation of diagnostic tests/studies during a patient encounter are not included in determining the levels of E/M services when the professional interpretation

of those tests/studies is reported separately by the physician or other qualified health care professional reporting the E/M service. Tests that do not require separate interpretation (eg, tests that are results only) and are analyzed as part of MDM do not count as an independent interpretation and may be counted as ordered or reviewed for selecting an MDM level.

The performance of diagnostic tests/studies for which specific CPT codes are available may be reported separately, in addition to the appropriate E/M code. The interpretation of the results of diagnostic tests/studies (ie, professional component) with preparation of a separate distinctly identifiable signed written report may also be reported separately, using the appropriate CPT code and, if required, with modifier 26 appended.

See Instructions for Selecting a Level Based on MDM or Time.

The physician or other qualified health care professional may need to indicate that on the day a procedure or service identified by a CPT code was performed, the patient's condition required a significant separately identifiable E/M service. The E/M service may be caused or prompted by the symptoms or condition for which the procedure and/or service was provided. This circumstance may be reported by adding modifier 25 to the appropriate level of E/M service. As such, different diagnoses are not required for reporting of the procedure and the E/M services on the same date.

History and/or Examination

These E/M services include a medically appropriate history and/or physical examination, when performed. The nature and extent of the history and/or physical examination are determined by the treating physician or other qualified health care professional reporting the service. The care team may collect information, and the patient or caregiver may supply information directly (eg, by electronic health record [EHR] portal or questionnaire) that is reviewed by the reporting physician or other qualified health care professional. The extent of history and physical examination is not an element in selection of the level of these E/M service codes.

Levels of E/M Services

Select the appropriate level of E/M services based on the following:

1. The level of the MDM as defined for each service, **or**

2. The total time for E/M services performed on the date of the encounter.

Within each category or subcategory of E/M service based on MDM or time, there are three to five levels of E/M services available for reporting purposes. Levels of E/M services are **not** interchangeable among the different categories or subcategories of service. For example, the first level of E/M services in the subcategory of office visit, new patient, does not have the same definition as the first level of E/M services in the subcategory of office visit, established patient. Each level of E/M services may be used by all physicians or other qualified health care professionals.

Guidelines for Selecting a level service based on Medical Decision Making

Four types of MDM are recognized: straightforward, low, moderate, and high. The concept of the level of MDM does not apply to 99211 or 99281.

MDM includes establishing diagnoses, assessing the status of a condition, and/or selecting a management option. MDM is defined by three elements. The elements are:

- ***The number and complexity of problem(s) that are addressed during the encounter***.
- ***The amount and/or complexity of data to be reviewed and analyzed.*** These data include medical records, tests, and/or other information that must be obtained, ordered, reviewed, and analyzed for the encounter. This includes information obtained from multiple sources or interprofessional communications that are not reported separately and interpretation of tests that are not reported

separately. Ordering a test is included in the category of test result(s) and the review of the test result is part of the encounter and not a subsequent encounter. Ordering a test may include those considered, but not selected after shared decision making. For example, a patient may request diagnostic imaging that is not necessary for their condition and discussion of the lack of benefit may be required. Alternatively, a test may normally be performed, but due to risk for a specific patient is not ordered. These considerations must be documented. Data are divided into three categories:

- Tests, documents, orders, or independent historian(s). (Each unique test, order, or document is counted to meet a threshold number.)
- Independent interpretation of tests (not separately reported)
- Discussion of management or test interpretation with external physician or other qualified health care professional or appropriate source (not separately reported)

- **The risk of complications and/or morbidity or mortality of patient management:** This includes decisions made at the encounter associated with the diagnostic procedure(s) and treatment(s). This includes the possible management options selected and those considered but not selected, after shared decision making with the patient and/or family. For example, a decision about hospitalization includes consideration of alternative levels of care. Examples may include a psychiatric patient with a sufficient degree of support in the outpatient setting or the decision to not hospitalize a patient with advanced dementia with an acute condition that would generally warrant inpatient care, but for whom the goal is palliative treatment.

Shared decision making involves eliciting patient and/or family preferences, patient and/or family education, and explaining risks and benefits of management options.

MDM may be impacted by role and management responsibility.

When the physician or other qualified health care professional is reporting a separate CPT code that includes interpretation and/or report, the interpretation and/or report is not counted toward the MDM when selecting a level of E/M services.

When the physician or other qualified health care professional is reporting a separate service for discussion of management with a physician or another qualified health care professional, the discussion is not counted toward the MDM when selecting a level of E/M services.

The Levels of Medical Decision Making (MDM) table (Table 2) is a guide to assist in selecting the level of MDM for reporting an E/M services code. The table includes the four levels of MDM (ie, straightforward, low, moderate, high) and the three elements of MDM (ie, number and complexity of problems addressed at the encounter, amount and/or complexity of data reviewed and analyzed, and risk of complications and/or morbidity or mortality of patient management). To qualify for a particular level of MDM, two of the three elements for that level of MDM must be met or exceeded.

Examples in the table may be more or less applicable to specific settings of care. For example, the decision to hospitalize applies to the outpatient or nursing facility encounters, whereas the decision to escalate hospital level of care (eg, transfer to ICU) applies to the hospitalized or observation care patient.

See also the introductory guidelines of each code family section.

Table 2: Levels of Medical Decision Making (MDM)

Level of MDM (Based on 2 out of 3 Elements of MDM)	Elements of Medical Decision Making		
	Number and Complexity of Problems Addressed at the Encounter	Amount and/or Complexity of Data to be Reviewed and Analyzed **Each unique test, order, or document contributes to the combination of 2 or combination of 3 in Category 1 below.*	Risk of Complications and/or Morbidity or Mortality of Patient Management
N/A	N/A	N/A	N/A
Straightforward	Minimal • 1 self-limited or minor problem	Minimal or none	Minimal risk of morbidity from additional diagnostic testing or treatment
Low	Low • 2 or more self-limited or minor problems; or • 1 stable, chronic illness; or • 1 acute, uncomplicated illness or injury or • 1 stable acute illness or • 1 acute, uncomplicated illness or injury requiring hospital inpatient or observation level of care	Limited *(Must meet the requirements of at least 1 of the 2 categories*) Category 1: Tests and documents • Any combination of 2 from the following: ○ Review of prior external note(s) from each unique source*; ○ Review of the result(s) of each unique test*; ○ Ordering of each unique test* or Category 2: Assessment requiring an independent historian(s) *(For the categories of independent interpretation of tests and discussion of management or test interpretation, see moderate or high)*	Low risk of morbidity from additional diagnostic testing or treatment

Moderate	Moderate
	• 1 or more chronic illnesses with exacerbation, progression, or side effects of treatment;
	or
	• 2 or more stable, chronic illnesses;
	or
	• 1 undiagnosed new problem with uncertain prognosis;
	or
	• 1 acute illness with systemic symptoms;
	or
	• 1 acute, complicated injury
		Moderate
		(Must meet the requirements of at least 1 out of 3 categories)
		Category 1: Tests, documents, or independent historian(s)
		• Any combination of 3 from the following:
		  ○ Review of prior external note(s) from each unique source*;
		  ○ Review of the result(s) of each unique test*;
		  ○ Ordering of each unique test*;
		  ○ Assessment requiring an independent historian(s)
		or
		Category 2: Independent interpretation of tests
		• Independent interpretation of a test performed by another physician/other qualified health care professional (not separately reported);
		or
		Category 3: Discussion of management or test interpretation
		• Discussion of management or test interpretation with external physician/other qualified health care professional/appropriate source (not separately reported)
			Moderate risk of morbidity from additional diagnostic testing or treatment
			
			Examples only:
			• Prescription drug management
			• Decision regarding minor surgery with identified patient or procedure risk factors
			• Decision regarding elective major surgery without identified patient or procedure risk factors
			• Diagnosis or treatment significantly limited by social determinants of health

High	High
	• 1 or more chronic illnesses with severe exacerbation, progression, or side effects of treatment;
	or
	• 1 acute or chronic illness or injury that poses a threat to life or bodily function
		Extensive
		(Must meet the requirements of at least 2 out of 3 categories)
		
		Category 1: Tests, documents, or independent historian(s)
		• Any combination of 3 from the following:
		  ○ Review of prior external note(s) from each unique source*;
		  ○ Review of the result(s) of each unique test*;
		  ○ Ordering of each unique test*;
		  ○ Assessment requiring an independent historian(s)
		or
		Category 2: Independent interpretation of tests
		• Independent interpretation of a test performed by another physician/other qualified health care professional (not separately reported);
		or
		Category 3: Discussion of management or test interpretation
		• Discussion of management or test interpretation with external physician/other qualified health care professional/appropriate source (not separately reported)
			High risk of morbidity from additional diagnostic testing or treatment
			
			Examples only:
			• Drug therapy requiring intensive monitoring for toxicity
			• Decision regarding elective major surgery with identified patient or procedure risk factors
			• Decision regarding emergency major surgery
			• Decision regarding hospitalization or escalation of hospital-level of care
			• Decision not to resuscitate or to de-escalate care because of poor prognosis
			• Parenteral controlled substances

Number and Complexity of Problems Addressed at the Encounter

One element used in selecting the level of services is the number and complexity of the problems that are addressed at the encounter. Multiple new or established conditions may be addressed at the same time and may affect MDM. Symptoms may cluster around a specific diagnosis and each symptom is not necessarily a unique condition. Comorbidities and underlying diseases, in and of themselves, are not considered in selecting a level of E/M services **unless** they are addressed, and their presence increases the amount and/or complexity of data to be reviewed and analyzed or the risk of complications and/or morbidity or mortality of patient management. The final diagnosis for a condition does not, in and of itself, determine the complexity or risk, as extensive evaluation may be required to reach the conclusion that the signs or symptoms do not represent a highly morbid condition. Therefore, presenting symptoms which are likely to represent a highly morbid condition may drive MDM even when the ultimate diagnosis is not highly morbid. The evaluation and /or treatment should be consistent with the likely nature of the condition. Multiple problems of a lower severity may, in the aggregate, create higher risk due to interaction.

The term "risk" as used in these definitions relates to risk from the condition. While condition risk and management risk may often correlate, the risk from the condition is distinct from the risk of the management.

Definitions for the elements of MDM (see Table 2, Levels of Medical Decision Making) are:

Problem: *A problem is a disease, condition, illness, injury, symptom, sign, finding, complaint, or other matter addressed at the encounter, with or without a diagnosis being established at the time of the encounter.*

Problem addressed: A problem is addressed or managed when it is evaluated or treated at the encounter by the physician or other qualified health care professional reporting the service. This includes consideration of further testing or treatment that may not be elected by virtue of risk/benefit analysis or patient/parent/guardian/surrogate choice. Notation in the patient's medical record that another professional is managing the problem without additional assessment or care coordination documented does not qualify as being addressed or managed by the physician or other qualified health care professional reporting the service. Referral without evaluation (by history, examination, or diagnostic study[ies]) or consideration of treatment does not qualify as being addressed or managed by the physician or other qualified health care professional reporting the service. For hospital inpatient and observation care services, the problem addressed is the problem status on the date of the encounter, which may be significantly different than on admission. It is the problem being managed or co-managed by the reporting physician or qualified health care professional and may not be the cause of admission or continued stay.

Minimal problem: A problem that may not require the presence of the physician or other qualified health care professional, but the service is provided under the physician's or other qualified health care professional's supervision (see 99211, 99281).

Self-limited or minor problem: *A problem that runs a definite and prescribed course, is transient in nature, and is not likely to permanently alter health status.*

Stable, chronic illness: A problem with an expected duration of at least one year or until the death of the patient. For the purpose of defining chronicity, conditions are treated as chronic whether or not stage or severity changes (eg, uncontrolled diabetes and controlled diabetes are a single chronic condition). "Stable" for the purposes of categorizing MDM is defined by the specific treatment goals for an individual patient. A patient who is not at his or her treatment goal is not stable, even if the condition has not changed and there is no short-term threat to life or function. For example, a patient with persistently poorly controlled blood pressure for whom better control is a goal is not stable, even if the pressures are not changing and the patient is asymptomatic. The risk of morbidity **without** treatment is significant.

Acute, uncomplicated illness or injury: A recent or new short-term problem with low risk of morbidity for which treatment is considered. There is little to no risk of mortality with treatment, and full recovery without functional impairment is expected. A problem that is normally self-limited or minor but is not resolving consistent with a definite and prescribed course is an acute, uncomplicated illness.

Acute, uncomplicated illness or injury requiring hospital inpatient or observation level care: A recent or new short-term problem with low risk of morbidity for which treatment is required. There is little to no risk of mortality with treatment, and full recovery without functional impairment is expected. The treatment required is delivered in a hospital inpatient or observation level setting.

Stable, acute illness: A problem that is new or recent for which treatment has been initiated. The patient is improved and while resolution may not be complete is stable with respect to this condition.

Chronic illness with exacerbation, progression, or side effects of treatment: A chronic illness that is acutely worsening, poorly controlled, or progressing with an intent to control progression and requiring additional supportive care or requiring attention to treatment for side effects.

Undiagnosed new problem with uncertain prognosis: A problem in the differential diagnosis that represents a condition likely to result in a high risk of morbidity without treatment.

Acute illness with systemic symptoms: An illness that causes systemic symptoms and has a high risk of morbidity without treatment. For systemic general symptoms, such as fever, body aches, or fatigue in a minor illness that may be treated to alleviate symptoms, see the definitions for **self-limited or minor problem** or **acute, uncomplicated illness or injury.** Systemic symptoms may not be general but may be single system.

Acute, complicated injury: An injury which requires treatment that includes evaluation of body systems that are not directly part of the injured organ, the injury is extensive, or the treatment options are multiple and/or associated with risk of morbidity.

Chronic illness with severe exacerbation, progression, or side effects of treatment: The severe exacerbation or progression of a chronic illness or severe side effects of treatment that have significant risk of morbidity and may require escalation in level of care.

Acute or chronic illness or injury that poses a threat to life or bodily function: An acute illness with systemic symptoms, an acute complicated injury, or a chronic illness or injury with exacerbation and/or progression or side effects of treatment, that poses a threat to life or bodily function in the near term without treatment. Some symptoms may represent a condition that is significantly probable and poses a potential threat to life or bodily function. These may be included in this category when the evaluation and treatment is consistent with this degree of potential severity.

Amount and/or Complexity of Data to be Reviewed and Analyzed

One element used in selecting the level of services is the amount and/or complexity of data to be reviewed or analyzed at an encounter.

Analyzed: Analyzed is a term describing the process of using the data as part of the MDM. The data element itself may not be subject to analysis (eg, glucose), but it is instead included in the thought processes for diagnosis, evaluation, or treatment. Tests ordered are presumed to be analyzed when the results are reported. Therefore, when they are ordered during an encounter, they are counted in that encounter. Tests that are ordered outside of an encounter may be counted in the encounter where they are analyzed. In the case of a recurring order, each new result may be counted in the encounter at which it is analyzed. For example, an encounter that includes an order for monthly prothrombin times would count for one prothrombin time ordered and reviewed. Additional future results, if analyzed in a subsequent encounter, may be counted as a single test in that subsequent encounter. Any service for which the professional component is separately reported by the physician or other qualified health care professional

reporting the E/M services is not counted as a data element ordered, reviewed, analyzed, or independently interpreted for the purposes of determining the level of MDM.

Test: Tests are imaging, laboratory, psychometric, or physiologic data. A clinical laboratory panel (eg, basic metabolic panel [80047]) is a single test. The differentiation between single or multiple tests is defined in accordance with the CPT code set. For the purposes of data reviewed and analyzed, pulse oximetry is not a test.

Unique: A unique test is defined by the CPT code set. When multiple results of the same unique test (eg, serial blood glucose values) are compared during an E/M service, only count one unique test. Tests that have overlapping elements are not unique, even if they are identified with distinct CPT codes. For example, a CBC with differential would incorporate the set of hemoglobin, CBC without differential, and platelet count. A unique source is defined as a physician or qualified heath care professional in a distinct group or different specialty or subspecialty, or a unique entity. Review of all materials from any unique source counts as one element towards MDM.

Combination of Data Elements: A combination of different data elements, for example a combination of notes reviewed, tests ordered, tests reviewed, or independent historian, allows these elements to be summed. It does not require each item type or category to be represented. A unique test ordered, plus a note reviewed and an independent historian would be a combination of three elements.

External: *External records, communications and/or test results are from an external physician, other qualified health care professional, facility, or health care organization.*

External physician or other qualified health care professional: *An external physician or other qualified health care professional who is not in the same group practice or is of a different specialty or subspecialty. This includes licensed professionals who are practicing independently. The individual may also be a facility or organizational provider such as from a hospital, nursing facility, or home health care agency.*

Discussion: Discussion requires an interactive exchange. The exchange must be direct and not through intermediaries (eg, clinical staff or trainees). Sending chart notes or written exchanges that are within progress notes does not qualify as an interactive exchange. The discussion does not need to be on the date of the encounter but is counted only once and only when it is used in the decision making of the encounter. It may be asynchronous (ie, does not need to be in person), but it must be initiated and completed within a short time period (eg, within a day or two).

Independent historian(s): An individual (eg, parent, guardian, surrogate, spouse, witness) who provides a history in addition to a history provided by the patient who is unable to provide a complete or reliable history (eg, due to developmental stage, dementia, or psychosis) or because a confirmatory history is judged to be necessary. In the case where there may be conflict or poor communication between multiple historians and more than one historian is needed, the independent historian requirement is met. It does not include translation services. The independent history does not need to be obtained in person but does need to be obtained directly from the historian providing the independent information.

Independent interpretation: The interpretation of a test for which there is a CPT code, and an interpretation or report is customary. This does not apply when the physician or other qualified health care professional who reports the E/M service is reporting or has previously reported the test. A form of interpretation should be documented but need not conform to the usual standards of a complete report for the test.

Appropriate source: *For the purpose of the* ***discussion of management*** *data element (see Table 2, Levels of Medical Decision Making), an appropriate source includes professionals who are not health care professionals but may be involved in the management of the patient (eg, lawyer, parole officer, case manager, teacher). It does not include discussion with family or informal caregivers.*

Risk of Complications and/or Morbidity or Mortality of Patient Management

One element used in selecting the level of services is the risk of complications and/or morbidity or mortality of patient management at an encounter. This is distinct from the risk of the condition itself.

Risk: The probability and/or consequences of an event. The assessment of the level of risk is affected by the nature of the event under consideration. For example, a low probability of death may be high risk, whereas a high chance of a minor, self-limited adverse effect of treatment may be low risk. Definitions of risk are based upon the usual behavior and thought processes of a physician or other qualified health care professional in the same specialty. Trained clinicians apply common language usage meanings to terms such as high, medium, low, or minimal risk and do not require quantification for these definitions (though quantification may be provided when evidence-based medicine has established probabilities). For the purposes of MDM, level of risk is based upon consequences of the problem(s) addressed at the encounter when appropriately treated. Risk also includes MDM related to the need to initiate or forego further testing, treatment, and/or hospitalization. The risk of patient management criteria applies to the patient management decisions made by the reporting physician or other qualified health care professional as part of the reported encounter.

Morbidity: *A state of illness or functional impairment that is expected to be of substantial duration during which function is limited, quality of life is impaired, or there is organ damage that may not be transient despite treatment.*

Social determinants of health: *Economic and social conditions that influence the health of people and communities. Examples may include food or housing insecurity.*

Surgery (minor or major, elective, emergency, procedure or patient risk):

> ***Surgery-Minor or Major:*** The classification of surgery into minor or major is based upon the common meaning of such terms when used by trained clinicians, similar to the use of the term "risk". These terms are not defined by a surgical package classification.
>
> ***Surgery-Elective or Emergency:*** Elective procedures and emergent or urgent procedures describe the timing of a procedure when the timing is related to the patient's condition. An elective procedure is typically planned in advance (eg, scheduled for weeks later), while an emergent procedure is typically performed immediately or with minimal delay to allow for patient stabilization. Both elective and emergent procedures may be minor or major procedures.
>
> ***Surgery-Risk Factors, Patient or Procedure:*** Risk factors are those that are relevant to the patient and procedure. Evidence-based risk calculators may be used, but are not required, in assessing patient and procedure risk.

Drug therapy requiring intensive monitoring for toxicity: A drug that requires intensive monitoring is a therapeutic agent that has the potential to cause serious morbidity or death. The monitoring is performed for assessment of these adverse effects and not primarily for assessment of therapeutic efficacy. The monitoring should be that which is generally accepted practice for the agent but may be patient-specific in some cases. Intensive monitoring may be long-term or short-term. Long-term intensive monitoring is not performed less than quarterly. The monitoring may be performed with a laboratory test, a physiologic test, or imaging. Monitoring by history or examination does not qualify. The monitoring affects the level of MDM in an encounter in which it is considered in the management of the patient. An example may be monitoring for cytopenia in the use of an antineoplastic agent between dose cycles. Examples of monitoring that do not qualify include monitoring glucose levels during insulin therapy, as the primary reason is the therapeutic effect (unless severe hypoglycemia is a current, significant concern); or annual electrolytes and renal function for a patient on a diuretic, as the frequency does not meet the threshold.

Guidelines for Selecting Level of Service Based on Time

Certain categories of time-based E/M codes that do not have levels of services based on MDM (eg, Critical Care Services) in the E/M section use time differently. It is important to review the instructions for each category.

Time is **not** a descriptive component for the emergency department levels of E/M services because emergency department services are typically provided on a variable intensity basis, often involving multiple encounters with several patients over an extended period of time.

When time is used for reporting E/M services codes, the time defined in the service descriptors is used for selecting the appropriate level of services. The E/M services for which these guidelines apply require a face-to-face encounter with the physician or other qualified health care professional. For office or other outpatient services, if the physician's or other qualified health care professional's time is spent in the supervision of clinical staff who perform the face-to-face services of the encounter, use 99211.

For coding purposes, time for these services is the total time on the date of the encounter. It includes both the face-to-face and non-face-to-face time personally spent by the physician and/or other qualified health care professional(s) on the day of the encounter (includes time in activities that require the physician or other qualified health care professional and does not include time in activities normally performed by clinical staff). It does not include any time spent in the performance of other separately reported service(s).

A shared or split visit is defined as a visit in which a physician and other qualified health care professional(s) both provide the face-to-face and non-face-to-face work related to the visit. When time is being used to select the appropriate level of services for which time-based reporting of shared or split visits is allowed, the time personally spent by the physician and other qualified health care professional(s) assessing and managing the patient on the date of the encounter is summed to define total time. Only distinct time should be summed for shared or split visits (ie, when two or more individuals jointly meet with or discuss the patient, only the time of one individual should be counted).

When prolonged time occurs, the appropriate prolonged services code may be reported. The total time on the date of the encounter spent caring for the patient should be documented in the medical record when it is used as the basis for code selection.

Physician or other other qualified health care professional time includes the following activities, when performed:

- preparing to see the patient (eg, review of tests)
- obtaining and/or reviewing separately obtained history
- performing a medically appropriate examination and/or evaluation
- counseling and educating the patient/family/caregiver
- ordering medications, tests, or procedures
- referring and communicating with other health care professionals (when not separately reported)
- documenting clinical information in the electronic or other health record
- independently interpreting results (when not separately reported) and communicating results to the patient family/caregiver
- care coordination (when not separately reported)

Do not count time spent on the following:

- the performance of other services reported separately

- travel
- teaching that is general and not limited to discussion that is required for the management of the specific patient

Unlisted Service

An E/M service may be provided that is not listed in this section of the CPT codebook. When reporting such a service, the appropriate unlisted code may be used to indicate the service, identifying it by "Special Report," as discussed in the following paragraph. The "Unlisted Services" and accompanying codes for the E/M section are as follows:

***99429 Unlisted preventive** medicine service*

***99499 Unlisted evaluation and management** service*

Special Report

An unlisted service or one that is unusual, variable, or new may require a special report demonstrating the medical appropriateness of the service. Pertinent information should include an adequate definition or description of the nature, extent, and need for the procedure and the time, effort, and equipment necessary to provide the service. Additional items that may be included are complexity of symptoms, final diagnosis, pertinent physical findings, diagnostic and therapeutic procedures, concurrent problems, and follow-up care.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:99315 Tracking Number I8 Original Specialty Recommended RVU: **1.50**
Presented Recommended RVU: **1.50**
Global Period: XXX Current Work RVU: **1.28** RUC Recommended RVU: **1.50**

CPT Descriptor: Nursing facility discharge day management, 30 minutes or less

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: Final nursing facility day visit for a 72-year-old male with congestive heart failure and multiple comorbidities, who is being discharged home on diet and oral medications.

Percentage of Survey Respondents who found Vignette to be Typical: 80%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Review data from faxes, telephone calls, and other telecommunications regarding the patient's status since the last visit related to any new medical issues. Communicate with facility nursing staff and therapy staff, other health care professionals, and family members regarding patient status and pending discharge plans.

Description of Intra-Service Work: Review medical records and other available data. Obtain an interval history and perform a physical examination. Formulate and/or revise diagnosis and treatment plan(s), including making the decision for discharge. Review information regarding availability, safety, and adequacy of post-discharge support systems. Discuss aftercare treatment with patient, family and/or caregivers and other health care professionals. Provide care coordination for transition that includes instructions to caregivers for aftercare. Arrange for post-discharge follow-up professional services and testing as necessary. Reconcile patient's medications with attention to pre-admission therapy, inpatient therapy, and outpatient formulary. Write prescriptions as necessary. Complete discharge and aftercare forms. Inform referring physician of discharge plans. Complete medical record documentation.

Description of Post-Service Work: Complete discharge records. Respond and attend to any treatment failures, negative outcomes, medication refill requests, or adverse medication reactions that may occur after discharge until the primary care physician assumes care. Provide necessary care coordination, telephonic or electronic communication assitance, and other necessary management related to this facility stay. Receive and respond to any interval testing results or correspondence, including obtaining results pending at discharge, until the primary care physician assumes care. Revise treatment plan(s) and communicate with patient and/or caregiver, as necessary, until the primary care physician assumes care.

Modifier -51 Exempt Status
Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? No

TOP KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99495	XXX	2.78	**RUC Time**

CPT Descriptor Transitional Care Management Services with the following required elements: communication (direct contact, telephone, electronic) with the patient and/or caregiver within 2 business days of discharge, medical decision making of at least moderate complexity during the service period, face-to-face visit, within 14 calendar days of discharge

SECOND HIGHEST KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99214	XXX	1.92	**RUC Time**

CPT Descriptor Office or other outpatient visit for the evaluation and management of an established patient, which requires a mdecially appropriate history and/or examination and moderate level of medical decision making. When using time for code selection, 30-39 minutes of total time is spent on the date of the encounter.

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99203	XXX	1.60	**RUC Time**	11,452,897

CPT Descriptor 1 Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and low level of medical decision making. When using time for code selection, 30-44 minutes of total time is spent on the date of the encounter.

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
95861	XXX	1.54	**RUC Time**	44,204

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	12%	35%	44%	10%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	17%	45%	39%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	12%	58%	30%
Physical effort required	8%	60%	33%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	8%	40%	52%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	3%	12%	37%	33%	15%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	24%	30%	45%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	9%	48%	42%
Physical effort required	9%	45%	45%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	12%	30%	57%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

The CPT codes for initial and subsequent nursing facility services were surveyed because the CPT editorial panel changed the descriptors of the codes so that the choice of code to report is based on either medical decision making or the total time spent on the date of the encounter. The total time will be based on the results of the surveys for each code. The CPT codes for discharge services were not changed but were surveyed because they are part of the nursing facility services family. CPT also deleted 99318 which was used to report annual nursing facility assessment because such

assessments are not required by law. In the future these annual assessments will be reported using the appropriate initial or subsequent care code.

The codes were surveyed by the American Geriatrics Society (AGS), the American Medical Directors Association (AMDA), the American Academy of Physical Medicine & Rehabilitation (AAPM&R), the American Nurses Association (ANA), the American Podiatric Medical Association (APMA), and the American College of Physicians (ACP). The surveying societies convened an expert panel to review the survey results and make work and time recommendations to the RUC.

Compelling Evidence

Our expert panel identified two compelling evidence arguments relevant to the discharge codes 99315 and 99316. These include change in physician work due to technology and change in physician work due to change in patient population and length of stay. These arguments are described in detail below.

Change in physician work due to technology, specifically the use of multiple EMRs. Nursing facilities were slow to integrate EMR in their workflow, utilizing EMR that were nursing facility and not physician /provider friendly. Physicians and other QHP need to review and extract data from the nursing facility EMR to integrate into their standard work usually outpatient based EMR such as Epic or Cerner. Similarly, when orders or other interventions are made, documentation needs to occur in both systems. There are no EMRs in this space that integrate meaningfully. The typical computer of a physician or QHP working in this setting will have multiple EMR on it depending on the number of nursing facilities or skilled nursing facilities the individual works with. The necessary duplication of documentation across systems makes for more provider work especially on discharge where problems such as medications and follow-up need to be reconciled, documented, and acted upon in two systems.

Change in physician work due to change in patient population and length of stay. Data supports that since the discharge codes were last reviewed in 2010, the length of stay in the nursing home has decreased. According to the March 2021 MedPAC Report to Congress, the number of covered days per admission in the SNF has decreased from 27.1 in 2010 to 24.8 in 2019; a decrease of 8.5%. This is coupled with shorter hospital stays and faster discharge to the nursing facility. Further, the March 2020 MedPAC Report to Congress includes data documenting mean risk adjusted rates of community discharge have increased from 35.7% in 2012 to 41.4% in 2018 during which time readmits during the SNF stay decreased from 11.4 to 10.6%. These points also support more physician work discharging earlier and more often safely to home.

The acuity of patients admitted to nursing home after being discharged from an acute care hospital has increased significantly from 2011 to 2018. The table below shows the increase in patient acuity upon hospital discharge (Elixhauser scale) and the Hierarchical Condition Category (HCC) score on SNF admission. Note that a SNF patient is the typical patient for nursing home visits.

All Hospital Discharges to SNFs

		Elixhauser		HCC	
Year	N	Mean/Estimate	Std. Error	Mean/Estimate	Std. Error
2011	2,617,881	8.839	0.006	2.028	0.001
2012	2,579,944	8.951	0.007	2.067	0.001
2013	2,585,660	9.102	0.007	2.107	0.001
2014	2,639,292	9.178	0.006	2.144	0.001
2015	2,696,494	9.346	0.006	2.205	0.001
2016	2,687,022	9.341	0.006	2.287	0.001
2017	2,742,833	9.554	0.006	2.358	0.001
2018	2,673,328	9.706	0.006	2.402	0.001

The Elixhauser index is a well-established tool that categorizes 30 patient comorbidities based on ICD diagnosis, in this case upon hospital discharge, and is used in a variety of ways including predicting adverse events and utilization of resources. The HCC is a risk adjustment model which calculates risk scores for aged and disable Medicare beneficiaries, often used to represent the expected costs of a Medicare member in the coming year. This data was supplied by Dr Vincent Mor, Brown University Center for Gerontology and Healthcare Research, using LTCFocus.org,

a research data base from the Shaping Long-Term Care in America Project sponsored by Brown University and the National Institute on Aging.

Fashaw et. al. (JAMDA 21 (2020) 233-239, reviewed comprehensive data in US Nursing Homes from 1985-2015 and found that in 2015, as opposed to 1985, among other things, the resident cognitive function has decreased (e.g., percent of residents with dementia increased from 39% in 1995 to 45% in 2015), the percent of patients with a psychiatric diagnosis increased from 11% in 1995 to 31% in 2015, the percent of residents receiving antidepressants increased from 20% in 1995 to 49% in 2015, and the need to assistance with activities of daily living has increased,

Teno, et. al. (JAMA 2017) reviewed Medicare Part B claims data and showed that the care of SNF patients has shifted from physicians to nurse practitioners and physician assistances and that those physicians, NPs, and PAs who provide SNF care are SNFists - i.e., providers who bill more than 90% of all their visits in the nursing home setting.

Werner (JAMA 2018) reviewed MEDPAR data and determined that the length of acute care hospital stay before discharge to a post-acute facility decreased from 9.0 days in 2000 to 7.3 days in 2015 and length of stay in the post-acute care facility increased from 21.7 days in 2000 to more than 25 days in 2014 and 2015.

McCarthy et. al. (JAMA 2020) reviewed the nationwide Minimum Data Set (MDS) to look at transfers from nursing homes to acute care hospitals. They found that the number of transfers decreased from 2011 to 2016, especially for patients with dementia, heart failure, and chronic obstructive pulmonary disease - without an increased mortality rate in nursing homes.

Survey Data Review

The expert panel reviewed code 99315 which is for discharge day management, 30 minutes or less. This code was not changed but is part of the family. There were 185 respondents of whom 81% found the vignette to be typical. The survey times and median work RVU were 10/25/5/40/2.10 and the 25th percentile work RVU was 1.50. The two key reference services were 99495, Transitional Care Management Services with the following required elements: Communication (direct contact, telephone, electronic) with the patient and/or caregiver within 2 business days of discharge Medical decision making of at least moderate complexity during the service period Face-to-face visit, within 14 calendar days of discharge, which has times and work RVU of 0/54/0/54/2.78, and 99214, Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. When using time for code selection, 30-39 minutes of total time is spent on the date of the encounter, with times and work RVUs of 7/30/10/47/1.92.

The expert panel noted that the current times and work RVU for 99315 are 10/20/10/40/1.28.

The expert panel noted that while the survey total time was the same as the current total time, the intra time was five minutes higher. The expert panel also agreed that 99315 should be valued lower than both key reference services. The panel compared the survey intra time and 25th percentile work RVU to those for both key reference services. For 99495, the intra time of 54 minutes for 99495 is 216% higher than the intra survey time and the work RVU of 2.78 is 185% higher than the survey 25th percentile. For 99214 the intra time of 30 minutes is 20% higher then the survey intra time, the total time of 47 minutes is 17% more than the survey total time, and the work RVU of 1.92 is 28% more than the survey 25th percentile RVU. Therefore, the survey 25th percentile RVU places 99315 in proper rank order with both key reference services.

The expert panel also looked at two MPC codes, 99203, New patient visit requiring low level medical decision making with times and work RVU of 5/25/5/35/1.6, and 95861, Muscle test two limbs with times and work RVU of 10/29/10/49/1.54.

The expert panel agreed that the survey times and 25th percentile work RVU of 10/25/5/40/1.5 places 99315 in correct rank order with both these MPC codes.

Therefore, the expert panel recommends for 99315, times and work RVU of 10/25/5/40/1.5.

Finally, the expert panel reviewed its recommendations for all the surveyed codes to determine whether the recommendations placed the codes in proper rank order with each other.

The panel reviewed the total times, intra times and work RVUs among the subsequent visit codes, among the initial visit codes, and between the discharge codes to determine if the ratios (i.e., percent) differences of those parameters were consistent. They were very consistent. The expert panel also reviewed these data for the comparable initial visit and subsequent visit codes (e.g., 99306 and 99310) to determine if the percent differences were consistent. They were very consistent. Similarly, the date between the two discharge codes were very consistent. The expert panel agreed that this analysis supported all the recommendations for time and work RVUs.

Code	Intra-time	Total Time	Work RVU
99304	25	36	1.6
99305	35	55	2.5
Ratio of 99305 to 99304	1.4	1.52	1.56
99305	35	55	2.5
99306	50	80	3.5
Ratio of 99306 to 99305	1.42	1.45	1.4
99307	12	14	0.70

99315	25	40	1.5
99316	40	63	2.5
Ratio of 99316 to 99315	1.6	1.575	1.67

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 99315

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Nurse Practitioner	How often? Sometimes
Specialty Internal Medicine	How often? Sometimes
Specialty Family Medicine	How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 309110
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National estimate was based on total Medicare volume and Medicaid volume plus an additional 10% estimated for other payors

Specialty Nurse Practitioners	Frequency 110043	Percentage 35.59 %
Specialty Internal Medicine	Frequency 94279	Percentage 30.50 %
Specialty Family Medicine	Frequency 59967	Percentage 19.39 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 251,226 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimates are based on 2019 Medicare data from the RUC Database

Specialty Nurse Practitioner	Frequency 89436	Percentage 35.59 %
Specialty Internal Medicine	Frequency 76624	Percentage 30.50 %
Specialty Family Medicine	Frequency 48738	Percentage 19.40 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Evaluation Management

BETOS Sub-classification:
Nursing home visit

BETOS Sub-classification Level II:
NA

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 99315

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:99316 Tracking Number I9 Original Specialty Recommended RVU: **2.50**
Presented Recommended RVU: **2.50**
Global Period: XXX Current Work RVU: **1.90** RUC Recommended RVU: **2.50**

CPT Descriptor: Nursing facility discharge day management; more than 30 minutes

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: Final nursing facility day visit for an 84-year-old male who suffered a cerebrovascular accident with hemiparesis and who has congestive heart failure, peripheral vascular disease, and diabetes. The patient needs help transferring and is unable to administer his own insulin but has adequate supports at home to be discharged to the community.

Percentage of Survey Respondents who found Vignette to be Typical: 94%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Review data from faxes, telephone calls, and other telecommunication regarding patient's staus since the last visit related to any new medical issues. Communicate with facility nursing and therapy staff, other health care professionals, and family members refarding patient status and pending discharge plans.

Description of Intra-Service Work: Review medical records and other available data. Obtain an interval hisotry and perform a physical examination. Consider relevant data, options, and risks and formulate and/or revise diagnosis and treatment plan(s0, including making the decision for discharge. Review information regarding the availability, adequacy, and safety of post-discharge support systems. Discuss aftercare treatment with patient, family, and/or caregivers and other healthcare profressionals. Provide care coordiantion for the transition, including instructions to caregivers for aftercare. Arrange for post-discharge follow up professional services and testing. Reconcile patient's medications with attention to pre-admission therapy, inpatient therapy, and outpatient formulary. Write prescriptions as necessary. Complete discharge and aftercare forms. Inform the referring physician or discharge plans. Complete medical record documentation.

Description of Post-Service Work: Complete discharge records. Respond to any treatment failures, negative outcomes, medication refill requests, or adverse medication reactions that may occur after discharge until the primary care physician assumes care. Provide necessary care coordiation, telephonic or electronic communication assistance, and other necessary management related to this facility stay. Receive and respond to any interval testing results or correspondence, including obtaining any results pending at discharge, until the primary care physician assumes care. Revise treatment plan(s) and communicate with patient and/or caregiver as ncessary, until the primary care physician assumes care.

Modifier -51 Exempt Status
Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? No

TOP KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99496	XXX	3.79	**RUC Time**

CPT Descriptor Transitional Care Management Services with the following required elements: communication (direct contact, telephone, electronic) with the patient and/or caregiver within 2 business days of discharge, medical decision making of high complexity during the service period, face-to-face visit, within 7 calendar days of discharge

SECOND HIGHEST KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99215	XXX	2.80	**RUC Time**

CPT Descriptor Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and high level of medical decision making. When using time for code selection, 40-54 minutes of total time is spent on the date of the encounter.

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99204	XXX	2.60	**RUC Time**	10,714,246

CPT Descriptor 1 Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. When using time for code selection, 45-59 minutes of total time is spent on the date of the encounter

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
75635	XXX	2.40	**RUC Time**	114,472

CPT Descriptor 2 Computed tomographic angiography, abdominal aorta and bilateral iliofemoral lower extremity runoff, with contrast material(s), including noncontrast images, if performed, and image postprocessing

Other Reference CPT Code	Global	Work RVU	Time Source
95810	XXX	2.50	**RUC Time**

CPT Descriptor Polysomnography; age 6 years or older, sleep staging with 4 or more additional parameters of sleep, attended by a technologist

RELATIONSHIP OF CODE BEING REVIEWED TO TOP TWO KEY REFERENCE SERVICES:
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by percent distribution) of the service you are rating to the top two chosen key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Top Key Reference Code: 88 **% of respondents:** 46.0 **%**

Number of respondents who choose 2nd Key Reference Code: 38 **% of respondents:** 19.8 **%**

TIME ESTIMATES (Median)

	CPT Code: 99316	Top Key Reference CPT Code: 99496	2nd Key Reference CPT Code: **99215**

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	10%	22%	41%	27%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	13%	34%	54%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	8%	48%	44%
Physical effort required	6%	56%	39%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	11%	25%	64%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	3%	3%	16%	53%	26%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	16%	18%	65%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	5%	45%	50%
Physical effort required	6%	39%	45%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	11%	16%	73%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

The CPT codes for initial and subsequent nursing facility services were surveyed because the CPT editorial panel changed the descriptors of the codes so that the choice of code to report is based on either medical decision making or the total time spent on the date of the encounter. The total time will be based on the results of the surveys for each code. The CPT codes for discharge services were not changed but were surveyed because they are part of the nursing facility services family. CPT also deleted 99318 which was used to report annual nursing facility assessment because such assessments are not required by law. In the future these annual assessments will be reported using the appropriate initial or subsequent care code.

The codes were surveyed by the American Geriatrics Society (AGS), the American Medical Directors Association (AMDA), the American Academy of Physical Medicine & Rehabilitation (AAPM&R), the American Nurses Association (ANA), the American Podiatric Medical Association (APMA), and the American College of Physicians (ACP). The surveying societies convened an expert panel to review the survey results and make work and time recommendations to the RUC.

Compelling Evidence

Our expert panel identified two compelling evidence arguments relevant to the discharge codes 99315 and 99316. These include change in physician work due to technology and change in physician work due to change in patient population and length of stay. These arguments are described in detail below.

Change in physician work due to technology, specifically the use of multiple EMRs. Nursing facilities were slow to integrate EMR in their workflow, utilizing EMR that were nursing facility and not physician /provider friendly. Physicians and other QHP need to review and extract data from the nursing facility EMR to integrate into their standard work usually outpatient based EMR such as Epic or Cerner. Similarly, when orders or other interventions are made, documentation needs to occur in both systems. There are no EMRs in this space that integrate meaningfully. The typical computer of a physician or QHP working in this setting will have multiple EMR on it depending on the number of nursing facilities or skilled nursing facilities the individual works with. The necessary duplication of documentation across systems makes for more provider work especially on discharge where problems such as medications and follow-up need to be reconciled, documented, and acted upon in two systems.

Change in physician work due to change in patient population and length of stay. Data supports that since the discharge codes were last reviewed in 2010, the length of stay in the nursing home has decreased. According to the March 2021 MedPAC Report to Congress, the number of covered days per admission in the SNF has decreased from 27.1 in 2010 to 24.8 in 2019; a decrease of 8.5%. This is coupled with shorter hospital stays and faster discharge to the nursing facility. Further, the March 2020 MedPAC Report to Congress includes data documenting mean risk adjusted rates of community discharge have increased from 35.7% in 2012 to 41.4% in 2018 during which time readmits during the SNF stay decreased from 11.4 to 10.6%. These points also support more physician work discharging earlier and more often safely to home.

The acuity of patients admitted to nursing home after being discharged from an acute care hospital has increased significantly from 2011 to 2018. The table below shows the increase in patient acuity upon hospital discharge (Elixhauser scale) and the Hierarchical Condition Category (HCC) score on SNF admission. Note that a SNF patient is the typical patient for nursing home visits.

All Hospital Discharges to SNFs

		Elixhauser		HCC	
Year	N	Mean/Estimate	Std. Error	Mean/Estimate	Std. Error
2011	2,617,881	8.839	0.006	2.028	0.001
2012	2,579,944	8.951	0.007	2.067	0.001
2013	2,585,660	9.102	0.007	2.107	0.001
2014	2,639,292	9.178	0.006	2.144	0.001
2015	2,696,494	9.346	0.006	2.205	0.001
2016	2,687,022	9.341	0.006	2.287	0.001
2017	2,742,833	9.554	0.006	2.358	0.001
2018	2,673,328	9.706	0.006	2.402	0.001

The Elixhauser index is a well-established tool that categorizes 30 patient comorbidities based on ICD diagnosis, in this case upon hospital discharge, and is used in a variety of ways including predicting adverse events and utilization of resources. The HCC is a risk adjustment model which calculates risk scores for aged and disable Medicare beneficiaries, often used to represent the expected costs of a Medicare member in the coming year. This data was supplied by Dr Vincent Mor, Brown University Center for Gerontology and Healthcare Research, using LTCFocus.org, a research data base from the Shaping Long-Term Care in America Project sponsored by Brown University and the National Institute on Aging.

Fashaw et. al. (JAMDA 21 (2020) 233-239, reviewed comprehensive data in US Nursing Homes from 1985-2015 and found that in 2015, as opposed to 1985, among other things, the resident cognitive function has decreased (e.g., percent of residents with dementia increased from 39% in 1995 to 45% in 2015), the percent of patients with a psychiatric diagnosis increased from 11% in 1995 to 31% in 2015, the percent of residents receiving antidepressants increased from 20% in 1995 to 49% in 2015, and the need to assistance with activities of daily living has increased,

Teno, et. al. (JAMA 2017) reviewed Medicare Part B claims data and showed that the care of SNF patients has shifted from physicians to nurse practitioners and physician assistances and that those physicians, NPs, and PAs who provide SNF care are SNFists - i.e., providers who bill more than 90% of all their visits in the nursing home setting.

Werner (JAMA 2018) reviewed MEDPAR data and determined that the length of acute care hospital stay before discharge to a post-acute facility decreased from 9.0 days in 2000 to 7.3 days in 2015 and length of stay in the post-acute care facility increased from 21.7 days in 2000 to more than 25 days in 2014 and 2015.

McCarthy et. al. (JAMA 2020) reviewed the nationwide Minimum Data Set (MDS) to look at transfers from nursing homes to acute care hospitals. They found that the number of transfers decreased from 2011 to 2016, especially for patients with dementia, heart failure, and chronic obstructive pulmonary disease - without an increased mortality rate in nursing homes.

Survey Data Review

The expert panel reviewed code 99316, discharge day management, more than 30 minutes. This code was not changed but is part of the family. There were 191 respondents of whom 94% fund the vignette to be typical. The survey times and median work RVU were 15/40/8/63/3.01 and the 25th percentile work RVU was 2.5. The key reference services were 99496, Transitional Care Management Services with the following required elements: Communication (direct contact, telephone, electronic) with the patient and/or caregiver within 2 business days of discharge Medical decision making of high complexity during the service period Face-to-face visit, within 7 calendar days of discharge, with times and work RVU of 0/75/0/75/3.79, and 99215, Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and high level of medical decision making. When using time for code selection, 40-54 minutes of total time is spent on the date of the encounter, with times and work RVU of 10/45/15/70/2.80.

The expert panel noted that the current times and work RVU for 99316 are 14/25/15/54/1.90.

The expert panel noted that the survey intra time is 15 minutes (60% greater) more than the current intra time and the survey total time of 63 minutes is nine minutes (17% greater) more than the current total time. The expert then compared the survey data to the reference services. The total time for 99215 is 11% higher than the survey total time, the intra time of 45 minutes is 12% higher than the survey intra time, and the work RVU of 2.80 is 12% higher than the survey 25th percentile work RVU. The intra time for 99496 is 87% more than the survey intra time, and 19% more than the survey total time and the work RVU of 3.79 is 51% more than the survey 25th percentile work RVU.

The expert panel believes that the 25th percentile work RVU of 2.5 please 99316 in correct rank order with the key reference services. In addition, the expert panel reviewed two MPC codes, 99204, New patient visit requiring moderate level medical decision making with times and work RVU of 10/40/10/60/2.6, and 75635, Computed tomographic angiography, abdominal aorta and bilateral iliofemoral lower extremity runoff, with contrast material(s), including noncontrast images, if performed, and image postprocessing, with times and work RVU of 10/39/8/57/2.4. The expert panel believe that the survey 25th percentile work RVU places 99316 in correct rank order to these two MPC codes.

Therefore, the expert panel recommends times and work RVU for 99316 of 15/40/8/63/2.5.

Finally, the expert panel reviewed its recommendations for all the surveyed codes to determine whether the recommendations placed the codes in proper rank order with each other.

The panel reviewed the total times, intra times and work RVUs among the subsequent visit codes, among the initial visit codes, and between the discharge codes to determine if the ratios (i.e., percent) differences of those parameters were consistent. They were very consistent. The expert panel also reviewed these data for the comparable initial visit and subsequent visit codes (e.g., 99306 and 99310) to determine if the percent differences were consistent. They were very consistent. Similarly, the date between the two discharge codes were very consistent. The expert panel agreed that this analysis supported all the recommendations for time and work RVUs.

Code	Intra-time	Total Time	Work RVU
99304	25	36	1.6
99305	35	55	2.5
Ratio of 99305 to 99304	1.4	1.52	1.56
99305	35	55	2.5
99306	50	80	3.5
Ratio of 99306 to 99305	1.42	1.45	1.4
99307	12	14	0.70
99308	18	27	1.3
Ratio of 99308 to 99307	1.5	1.93	1.86
99308	18	27	1.3
99309	30	47	1.92
Ratio of 99309 to 99308	1.67	1.74	1.48
99309	30	47	1.92
99310	45	70	2.8
Ratio of 99310 to 99309	1.5	1.49	1.46
99304	25	36	1.6
99308	18	27	1.3
Ratio of 99308 to 99304	0.72	0.75	0.81
99305	35	55	2.5
99309	30	47	1.92
Ratio of 99309 to 99305	0.86	0.85	0.77
99306	50	80	3.5
99310	45	70	2.8
Ratio of 99310 to 99306	0.9	0.875	0.80
99315	25	40	1.5
99316	40	63	2.5
Ratio of 99316 to 99315	1.6	1.575	1.67

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 99316

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Nurse Practitioners	How often? Sometimes
Specialty Internal Medicine	How often? Sometimes
Specialty Family Medicine	How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 519002
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National estimate was based on total Medicare volume and Medicaid volume plus an additional 10% estimated for other payors

Specialty Nurse Practitioner	Frequency 257425	Percentage 49.60 %
Specialty Internal Medicine	Frequency 128712	Percentage 24.79 %
Specialty Family Medicine	Frequency 52938	Percentage 10.19 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 447,543 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimates are based on 2019 Medicare data from the RUC database

Specialty Nurse Practitioner	Frequency 221981	Percentage 49.59 %
Specialty Internal Medicine	Frequency 110991	Percentage 24.80 %
Specialty Family Practice	Frequency 45649	Percentage 10.19 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment
Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Evaluation Management

BETOS Sub-classification:
Nursing home visit

BETOS Sub-classification Level II:
NA

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 99316

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

Quality
Nursing Home Reform Act
OBRA 1987
nursing home characteristics

A B S T R A C T

Objective: In 1987, the Omnibus Reconciliation Act (OBRA) called for a dramatic overhaul of the nursing home (NH) quality assurance system. This study examines trends in facility, resident, and quality characteristics since passage of that legislation.
Methods: We conducted univariate analyses of national data on US NHs from 3 sources: (1) the 1985 National Nursing Home Survey (NNHS), (2) the 1992-2015 Online Survey Certification and Reporting (OSCAR) Data, and (3) LTCfocUS data for 2000-2015. We examined changes in NH characteristics, resident composition, and quality.
Setting and participants: US NH facilities and residents between 1985 and 2015.
Results: The proportion of NHs that are Medicare and Medicaid certified, members of chains, and operating not-for-profit has increased over the past 30 years. There have also been reductions in occupancy and increases in the share of residents who are racial or ethnic minorities, admitted for post-acute care, in need of physical assistance with daily activities, primarily supported by Medicare, and diagnosed with a psychiatric condition such as schizophrenia. With regard to NH quality, direct care staffing levels have increased. The proportion of residents physically restrained has decreased dramatically, coupled with changes in inappropriate antipsychotic (chemical restraint) use.
Conclusions and implications: Together with changes in the long-term care market, the NHs of today look very different from NHs 30 years ago. The 30th anniversary of OBRA provides a unique opportunity to reflect, consider what we have learned, and think about the future of this and other sectors of long-term care.

For more than 30 years, the quality of nursing home (NH) care has been a continuous concern.[1] In 1984, following published reports and concerns about resident abuse, neglect, and a lack of regulation and oversight, Congress asked the Institute of Medicine (IOM) to investigate the quality of NHs and make recommendations for improvement. The resulting report proposed radical NH reforms,[2] many of which were codified by Congress as part of the Nursing Home Reform Act of the Omnibus Budget Reconciliation Act of 1987 (OBRA 1987).

OBRA 1987 created regulations for NHs in an effort to improve the quality of care delivered to residents. OBRA included a minimum set of care standards and rights for people residing in Medicare- and Medicaid-certified NHs. OBRA 1987 had a focus on residents' quality of life and care, expectations for improved or maintained resident health, as well as residents' rights to banking, organized family councils, and freedom from unnecessary physical and chemical restraints. The Act also standardized certification standards and enforcement strategies. As such, OBRA 1987 was an overhaul of the NH industry and marked a new beginning for NH care and regulation.

In the 30+ years since OBRA 1987, there have been a number of other changes that have directly affected the NH industry. In response

This work was supported by the National Institute on Aging (P01 AG027296); the Agency for Healthcare Research and Quality (4T32 HS000011); and the Veterans Affairs Health Services Research and Development Service (CDA 14-422).

to consumer preferences to remain in the community, "age-in-place," and efforts to rebalance states' long-term care budgets,[3–5] there has been a considerable increase in home- and community-based services (HCBS). HCBS were seen as mechanisms to divert or delay expensive, and often undesired, NH placement. Over the last several decades, states have begun funding more HCBS, primarily through Medicaid waiver programs; and, for the first time in 2013, states spent more on HCBS than care provided in NHs.[6] Accompanying these care delivery, market, and financing changes has been growth of an aging and diversifying population, as well as a number of laws and regulations directly impacting the NH industry (eg, the Balanced Budget Act of 1997 and the introduction of case-mix reimbursement).

The purpose of this study was to summarize changes in the NH industry in the 30 years since the seminal regulatory change affecting NHs. Specifically, we use historical data from 3 national sources and describe changes in NH facility characteristics, resident characteristics, and quality of care from 1985 through 2015. The 30th Anniversary of OBRA provides a unique opportunity to examine the changes within this vitally important industry. This article can aid in understanding long-term trends, as well as provide insight into what changes we might expect in the future.

Methods

Data

We analyzed data from 3 sources to examine resident and facility characteristics, longitudinally: (a) National Nursing Home Survey, (b) Online Survey Certification and Reporting Data/Certification and Survey Provider Enhanced Reporting, and (c) LTCFocUS data.

National Nursing Home Survey (NNHS)

The National Center for Health Statistics conducted the NNHS. The NNHS consists of a nationally representative sample of more than 1,000 NHs and their residents. NHs included in the surveys had at least 3 or more beds and were Medicare or Medicaid certified or had a state license to operate as an NH. The facilities and residents were selected by a stratified 2-stage probability design. In the first stage, NHs were selected, and in the second stage, residents were sampled from the selected NHs. NNHS data were used to describe facility and aggregated resident characteristics. Data for these analyses came from the University of Michigan ICPSR public use NNHS data files for 1985.[7]

Online Survey Certification and Reporting Data (OSCAR)/ Certification and Survey Provider Enhanced Reporting (CASPER)

CMS' OSCAR/CASPER database is a national database of all NH data elements collected by state survey agencies during the required annual onsite Medicare and Medicaid Certification inspection. The inspections occur at least once during a 15-month period. OSCAR/CASPER data are used to determine facility characteristics, deficiencies in care noted during the survey, and aggregated resident data. Data included all certified NHs between the years 1992 and 2015. Variables in OSCAR/CASPER have been validated for research purposes.[8]

Long-Term Care FocUS (LTCFocUS)

We used LTCFocUS.org, a product of the Shaping Long-Term Care in America Project at the Brown University Center for Gerontology and Healthcare Research and supported, in part, by the National Institute on Aging (www.ltcfocus.org). This data set included information for years 2000-2015 and combined variables from the OSCAR data; the Minimum Data Set (MDS), resident-level data related to resident clinical and functional status; the Area Resource File (ARF), a national county-level health resources database maintained by the Health Resources and Services Administration that contains data about the health professionals and facilities in each county; and the Residential History File, a data resource built using Medicare Enrollment data, Medicare claims data, and assessment data to track individuals as they move through the long-term care system.[9] For these analyses, we used the LTCFocUS data to describe the aggregated characteristics of residents served in NHs between 2000 and 2015.

Variables

We included the following facility characteristics to describe changes in the NH market over time: dual certification for Medicare and Medicaid, multifacility chain membership, for-profit status (vs nonprofit or government), presence of an Alzheimer's special care unit, facility size (ie, total number of beds), and occupancy rate.

To describe the resident composition, we included demographic characteristics, length of stay, admission source, physical function, mental health diagnoses, and medication use measures. Demographic variables from LTCfocUS included the percentage of female residents in each facility; the percentage of blacks, whites, and Hispanics in each facility; and the average age for residents residing in each facility. Also from the LTCfocUS, we included the percentage of long-stay residents, defined as the percentage of residents in the NH at least 90 of the last 100 days. We also include the percentage of residents admitted to the NH directly from the hospital vs the community or other LTC setting. From the OSCAR/CASPER, we included information about residents' primary payer as the percentage of residents whose primary support was Medicaid or Medicare. Measures of resident physical and cognitive function included the facility's average Activities of Daily Living (ADL) scale score, bed/chair bound measures, individual early-, middle-, and late-loss ADL, and the percentage of residents with dementia. The ADL scale score comes from LTCFocUS, ranges from 0 to 28, and is created by summing 7 ADL items on a scale from 0 to 4 (with 0 = complete independence and 4 = total dependence for each item). The facility average represents the average across all residents in the facility. Chairbound and bedbound measures come from the NNHS and OSCAR/CASPER data and refer to the percentage of residents unable to leave their chair or bed, respectively, at the time of the survey. The individual ADL of interest from the NNHS and OSCAR/CASPER data include dressing, bathing, transferring, toileting, and eating, and represent the percentage of residents who were not completely independent in each of these activities at the time of the survey. From the NNHS and OSCAR/CASPER data, we also included a measure for the percentage of residents with dementia within the facility. Measures of resident mental health and medication use included the percentage of residents with a psychiatric diagnosis (excluding dementia and depression), a schizophrenia diagnosis, receiving antianxiety medications, receiving antidepressants, and receiving antipsychotics.

Information on facility quality consisted of structure, process, and outcome measures.[10] As a measure of structure, we included the number of certified nursing aides, licensed professional nurses, and registered nurse hours per resident per day from the OSCAR/CASPER data. We obtained information about facilities' quality process measures including the percentage of residents in a facility who were physically restrained, received tube feeding, had a catheter, received antipsychotic medications without a diagnosis of schizophrenia or bipolar disorder at the time of the survey, and the percentage of facilities experiencing medication errors. Medication error refers to the percentage of facilities cited for drug error rates higher than 5% reported during the annual survey. Quality outcome measures included the percentage of residents within a facility with pressure ulcers, and the percentage of residents within a facility experiencing incontinence. Values for pressure ulcers indicate the percentage of residents during the annual survey with pressure sores. The incontinence measures indicate the percentage of residents with bladder or bowel incontinence at the time of the survey.

Table 1
Changes Over Time in Facility Characteristics (1985-2015)

Year	1985, Mean (CI)	1995, % or Mean (SD)	2005, % or Mean (SD)	2015, % or Mean (SD)
Number of nursing homes, n	19,068*	16,824	16,091	15,686
Percentage dual (Medicare + Medicaid) certified	33.3 (28.9, 37.8)	78.6	93.4	97.1
Percentage member of a chain		51.24	52.43	56.81
Percentage for-profit	75.0 (70.9, 79.1)	66.4	66.0	69.1
Percentage with Alzheimer's Unit		11.2	18.2	15.2
Average number of beds		100.84 (67.93)	104.97 (65.37)	106.13 (61.31)
Percentage with 3-49 beds	33.7 (26.8, 41.0)	18.8	14.9	12.9
Percentage with 50-99 beds	32.4 (28.0, 36.8)	36.0	36.3	37.1
Percentage with 100-199 beds	27.8 (24.2, 31.5)	38.5	42.2	44.0
Percentage with ≥200 beds	6.1 (5.1, 7.2)	6.8	6.5	6.0
Average occupancy rate		87.14 (16.41)	84.43 (15.14)	81.19 (15.79)

CI, confidence interval; SD, standard deviation.
*Weighted number of facilities.

Analyses

Univariate analyses of the above variables were completed using Stata, version 14 (StataCorp, College Station, TX). Data from the NNHS were weighted using the facility, bed, and current resident weights provided. OSCAR/CASPER and LTCFocUS data are available at the facility level. Facility-level variables are averaged for each study year. We do not include inferential statistics in this article because we are presenting data for the entire population of NHs in the United States for the majority of years.

Results

Facility Characteristics

In the past 30 years, the NH industry has decreased in size, from 19,068 facilities in 1985 to 15,686 in 2016 (Table 1). There has also been an increase in the percentage of facilities that are nonprofit (25% in 1985 and 31% in 2015) and that are dually certified by both Medicare and Medicaid (33% in 1985 and up to 97% 2015). Between 1995 and 2015, chain membership increased from 51% to 57%, the percentage of facilities with an Alzheimer's special care unit increased from 11% to 15%, and the overall NH occupancy rates declined from 87% to 81%.

Resident Composition

The population that NHs serve has changed over the last 30 years (Table 2). Data from the NNHS and LTCFocUS suggest that although the average age of residents has remained constant, the percentage of residents who are racial and ethnic minorities has increased from 7.8% in 1985 to 20.7% in 2015. The average percentage of females decreased from 72% of residents in 1985 to 67% in 2015. The prevalence of long-stay residents within NHs has remained stable at 69% of all residents over this time period. However, the percentage of residents admitted from the hospital increased from 67% in 2000 to 85% in 2015. There has also been a shift of payer types over time (Figure 1). Between 1992 and 2015, the average percentage of residents with Medicaid as a primary payer decreased from 64% to 58%, whereas the average percentage of residents with Medicare as the primary payer rose from 9% to 15%.

Resident physical and cognitive function has decreased over the years (Table 3). According to LTCFocUS data, the average ADL dependency score among NH residents increased slightly, from 15 to 17, between 2000 and 2015. According to NNHS and OSCAR/CASPER data, residents who required assistance in bathing increased from a national average of 89% in 1985 to an average facility average of 96% in 2015. The same trend is demonstrated by the increased share of residents who need assistance with the other ADL from 1985 to 2015: assistance with dressing rose from 74% to 92%, assistance with transferring from 60% to 85%, assistance with toileting from 49% to 88%, and assisting with eating increased from 38% to 56%. However, there was a decrease in the percentage of residents who were bed-bound from 6% in 1985 to 4% in 2015, whereas being chair bound rose from 39% to 64%. The percentage of residents with dementia increased from an average of 39% in 1995 to an average of 45% across the facilities in 2015.

The share of residents with psychiatric diagnoses has increased over the years, as has the use of psychotropic medications. According to the OSCAR/CASPER data, there was an almost 3-fold increase in the share of residents with a psychiatric diagnosis, from 11% in 1995 to 31% by 2015. Between 1985 and 2015, the average percentage of

residents with schizophrenia increased from 6% to 11%. The percentages of residents receiving antianxiety, antidepressant, and antipsychotic medications in 1995 were 15%, 20%, and 16%, respectively, and by 2015 increased to 23%, 49%, and 20%, respectively.

Quality of Care

The average direct care staffing hours have increased over time, with the greatest increases observed among CNAs (see Table 4). Overall, quality process measures have also improved since the passage of OBRA 1987. Notably, the average proportion of residents being physically restrained decreased dramatically from 19% to 1%, and the percentage of residents receiving antipsychotic medications inappropriately, as a chemical restraint, decreased from 16% in 2000 to 12% in 2015, although there was a peak of 22% in 2005. However, there was not much change in the proportion of facilities cited for medication errors over this time period.

Quality outcome measures also improved over time. The proportion of residents with pressure ulcers decreased from 8% to 6%. Lastly, congruent with increased need for assistance, bowel and bladder incontinence increased from 42% to 44% and 49% to 62%, respectively.

Discussion

Within this 30-year period, there were facility, resident, and quality of care changes that can be linked to regulations adopted through the OBRA 1987 and other policy shifts in the long-term care sector.

Certification

Over the last 30 years, we witnessed a change in NH certification. This change is consistent with the OBRA 1987 requirement for NHs to be certified and meet the federal participation requirements in order to receive Medicaid and Medicare payments.[11] Previously, Medicare-certified facilities had more stringent requirements, but seeing that the majority of government spending came from Medicaid, OBRA 1987 stipulated that all Medicaid-certified facilities met a set of standards that were similar to that of Medicare.[1] Additionally, noting Medicare's generous reimbursement for skilled care, many Medicaid-only NHs became dually certified in both Medicare and Medicaid.[12] These policy and financing incentives likely contributed to the increase in the proportion of facilities that were dually certified during this time period.

Changing Demand and Supply, and Lower Occupancy

Concurrent with shifting US demographics (eg, an aging and increasingly diverse population), NHs in the last 30 years have witnessed increases in the proportion of minorities and decreases in the proportion of white residents. Recognizing the aging population, the long-term care market began to appear more lucrative and attracted a greater number of investors to NH operations.[13] This is evidenced by the percentage of NHs that were owned and operated by a chain. Stevenson, Grabowski, and Coots (2006) posit that chain facilities increased because of the interplay of certificate of need laws and resulting acquisitions.

Despite the aging of the population, there was a decrease in the number of NHs and facility occupancy rates during this time period. This decrease in NH supply and occupancy is likely attributable to the rise of community options such as assisted living and other HCBS.[14,15] In 2000, Medicaid spent about 27% of its total Medicaid long-term services and supports expenditures on HCBS and 73% on institutional care; by 2016, 57% of the expenditures were for HCBS and 43% for NH care.[6] It can be difficult to quantify the increase in community-based services due to data challenges; however, the National Survey of Resident Care Facilities identified approximately 31,100 residential facilities in 2010 and researchers have suggested a continued growth in the market.[16–18] The growth of long-term care alternatives allows individuals to remain in their homes and communities longer, in many cases delaying NH placement or diverting it altogether.[19–23] These trends may also explain some of the reasons behind the increase in functional impairment among NH residents over this time period.

Another potential explanation for the increase in functional impairment witnessed over this 30-year period may be the increase in post-acute, rehabilitative care provided in NHs. Recognizing the profitability associated with providing Medicare-reimbursed services,[24] NHs began to accept more post-acute care patients, with a large number of NHs choosing to specialize in the care of post-acute patients.[12,25] This shift in the orientation of NHs over this time period, from providing typically long-term custodial care to post-acute, rehabilitative care, may contribute to the increase in resident acuity witnessed in this study. It is evident from our findings that there is an increased percentage of residents being admitted directly from the hospital, presumably for post-acute care, which may contribute to higher levels of functional impairment as residents may be leaving hospitals "quicker and sicker."[26,27]

Quality Improvement

Despite higher resident levels of need, NH quality appears to have improved over time. Our data show modest gains in quality indicators between 1995 and 2015. The literature around drivers of quality improvement in NHs is vast and includes mechanisms such as NH ownership, nurse staffing, public reporting, and quality improvement initiatives. The quality improvement that we witnessed during this time period could have been attributable to the increase in nonprofit NHs, which have consistently shown to have higher quality ratings.[13] Quality improvement could also be directly related to the increase in nursing hours witnessed over this time period. OBRA 1987 improved the standards for nursing hours, and we observed these increases over time. Although it is possible that the increase in nursing hours may be in direct response to increasing need among residents, prior research has concluded that increasing nursing hours improves patient outcomes.[28–30] It is also plausible that new inspection, survey, enforcement efforts, and public reporting prompted improvements in quality

measures.[1,31] Although it can be argued that NHs still have room to improve in their quality indicators, it is important to note that despite an increasingly vulnerable and higher need population, we still observe quality gains among NHs during this time period.

One of the direct effects of OBRA 1987 was a substantial decrease in the use of physical restraints. Physical restraints were initially used on residents with serious mental illness to manage behaviors, but began to be used more widely on residents with behavioral symptoms, including residents with dementia.[32] Prior research indicates that physical restraints are associated with worse outcomes for residents, such as increased depression, less social engagement among NH residents,[33–35] reduced muscle strength,[33] and pressure ulcers.[33,34,36] Parts of OBRA 1987 focused directly on the residents' rights to be free from all restraints. Unfortunately, decreases in physical restraints were coupled with initial increases in chemical restraint use, such as inappropriate antipsychotic use. Antipsychotic medications increase the risk of falls[37] and death.[38,39] In 2005, the FDA released a Black Box warning to decrease the use of antipsychotics among older adults.[40] This warning is consistent with the 2005 peak in antipsychotic use that is present in our data. In 2011, CMS launched a national partnership to further reduce inappropriate antipsychotic use, which has been largely successful.[41] With the increase in dementia residents and initiatives to improve dementia care in NHs, there was a simultaneous increase in Alzheimer's SCUs, with a peak in the percentage of facilities with an Alzheimer's SCU in 2005. Literature suggests that residents within facilities with SCUs have significantly more challenging behaviors and have increased risk for chemical restraint use.[42,43] The presence of these units may also account for the increased resident impairment.

It is also important to note the dramatic increase in residents with serious mental illnesses (SMI), as this could be a direct result of state psychiatric facilities closures in the 1960s and 1970s. The increase in the SMI population creates a new and increased burden for NHs and their staff that may negatively affect the quality of care that NHs are able to provide.[44,45]

Despite the success of several prompted voiding interventions,[46,47] we observed increases into the share of NH residents experiencing incontinence over the past 30 years, potentially reflective of the increasing needs of the NH population. Prompting toileting interventions can be labor intensive, and it is often more convenient to diaper a resident than toilet.[48] More work is needed in this important quality of life area.

Limitations

This work provides a high-level look at national trends in NH characteristics, resident composition, and quality measures. Data are averaged across all facilities for the available study years. We do not have access to annual data available between 1986 and 1994, and because of the facility-level nature of our data we are unable to summarize resident-level changes over time. For example, it would be interesting to examine changes in acuity, separately for long-stay vs short-stay residents, or changes in residents' lengths of stay. This would help us understand if the increase in acuity over time is due to an increased focus on post-acute care, or attributable to higher levels of acuity among long-term residents who may delay entry into NHs through home- and community-based alternatives. Future work in this area would be beneficial to understanding additional impacts of OBRA on the long-term care industry as a whole.

Conclusions and Implications

Overall, OBRA 1987 is positively associated with the quality of care improvements in NHs despite increasing impairment of NH residents. OBRA 1987 was also successful in implementing and enforcing the MDS resident assessment survey, and without that this research would not be possible. Because of the aging-in-place movement, we are seeing lower occupancy rates in NHs. Older adults without financial resources, disproportionality minority older adults, are becoming an increasing proportion of NH residents, as they may not be able to as readily access these care alternatives. Current and future policies should focus on expanding equitable access to the remaining long-term care services and supports in the continuum of care, particularly given the policies and initiatives focused on decreasing NH utilization through support of home and community based alternatives.[49] Although NHs continue to focus more on short-stay post-acute care residents and long-stay residents with dementia, more work will need to be done in community-based settings to ensure the highest quality care and life. Improving quality is also about improving equity, and it is important for future work to examine access to quality care for our most vulnerable older adults who are sometimes triply and doubly vulnerable because of their cognitive status, race, and/or socioeconomic position. As our work shows, much of the quality progress made in NHs has been because of regulation and oversight over the years. The same level of oversight does not exist for all community alternatives, but the evidence presented here is indicative of effective practices.

Future research is also needed to understand whether these improvements in quality over the past 30 years have been equitable on the basis of race, socioeconomic status, gender, and geography. In sum, our findings document the 30-year history of NHs since the passage of the seminal legislation: OBRA 1987. As we look toward the future of long-term care, it is important that we reflect on the past.

JAMA Internal Medicine | Original Investigation

Hospital Transfer Rates Among US Nursing Home Residents With Advanced Illness Before and After Initiatives to Reduce Hospitalizations

Ellen P. McCarthy, PhD, MPH; Jessica A. Ogarek, MS; Lacey Loomer, MSPH; Pedro L. Gozalo, MSc, PhD; Vincent Mor, PhD; Mary Beth Hamel, MD, MPH; Susan L. Mitchell, MD, MPH

IMPORTANCE Hospital transfers among nursing home residents in the United States who have been diagnosed with advanced illnesses and have limited life expectancy are often burdensome, costly, and of little clinical benefit. National initiatives, introduced since 2012, have focused on reducing such hospitalizations, but little is known about the consequences of these initiatives in this population.

OBJECTIVE To investigate the change in hospital transfer rates among nursing home residents with advanced illnesses, such as dementia, congestive heart failure (CHF), and chronic obstructive pulmonary disease (COPD), from 2011 to 2017—before and after the introduction of national initiatives to reduce hospitalizations.

DESIGN, SETTING, AND PARTICIPANTS In this cross-sectional study, nationwide Minimum Data Set (MDS) assessments from January 1, 2011, to December 31, 2016 (with the follow-up for transfer rates until December 31, 2017), were used to identify annual inception cohorts of long-stay (>100 days) nursing home residents who had recently progressed to the advanced stages of dementia, CHF, or COPD. The data were analyzed from October 24, 2018, to October 3, 2019.

MAIN OUTCOMES AND MEASURES The number of hospital transfers (hospitalizations, observation stays, and emergency department visits) per person-year alive was calculated from the MDS assessment from the date when residents first met the criteria for advanced illness up to 12 months afterward using Medicare claims from 2011 to 2017. Transfer rates for all causes, potentially avoidable conditions (sepsis, pneumonia, dehydration, urinary tract infections, CHF, and COPD), and serious bone fractures (pelvis, hip, wrist, ankle, and long bones of arms or legs) were investigated. Hospice enrollment and mortality were also ascertained.

RESULTS The proportions of residents in the 2011 and 2016 cohorts who underwent any hospital transfer were 56.1% and 45.4% of those with advanced dementia, 77.6% and 69.5% of those with CHF, and 76.2% and 67.2% of those with COPD. The mean (SD) number of transfers per person-year alive for potentially avoidable conditions was higher in the 2011 cohort vs 2016 cohort: advanced dementia, 2.4 (14.0) vs 1.6 (11.2) (adjusted risk ratio [aRR], 0.73; 95% CI, 0.65-0.81); CHF, 8.5 (32.0) vs 6.7 (26.8) (aRR, 0.72; 95% CI, 0.65-0.81); and COPD, 7.8 (30.9) vs 5.5 (24.8) (aRR, 0.64; 95% CI, 0.57-0.72). Transfers for bone fractures remained unchanged, and mortality did not increase. Hospice enrollment was low across all illness groups and years (range, 23%-30%).

CONCLUSIONS AND RELEVANCE The findings of this study suggest that concurrent with new initiatives aimed at reducing hospitalizations, hospital transfers declined between 2011 and 2017 among nursing home residents with advanced illnesses without increased mortality rates. Opportunities remain to further reduce unnecessary hospital transfers in this population and improve goal-directed care for those residents who opt to forgo hospitalization.

A central objective of the Patient Protection and Affordable Care Act (ACA) of 2010 was to transform health care by ensuring that patients receive high-value, effective care.[1] Toward this objective, there has been particular focus on reducing potentially avoidable hospital transfers from the long-term care setting. The opportunity and need to reduce avoidable hospitalizations are greatest among people with advanced chronic illnesses[2] for whom the burdens of hospitalization often outweigh the benefits.[3-5] Little is currently known about how hospital transfer rates have changed among this population since broad initiatives were introduced.

Approximately 50% of nursing home residents experience 1 or more hospitalization in their last year of life.[6] At least half of these hospitalizations are estimated to be potentially avoidable because the acute condition could be managed effectively in the nursing home or the hospital-level care is not aligned with patient preferences.[7-11] Decisions regarding hospital transfers should be guided by the primary goal of care (eg, prolongation of life vs comfort), which is comfort for most nursing home residents with advanced illness.[12-15] With rare exceptions (eg, serious bone fractures), hospitalization seldom promotes the goal of comfort.

Since 2012, several new approaches have emerged from the ACA to try to reduce hospital transfers of nursing home residents. Care models that enhance the nursing home's on-site capability to manage specific targeted conditions (sepsis, pneumonia, urinary tract infections, dehydration, congestive heart failure [CHF], and chronic obstructive pulmonary disease [COPD]) have shown promise through the quality initiative program of the Centers for Medicare & Medicaid Services (CMS) to reduce avoidable hospitalizations.[9,10] Evaluation of the initiative's first phase in 7 states demonstrated estimated net reductions in 2015 of 2.2% to 9.3% in the probability of an all-cause hospitalization and 1.4% to 7.2% in the probability of a potentially avoidable hospitalization for participating residents compared with comparison groups.[1] Alternative payment models, such as accountable care organizations and bundled payments, also create financial incentives for nursing homes to reduce hospital transfers.[16] The Hospital Readmissions Reduction Program (HRRP) implemented financial penalties for hospitals with excess readmissions for target conditions including pneumonia, CHF, and COPD.[17,18] These concurrent initiatives raised national awareness and forged collaborations around transitional care to avoid unnecessary hospitalizations.[19] The consequences of such initiatives on hospital transfer rates, specifically among residents with advanced illnesses, have not been reported, to our knowledge.

The present study used Minimum Data Set (MDS) assessments linked to Medicare data to examine the national trends of hospital transfer rates from 2011 to 2017 among long-stay, fee-for-service nursing home residents with advanced dementia, CHF, or COPD. We specifically examined transfers for conditions that were deemed to be potentially avoidable and were the target of recent policy initiatives. For comparison, we also examined hospital transfer rates for serious bone fractures, which we hypothesized would be less affected by such initiatives. Finally, we assessed mortality and hospice enrollment rates.

Key Points

Question How did the hospital transfer rates change between 2011 and 2017 among nursing home residents diagnosed with advanced illness and limited life expectancy before and after the introduction of national initiatives to reduce hospitalizations?

Findings In this US nationwide cross-sectional study of 6 cohorts of nursing home residents with advanced illness, such as dementia, congestive heart failure, and chronic obstructive pulmonary disease, although hospital transfers for all causes and for potentially avoidable conditions were common, such transfers were found to have declined considerably from 2011 to 2017, and concurrent hospice use was low across all cohorts.

Meaning The findings of this study suggest that hospital transfer rates among nursing home residents with advanced illness declined from 2011 to 2017 and that opportunities remain to reduce unnecessary hospital transfers among residents with advanced illness.

Methods

Advanced Illness Cohorts

In this cross-sectional study, the MDS version 3.0 assessments[20] from federally licensed nursing homes in the United States were used from January 1, 2011, to December 31, 2016, to construct annual inception cohorts of long-stay residents (ie, >100 days) aged 65 years or older who were diagnosed with advanced dementia, CHF, or COPD. The MDS version 3.0 is a standardized, comprehensive assessment conducted on all nursing home residents at admission and at routine intervals (eg, quarterly) and was implemented in 2011.[20] Key differences between MDS 3.0 and MDS 2.0 precluded us from using MDS before 2011.[21] To construct these cohorts, we identified residents from the first MDS assessment at which they met the full criteria for advanced dementia, CHF, or COPD (hereafter, baseline assessment) in each calendar year. Residents may have had the illness, such as CHF, on a prior MDS assessment but were not included in the cohort until they first met the criteria for advanced disease, as described below. Residents had to be continuously enrolled in the Medicare Parts A and B fee-for-service program for up to 12 months after their baseline assessment and could belong to more than 1 advanced illness group. Residents enrolled in hospice at the baseline assessment were excluded. The institutional review board at Brown University approved this study under expedited review and waived informed consent under 45 CFR 46.116.

We defined advanced dementia, CHF, and COPD using criteria adapted from previous studies[5,22,23] using MDS to approximate hospice eligibility criteria, thus implying limited life expectancy. Advanced dementia criteria included the following: diagnosis of Alzheimer disease or other dementia, advanced cognitive impairment as defined by a score of 3 (moderate impairment) or 4 (severe impairment) on the Cognitive Function Scale,[24] and extensive or total assistance needed for eating and transferring. Advanced CHF was defined as follows: CHF diagnosis, shortness of breath while sitting or supine, and extensive or total assistance needed for transferring. Advanced COPD was

defined as follows: diagnosis of COPD (including emphysema and asthma), shortness of breath while sitting or supine, and extensive or total assistance needed for transferring.

Covariates

Age, sex, nonwhite race, dual-eligible status indicating beneficiaries qualifying for both Medicare and Medicaid, MDS 3.0 mortality risk score (MRS3),[25] and cohort year were ascertained from the baseline MDS assessment. The MRS3 (0-39) is a validated risk score based on demographic, clinical, and functional characteristics, with higher values indicating greater 30- and 60-day mortality risk. An MRS3 score of 8 or higher is associated with a 5.4 times increased odds of 30-day mortality compared with scores lower than 8.[25]

Outcomes

Residents were followed for up to 12 months from their baseline MDS assessment using Medicare claims from January 1, 2011, to December 31, 2017, to ascertain the occurrence of hospital transfers for all causes, potentially avoidable conditions, and serious bone fractures. Thus, person-time and outcomes spanned 2 calendar years (eg, for the 2016 cohort, outcomes were assessed in both 2016 and 2017). Hospital transfers included acute hospitalizations, observation stays, and emergency department (ED) visits. Hospitalizations were identified from the Medicare Provider Analysis and Review file.[26] Observation stays were defined as any outpatient facility claim for observation services using Healthcare Common Procedure Codes G0378-G0379,[27] *Current Procedural Terminology* codes 99217-99220,[28] or hospital outpatient revenue center code 0762. Emergency department visits were ascertained using outpatient facility claims with revenue center codes 0450-0459 or 0981, Healthcare Common Procedure Codes G0380-G0385, or carrier claims for ED services using *Current Procedural Terminology* codes 99281-99285. Observation stays that became admissions were considered to be hospitalizations. Emergency department visits that became hospitalizations or observation stays were classified accordingly.

Potentially avoidable transfers were identified using ambulatory care-sensitive conditions,[7-11] including sepsis, pneumonia, dehydration, urinary tract infections, heart failure, and COPD (including emphysema and asthma) (eTable 1 in the Supplement). These conditions account for 78% of the potentially avoidable hospitalizations among nursing home residents.[9] Serious bone fractures were examined as counterfactual conditions that usually result in hospital transfers regardless of existing policies and included fractures of the pelvis, hip, long bones of arms (humerus, ulna, and radius) and legs (femur, tibia, and fibula), wrists, and ankles (eTable 1 in the Supplement). We classified hospital transfers for these conditions using the claim's principal diagnosis. Mortality and hospice enrollment within 12 months after the baseline assessment were identified from the Medicare Master Beneficiary Summary File[29] and the 2011 to 2017 hospice claims, respectively.

Statistical Analysis

The data were analyzed from October 24, 2018, to October 3, 2019. Descriptive analyses were performed for resident characteristics and outcomes using means with SDs for continuous variables and proportions for categorical variables. Descriptive results were generated for each advanced illness group stratified by cohort year. Hospital transfers were further described by type (hospitalizations, observation stays, and ED visits) and by condition (all causes, potentially avoidable, and serious bone fractures). The proportion of potentially avoidable transfers attributable to specific diagnoses (eg, sepsis, pneumonia) were also calculated and presented graphically. Outliers defined as residents with all-cause hospital transfer rates exceeding 365 transfers per person-year alive across 12 months were removed (<1% of residents across all cohorts combined). Hospital transfer outcomes across 12 months were measured as the proportion of residents who experienced at least 1 transfer and the number of transfers per person-year alive. Mortality and hospice enrollment outcomes across 12 months were measured as the proportion of residents who experienced the event and the time to event. For all models, the main independent variable was the cohort year, with 2011 as the referent category. All models were adjusted for age, sex, nonwhite race, and MRS3 score. All models were fitted using generalized estimating equations to account for clustering within nursing homes and included an offset for log-transformed person-time.

Binary outcomes (any hospital transfers, hospice enrollment, and mortality) were analyzed using log-linked binomial models to estimate relative risk with cohort year. Zero-inflated Poisson regression models were used to analyze outcomes measured as number of transfers per person-year alive to allow for overdispersion owing to the high proportion of residents without a hospital transfer.[30] Adjusted risk ratios (aRRs) and 95% CIs were generated for these analyses. Finally, Cox proportional hazards regression models were used to analyze time-to-event outcomes (hospice enrollment, mortality) across 12 months of follow-up. In the hospice model, death without hospice was considered to be a competing risk. Adjusted hazard ratios and 95% CIs were estimated from these analyses. Analyses were performed using SAS, version 9.4 (SAS Institute Inc).

Results

Table 1 gives the characteristics of the nursing home residents by cohort year and advanced illness group. The 2011 cohort sizes were smaller for all illness groups compared with those of other years because residents had to be in the nursing home for at least 100 days and MDS data before 2011 were not used. Nonetheless, the overall distributions of age and sex were similar across cohort years within illness groups. Residents with advanced CHF (10.1-10.9) and COPD (9.0-9.6) generally had higher MRS3 scores (higher mortality risk) compared with residents with advanced dementia (7.5-8.4). All cohorts were predominately female, white, and dually eligible for Medicare and Medicaid.

Table 2 provides hospital transfer outcomes. All-cause hospital transfers were common in all illness groups across all years and were consistently lower for residents with advanced dementia compared with other groups. The most pronounced reduction in transfers occurred from the 2011 to 2012 cohort and

Abbreviations: MDS, Minimum Data Set; MRS3, MDS 3.0 mortality risk score.

[a] Cohort year refers to the calendar year of the inception cohort constructed for each advanced illness using MDS 3.0 assessments from 2011 to 2016.

[b] Cohort sizes from 2011 were smaller compared with those of other years because residents had to be in the nursing home for at least 100 days and MDS data before 2011 were not used.

[c] Beneficiaries who qualify for both Medicare and Medicaid benefits.

[d] MDS 3.0 mortality risk score, range 0-39; higher scores indicate higher risk of mortality.

then from the 2012 to 2013 cohort. Data showed no further reduction after 2013 and higher rates in 2016 than in 2015, particularly in the CHF and COPD cohorts. The adjusted proportions of residents who had at least 1 hospital transfer for any cause in the 2011 and 2016 cohorts were 56.1% and 45.4% for those with advanced dementia, 77.6% and 69.5% for those with CHF, and 76.2% and 67.2% for those with COPD. The mean (SD) number of hospital transfers per person-year alive for any cause was higher in the 2011 vs 2016 cohorts for nursing home residents with advanced dementia, 5.8 (22.7) vs 3.9 (17.9); CHF, 16.8 (43.9) vs 13.5 (38.9); and COPD, 15.6 (42.4) vs 11.2 (35.8). For each illness, the decrease in transfer rates between the 2011 and 2016 cohorts remained significant (advanced dementia [aRR, 0.72; 95% CI, 0.67-0.78]; CHF [aRR, 0.74; 95% CI, 0.68-0.80]; and COPD [aRR, 0.66; 95% CI, 0.61-0.72]) after adjustment for baseline characteristics. As demonstrated in **Figure 1**, reductions in hospital transfer rates over time were almost entirely attributable to declines in acute hospitalizations in each illness group.

Transfers for potentially avoidable conditions were common and decreased over time in each illness group in patterns similar to those of transfers for all causes (Table 2). The adjusted proportions of residents having at least 1 hospital transfer for a potentially avoidable condition in the 2011 and 2016 cohorts, respectively, were 26.5% and 20.4% for those with advanced dementia; 50.0% and 42.9% for those with CHF; and 49.2% and 40.7% for those with COPD. The mean (SD) number of hospital transfers per person-year alive for potentially avoidable conditions for the 2011 vs 2016 cohorts were 2.4 (14.0) vs 1.6 (11.2) (aRR, 0.73; 95% CI, 0.65-0.81) for those with advanced dementia; 8.5 (32.0) vs 6.7 (26.8) (aRR, 0.72; 95% CI, 0.65-0.81) for those with CHF; and 7.8 (30.9) vs 5.5 (24.8) (aRR, 0.64; 95% CI, 0.57-0.72) for those with COPD. Sepsis was the most frequent condition attributed to potentially avoidable transfers in all cohort years for all groups (**Figure 2**). The next most frequent conditions documented for potentially avoidable transfers were pneumonia and urinary tract infections for advanced dementia and CHF and pneumonia for both advanced CHF and COPD.

Hospital transfers for a primary diagnosis of serious bone fractures were relatively uncommon and, as hypothesized, remained unchanged for all advanced illness groups across all years (Table 2). **Table 3** gives the mortality and hospice enrollment outcomes. Hospice enrollment was low across all illness groups and years (range, 23%-30%). Mortality within 1 year exceeded 50% for all advanced illness groups across all years but did not increase over time in any illness group. Hospice use

Abbreviations: COPD, chronic obstructive pulmonary disease; MDS, Minimum Data Set; MRS3, MDS 3.0 mortality risk score; RR, relative risk.

[a] Cohort year refers to the calendar year of the inception cohort constructed for each advanced illness using MDS assessments from 2011 to 2016. Medicare data from 2011 to 2017 were used to identify transfers occurring within 12 months of meeting the criteria for advanced illness for each cohort. Thus, person-time and transfers were assessed for up to 12 months and spanned 2 calendar years (eg, for the 2016 cohort, transfers were assessed in both 2016 and 2017).

[b] All models were adjusted for age, sex, nonwhite race, and MRS3 and included an offset for log(person-time).

[c] Transfers for primary diagnosis of sepsis, pneumonia, dehydration, urinary tract infections, heart failure, and COPD or asthma.

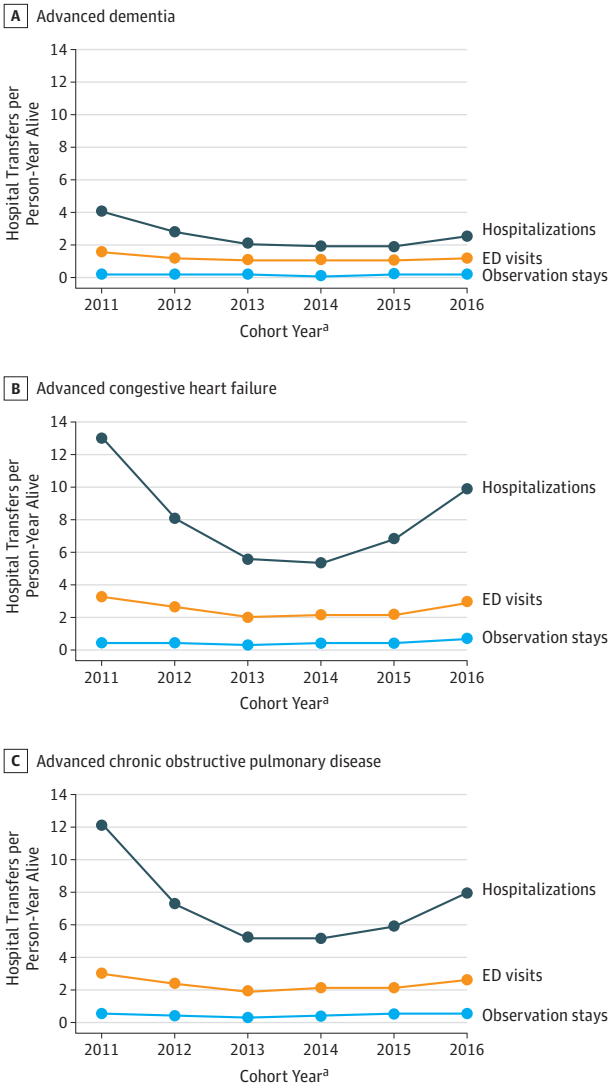
[d] Fractures of pelvis, hip, wrist, ankle, and long bone fractures of arms (humerus, ulna, and radius) and legs (femur, tibia, and fibula).

was low for all illnesses across all years but increased slightly for the 2016 cohort of residents with advanced dementia.

Discussion

We examined changes in national hospital transfer rates among long-stay nursing home residents with advanced dementia, CHF, and COPD from 2011 to 2017, a period during which national initiatives were introduced to reduce hospital transfers across care settings, including the long-term care setting. Transfers for all causes and potentially avoidable conditions declined for each advanced illness group during these years without adversely affecting mortality. This decline was almost entirely attributable to a reduction in hospitalizations rather than in observation stays or ED visits. In contrast, transfer rates for serious bone fractures, which are less likely to be associated with policy changes, remained stable. Sepsis and pneumonia were common reasons for potentially avoidable hospital transfers across all groups. Although the hospital transfer rates for all causes and potentially avoidable conditions declined, they remained common. In the 2016 cohorts, 45% of the residents with advanced

Figure 1. Transfer Rates for Hospitalizations, Emergency Department (ED) Visits, and Observation Stays for Illness Groups by Cohort Year



[a] Cohort year refers to the calendar year of the inception cohort constructed for each advanced illness using Minimum Data Set assessments from 2011 to 2016. Medicare data from 2011 to 2017 were used to identify transfers occurring within 12 months of meeting the criteria for advanced illness for each cohort. Thus, person-time and transfers were assessed for up to 12 months and spanned 2 calendar years (eg, for the 2016 cohort, transfers were assessed in both 2016 and 2017).

dementia and roughly two-thirds of those with advanced CHF and COPD experienced at least 1 transfer despite the greater than 50% mortality rate across all groups. These observations, coupled with low hospice enrollment throughout all years, suggest that opportunities remain to further reduce hospital transfers and improve end-of-life care for nursing home residents with advanced illnesses.

Although several studies describe changes in hospitalization rates in the United States in 2014 and 2015,[17,18,31-33] the present study focused on long-term care residents with advanced illness. The issue is particularly pertinent for this population because hospital transfers can be especially burdensome, of little clinical benefit, and distressing for family members.[3-5,34] Treatment decisions should be guided by patient preferences. Thus, if the decline in transfer rates observed in this study reflect, in part, decisions to avoid hospitalizations in favor of comfort-focused care, then such care should be available in the nursing home. High-quality palliative care is currently lacking in many US nursing homes.[35-37] Palliative care and hospice improve the quality of end-of-life care among nursing home residents, including reducing hospitalization rates.[32,36-39] Although we could not ascertain whether residents received palliative care outside the Medicare Hospice Benefit, we observed low rates of hospice enrollment and no concurrent uptake of hospice as hospital transfer rates declined. Given the increased scrutiny and federal audits of nursing homes with long hospice stays, the present study suggests that most residents with advanced dementia, CHF, and COPD are not receiving hospice care near the end of life.

Potentially avoidable hospital transfers among dual-eligible beneficiaries are key quality measures in long-term care and cost Medicare an estimated $2.6 billion annually.[9,40] Infections accounted for most potentially avoidable hospital transfers across advanced illness groups. Among residents with advanced CHF and COPD, exacerbations of these underlying conditions were also common reasons for transfers. Consequently, advance care planning among providers, residents, and family members presents a critical opportunity for informed decision-making about wishes for future hospitalizations in anticipation of expected clinical complications, and online resources are available to help guide these discussions.[41] Proxies of residents with advanced dementia should understand that recurrent infections are a hallmark of the end stage of the disease. Among residents with advanced illness for whom curative care remains aligned with their preferences, infections and cardiopulmonary decompensations can often be managed in the nursing home.[3,42-45] Of note, mortality did not increase across the cohort years in any group despite the decline in hospital transfers.

Programmatic initiatives, such as Interventions to Reduce Acute Care Transfers (INTERACT),[46] have been adopted widely to avoid unnecessary hospitalizations by improving the nursing home's capacity to provide on-site evaluation and management of acute changes through early recognition, monitoring, and staff training. Although a recent cluster randomized clinical trial of INTERACT demonstrated no effect on hospitalizations or ED visits, the trial highlighted the complexities of implementing and sustaining such interventions in nursing homes.[16]

This study's findings are consistent with those of studies documenting prominent declines in hospitalization and readmission rates between 2010 and 2012 after the enactment of the ACA and announcement of the HRRP, a Medicare value-based purchasing program that financially penalizes hospitals with excess readmissions for specific conditions.[17,18,47-49] Health care systems may have made systemic preparations in anticipation of the HRRP penalty phase in October 2012. Our findings also support the possible spillover effect of HRRP onto nonspecific conditions.[17,18,47,48,50] Consistent with other studies, we

[a] Cohort year refers to the calendar year of the inception cohort constructed for each advanced illness using Minimum Data Set assessments from 2011 to 2016. Medicare data from 2011 to 2017 were used to identify transfers occurring within 12 months of meeting the criteria for advanced illness for each cohort. Thus, person-time and transfers were assessed for up to 12 months and spanned 2 calendar years (eg, for the 2016 cohort, transfers were assessed in both 2016 and 2017).

observed a leveling off of hospital transfer rates during 2014 to 2016.[17,18,47,48] Chhabra and colleagues[48] suggest that this pattern may reflect a floor effect—a point at which achieving additional reductions in rates becomes more difficult. Regression to the mean may also partly explain the marked decline observed in transfer rates compared with those in 2011.[33]

Several factors acting in parallel may contribute to the observed declines in potentially avoidable transfers. Increased attention and quality and performance improvement initiatives have targeted unnecessary hospital transfers. Recent studies demonstrate reductions in hospital readmissions for potentially avoidable conditions after implementation of the HRRP.[17,18] Although nursing homes were not subject to financial penalties under HRRP, many nursing homes across the United States adopted quality improvement programs, such as INTERACT, in anticipation of CMS quality assurance and performance improvement regulations.[46] In addition, nursing homes included in accountable care organizations or other preferred referral

[a] Cohort year refers to the calendar year of the inception cohort constructed for each advanced illness using MDS assessments from 2011 to 2016. Medicare data from 2011 to 2017 were used to identify outcomes occurring within 12 months of meeting the criteria for advanced illness for each cohort. Thus, person-time and outcomes were assessed for up to 12 months and spanned 2 calendar years (eg, for the 2016 cohort, outcomes were assessed in both 2016 and 2017).

[b] Adjusted for age, sex, nonwhite race, and MRS3 and offset for person-time.

[c] Adjusted for age, sex, nonwhite race, and MRS3. Mortality: HR <1.00 indicates lower rate of death relative to rate in 2011.

[d] Adjusted for age, sex, nonwhite race, and MRS3. Death was considered a competing risk. Hospice: HR <1.00 indicates lower rate of hospice enrollment relative to rate in 2011.

networks were further incentivized to reduce hospitalizations to remain in network.[16] The CMS is conducting demonstration projects to examine payment models that include value-based purchasing incentives as part of the initiative to reduce avoidable hospitalizations among nursing home residents.[10] The Skilled Nursing Facility (SNF) value-based purchasing program took effect in October 2018 to extend penalties for excess readmissions to SNFs; preliminary data suggest that 73% of SNFs face financial penalties after failing to achieve benchmarks.[51]

Previous research in long-term care settings has focused almost exclusively on potentially avoidable hospitalizations. The present study extends prior work to include all potentially avoidable hospital transfers, including ED visits and observation stays. We found that declines in all-cause hospital transfer rates were almost exclusively associated with reductions in acute hospitalizations, and the rates of observation stays remained low between 2011 and 2017. Thus, concerns that hospitals may shift admissions to observation stay status to avoid HRRP penalties[18] appear to be unfounded in this population. In addition, rates of decline were similar for all-cause and potentially avoidable transfers, suggesting that broader efforts are being made to reduce hospital transfers or that there is a spillover effect from the focus on potentially avoidable conditions. Although we observed reductions in potentially avoidable hospital transfers, several thousand nursing home residents with advanced illness continue to be transferred to hospitals near the end of life. We estimated 708 096 transfers for all-cause transfers across the 3 advanced illness cohorts from 2011 to 2017, of which 259 339 (36.8%) were potentially avoidable. Moreover, despite the initial reduction in potentially avoidable transfers from 39.1% in 2011 to 35.1% in 2013, the rate appears to have rebounded to 37.7% by 2016 (eTable 2 and eFigure in the Supplement).

Limitations

This study has limitations. The application of claims-based measures of potentially avoidable conditions to nursing home populations remains controversial because they do not capture the complex health status of frail, older nursing home residents with multimorbid conditions or the specific challenges of managing acute illnesses in this population and setting.[7,45] Moreover, insurance claims and MDS 3.0

assessments do not fully capture the circumstances leading to decisions for hospital transfer, including advance directives. Important drivers of decisions to transfer are associated with decisional processes and organizational factors, including communication, family preferences, and nursing home resources.[52-56] Furthermore, the principal diagnoses listed on hospital claims are assigned at discharge as the diagnosis that was chiefly responsible for the admission, whereas the diagnosis assigned to an ED visit or observation stay is based on more limited information.[57] However, we focused on long-term care residents with advanced illness for whom care decisions should align with values and goals of care and for whom the harms associated with hospital transfers usually outweigh possible benefits.[3-5]

Conclusions

Hospital transfer rates for all causes and for potentially avoidable causes declined in 2017 compared with 2011 for long-stay nursing home residents with advanced dementia, CHF, or COPD, with no increase in mortality. Reductions in potentially avoidable transfers are encouraging, yet many residents still experienced multiple transfers for infections and CHF or COPD exacerbations. These findings indicate important opportunities to improve care of nursing home residents with advanced illness through improvements in advance care planning, acute care management, and the delivery of high-quality palliative care.

RESEARCH LETTER

Temporal Trends in the Numbers of Skilled Nursing Facility Specialists From 2007 Through 2014

Residents of nursing homes (NHs) comprise a medically complex and vulnerable population with many persons experiencing multiple comorbid conditions, frailty, and advanced dementia. Health care professionals such as physicians, nurse practitioners (NPs), and physician assistants (PAs) play an important role in managing their care. An Office of Inspector General Report[1] noted that specialization of health care professionals in NH care could potentially improve care through increased presence of health care professionals in NHs, enhanced knowledge in the care of patients with medically complex conditions, and better understanding of the regulatory environment. On the contrary, specialization in 1 setting of care could result in increased fragmentation of care, giving rise to concerns about medical errors and lack of care coordination. Little empirical research is available about the number of clinicians who primarily practice in NHs or the proportion of NH care delivered by these clinicians.[2] Using national Medicare Part B claims from 2007, 2010, and 2014, we characterized temporal trends in the number of physicians, NPs, and PAs concentrating their practice in the NH or skilled nursing facility (SNF) setting (ie, SNFists), the fraction of all NH and SNF claims generated by SNFists, and state variation in this phenomenon in 2014.

Editor's Note

Methods | The Medicare Part B Carrier File includes Evaluation and Management codes based on common sites of service: the nursing home, outpatient office, hospital, emergency department, a patient's home, and assisted living, custodial care facilities. Using Evaluation and Management codes from 20% of all Medicare Part B Carrier file claims from 2007, 2010, and 2014, we identified all physicians, NPs, and PAs who billed more than 90% of all their visits in the NH setting. The 90% threshold is consistent with a prior study of hospitalist care in the United States[3]; in a sensitivity analysis, we relaxed this threshold to 50%. Temporal trend comparisons for 2007, 2010, and 2014 were performed using variance-weighted least squares. We further characterized, in each state, the fraction of all outpatient visits in NHs that were accounted for by SNFists. An institutional review board waiver was obtained from Brown University.

Results | Between 2007 and 2014, the proportion of physicians ever billing in an NH decreased from 13.7% to 9.8% (test of trend, $P < .001$) while the number of physicians classified as SNFists increased by 48.2% (1496 vs 2225), increasing from 0.34% to 0.49% of all physicians (**Table**). The number of NPs or PAs classified as SNFists nearly doubled (1678 vs 3074). The proportion of NPs and PAs classified as SNFists remained stable because of increasing numbers of these clinicians. The proportion of all Evaluation and Management bills for care in an NH or SNF submitted by clinicians classified as SNFists increased from 11.6% to 14.3% among physicians (test of trend, $P < .001$) and from 10.4% to 17.2% among NPs and PAs (test of trend, $P < .001$). Between 2007 and 2014, the proportion of total SNF billing accounted for by SNFist clinicians increased from 22.0% to 31.5% (test of trend, $P < .001$). The SNFists' proportion of total NH billing varied by state, amounting to nearly 50% in Delaware, Hawaii, Tennessee, Connecticut, and Massachusetts. In a sensitivity analysis using a threshold of more than 50% of visits in the SNF, the number of physician SNFists increased from 2551 to 3529 and the number of NP or PA SNFists increased from 3267 to 5477.

Table. Physician, Nurse Practitioner, and Physician Assistant Billing in 2007, 2010, and 2014

Billing Category	2007	2010	2014
Physicians, No.	435 943	419 299	459 895
Ever billing in an SNF,[a] No. (%)	59 724 (13.7)	50 814 (12.1)	45 070 (9.8)
Billing ≥90% in an SNF,[a] No. (%)	1496 (0.34)	1697 (0.40)	2225 (0.49)
Nurse practitioners or physician assistants, No.	64 393	80 029	131 986
Ever billing in an SNF,[b] No. (%)	7528 (11.7)	8309 (10.4)	12 470 (9.5)
Billing ≥90% in an SNF,[b] No. (%)	1678 (2.6)	2031 (2.5)	3074 (2.3)
Evaluation and management code bills at SNF, No.	4 731 367	4 538 967	5 205 865
By physician billing ≥90% in an SNF,[c] No. (%)	550 425 (11.6)	584 952 (12.9)	747 106 (14.3)
By nurse practitioner or physician assistant billing ≥90% in an SNF,[c] No. (%)	49 145 (10.4)	581 235 (12.8)	895 830 (17.2)

Abbreviation: SNF, skilled nursing facility.

[a] For the physicians ever billing in an SNF or physicians billing 90% or more in an SNF, the denominator is physicians billing Medicare in that year.

[b] For nurse practitioner or physician assistant billing, the denominator is nurse practitioners or physician assistants billing Medicare in that year.

[c] The denominator for physicians, nurse practitioners, and physician assistants billing at 90% or more is the number of evaluation and management codes billed in a nursing home or SNF in the year 2007, 2010, or 2014.

Discussion | The care of frail and medically complex NH residents is increasingly performed by NPs and PAs who focus nearly exclusively in this site of care. In some states, SNFists accounted for nearly half of the total billing in the NH setting of care. Future research is needed to understand how this specialization of care affects not only care delivery but the overall experience of frail, elderly patients.

RESEARCH LETTER

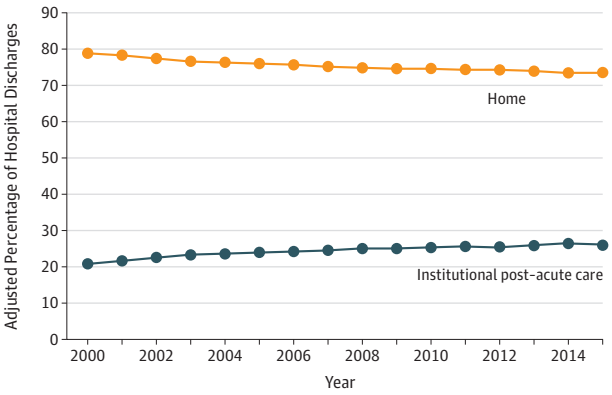
Trends in Post-Acute Care Use Among Medicare Beneficiaries: 2000 to 2015

Since Medicare's adoption of the inpatient prospective payment system in 1983, hospitals have sought ways to reduce costs, resulting in a decrease in hospital length of stay and an increase in the use of institutional post-acute care,[1] making it a major Medicare expenditure.[2] Since the Affordable Care Act passed in 2010, Medicare has implemented payment reforms designed to make hospitals and clinicians accountable for the cost and quality of care delivered. Examples include the Hospital Readmissions Reduction Program (implemented in 2012), accountable care organizations (2012), and bundled payments (2013). How these payment reforms affect the use of post-acute care is unknown.[3] The expense of post-acute care may diminish its use under cost-containment incentives.[4] Alternatively, pressure to reduce costs by reducing unnecessary readmissions may encourage its use. Our objective was to document recent trends in use of institutional post-acute care (including the 2 most common sites: skilled nursing facilities [SNFs] and inpatient rehabilitation facilities [IRFs]) and, simultaneously, hospital and post-acute care length of stay.

Methods | We used the 100% MedPAR file[5] to identify Medicare beneficiaries discharged alive from an acute care hospital between January 2000 and December 2015 (n = 199 069 327), excluding discharges younger than 65 years or discharged to hospice (n = 39 036 324 or 19.6%), enrolled in Medicare Advantage (n = 20 250 852 or 10.2%), or discharged to institutional settings other than SNF or IRF (eg, psychiatric hospital; n = 1 808 518 or 0.9%). We identified each discharge's first post-hospitalization destination (home vs institutional post-acute care) and the number of days in the hospital and post-acute care. We used multivariable regression to predict risk-adjusted annual outcomes adjusted for age, sex, race, and 31 Elixhauser comorbidities. We tested for the statistical significance of differences over time using *t* tests (2-tailed with an α of .05). All analyses were performed using Stata (StataCorp), version 15. This study was approved by the institutional review board of the University of Pennsylvania with a waiver of informed consent.

Results | Among 137 973 633 hospital discharges, 20.3% were discharged to SNFs and 3.7% were discharged to IRFs. The adjusted percentage of hospital discharges to post-acute care increased from 21.0% in 2000 to 26.3% in 2015 (increase of 5.36 percentage points [95% CI, 5.32 to 5.40]; *P* <.001), whereas the adjusted percentage of discharges home decreased from 79.0% in 2000 to 73.6% in 2015 (decrease of 5.36 percentage points [95% CI ,−5.40 to −5.32]; *P* <.001) (**Figure 1**).

Figure 1. Proportion of Medicare Beneficiaries Discharged to Institutional Post-Acute Care vs Discharged Home



Estimates are adjusted for patient age, sex, race, and Elixhauser comorbidities. The median number of hospital discharges to home per year was 6 664 718 (interquartile range [IQR], 5 768 018-7 367 173) and the median number of discharges to post–acute care per year was 2 151 959 (IQR, 1 978 709-2 199 801).

Among patients discharged to post-acute care, hospital length of stay decreased from 9.0 days in 2000 to 7.3 days in 2015 (decrease of 1.70 days [95% CI, −1.71 to −1.69]; *P* <.001) (**Figure 2**). Among patients discharged home, hospital stays decreased from 5.7 days in 2000 to 4.8 days in 2015 (decrease of −0.91 days [95% CI, −0.92 to −0.91]; *P* <.001). At the same time, length of stay in post-acute care increased from 21.7 days in 2000 to 25.7 days in 2014 (increase of 3.98 days [95% CI, 3.93 to 4.02]; *P* < .001) and then decreased to 25.1 days in 2015 (decrease of 0.54 days [95% CI, 0.50 to 0.59]; *P* < .001).

Discussion | The use of institutional post-acute care increased between 2000 and 2015 and was accompanied by increasing length of post-acute care stays through 2014. These trends did not appear to change when payment reform was implemented under the Affordable Care Act. SNFs (which accounted for 85% of institutional post-acute care) are paid per diem and thus may have strong incentives to maintain longer lengths of stay. This study was limited by the exclusion of Medicare Advantage enrollees. If policy incentives are to effectively reduce SNF length of stay, they might need to align SNF payment with the goal of reducing SNF use.

It is uncertain whether the use of post-acute care benefits patients. Despite its proliferation, there is little evidence that post-acute care improves key patient outcomes—preventing rehospitalizations or improving functional recovery. Further investigating how post-acute care affects patient outcomes is essential.

COMMENT & RESPONSE

Diagnosis and Treatment of Hidradenitis Suppurativa

To the Editor Drs Saunte and Jemec performed an illustrative review focused on the advances in diagnosis and treatment of hidradenitis suppurativa (HS).[1] However, the advances in imaging of the disease were not discussed.

For example, regarding the pathogenesis, ultrasound studies have allowed visualization of the hidden connections between the tunnels or fistulous tracts and fluid collections and the dilated and ruptured base of the hair follicles, which were illustrated in Figure 3 in the article.[1-3] Regarding the staging of hidradenitis, ultrasonography has also demonstrated that clinical evaluation and commonly used clinical scoring systems can miscategorize as healthy skin corporal segments with fluid collections or fistulous tracts underneath.[3] The latter findings on imaging can be critical because, as pointed out by the authors, the choice of therapy is guided by disease severity. Currently, color Doppler ultrasound can support the detection of key subclinical lesions, the staging of the disease, and the assessment of activity and has been added to the clinical evaluation of hidradenitis in many centers around the world.[3,4] Moreover, ultrasound is also being used in ongoing trials.

In patients with indications for local or systemic treatments, imaging can be a noninvasive tool for monitoring the response. In patients with a surgical indication, an image-guided mapping of the extent of the abnormalities can be performed. Ultrasound has the ability to detect, categorize, and measure the lesions in all the corporal regions affected by hidradenitis.[3] This imaging information may allow better selection of the type of medical treatment or the location and extent of the surgical incision.[3]

CLINICAL INVESTIGATION

Successful Discharge to Community Gap of FFS Medicare Beneficiaries With and Without ADRD Narrowed

Barbara H. Bardenheier, PhD,†‡ Momotazur Rahman, PhD,*‡ Cyrus Kosar, MS,*‡ Rachel M. Werner, MD, PhD,§¶ and Vincent Mor, PhD*‡*

BACKGROUND/OBJECTIVES: We sought to compare the post-acute and long-term care experience of Medicare beneficiaries with and without Alzheimer Disease and Related Dementias (ADRD), and whether differences changed from January 1, 2007 to September 30, 2015.

DESIGN: Retrospective cross-sectional trend study using Medicare claims linked to the Centers for Medicare & Medicaid Services' (CMS) Minimum Data Set.

SETTING: CMS-certified skilled nursing facilities (skilled nursing facility (SNF), n = 17,043).

PARTICIPANTS: Fee-for-service Medicare beneficiaries aged ≥66 years (n = 6,614,939) discharged from a hospital to a SNF who had not lived in a nursing home during the year before hospitalization.

MEASUREMENTS: ADRD was defined by the Chronic Condition Data Warehouse. Outcome measures included: (1) successful discharge defined as being in SNF less than 90 days, then discharged back to the community, alive without subsequent inpatient health care for 30 continuous days; (2) became long-stay resident in SNF; (3) death in SNF within 90 days; (4) hospital readmission within 30 days of entering SNF; and (5) transferred to another nursing home within 30 days of entering SNF.

RESULTS: Successful discharge of beneficiaries with ADRD increased from 43.4% in 2007 to 53.9% in 2015 (average annual percent change (AAPC) = 2.1 (95% CI = 2.0–2.2)); those without ADRD also increased (from 59.1% to 63.6%, AAPC = 0.9 (95% CI = 0.7–1.1)) but not as fast as those with ADRD ($P < .01$). The proportion of all beneficiaries who became long-stay or were readmitted to the hospital decreased ($P < .05$). The proportion with ADRD who became long-stay was nearly three times higher than those without throughout the study (15.0% vs 5.5% in 2007; 11.3% vs 4.3% in 2015).

CONCLUSION: Though disparity in ADRD in becoming long-stay residents remains, the increase in successful discharges among those with ADRD also stresses the increasing importance of community as a care setting for adults with ADRD. **J Am Geriatr Soc 00:1-7, 2020.**

Keywords: ADRD; successful discharge; disparity

INTRODUCTION

Between 2010 and 2016 20.3% of Medicare beneficiaries received post-acute care (PAC) services in a skilled nursing facility (SNF) after being discharged from the hospital.[1] The improving Medicare Post-Acute-Care Transformation Act of 2014 mandated addition of a national quality measure for successful community discharge from PAC services. Although the goal of PAC rehabilitation is to maximize independence and facilitate a safe community transition, some SNF patients may be awaiting family arrangements to provide care at home or for selection of a long-term nursing facility. Some may need to stabilize and to get their numerous medical conditions to a manageable care plan. But generally, returning to and remaining in the community after an illness, injury, or surgery reflects the quality of PAC[2] (https://impactcollaboratory.org/). Although some studies have assessed inpatient rehabilitation facilities patients' success in

community discharge,[3,4] little is known about SNF patients' success in returning and staying home post-discharge.

SNF admission is often the gateway to becoming a long-term nursing home resident. And, Alzheimer Disease and Related Dementias (ADRD) patients are more likely to become long-stay residents. The Affordable Care Act (ACA) and other policy initiatives strongly encourage community based long-term care for ADRD patients.[5] In 2012, under the ACA the Centers for Medicare & Medicaid Services (CMS) could penalize hospitals for readmissions in less than 30 days for certain conditions. Successful transitioning from the hospital to a SNF is even more complicated for persons with ADRD. For example, patients with ADRD whose behavioral problems surpass the SNF's capacity to accommodate them are at high risk of rehospitalization or transfer to a different SNF.[6] For this reason, SNF administrators may be less likely to accept patients with ADRD after acute hospitalization. Indeed, one study reported that SNF personnel believe hospital personnel downplay ADRD patients' behavioral problems to increase their chances of SNF admission.[6] For these reasons, real and perceived about patients with ADRD, we hypothesized that Medicare beneficiaries with ADRD would experience more negative outcomes than those without ADRD, in terms of their likelihood of successfully returning home, experiencing rehospitalization, dying in the SNF, becoming a permanent nursing home resident, or transferring to another SNF, and we assessed whether the differences changed between 2007 and 2015.

METHODS

Study Population

Our sample was drawn from 100% of Medicare SNF claims linked to the CMS Minimum Data Set, which are mandatory clinical assessments for all nursing home residents of Medicare-certified nursing homes, from January 1, 2007 through September 30, 2015 (with follow-up for post-discharge outcomes dated through December 31, 2015). The study period was chosen to include only events occurring before the introduction of the ICD-10 coding system. We included fee-for-service Medicare beneficiaries aged ≥66 years who were discharged alive from the hospital and admitted to a SNF within 1 day of hospital discharge. We excluded those with history of being in a nursing home within the 12 months (using the MDS) before hospital admission because they were likely to be sicker and/or more severely demented.[7]

Main Exposure Measure

We identified Medicare beneficiaries with ADRD using the Chronic Condition Data Warehouse (CCW) flag in the Medicare beneficiary summary file as of the day of hospital discharge. The CCW algorithm identifies beneficiaries as having ADRD if they have one of 24 ICD-9 codes present on one or more inpatient, SNF, HHA, outpatient, or carrier claim over a 3-year look-back period.[8] This definition has a sensitivity (0.85) and specificity (0.89).[9] We believe this is sufficient to assess changes in trends because (1) the measure did not change during the study period (ICD-9 codes were used throughout) and (2) we hypothesized post-discharge outcomes of ADRD patients may differ from those without ADRD, in part due to perceptions of ADRD patients. In other words, regardless of truly having ADRD, if beneficiaries' have an ADRD diagnosis, then healthcare providers perceive that they have ADRD.

Outcome Measures

We assessed trends over our study period in seven outcome measures. First, we defined successful discharge as being discharged alive from a SNF to the community within 90 days of SNF admission without subsequent inpatient healthcare utilization for 30 continuous days. Second, we defined becoming a long-stay resident as remaining in the SNF more than 90 days after SNF admission. Third, we defined dying in the SNF as dying within 90 days of SNF admission. Fourth, we assessed death within 90 days after discharge from the SNF (after being in the SNF at least 90 days). We assessed rehospitalization two ways: within 30 days and within 90 of hospital discharge. For both rehospitalization measures, those who died in the same

Table 1. Characteristics of Medicare Beneficiaries Aged 66 years and Older with Hospital Discharge to Nursing Home

Note: All years are from January 1 to December 31, except 2015 is from January 1 to September 30. Adjusted for age, sex, race, dual eligible status, % MA penetration in zipcode, % dual eligible in zipcode. AAPC, average annual percentage change; CI, confidence interval; died in SNF, within 30 days of entering SNF; FFS, fee-for-service; long-stay, still in SNF after 90 days of entering; SNF, skilled nursing facility; successful discharge, in SNF 90 days, then they were discharged back to the community, alive without subsequent inpatient healthcare utilization for 30 continuous days.

timeframe were censored. Finally, we assessed transfer to another NH within 30 days of entering the SNF. To clarify "SNF," our focus is not on SNF coverage for payment, but rather PAC in a SNF which is typically short-stay or ≤90 days. We used the sequence of claims and the MDS to identify outcomes.

Statistical Analyses

First, we assessed the overall change in number of beneficiaries with and without ADRD from 2007 to 2014 (for this we excluded 2015 because it was a partial year). Trends for each outcome were then assessed on annual cohorts of beneficiaries who were discharged from the hospital to a SNF, adjusting for age, sex, race, dual-eligibility, Medicare Advantage penetration (zipcode of residence), and percent dual-eligible (zipcode of residence). We used STATA version 16 software to obtain adjusted predictive margins and standard errors. We evaluated monotonic trends by joinpoint regression using Joinpoint software,[10] which has the same underlying assumptions as simple regression and allows for input of estimates and standard errors. To determine if the trend was statistically significant we used the average annual percent change (AAPC) and its associated *P*-value. We also compared AAPC differences in trends between those with and without ADRD. All analyses were stratified by beneficiary ADRD status.

Sensitivity Analyses

Because our analyses included all FFS beneficiaries discharged from the hospital to a SNF, we wanted to determine if results would be similar for a more homogenous group or if our findings were driven by certain subgroups. Therefore, we performed the same trend analyses for patients hospitalized for hip fractures and were discharged from the hospital to a SNF. Codes used to define hip fractures were 820.xx.

All analyses were conducted after establishing a data use agreement with CMS and obtaining final approval from Brown University's Institutional Review Board.

RESULTS

We identified 2,134,798 beneficiaries with prevalent ADRD (243,321 or 11.4% were included in multiple years) and 3,582,546 without (654,274 or 18.3% were included in multiple years) who otherwise met study eligibility criteria. The average age of beneficiaries with ADRD discharged from hospital to SNF was close to 84 years in 2007, 2011, and 2015; the average age of those without ADRD was approximately 80 years at the beginning, middle, and end of the study (Table 1). About two-thirds of those with and without ADRD were female. The average proportion with Medicare Advantage penetration in the residents' zip code increased from 2007 to 2015 for those with (17.8%–28.7%) and without ADRD (17.6%–28.1%). A few (7.4% n = 486,715) of beneficiaries were referred to a hospice within 90 days of entering the SNF or in the 90 days following SNF discharge; of those, 85.2% died.

The number of beneficiaries with ADRD discharged from the hospital to a SNF increased 36.3% from 211,518 in 2007 to 288,361 in 2014 (2015 was a partial year, AAPC = 3.1 (0.3, 5.9)). There was no significant change in the number of beneficiaries without ADRD discharged from the hospital to a SNF from 2007 to 2014 (AAPC = 1.1 (−1.6, 3.9)). The proportion of traditional Medicare beneficiaries with ADRD who had a successful discharge from the SNF to the community increased from 43.5% in 2007 to 50.9% in 2015 (AAPC = 2.0 (1.8, 2.2)) (Table 2 and Figure 1). Successful discharge for those without ADRD also increased (from 59.0% to 62.9%, AAPC = 1.0 (0.8, 1.2)), but not as fast as for those with ADRD (AAPC difference (ADRD − No ADRD) = 1.0 (0.8, 1.2), $P < .01$). The proportion of beneficiaries with ADRD who became long-stay nursing home residents decreased (from 15.0% in 2007 to 11.3% in 2015, AAPC = −3.6 (−4.4, −2.8)); those without ADRD decreased also (from 5.5% to 4.3%, AAPC = −3.4 (−4.3, −2.6)) similar to those with ADRD ($P = .70$). However, the proportion of those with ADRD who became long-stay was nearly three times higher than those without. The proportion of beneficiaries with ADRD who died within 90 days of entering the SNF decreased from 2007 (16.9%) to 2015 (15.8%, AAPC = −0.7 (−1.2, −0.2)); those without ADRD decreased as well from 13.9% in 2007 to 12.8% in 2015 (AAPC = −1.4 (−1.8, −0.9)), faster than those with ADRD (AAPC difference (ADRD − No ADRD) = 0.9 (1.7, 0.1), $P < .01$). The proportion of beneficiaries with ADRD who died within 90 days of discharge from the SNF did not change from 2007 (8.9%) to 2015 (8.2%, $P = .7$); those without ADRD decreased from 6.3% in 2007 to 5.7% in 2015 (AAPC = −1.1 (−1.5, −0.6)), faster than those with ADRD (AAPC difference (ADRD − No ADRD) = 0.9 (1.7, 0.1), $P < .01$). The

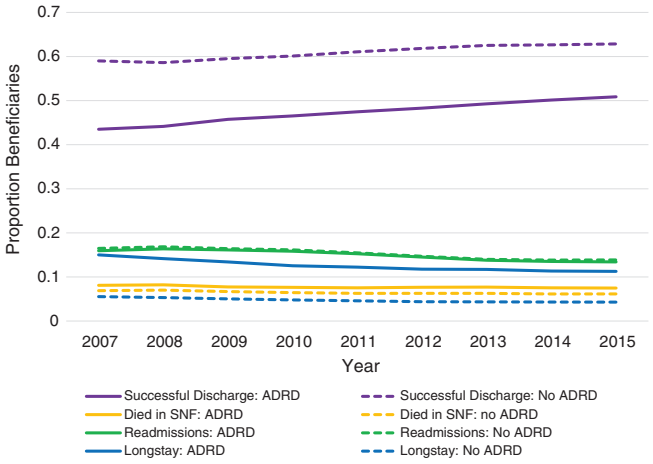

Figure 1. Adjusted proportion of FFS Medicare Beneficiaries aged >65 years discharged from hospital to SNF by ADRD status, January 1, 2007 through September 30, 2015. Adjusted for age, sex, race, dual eligible status, % MA penetration in zipcode, % dual eligible in zipcode. ADRD, Alzheimer's disease and related dementias; died in SNF, within 30 days of entering SNF; FFS, fee-for-service; long-stay, still in SNF after 90 days of entering; readmissions, readmitted to hospital within 30 days of entering SNF; SNF, skilled nursing facility; successful discharge, in SNF 90 days, then they were discharged back to the community, alive without subsequent inpatient healthcare utilization for 30 continuous days.

Note: All years are from January 1 to December 31, except 2015 is from January 1 to September 30. Adjusted for age, sex, race, dual eligible status, % MA penetration in zipcode, % dual eligible in zipcode. AAPC, average annual percentage change; CI, confidence interval; died in SNF, within 30 days of entering SNF; FFS, fee-for-service; long-stay, still in SNF after 90 days of entering; SNF, skilled nursing facility; successful discharge, in SNF 90 days, then they were discharged back to the community, alive without subsequent inpatient healthcare utilization for 30 continuous days.

proportion of beneficiaries discharged and rehospitalized within 30 days and 90 days decreased among both those with (AAPC = −2.8 (−3.6, −2.0) and AAPC = −1.7 (−2.3, −1.2)) and without ADRD (APC = −2.9 (−3.6, −2.1) and AAPC = −2.1 (−2.7, −1.5)) during the study period, though not significantly different from each other (P = .90 and P = .20, respectively). The proportion of beneficiaries discharged to SNF and transferred to another nursing facility decreased among both those with ADRD from 5.0% to 4.3% (AAPC = −2.0 (−3.3, −0.7)) and without ADRD from 3.5% to 2.8% (AAPC = −3.1 (−4.4, −1.8)), though not significantly different from each other (P = .20).

Results of Sensitivity Analyses

Overall, 9.5% of patients discharged had claims for being hospitalized with hip fracture. The number of beneficiaries discharged from the hospital to a SNF increased 35.8% from 23,485 in 2007 to 31,882 in 2014 (2015 was a partial year and therefore excluded, AAPC = 3.1 (0.7, 5.6)). There was no significant change in beneficiaries without ADRD discharged from the hospital to a SNF (AAPC = 0.6 (−1.8, 3.1). Those hospitalized for hip fracture, with and without ADRD, experienced more successful SNF-to-community discharges after acute hospitalization, fewer deaths, rehospitalizations, long-stays, and transfers to other nursing facilities within 30 days of entering the SNF from 2007 to 2015 (P < .05) (Table 3). The gap between those with and without ADRD in successful SNF-to-community discharges after acute hospitalization narrowed, as rates of successful discharges increased faster among those with ADRD (AAPC difference (ADRD − No ADRD) = 0.9 (0.6, 1.2)).

DISCUSSION

In general, traditional Medicare beneficiaries with ADRD have worse outcomes than those without ADRD, but the gap is narrowing with respect to returning home from the SNF, surviving and not being rehospitalized. From 2007 to 2015, Medicare beneficiaries experienced more successful SNF-to-community discharges after acute hospitalization, due to fewer rehospitalizations, long-stays, and transfers to other nursing facilities within 30 days of entering the SNF. The gap between those with and without ADRD in successful SNF-to-community discharges after acute hospitalization narrowed, as the rates of successful discharges increased faster among those with ADRD. Deaths within 90 days of discharge to SNF did not change among beneficiaries with ADRD, yet the mortality rate decreased among the non-ADRD group. Notably, the gap between those with and without ADRD in becoming long-stay remained; those with ADRD were nearly three times as likely to become long-stay residents.

Studies have reported an increase in the number of adults living with ADRD.[11] This is reflected in our study showing an increase in ADRD patients discharged from the hospital to the SNF overall and also in our sensitivity analysis among hospitalizations for hip fractures. Our results may indicate that the greater number of patients with ADRD discharged home may reflect healthier people being diagnosed with ADRD at earlier stages.

Higher rates of successful discharge from SNF to the community and fewer rehospitalizations, long-stays, and transfers to other nursing facilities among beneficiaries with ADRD over a decade are quite encouraging. Previous studies have reported persons with ADRD experience frequent transitions across the range of care, especially into and out of hospital and SNF settings.[12,13] And, nearly half of long-stay nursing home residents suffer from ADRD.[14,15] Our data suggest that the proportion of patients with ADRD who become long-stay residents after entering the SNF after being hospitalized is decreasing.

It is not surprising that rates of rehospitalization after hospital discharge to SNF decreased for all beneficiaries. In October 2012 a policy was mandated by the ACA to penalize hospitals with high readmission rates for certain conditions.[16] Readmission rates for some SNFs may have been high before 2012 because of the change in use of SNF care. Most SNFs (>90%) are dually certified as a SNF and as a nursing home.[17] Thus, a facility that offers skilled care often also provides long-term care services that Medicare does not cover. Ideally, SNF care is provided to restore function to patients discharged from acute hospital care before transitioning back to the community. In the decade before 2012, use of SNF care after acute hospitalization had greatly increased in part because of the shift of nursing homes from serving life long residents to facilities treating increasingly medically complex patients seeking PAC for recuperation after hospitalization. This may in part have been driven by a financial incentive to take advantage of the short-term Medicare benefit. Medicare covers up to 100 days after 3 days of hospitalization whereas Medicaid pays for most of long-term care, the Medicare payment for SNF services being higher than that for Medicaid. In other words, some patients may have been sent to the SNF as long as the financial benefit was available and then sent back to the hospital. Yet since the 2012 policy, that practice likely diminished.

Our result of decline in long-stay residents, with and without ADRD, helps to explain why occupancy in nursing homes continues to decline even though the number of beds has been steadily declining.[18-20] In nursing homes in states with no or nursing home-specific certificate-of-need programs (designed to curb healthcare spending), the number of beds has decreased since 1992.[21] The decline in long-stay residents may also be a reflection of the number of nursing home closures. Facilities with large proportions of long-stay residents tended to have high Medicaid occupancy,[22] and those facilities were most at risk of closure.[23]

Our study was subject to several limitations. First, discharge data for the Medicare Advantage population are not reliable and therefore were not included. Given the rapid growth of Medicare Advantage, which has a strong disincentive for hospital use, the results observed may not reflect the overall population aged 66 years and older. Second, the proportion of ADRD we reported likely includes some false-positive and false-negative ADRD cases; however, the CCW algorithm is the only approach that can identify a broad sample of beneficiaries with ADRD across community and nursing home settings in hospitalization data. Still, regardless of how ADRD is diagnosed, the trends reveal an increase in successful discharges but a steady gap in becoming long-stay residents with a nearly threefold risk among

those with ADRD. Third, we did not assess the geographic availability of PAC services; hence some patients may have been discharged to the community because of access rather than recovery. Fourth, we could not account for health beliefs, financial resources, availability of an appropriate caregiver (paid or unpaid), or cultural differences which may have influenced discharge to and remaining in the community. Finally, a potential limitation is that certain cohorts of beneficiaries discharged from the hospital to SNFs could have driven the results. However, sensitivity analyses confirmed overall results with a homogenous group. Among patients who had been hospitalized for hip fractures, trends for those with and without ADRD were in the same direction and the same estimates were statistically significant as were found for the overall group of beneficiaries with two exceptions.

We examined the trends in outcomes among Medicare beneficiaries discharged to SNF with and without a diagnosis of ADRD and found that many outcomes improved for all persons but that successful discharge rates, going home and remaining there, improved more rapidly for persons living with dementia than for persons without dementia. It may be that practices with regard to hospitalization may have influenced the trends in addition to practices in the SNF. Thus, more research is needed to understand what is driving the reduction in transfers, deaths, and long-stays among patients with ADRD discharged from hospital to SNF. In addition, the increase in successful SNF to community discharges stresses the increasing importance of community as the care setting for adults with ADRD.

ACKNOWLEDGMENTS

Conflict of Interest: BHB, MR, CK, and RMW have no conflicts of interest to report. VM receives compensation for his role as Chair of the Scientific Advisory Committee of naviHealth, a post-acute care convening company serving managed care companies and integrated hospital systems.

Author Contributions: VM and MR conceived and designed the study. BHB drafted the manuscript and did the statistical analyses. MR and CK obtained and compiled the data. All authors revised the report for intellectual content and contributed to the literature search. VM and RMW provided administrative, technical and material support.

Sponsor's Role: This research was supported, in part, by NIH P01AG027296.

FACILITY DIRECT PE INPUTS **CPT CODE(S):99315, 99316**

SPECIALTY SOCIETY(IES):_AAPM&R, ACP, AGS, AMDA, ANA, APMA

PRESENTER(S): Charles Crecelius, MD, PhD, CMD; Audrey Chun, MD; MD; Charles Hamori, MD; Carlo Milani, MD; and Korinne Van Keuren, DNP, APRN; Elizabeth Volpert, DNP, APRN

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC) PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

Meeting Date: October 2021

CPT Code	Long Descriptor	Global Period
99315	Nursing facility discharge day management; 30 minutes or less	XXX
99316	Nursing facility discharge day management; more than 30 minutes	XXX

Vignette(s) (*vignette required even if PE only code(s)***):**

CPT Code	Vignette
99315	Final nursing facility day visit for a 72-year-old male with congestive heart failure and multiple comorbidities, who is being discharged home on diet and oral medications.
99316	Final nursing facility day visit for an 84-year-old male who suffered a cerebrovascular accident with hemiparesis and who has congestive heart failure, peripheral vascular disease and diabetes. The patient needs help transferring and is unable to administer his own insulin but has adequate supports at home to be discharged to the community.

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

   The specialty society expert panel, comprised of advisors from the participating specialties, met and discussed recommendations for practice expense both via phone and over email. The expert panel reviewed the existing PE inputs for the code family and made revisions as necessary to reflect current practice.

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code, but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here (*for service reviewed prior to the implementation of clinical activity codes, detail is not provided in the RUC database, please contact Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org for PE spreadsheets for your reference codes*):

   Existing PE inputs from 2004 (99315 and 99316) were used as reference.

3. Is this code(s) typically reported with an E/M service?

   No

4. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time:

   N/A

5. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies for the **code family**, please provide compelling evidence (please see *PE compelling evidence guidelines*) Please explain if the increase can be entirely accounted for because of an increase in physician time:

   N/A

6. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (*please see second worksheet in PE spreadsheet workbook*), please explain the difference here:

Pre-Service
All codes include time for an activity described in 2004 and 2005 PE spreadsheets as "phone calls between visits with patient, family, pharmacy." This has been rolled into CA005 Complete pre-procedure phone calls and prescription.

Post-Service
All codes include time for an activity described in 2004 and 2005 PE spreadsheets as "phone calls between visits with patient, family, pharmacy." This has been rolled into CA037 Conduct patient communications.
Codes 99315 and 99316 included time for an activity described in the 2004 PE spreadsheet as "Coordinate home or outpatient care." This has been rolled into CA038 Coordinate post-procedure services.

7. Please provide a brief description of the clinical staff work for the following:
   a. Pre-Service period:

99315	**CA005 3 minutes** Clinical staff completes phone calls with family/caregiver or nurse/care coordinator at the facility, confirms any procedures or services provided since last visit, and confirms medication changes since last visit.
99316	**CA005 3 minutes** Clinical staff completes phone calls with family/caregiver or nurse/care coordinator at the facility, confirms any procedures or services provided since last visit, and confirms medication changes since last visit.

   b. Service period (includes pre, intra and post):

   c. Post-service period:

99315	**CA037 3 minutes** Clinical staff completes follow-up phone calls with family/caregiver and/or facility nurse/therapist/care coordinator. **CA038 6 minutes** Staff confirms procedure/therapy/DME orders associated with patient discharge. Staff assists in coordination of care with primary care physician and relevant outpatient therapy and home health providers. Staff assists in interfacing between documentation in facility EMR and physician EMR.
99316	**CA037 3 minutes** Clinical staff completes follow-up phone calls with family/caregiver and/or facility nurse/therapist/care coordinator. **CA038 6 minutes** Staff confirms procedure/therapy/DME orders associated with patient discharge. Staff assists in coordination of care with primary care physician and relevant outpatient therapy and home health providers.

		Staff assists in interfacing between documentation in facility EMR and physician EMR.

8. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (*please see second worksheet in PE spreadsheet workbook*):

N/A

9. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov.

N/A

INVOICES

10. ☐ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

11. ☐ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

12. If you wish to include a supply that is not on the list (*please see fourth worksheet in PE spreadsheet workbook*) please provide a paid invoice. Identify and explain the invoice here:

N/A

13. Are you recommending a PE supply pack for this recommendation? Yes or No.
If Yes, please indicate if the pack is an established package of supplies as defined by CMS (eg, SA047 *pack, E/M visit*) or a pack that is commercially available?

N/A

14. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation. Please include the description, CMS supply code, unit, item quantity and unit price (if available). See documents two and three under PE reference materials on the RUC Collaboration Website for information on the contents of kits, packs and trays.

N/A

15. If you wish to include an equipment item that is not on the list (*please see fifth worksheet in PE spreadsheet workbook*) please provide a paid invoice and the useful life. Identify and explain the invoice here:

N/A

16. Have you recommended equipment minutes for a computer or equivalent laptop/integrated computer, equipment item computer, desktop, w-monitor, ED021 or notebook (Dell Latitute D600), ED038?
    a. If yes, please explain how the computer is used for this service(s).
    b. Is the computer used exclusively as an integral component of the service or is it also used for other purposes not specific to the code?

c. Does the computer include code specific software that is typically used to provide the service(s)?

N/A

17. List all the equipment included in your recommendation and the equipment formula chosen *(*please see document titled *Calculating equipment time).* If you have selected "other formula" for any of the equipment please explain here:

N/A

18. If there is any other item(s) on your spreadsheet not covered in the categories above that require greater detail/explanation, please include here:

N/A

PROFESSIONAL LIABILITY INSURANCE (PLI) INFORMATION

19. If this is a PE only code please select a crosswalk based on a similar specialty mix:

N/A

ITEMIZED LIST OF CHANGES (FOLLOWING THE PE SUBCOMMITTEE MEETING

During and immediately following the review of this tab at the PE Subcommittee meeting please revise the summary of recommendation (PE SOR) based on modifications made during the meeting. Please submit the revised form electronically to Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org immediately following the close of business the same day that the tab is reviewed. On the PE spreadsheet, please highlight the cells and/or use red font to show the changes made during the PE Subcommittee meeting (if you have provided any of this highlighting based on changes from the reference code prior to the PE Subcommittee meeting please remove it, so not to be confused with changes made during the meeting). In addition to those revisions please also provide an itemized list of the modifications made to the PE spreadsheet during the PE Subcommittee meeting in the space below (e.g. clinical activity CA010 *obtain vital signs* was reduced from 5 minutes to 3 minutes).

NOTE: The virtual meetings have provided for real-time updates to the PE spreadsheets. PE SORs must still be updated and resubmitted asap.

NONFACILITY DIRECT PE INPUTS **CPT CODE(S):99315 99316**

SPECIALTY SOCIETY(IES):_AAPM&R, ACP, AGS, AMDA, ANA, APMA_

PRESENTER(S): Charles Crecelius, MD, PhD, CMD; Audrey Chun, MD; Charles Hamori, MD; Carlo Milani, MD; Korinne Van Keuren, DNP, APRN and Elizabeth Volpert, DNP, APRN

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC) PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

Meeting Date: October 2021

CPT Code	Long Descriptor	Global Period
99315	Nursing facility discharge day management; 30 minutes or less	XXX
99316	Nursing facility discharge day management; more than 30 minutes	XXX

Vignette(s) (*vignette required even if PE only code(s)***):**

CPT Code	Vignette
99315	Final nursing facility day visit for a 72-year-old male with congestive heart failure and multiple comorbidities, who is being discharged home on diet and oral medications.
99316	Final nursing facility day visit for an 84-year-old male who suffered a cerebrovascular accident with hemiparesis and who has congestive heart failure, peripheral vascular disease and diabetes. The patient needs help transferring and is unable to administer his own insulin but has adequate supports at home to be discharged to the community.

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

   The specialty society expert panel, comprised of advisors from the participating specialties, met and discussed recommendations for practice expense both via phone and over email. The expert panel reviewed the existing PE inputs for the code family and made revisions as necessary to reflect current practice.

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code, but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here (*for service reviewed prior to the implementation of clinical activity codes, detail is not provided in the RUC database, please contact Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org for PE spreadsheets for your reference codes*):

   Existing PE inputs from 2004 (99315 and 99316) were used as reference.

3. Is this code(s) typically reported with an E/M service?
   Is this code(s) typically reported with the E/M service in the nonfacility?
   (Please see provided data titled *Medicare Same Day NF EM Billed Together - NF Dom Spec* in the RUC Review Resource Materials)

   No

4. What specialty is the dominant provider in the nonfacility?
   What percent of the time does the dominant provider provide the service(s) in the nonfacility?
   Is the dominant provider in the nonfacility different than for the global?
   (Please see provided data titled *Medicare Same Day NF EM Billed Together - NF Dom Spec* in the RUC Review Resource Materials)

   Non-Facility Dominant Specialties

99315	Non-Facility Dominant Specialties – internal medicine (36.9%), nurse practitioner (30.5%), family medicine (20.7%)
99316	Non-Facility Dominant Specialties – nurse practitioner (43.5%), internal medicine (29.4%), family medicine (12.9%)

There are small differences in the percentages and order of the dominant specialties when comparing non-facility to global dominant specialties.

Global Dominant Specialties

99315	Non-Facility Dominant Specialties – nurse practitioner (35.6%), internal medicine (30.5%), family medicine (19.4%)
99316	Non-Facility Dominant Specialties – nurse practitioner (49.6%), internal medicine (24.8%), family medicine (10.2%)

5. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time:

N/A

6. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies for the **code family**, please provide compelling evidence (please see *PE compelling evidence guidelines*) Please explain if the increase can be entirely accounted for because of an increase in physician time:

N/A

7. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (*please see second worksheet in PE spreadsheet workbook*), please explain the difference here:

Pre-Service
All codes include time for an activity described in 2004 and 2005 PE spreadsheets as "phone calls between visits with patient, family, pharmacy." This has been rolled into CA005 Complete pre-procedure phone calls and prescription.

Post-Service
All codes include time for an activity described in 2004 and 2005 PE spreadsheets as "phone calls between visits with patient, family, pharmacy." This has been rolled into CA037 Conduct patient communications.
Codes 99315 and 99316 included time for an activity described in the 2004 PE spreadsheet as "Coordinate home or outpatient care." This has been rolled into CA038 Coordinate post-procedure services.

8. How much time was allocated to clinical activity, *obtain vital signs* (CA010) prior to CMS increasing the clinical activity to 5 minutes for calendar year 2018? The standard for clinical activity, obtains vital signs remains 0, 3 and 5 based on the number of vital signs taken. Please provide a rationale for the clinical staff time that you are requesting for obtain vital signs here:

N/A

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

9. Please provide a brief description of the clinical staff work for the following:
   a. Pre-Service period:

99315	**CA005 3 minutes** Clinical staff completes phone calls with family/caregiver or nurse/care coordinator at the facility, confirms any procedures or services provided since last visit, and confirms medication changes since last visit.
99316	**CA005 3 minutes** Clinical staff completes phone calls with family/caregiver or nurse/care coordinator at the facility, confirms any procedures or services provided since last visit, and confirms medication changes since last visit.

   b. Service period (includes pre, intra and post):

   c. Post-service period:

99315	**CA037 3 minutes** Clinical staff completes follow-up phone calls with family/caregiver and/or facility nurse/therapist/care coordinator. **CA038 6 minutes** Staff confirms procedure/therapy/DME orders associated with patient discharge. Staff assists in coordination of care with primary care physician and relevant outpatient therapy and home health providers. Staff assists in interfacing between documentation in facility EMR and physician EMR.
99316	**CA037 3 minutes** Clinical staff completes follow-up phone calls with family/caregiver and/or facility nurse/therapist/care coordinator. **CA038 6 minutes** Staff confirms procedure/therapy/DME orders associated with patient discharge. Staff assists in coordination of care with primary care physician and relevant outpatient therapy and home health providers. Staff assists in interfacing between documentation in facility EMR and physician EMR.

10. Please provide granular detail regarding what the clinical staff is doing during the intra-service (of service period) clinical activity, *assist physician or other qualified healthcare professional---directly related to physician work time* or *Perform procedure/service---NOT directly related to physician work time:*

N/A

11. If you have used a percentage of the physician intra-service work time other then 100 or 67 percent for the intra-service (of service period) clinical activity, please indicate the percentage and explain why the alternate percentage is needed and how it was derived.

N/A

ITEMIZED LIST OF CHANGES (FOLLOWING THE PE SUBCOMMITTEE MEETING

During and immediately following the review of this tab at the PE Subcommittee meeting, please revise the summary of recommendation (PE SOR) based on modifications made during the meeting. Please submit the revised form electronically to Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org immediately following the close of business the same day that the tab is reviewed. On the PE spreadsheet, please highlight the cells and/or use red font to show the changes made during the PE Subcommittee meeting (if you have provided any of this highlighting based on changes from the reference code prior to the PE Subcommittee meeting please remove it, so not to be confused with changes made during the meeting). In addition to those revisions please also provide an itemized list of the modifications made to the PE spreadsheet during the PE Subcommittee meeting in the space below (e.g. clinical activity CA010 *obtain vital signs* was reduced from 5 minutes to 3 minutes).

NOTE: The virtual meetings have provided for real-time updates to the PE spreadsheets. PE SORs must still be updated and resubmitted asap.

AMA/Specialty Society RVS Update Committee Summary of Recommendations

April 2021

Nursing Facility Services – Tab 13

Following the implementation of the revisions to the Evaluation and Management (E/M) office visits (99201-99215) for the CPT 2021 code set, the CPT/RUC Workgroup on E/M met twelve times in 2020 and early 2021 to standardize the rest of the E/M sections in the CPT code set. The CPT/RUC Workgroup on E/M was committed to changing the current coding and documentation requirements for E/M visits to simplify the work of the health care provider and improve the health of the patient. To achieve these goals, the Workgroup set forth the following guiding principles related to the group's ongoing work product:

1. To decrease administrative burden of documentation and coding and align CPT and CMS whenever possible
2. To decrease the need for audits
3. To decrease unnecessary documentation in the medical record that is not needed for patient care
4. To ensure that payment for E/M is resource-based and that there is no direct goal for payment redistribution between specialties.

In February 2021, the CPT Editorial Panel deleted the annual nursing facility assessment code and revised seven nursing facility codes to align with the principles included in the E/M office visit services by documenting and selecting level of service based on total time or medical decision making.

Similar to the office visits, beginning in 2023, when total time on the date of encounter is used to select the appropriate level of a nursing facility visit service code, both the face-to-face and non-face-to-face time personally spent by the physician (or other qualified health care professional that is reporting the office visit) assessing and managing the patient are summed to select the appropriate code. The nursing facility services were surveyed for the April 2021 RUC meeting. The survey time captured includes pre-service time 1-day before the date of encounter, intra-service time is all the time on the date of encounter and post-service time is 3-days after the date of encounter.

The RUC noted that all the of these services are typically performed in the skilled nursing facility which requires a higher level of care than the nursing facility.

COMPELLING EVIDENCE

In April 2021, the RUC met to review the nursing facility changes. The specialty societies indicated that there is compelling evidence based on flawed methodology. The specialty societies reviewed the methodology used by the RUC in 2007 to arrive at the current values. That methodology was inconsistent among the codes in the family and was not based on survey values or direct crosswalks. For example, 99304, the initial nursing visit code requiring low level medical decision making was valued based on the sum of the value of 99203, a new patient visit also requiring a low level of medical decision making, plus one-fourth the value of 99374, physician supervision of a patient under the care of a home health

agency. The RUC justified its recommendations for all the initial nursing visit codes by dividing the median time of the nursing visit code by the median time of the comparable subsequent hospital visit code, multiplying that fraction by the work RVU of the hospital visit code and adding one-fourth of 99374. Similarly, the methodology for valuing the subsequent nursing visit codes was inconsistent and differed from the methodology used for the initial visit codes. The RUC agreed that there is compelling evidence that the previous valuation was based on flawed methodology.

INITIAL NURSING FACILITY CARE

99304 ***Initial nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and straightforward or low level of medical decision making. When using total time on the date of the encounter for code selection, 25 minutes must be met or exceeded.***
The RUC reviewed the survey results from 203 physicians and determined that the survey 25th percentile work RVU of 1.50 appropriately accounts for the work required to perform this service. The RUC recommends 6 minutes of pre-service time, 25 minutes of intra-service time and 5 minutes of post-service time.

The RUC compared the surveyed code to the top key reference service 99203 *Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and low level of medical decision making. When using time for code selection, 30-44 minutes of total time is spent on the date of the encounter* (work RVU = 1.60, 25 minutes intra-service time and 35 minutes total time) and determined that 99304 describing straightforward/low medical decision-making is appropriately slightly less physician work than CPT code 99203.

The RUC also compared 99304 to the second top key reference service 99202 *Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and straightforward medical decision making. When using time for code selection, 15-29 minutes of total time is spent on the date of the encounter* (work RVU = 0.93, 15 minutes intra-service time and 20 minutes total time) and determined that CPT code 99304 requires much more physician work and time, thus is valued appropriately. The survey supports a value between the two new patient office visits and the RUC agrees CPT code 99304 is in the proper rank order among other similar services.

For additional support, the RUC referenced MPC code 95861 *Needle electromyography; 2 extremities with or without related paraspinal areas* (work RVU = 1.54 and 29 minutes of intra-service time) and code 74181 *Magnetic resonance (eg, proton) imaging, abdomen; without contrast material(s)* (work RVU = 1.46 and 20 minutes of intra-service time), which require similar physician work and time. **The RUC recommends a work RVU of 1.50 for CPT code 99304.**

99305 ***Initial nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. When using total time on the date of the encounter for code selection, 35 minutes must be met or exceeded.***
The RUC reviewed the survey results from 204 physicians and determined that the survey 25th percentile work RVU of 2.50 appropriately accounts for the work required to perform this service. The RUC recommends 10 minutes of pre-service time, 35 minutes of intra-service time and 10 minutes of post-service time.

The RUC compared the surveyed code to the top key reference service 99204 *Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. When using time for code selection, 45-59 minutes of total time is spent on the date of the encounter* (work RVU = 2.60, 40 minutes intra-service time and 60 minutes total time) and determined that 99305 requires slightly less physician work and time to perform.

The RUC also compared 99305 to the second top key reference service, 99203 *Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and low level of medical decision making. When using time for code selection, 30-44 minutes of total time is spent on the date of the encounter.* (work RVU = 1.60, 25 minutes intra-service time and 35 minutes total time) and determined that 99305 requires much more physician work and time than 99203. The survey supports a value between the two new patient office visits and the RUC agrees CPT code 99305 is in the proper rank order among other similar services.

For additional support, the RUC referenced MPC code 95810 *Polysomnography; age 6 years or older, sleep staging with 4 or more additional parameters of sleep, attended by a technologist* (work RVU = 2.50 and 36.5 minutes of intra-service time) and code 75574 *Computed tomographic angiography, heart, coronary arteries and bypass grafts (when present), with contrast material, including 3D image postprocessing (including evaluation of cardiac structure and morphology, assessment of cardiac function, and evaluation of venous structures, if performed)* (work RVU = 2.40 and 30 minutes of intra-service time), which require similar physician work and time. **The RUC recommends a work RVU of 2.50 for CPT code 99305.**

99306 ***Initial nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and high level of medical decision making. When using total time on the date of the encounter for code selection, 45 minutes must be met or exceeded.***
The RUC reviewed the survey results from 208 physicians and determined that the survey 25th percentile work RVU of 3.50 appropriately accounts for the work required to perform this service. The RUC recommends 15 minutes of pre-service time, 50 minutes of intra-service time and 15 minutes of post-service time.

The RUC compared the surveyed code to the top key reference service 99205 *Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and high level of medical decision making. When using time for code selection, 60-74 minutes of total time is spent on the date of the encounter.* (work RVU = 3.50, 59 minutes intra-service time and 88 minutes total time) and determined that these services require the same physician work and should be valued the same. Although 99306 requires slightly less physician time, both require a high level of medical decision making and similar typical patients who require intensive management.

For additional support, the RUC referenced MPC code 90962 *End-stage renal disease (ESRD) related services monthly, for patients 20 years of age and older; with 1 face-to-face visit by a physician or other qualified health care professional per month* (work RVU = 3.57 and 70 minutes of intra-service/total time) and code 50328 *Backbench reconstruction of cadaver or living donor renal allograft prior to transplantation; arterial anastomosis, each* (work RVU = 3.50 and 45 minutes of intra-service/total time), which require similar physician work and time. **The RUC recommends a work RVU of 3.50 for CPT code 99306.**

SUBSEQUENT NURSING FACILITY CARE

99307 ***Subsequent nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and straightforward medical decision making. When using total time on the date of the encounter for code selection, 10 minutes must be met or exceeded.***
The RUC reviewed the survey results from 196 physicians and determined that the survey 25th percentile work RVU of 0.70 appropriately accounts for the work required to perform this service. The RUC recommends 1 minutes of pre-service time, 12 minutes of intra-service time and 1 minute of post-service time.

The RUC compared the surveyed code to the top key reference service 99212 *Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and straightforward medical decision making. When using time for code selection, 10-19 minutes of total time is spent on the date of the encounter* (work RVU = 0.70, 11 minutes intra-service time and 16 minutes total time) and determined that these services require the same straightforward level of medical decision making, the same physician work and similar physician time to perform, thus should be valued the same.

The RUC also compared 99307 to the second top key reference service 99213 *Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and low level of medical decision making. When using time for code selection, 20-29 minutes of total time is spent on the date of the encounter* (work RVU = 1.30, 20 minutes intra-service time and 40 minutes total time) and determined that 99307 requires much less physician work, time and a lower level of medical decision making, thus is valued appropriately.

For additional support, the RUC referenced MPC code 95251 *Ambulatory continuous glucose monitoring of interstitial tissue fluid via a subcutaneous sensor for a minimum of 72 hours; analysis, interpretation and report* (work RVU = 0.70 and 15 minutes of intra-service time) and code 62368 *Electronic analysis of programmable, implanted pump for intrathecal or epidural drug infusion (includes evaluation of reservoir status, alarm status, drug prescription status); with reprogramming* (work RVU = 0.67 and 15 minutes of intra-service time), which require similar physician work and time. **The RUC recommends a work RVU of 0.70 for CPT code 99307.**

99308 ***Subsequent nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and low medical decision making. When using total time on the date of the encounter for code selection, 15 minutes must be met or exceeded.***
The RUC reviewed the survey results from 214 physicians and determined that the survey 25th percentile work RVU of 1.30 appropriately accounts for the work required to perform this service. The RUC recommends 5 minutes of pre-service time, 18 minutes of intra-service time and 4 minutes of post-service time.

The RUC compared the surveyed code to the top key reference service 99213 *Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and low level of medical decision making. When using time for code selection, 20-29 minutes of total time is spent on the date of the encounter* (work RVU = 1.30, 20 minutes intra-service time and 40 minutes total time) and determined that these services require the same low level of medical decision making, the same physician work and similar physician time to perform.

The RUC also compared 99308 to the second top key reference service 99214 *Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. When using time for code selection, 30-39 minutes of total time is spent on the date of the encounter* (work RVU = 1.92, 30 minutes intra-service time and 47 minutes total time) and determined that 99308 requires less physician work, time and level of medical decision making to perform than 99214, thus is valued appropriately.

For additional support, the RUC referenced MPC code 74170 *Computed tomography, abdomen; without contrast material, followed by contrast material(s) and further sections* (work RVU = 1.40 and 18 minutes of intra-service time) and code 74280 *Radiologic examination, colon, including scout abdominal radiograph(s) and delayed image(s), when performed; double-contrast (eg, high density barium and air) study, including glucagon, when administered* (work RVU = 1.26 and 20 minutes of intra-service time), which require similar physician work and time. **The RUC recommends a work RVU of 1.30 for CPT code 99308.**

99309 ***Subsequent nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and moderate medical decision making. When using total time on the date of the encounter for code selection, 30 minutes must be met or exceeded.***
The RUC reviewed the survey results from 217 physicians and determined that the 25th percentile work RVU of 1.92 appropriately accounts for the work required to perform this service. The RUC recommends 7 minutes of pre-service time, 30 minutes of intra-service time and 10 minutes of post-service time.

The RUC compared the surveyed code to the top key reference service 99214 *Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. When using time for code selection, 30-39 minutes of total time is spent on the date of the encounter* (work RVU = 1.92, 30 minutes intra-service time and 47 minutes total time) and determined that these services require the same moderate level of medical decision making, physician work and physician time to perform.

The RUC also compared 99309 to the second top key reference service 99215 *Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and high level of medical decision making. When using time for code selection, 40-54 minutes of total time is spent on the date of the encounter* (work RVU = 2.80, 45 minutes intra-service time and 70 minutes total time) and determined that 99309 requires less physician work, time and level of decision making, thus is valued appropriately.

For additional support, the RUC referenced MPC code 94002 *Ventilation assist and management, initiation of pressure or volume preset ventilators for assisted or controlled breathing; hospital inpatient/observation, initial day* (work RVU = 1.99 and 30 minutes of intra-service time) and code 95957 *Digital analysis of electroencephalogram (EEG) (eg, for epileptic spike analysis)* (work RVU = 1.98 and 30 minutes of intra-service time), which require similar physician work and time. **The RUC recommends a work RVU of 1.92 for CPT code 99309.**

99310 *Subsequent nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and high medical decision making. When using total time on the date of the encounter for code selection, 45 minutes must be met or exceeded.*
The RUC reviewed the survey results from 203 physicians and determined that the survey 25th percentile work RVU of 2.80 appropriately accounts for the work required to perform this service. The RUC recommends 10 minutes of pre-service time, 45 minutes of intra-service time and 15 minutes of post-service time.

The RUC compared the surveyed code to the top key reference service 99215 *Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and high level of medical decision making. When using time for code selection, 40-54 minutes of total time is spent on the date of the encounter* (work RVU = 2.80, 45 minutes intra-service time and 70 minutes total time) and determined that these services require the same high level of medical decision making, physician work and physician time to perform, thus should be valued the same.

The RUC also compared 99310 to the second top key reference service 99291 *Critical care, evaluation and management of the critically ill or critically injured patient; first 30-74 minutes* (work RVU = 4.50, 40 minutes intra-service time and 70 minutes total time) and determined 99310 requires less physician work and the typical patient is less intense than the critical care service. Thus, CPT code 99310 is appropriately valued lower than 99291.

For additional support, the RUC referenced MPC code 99204 *Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. When using time for code selection, 45-59 minutes of total time is spent on the date of the encounter* (work RVU = 2.60 and 40 minutes of intra-service time) and code 75561 *Cardiac magnetic resonance imaging for morphology and function without contrast material(s), followed by contrast material(s) and further sequences;* (work RVU = 2.60 and 45 minutes of intra-service time), which require similar physician work and time. **The RUC recommends a work RVU of 2.80 for CPT code 99310.**

NURSING FACILITY CARE DISCHARGE DAY MANAGEMENT

99315 ***Nursing facility discharge day management; 30 minutes or less***
99316 ***Nursing facility discharge day management; more than 30 minutes***
The RUC reviewed CPT codes 99315 and 99316 and determined to maintain the proper rank order, these services should be reviewed with the hospital discharge day management codes, 99238 and 99239, in October 2021**. The RUC recommends to table review of CPT codes 99315 and 99316 until October 2021.**

CPT Descriptor Time
The RUC recommends the following times for the CPT descriptors based on the survey medians. The time in the CPT descriptors are rounded or incremental between this family of services for the ease of those who may report these services based on time.

CPT Code		Time on the Date of Encounter Recommendation to CPT
99304	Initial nursing facility care, per day, straightforward or low MDM	**25**
99305	Initial nursing facility care, per day, moderate MDM	**35**
99306	Initial nursing facility care, per day, high MDM	**45**
99307	Subsequent nursing facility care, per day, straightforward MDM	**10**
99308	Subsequent nursing facility care, per day, low MDM	**15**
99309	Subsequent nursing facility care, per day, moderate MDM	**30**
99310	Subsequent nursing facility care, per day, high MDM	**45**

Practice Expense
The Practice Expense Subcommittee approved the direct practice expense inputs as recommended by the specialty societies without modification. **The RUC recommends the direct practice expense inputs as submitted by the specialty society.**

CPT Code	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation

Evaluation and Management

Nursing Facility Services

The following codes are used to report evaluation and management services to patients in nursing facilities and skilled nursing facilities ~~(formerly called skilled nursing facilities [SNFs], intermediate care facilities [ICFs], or long-term care facilities [LTCFs])~~. These codes should also be used to report evaluation and management services provided to a patient in a psychiatric residential treatment center and intermediate care facility for individuals with intellectual disabilities. ~~(a facility or a distinct part of a facility for psychiatric care, which provides a 24-hour therapeutically planned and professionally staffed group living and learning environment). If procedures such as medical psychotherapy are provided in addition to evaluation and management services, these should be reported in addition to the evaluation and management services provided.~~

~~Nursing facilities that provide convalescent, rehabilitative, or long-term care are required to conduct comprehensive, accurate, standardized, and reproducible assessments of each resident's functional capacity using a Resident Assessment Instrument (RAI). All RAIs include the Minimum Data Set (MDS), Resident Assessment Protocols (RAPs), and utilization guidelines. The MDS is the primary screening and assessment tool; the RAPs trigger the identification of potential problems and provide guidelines for follow-up assessments.~~

Regulations pertaining to the care of nursing facility residents govern the nature and minimum frequency of assessments and visits. These regulations also govern who may perform the initial comprehensive visits.

These services are performed by the principal physician(s) and other qualified health care professional(s), overseeing the care of the patient in the facility. The principal physician is sometimes referred to as the admitting physician and is the physician who oversees the patient's care as compared to other physicians or other qualified health care professionals who may be furnishing specialty care. These services are also performed by physicians or other qualified health care professionals in the role of a specialist performing a consultation or concurrent care. Modifiers may be required to identify the role of the individual performing the service.

~~Physicians have a central role in assuring that all residents receive thorough assessments and that medical plans of care are instituted or revised to enhance or maintain the residents' physical and psychosocial functioning. This role includes providing input in the development of the MDS and a multi-disciplinary plan of care, as required by regulations pertaining to the care of nursing facility residents.~~

Two major subcategories of nursing facility services are recognized: Initial Nursing Facility Care and Subsequent Nursing Facility Care. Both subcategories apply to new or established patients.

The types of care (eg, skilled nursing facility and nursing facility care) are reported with the same codes. Place of service codes should be reported to specify the type of facility (and care) where the service(s) are performed.

*For definitions of commonly used terms, see **Evaluation and Management Services Guidelines.***

When selecting a level of medical decision making (MDM) for nursing facility services, the Nature and Complexity of Problems Addressed at the Encounter is considered. For this determination, a high level MDM type specific to Initial Nursing Facility Care by the principal physician or other qualified health care professional is recognized. This type is:

Multiple morbidities requiring intensive management: A set of conditions, syndromes or functional impairments that are likely to require frequent medication changes or other treatment changes and/or re-evaluations. The patient is at significant risk of worsening medical (including behavioral) status and risk for (re)admission to a hospital.

The definitions and requirements related to the Amount and Complexity of Data to be Reviewed and Analyzed and the Risk of Complications and/or Morbidity or Mortality of Patient Management are unchanged.

~~(For care plan oversight services provided to nursing facility residents, see 99379-99380)~~

Initial Nursing Facility Care
New or Established Patient

When the patient is admitted to the nursing facility in the course of an encounter in another site of service (eg, hospital emergency department, office), the services in the initial site may be separately reported. Modifier 25 may be added to the other evaluation and management service to indicate a significant, separately identifiable service by the same physician or qualified health care professional was performed on the same date. ~~all evaluation and management services provided by that physician in conjunction with that admission are considered part of the initial nursing facility care when performed on the same date as the admission or readmission. The nursing facility care level of service reported by the admitting physician should include the services related to the admission he/she provided in the other sites of service as well as in the nursing facility setting.~~

In the case when services in a separate site are reported and the initial nursing facility care service is a consultation service by the same physician or other qualified health care professional and reported on the same date, do not report 99304, 99305, 99306, 99252, 99253, 99254, 99255. The consultant reports the subsequent nursing facility care codes 99307, 99308, 99309, 99310 for the second service on the same date.

Hospital inpatient ~~discharge~~ or observation discharge services performed on the same date of nursing facility admission or readmission may be reported separately. For a patient discharged from inpatient or observation status on the same date of nursing facility admission or readmission, the hospital or observation discharge services ~~should~~ may be reported with codes 99238, 99239 as appropriate. ~~For a patient discharged from observation status on the same date of nursing facility admission or readmission, the observation care discharge services should be reported with code 99217.~~ For a patient admitted and discharged from observation or inpatient status on the same date, see codes 99234- 99236. Time related to ~~these~~ hospital inpatient or observation care services may not be used for code selection of any nursing facility service.

~~(For nursing facility care discharge, see 99315, 99316)~~

Initial nursing facility care codes 99304, 99305, 99306 may be used once per admission, per physician or other qualified health care professional, regardless of length of stay. They may be used for the initial comprehensive visit performed by the principal physician or other qualified health care professional. Skilled nursing facility initial comprehensive visits must be performed by a physician. Qualified health care professionals may report initial comprehensive nursing facility visits for nursing facility level of care patients, if allowed by state law or regulation. The principal physician or qualified health care professional may work with others (who may not always be in the same group) but are overseeing the overall medical care of the patient, in order to provide

timely care to the patient. Medically necessary assessments conducted by these professionals prior to the initial comprehensive visit are reported using subsequent care codes (99307, 99308, 99309, 99310).

Initial services by other physicians and other qualified health care professionals who are performing consultations may be reported using initial nursing facility care codes (99304, 99305, 99306) or inpatient consultations (99252, 99253, 99254, 99255). This is not dependent upon the principal care professionals completion of the initial comprehensive services first.

An initial service may be reported when the patient has not received any face-to-face professional services from the physician or other qualified health care professional or another physician or other qualified health care professional of the exact same specialty and subspecialty who belongs to the same group practice during the stay. When advanced practice nurses or physician assistants are working with physicians they are considered as working in the exact same specialty and subspecialty as the physician. An initial service may also be reported if the patient is a new patient as defined in the Evaluation and Management Guidelines.

For reporting initial nursing facility care, transitions between skilled nursing facility level of care ad nursing facility level of care do not constitute a new stay.

~~***Coding Tip***~~

~~**The Significance of Time as a Factor in Selection of an Evaluation and Management Code from This Section**~~

~~The inclusion of time as an explicit factor beginning in CPT 1992 was done to assist in selecting the most appropriate level of E/M services included in codes in this section. Beginning with CPT 2021, except for 99211, time alone may be used to select the appropriate code level for the office or other outpatient E/M services codes (99202, 99203, 99204, 99205, 99212, 99213, 99214, 99215). Different categories of services use time differently. It is important to review the instructions for each category.~~

~~**Unit/floor time (hospital observation services [99218, 99219, 99220, 99224, 99225, 99226, 99234, 99235, 99236], hospital inpatient services [99221, 99222, 99223, 99231, 99232, 99233], inpatient consultations [99251, 99252, 99253, 99254, 99255], nursing facility services [99304, 99305, 99306, 99307, 99308, 99309, 99310, 99315, 99316, 99318]):**~~

~~For coding purposes, time for these services is defined as unit/ floor time, which includes the time present on the patient's hospital unit and at the bedside rendering services for that patient. This includes the time to establish and/or review the patient's chart, examine the patient, write notes, and communicate with other professionals and the patient's family.~~

~~CPT Coding Guidelines, Evaluation and Management, Guidelines Common to All E/M Services, Time~~

▲99304	I1	Initial nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and straightforward or low level of medical decision making. ~~these 3 key components:~~ ~~• **A detailed or comprehensive history;**~~ ~~• **A detailed or comprehensive examination; and**~~ ~~• **Medical decision making that is straightforward or of low complexity.**~~ ~~Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs.~~ ~~Usually, the problem(s) requiring admission are of low severity. Typically, 25 minutes are spent at the bedside and on the patient's facility floor or unit.~~ When using total time on the date of the encounter for code selection, 25 minutes must be met or exceeded.	XXX	1.50
▲99305	I2	Initial nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. ~~these 3 key components:~~ ~~• **A comprehensive history;**~~ ~~• **A comprehensive examination; and**~~ ~~• **Medical decision making of moderate complexity.**~~ ~~Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs.~~ ~~Usually, the problem(s) requiring admission are of moderate severity. Typically, 35 minutes are spent at the bedside and on the patient's facility floor or unit.~~ When using total time on the date of the encounter for code selection, 35 minutes must be met or exceeded.	XXX	2.50

▲99306	I3	Initial nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and high level of medical decision making. ~~these 3 key components:~~ • ~~**A comprehensive history;**~~ • ~~**A comprehensive examination; and**~~ • ~~**Medical decision making of high complexity.**~~ ~~Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs.~~ ~~Usually, the problem(s) requiring admission are of high severity. Typically, 45 minutes are spent at the bedside and on the patient's facility floor or unit.~~ When using total time on the date of the encounter for code selection, 45 minutes must be met or exceeded. (For services 60 minutes or longer, use prolonged services code 993X0)	XXX	3.50
Subsequent Nursing Facility Care ~~All levels of subsequent nursing facility care include reviewing the medical record and reviewing the results of diagnostic studies and changes in the patient's status (ie, changes in history, physical condition, and response to management) since the last assessment by the physician or other qualified health care professional.~~				
▲99307	I4	Subsequent nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and straightforward medical decision making. ~~at least 2 of these 3 key components:~~ • ~~**A problem focused interval history;**~~ • ~~**A problem focused examination;**~~ • ~~**Straightforward medical decision making.**~~ ~~Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs.~~ ~~Usually, the patient is stable, recovering, or improving. Typically, 10 minutes are spent at the bedside and on the patient's facility floor or unit.~~ When using total time on the date of the encounter for code selection, 10 minutes must be met or exceeded.	XXX	0.70

▲99308	I5	Subsequent nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and low level of medical decision making. ~~at least 2 of these 3 key components:~~ • ~~**An expanded problem focused interval history;**~~ • ~~**An expanded problem focused examination;**~~ • ~~**Medical decision making of low complexity.**~~ ~~Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs.~~ ~~Usually, the patient is responding inadequately to therapy or has developed a minor complication. Typically, 15 minutes are spent at the bedside and on the patient's facility floor or unit.~~ When using total time on the date of the encounter for code selection, 15 minutes must be met or exceeded.	XXX	1.30
▲99309	I6	Subsequent nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. ~~at least 2 of these 3 key components:~~ • ~~**A detailed interval history;**~~ • ~~**A detailed examination;**~~ • ~~**Medical decision making of moderate complexity**~~ ~~Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs.~~ ~~Usually, the patient has developed a significant complication or a significant new problem. Typically, 25 minutes are spent at the bedside and on the patient's facility floor or unit.~~ When using total time on the date of the encounter for code selection, 30 minutes must be met or exceeded.	XXX	1.92

▲99310	I7	Subsequent nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and high level of medical decision making. ~~at least 2 of these 3 key components:~~ • ~~**A comprehensive interval history;**~~ • ~~**A comprehensive examination;**~~ • ~~**Medical decision making of high complexity**~~ ~~Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs.~~ ~~The patient may be unstable or may have developed a significant new problem requiring immediate physician attention. Typically, 35 minutes are spent at the bedside and on the patient's facility floor or unit.~~ When using total time on the date of the encounter for code selection, 45 minutes must be met or exceeded. (For services 60 minutes or longer, use prolonged services code 993X0)	XXX	2.80
Nursing Facility Discharge Services The nursing facility discharge day management codes are to be used to report the total duration of time spent by a physician or other qualified health care professional for the final nursing facility discharge of a patient. The codes include, as appropriate, final examination of the patient, discussion of the nursing facility stay, even if the time spent on that date is not continuous. Instructions are given for continuing care to all relevant caregivers, and preparation of discharge records, prescriptions and referral forms. These services require a face-to-face encounter ~~but~~ that may be performed on a calendar date prior to the actual discharge date. The time of the face-to-face encounter performed on a date prior to the discharge date is counted toward 99315, 99316 and not reported separately.				
(f)99315	I8	*Nursing facility discharge day management; 30 minutes or less*	XXX	Tabled until October 2021 RUC Meeting
(f)99316	I9	*more than 30 minutes*	XXX	Tabled until October 2021 RUC Meeting

Other Nursing Facility Services				
~~D99318~~	-	~~Evaluation and management of a patient involving an annual nursing facility assessment, which requires these 3 key components:~~ • ~~**A detailed interval history;**~~ • ~~**A comprehensive examination; and**~~ • ~~**Medical decision making that is of low to moderate complexity.**~~ ~~Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs.~~ ~~Usually, the patient is stable, recovering, or improving. Typically, 30 minutes are spent at the bedside and on the patient's facility floor or unit.~~ ~~(Do not report 99318 on the same date of service as nursing facility services codes 99304-99316)~~ (99318 has been deleted. To report, see 99307, 99308, 99309, 99310)	~~XXX~~	~~N/A~~ (2021 work RVU = 1.71)

CPT 2023 E/M Guidelines

Category I
Evaluation and Management (E/M) Services Guidelines

In addition to the information presented in the Introduction, several other items unique to this section are defined or identified here.

E/M Guidelines Overview

The E/M guidelines have sections that are common to all E/M categories and sections that are category specific. Most of the categories and many of the subcategories of service have special guidelines or instructions unique to that category or subcategory. Where these are indicated, eg, "Hospital Inpatient and Observation Care," special instructions are presented before the listing of the specific E/M services codes. It is important to review the instructions for each category or subcategory. These guidelines are to be used by the reporting physician or other qualified health care professional to select the appropriate level of service. These guidelines do not establish documentation requirements or standards of care. The main purpose of documentation is to support care of the patient by current and future health care team(s). These guidelines are for services that require a face-to-face encounter. (For 99211 and 99281 the face-to-face services may be performed by clinical staff).

In the **Evaluation and Management** section (99202-99499) there are many code categories. Each category may have specific guidelines, or the codes may include specific details. These E/M guidelines are written for the following categories:

- Office or Other Outpatient Services
- Hospital Inpatient and Observation Care Services
- Consultations
- Emergency Department Services
- Nursing Facility Services
- Home and Residence Services
- Prolonged Service With or Without Direct Contact on the Date of an Evaluation and Management Service

Classification of Evaluation and Management (E/M) Services

The E/M section is divided into broad categories such as office visits, hospital inpatient or observation care visits, and consultations. Most of the categories are further divided into two or more subcategories of E/M services. For example, there are two subcategories of office visits (new patient and established patient) and there are two subcategories of hospital inpatient and observation care visits (initial and subsequent). The subcategories of E/M services are further classified into levels of E/M services that are identified by specific codes.

The basic format of codes with levels of E/M services based on medical decision making (MDM) or time is the same. First, a unique code number is listed. Second, the place and/or type of service is specified, eg, office or other outpatient visit. Third, the content of the service is defined. Fourth, time is specified. (A detailed discussion of time is provided following the Decision Tree for New vs Established Patients.)

The place of service and service type is defined by the location where the face-to-face encounter occurs. For example, service provided to a nursing facility resident brought to the office is reported with an office or other outpatient code.

New and Established Patients

Solely for the purposes of distinguishing between new and established patients, professional services are those face-to-face services rendered by physicians and other qualified health care professionals who may report evaluation and management services. A new patient is one who has not received any professional services from the physician or other qualified health care professional or another physician or other qualified health care professional of the exact same specialty and subspecialty who belongs to the same group practice, within the past three years.

An established patient is one who has received professional services from the physician or other qualified health care professional or another physician or other qualified health care professional of the exact same specialty and subspecialty who belongs to the same group practice, within the past three years. See Decision Tree for New vs Established Patients.

In the instance where a physician or other qualified health care professional is on call for or covering for another physician or other qualified health care professional, the patient's encounter will be classified as it would have been by the physician or other qualified health care professional who is not available. When advanced practice nurses and physician assistants are working with physicians, they are considered as working in the exact same specialty and subspecialty as the physician.

No distinction is made between new and established patients in the emergency department. E/M services in the emergency department category may be reported for any new or established patient who presents for treatment in the emergency department.

The Decision Tree for New vs Established Patients is provided to aid in determining whether to report the E/M service provided as a new or an established patient encounter.

Coding Tip

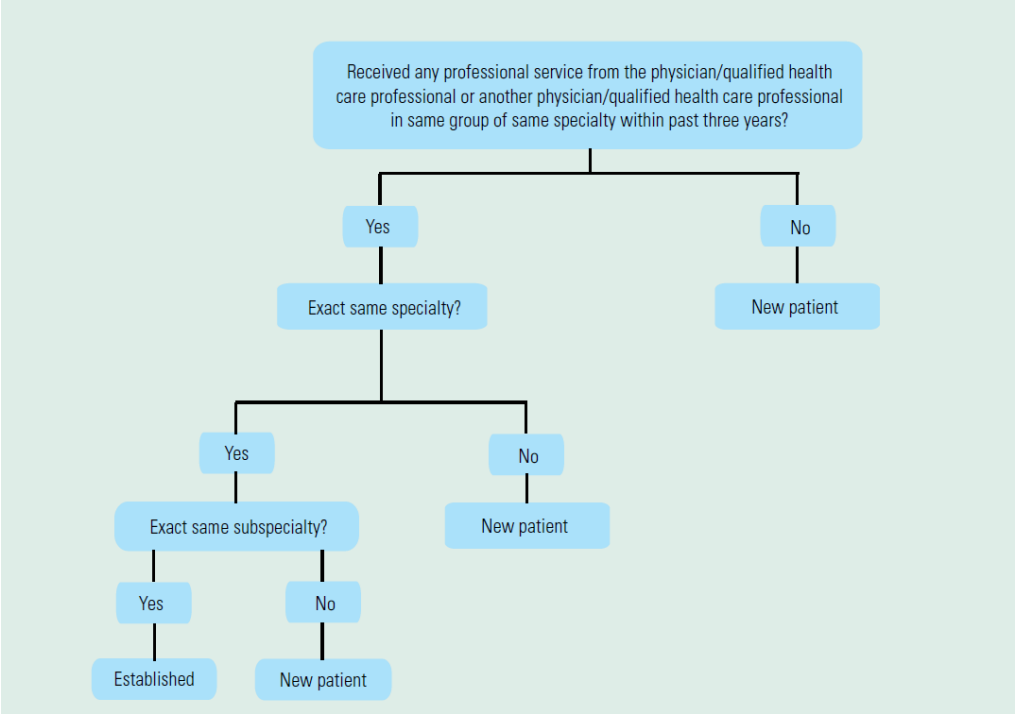
Instructions for Use of the CPT Codebook

When advanced practice nurses and physician assistants are working with physicians, they are considered as working in the exact same specialty and exact same subspecialty as the physician. A "physician or other qualified health care professional" is an individual who is qualified by education, training, licensure/regulation (when applicable), and facility privileging (when applicable) who performs a professional service within his or her scope of practice and independently reports that professional service. These professionals are distinct from "clinical staff." A clinical staff member is a person who works under the supervision of a physician or other qualified health care professional, and who is allowed by law, regulation and facility policy to perform or assist in the performance of a specific professional service but does not individually report that professional service. Other policies may also affect who may report specific services.

CPT Coding Guidelines, Introduction, Instructions for Use of the CPT Codebook

---

Decision Tree for New vs Established Patients



Initial and Subsequent Services

Some categories apply to both new and established patients (eg, hospital inpatient or observation care). These categories differentiate services by whether the service is the initial service or a subsequent service. For the purpose of distinguishing between initial or subsequent visits, professional services are those face-to-face services rendered by physicians and other qualified health care professionals who may report evaluation and management services. An initial service is when the patient has not received any professional services from the physician or other qualified health care professional or another physician or other qualified health care professional of the exact same specialty and subspecialty who belongs to the same group practice, during the inpatient or observation or nursing facility admission and stay.

A subsequent service is when the patient has received professional service(s) from the physician or other qualified health care professional or another physician or other qualified health care professional of the exact same specialty and subspecialty who belongs to the same group practice, during the admission and stay.

In the instance where a physician or other qualified health care professional is on call for or covering for another physician or other qualified health care professional, the patient's encounter will be classified as it would have been by the physician or other qualified health care professional who is not available. When advanced practice nurses and physician assistants are working with physicians, they are considered as working in the exact same specialty and subspecialty as the physician.

For reporting hospital inpatient or observation care services, a stay that includes a transition from observation to inpatient is a single stay. For reporting nursing facility services, a stay that includes transition(s) between skilled nursing facility and nursing facility level of care is the same stay.

Services Reported Separately

Any specifically identifiable procedure or service (ie, identified with a specific CPT code) performed on the date of E/M services may be reported separately.

The ordering and actual performance and/or interpretation of diagnostic tests/studies during a patient encounter are not included in determining the levels of E/M services when the professional interpretation

of those tests/studies is reported separately by the physician or other qualified health care professional reporting the E/M service. Tests that do not require separate interpretation (eg, tests that are results only) and are analyzed as part of MDM do not count as an independent interpretation and may be counted as ordered or reviewed for selecting an MDM level.

The performance of diagnostic tests/studies for which specific CPT codes are available may be reported separately, in addition to the appropriate E/M code. The interpretation of the results of diagnostic tests/studies (ie, professional component) with preparation of a separate distinctly identifiable signed written report may also be reported separately, using the appropriate CPT code and, if required, with modifier 26 appended.

See Instructions for Selecting a Level Based on MDM or Time.

The physician or other qualified health care professional may need to indicate that on the day a procedure or service identified by a CPT code was performed, the patient's condition required a significant separately identifiable E/M service. The E/M service may be caused or prompted by the symptoms or condition for which the procedure and/or service was provided. This circumstance may be reported by adding modifier 25 to the appropriate level of E/M service. As such, different diagnoses are not required for reporting of the procedure and the E/M services on the same date.

History and/or Examination

These E/M services include a medically appropriate history and/or physical examination, when performed. The nature and extent of the history and/or physical examination are determined by the treating physician or other qualified health care professional reporting the service. The care team may collect information, and the patient or caregiver may supply information directly (eg, by electronic health record [EHR] portal or questionnaire) that is reviewed by the reporting physician or other qualified health care professional. The extent of history and physical examination is not an element in selection of the level of these E/M service codes.

Levels of E/M Services

Select the appropriate level of E/M services based on the following:

1. The level of the MDM as defined for each service, **or**

2. The total time for E/M services performed on the date of the encounter.

Within each category or subcategory of E/M service based on MDM or time, there are three to five levels of E/M services available for reporting purposes. Levels of E/M services are **not** interchangeable among the different categories or subcategories of service. For example, the first level of E/M services in the subcategory of office visit, new patient, does not have the same definition as the first level of E/M services in the subcategory of office visit, established patient. Each level of E/M services may be used by all physicians or other qualified health care professionals.

Guidelines for Selecting a level service based on Medical Decision Making

Four types of MDM are recognized: straightforward, low, moderate, and high. The concept of the level of MDM does not apply to 99211 or 99281.

MDM includes establishing diagnoses, assessing the status of a condition, and/or selecting a management option. MDM is defined by three elements. The elements are:

- ***The number and complexity of problem(s) that are addressed during the encounter***.
- ***The amount and/or complexity of data to be reviewed and analyzed.*** These data include medical records, tests, and/or other information that must be obtained, ordered, reviewed, and analyzed for the encounter. This includes information obtained from multiple sources or interprofessional communications that are not reported separately and interpretation of tests that are not reported

separately. Ordering a test is included in the category of test result(s) and the review of the test result is part of the encounter and not a subsequent encounter. Ordering a test may include those considered, but not selected after shared decision making. For example, a patient may request diagnostic imaging that is not necessary for their condition and discussion of the lack of benefit may be required. Alternatively, a test may normally be performed, but due to risk for a specific patient is not ordered. These considerations must be documented. Data are divided into three categories:

- Tests, documents, orders, or independent historian(s). (Each unique test, order, or document is counted to meet a threshold number.)
- Independent interpretation of tests (not separately reported)
- Discussion of management or test interpretation with external physician or other qualified health care professional or appropriate source (not separately reported)

- **The risk of complications and/or morbidity or mortality of patient management:** This includes decisions made at the encounter associated with the diagnostic procedure(s) and treatment(s). This includes the possible management options selected and those considered but not selected, after shared decision making with the patient and/or family. For example, a decision about hospitalization includes consideration of alternative levels of care. Examples may include a psychiatric patient with a sufficient degree of support in the outpatient setting or the decision to not hospitalize a patient with advanced dementia with an acute condition that would generally warrant inpatient care, but for whom the goal is palliative treatment.

Shared decision making involves eliciting patient and/or family preferences, patient and/or family education, and explaining risks and benefits of management options.

MDM may be impacted by role and management responsibility.

When the physician or other qualified health care professional is reporting a separate CPT code that includes interpretation and/or report, the interpretation and/or report is not counted toward the MDM when selecting a level of E/M services.

When the physician or other qualified health care professional is reporting a separate service for discussion of management with a physician or another qualified health care professional, the discussion is not counted toward the MDM when selecting a level of E/M services.

The Levels of Medical Decision Making (MDM) table (Table 2) is a guide to assist in selecting the level of MDM for reporting an E/M services code. The table includes the four levels of MDM (ie, straightforward, low, moderate, high) and the three elements of MDM (ie, number and complexity of problems addressed at the encounter, amount and/or complexity of data reviewed and analyzed, and risk of complications and/or morbidity or mortality of patient management). To qualify for a particular level of MDM, two of the three elements for that level of MDM must be met or exceeded.

Examples in the table may be more or less applicable to specific settings of care. For example, the decision to hospitalize applies to the outpatient or nursing facility encounters, whereas the decision to escalate hospital level of care (eg, transfer to ICU) applies to the hospitalized or observation care patient.

See also the introductory guidelines of each code family section.

Table 2: Levels of Medical Decision Making (MDM)

Level of MDM (Based on 2 out of 3 Elements of MDM)	Elements of Medical Decision Making		
	Number and Complexity of Problems Addressed at the Encounter	Amount and/or Complexity of Data to be Reviewed and Analyzed **Each unique test, order, or document contributes to the combination of 2 or combination of 3 in Category 1 below.*	Risk of Complications and/or Morbidity or Mortality of Patient Management
N/A	N/A	N/A	N/A
Straightforward	Minimal • 1 self-limited or minor problem	Minimal or none	Minimal risk of morbidity from additional diagnostic testing or treatment
Low	Low • 2 or more self-limited or minor problems; or • 1 stable, chronic illness; or • 1 acute, uncomplicated illness or injury or • 1 stable acute illness or • 1 acute, uncomplicated illness or injury requiring hospital inpatient or observation level of care	Limited *(Must meet the requirements of at least 1 of the 2 categories*) Category 1: Tests and documents • Any combination of 2 from the following: ○ Review of prior external note(s) from each unique source*; ○ Review of the result(s) of each unique test*; ○ Ordering of each unique test* or Category 2: Assessment requiring an independent historian(s) *(For the categories of independent interpretation of tests and discussion of management or test interpretation, see moderate or high)*	Low risk of morbidity from additional diagnostic testing or treatment

Moderate	Moderate
	• 1 or more chronic illnesses with exacerbation, progression, or side effects of treatment;
	or
	• 2 or more stable, chronic illnesses;
	or
	• 1 undiagnosed new problem with uncertain prognosis;
	or
	• 1 acute illness with systemic symptoms;
	or
	• 1 acute, complicated injury
		Moderate
		(Must meet the requirements of at least 1 out of 3 categories)
		Category 1: Tests, documents, or independent historian(s)
		• Any combination of 3 from the following:
		  ○ Review of prior external note(s) from each unique source*;
		  ○ Review of the result(s) of each unique test*;
		  ○ Ordering of each unique test*;
		  ○ Assessment requiring an independent historian(s)
		or
		Category 2: Independent interpretation of tests
		• Independent interpretation of a test performed by another physician/other qualified health care professional (not separately reported);
		or
		Category 3: Discussion of management or test interpretation
		• Discussion of management or test interpretation with external physician/other qualified health care professional/appropriate source (not separately reported)
			Moderate risk of morbidity from additional diagnostic testing or treatment
			
			Examples only:
			• Prescription drug management
			• Decision regarding minor surgery with identified patient or procedure risk factors
			• Decision regarding elective major surgery without identified patient or procedure risk factors
			• Diagnosis or treatment significantly limited by social determinants of health

High	High
	• 1 or more chronic illnesses with severe exacerbation, progression, or side effects of treatment;
	or
	• 1 acute or chronic illness or injury that poses a threat to life or bodily function
		Extensive
		(Must meet the requirements of at least 2 out of 3 categories)
		
		Category 1: Tests, documents, or independent historian(s)
		• Any combination of 3 from the following:
		  ○ Review of prior external note(s) from each unique source*;
		  ○ Review of the result(s) of each unique test*;
		  ○ Ordering of each unique test*;
		  ○ Assessment requiring an independent historian(s)
		or
		Category 2: Independent interpretation of tests
		• Independent interpretation of a test performed by another physician/other qualified health care professional (not separately reported);
		or
		Category 3: Discussion of management or test interpretation
		• Discussion of management or test interpretation with external physician/other qualified health care professional/appropriate source (not separately reported)
			High risk of morbidity from additional diagnostic testing or treatment
			
			Examples only:
			• Drug therapy requiring intensive monitoring for toxicity
			• Decision regarding elective major surgery with identified patient or procedure risk factors
			• Decision regarding emergency major surgery
			• Decision regarding hospitalization or escalation of hospital-level of care
			• Decision not to resuscitate or to de-escalate care because of poor prognosis
			• Parenteral controlled substances

Number and Complexity of Problems Addressed at the Encounter

One element used in selecting the level of services is the number and complexity of the problems that are addressed at the encounter. Multiple new or established conditions may be addressed at the same time and may affect MDM. Symptoms may cluster around a specific diagnosis and each symptom is not necessarily a unique condition. Comorbidities and underlying diseases, in and of themselves, are not considered in selecting a level of E/M services **unless** they are addressed, and their presence increases the amount and/or complexity of data to be reviewed and analyzed or the risk of complications and/or morbidity or mortality of patient management. The final diagnosis for a condition does not, in and of itself, determine the complexity or risk, as extensive evaluation may be required to reach the conclusion that the signs or symptoms do not represent a highly morbid condition. Therefore, presenting symptoms which are likely to represent a highly morbid condition may drive MDM even when the ultimate diagnosis is not highly morbid. The evaluation and /or treatment should be consistent with the likely nature of the condition. Multiple problems of a lower severity may, in the aggregate, create higher risk due to interaction.

The term "risk" as used in these definitions relates to risk from the condition. While condition risk and management risk may often correlate, the risk from the condition is distinct from the risk of the management.

Definitions for the elements of MDM (see Table 2, Levels of Medical Decision Making) are:

Problem: *A problem is a disease, condition, illness, injury, symptom, sign, finding, complaint, or other matter addressed at the encounter, with or without a diagnosis being established at the time of the encounter.*

Problem addressed: A problem is addressed or managed when it is evaluated or treated at the encounter by the physician or other qualified health care professional reporting the service. This includes consideration of further testing or treatment that may not be elected by virtue of risk/benefit analysis or patient/parent/guardian/surrogate choice. Notation in the patient's medical record that another professional is managing the problem without additional assessment or care coordination documented does not qualify as being addressed or managed by the physician or other qualified health care professional reporting the service. Referral without evaluation (by history, examination, or diagnostic study[ies]) or consideration of treatment does not qualify as being addressed or managed by the physician or other qualified health care professional reporting the service. For hospital inpatient and observation care services, the problem addressed is the problem status on the date of the encounter, which may be significantly different than on admission. It is the problem being managed or co-managed by the reporting physician or qualified health care professional and may not be the cause of admission or continued stay.

Minimal problem: A problem that may not require the presence of the physician or other qualified health care professional, but the service is provided under the physician's or other qualified health care professional's supervision (see 99211, 99281).

Self-limited or minor problem: *A problem that runs a definite and prescribed course, is transient in nature, and is not likely to permanently alter health status.*

Stable, chronic illness: A problem with an expected duration of at least one year or until the death of the patient. For the purpose of defining chronicity, conditions are treated as chronic whether or not stage or severity changes (eg, uncontrolled diabetes and controlled diabetes are a single chronic condition). "Stable" for the purposes of categorizing MDM is defined by the specific treatment goals for an individual patient. A patient who is not at his or her treatment goal is not stable, even if the condition has not changed and there is no short-term threat to life or function. For example, a patient with persistently poorly controlled blood pressure for whom better control is a goal is not stable, even if the pressures are not changing and the patient is asymptomatic. The risk of morbidity **without** treatment is significant.

Acute, uncomplicated illness or injury: A recent or new short-term problem with low risk of morbidity for which treatment is considered. There is little to no risk of mortality with treatment, and full recovery without functional impairment is expected. A problem that is normally self-limited or minor but is not resolving consistent with a definite and prescribed course is an acute, uncomplicated illness.

Acute, uncomplicated illness or injury requiring hospital inpatient or observation level care: A recent or new short-term problem with low risk of morbidity for which treatment is required. There is little to no risk of mortality with treatment, and full recovery without functional impairment is expected. The treatment required is delivered in a hospital inpatient or observation level setting.

Stable, acute illness: A problem that is new or recent for which treatment has been initiated. The patient is improved and while resolution may not be complete is stable with respect to this condition.

Chronic illness with exacerbation, progression, or side effects of treatment: A chronic illness that is acutely worsening, poorly controlled, or progressing with an intent to control progression and requiring additional supportive care or requiring attention to treatment for side effects.

Undiagnosed new problem with uncertain prognosis: A problem in the differential diagnosis that represents a condition likely to result in a high risk of morbidity without treatment.

Acute illness with systemic symptoms: An illness that causes systemic symptoms and has a high risk of morbidity without treatment. For systemic general symptoms, such as fever, body aches, or fatigue in a minor illness that may be treated to alleviate symptoms, see the definitions for **self-limited or minor problem** or **acute, uncomplicated illness or injury.** Systemic symptoms may not be general but may be single system.

Acute, complicated injury: An injury which requires treatment that includes evaluation of body systems that are not directly part of the injured organ, the injury is extensive, or the treatment options are multiple and/or associated with risk of morbidity.

Chronic illness with severe exacerbation, progression, or side effects of treatment: The severe exacerbation or progression of a chronic illness or severe side effects of treatment that have significant risk of morbidity and may require escalation in level of care.

Acute or chronic illness or injury that poses a threat to life or bodily function: An acute illness with systemic symptoms, an acute complicated injury, or a chronic illness or injury with exacerbation and/or progression or side effects of treatment, that poses a threat to life or bodily function in the near term without treatment. Some symptoms may represent a condition that is significantly probable and poses a potential threat to life or bodily function. These may be included in this category when the evaluation and treatment is consistent with this degree of potential severity.

Amount and/or Complexity of Data to be Reviewed and Analyzed

One element used in selecting the level of services is the amount and/or complexity of data to be reviewed or analyzed at an encounter.

Analyzed: Analyzed is a term describing the process of using the data as part of the MDM. The data element itself may not be subject to analysis (eg, glucose), but it is instead included in the thought processes for diagnosis, evaluation, or treatment. Tests ordered are presumed to be analyzed when the results are reported. Therefore, when they are ordered during an encounter, they are counted in that encounter. Tests that are ordered outside of an encounter may be counted in the encounter where they are analyzed. In the case of a recurring order, each new result may be counted in the encounter at which it is analyzed. For example, an encounter that includes an order for monthly prothrombin times would count for one prothrombin time ordered and reviewed. Additional future results, if analyzed in a subsequent encounter, may be counted as a single test in that subsequent encounter. Any service for which the professional component is separately reported by the physician or other qualified health care professional

reporting the E/M services is not counted as a data element ordered, reviewed, analyzed, or independently interpreted for the purposes of determining the level of MDM.

Test: Tests are imaging, laboratory, psychometric, or physiologic data. A clinical laboratory panel (eg, basic metabolic panel [80047]) is a single test. The differentiation between single or multiple tests is defined in accordance with the CPT code set. For the purposes of data reviewed and analyzed, pulse oximetry is not a test.

Unique: A unique test is defined by the CPT code set. When multiple results of the same unique test (eg, serial blood glucose values) are compared during an E/M service, only count one unique test. Tests that have overlapping elements are not unique, even if they are identified with distinct CPT codes. For example, a CBC with differential would incorporate the set of hemoglobin, CBC without differential, and platelet count. A unique source is defined as a physician or qualified heath care professional in a distinct group or different specialty or subspecialty, or a unique entity. Review of all materials from any unique source counts as one element towards MDM.

Combination of Data Elements: A combination of different data elements, for example a combination of notes reviewed, tests ordered, tests reviewed, or independent historian, allows these elements to be summed. It does not require each item type or category to be represented. A unique test ordered, plus a note reviewed and an independent historian would be a combination of three elements.

External: *External records, communications and/or test results are from an external physician, other qualified health care professional, facility, or health care organization.*

External physician or other qualified health care professional: *An external physician or other qualified health care professional who is not in the same group practice or is of a different specialty or subspecialty. This includes licensed professionals who are practicing independently. The individual may also be a facility or organizational provider such as from a hospital, nursing facility, or home health care agency.*

Discussion: Discussion requires an interactive exchange. The exchange must be direct and not through intermediaries (eg, clinical staff or trainees). Sending chart notes or written exchanges that are within progress notes does not qualify as an interactive exchange. The discussion does not need to be on the date of the encounter but is counted only once and only when it is used in the decision making of the encounter. It may be asynchronous (ie, does not need to be in person), but it must be initiated and completed within a short time period (eg, within a day or two).

Independent historian(s): An individual (eg, parent, guardian, surrogate, spouse, witness) who provides a history in addition to a history provided by the patient who is unable to provide a complete or reliable history (eg, due to developmental stage, dementia, or psychosis) or because a confirmatory history is judged to be necessary. In the case where there may be conflict or poor communication between multiple historians and more than one historian is needed, the independent historian requirement is met. It does not include translation services. The independent history does not need to be obtained in person but does need to be obtained directly from the historian providing the independent information.

Independent interpretation: The interpretation of a test for which there is a CPT code, and an interpretation or report is customary. This does not apply when the physician or other qualified health care professional who reports the E/M service is reporting or has previously reported the test. A form of interpretation should be documented but need not conform to the usual standards of a complete report for the test.

Appropriate source: *For the purpose of the* ***discussion of management*** *data element (see Table 2, Levels of Medical Decision Making), an appropriate source includes professionals who are not health care professionals but may be involved in the management of the patient (eg, lawyer, parole officer, case manager, teacher). It does not include discussion with family or informal caregivers.*

Risk of Complications and/or Morbidity or Mortality of Patient Management

One element used in selecting the level of services is the risk of complications and/or morbidity or mortality of patient management at an encounter. This is distinct from the risk of the condition itself.

Risk: The probability and/or consequences of an event. The assessment of the level of risk is affected by the nature of the event under consideration. For example, a low probability of death may be high risk, whereas a high chance of a minor, self-limited adverse effect of treatment may be low risk. Definitions of risk are based upon the usual behavior and thought processes of a physician or other qualified health care professional in the same specialty. Trained clinicians apply common language usage meanings to terms such as high, medium, low, or minimal risk and do not require quantification for these definitions (though quantification may be provided when evidence-based medicine has established probabilities). For the purposes of MDM, level of risk is based upon consequences of the problem(s) addressed at the encounter when appropriately treated. Risk also includes MDM related to the need to initiate or forego further testing, treatment, and/or hospitalization. The risk of patient management criteria applies to the patient management decisions made by the reporting physician or other qualified health care professional as part of the reported encounter.

Morbidity: *A state of illness or functional impairment that is expected to be of substantial duration during which function is limited, quality of life is impaired, or there is organ damage that may not be transient despite treatment.*

Social determinants of health: *Economic and social conditions that influence the health of people and communities. Examples may include food or housing insecurity.*

Surgery (minor or major, elective, emergency, procedure or patient risk):

> ***Surgery-Minor or Major:*** The classification of surgery into minor or major is based upon the common meaning of such terms when used by trained clinicians, similar to the use of the term "risk". These terms are not defined by a surgical package classification.
>
> ***Surgery-Elective or Emergency:*** Elective procedures and emergent or urgent procedures describe the timing of a procedure when the timing is related to the patient's condition. An elective procedure is typically planned in advance (eg, scheduled for weeks later), while an emergent procedure is typically performed immediately or with minimal delay to allow for patient stabilization. Both elective and emergent procedures may be minor or major procedures.
>
> ***Surgery-Risk Factors, Patient or Procedure:*** Risk factors are those that are relevant to the patient and procedure. Evidence-based risk calculators may be used, but are not required, in assessing patient and procedure risk.

Drug therapy requiring intensive monitoring for toxicity: A drug that requires intensive monitoring is a therapeutic agent that has the potential to cause serious morbidity or death. The monitoring is performed for assessment of these adverse effects and not primarily for assessment of therapeutic efficacy. The monitoring should be that which is generally accepted practice for the agent but may be patient-specific in some cases. Intensive monitoring may be long-term or short-term. Long-term intensive monitoring is not performed less than quarterly. The monitoring may be performed with a laboratory test, a physiologic test, or imaging. Monitoring by history or examination does not qualify. The monitoring affects the level of MDM in an encounter in which it is considered in the management of the patient. An example may be monitoring for cytopenia in the use of an antineoplastic agent between dose cycles. Examples of monitoring that do not qualify include monitoring glucose levels during insulin therapy, as the primary reason is the therapeutic effect (unless severe hypoglycemia is a current, significant concern); or annual electrolytes and renal function for a patient on a diuretic, as the frequency does not meet the threshold.

Guidelines for Selecting Level of Service Based on Time

Certain categories of time-based E/M codes that do not have levels of services based on MDM (eg, Critical Care Services) in the E/M section use time differently. It is important to review the instructions for each category.

Time is **not** a descriptive component for the emergency department levels of E/M services because emergency department services are typically provided on a variable intensity basis, often involving multiple encounters with several patients over an extended period of time.

When time is used for reporting E/M services codes, the time defined in the service descriptors is used for selecting the appropriate level of services. The E/M services for which these guidelines apply require a face-to-face encounter with the physician or other qualified health care professional. For office or other outpatient services, if the physician's or other qualified health care professional's time is spent in the supervision of clinical staff who perform the face-to-face services of the encounter, use 99211.

For coding purposes, time for these services is the total time on the date of the encounter. It includes both the face-to-face and non-face-to-face time personally spent by the physician and/or other qualified health care professional(s) on the day of the encounter (includes time in activities that require the physician or other qualified health care professional and does not include time in activities normally performed by clinical staff). It does not include any time spent in the performance of other separately reported service(s).

A shared or split visit is defined as a visit in which a physician and other qualified health care professional(s) both provide the face-to-face and non-face-to-face work related to the visit. When time is being used to select the appropriate level of services for which time-based reporting of shared or split visits is allowed, the time personally spent by the physician and other qualified health care professional(s) assessing and managing the patient on the date of the encounter is summed to define total time. Only distinct time should be summed for shared or split visits (ie, when two or more individuals jointly meet with or discuss the patient, only the time of one individual should be counted).

When prolonged time occurs, the appropriate prolonged services code may be reported. The total time on the date of the encounter spent caring for the patient should be documented in the medical record when it is used as the basis for code selection.

Physician or other other qualified health care professional time includes the following activities, when performed:

- preparing to see the patient (eg, review of tests)
- obtaining and/or reviewing separately obtained history
- performing a medically appropriate examination and/or evaluation
- counseling and educating the patient/family/caregiver
- ordering medications, tests, or procedures
- referring and communicating with other health care professionals (when not separately reported)
- documenting clinical information in the electronic or other health record
- independently interpreting results (when not separately reported) and communicating results to the patient family/caregiver
- care coordination (when not separately reported)

Do not count time spent on the following:

- the performance of other services reported separately

- travel
- teaching that is general and not limited to discussion that is required for the management of the specific patient

Unlisted Service

An E/M service may be provided that is not listed in this section of the CPT codebook. When reporting such a service, the appropriate unlisted code may be used to indicate the service, identifying it by "Special Report," as discussed in the following paragraph. The "Unlisted Services" and accompanying codes for the E/M section are as follows:

***99429 Unlisted preventive** medicine service*

***99499 Unlisted evaluation and management** service*

Special Report

An unlisted service or one that is unusual, variable, or new may require a special report demonstrating the medical appropriateness of the service. Pertinent information should include an adequate definition or description of the nature, extent, and need for the procedure and the time, effort, and equipment necessary to provide the service. Additional items that may be included are complexity of symptoms, final diagnosis, pertinent physical findings, diagnostic and therapeutic procedures, concurrent problems, and follow-up care.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:99304 Tracking Number I1 Original Specialty Recommended RVU: **1.60**
Presented Recommended RVU: **1.50**
Global Period: XXX Current Work RVU: **1.64** RUC Recommended RVU: **1.50**

CPT Descriptor: Initial nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and straightforward or low level of medical decision making. When using total time on the date of the encounter for code selection, 25 minutes must be met or exceeded.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: Initial nursing facility visit for a patient with limited supports at home receiving post-acute care for an operative procedure that was uncomplicated.

Percentage of Survey Respondents who found Vignette to be Typical: 79%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Prepare to see patient; review medical records, and communicate with other health professionals as necessary.

Description of Intra-Service Work: Obtain a detailed history and fluid intake and other health conditions from patient's family, assisted living staff, and other health care professionals as necessary. Vital signs are noted. Perform a comprehensive physical examination that includes inspecting skin for pre-ulcerations and ulcerations; evaluating patients oral hygiene; cardiovascular, pulmoary, abdominal and genitourinary (GU) exams for evidence of obstructive urinary retention and fecal impaction; evauating patient's ability to communicate; and assessing safety of patient's gait.

Description of Post-Service Work: Follow up with telehpone calls to the facility regarding diagnostic findings, intraservice coordination and documentation of care, and interaction with facility health care professionals associated with delivery of care to this patient until the next face-to-face physician encounter. Discuss with family and/or surrogate decsion maker the preferred intensity of care as it relates to do not resuscitate (DNR) orders for this patient.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	3%	44%	48%	5%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	8%	48%	44%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	3%	71%	26%
Physical effort required	2%	59%	39%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	7%	40%	53%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	52%	39%	9%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	4%	48%	48%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	4%	67%	29%
Physical effort required	7%	50%	43%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	52%	48%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

The CPT codes for initial and subsequent nursing facility services were surveyed because the CPT editorial panel changed the descriptors of the codes so that the choice of code to report is based on either medical decision making or the total time spent on the date of the encounter. The total time will be based on the results of the surveys for each code. The CPT codes for discharge services were not changed by were surveyed because they are part of the nursing facility services family. CPT also deleted 99318 which was used to report annual nursing facility assessment because such assessments may be required by law. In the future these annual assessments will be reported using the appropriate initial or subsequent care code.

The codes were surveyed by the American Geriatrics Society (AGS), the American Medical Directors Association (AMDA), the American Academy of Physical Medicine & Rehabilitation (AAPM&R), the American Nurses Association (ANA), the American Podiatric Medical Association (APMA), and the American College of Physicians (ACP). The surveying societies convened an expert panel to review the survey results and make work and time recommendations to the RUC.

Compelling Evidence

The last time the nursing facility services codes were reviewed by the RUC was in February 2007. The expert panel reviewed peer-reviewed literature (see attached articles) that documented that there have been changes in physician work due to patient population and length of hospital stay. After its review the expert panel agreed that these codes met these compelling evidence criteria.

Specifically, the acuity of patients admitted to nursing home after being discharged from an acute care hospital has increased significantly from 2011 to 2018. The table below shows the increase in patient acuity upon hospital discharge (Elixhauser scale) and the Hierarchical Condition Category (HCC) score on SNF admission. Note that a SNF patient is the typical patient for nursing home visits.

All Hospital Discharges to SNFs

		Elixhauser		HCC	
Year	N	Mean/Estimate	Std. Error	Mean/Estimate	Std. Error
2011	2,617,881	8.839	0.006	2.028	0.001
2012	2,579,944	8.951	0.007	2.067	0.001
2013	2,585,660	9.102	0.007	2.107	0.001
2014	2,639,292	9.178	0.006	2.144	0.001
2015	2,696,494	9.346	0.006	2.205	0.001
2016	2,687,022	9.341	0.006	2.287	0.001
2017	2,742,833	9.554	0.006	2.358	0.001
2018	2,673,328	9.706	0.006	2.402	0.001

The Elixhauser index is a well-established tool that categorizes 30 patient comorbidities based on ICD diagnosis, in this case upon hospital discharge, and is used in a variety of ways including predicting adverse events and utilization of resources. The HCC is a risk adjustment model which calculates risk scores for aged and disable Medicare beneficiaries, often used to represent the expected costs of a Medicare member in the coming year. This data was supplied by Dr Vincent Mor, Brown University Center for Gerontology and Healthcare Research, using LTCFocus.org, a research data base from the Shaping Long-Term Care in America Project sponsored by Brown University and the National Institute on Aging.

Fashaw et. al. (JAMDA 21 (2020) 233-239, reviewed comprehensive data in US Nursing Homes from 1985-2015 and found that in 2015, as opposed to 1985, among other things, the resident cognitive function has decreased (e.g., percent of residents with dementia increased from 39% in 1995 to 45% in 2015), the percent of patients with a psychiatric diagnosis increased from 11% in 1995 to 31% in 2015, the percent of residents receiving antidepressants increased from 20% in 1995 to 49% in 2015, and the need to assistance with activities of daily living has increased,

Teno, et. al. (JAMA 2017) reviewed Medicare Part B claims data and showed that the care of SNF patients has shifted from physicians to nurse practitioners and physician assistances and that those physicians, NPs, and PAs who provide SNF care are SNFists - i.e., providers who bill more than 90% of all their visits in the nursing home setting

Werner (JAMA 2018) reviewed MEDPAR data and determined that the length of acute care hospital stay before discharge to a post-acute facility decreased from 9.0 days in 2000 to 7.3 days in 2015 and length of stay in the post-acute care facility increased from 21.7 days in 2000 to more than 25 days in 2014 and 2015.

McCarthy et. al. (JAMA 2020) reviewed the nationwide Minimum Data Set (MDS) to look at transfers from nursing homes to acute care hospitals. They found that the number of transfers decreased from 2011 to 2016, especially for patients with dementia, heart failure, and chronic obstructive pulmonary disease - without an increased mortality rate in nursing homes.

After reviewing these data, the expert panel concluded that due to changes in patient population, changes in specialty mix, and the reduced length of acute care hospital stay before discharge to a nursing home, that the compelling evidence criteria were met.

Survey Data Review

The expert panel reviewed the initial visit code 99304.

99304 requires straightforward or low-level medical decision making or is based on total time spent on the date of the encounter. There were 203 respondents of whom 79% found the vignette to be typical. The survey times and median work RVU were 6/25/5/36/1.70. The 25th percentile work RVU was 1.5. The key reference services were 99203, Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and low level of medical decision making. When using time for code selection, 30-44 minutes of total time is spent on the date of the encounter, with times and work RVU of 5/25/5/35/1.6, and 99202, Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and straightforward medical decision making. When using time for code selection, 15-29 minutes of total time is spent on the date of the encounter, with times and work RVU of 2/15/3/20/0.93.

The expert panel reviewed the current times and work RVU for 99304, 10/23/10/43/1.64.

The panel agreed that while the survey median intra-service time was two minutes higher than the current intra-service time, the total time has decreased by seven minutes. In addition, the survey median intra-service time and total time were practically identical to 99203, the most commonly chosen reference service. Based on the survey times, the expert panel determined a crosswalk to the key reference service, 99203 would result in the most accurate valuation. Therefore, the expert panel recommends for 99304, times and work RVU of 6/25/5/36/1.60.

Finally, the expert panel reviewed its recommendations for all the surveyed codes to determine whether the recommendations placed the codes in proper rank order with each other.

The panel reviewed the total times, intra times and work RVUs among the subsequent visit codes, among the initial visit codes, and between the discharge codes to determine if the ratios (i.e., percent) differences of those parameters were consistent. They were very consistent. The expert panel also reviewed these data for the comparable initial visit and subsequent visit codes (e.g., 99306 and 99310) to determine if the percent differences were consistent. They were very consistent. Similarly, the date between the two discharge codes were very consistent. The expert panel agreed that this analysis supported all the recommendations for time and work RVUs.

Code	Intra-time	Total Time	Work RVU
99304	25	36	1.6
99305	35	55	2.5
Ratio of 99305 to 99304	1.4	1.52	1.56

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 99304

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Podiatry How often? Sometimes

Specialty Internal Medicine How often? Sometimes

Specialty Nurse Practitioner How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 449940
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National estimate was based on total Medicare volume and Medicaid volume plus an additional 10% estimated for private and self-pay patients.

Specialty Podiatry Frequency 102586 Percentage 22.79 %

Specialty Family medicine Frequency 82789 Percentage 18.40 %

Specialty Internal Medicine Frequency 56242 Percentage 12.49 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 336,776 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimates are based on 2019 Medicare data from the RUC Database

Specialty Podiatry Frequency 76785 Percentage 22.80 %

Specialty Family Medicine Frequency 61967 Percentage 18.40 %

Specialty Internal Medicine Frequency 42097 Percentage 12.50 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Evaluation Management

BETOS Sub-classification:
Nursing home visit

BETOS Sub-classification Level II:
NA

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 99304

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:99305 Tracking Number I2 Original Specialty Recommended RVU: **2.50**
Presented Recommended RVU: **2.50**
Global Period: XXX Current Work RVU: **2.35** RUC Recommended RVU: **2.50**

CPT Descriptor: Initial nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. When using total time on the date of the encounter for code selection, 35 minutes must be met or exceeded.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: Initial nursing facility visit for a patient recovering from an illness or acute injury that requires ongoing medical management of their multiple stable problems.

Percentage of Survey Respondents who found Vignette to be Typical: 90%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Prepare to see the patient. Review medical records, laboratory results, and diagnostic findings. Communicate with facility health care professionals as necessary.

Description of Intra-Service Work: Obtain a comprehensive patient history and perform a comprehensive physical examination. Review patient's intake and hydration status, postoperative condition, initial rehabilitation results, and status of recent urosepsis and pressure ulcer. Evaluate status of patient's multiple chronic health problems. Examine patient's vision and hearing and neurological examination. Develop a multidisciplinary plan of care that includes physical therapy (PT) and occupational therapy (OT) services, initiation of a pressure wound care program, adjustments in diet, weaning off catheter, re-titration of medications, evaluation of dietary and fluid intake, and monitoring for mental status changes due to changes in environment.

Description of Post-Service Work: Follow up with telephone calls to patient's orthopedist and to SNF facility regarding diagnotic findings, post-service coordination and documentation of care, and interaction with facility health care professionals associated with delivery of care to this patient until the next face-to-face physician encounter. Discuss with family and/or surrogate decision maker the preferred intensity of care as it relates to DNR orders for this patient.

Modifier -51 Exempt Status
Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? No

TOP KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99204	XXX	2.60	**RUC Time**

CPT Descriptor Office or outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. When using time for code selection, 45-49 mintues of total time is spent on the date of the encounter.

SECOND HIGHEST KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99203	XXX	1.60	**RUC Time**

CPT Descriptor Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and low level of medical decision making. When using time for code selction, 30-44 minutes of total time is spent on the date of the encounter.

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99204	XXX	2.60	**RUC Time**	10,714,246

CPT Descriptor 1 Office or outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. When using time for code selection, 45-49 mintues of total time is spent on the date of the encounter.

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
95810	XXX	2.50	**RUC Time**	272,131

CPT Descriptor 2 Polysomnography; age 6 or older, sleep staging with 4 or more additional parameters of sleep, attended by a technologist

Other Reference CPT Code	Global	Work RVU	Time Source
75574	XXX	2.40	**RUC Time**

CPT Descriptor Computed tomographic angiography, heart, coronary arteries and bypass grafts (when present), with contrast material, including 3D image postprocessing (including evaluation of cardiac structure and morphology, assessment of cardiac function, and evaluation of venous structures, if performed)

RELATIONSHIP OF CODE BEING REVIEWED TO TOP TWO KEY REFERENCE SERVICES:
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by percent distribution) of the service you are rating to the top two chosen key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Top Key Reference Code: 108 **% of respondents:** 52.9 **%**

Number of respondents who choose 2nd Key Reference Code: 25 **% of respondents:** 12.2 **%**

TIME ESTIMATES (Median)

	CPT Code: 99305	**Top Key Reference CPT Code:** 99204	**2nd Key Reference CPT Code:** **99203**
Median Pre-Service Time	10.00	10.00	5.00
Median Intra-Service Time	35.00	40.00	25.00
Median Immediate Post-service Time	10.00	10.00	5.00

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	2%	24%	57%	17%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	5%	31%	64%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	3%	54%	43%
Physical effort required	3%	51%	46%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	3%	27%	70%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	4%	36%	44%	16%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	4%	48%	48%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	8%	72%	20%
Physical effort required	0%	56%	44%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	8%	36%	56%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

The CPT codes for initial and subsequent nursing facility services were surveyed because the CPT editorial panel changed the descriptors of the codes so that the choice of code to report is based on either medical decision making or the total time spent on the date of the encounter. The total time will be based on the results of the surveys for each code. The CPT codes for discharge services were not changed by were surveyed because they are part of the nursing facility services family. CPT also deleted 99318 which was used to report annual nursing facility assessment because such assessments may be required by law. In the future these annual assessments will be reported using the appropriate initial or subsequent care code.

The codes were surveyed by the American Geriatrics Society (AGS), the American Medical Directors Association (AMDA), the American Academy of Physical Medicine & Rehabilitation (AAPM&R), the American Nurses Association (ANA), the American Podiatric Medical Association (APMA), and the American College of Physicians (ACP). The surveying societies convened an expert panel to review the survey results and make work and time recommendations to the RUC.

Compelling Evidence

The last time the nursing facility services codes were reviewed by the RUC was in February 2007. The expert panel reviewed peer-reviewed literature (see attached articles) that documented that there have been changes in physician work due to patient population and length of hospital stay. After its review the expert panel agreed that these codes met these compelling evidence criteria.

Specifically, the acuity of patients admitted to nursing home after being discharged from an acute care hospital has increased significantly from 2011 to 2018. The table below shows the increase in patient acuity upon hospital discharge (Elixhauser scale) and the Hierarchical Condition Category (HCC) score on SNF admission. Note that a SNF patient is the typical patient for nursing home visits.

All Hospital Discharges to SNFs

		Elixhauser		HCC	
Year	N	Mean/Estimate	Std. Error	Mean/Estimate	Std. Error
2011	2,617,881	8.839	0.006	2.028	0.001
2012	2,579,944	8.951	0.007	2.067	0.001
2013	2,585,660	9.102	0.007	2.107	0.001
2014	2,639,292	9.178	0.006	2.144	0.001
2015	2,696,494	9.346	0.006	2.205	0.001
2016	2,687,022	9.341	0.006	2.287	0.001
2017	2,742,833	9.554	0.006	2.358	0.001
2018	2,673,328	9.706	0.006	2.402	0.001

The Elixhauser index is a well-established tool that categorizes 30 patient comorbidities based on ICD diagnosis, in this case upon hospital discharge, and is used in a variety of ways including predicting adverse events and utilization of resources. The HCC is a risk adjustment model which calculates risk scores for aged and disable Medicare beneficiaries, often used to represent the expected costs of a Medicare member in the coming year. This data was supplied by Dr Vincent Mor, Brown University Center for Gerontology and Healthcare Research, using LTCFocus.org, a research data base from the Shaping Long-Term Care in America Project sponsored by Brown University and the National Institute on Aging.

Fashaw et. al. (JAMDA 21 (2020) 233-239, reviewed comprehensive data in US Nursing Homes from 1985-2015 and found that in 2015, as opposed to 1985, among other things, the resident cognitive function has decreased (e.g., percent of residents with dementia increased from 39% in 1995 to 45% in 2015), the percent of patients with a psychiatric diagnosis increased from 11% in 1995 to 31% in 2015, the percent of residents receiving antidepressants increased from 20% in 1995 to 49% in 2015, and the need to assistance with activities of daily living has increased,

Teno, et. al. (JAMA 2017) reviewed Medicare Part B claims data and showed that the care of SNF patients has shifted from physicians to nurse practitioners and physician assistances and that those physicians, NPs, and PAs who provide SNF care are SNFists - i.e., providers who bill more than 90% of all their visits in the nursing home setting

Werner (JAMA 2018) reviewed MEDPAR data and determined that the length of acute care hospital stay before discharge to a post-acute facility decreased from 9.0 days in 2000 to 7.3 days in 2015 and length of stay in the post-acute care facility increased from 21.7 days in 2000 to more than 25 days in 2014 and 2015.

McCarthy et. al. (JAMA 2020) reviewed the nationwide Minimum Data Set (MDS) to look at transfers from nursing homes to acute care hospitals. They found that the number of transfers decreased from 2011 to 2016, especially for patients with dementia, heart failure, and chronic obstructive pulmonary disease - without an increased mortality rate in nursing homes.

After reviewing these data, the expert panel concluded that due to changes in patient population, changes in specialty mix, and the reduced length of acute care hospital stay before discharge to a nursing home, that the compelling evidence criteria were met.

Survey Data Review
The panel reviewed 99305.

99305, requires moderate level medical decision making or is based on total time spent on the date of the encounter. There were 204 respondents of whom 90% found the vignette to be typical. The survey times and median work RVU were 10/35/10/55/2.75. The 25th percentile work RVU was 2.50. The key reference services were 99204, Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. When using time for code selection, 45-59 minutes of total time is spent on the date of the encounter, with times and work RVU of 10/40/10/60/2.60, and 99203, Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and low level of medical decision making. When using time for code selection, 30-44 minutes of total time is spent on the date of the encounter, with times and work RVU of 5/25/5/35/1.6.

The expert panel noted that the current times and work RVU for 99305 are 11/33/13/57/2.35.

The panel agreed that the increased patient acuity in the nursing facility setting and the shortened length of stay in acute care hospitals before patients are discharged into the nursing home setting supported the survey 25th percentile work RVU of 2.50 and the times of 10/35/10/55/ The panel reviewed the data for the key reference services and agreed that 99202 describes a patient population that is significantly less acute and complex then the patient population described by 99305. The expert panel also agreed that a work RVU of 2.50 placed 99305 in proper rank order with 99204 which has a work RVU of 2.60, a total time of 60 minutes and an intra-time of 40 minutes.

Therefore, the panel recommends times and work RVU of 10/35/10/55/ 2.50

Finally, the expert panel reviewed its recommendations for all the surveyed codes to determine whether the recommendations placed the codes in proper rank order with each other.

The panel reviewed the total times, intra times and work RVUs among the subsequent visit codes, among the initial visit codes, and between the discharge codes to determine if the ratios (i.e., percent) differences of those parameters were consistent. They were very consistent. The expert panel also reviewed these data for the comparable initial visit and subsequent visit codes (e.g., 99306 and 99310) to determine if the percent differences were consistent. They were very consistent. Similarly, the date between the two discharge codes were very consistent. The expert panel agreed that this analysis supported all the recommendations for time and work RVUs.

Code	Intra-time	Total Time	Work RVU
99304	25	36	1.6
99305	35	55	2.5
Ratio of 99305 to 99304	1.4	1.52	1.56

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the

provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 99305

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Internal Medicine How often? Sometimes

Specialty Family Medicine How often? Sometimes

Specialty Nurse Practitioner How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 1333571
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National estimate was based on total Medicare volument and Medicaid volume plus an additional 10% estimated for private payors

Specialty Internal Medicine Frequency 397404 Percentage 29.79 %

Specialty Family Medicine Frequency 257379 Percentage 19.29 %

Specialty Nurse Practitioner Frequency 184033 Percentage 13.80 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 1,054,727 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimates are based on 2019 Medicare data from the RUC database

Specialty Internal Medicine Frequency 314309 Percentage 29.80 %

Specialty Family Medicine Frequency 203562 Percentage 19.29 %

Specialty Nurse Practitioner Frequency 145552 Percentage 13.79 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment
Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Evaluation Management

BETOS Sub-classification:
Nursing home visit

BETOS Sub-classification Level II:

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 99305

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:99306 Tracking Number I3 Original Specialty Recommended RVU: **3.50**
Presented Recommended RVU: **3.50**
Global Period: XXX Current Work RVU: **3.06** RUC Recommended RVU: **3.50**

CPT Descriptor: Initial nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and high level of medical decision making. When using total time on the date of the encounter for code selection, 45 minutes must be met or exceeded.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: Initial nursing facility visit for a patient with multiple morbidities requiring intensive management

Percentage of Survey Respondents who found Vignette to be Typical: 93%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Prepare to see the patient. Review medical records, laboratory results, and diagnostic findings. Communicate with facility health care professionals as necessary.

Description of Intra-Service Work: Obtain a comprehensive history and perform a comprehensive physical examination. Review patient's intake and hydration status and sliding scare insulin and psychotropic regimen. Discuss patient's multiple, still unstable, health problems with health care providers. Assess current status of cardiopilmonary function, swallowing and mobility function, and cognitive function. Review laboratory test findings including oxygenation, hydration, white blood cell count (WBC), cardiac rhythm, and glucose level trends. Initiate orders for O2, IV fluids, antibiotics, pain control, rehabilitation, and diagnostic testing to assess status. Develop a multidisciplinary care plan that includes PT, respiratory therapy (RT), and speech services; titration off insulin sliding scale; adjustments in diet and hydration; re-titration of psychotropic and analgesic medications; and monitoring for mental status changes.

Description of Post-Service Work: Follow up with telephone calls to the facility regarding diagnostic findings and intraservice coordination and documentation of care. Interact with facility health care professionals associated with delivery of care to this patient until the next face-to-face physician encounter. Discuss with family and/or surrogate decision maker the preferred intensity of care as it relates to DNR orders for this patient.

Modifier -51 Exempt Status

Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:

Is this new/revised procedure considered to be a new technology or service? No

TOP KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99205	XXX	3.50	**RUC Time**

CPT Descriptor Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and high level of medical decision making. When using time for code selection, 60-74 minutes of total time is spent on the date of the encounter.

SECOND HIGHEST KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99496	XXX	3.79	**RUC Time**

CPT Descriptor Transitional Care Management Services with the following required elements: Communication (direct contact, telephone, electronic) with the patient and/or caregiver within 2 business days of discharge Medical Decision making of high complexity during the service period face-to-face visits, within 7 calendar days of discharge.

KEY MPC COMPARISON CODES:

Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99205	XXX	3.50	**RUC Time**	2,923,626

CPT Descriptor 1 Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and high level of medical decision making. When using time for code selection, 60-74 minutes of total time is spent on the date of the encounter.

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
90962	XXX	3.57	**RUC Time**	213,048

CPT Descriptor 2 End-stage renal disease (ESRD) related services monthly, for patients 20 years of age and older; with 1 face-to-face visit by a physician or other qualified helath care professional per month

Other Reference CPT Code	Global	Work RVU	Time Source
50328	XXX	3.50	**RUC Time**

CPT Descriptor Backbench reconstruction of cadavar or living donor renal alograft prior to transplant; atrial anastomosis, each

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	2%	12%	36%	50%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	3%	16%	81%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	2%	38%	60%
Physical effort required	2%	44%	54%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	1%	14%	85%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	3%	0%	17%	33%	47%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	10%	27%	63%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	7%	40%	53%
Physical effort required	3%	43%	54%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	7%	10%	83%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

The CPT codes for initial and subsequent nursing facility services were surveyed because the CPT editorial panel changed the descriptors of the codes so that the choice of code to report is based on either medical decision making or the total time spent on the date of the encounter. The total time will be based on the results of the surveys for each code. The CPT codes for discharge services were not changed by were surveyed because they are part of the nursing facility services family. CPT also deleted 99318 which was used to report annual nursing facility assessment because such assessments may be required by law. In the future these annual assessments will be reported using the appropriate initial or subsequent care code.

The codes were surveyed by the American Geriatrics Society (AGS), the American Medical Directors Association (AMDA), the American Academy of Physical Medicine & Rehabilitation (AAPM&R), the American Nurses Association (ANA), the American Podiatric Medical Association (APMA), and the American College of Physicians (ACP). The surveying societies convened an expert panel to review the survey results and make work and time recommendations to the RUC.

Compelling Evidence

The last time the nursing facility services codes were reviewed by the RUC was in February 2007. The expert panel reviewed peer-reviewed literature (see attached articles) that documented that there have been changes in physician work due to patient population and length of hospital stay. After its review the expert panel agreed that these codes met these compelling evidence criteria.

Specifically, the acuity of patients admitted to nursing home after being discharged from an acute care hospital has increased significantly from 2011 to 2018. The table below shows the increase in patient acuity upon hospital discharge (Elixhauser scale) and the Hierarchical Condition Category (HCC) score on SNF admission. Note that a SNF patient is the typical patient for nursing home visits.

All Hospital Discharges to SNFs

		Elixhauser		HCC	
Year	N	Mean/Estimate	Std. Error	Mean/Estimate	Std. Error
2011	2,617,881	8.839	0.006	2.028	0.001
2012	2,579,944	8.951	0.007	2.067	0.001
2013	2,585,660	9.102	0.007	2.107	0.001
2014	2,639,292	9.178	0.006	2.144	0.001
2015	2,696,494	9.346	0.006	2.205	0.001
2016	2,687,022	9.341	0.006	2.287	0.001
2017	2,742,833	9.554	0.006	2.358	0.001
2018	2,673,328	9.706	0.006	2.402	0.001

The Elixhauser index is a well-established tool that categorizes 30 patient comorbidities based on ICD diagnosis, in this case upon hospital discharge, and is used in a variety of ways including predicting adverse events and utilization of resources. The HCC is a risk adjustment model which calculates risk scores for aged and disable Medicare beneficiaries, often used to represent the expected costs of a Medicare member in the coming year. This data was supplied by Dr Vincent Mor, Brown University Center for Gerontology and Healthcare Research, using LTCFocus.org, a research data base from the Shaping Long-Term Care in America Project sponsored by Brown University and the National Institute on Aging.

Fashaw et. al. (JAMDA 21 (2020) 233-239, reviewed comprehensive data in US Nursing Homes from 1985-2015 and found that in 2015, as opposed to 1985, among other things, the resident cognitive function has decreased (e.g., percent of residents with dementia increased from 39% in 1995 to 45% in 2015), the percent of patients with a psychiatric diagnosis increased from 11% in 1995 to 31% in 2015, the percent of residents receiving antidepressants increased from 20% in 1995 to 49% in 2015, and the need to assistance with activities of daily living has increased,

Teno, et. al. (JAMA 2017) reviewed Medicare Part B claims data and showed that the care of SNF patients has shifted from physicians to nurse practitioners and physician assistances and that those physicians, NPs, and PAs who provide SNF care are SNFists - i.e., providers who bill more than 90% of all their visits in the nursing home setting.

Werner (JAMA 2018) reviewed MEDPAR data and determined that the length of acute care hospital stay before discharge to a post-acute facility decreased from 9.0 days in 2000 to 7.3 days in 2015 and length of stay in the post-acute care facility increased from 21.7 days in 2000 to more than 25 days in 2014 and 2015.

McCarthy et. al. (JAMA 2020) reviewed the nationwide Minimum Data Set (MDS) to look at transfers from nursing homes to acute care hospitals. They found that the number of transfers decreased from 2011 to 2016, especially for patients with dementia, heart failure, and chronic obstructive pulmonary disease - without an increased mortality rate in nursing homes.

After reviewing these data, the expert panel concluded that due to changes in patient population, changes in specialty mix, and the reduced length of acute care hospital stay before discharge to a nursing home, that the compelling evidence criteria were met.

Survey Data Review

Next, the panel reviewed 99306 which requires a high level of medical decision making or is based on the total time spent on the date of the encounter. There were 208 respondents of whom 94% found the vignette to be typical. The survey times and median work RVU were 15/50/15/80/3.75 and the 25th percentile work RVU was 3.50. The two key reference services were, 99205, Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and high level of medical decision making. When using time for code selection, 60-74 minutes of total time is spent on the date of the encounter, with times and work RVU of 14/59/15/88/3.5 and, 99496, Transitional Care Management Services with the following required elements: Communication (direct contact, telephone, electronic) with the patient and/or caregiver within 2 business days of discharge Medical decision making of high complexity during the service period Face-to-face visit, within 7 calendar days of discharge of medical decision making, with times and work RVU of 0/75/0/75/3.79.

The expert panel noted that the current times and work RVU for 99306 were 15/45/20/80/3.06.

The panel noted that while the total time for 99306 remained the same, the intra-service time increased by 5 minutes (more than 10%). The panel also noted that while the total times and intra-service times were less than for 99205, the patient population and acuity supported a work value at least equal to 99205. Further 99496 has a lower total time than 99406 - but a greater intra time. And the survey median of 3.50 places 99306 in proper rank order with 99496. The panel also reviewed MPC code 90962, End-stage renal disease (ESRD) related services monthly, for patients 20 years of age and older; with 1 face-to-face visit by a physician or other qualified health care professional per month, which is an MPC code and has times and work RVU of 0/70/0/70/3.57

The expert panel noted that 90962 has less total time than 99306 but more intra-service time and that the survey 25th percentile work RVU for 99306 of 3.50 places it in correct rank order with 90962 and the key reference services.

Therefore, the expert panel recommends times and work RVU of 15/50/15/80/3.50.

Finally, the expert panel reviewed its recommendations for all the surveyed codes to determine whether the recommendations placed the codes in proper rank order with each other.

The panel reviewed the total times, intra times and work RVUs among the subsequent visit codes, among the initial visit codes, and between the discharge codes to determine if the ratios (i.e., percent) differences of those parameters were consistent. They were very consistent. The expert panel also reviewed these data for the comparable initial visit and subsequent visit codes (e.g., 99306 and 99310) to determine if the percent differences were consistent. They were very

consistent. Similarly, the date between the two discharge codes were very consistent. The expert panel agreed that this analysis supported all the recommendations for time and work RVUs.

Code	Intra-time	Total Time	Work RVU
99304	25	36	1.6
99305	35	55	2.5
Ratio of 99305 to 99304	1.4	1.52	1.56

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 99306

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Internal Medicine	How often? Sometimes
Specialty Family Medicine	How often? Sometimes
Specialty Nurse Practitioner	How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 1751100
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National estimate is based on total Medicare volume and Medicaid volume plus an additional 10% estimated for other payors.

Specialty Internal Medicine	Frequency 745969	Percentage 42.60 %
Specialty Family Medicine	Frequency 341464	Percentage 19.49 %
Specialty Nurse Practitioner	Frequency 171608	Percentage 9.80 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 1,389,990 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimates are based on 2019 Medicare data from the RUC database

Specialty Internal Medicine	Frequency 592136	Percentage 42.60 %
Specialty Family Medicine	Frequency 271048	Percentage 19.49 %
Specialty Nurse Practitioners	Frequency 136219	Percentage 9.79 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Evaluation Management

BETOS Sub-classification:
Nursing home visit

BETOS Sub-classification Level II:
NA

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 99306

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:99307 Tracking Number I4 Original Specialty Recommended RVU: **0.70**
Presented Recommended RVU: **0.70**
Global Period: XXX Current Work RVU: **0.76** RUC Recommended RVU: **0.70**

CPT Descriptor: Subsequent nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and straightforward medical decision making. When using total time on the date of the encounter for code selection, 10 minutes must be met or exceeded.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: Subsequent nursing facility visit for a patient with a self-limited or minor problem.

Percentage of Survey Respondents who found Vignette to be Typical: 89%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Prepare to see the patient. Review records of previously attempted interventions. Communicate with facility health care professionals as necessary.

Description of Intra-Service Work: Obtain an interval history that reveals ongoing poor dietary intake and urinary incontinence in a patient who cannot participate in pressure relief activities because of cognitive impairment. Perform a focused physical examination that reveals an improving lesion with no peripheral inflammation and no evidence of systemic involvement. As a result, alter patient's topical regimen, order a new nutritional program, and authorize a support surface.

Description of Post-Service Work: Follow-up with telephone calls to the facility

Modifier -51 Exempt Status
Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? No

TOP KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99212	XXX	0.70	**RUC Time**

CPT Descriptor Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and straightforward medical decision making. When using time for code selection, 10-19 minutes of total time is spent on the date of the encounter.

SECOND HIGHEST KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99213	XXX	1.30	**RUC Time**

CPT Descriptor Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and low level of medical decision making. When using time for code selection, 20-19 minutes of total time is spent on the date of the encounter.

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99212	XXX	0.70	**RUC Time**	10,729,531

CPT Descriptor 1 Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and straightforward medical decision making. When using time for code selection, 10-19 minutes of total time is spent on the date of the encounter.

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
95251	XXX	0.70	**RUC Time**	248,288

CPT Descriptor 2 Ambulatory continuous glucose monitoring of interstitial tissue fluid via a subcutaneous sensor for a minimum of 72 hours; analysis, interpretation and report

Other Reference CPT Code	Global	Work RVU	Time Source
62368	XXX	0.67	**RUC Time**

CPT Descriptor Electronic analysis of programmable, implanted pump for intrathecal or epidural drug infusion (includes evaluation of reservoir status, alarm status, drug prescription status); with reprogramming

---

RELATIONSHIP OF CODE BEING REVIEWED TO TOP TWO KEY REFERENCE SERVICES:
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by percent distribution) of the service you are rating to the top two chosen key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Top Key Reference Code: 130 **% of respondents:** 66.3 **%**

Number of respondents who choose 2nd Key Reference Code: 43 **% of respondents:** 21.9 **%**

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	1%	7%	61%	27%	4%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	13%	58%	29%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	8%	74%	18%
Physical effort required	7%	68%	25%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	5%	60%	35%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	9%	68%	21%	2%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	19%	51%	30%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	14%	67%	19%
Physical effort required	5%	70%	25%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	9%	60%	31%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

The CPT codes for initial and subsequent nursing facility services were surveyed because the CPT editorial panel changed the descriptors of the codes so that the choice of code to report is based on either medical decision making or the total time spent on the date of the encounter. The total time will be based on the results of the surveys for each code. The CPT codes for discharge services were not changed by were surveyed because they are part of the nursing facility services family. CPT also deleted 99318 which was used to report annual nursing facility assessment because such assessments may be required by law. In the future these annual assessments will be reported using the appropriate initial or subsequent care code.

The codes were surveyed by the American Geriatrics Society (AGS), the American Medical Directors Association (AMDA), the American Academy of Physical Medicine & Rehabilitation (AAPM&R), the American Nurses Association (ANA), the American Podiatric Medical Association (APMA), and the American College of Physicians (ACP). The surveying societies convened an expert panel to review the survey results and make work and time recommendations to the RUC.

Compelling Evidence

The last time the nursing facility services codes were reviewed by the RUC was in February 2007. The expert panel reviewed peer-reviewed literature (see attached articles) that documented that there have been changes in physician work due to patient population and length of hospital stay. After its review the expert panel agreed that these codes met these compelling evidence criteria.

Specifically, the acuity of patients admitted to nursing home after being discharged from an acute care hospital has increased significantly from 2011 to 2018. The table below shows the increase in patient acuity upon hospital discharge (Elixhauser scale) and the Hierarchical Condition Category (HCC) score on SNF admission. Note that a SNF patient is the typical patient for nursing home visits.

All Hospital Discharges to SNFs

		Elixhauser		HCC	
Year	N	Mean/Estimate	Std. Error	Mean/Estimate	Std. Error
2011	2,617,881	8.839	0.006	2.028	0.001
2012	2,579,944	8.951	0.007	2.067	0.001
2013	2,585,660	9.102	0.007	2.107	0.001
2014	2,639,292	9.178	0.006	2.144	0.001
2015	2,696,494	9.346	0.006	2.205	0.001
2016	2,687,022	9.341	0.006	2.287	0.001
2017	2,742,833	9.554	0.006	2.358	0.001
2018	2,673,328	9.706	0.006	2.402	0.001

The Elixhauser index is a well-established tool that categorizes 30 patient comorbidities based on ICD diagnosis, in this case upon hospital discharge, and is used in a variety of ways including predicting adverse events and utilization of resources. The HCC is a risk adjustment model which calculates risk scores for aged and disable Medicare beneficiaries, often used to represent the expected costs of a Medicare member in the coming year. This data was supplied by Dr Vincent Mor, Brown University Center for Gerontology and Healthcare Research, using LTCFocus.org, a research data base from the Shaping Long-Term Care in America Project sponsored by Brown University and the National Institute on Aging.

Fashaw et. al. (JAMDA 21 (2020) 233-239, reviewed comprehensive data in US Nursing Homes from 1985-2015 and found that in 2015, as opposed to 1985, among other things, the resident cognitive function has decreased (e.g., percent of residents with dementia increased from 39% in 1995 to 45% in 2015), the percent of patients with a psychiatric diagnosis increased from 11% in 1995 to 31% in 2015, the percent of residents receiving antidepressants increased from 20% in 1995 to 49% in 2015, and the need to assistance with activities of daily living has increased,

Teno, et. al. (JAMA 2017) reviewed Medicare Part B claims data and showed that the care of SNF patients has shifted from physicians to nurse practitioners and physician assistances and that those physicians, NPs, and PAs who provide SNF care are SNFists - i.e., providers who bill more than 90% of all their visits in the nursing home setting

Werner (JAMA 2018) reviewed MEDPAR data and determined that the length of acute care hospital stay before discharge to a post-acute facility decreased from 9.0 days in 2000 to 7.3 days in 2015 and length of stay in the post-acute care facility increased from 21.7 days in 2000 to more than 25 days in 2014 and 2015.

McCarthy et. al. (JAMA 2020) reviewed the nationwide Minimum Data Set (MDS) to look at transfers from nursing homes to acute care hospitals. They found that the number of transfers decreased from 2011 to 2016, especially for patients with dementia, heart failure, and chronic obstructive pulmonary disease - without an increased mortality rate in nursing homes.

After reviewing these data, the expert panel concluded that due to changes in patient population, changes in specialty mix, and the reduced length of acute care hospital stay before discharge to a nursing home, that the compelling evidence criteria were met.

Survey Data Review

The panel reviewed 99307, which requires straightforward medical decision making or is based on total time spent on the date of the encounter. There were 196 respondents of whom 89% found the vignette to be typical. The survey times and median work RVU were 5/10/5/20/0.76 and the 25th percentile work RVU was 0.70. The two key reference services were 99212, Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and straightforward medical decision making. When using time for code selection, 10-19 minutes of total time is spent on the date of the encounter, with times and work RVU of 2/11/3/0.70, and 99213, Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and low level of medical decision making. When using time for code selection, 20-29 minutes of total time is spent on the date of the encounter, with times and work RVU of 5/20/5/30/1.30.

The expert panel noted that the current times and work RVU for 99307 are 5/10/5/20/0.76.

The panel agreed that while the survey intra-service time was two minutes higher than the current time, the total time decreased by six minutes. Furthermore, the survey intra-service time was one minute more than intra-service time for 99212 and the total time was two minutes less. Given the increased acuity of nursing home patients, the expert panel agreed that the 25th percentile work RVU of 0.70 - which is identical to that of 99212 - placed 99307 In proper rank order with 99212. In addition, the work value of 0.70 places 99307 in proper rank order with 99213 which has a total time more than twice the survey total time for 99307, an intra-service time 66% higher than the 99307 survey median and a work RVU 85% higher than the 25th percentile than the survey 25th percentile work RVU for 99307.

Therefore, the expert panel recommends times and work RVU for 99307 of 1/12/1/14/0/70.

Finally, the expert panel reviewed its recommendations for all the surveyed codes to determine whether the recommendations placed the codes in proper rank order with each other.

The panel reviewed the total times, intra times and work RVUs among the subsequent visit codes, among the initial visit codes, and between the discharge codes to determine if the ratios (i.e., percent) differences of those parameters were consistent. They were very consistent. The expert panel also reviewed these data for the comparable initial visit and subsequent visit codes (e.g., 99306 and 99310) to determine if the percent differences were consistent. They were very consistent. Similarly, the date between the two discharge codes were very consistent. The expert panel agreed that this analysis supported all the recommendations for time and work RVUs.

Code	Intra-time	Total Time	Work RVU
99304	25	36	1.6
99305	35	55	2.5

Ratio of 99316 to 99315	1.6	1.575	1.67

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 99307

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Nurse Practitioner	How often? Sometimes
Specialty Internal Medicine	How often? Sometimes
Specialty Family Medicine	How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 4035247
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National estimate was based on total Medicare volume and Medicaid volume plus an additional 10% estimated for other payors

Specialty Nurse Practitioner	Frequency 1000741	Percentage 24.79 %
Specialty Internal Medicine	Frequency 823190	Percentage 20.39 %
Specialty Family Medicine	Frequency 702133	Percentage 17.40 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 2,372,760 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimates are based on 2019 medicare data from the RUC Database

Specialty Nurse Practitioner	Frequency 588444	Percentage 24.79 %
Specialty Internal Medicine	Frequency 484043	Percentage 20.39 %
Specialty Family Medicine	Frequency 412860	Percentage 17.39 %

Do many physicians perform this service across the United States? Yes

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Evaluation Management

BETOS Sub-classification:
Nursing home visit

BETOS Sub-classification Level II:
NA

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 99307

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:99308 Tracking Number I5 Original Specialty Recommended RVU: **1.30**
Presented Recommended RVU: **1.30**
Global Period: XXX Current Work RVU: **1.16** RUC Recommended RVU: **1.30**

CPT Descriptor: Subsequent nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and low level of medical decision making. When using total time on the date of the encounter for code selection, 15 minutes must be met or exceeded.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: Subsequent nursing facility visit for a patient with a stable chronic illness or recovering from an acute uncomplicated injury.

Percentage of Survey Respondents who found Vignette to be Typical: 94%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Prepare to see the patient. Review medical records. Communicate with other facility health care professionals as necessary.

Description of Intra-Service Work: Obtain an expanded history that includes intake and hydration information, discussion of the suprapubic-localized discomfort, muscle spasm, and psychosocial review of patient's coping ability with underlying disease. Perform an expanding physical examination, which reveals no evidence of dehydration, additional gross hematuria, or focal neurological findings, however, increased patient depression is observed. After necessary laboratory tests are ordered, patient is treated for the UTI and started on anti-depression medication.

Description of Post-Service Work: Follow up with telephone calls to the NF regarding titration of anti-depressant. Review confirming diagnostic laboratory data and antibiotic effectiveness. Discuss coordination and documentation of care and interaction with facility health care professionals associated with delivery of care to this patient until the next face-to-face physician encounter.

Modifier -51 Exempt Status
Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? No

TOP KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99213	XXX	1.30	**RUC Time**

CPT Descriptor Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and low level of medical decision making. When using time for code selection, 20-29 minutes of total time is spent on the date of the encounter.

SECOND HIGHEST KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99214	XXX	1.92	**RUC Time**

CPT Descriptor Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. When using time for code selection, 30-39 minutes of total time is spent on the date of the encounter.

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99212	XXX	0.70	**RUC Time**	10,729,531

CPT Descriptor 1 Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and straightforward medical decision making. When using time for code selection, 10-19 minutes of total time is spent on the date of the encounter.

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
74170	XXX	1.40	**RUC Time**	107,476

CPT Descriptor 2 Computed tomography, abdomen; without contrast material, followed by contrast material(s) and further sections

Other Reference CPT Code	Global	Work RVU	Time Source
74280	XXX	1.26	**RUC Time**

CPT Descriptor Radiologic examination, colon, including scout absominal radiograph(s) and delayed image(s), when performed; double contrast (eg, high density barium and air) study, including glucagon, when administered

---

RELATIONSHIP OF CODE BEING REVIEWED TO TOP TWO KEY REFERENCE SERVICES:
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by percent distribution) of the service you are rating to the top two chosen key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Top Key Reference Code: 140 **% of respondents:** 65.4 **%**

Number of respondents who choose 2nd Key Reference Code: 38 **% of respondents:** 17.7 **%**

TIME ESTIMATES (Median)

	CPT Code: 99308	**Top Key Reference CPT Code:** 99213	**2nd Key Reference CPT Code:** **99214**

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	1%	47%	44%	8%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	6%	56%	37%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	5%	67%	29%
Physical effort required	4%	67%	33%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	2%	48%	50%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	5%	55%	26%	13%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	13%	42%	44%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	16%	58%	26%
Physical effort required	11%	55%	34%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	6%	50%	45%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

The CPT codes for initial and subsequent nursing facility services were surveyed because the CPT editorial panel changed the descriptors of the codes so that the choice of code to report is based on either medical decision making or the total time spent on the date of the encounter. The total time will be based on the results of the surveys for each code. The CPT codes for discharge services were not changed by were surveyed because they are part of the nursing facility services family. CPT also deleted 99318 which was used to report annual nursing facility assessment because such assessments may be required by law. In the future these annual assessments will be reported using the appropriate initial or subsequent care code.

The codes were surveyed by the American Geriatrics Society (AGS), the American Medical Directors Association (AMDA), the American Academy of Physical Medicine & Rehabilitation (AAPM&R), the American Nurses Association (ANA), the American Podiatric Medical Association (APMA), and the American College of Physicians (ACP). The surveying societies convened an expert panel to review the survey results and make work and time recommendations to the RUC.

Compelling Evidence

The last time the nursing facility services codes were reviewed by the RUC was in February 2007. The expert panel reviewed peer-reviewed literature (see attached articles) that documented that there have been changes in physician work due to patient population and length of hospital stay. After its review the expert panel agreed that these codes met these compelling evidence criteria.

Specifically, the acuity of patients admitted to nursing home after being discharged from an acute care hospital has increased significantly from 2011 to 2018. The table below shows the increase in patient acuity upon hospital discharge (Elixhauser scale) and the Hierarchical Condition Category (HCC) score on SNF admission. Note that a SNF patient is the typical patient for nursing home visits.

All Hospital Discharges to SNFs

		Elixhauser		HCC	
Year	N	Mean/Estimate	Std. Error	Mean/Estimate	Std. Error
2011	2,617,881	8.839	0.006	2.028	0.001
2012	2,579,944	8.951	0.007	2.067	0.001
2013	2,585,660	9.102	0.007	2.107	0.001
2014	2,639,292	9.178	0.006	2.144	0.001
2015	2,696,494	9.346	0.006	2.205	0.001
2016	2,687,022	9.341	0.006	2.287	0.001
2017	2,742,833	9.554	0.006	2.358	0.001
2018	2,673,328	9.706	0.006	2.402	0.001

The Elixhauser index is a well-established tool that categorizes 30 patient comorbidities based on ICD diagnosis, in this case upon hospital discharge, and is used in a variety of ways including predicting adverse events and utilization of resources. The HCC is a risk adjustment model which calculates risk scores for aged and disable Medicare beneficiaries, often used to represent the expected costs of a Medicare member in the coming year. This data was supplied by Dr Vincent Mor, Brown University Center for Gerontology and Healthcare Research, using LTCFocus.org, a research data base from the Shaping Long-Term Care in America Project sponsored by Brown University and the National Institute on Aging.

Fashaw et. al. (JAMDA 21 (2020) 233-239, reviewed comprehensive data in US Nursing Homes from 1985-2015 and found that in 2015, as opposed to 1985, among other things, the resident cognitive function has decreased (e.g., percent of residents with dementia increased from 39% in 1995 to 45% in 2015), the percent of patients with a psychiatric diagnosis increased from 11% in 1995 to 31% in 2015, the percent of residents receiving antidepressants increased from 20% in 1995 to 49% in 2015, and the need to assistance with activities of daily living has increased,

Teno, et. al. (JAMA 2017) reviewed Medicare Part B claims data and showed that the care of SNF patients has shifted from physicians to nurse practitioners and physician assistances and that those physicians, NPs, and PAs who provide SNF care are SNFists - i.e., providers who bill more than 90% of all their visits in the nursing home setting.

Werner (JAMA 2018) reviewed MEDPAR data and determined that the length of acute care hospital stay before discharge to a post-acute facility decreased from 9.0 days in 2000 to 7.3 days in 2015 and length of stay in the post-acute care facility increased from 21.7 days in 2000 to more than 25 days in 2014 and 2015.

McCarthy et. al. (JAMA 2020) reviewed the nationwide Minimum Data Set (MDS) to look at transfers from nursing homes to acute care hospitals. They found that the number of transfers decreased from 2011 to 2016, especially for patients with dementia, heart failure, and chronic obstructive pulmonary disease - without an increased mortality rate in nursing homes.

After reviewing these data, the expert panel concluded that due to changes in patient population, changes in specialty mix, and the reduced length of acute care hospital stay before discharge to a nursing home, that the compelling evidence criteria were met.

Survey Data Review

The panel reviewed 99308 which requires low level medical decision making or is based on total time spent on the date of the encounter. There were 214 respondents of whom 95% found the vignette to be typical. The survey times and median work RVU were 5/18/4/27/1.44 with a 25th percentile work RVU of 1.30. The two key reference services were 99213, Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and low level of medical decision making. When using time for code selection, 20-29 minutes of total time is spent on the date of the encounter, with times and work RVU of 5/20/5/1.3, and 99214, Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. When using time for code selection, 30-39 minutes of total time is spent on the date of the encounter, with times and work RVUs of 7/30/10/47/1.92.

The expert panel noted that the current times and work RVU for 99308 are 7/15/9/31/1.16.

The expert panel noted that while the survey median intra-service time was three minutes higher than the current time, the total time was four minutes less than the current time. Moreover, even though the total and intra-service time were slightly less than the comparable times for 99213 (the first key reference service), the increased acuity of nursing home patients supported an equivalent work RVU. Furthermore, the total and intra-service times for 99214 are 74% and 66% higher than the survey times for 99308 which supports a work RVU for 99308 of 1.30 which is 67% of the work value of 99214.

Therefore, the expert panel recommends times and work RVU for 99308 of 5/18/4/27/1.3.

Finally, the expert panel reviewed its recommendations for all the surveyed codes to determine whether the recommendations placed the codes in proper rank order with each other.

The panel reviewed the total times, intra times and work RVUs among the subsequent visit codes, among the initial visit codes, and between the discharge codes to determine if the ratios (i.e., percent) differences of those parameters were consistent. They were very consistent. The expert panel also reviewed these data for the comparable initial visit and subsequent visit codes (e.g., 99306 and 99310) to determine if the percent differences were consistent. They were very consistent. Similarly, the date between the two discharge codes were very consistent. The expert panel agreed that this analysis supported all the recommendations for time and work RVUs.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the

provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. N/A

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 99308

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Nurse Practitioner	How often? Sometimes
Specialty Internal Medicine	How often? Sometimes
Specialty Family Medicine	How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 15664105
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National estimate was based on total Medicare volume and Medicaid volume plus an additional 10% estimated for other payors

Specialty Nurse Practitioner	Frequency 5874039	Percentage 37.49 %
Specialty Internal Medicine	Frequency 3461039	Percentage 22.09 %
Specialty Family Medicine	Frequency 2036334	Percentage 13.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 11,312,117 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimates are based on 2019 Medicare data from the RUC Database, plus 10% from deleted code 99318.

Specialty Nurse Practitioner	Frequency 4239781	Percentage 37.47 %
Specialty Internal Medicine	Frequency 2499977	Percentage 22.09 %
Specialty Family Medicine	Frequency 1470575	Percentage 12.99 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Evaluation Management

BETOS Sub-classification:
Nursing home visit

BETOS Sub-classification Level II:
NA

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 99308

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:99309 Tracking Number I6 Original Specialty Recommended RVU: **1.92**
Presented Recommended RVU: **1.92**
Global Period: XXX Current Work RVU: **1.55** RUC Recommended RVU: **1.92**

CPT Descriptor: Subsequent nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. When using total time on the date of the encounter for code selection, 30 minutes must be met or exceeded.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: Subsequent nursing facility visit for a patient with a new or progressing illness or acute injury that requires diagnostic evaluation, medical management or potential surgical treatment.

Percentage of Survey Respondents who found Vignette to be Typical: 86%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Prepare to see the patient. Review telephonic orders associated with recently reported URI; changes in dietary, bowel, and psychotropic regimens; and treatment of non-infected skin tear. Communicate with facility health care professionals as necessary..

Description of Intra-Service Work: Obtain a detailed interval history of each organ system that has an acute or active medical problem, including review of patient's multiple medications and recent laboratory and diagnostic testing ordered to evaluate patient's comprised respiratory condition. Perform a detailed physical examination and update the nursing plan of care.

Description of Post-Service Work: Evaluate additional diagnostic testing to determine hydration and pulmonary status and further changes in patient's psychotropic regimen. Follow up with telephone calls to facility staff, discussing coordination and documentation of care and interaction with facility health care professionals associated with delivery of care to this patient until the next face-to-face physician encounter.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	25%	54%	21%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	1%	36%	63%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	2%	51%	47%
Physical effort required	0%	50%	50%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	1%	23%	75%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	15%	15%	50%	21%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	9%	32%	59%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	9%	53%	39%
Physical effort required	6%	47%	47%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	6%	21%	73%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

The CPT codes for initial and subsequent nursing facility services were surveyed because the CPT editorial panel changed the descriptors of the codes so that the choice of code to report is based on either medical decision making or the total time spent on the date of the encounter. The total time will be based on the results of the surveys for each code. The CPT codes for discharge services were not changed by were surveyed because they are part of the nursing facility services family. CPT also deleted 99318 which was used to report annual nursing facility assessment because such assessments may be required by law. In the future these annual assessments will be reported using the appropriate initial or subsequent care code.

The codes were surveyed by the American Geriatrics Society (AGS), the American Medical Directors Association (AMDA), the American Academy of Physical Medicine & Rehabilitation (AAPM&R), the American Nurses Association (ANA), the American Podiatric Medical Association (APMA), and the American College of Physicians (ACP). The surveying societies convened an expert panel to review the survey results and make work and time recommendations to the RUC.

Compelling Evidence

The last time the nursing facility services codes were reviewed by the RUC was in February 2007. The expert panel reviewed peer-reviewed literature (see attached articles) that documented that there have been changes in physician work due to patient population and length of hospital stay. After its review the expert panel agreed that these codes met these compelling evidence criteria.

Specifically, the acuity of patients admitted to nursing home after being discharged from an acute care hospital has increased significantly from 2011 to 2018. The table below shows the increase in patient acuity upon hospital discharge (Elixhauser scale) and the Hierarchical Condition Category (HCC) score on SNF admission. Note that a SNF patient is the typical patient for nursing home visits.

All Hospital Discharges to SNFs

		Elixhauser		HCC	
Year	N	Mean/Estimate	Std. Error	Mean/Estimate	Std. Error
2011	2,617,881	8.839	0.006	2.028	0.001
2012	2,579,944	8.951	0.007	2.067	0.001
2013	2,585,660	9.102	0.007	2.107	0.001
2014	2,639,292	9.178	0.006	2.144	0.001
2015	2,696,494	9.346	0.006	2.205	0.001
2016	2,687,022	9.341	0.006	2.287	0.001
2017	2,742,833	9.554	0.006	2.358	0.001
2018	2,673,328	9.706	0.006	2.402	0.001

The Elixhauser index is a well-established tool that categorizes 30 patient comorbidities based on ICD diagnosis, in this case upon hospital discharge, and is used in a variety of ways including predicting adverse events and utilization of resources. The HCC is a risk adjustment model which calculates risk scores for aged and disable Medicare beneficiaries, often used to represent the expected costs of a Medicare member in the coming year. This data was supplied by Dr Vincent Mor, Brown University Center for Gerontology and Healthcare Research, using LTCFocus.org, a research data base from the Shaping Long-Term Care in America Project sponsored by Brown University and the National Institute on Aging.

Fashaw et. al. (JAMDA 21 (2020) 233-239, reviewed comprehensive data in US Nursing Homes from 1985-2015 and found that in 2015, as opposed to 1985, among other things, the resident cognitive function has decreased (e.g., percent of residents with dementia increased from 39% in 1995 to 45% in 2015), the percent of patients with a psychiatric diagnosis increased from 11% in 1995 to 31% in 2015, the percent of residents receiving antidepressants increased from 20% in 1995 to 49% in 2015, and the need to assistance with activities of daily living has increased,

Teno, et. al. (JAMA 2017) reviewed Medicare Part B claims data and showed that the care of SNF patients has shifted from physicians to nurse practitioners and physician assistances and that those physicians, NPs, and PAs who provide SNF care are SNFists - i.e., providers who bill more than 90% of all their visits in the nursing home setting.

Werner (JAMA 2018) reviewed MEDPAR data and determined that the length of acute care hospital stay before discharge to a post-acute facility decreased from 9.0 days in 2000 to 7.3 days in 2015 and length of stay in the post-acute care facility increased from 21.7 days in 2000 to more than 25 days in 2014 and 2015.

McCarthy et. al. (JAMA 2020) reviewed the nationwide Minimum Data Set (MDS) to look at transfers from nursing homes to acute care hospitals. They found that the number of transfers decreased from 2011 to 2016, especially for patients with dementia, heart failure, and chronic obstructive pulmonary disease - without an increased mortality rate in nursing homes.

After reviewing these data, the expert panel concluded that due to changes in patient population, changes in specialty mix, and the reduced length of acute care hospital stay before discharge to a nursing home, that the compelling evidence criteria were met.

Survey Data Review

The expert panel reviewed 99309 which requires a moderate level of medical decision making or is based on the total time spent on the date of the encounter. There were 217 respondents of whom 86% found the vignette to be typical. The times and median work RVU were 7/30/10/47/2.09 and the 25th percentile work RVU was 1.92. The two key reference services were 99214, Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. When using time for code selection, 30-39 minutes of total time is spent on the date of the encounter, with times and work RVUs of 7/30/10/47/1.92, and 99215, Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and high level of medical decision making. When using time for code selection, 40-54 minutes of total time is spent on the date of the encounter, with times and work RVU of 10/45/15/70/2.80.

The panel noted that the current times and work RVU for 99309 are 10/25/10/45/1.55.

The survey median intra time is five minutes longer than the current intra time and the total time is two minutes higher. Furthermore, the survey times and survey 25th percentile work RVU are identical to the times and work RVU for 99214, the key reference services chosen by 149 of the 217 respondents. Because the survey data for 99309 was a direct crosswalk to the key reference service at the 25th percentile the expert panel agreed to recommend the 25th percentile work RVU of 1.92. This also places 99309 in correct rank order to 99215 which has 50% more intra time (45 min. vs. 30 min.) and 49% more total time (70 min. vs. 47 min.) and 2.80 is 46% higher than 1.92.

Therefore, the expert panel recommends for 99309 times and work RVU of 7/30/10/47/1.92.

Finally, the expert panel reviewed its recommendations for all the surveyed codes to determine whether the recommendations placed the codes in proper rank order with each other.

The panel reviewed the total times, intra times and work RVUs among the subsequent visit codes, among the initial visit codes, and between the discharge codes to determine if the ratios (i.e., percent) differences of those parameters were consistent. They were very consistent. The expert panel also reviewed these data for the comparable initial visit and subsequent visit codes (e.g., 99306 and 99310) to determine if the percent differences were consistent. They were very consistent. Similarly, the date between the two discharge codes were very consistent. The expert panel agreed that this analysis supported all the recommendations for time and work RVUs.

Code	Intra-time	Total Time	Work RVU
99304	25	36	1.6
99305	35	55	2.5
Ratio of 99305 to 99304	1.4	1.52	1.56

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the

provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. N/A

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 99309

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Nurse Practitioner	How often? Sometimes
Specialty Internal Medicine	How often? Sometimes
Specialty Family Medicine	How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 13567069
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National estimate was based on total Medicare volume and Medicaid volume plus an additional 10% estimated for other payors

Specialty Nurse Practitioner	Frequency 6146335	Percentage 45.30 %
Specialty Internal Medicine	Frequency 2930703	Percentage 21.60 %
Specialty Family Medicine	Frequency 1628168	Percentage 12.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 10,094,874 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimates are based on 2019 Medicare data from the RUC Database plus 85% of deleted 99318

Specialty Nurse Practitioner	Frequency 4571968	Percentage 45.28 %
Specialty Internal Medicine	Frequency 2180492	Percentage 21.59 %
Specialty Family Medicine	Frequency 1222384	Percentage 12.10 %

Do many physicians perform this service across the United States? Yes

SUMMARY OF RECOMMENDATION

CPT Code:99310 Tracking Number I7 Original Specialty Recommended RVU: **2.80**
Presented Recommended RVU: **2.80**
Global Period: XXX Current Work RVU: **2.35** RUC Recommended RVU: **2.80**

CPT Descriptor: Subsequent nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and high level of medical decision making. When using total time on the date of the encounter for code selection, 45 minutes must be met or exceeded.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: Subsequent nursing facility visit for a patient with a chronic illness with severe exacerbation that poses a threat to life or bodily function, or an acute illness/injury that poses a threat to life or bodily function.

Percentage of Survey Respondents who found Vignette to be Typical: 90%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Prepare to see the patient. Review medical records and previously ordered diagnostic laboratory tests. Communicate with facility health care professionals as necessary.

Description of Intra-Service Work: Obtain a comprehensive history. Perform a comprehensive physical examination. Formulate a multidisciplinary treatment plan (MDM of moderate-complexity) that includes IV hydration and antibiotic therapy; nursing instructions regarding monitoring of respiratory, mental, functional, and diabetic status; respiratory and physical therapy assessments with treatment as indicated; and further laboratory monitoring to track effectiveness of treatment.

Description of Post-Service Work: Evaluate results of additionally ordered laboratory and diagnostic testing. Follow up with telephone calls to the facility to adjust interventions as indicated. Document coordination of care and interaction with facility health care professionals associated with delivery of care to this patient until the next face-to-face physician encounter. Discuss end-of-life issues with family members.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	1%	21%	31%	47%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	1%	30%	69%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	2%	44%	54%
Physical effort required	1%	45%	54%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	2%	22%	76%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	5%	42%	11%	42%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	11%	32%	58%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	5%	58%	37%
Physical effort required	5%	58%	37%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	32%	68%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

The CPT codes for initial and subsequent nursing facility services were surveyed because the CPT editorial panel changed the descriptors of the codes so that the choice of code to report is based on either medical decision making or the total time spent on the date of the encounter. The total time will be based on the results of the surveys for each code. The CPT codes for discharge services were not changed by were surveyed because they are part of the nursing facility services family. CPT also deleted 99318 which was used to report annual nursing facility assessment because such assessments may be required by law. In the future these annual assessments will be reported using the appropriate initial or subsequent care code.

The codes were surveyed by the American Geriatrics Society (AGS), the American Medical Directors Association (AMDA), the American Academy of Physical Medicine & Rehabilitation (AAPM&R), the American Nurses Association (ANA), the American Podiatric Medical Association (APMA), and the American College of Physicians (ACP). The surveying societies convened an expert panel to review the survey results and make work and time recommendations to the RUC.

Compelling Evidence

The last time the nursing facility services codes were reviewed by the RUC was in February 2007. The expert panel reviewed peer-reviewed literature (see attached articles) that documented that there have been changes in physician work due to patient population and length of hospital stay. After its review the expert panel agreed that these codes met these compelling evidence criteria.

Specifically, the acuity of patients admitted to nursing home after being discharged from an acute care hospital has increased significantly from 2011 to 2018. The table below shows the increase in patient acuity upon hospital discharge (Elixhauser scale) and the Hierarchical Condition Category (HCC) score on SNF admission. Note that a SNF patient is the typical patient for nursing home visits.

All Hospital Discharges to SNFs

		Elixhauser		HCC	
Year	N	Mean/Estimate	Std. Error	Mean/Estimate	Std. Error
2011	2,617,881	8.839	0.006	2.028	0.001
2012	2,579,944	8.951	0.007	2.067	0.001
2013	2,585,660	9.102	0.007	2.107	0.001
2014	2,639,292	9.178	0.006	2.144	0.001
2015	2,696,494	9.346	0.006	2.205	0.001
2016	2,687,022	9.341	0.006	2.287	0.001
2017	2,742,833	9.554	0.006	2.358	0.001
2018	2,673,328	9.706	0.006	2.402	0.001

The Elixhauser index is a well-established tool that categorizes 30 patient comorbidities based on ICD diagnosis, in this case upon hospital discharge, and is used in a variety of ways including predicting adverse events and utilization of resources. The HCC is a risk adjustment model which calculates risk scores for aged and disable Medicare beneficiaries, often used to represent the expected costs of a Medicare member in the coming year. This data was supplied by Dr Vincent Mor, Brown University Center for Gerontology and Healthcare Research, using LTCFocus.org, a research data base from the Shaping Long-Term Care in America Project sponsored by Brown University and the National Institute on Aging.

Fashaw et. al. (JAMDA 21 (2020) 233-239, reviewed comprehensive data in US Nursing Homes from 1985-2015 and found that in 2015, as opposed to 1985, among other things, the resident cognitive function has decreased (e.g., percent of residents with dementia increased from 39% in 1995 to 45% in 2015), the percent of patients with a psychiatric diagnosis increased from 11% in 1995 to 31% in 2015, the percent of residents receiving antidepressants increased from 20% in 1995 to 49% in 2015, and the need to assistance with activities of daily living has increased,

Teno, et. al. (JAMA 2017) reviewed Medicare Part B claims data and showed that the care of SNF patients has shifted from physicians to nurse practitioners and physician assistances and that those physicians, NPs, and PAs who provide SNF care are SNFists - i.e., providers who bill more than 90% of all their visits in the nursing home setting.

Werner (JAMA 2018) reviewed MEDPAR data and determined that the length of acute care hospital stay before discharge to a post-acute facility decreased from 9.0 days in 2000 to 7.3 days in 2015 and length of stay in the post-acute care facility increased from 21.7 days in 2000 to more than 25 days in 2014 and 2015.

McCarthy et. al. (JAMA 2020) reviewed the nationwide Minimum Data Set (MDS) to look at transfers from nursing homes to acute care hospitals. They found that the number of transfers decreased from 2011 to 2016, especially for patients with dementia, heart failure, and chronic obstructive pulmonary disease - without an increased mortality rate in nursing homes.

After reviewing these data, the expert panel concluded that due to changes in patient population, changes in specialty mix, and the reduced length of acute care hospital stay before discharge to a nursing home, that the compelling evidence criteria were met.

Survey Data Review

The panel reviewed 99310 which requires high level medical decision making or is based on the total time spent on the day of the encounter. There were 203 respondents of whom 86% found the vignette to be typical. The survey times and median work RVU were 10/45/15/70/3.00 and the 25th percentile work RVU was 2.80. The two key reference services were 99215, Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and high level of medical decision making. When using time for code selection, 40-54 minutes of total time is spent on the date of the encounter, with times and work RVU of 10/45/15/70/2.80, and 99291, Critical care, evaluation and management of the critically ill or critically injured patient; first 30-74 minutes, with times and work RVU of 15/40/15/70/4.5.

The expert panel noted that the current times and work RVU for 99310 are 15/35/20/70/2.35.

The expert panel noted that the survey intra time was 10 minutes longer than the current intra time even though the total time was the same. In addition, the survey times and 25th percentile RVU were identical to the times and work RVU for 99215 which was chosen as the key reference service by 147 of the 203 respondents. The survey times and 25th percentile work RVU also place 99310 in correct rank order with 99291 because while the times are similar, 99291 is much more intense service which is reflected by the work RVU for 99291 which is 60% higher then the recommended work RVU for 99310.

Therefore, the expert panel recommends for 99310, times and work RVU of 10/45/15/70/2.8.

Finally, the expert panel reviewed its recommendations for all the surveyed codes to determine whether the recommendations placed the codes in proper rank order with each other.

The panel reviewed the total times, intra times and work RVUs among the subsequent visit codes, among the initial visit codes, and between the discharge codes to determine if the ratios (i.e., percent) differences of those parameters were consistent. They were very consistent. The expert panel also reviewed these data for the comparable initial visit and subsequent visit codes (e.g., 99306 and 99310) to determine if the percent differences were consistent. They were very consistent. Similarly, the date between the two discharge codes were very consistent. The expert panel agreed that this analysis supported all the recommendations for time and work RVUs.

Code	Intra-time	Total Time	Work RVU
99304	25	36	1.6
99305	35	55	2.5
Ratio of 99305 to 99304	1.4	1.52	1.56
99305	35	55	2.5
99306	50	80	3.5
Ratio of 99306 to 99305	1.42	1.45	1.4
99307	12	14	0.70

99308	18	27	1.3
Ratio of 99308 to 99307	1.5	1.93	1.86
99308	18	27	1.3
99309	30	47	1.92
Ratio of 99309 to 99308	1.67	1.74	1.48
99309	30	47	1.92
99310	45	70	2.8
Ratio of 99310 to 99309	1.5	1.49	1.46
99304	25	36	1.6

99316	40	63	2.5
Ratio of 99316 to 99315	1.6	1.575	1.67

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. N/A

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 99310

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Nurse Practitioner	How often? Sometimes
Specialty Internal Medicine	How often? Sometimes
Specialty Family Medicine	How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 2142752
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National estimate was based on total Medicare volume and Medicaid volume plus an additional 10% estimated for other payors

Specialty Nurse Practitioner	Frequency 1075661	Percentage 50.19 %
Specialty Internal Medicine	Frequency 402837	Percentage 18.79 %
Specialty Family Medicine	Frequency 227132	Percentage 10.60 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 1,676,670 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimates are based on 2019 Medicare data from the RUC Database, plus 5% from deleted code 99318.

Specialty Nurse Practitioner	Frequency 841520	Percentage 50.18 %
Specialty Internal Medicine	Frequency 315046	Percentage 18.78 %
Specialty Family Medicine	Frequency 177727	Percentage 10.59 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Evaluation Management

BETOS Sub-classification:
Nursing home visit

BETOS Sub-classification Level II:
NA

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 99310

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

Keywords:
Quality
Nursing Home Reform Act
OBRA 1987
nursing home characteristics

A B S T R A C T

Objective: In 1987, the Omnibus Reconciliation Act (OBRA) called for a dramatic overhaul of the nursing home (NH) quality assurance system. This study examines trends in facility, resident, and quality characteristics since passage of that legislation.
Methods: We conducted univariate analyses of national data on US NHs from 3 sources: (1) the 1985 National Nursing Home Survey (NNHS), (2) the 1992-2015 Online Survey Certification and Reporting (OSCAR) Data, and (3) LTCfocUS data for 2000-2015. We examined changes in NH characteristics, resident composition, and quality.
Setting and participants: US NH facilities and residents between 1985 and 2015.
Results: The proportion of NHs that are Medicare and Medicaid certified, members of chains, and operating not-for-profit has increased over the past 30 years. There have also been reductions in occupancy and increases in the share of residents who are racial or ethnic minorities, admitted for post-acute care, in need of physical assistance with daily activities, primarily supported by Medicare, and diagnosed with a psychiatric condition such as schizophrenia. With regard to NH quality, direct care staffing levels have increased. The proportion of residents physically restrained has decreased dramatically, coupled with changes in inappropriate antipsychotic (chemical restraint) use.
Conclusions and implications: Together with changes in the long-term care market, the NHs of today look very different from NHs 30 years ago. The 30th anniversary of OBRA provides a unique opportunity to reflect, consider what we have learned, and think about the future of this and other sectors of long-term care.

For more than 30 years, the quality of nursing home (NH) care has been a continuous concern.[1] In 1984, following published reports and concerns about resident abuse, neglect, and a lack of regulation and oversight, Congress asked the Institute of Medicine (IOM) to investigate the quality of NHs and make recommendations for improvement. The resulting report proposed radical NH reforms,[2] many of which were codified by Congress as part of the Nursing Home Reform Act of the Omnibus Budget Reconciliation Act of 1987 (OBRA 1987).

OBRA 1987 created regulations for NHs in an effort to improve the quality of care delivered to residents. OBRA included a minimum set of care standards and rights for people residing in Medicare- and Medicaid-certified NHs. OBRA 1987 had a focus on residents' quality of life and care, expectations for improved or maintained resident health, as well as residents' rights to banking, organized family councils, and freedom from unnecessary physical and chemical restraints. The Act also standardized certification standards and enforcement strategies. As such, OBRA 1987 was an overhaul of the NH industry and marked a new beginning for NH care and regulation.

In the 30+ years since OBRA 1987, there have been a number of other changes that have directly affected the NH industry. In response

This work was supported by the National Institute on Aging (P01 AG027296); the Agency for Healthcare Research and Quality (4T32 HS000011); and the Veterans Affairs Health Services Research and Development Service (CDA 14-422).

to consumer preferences to remain in the community, "age-in-place," and efforts to rebalance states' long-term care budgets,[3–5] there has been a considerable increase in home- and community-based services (HCBS). HCBS were seen as mechanisms to divert or delay expensive, and often undesired, NH placement. Over the last several decades, states have begun funding more HCBS, primarily through Medicaid waiver programs; and, for the first time in 2013, states spent more on HCBS than care provided in NHs.[6] Accompanying these care delivery, market, and financing changes has been growth of an aging and diversifying population, as well as a number of laws and regulations directly impacting the NH industry (eg, the Balanced Budget Act of 1997 and the introduction of case-mix reimbursement).

The purpose of this study was to summarize changes in the NH industry in the 30 years since the seminal regulatory change affecting NHs. Specifically, we use historical data from 3 national sources and describe changes in NH facility characteristics, resident characteristics, and quality of care from 1985 through 2015. The 30th Anniversary of OBRA provides a unique opportunity to examine the changes within this vitally important industry. This article can aid in understanding long-term trends, as well as provide insight into what changes we might expect in the future.

Methods

Data

We analyzed data from 3 sources to examine resident and facility characteristics, longitudinally: (a) National Nursing Home Survey, (b) Online Survey Certification and Reporting Data/Certification and Survey Provider Enhanced Reporting, and (c) LTCFocUS data.

National Nursing Home Survey (NNHS)

The National Center for Health Statistics conducted the NNHS. The NNHS consists of a nationally representative sample of more than 1,000 NHs and their residents. NHs included in the surveys had at least 3 or more beds and were Medicare or Medicaid certified or had a state license to operate as an NH. The facilities and residents were selected by a stratified 2-stage probability design. In the first stage, NHs were selected, and in the second stage, residents were sampled from the selected NHs. NNHS data were used to describe facility and aggregated resident characteristics. Data for these analyses came from the University of Michigan ICPSR public use NNHS data files for 1985.[7]

Online Survey Certification and Reporting Data (OSCAR)/ Certification and Survey Provider Enhanced Reporting (CASPER)

CMS' OSCAR/CASPER database is a national database of all NH data elements collected by state survey agencies during the required annual onsite Medicare and Medicaid Certification inspection. The inspections occur at least once during a 15-month period. OSCAR/CASPER data are used to determine facility characteristics, deficiencies in care noted during the survey, and aggregated resident data. Data included all certified NHs between the years 1992 and 2015. Variables in OSCAR/CASPER have been validated for research purposes.[8]

Long-Term Care FocUS (LTCFocUS)

We used LTCFocUS.org, a product of the Shaping Long-Term Care in America Project at the Brown University Center for Gerontology and Healthcare Research and supported, in part, by the National Institute on Aging (www.ltcfocus.org). This data set included information for years 2000-2015 and combined variables from the OSCAR data; the Minimum Data Set (MDS), resident-level data related to resident clinical and functional status; the Area Resource File (ARF), a national county-level health resources database maintained by the Health Resources and Services Administration that contains data about the health professionals and facilities in each county; and the Residential History File, a data resource built using Medicare Enrollment data, Medicare claims data, and assessment data to track individuals as they move through the long-term care system.[9] For these analyses, we used the LTCFocUS data to describe the aggregated characteristics of residents served in NHs between 2000 and 2015.

Variables

We included the following facility characteristics to describe changes in the NH market over time: dual certification for Medicare and Medicaid, multifacility chain membership, for-profit status (vs nonprofit or government), presence of an Alzheimer's special care unit, facility size (ie, total number of beds), and occupancy rate.

To describe the resident composition, we included demographic characteristics, length of stay, admission source, physical function, mental health diagnoses, and medication use measures. Demographic variables from LTCfocUS included the percentage of female residents in each facility; the percentage of blacks, whites, and Hispanics in each facility; and the average age for residents residing in each facility. Also from the LTCfocUS, we included the percentage of long-stay residents, defined as the percentage of residents in the NH at least 90 of the last 100 days. We also include the percentage of residents admitted to the NH directly from the hospital vs the community or other LTC setting. From the OSCAR/CASPER, we included information about residents' primary payer as the percentage of residents whose primary support was Medicaid or Medicare. Measures of resident physical and cognitive function included the facility's average Activities of Daily Living (ADL) scale score, bed/chair bound measures, individual early-, middle-, and late-loss ADL, and the percentage of residents with dementia. The ADL scale score comes from LTCFocUS, ranges from 0 to 28, and is created by summing 7 ADL items on a scale from 0 to 4 (with 0 = complete independence and 4 = total dependence for each item). The facility average represents the average across all residents in the facility. Chairbound and bedbound measures come from the NNHS and OSCAR/CASPER data and refer to the percentage of residents unable to leave their chair or bed, respectively, at the time of the survey. The individual ADL of interest from the NNHS and OSCAR/CASPER data include dressing, bathing, transferring, toileting, and eating, and represent the percentage of residents who were not completely independent in each of these activities at the time of the survey. From the NNHS and OSCAR/CASPER data, we also included a measure for the percentage of residents with dementia within the facility. Measures of resident mental health and medication use included the percentage of residents with a psychiatric diagnosis (excluding dementia and depression), a schizophrenia diagnosis, receiving antianxiety medications, receiving antidepressants, and receiving antipsychotics.

Information on facility quality consisted of structure, process, and outcome measures.[10] As a measure of structure, we included the number of certified nursing aides, licensed professional nurses, and registered nurse hours per resident per day from the OSCAR/CASPER data. We obtained information about facilities' quality process measures including the percentage of residents in a facility who were physically restrained, received tube feeding, had a catheter, received antipsychotic medications without a diagnosis of schizophrenia or bipolar disorder at the time of the survey, and the percentage of facilities experiencing medication errors. Medication error refers to the percentage of facilities cited for drug error rates higher than 5% reported during the annual survey. Quality outcome measures included the percentage of residents within a facility with pressure ulcers, and the percentage of residents within a facility experiencing incontinence. Values for pressure ulcers indicate the percentage of residents during the annual survey with pressure sores. The incontinence measures indicate the percentage of residents with bladder or bowel incontinence at the time of the survey.

Table 1
Changes Over Time in Facility Characteristics (1985-2015)

Year	1985, Mean (CI)	1995, % or Mean (SD)	2005, % or Mean (SD)	2015, % or Mean (SD)
Number of nursing homes, n	19,068*	16,824	16,091	15,686
Percentage dual (Medicare + Medicaid) certified	33.3 (28.9, 37.8)	78.6	93.4	97.1
Percentage member of a chain		51.24	52.43	56.81
Percentage for-profit	75.0 (70.9, 79.1)	66.4	66.0	69.1
Percentage with Alzheimer's Unit		11.2	18.2	15.2
Average number of beds		100.84 (67.93)	104.97 (65.37)	106.13 (61.31)
Percentage with 3-49 beds	33.7 (26.8, 41.0)	18.8	14.9	12.9
Percentage with 50-99 beds	32.4 (28.0, 36.8)	36.0	36.3	37.1
Percentage with 100-199 beds	27.8 (24.2, 31.5)	38.5	42.2	44.0
Percentage with ≥200 beds	6.1 (5.1, 7.2)	6.8	6.5	6.0
Average occupancy rate		87.14 (16.41)	84.43 (15.14)	81.19 (15.79)

CI, confidence interval; SD, standard deviation.
*Weighted number of facilities.

Analyses

Univariate analyses of the above variables were completed using Stata, version 14 (StataCorp, College Station, TX). Data from the NNHS were weighted using the facility, bed, and current resident weights provided. OSCAR/CASPER and LTCFocUS data are available at the facility level. Facility-level variables are averaged for each study year. We do not include inferential statistics in this article because we are presenting data for the entire population of NHs in the United States for the majority of years.

Results

Facility Characteristics

In the past 30 years, the NH industry has decreased in size, from 19,068 facilities in 1985 to 15,686 in 2016 (Table 1). There has also been an increase in the percentage of facilities that are nonprofit (25% in 1985 and 31% in 2015) and that are dually certified by both Medicare and Medicaid (33% in 1985 and up to 97% 2015). Between 1995 and 2015, chain membership increased from 51% to 57%, the percentage of facilities with an Alzheimer's special care unit increased from 11% to 15%, and the overall NH occupancy rates declined from 87% to 81%.

Resident Composition

The population that NHs serve has changed over the last 30 years (Table 2). Data from the NNHS and LTCFocUS suggest that although the average age of residents has remained constant, the percentage of residents who are racial and ethnic minorities has increased from 7.8% in 1985 to 20.7% in 2015. The average percentage of females decreased from 72% of residents in 1985 to 67% in 2015. The prevalence of long-stay residents within NHs has remained stable at 69% of all residents over this time period. However, the percentage of residents admitted from the hospital increased from 67% in 2000 to 85% in 2015. There has also been a shift of payer types over time (Figure 1). Between 1992 and 2015, the average percentage of residents with Medicaid as a primary payer decreased from 64% to 58%, whereas the average percentage of residents with Medicare as the primary payer rose from 9% to 15%.

Resident physical and cognitive function has decreased over the years (Table 3). According to LTCFocUS data, the average ADL dependency score among NH residents increased slightly, from 15 to 17, between 2000 and 2015. According to NNHS and OSCAR/CASPER data, residents who required assistance in bathing increased from a national average of 89% in 1985 to an average facility average of 96% in 2015. The same trend is demonstrated by the increased share of residents who need assistance with the other ADL from 1985 to 2015: assistance with dressing rose from 74% to 92%, assistance with transferring from 60% to 85%, assistance with toileting from 49% to 88%, and assisting with eating increased from 38% to 56%. However, there was a decrease in the percentage of residents who were bed-bound from 6% in 1985 to 4% in 2015, whereas being chair bound rose from 39% to 64%. The percentage of residents with dementia increased from an average of 39% in 1995 to an average of 45% across the facilities in 2015.

The share of residents with psychiatric diagnoses has increased over the years, as has the use of psychotropic medications. According to the OSCAR/CASPER data, there was an almost 3-fold increase in the share of residents with a psychiatric diagnosis, from 11% in 1995 to 31% by 2015. Between 1985 and 2015, the average percentage of

residents with schizophrenia increased from 6% to 11%. The percentages of residents receiving antianxiety, antidepressant, and antipsychotic medications in 1995 were 15%, 20%, and 16%, respectively, and by 2015 increased to 23%, 49%, and 20%, respectively.

Quality of Care

The average direct care staffing hours have increased over time, with the greatest increases observed among CNAs (see Table 4). Overall, quality process measures have also improved since the passage of OBRA 1987. Notably, the average proportion of residents being physically restrained decreased dramatically from 19% to 1%, and the percentage of residents receiving antipsychotic medications inappropriately, as a chemical restraint, decreased from 16% in 2000 to 12% in 2015, although there was a peak of 22% in 2005. However, there was not much change in the proportion of facilities cited for medication errors over this time period.

Quality outcome measures also improved over time. The proportion of residents with pressure ulcers decreased from 8% to 6%. Lastly, congruent with increased need for assistance, bowel and bladder incontinence increased from 42% to 44% and 49% to 62%, respectively.

Discussion

Within this 30-year period, there were facility, resident, and quality of care changes that can be linked to regulations adopted through the OBRA 1987 and other policy shifts in the long-term care sector.

Certification

Over the last 30 years, we witnessed a change in NH certification. This change is consistent with the OBRA 1987 requirement for NHs to be certified and meet the federal participation requirements in order to receive Medicaid and Medicare payments.[11] Previously, Medicare-certified facilities had more stringent requirements, but seeing that the majority of government spending came from Medicaid, OBRA 1987 stipulated that all Medicaid-certified facilities met a set of standards that were similar to that of Medicare.[1] Additionally, noting Medicare's generous reimbursement for skilled care, many Medicaid-only NHs became dually certified in both Medicare and Medicaid.[12] These policy and financing incentives likely contributed to the increase in the proportion of facilities that were dually certified during this time period.

Changing Demand and Supply, and Lower Occupancy

Concurrent with shifting US demographics (eg, an aging and increasingly diverse population), NHs in the last 30 years have witnessed increases in the proportion of minorities and decreases in the proportion of white residents. Recognizing the aging population, the long-term care market began to appear more lucrative and attracted a greater number of investors to NH operations.[13] This is evidenced by the percentage of NHs that were owned and operated by a chain. Stevenson, Grabowski, and Coots (2006) posit that chain facilities increased because of the interplay of certificate of need laws and resulting acquisitions.

Despite the aging of the population, there was a decrease in the number of NHs and facility occupancy rates during this time period. This decrease in NH supply and occupancy is likely attributable to the rise of community options such as assisted living and other HCBS.[14,15] In 2000, Medicaid spent about 27% of its total Medicaid long-term services and supports expenditures on HCBS and 73% on institutional care; by 2016, 57% of the expenditures were for HCBS and 43% for NH care.[6] It can be difficult to quantify the increase in community-based services due to data challenges; however, the National Survey of Resident Care Facilities identified approximately 31,100 residential facilities in 2010 and researchers have suggested a continued growth in the market.[16–18] The growth of long-term care alternatives allows individuals to remain in their homes and communities longer, in many cases delaying NH placement or diverting it altogether.[19–23] These trends may also explain some of the reasons behind the increase in functional impairment among NH residents over this time period.

Another potential explanation for the increase in functional impairment witnessed over this 30-year period may be the increase in post-acute, rehabilitative care provided in NHs. Recognizing the profitability associated with providing Medicare-reimbursed services,[24] NHs began to accept more post-acute care patients, with a large number of NHs choosing to specialize in the care of post-acute patients.[12,25] This shift in the orientation of NHs over this time period, from providing typically long-term custodial care to post-acute, rehabilitative care, may contribute to the increase in resident acuity witnessed in this study. It is evident from our findings that there is an increased percentage of residents being admitted directly from the hospital, presumably for post-acute care, which may contribute to higher levels of functional impairment as residents may be leaving hospitals "quicker and sicker."[26,27]

Quality Improvement

Despite higher resident levels of need, NH quality appears to have improved over time. Our data show modest gains in quality indicators between 1995 and 2015. The literature around drivers of quality improvement in NHs is vast and includes mechanisms such as NH ownership, nurse staffing, public reporting, and quality improvement initiatives. The quality improvement that we witnessed during this time period could have been attributable to the increase in nonprofit NHs, which have consistently shown to have higher quality ratings.[13] Quality improvement could also be directly related to the increase in nursing hours witnessed over this time period. OBRA 1987 improved the standards for nursing hours, and we observed these increases over time. Although it is possible that the increase in nursing hours may be in direct response to increasing need among residents, prior research has concluded that increasing nursing hours improves patient outcomes.[28–30] It is also plausible that new inspection, survey, enforcement efforts, and public reporting prompted improvements in quality

measures.[1,31] Although it can be argued that NHs still have room to improve in their quality indicators, it is important to note that despite an increasingly vulnerable and higher need population, we still observe quality gains among NHs during this time period.

One of the direct effects of OBRA 1987 was a substantial decrease in the use of physical restraints. Physical restraints were initially used on residents with serious mental illness to manage behaviors, but began to be used more widely on residents with behavioral symptoms, including residents with dementia.[32] Prior research indicates that physical restraints are associated with worse outcomes for residents, such as increased depression, less social engagement among NH residents,[33–35] reduced muscle strength,[33] and pressure ulcers.[33,34,36] Parts of OBRA 1987 focused directly on the residents' rights to be free from all restraints. Unfortunately, decreases in physical restraints were coupled with initial increases in chemical restraint use, such as inappropriate antipsychotic use. Antipsychotic medications increase the risk of falls[37] and death.[38,39] In 2005, the FDA released a Black Box warning to decrease the use of antipsychotics among older adults.[40] This warning is consistent with the 2005 peak in antipsychotic use that is present in our data. In 2011, CMS launched a national partnership to further reduce inappropriate antipsychotic use, which has been largely successful.[41] With the increase in dementia residents and initiatives to improve dementia care in NHs, there was a simultaneous increase in Alzheimer's SCUs, with a peak in the percentage of facilities with an Alzheimer's SCU in 2005. Literature suggests that residents within facilities with SCUs have significantly more challenging behaviors and have increased risk for chemical restraint use.[42,43] The presence of these units may also account for the increased resident impairment.

It is also important to note the dramatic increase in residents with serious mental illnesses (SMI), as this could be a direct result of state psychiatric facilities closures in the 1960s and 1970s. The increase in the SMI population creates a new and increased burden for NHs and their staff that may negatively affect the quality of care that NHs are able to provide.[44,45]

Despite the success of several prompted voiding interventions,[46,47] we observed increases into the share of NH residents experiencing incontinence over the past 30 years, potentially reflective of the increasing needs of the NH population. Prompting toileting interventions can be labor intensive, and it is often more convenient to diaper a resident than toilet.[48] More work is needed in this important quality of life area.

Limitations

This work provides a high-level look at national trends in NH characteristics, resident composition, and quality measures. Data are averaged across all facilities for the available study years. We do not have access to annual data available between 1986 and 1994, and because of the facility-level nature of our data we are unable to summarize resident-level changes over time. For example, it would be interesting to examine changes in acuity, separately for long-stay vs short-stay residents, or changes in residents' lengths of stay. This would help us understand if the increase in acuity over time is due to an increased focus on post-acute care, or attributable to higher levels of acuity among long-term residents who may delay entry into NHs through home- and community-based alternatives. Future work in this area would be beneficial to understanding additional impacts of OBRA on the long-term care industry as a whole.

Conclusions and Implications

Overall, OBRA 1987 is positively associated with the quality of care improvements in NHs despite increasing impairment of NH residents. OBRA 1987 was also successful in implementing and enforcing the MDS resident assessment survey, and without that this research would not be possible. Because of the aging-in-place movement, we are seeing lower occupancy rates in NHs. Older adults without financial resources, disproportionality minority older adults, are becoming an increasing proportion of NH residents, as they may not be able to as readily access these care alternatives. Current and future policies should focus on expanding equitable access to the remaining long-term care services and supports in the continuum of care, particularly given the policies and initiatives focused on decreasing NH utilization through support of home and community based alternatives.[49] Although NHs continue to focus more on short-stay post-acute care residents and long-stay residents with dementia, more work will need to be done in community-based settings to ensure the highest quality care and life. Improving quality is also about improving equity, and it is important for future work to examine access to quality care for our most vulnerable older adults who are sometimes triply and doubly vulnerable because of their cognitive status, race, and/or socioeconomic position. As our work shows, much of the quality progress made in NHs has been because of regulation and oversight over the years. The same level of oversight does not exist for all community alternatives, but the evidence presented here is indicative of effective practices.

Future research is also needed to understand whether these improvements in quality over the past 30 years have been equitable on the basis of race, socioeconomic status, gender, and geography. In sum, our findings document the 30-year history of NHs since the passage of the seminal legislation: OBRA 1987. As we look toward the future of long-term care, it is important that we reflect on the past.

Hospital Transfer Rates Among US Nursing Home Residents With Advanced Illness Before and After Initiatives to Reduce Hospitalizations

Ellen P. McCarthy, PhD, MPH; Jessica A. Ogarek, MS; Lacey Loomer, MSPH; Pedro L. Gozalo, MSc, PhD; Vincent Mor, PhD; Mary Beth Hamel, MD, MPH; Susan L. Mitchell, MD, MPH

IMPORTANCE Hospital transfers among nursing home residents in the United States who have been diagnosed with advanced illnesses and have limited life expectancy are often burdensome, costly, and of little clinical benefit. National initiatives, introduced since 2012, have focused on reducing such hospitalizations, but little is known about the consequences of these initiatives in this population.

OBJECTIVE To investigate the change in hospital transfer rates among nursing home residents with advanced illnesses, such as dementia, congestive heart failure (CHF), and chronic obstructive pulmonary disease (COPD), from 2011 to 2017—before and after the introduction of national initiatives to reduce hospitalizations.

DESIGN, SETTING, AND PARTICIPANTS In this cross-sectional study, nationwide Minimum Data Set (MDS) assessments from January 1, 2011, to December 31, 2016 (with the follow-up for transfer rates until December 31, 2017), were used to identify annual inception cohorts of long-stay (>100 days) nursing home residents who had recently progressed to the advanced stages of dementia, CHF, or COPD. The data were analyzed from October 24, 2018, to October 3, 2019.

MAIN OUTCOMES AND MEASURES The number of hospital transfers (hospitalizations, observation stays, and emergency department visits) per person-year alive was calculated from the MDS assessment from the date when residents first met the criteria for advanced illness up to 12 months afterward using Medicare claims from 2011 to 2017. Transfer rates for all causes, potentially avoidable conditions (sepsis, pneumonia, dehydration, urinary tract infections, CHF, and COPD), and serious bone fractures (pelvis, hip, wrist, ankle, and long bones of arms or legs) were investigated. Hospice enrollment and mortality were also ascertained.

RESULTS The proportions of residents in the 2011 and 2016 cohorts who underwent any hospital transfer were 56.1% and 45.4% of those with advanced dementia, 77.6% and 69.5% of those with CHF, and 76.2% and 67.2% of those with COPD. The mean (SD) number of transfers per person-year alive for potentially avoidable conditions was higher in the 2011 cohort vs 2016 cohort: advanced dementia, 2.4 (14.0) vs 1.6 (11.2) (adjusted risk ratio [aRR], 0.73; 95% CI, 0.65-0.81); CHF, 8.5 (32.0) vs 6.7 (26.8) (aRR, 0.72; 95% CI, 0.65-0.81); and COPD, 7.8 (30.9) vs 5.5 (24.8) (aRR, 0.64; 95% CI, 0.57-0.72). Transfers for bone fractures remained unchanged, and mortality did not increase. Hospice enrollment was low across all illness groups and years (range, 23%-30%).

CONCLUSIONS AND RELEVANCE The findings of this study suggest that concurrent with new initiatives aimed at reducing hospitalizations, hospital transfers declined between 2011 and 2017 among nursing home residents with advanced illnesses without increased mortality rates. Opportunities remain to further reduce unnecessary hospital transfers in this population and improve goal-directed care for those residents who opt to forgo hospitalization.

A central objective of the Patient Protection and Affordable Care Act (ACA) of 2010 was to transform health care by ensuring that patients receive high-value, effective care.[1] Toward this objective, there has been particular focus on reducing potentially avoidable hospital transfers from the long-term care setting. The opportunity and need to reduce avoidable hospitalizations are greatest among people with advanced chronic illnesses[2] for whom the burdens of hospitalization often outweigh the benefits.[3-5] Little is currently known about how hospital transfer rates have changed among this population since broad initiatives were introduced.

Approximately 50% of nursing home residents experience 1 or more hospitalization in their last year of life.[6] At least half of these hospitalizations are estimated to be potentially avoidable because the acute condition could be managed effectively in the nursing home or the hospital-level care is not aligned with patient preferences.[7-11] Decisions regarding hospital transfers should be guided by the primary goal of care (eg, prolongation of life vs comfort), which is comfort for most nursing home residents with advanced illness.[12-15] With rare exceptions (eg, serious bone fractures), hospitalization seldom promotes the goal of comfort.

Since 2012, several new approaches have emerged from the ACA to try to reduce hospital transfers of nursing home residents. Care models that enhance the nursing home's on-site capability to manage specific targeted conditions (sepsis, pneumonia, urinary tract infections, dehydration, congestive heart failure [CHF], and chronic obstructive pulmonary disease [COPD]) have shown promise through the quality initiative program of the Centers for Medicare & Medicaid Services (CMS) to reduce avoidable hospitalizations.[9,10] Evaluation of the initiative's first phase in 7 states demonstrated estimated net reductions in 2015 of 2.2% to 9.3% in the probability of an all-cause hospitalization and 1.4% to 7.2% in the probability of a potentially avoidable hospitalization for participating residents compared with comparison groups.[1] Alternative payment models, such as accountable care organizations and bundled payments, also create financial incentives for nursing homes to reduce hospital transfers.[16] The Hospital Readmissions Reduction Program (HRRP) implemented financial penalties for hospitals with excess readmissions for target conditions including pneumonia, CHF, and COPD.[17,18] These concurrent initiatives raised national awareness and forged collaborations around transitional care to avoid unnecessary hospitalizations.[19] The consequences of such initiatives on hospital transfer rates, specifically among residents with advanced illnesses, have not been reported, to our knowledge.

The present study used Minimum Data Set (MDS) assessments linked to Medicare data to examine the national trends of hospital transfer rates from 2011 to 2017 among long-stay, fee-for-service nursing home residents with advanced dementia, CHF, or COPD. We specifically examined transfers for conditions that were deemed to be potentially avoidable and were the target of recent policy initiatives. For comparison, we also examined hospital transfer rates for serious bone fractures, which we hypothesized would be less affected by such initiatives. Finally, we assessed mortality and hospice enrollment rates.

Key Points

Question How did the hospital transfer rates change between 2011 and 2017 among nursing home residents diagnosed with advanced illness and limited life expectancy before and after the introduction of national initiatives to reduce hospitalizations?

Findings In this US nationwide cross-sectional study of 6 cohorts of nursing home residents with advanced illness, such as dementia, congestive heart failure, and chronic obstructive pulmonary disease, although hospital transfers for all causes and for potentially avoidable conditions were common, such transfers were found to have declined considerably from 2011 to 2017, and concurrent hospice use was low across all cohorts.

Meaning The findings of this study suggest that hospital transfer rates among nursing home residents with advanced illness declined from 2011 to 2017 and that opportunities remain to reduce unnecessary hospital transfers among residents with advanced illness.

Methods

Advanced Illness Cohorts

In this cross-sectional study, the MDS version 3.0 assessments[20] from federally licensed nursing homes in the United States were used from January 1, 2011, to December 31, 2016, to construct annual inception cohorts of long-stay residents (ie, >100 days) aged 65 years or older who were diagnosed with advanced dementia, CHF, or COPD. The MDS version 3.0 is a standardized, comprehensive assessment conducted on all nursing home residents at admission and at routine intervals (eg, quarterly) and was implemented in 2011.[20] Key differences between MDS 3.0 and MDS 2.0 precluded us from using MDS before 2011.[21] To construct these cohorts, we identified residents from the first MDS assessment at which they met the full criteria for advanced dementia, CHF, or COPD (hereafter, baseline assessment) in each calendar year. Residents may have had the illness, such as CHF, on a prior MDS assessment but were not included in the cohort until they first met the criteria for advanced disease, as described below. Residents had to be continuously enrolled in the Medicare Parts A and B fee-for-service program for up to 12 months after their baseline assessment and could belong to more than 1 advanced illness group. Residents enrolled in hospice at the baseline assessment were excluded. The institutional review board at Brown University approved this study under expedited review and waived informed consent under 45 CFR 46.116.

We defined advanced dementia, CHF, and COPD using criteria adapted from previous studies[5,22,23] using MDS to approximate hospice eligibility criteria, thus implying limited life expectancy. Advanced dementia criteria included the following: diagnosis of Alzheimer disease or other dementia, advanced cognitive impairment as defined by a score of 3 (moderate impairment) or 4 (severe impairment) on the Cognitive Function Scale,[24] and extensive or total assistance needed for eating and transferring. Advanced CHF was defined as follows: CHF diagnosis, shortness of breath while sitting or supine, and extensive or total assistance needed for transferring. Advanced COPD was

defined as follows: diagnosis of COPD (including emphysema and asthma), shortness of breath while sitting or supine, and extensive or total assistance needed for transferring.

Covariates

Age, sex, nonwhite race, dual-eligible status indicating beneficiaries qualifying for both Medicare and Medicaid, MDS 3.0 mortality risk score (MRS3),[25] and cohort year were ascertained from the baseline MDS assessment. The MRS3 (0-39) is a validated risk score based on demographic, clinical, and functional characteristics, with higher values indicating greater 30- and 60-day mortality risk. An MRS3 score of 8 or higher is associated with a 5.4 times increased odds of 30-day mortality compared with scores lower than 8.[25]

Outcomes

Residents were followed for up to 12 months from their baseline MDS assessment using Medicare claims from January 1, 2011, to December 31, 2017, to ascertain the occurrence of hospital transfers for all causes, potentially avoidable conditions, and serious bone fractures. Thus, person-time and outcomes spanned 2 calendar years (eg, for the 2016 cohort, outcomes were assessed in both 2016 and 2017). Hospital transfers included acute hospitalizations, observation stays, and emergency department (ED) visits. Hospitalizations were identified from the Medicare Provider Analysis and Review file.[26] Observation stays were defined as any outpatient facility claim for observation services using Healthcare Common Procedure Codes G0378-G0379,[27] *Current Procedural Terminology* codes 99217-99220,[28] or hospital outpatient revenue center code 0762. Emergency department visits were ascertained using outpatient facility claims with revenue center codes 0450-0459 or 0981, Healthcare Common Procedure Codes G0380-G0385, or carrier claims for ED services using *Current Procedural Terminology* codes 99281-99285. Observation stays that became admissions were considered to be hospitalizations. Emergency department visits that became hospitalizations or observation stays were classified accordingly.

Potentially avoidable transfers were identified using ambulatory care-sensitive conditions,[7-11] including sepsis, pneumonia, dehydration, urinary tract infections, heart failure, and COPD (including emphysema and asthma) (eTable 1 in the Supplement). These conditions account for 78% of the potentially avoidable hospitalizations among nursing home residents.[9] Serious bone fractures were examined as counterfactual conditions that usually result in hospital transfers regardless of existing policies and included fractures of the pelvis, hip, long bones of arms (humerus, ulna, and radius) and legs (femur, tibia, and fibula), wrists, and ankles (eTable 1 in the Supplement). We classified hospital transfers for these conditions using the claim's principal diagnosis. Mortality and hospice enrollment within 12 months after the baseline assessment were identified from the Medicare Master Beneficiary Summary File[29] and the 2011 to 2017 hospice claims, respectively.

Statistical Analysis

The data were analyzed from October 24, 2018, to October 3, 2019. Descriptive analyses were performed for resident characteristics and outcomes using means with SDs for continuous variables and proportions for categorical variables. Descriptive results were generated for each advanced illness group stratified by cohort year. Hospital transfers were further described by type (hospitalizations, observation stays, and ED visits) and by condition (all causes, potentially avoidable, and serious bone fractures). The proportion of potentially avoidable transfers attributable to specific diagnoses (eg, sepsis, pneumonia) were also calculated and presented graphically. Outliers defined as residents with all-cause hospital transfer rates exceeding 365 transfers per person-year alive across 12 months were removed (<1% of residents across all cohorts combined). Hospital transfer outcomes across 12 months were measured as the proportion of residents who experienced at least 1 transfer and the number of transfers per person-year alive. Mortality and hospice enrollment outcomes across 12 months were measured as the proportion of residents who experienced the event and the time to event. For all models, the main independent variable was the cohort year, with 2011 as the referent category. All models were adjusted for age, sex, nonwhite race, and MRS3 score. All models were fitted using generalized estimating equations to account for clustering within nursing homes and included an offset for log-transformed person-time.

Binary outcomes (any hospital transfers, hospice enrollment, and mortality) were analyzed using log-linked binomial models to estimate relative risk with cohort year. Zero-inflated Poisson regression models were used to analyze outcomes measured as number of transfers per person-year alive to allow for overdispersion owing to the high proportion of residents without a hospital transfer.[30] Adjusted risk ratios (aRRs) and 95% CIs were generated for these analyses. Finally, Cox proportional hazards regression models were used to analyze time-to-event outcomes (hospice enrollment, mortality) across 12 months of follow-up. In the hospice model, death without hospice was considered to be a competing risk. Adjusted hazard ratios and 95% CIs were estimated from these analyses. Analyses were performed using SAS, version 9.4 (SAS Institute Inc).

Results

Table 1 gives the characteristics of the nursing home residents by cohort year and advanced illness group. The 2011 cohort sizes were smaller for all illness groups compared with those of other years because residents had to be in the nursing home for at least 100 days and MDS data before 2011 were not used. Nonetheless, the overall distributions of age and sex were similar across cohort years within illness groups. Residents with advanced CHF (10.1-10.9) and COPD (9.0-9.6) generally had higher MRS3 scores (higher mortality risk) compared with residents with advanced dementia (7.5-8.4). All cohorts were predominately female, white, and dually eligible for Medicare and Medicaid.

Table 2 provides hospital transfer outcomes. All-cause hospital transfers were common in all illness groups across all years and were consistently lower for residents with advanced dementia compared with other groups. The most pronounced reduction in transfers occurred from the 2011 to 2012 cohort and

Abbreviations: MDS, Minimum Data Set; MRS3, MDS 3.0 mortality risk score.

[a] Cohort year refers to the calendar year of the inception cohort constructed for each advanced illness using MDS 3.0 assessments from 2011 to 2016.

[b] Cohort sizes from 2011 were smaller compared with those of other years because residents had to be in the nursing home for at least 100 days and MDS data before 2011 were not used.

[c] Beneficiaries who qualify for both Medicare and Medicaid benefits.

[d] MDS 3.0 mortality risk score, range 0-39; higher scores indicate higher risk of mortality.

then from the 2012 to 2013 cohort. Data showed no further reduction after 2013 and higher rates in 2016 than in 2015, particularly in the CHF and COPD cohorts. The adjusted proportions of residents who had at least 1 hospital transfer for any cause in the 2011 and 2016 cohorts were 56.1% and 45.4% for those with advanced dementia, 77.6% and 69.5% for those with CHF, and 76.2% and 67.2% for those with COPD. The mean (SD) number of hospital transfers per person-year alive for any cause was higher in the 2011 vs 2016 cohorts for nursing home residents with advanced dementia, 5.8 (22.7) vs 3.9 (17.9); CHF, 16.8 (43.9) vs 13.5 (38.9); and COPD, 15.6 (42.4) vs 11.2 (35.8). For each illness, the decrease in transfer rates between the 2011 and 2016 cohorts remained significant (advanced dementia [aRR, 0.72; 95% CI, 0.67-0.78]; CHF [aRR, 0.74; 95% CI, 0.68-0.80]; and COPD [aRR, 0.66; 95% CI, 0.61-0.72]) after adjustment for baseline characteristics. As demonstrated in **Figure 1**, reductions in hospital transfer rates over time were almost entirely attributable to declines in acute hospitalizations in each illness group.

Transfers for potentially avoidable conditions were common and decreased over time in each illness group in patterns similar to those of transfers for all causes (Table 2). The adjusted proportions of residents having at least 1 hospital transfer for a potentially avoidable condition in the 2011 and 2016 cohorts, respectively, were 26.5% and 20.4% for those with advanced dementia; 50.0% and 42.9% for those with CHF; and 49.2% and 40.7% for those with COPD. The mean (SD) number of hospital transfers per person-year alive for potentially avoidable conditions for the 2011 vs 2016 cohorts were 2.4 (14.0) vs 1.6 (11.2) (aRR, 0.73; 95% CI, 0.65-0.81) for those with advanced dementia; 8.5 (32.0) vs 6.7 (26.8) (aRR, 0.72; 95% CI, 0.65-0.81) for those with CHF; and 7.8 (30.9) vs 5.5 (24.8) (aRR, 0.64; 95% CI, 0.57-0.72) for those with COPD. Sepsis was the most frequent condition attributed to potentially avoidable transfers in all cohort years for all groups (**Figure 2**). The next most frequent conditions documented for potentially avoidable transfers were pneumonia and urinary tract infections for advanced dementia and CHF and pneumonia for both advanced CHF and COPD.

Hospital transfers for a primary diagnosis of serious bone fractures were relatively uncommon and, as hypothesized, remained unchanged for all advanced illness groups across all years (Table 2). **Table 3** gives the mortality and hospice enrollment outcomes. Hospice enrollment was low across all illness groups and years (range, 23%-30%). Mortality within 1 year exceeded 50% for all advanced illness groups across all years but did not increase over time in any illness group. Hospice use

Table 2. Hospital Transfer Outcomes Across 12 Months Among Nursing Home Residents With Advanced Illness by Cohort Year[a]

Abbreviations: COPD, chronic obstructive pulmonary disease; MDS, Minimum Data Set; MRS3, MDS 3.0 mortality risk score; RR, relative risk.

[a] Cohort year refers to the calendar year of the inception cohort constructed for each advanced illness using MDS assessments from 2011 to 2016. Medicare data from 2011 to 2017 were used to identify transfers occurring within 12 months of meeting the criteria for advanced illness for each cohort. Thus, person-time and transfers were assessed for up to 12 months and spanned 2 calendar years (eg, for the 2016 cohort, transfers were assessed in both 2016 and 2017).

[b] All models were adjusted for age, sex, nonwhite race, and MRS3 and included an offset for log(person-time).

[c] Transfers for primary diagnosis of sepsis, pneumonia, dehydration, urinary tract infections, heart failure, and COPD or asthma.

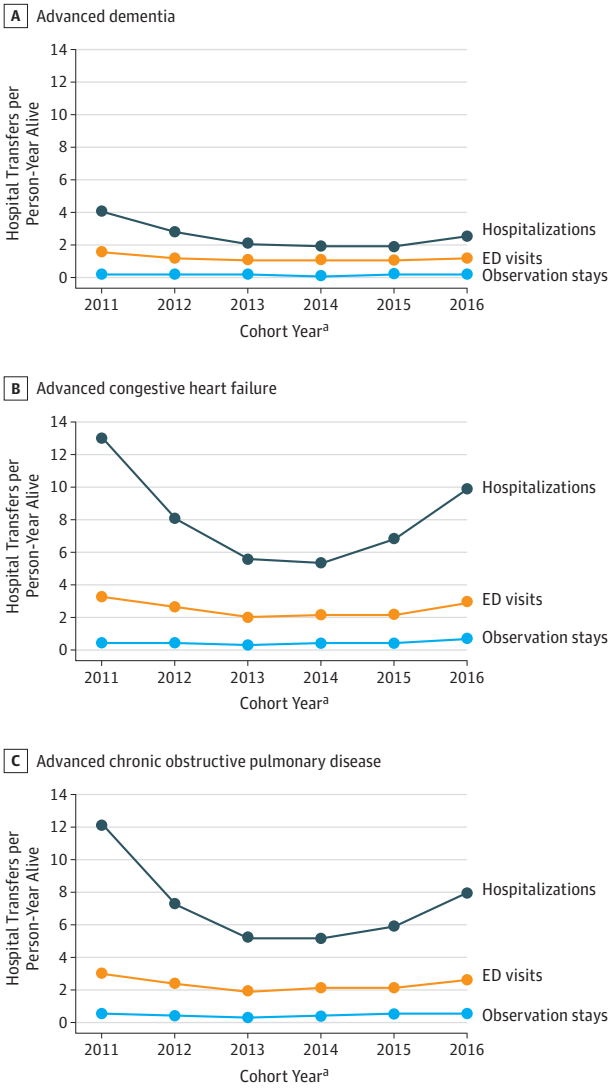
[d] Fractures of pelvis, hip, wrist, ankle, and long bone fractures of arms (humerus, ulna, and radius) and legs (femur, tibia, and fibula).

was low for all illnesses across all years but increased slightly for the 2016 cohort of residents with advanced dementia.

Discussion

We examined changes in national hospital transfer rates among long-stay nursing home residents with advanced dementia, CHF, and COPD from 2011 to 2017, a period during which national initiatives were introduced to reduce hospital transfers across care settings, including the long-term care setting. Transfers for all causes and potentially avoidable conditions declined for each advanced illness group during these years without adversely affecting mortality. This decline was almost entirely attributable to a reduction in hospitalizations rather than in observation stays or ED visits. In contrast, transfer rates for serious bone fractures, which are less likely to be associated with policy changes, remained stable. Sepsis and pneumonia were common reasons for potentially avoidable hospital transfers across all groups. Although the hospital transfer rates for all causes and potentially avoidable conditions declined, they remained common. In the 2016 cohorts, 45% of the residents with advanced

Figure 1. Transfer Rates for Hospitalizations, Emergency Department (ED) Visits, and Observation Stays for Illness Groups by Cohort Year



[a] Cohort year refers to the calendar year of the inception cohort constructed for each advanced illness using Minimum Data Set assessments from 2011 to 2016. Medicare data from 2011 to 2017 were used to identify transfers occurring within 12 months of meeting the criteria for advanced illness for each cohort. Thus, person-time and transfers were assessed for up to 12 months and spanned 2 calendar years (eg, for the 2016 cohort, transfers were assessed in both 2016 and 2017).

dementia and roughly two-thirds of those with advanced CHF and COPD experienced at least 1 transfer despite the greater than 50% mortality rate across all groups. These observations, coupled with low hospice enrollment throughout all years, suggest that opportunities remain to further reduce hospital transfers and improve end-of-life care for nursing home residents with advanced illnesses.

Although several studies describe changes in hospitalization rates in the United States in 2014 and 2015,[17,18,31-33] the present study focused on long-term care residents with advanced illness. The issue is particularly pertinent for this population because hospital transfers can be especially burdensome, of little clinical benefit, and distressing for family members.[3-5,34] Treatment decisions should be guided by patient preferences. Thus, if the decline in transfer rates observed in this study reflect, in part, decisions to avoid hospitalizations in favor of comfort-focused care, then such care should be available in the nursing home. High-quality palliative care is currently lacking in many US nursing homes.[35-37] Palliative care and hospice improve the quality of end-of-life care among nursing home residents, including reducing hospitalization rates.[32,36-39] Although we could not ascertain whether residents received palliative care outside the Medicare Hospice Benefit, we observed low rates of hospice enrollment and no concurrent uptake of hospice as hospital transfer rates declined. Given the increased scrutiny and federal audits of nursing homes with long hospice stays, the present study suggests that most residents with advanced dementia, CHF, and COPD are not receiving hospice care near the end of life.

Potentially avoidable hospital transfers among dual-eligible beneficiaries are key quality measures in long-term care and cost Medicare an estimated $2.6 billion annually.[9,40] Infections accounted for most potentially avoidable hospital transfers across advanced illness groups. Among residents with advanced CHF and COPD, exacerbations of these underlying conditions were also common reasons for transfers. Consequently, advance care planning among providers, residents, and family members presents a critical opportunity for informed decision-making about wishes for future hospitalizations in anticipation of expected clinical complications, and online resources are available to help guide these discussions.[41] Proxies of residents with advanced dementia should understand that recurrent infections are a hallmark of the end stage of the disease. Among residents with advanced illness for whom curative care remains aligned with their preferences, infections and cardiopulmonary decompensations can often be managed in the nursing home.[3,42-45] Of note, mortality did not increase across the cohort years in any group despite the decline in hospital transfers.

Programmatic initiatives, such as Interventions to Reduce Acute Care Transfers (INTERACT),[46] have been adopted widely to avoid unnecessary hospitalizations by improving the nursing home's capacity to provide on-site evaluation and management of acute changes through early recognition, monitoring, and staff training. Although a recent cluster randomized clinical trial of INTERACT demonstrated no effect on hospitalizations or ED visits, the trial highlighted the complexities of implementing and sustaining such interventions in nursing homes.[16]

This study's findings are consistent with those of studies documenting prominent declines in hospitalization and readmission rates between 2010 and 2012 after the enactment of the ACA and announcement of the HRRP, a Medicare value-based purchasing program that financially penalizes hospitals with excess readmissions for specific conditions.[17,18,47-49] Health care systems may have made systemic preparations in anticipation of the HRRP penalty phase in October 2012. Our findings also support the possible spillover effect of HRRP onto nonspecific conditions.[17,18,47,48,50] Consistent with other studies, we

[a] Cohort year refers to the calendar year of the inception cohort constructed for each advanced illness using Minimum Data Set assessments from 2011 to 2016. Medicare data from 2011 to 2017 were used to identify transfers occurring within 12 months of meeting the criteria for advanced illness for each cohort. Thus, person-time and transfers were assessed for up to 12 months and spanned 2 calendar years (eg, for the 2016 cohort, transfers were assessed in both 2016 and 2017).

observed a leveling off of hospital transfer rates during 2014 to 2016.[17,18,47,48] Chhabra and colleagues[48] suggest that this pattern may reflect a floor effect—a point at which achieving additional reductions in rates becomes more difficult. Regression to the mean may also partly explain the marked decline observed in transfer rates compared with those in 2011.[33]

Several factors acting in parallel may contribute to the observed declines in potentially avoidable transfers. Increased attention and quality and performance improvement initiatives have targeted unnecessary hospital transfers. Recent studies demonstrate reductions in hospital readmissions for potentially avoidable conditions after implementation of the HRRP.[17,18] Although nursing homes were not subject to financial penalties under HRRP, many nursing homes across the United States adopted quality improvement programs, such as INTERACT, in anticipation of CMS quality assurance and performance improvement regulations.[46] In addition, nursing homes included in accountable care organizations or other preferred referral

[a] Cohort year refers to the calendar year of the inception cohort constructed for each advanced illness using MDS assessments from 2011 to 2016. Medicare data from 2011 to 2017 were used to identify outcomes occurring within 12 months of meeting the criteria for advanced illness for each cohort. Thus, person-time and outcomes were assessed for up to 12 months and spanned 2 calendar years (eg, for the 2016 cohort, outcomes were assessed in both 2016 and 2017).

[b] Adjusted for age, sex, nonwhite race, and MRS3 and offset for person-time.

[c] Adjusted for age, sex, nonwhite race, and MRS3. Mortality: HR <1.00 indicates lower rate of death relative to rate in 2011.

[d] Adjusted for age, sex, nonwhite race, and MRS3. Death was considered a competing risk. Hospice: HR <1.00 indicates lower rate of hospice enrollment relative to rate in 2011.

networks were further incentivized to reduce hospitalizations to remain in network.[16] The CMS is conducting demonstration projects to examine payment models that include value-based purchasing incentives as part of the initiative to reduce avoidable hospitalizations among nursing home residents.[10] The Skilled Nursing Facility (SNF) value-based purchasing program took effect in October 2018 to extend penalties for excess readmissions to SNFs; preliminary data suggest that 73% of SNFs face financial penalties after failing to achieve benchmarks.[51]

Previous research in long-term care settings has focused almost exclusively on potentially avoidable hospitalizations. The present study extends prior work to include all potentially avoidable hospital transfers, including ED visits and observation stays. We found that declines in all-cause hospital transfer rates were almost exclusively associated with reductions in acute hospitalizations, and the rates of observation stays remained low between 2011 and 2017. Thus, concerns that hospitals may shift admissions to observation stay status to avoid HRRP penalties[18] appear to be unfounded in this population. In addition, rates of decline were similar for all-cause and potentially avoidable transfers, suggesting that broader efforts are being made to reduce hospital transfers or that there is a spillover effect from the focus on potentially avoidable conditions. Although we observed reductions in potentially avoidable hospital transfers, several thousand nursing home residents with advanced illness continue to be transferred to hospitals near the end of life. We estimated 708 096 transfers for all-cause transfers across the 3 advanced illness cohorts from 2011 to 2017, of which 259 339 (36.8%) were potentially avoidable. Moreover, despite the initial reduction in potentially avoidable transfers from 39.1% in 2011 to 35.1% in 2013, the rate appears to have rebounded to 37.7% by 2016 (eTable 2 and eFigure in the Supplement).

Limitations

This study has limitations. The application of claims-based measures of potentially avoidable conditions to nursing home populations remains controversial because they do not capture the complex health status of frail, older nursing home residents with multimorbid conditions or the specific challenges of managing acute illnesses in this population and setting.[7,45] Moreover, insurance claims and MDS 3.0

assessments do not fully capture the circumstances leading to decisions for hospital transfer, including advance directives. Important drivers of decisions to transfer are associated with decisional processes and organizational factors, including communication, family preferences, and nursing home resources.[52-56] Furthermore, the principal diagnoses listed on hospital claims are assigned at discharge as the diagnosis that was chiefly responsible for the admission, whereas the diagnosis assigned to an ED visit or observation stay is based on more limited information.[57] However, we focused on long-term care residents with advanced illness for whom care decisions should align with values and goals of care and for whom the harms associated with hospital transfers usually outweigh possible benefits.[3-5]

Conclusions

Hospital transfer rates for all causes and for potentially avoidable causes declined in 2017 compared with 2011 for long-stay nursing home residents with advanced dementia, CHF, or COPD, with no increase in mortality. Reductions in potentially avoidable transfers are encouraging, yet many residents still experienced multiple transfers for infections and CHF or COPD exacerbations. These findings indicate important opportunities to improve care of nursing home residents with advanced illness through improvements in advance care planning, acute care management, and the delivery of high-quality palliative care.

RESEARCH LETTER

Temporal Trends in the Numbers of Skilled Nursing Facility Specialists From 2007 Through 2014

Residents of nursing homes (NHs) comprise a medically complex and vulnerable population with many persons experiencing multiple comorbid conditions, frailty, and advanced dementia. Health care professionals such as physicians, nurse practitioners (NPs), and physician assistants (PAs) play an important role in managing their care. An Office of Inspector General Report[1] noted that specialization of health care professionals in NH care could potentially improve care through increased presence of health care professionals in NHs, enhanced knowledge in the care of patients with medically complex conditions, and better understanding of the regulatory environment. On the contrary, specialization in 1 setting of care could result in increased fragmentation of care, giving rise to concerns about medical errors and lack of care coordination. Little empirical research is available about the number of clinicians who primarily practice in NHs or the proportion of NH care delivered by these clinicians.[2] Using national Medicare Part B claims from 2007, 2010, and 2014, we characterized temporal trends in the number of physicians, NPs, and PAs concentrating their practice in the NH or skilled nursing facility (SNF) setting (ie, SNFists), the fraction of all NH and SNF claims generated by SNFists, and state variation in this phenomenon in 2014.

Editor's Note

Methods | The Medicare Part B Carrier File includes Evaluation and Management codes based on common sites of service: the nursing home, outpatient office, hospital, emergency department, a patient's home, and assisted living, custodial care facilities. Using Evaluation and Management codes from 20% of all Medicare Part B Carrier file claims from 2007, 2010, and 2014, we identified all physicians, NPs, and PAs who billed more than 90% of all their visits in the NH setting. The 90% threshold is consistent with a prior study of hospitalist care in the United States[3]; in a sensitivity analysis, we relaxed this threshold to 50%. Temporal trend comparisons for 2007, 2010, and 2014 were performed using variance-weighted least squares. We further characterized, in each state, the fraction of all outpatient visits in NHs that were accounted for by SNFists. An institutional review board waiver was obtained from Brown University.

Results | Between 2007 and 2014, the proportion of physicians ever billing in an NH decreased from 13.7% to 9.8% (test of trend, $P < .001$) while the number of physicians classified as SNFists increased by 48.2% (1496 vs 2225), increasing from 0.34% to 0.49% of all physicians (**Table**). The number of NPs or PAs classified as SNFists nearly doubled (1678 vs 3074). The proportion of NPs and PAs classified as SNFists remained stable because of increasing numbers of these clinicians. The proportion of all Evaluation and Management bills for care in an NH or SNF submitted by clinicians classified as SNFists increased from 11.6% to 14.3% among physicians (test of trend, $P < .001$) and from 10.4% to 17.2% among NPs and PAs (test of trend, $P < .001$). Between 2007 and 2014, the proportion of total SNF billing accounted for by SNFist clinicians increased from 22.0% to 31.5% (test of trend, $P < .001$). The SNFists' proportion of total NH billing varied by state, amounting to nearly 50% in Delaware, Hawaii, Tennessee, Connecticut, and Massachusetts. In a sensitivity analysis using a threshold of more than 50% of visits in the SNF, the number of physician SNFists increased from 2551 to 3529 and the number of NP or PA SNFists increased from 3267 to 5477.

Table. Physician, Nurse Practitioner, and Physician Assistant Billing in 2007, 2010, and 2014

Billing Category	2007	2010	2014
Physicians, No.	435 943	419 299	459 895
Ever billing in an SNF,[a] No. (%)	59 724 (13.7)	50 814 (12.1)	45 070 (9.8)
Billing ≥90% in an SNF,[a] No. (%)	1496 (0.34)	1697 (0.40)	2225 (0.49)
Nurse practitioners or physician assistants, No.	64 393	80 029	131 986
Ever billing in an SNF,[b] No. (%)	7528 (11.7)	8309 (10.4)	12 470 (9.5)
Billing ≥90% in an SNF,[b] No. (%)	1678 (2.6)	2031 (2.5)	3074 (2.3)
Evaluation and management code bills at SNF, No.	4 731 367	4 538 967	5 205 865
By physician billing ≥90% in an SNF,[c] No. (%)	550 425 (11.6)	584 952 (12.9)	747 106 (14.3)
By nurse practitioner or physician assistant billing ≥90% in an SNF,[c] No. (%)	49 145 (10.4)	581 235 (12.8)	895 830 (17.2)

Abbreviation: SNF, skilled nursing facility.

[a] For the physicians ever billing in an SNF or physicians billing 90% or more in an SNF, the denominator is physicians billing Medicare in that year.

[b] For nurse practitioner or physician assistant billing, the denominator is nurse practitioners or physician assistants billing Medicare in that year.

[c] The denominator for physicians, nurse practitioners, and physician assistants billing at 90% or more is the number of evaluation and management codes billed in a nursing home or SNF in the year 2007, 2010, or 2014.

Discussion | The care of frail and medically complex NH residents is increasingly performed by NPs and PAs who focus nearly exclusively in this site of care. In some states, SNFists accounted for nearly half of the total billing in the NH setting of care. Future research is needed to understand how this specialization of care affects not only care delivery but the overall experience of frail, elderly patients.

RESEARCH LETTER

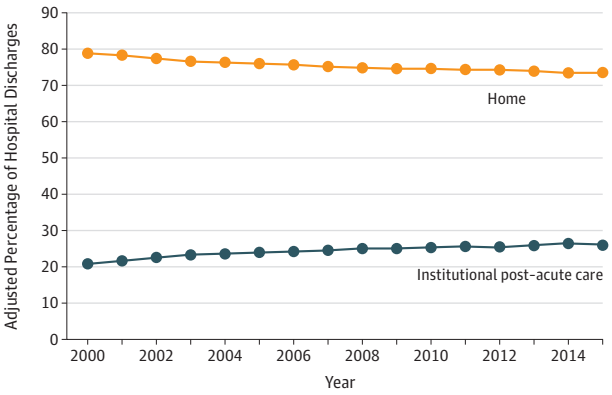
Trends in Post-Acute Care Use Among Medicare Beneficiaries: 2000 to 2015

Since Medicare's adoption of the inpatient prospective payment system in 1983, hospitals have sought ways to reduce costs, resulting in a decrease in hospital length of stay and an increase in the use of institutional post-acute care,[1] making it a major Medicare expenditure.[2] Since the Affordable Care Act passed in 2010, Medicare has implemented payment reforms designed to make hospitals and clinicians accountable for the cost and quality of care delivered. Examples include the Hospital Readmissions Reduction Program (implemented in 2012), accountable care organizations (2012), and bundled payments (2013). How these payment reforms affect the use of post-acute care is unknown.[3] The expense of post-acute care may diminish its use under cost-containment incentives.[4] Alternatively, pressure to reduce costs by reducing unnecessary readmissions may encourage its use. Our objective was to document recent trends in use of institutional post-acute care (including the 2 most common sites: skilled nursing facilities [SNFs] and inpatient rehabilitation facilities [IRFs]) and, simultaneously, hospital and post-acute care length of stay.

Methods | We used the 100% MedPAR file[5] to identify Medicare beneficiaries discharged alive from an acute care hospital between January 2000 and December 2015 (n = 199 069 327), excluding discharges younger than 65 years or discharged to hospice (n = 39 036 324 or 19.6%), enrolled in Medicare Advantage (n = 20 250 852 or 10.2%), or discharged to institutional settings other than SNF or IRF (eg, psychiatric hospital; n = 1 808 518 or 0.9%). We identified each discharge's first post-hospitalization destination (home vs institutional post-acute care) and the number of days in the hospital and post-acute care. We used multivariable regression to predict risk-adjusted annual outcomes adjusted for age, sex, race, and 31 Elixhauser comorbidities. We tested for the statistical significance of differences over time using *t* tests (2-tailed with an α of .05). All analyses were performed using Stata (StataCorp), version 15. This study was approved by the institutional review board of the University of Pennsylvania with a waiver of informed consent.

Results | Among 137 973 633 hospital discharges, 20.3% were discharged to SNFs and 3.7% were discharged to IRFs. The adjusted percentage of hospital discharges to post-acute care increased from 21.0% in 2000 to 26.3% in 2015 (increase of 5.36 percentage points [95% CI, 5.32 to 5.40]; *P* <.001), whereas the adjusted percentage of discharges home decreased from 79.0% in 2000 to 73.6% in 2015 (decrease of 5.36 percentage points [95% CI ,−5.40 to −5.32]; *P* <.001) (**Figure 1**).

Figure 1. Proportion of Medicare Beneficiaries Discharged to Institutional Post-Acute Care vs Discharged Home



Estimates are adjusted for patient age, sex, race, and Elixhauser comorbidities. The median number of hospital discharges to home per year was 6 664 718 (interquartile range [IQR], 5 768 018-7 367 173) and the median number of discharges to post–acute care per year was 2 151 959 (IQR, 1 978 709-2 199 801).

Among patients discharged to post-acute care, hospital length of stay decreased from 9.0 days in 2000 to 7.3 days in 2015 (decrease of 1.70 days [95% CI, −1.71 to −1.69]; *P* <.001) (**Figure 2**). Among patients discharged home, hospital stays decreased from 5.7 days in 2000 to 4.8 days in 2015 (decrease of −0.91 days [95% CI, −0.92 to −0.91]; *P* <.001). At the same time, length of stay in post-acute care increased from 21.7 days in 2000 to 25.7 days in 2014 (increase of 3.98 days [95% CI, 3.93 to 4.02]; *P* < .001) and then decreased to 25.1 days in 2015 (decrease of 0.54 days [95% CI, 0.50 to 0.59]; *P* < .001).

Discussion | The use of institutional post-acute care increased between 2000 and 2015 and was accompanied by increasing length of post-acute care stays through 2014. These trends did not appear to change when payment reform was implemented under the Affordable Care Act. SNFs (which accounted for 85% of institutional post-acute care) are paid per diem and thus may have strong incentives to maintain longer lengths of stay. This study was limited by the exclusion of Medicare Advantage enrollees. If policy incentives are to effectively reduce SNF length of stay, they might need to align SNF payment with the goal of reducing SNF use.

It is uncertain whether the use of post-acute care benefits patients. Despite its proliferation, there is little evidence that post-acute care improves key patient outcomes—preventing rehospitalizations or improving functional recovery. Further investigating how post-acute care affects patient outcomes is essential.

COMMENT & RESPONSE

Diagnosis and Treatment of Hidradenitis Suppurativa

To the Editor Drs Saunte and Jemec performed an illustrative review focused on the advances in diagnosis and treatment of hidradenitis suppurativa (HS).[1] However, the advances in imaging of the disease were not discussed.

For example, regarding the pathogenesis, ultrasound studies have allowed visualization of the hidden connections between the tunnels or fistulous tracts and fluid collections and the dilated and ruptured base of the hair follicles, which were illustrated in Figure 3 in the article.[1-3] Regarding the staging of hidradenitis, ultrasonography has also demonstrated that clinical evaluation and commonly used clinical scoring systems can miscategorize as healthy skin corporal segments with fluid collections or fistulous tracts underneath.[3] The latter findings on imaging can be critical because, as pointed out by the authors, the choice of therapy is guided by disease severity. Currently, color Doppler ultrasound can support the detection of key subclinical lesions, the staging of the disease, and the assessment of activity and has been added to the clinical evaluation of hidradenitis in many centers around the world.[3,4] Moreover, ultrasound is also being used in ongoing trials.

In patients with indications for local or systemic treatments, imaging can be a noninvasive tool for monitoring the response. In patients with a surgical indication, an image-guided mapping of the extent of the abnormalities can be performed. Ultrasound has the ability to detect, categorize, and measure the lesions in all the corporal regions affected by hidradenitis.[3] This imaging information may allow better selection of the type of medical treatment or the location and extent of the surgical incision.[3]

CLINICAL INVESTIGATION

Successful Discharge to Community Gap of FFS Medicare Beneficiaries With and Without ADRD Narrowed

Barbara H. Bardenheier, PhD,†‡ Momotazur Rahman, PhD,*‡ Cyrus Kosar, MS,*‡ Rachel M. Werner, MD, PhD,§¶ and Vincent Mor, PhD*‡*

BACKGROUND/OBJECTIVES: We sought to compare the post-acute and long-term care experience of Medicare beneficiaries with and without Alzheimer Disease and Related Dementias (ADRD), and whether differences changed from January 1, 2007 to September 30, 2015.

DESIGN: Retrospective cross-sectional trend study using Medicare claims linked to the Centers for Medicare & Medicaid Services' (CMS) Minimum Data Set.

SETTING: CMS-certified skilled nursing facilities (skilled nursing facility (SNF), n = 17,043).

PARTICIPANTS: Fee-for-service Medicare beneficiaries aged ≥66 years (n = 6,614,939) discharged from a hospital to a SNF who had not lived in a nursing home during the year before hospitalization.

MEASUREMENTS: ADRD was defined by the Chronic Condition Data Warehouse. Outcome measures included: (1) successful discharge defined as being in SNF less than 90 days, then discharged back to the community, alive without subsequent inpatient health care for 30 continuous days; (2) became long-stay resident in SNF; (3) death in SNF within 90 days; (4) hospital readmission within 30 days of entering SNF; and (5) transferred to another nursing home within 30 days of entering SNF.

RESULTS: Successful discharge of beneficiaries with ADRD increased from 43.4% in 2007 to 53.9% in 2015 (average annual percent change (AAPC) = 2.1 (95% CI = 2.0–2.2)); those without ADRD also increased (from 59.1% to 63.6%, AAPC = 0.9 (95% CI = 0.7–1.1)) but not as fast as those with ADRD ($P < .01$). The proportion of all beneficiaries who became long-stay or were readmitted to the hospital decreased ($P < .05$). The proportion with ADRD who became long-stay was nearly three times higher than those without throughout the study (15.0% vs 5.5% in 2007; 11.3% vs 4.3% in 2015).

CONCLUSION: Though disparity in ADRD in becoming long-stay residents remains, the increase in successful discharges among those with ADRD also stresses the increasing importance of community as a care setting for adults with ADRD. **J Am Geriatr Soc 00:1-7, 2020.**

Keywords: ADRD; successful discharge; disparity

INTRODUCTION

Between 2010 and 2016 20.3% of Medicare beneficiaries received post-acute care (PAC) services in a skilled nursing facility (SNF) after being discharged from the hospital.[1] The improving Medicare Post-Acute-Care Transformation Act of 2014 mandated addition of a national quality measure for successful community discharge from PAC services. Although the goal of PAC rehabilitation is to maximize independence and facilitate a safe community transition, some SNF patients may be awaiting family arrangements to provide care at home or for selection of a long-term nursing facility. Some may need to stabilize and to get their numerous medical conditions to a manageable care plan. But generally, returning to and remaining in the community after an illness, injury, or surgery reflects the quality of PAC[2] (https://impactcollaboratory.org/). Although some studies have assessed inpatient rehabilitation facilities patients' success in

community discharge,[3,4] little is known about SNF patients' success in returning and staying home post-discharge.

SNF admission is often the gateway to becoming a long-term nursing home resident. And, Alzheimer Disease and Related Dementias (ADRD) patients are more likely to become long-stay residents. The Affordable Care Act (ACA) and other policy initiatives strongly encourage community based long-term care for ADRD patients.[5] In 2012, under the ACA the Centers for Medicare & Medicaid Services (CMS) could penalize hospitals for readmissions in less than 30 days for certain conditions. Successful transitioning from the hospital to a SNF is even more complicated for persons with ADRD. For example, patients with ADRD whose behavioral problems surpass the SNF's capacity to accommodate them are at high risk of rehospitalization or transfer to a different SNF.[6] For this reason, SNF administrators may be less likely to accept patients with ADRD after acute hospitalization. Indeed, one study reported that SNF personnel believe hospital personnel downplay ADRD patients' behavioral problems to increase their chances of SNF admission.[6] For these reasons, real and perceived about patients with ADRD, we hypothesized that Medicare beneficiaries with ADRD would experience more negative outcomes than those without ADRD, in terms of their likelihood of successfully returning home, experiencing rehospitalization, dying in the SNF, becoming a permanent nursing home resident, or transferring to another SNF, and we assessed whether the differences changed between 2007 and 2015.

METHODS

Study Population

Our sample was drawn from 100% of Medicare SNF claims linked to the CMS Minimum Data Set, which are mandatory clinical assessments for all nursing home residents of Medicare-certified nursing homes, from January 1, 2007 through September 30, 2015 (with follow-up for post-discharge outcomes dated through December 31, 2015). The study period was chosen to include only events occurring before the introduction of the ICD-10 coding system. We included fee-for-service Medicare beneficiaries aged ≥66 years who were discharged alive from the hospital and admitted to a SNF within 1 day of hospital discharge. We excluded those with history of being in a nursing home within the 12 months (using the MDS) before hospital admission because they were likely to be sicker and/or more severely demented.[7]

Main Exposure Measure

We identified Medicare beneficiaries with ADRD using the Chronic Condition Data Warehouse (CCW) flag in the Medicare beneficiary summary file as of the day of hospital discharge. The CCW algorithm identifies beneficiaries as having ADRD if they have one of 24 ICD-9 codes present on one or more inpatient, SNF, HHA, outpatient, or carrier claim over a 3-year look-back period.[8] This definition has a sensitivity (0.85) and specificity (0.89).[9] We believe this is sufficient to assess changes in trends because (1) the measure did not change during the study period (ICD-9 codes were used throughout) and (2) we hypothesized post-discharge outcomes of ADRD patients may differ from those without ADRD, in part due to perceptions of ADRD patients. In other words, regardless of truly having ADRD, if beneficiaries' have an ADRD diagnosis, then healthcare providers perceive that they have ADRD.

Outcome Measures

We assessed trends over our study period in seven outcome measures. First, we defined successful discharge as being discharged alive from a SNF to the community within 90 days of SNF admission without subsequent inpatient healthcare utilization for 30 continuous days. Second, we defined becoming a long-stay resident as remaining in the SNF more than 90 days after SNF admission. Third, we defined dying in the SNF as dying within 90 days of SNF admission. Fourth, we assessed death within 90 days after discharge from the SNF (after being in the SNF at least 90 days). We assessed rehospitalization two ways: within 30 days and within 90 of hospital discharge. For both rehospitalization measures, those who died in the same

Note: All years are from January 1 to December 31, except 2015 is from January 1 to September 30. Adjusted for age, sex, race, dual eligible status, % MA penetration in zipcode, % dual eligible in zipcode. AAPC, average annual percentage change; CI, confidence interval; died in SNF, within 30 days of entering SNF; FFS, fee-for-service; long-stay, still in SNF after 90 days of entering; SNF, skilled nursing facility; successful discharge, in SNF 90 days, then they were discharged back to the community, alive without subsequent inpatient healthcare utilization for 30 continuous days.

timeframe were censored. Finally, we assessed transfer to another NH within 30 days of entering the SNF. To clarify "SNF," our focus is not on SNF coverage for payment, but rather PAC in a SNF which is typically short-stay or ≤90 days. We used the sequence of claims and the MDS to identify outcomes.

Statistical Analyses

First, we assessed the overall change in number of beneficiaries with and without ADRD from 2007 to 2014 (for this we excluded 2015 because it was a partial year). Trends for each outcome were then assessed on annual cohorts of beneficiaries who were discharged from the hospital to a SNF, adjusting for age, sex, race, dual-eligibility, Medicare Advantage penetration (zipcode of residence), and percent dual-eligible (zipcode of residence). We used STATA version 16 software to obtain adjusted predictive margins and standard errors. We evaluated monotonic trends by joinpoint regression using Joinpoint software,[10] which has the same underlying assumptions as simple regression and allows for input of estimates and standard errors. To determine if the trend was statistically significant we used the average annual percent change (AAPC) and its associated *P*-value. We also compared AAPC differences in trends between those with and without ADRD. All analyses were stratified by beneficiary ADRD status.

Sensitivity Analyses

Because our analyses included all FFS beneficiaries discharged from the hospital to a SNF, we wanted to determine if results would be similar for a more homogenous group or if our findings were driven by certain subgroups. Therefore, we performed the same trend analyses for patients hospitalized for hip fractures and were discharged from the hospital to a SNF. Codes used to define hip fractures were 820.xx.

All analyses were conducted after establishing a data use agreement with CMS and obtaining final approval from Brown University's Institutional Review Board.

RESULTS

We identified 2,134,798 beneficiaries with prevalent ADRD (243,321 or 11.4% were included in multiple years) and 3,582,546 without (654,274 or 18.3% were included in multiple years) who otherwise met study eligibility criteria. The average age of beneficiaries with ADRD discharged from hospital to SNF was close to 84 years in 2007, 2011, and 2015; the average age of those without ADRD was approximately 80 years at the beginning, middle, and end of the study (Table 1). About two-thirds of those with and without ADRD were female. The average proportion with Medicare Advantage penetration in the residents' zip code increased from 2007 to 2015 for those with (17.8%–28.7%) and without ADRD (17.6%–28.1%). A few (7.4% n = 486,715) of beneficiaries were referred to a hospice within 90 days of entering the SNF or in the 90 days following SNF discharge; of those, 85.2% died.

The number of beneficiaries with ADRD discharged from the hospital to a SNF increased 36.3% from 211,518 in 2007 to 288,361 in 2014 (2015 was a partial year, AAPC = 3.1 (0.3, 5.9)). There was no significant change in the number of beneficiaries without ADRD discharged from the hospital to a SNF from 2007 to 2014 (AAPC = 1.1 (−1.6, 3.9)). The proportion of traditional Medicare beneficiaries with ADRD who had a successful discharge from the SNF to the community increased from 43.5% in 2007 to 50.9% in 2015 (AAPC = 2.0 (1.8, 2.2)) (Table 2 and Figure 1). Successful discharge for those without ADRD also increased (from 59.0% to 62.9%, AAPC = 1.0 (0.8, 1.2)), but not as fast as for those with ADRD (AAPC difference (ADRD − No ADRD) = 1.0 (0.8, 1.2), $P < .01$). The proportion of beneficiaries with ADRD who became long-stay nursing home residents decreased (from 15.0% in 2007 to 11.3% in 2015, AAPC = −3.6 (−4.4, −2.8)); those without ADRD decreased also (from 5.5% to 4.3%, AAPC = −3.4 (−4.3, −2.6)) similar to those with ADRD ($P = .70$). However, the proportion of those with ADRD who became long-stay was nearly three times higher than those without. The proportion of beneficiaries with ADRD who died within 90 days of entering the SNF decreased from 2007 (16.9%) to 2015 (15.8%, AAPC = −0.7 (−1.2, −0.2)); those without ADRD decreased as well from 13.9% in 2007 to 12.8% in 2015 (AAPC = −1.4 (−1.8, −0.9)), faster than those with ADRD (AAPC difference (ADRD − No ADRD) = 0.9 (1.7, 0.1), $P < .01$). The proportion of beneficiaries with ADRD who died within 90 days of discharge from the SNF did not change from 2007 (8.9%) to 2015 (8.2%, $P = .7$); those without ADRD decreased from 6.3% in 2007 to 5.7% in 2015 (AAPC = −1.1 (−1.5, −0.6)), faster than those with ADRD (AAPC difference (ADRD − No ADRD) = 0.9 (1.7, 0.1), $P < .01$). The

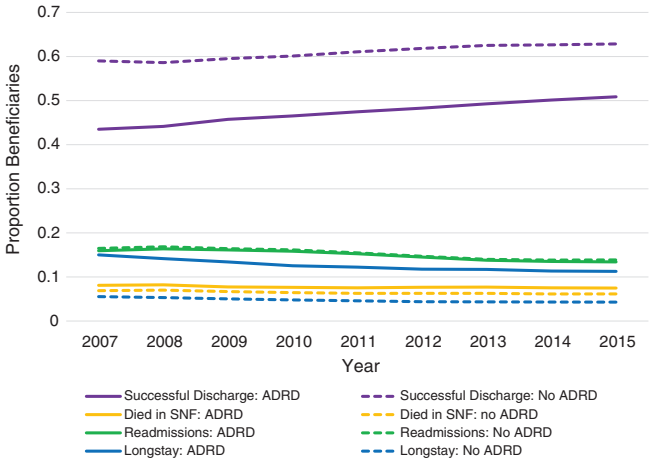

Figure 1. Adjusted proportion of FFS Medicare Beneficiaries aged >65 years discharged from hospital to SNF by ADRD status, January 1, 2007 through September 30, 2015. Note: All years are from January 1 to December 31, except 2015 is from January 1 to September 30. Adjusted for age, sex, race, dual eligible status, % MA penetration in zipcode, % dual eligible in zipcode. AAPC, average annual percentage change; CI, confidence interval; died in SNF, within 30 days of entering SNF; FFS, fee-for-service; long-stay, still in SNF after 90 days of entering; SNF, skilled nursing facility; successful discharge, in SNF 90 days, then they were discharged back to the community, alive without subsequent inpatient healthcare utilization for 30 continuous days.

proportion of beneficiaries discharged and rehospitalized within 30 days and 90 days decreased among both those with (AAPC = −2.8 (−3.6, −2.0) and AAPC = −1.7 (−2.3, −1.2)) and without ADRD (APC = −2.9 (−3.6, −2.1) and AAPC = −2.1 (−2.7, −1.5)) during the study period, though not significantly different from each other (P = .90 and P = .20, respectively). The proportion of beneficiaries discharged to SNF and transferred to another nursing facility decreased among both those with ADRD from 5.0% to 4.3% (AAPC = −2.0 (−3.3, −0.7)) and without ADRD from 3.5% to 2.8% (AAPC = −3.1 (−4.4, −1.8)), though not significantly different from each other (P = .20).

Results of Sensitivity Analyses

Overall, 9.5% of patients discharged had claims for being hospitalized with hip fracture. The number of beneficiaries discharged from the hospital to a SNF increased 35.8% from 23,485 in 2007 to 31,882 in 2014 (2015 was a partial year and therefore excluded, AAPC = 3.1 (0.7, 5.6)). There was no significant change in beneficiaries without ADRD discharged from the hospital to a SNF (AAPC = 0.6 (−1.8, 3.1). Those hospitalized for hip fracture, with and without ADRD, experienced more successful SNF-to-community discharges after acute hospitalization, fewer deaths, rehospitalizations, long-stays, and transfers to other nursing facilities within 30 days of entering the SNF from 2007 to 2015 (P < .05) (Table 3). The gap between those with and without ADRD in successful SNF-to-community discharges after acute hospitalization narrowed, as rates of successful discharges increased faster among those with ADRD (AAPC difference (ADRD − No ADRD) = 0.9 (0.6, 1.2)).

DISCUSSION

In general, traditional Medicare beneficiaries with ADRD have worse outcomes than those without ADRD, but the gap is narrowing with respect to returning home from the SNF, surviving and not being rehospitalized. From 2007 to 2015, Medicare beneficiaries experienced more successful SNF-to-community discharges after acute hospitalization, due to fewer rehospitalizations, long-stays, and transfers to other nursing facilities within 30 days of entering the SNF. The gap between those with and without ADRD in successful SNF-to-community discharges after acute hospitalization narrowed, as the rates of successful discharges increased faster among those with ADRD. Deaths within 90 days of discharge to SNF did not change among beneficiaries with ADRD, yet the mortality rate decreased among the non-ADRD group. Notably, the gap between those with and without ADRD in becoming long-stay remained; those with ADRD were nearly three times as likely to become long-stay residents.

Studies have reported an increase in the number of adults living with ADRD.[11] This is reflected in our study showing an increase in ADRD patients discharged from the hospital to the SNF overall and also in our sensitivity analysis among hospitalizations for hip fractures. Our results may indicate that the greater number of patients with ADRD discharged home may reflect healthier people being diagnosed with ADRD at earlier stages.

Higher rates of successful discharge from SNF to the community and fewer rehospitalizations, long-stays, and transfers to other nursing facilities among beneficiaries with ADRD over a decade are quite encouraging. Previous studies have reported persons with ADRD experience frequent transitions across the range of care, especially into and out of hospital and SNF settings.[12,13] And, nearly half of long-stay nursing home residents suffer from ADRD.[14,15] Our data suggest that the proportion of patients with ADRD who become long-stay residents after entering the SNF after being hospitalized is decreasing.

It is not surprising that rates of rehospitalization after hospital discharge to SNF decreased for all beneficiaries. In October 2012 a policy was mandated by the ACA to penalize hospitals with high readmission rates for certain conditions.[16] Readmission rates for some SNFs may have been high before 2012 because of the change in use of SNF care. Most SNFs (>90%) are dually certified as a SNF and as a nursing home.[17] Thus, a facility that offers skilled care often also provides long-term care services that Medicare does not cover. Ideally, SNF care is provided to restore function to patients discharged from acute hospital care before transitioning back to the community. In the decade before 2012, use of SNF care after acute hospitalization had greatly increased in part because of the shift of nursing homes from serving life long residents to facilities treating increasingly medically complex patients seeking PAC for recuperation after hospitalization. This may in part have been driven by a financial incentive to take advantage of the short-term Medicare benefit. Medicare covers up to 100 days after 3 days of hospitalization whereas Medicaid pays for most of long-term care, the Medicare payment for SNF services being higher than that for Medicaid. In other words, some patients may have been sent to the SNF as long as the financial benefit was available and then sent back to the hospital. Yet since the 2012 policy, that practice likely diminished.

Our result of decline in long-stay residents, with and without ADRD, helps to explain why occupancy in nursing homes continues to decline even though the number of beds has been steadily declining.[18-20] In nursing homes in states with no or nursing home-specific certificate-of-need programs (designed to curb healthcare spending), the number of beds has decreased since 1992.[21] The decline in long-stay residents may also be a reflection of the number of nursing home closures. Facilities with large proportions of long-stay residents tended to have high Medicaid occupancy,[22] and those facilities were most at risk of closure.[23]

Our study was subject to several limitations. First, discharge data for the Medicare Advantage population are not reliable and therefore were not included. Given the rapid growth of Medicare Advantage, which has a strong disincentive for hospital use, the results observed may not reflect the overall population aged 66 years and older. Second, the proportion of ADRD we reported likely includes some false-positive and false-negative ADRD cases; however, the CCW algorithm is the only approach that can identify a broad sample of beneficiaries with ADRD across community and nursing home settings in hospitalization data. Still, regardless of how ADRD is diagnosed, the trends reveal an increase in successful discharges but a steady gap in becoming long-stay residents with a nearly threefold risk among

those with ADRD. Third, we did not assess the geographic availability of PAC services; hence some patients may have been discharged to the community because of access rather than recovery. Fourth, we could not account for health beliefs, financial resources, availability of an appropriate caregiver (paid or unpaid), or cultural differences which may have influenced discharge to and remaining in the community. Finally, a potential limitation is that certain cohorts of beneficiaries discharged from the hospital to SNFs could have driven the results. However, sensitivity analyses confirmed overall results with a homogenous group. Among patients who had been hospitalized for hip fractures, trends for those with and without ADRD were in the same direction and the same estimates were statistically significant as were found for the overall group of beneficiaries with two exceptions.

We examined the trends in outcomes among Medicare beneficiaries discharged to SNF with and without a diagnosis of ADRD and found that many outcomes improved for all persons but that successful discharge rates, going home and remaining there, improved more rapidly for persons living with dementia than for persons without dementia. It may be that practices with regard to hospitalization may have influenced the trends in addition to practices in the SNF. Thus, more research is needed to understand what is driving the reduction in transfers, deaths, and long-stays among patients with ADRD discharged from hospital to SNF. In addition, the increase in successful SNF to community discharges stresses the increasing importance of community as the care setting for adults with ADRD.

ACKNOWLEDGMENTS

Conflict of Interest: BHB, MR, CK, and RMW have no conflicts of interest to report. VM receives compensation for his role as Chair of the Scientific Advisory Committee of naviHealth, a post-acute care convening company serving managed care companies and integrated hospital systems.

Author Contributions: VM and MR conceived and designed the study. BHB drafted the manuscript and did the statistical analyses. MR and CK obtained and compiled the data. All authors revised the report for intellectual content and contributed to the literature search. VM and RMW provided administrative, technical and material support.

Sponsor's Role: This research was supported, in part, by NIH P01AG027296.

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

Meeting Date: April, 2021

CPT Code	Long Descriptor	Global Period
99304	Initial nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and straightforward or low level of medical decision making. When using total time on the date of the encounter for code selection, XX minutes must be met or exceeded.	XXX
99305	Initial nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. When using total time on the date of the encounter for code selection, XX minutes must be met or exceeded.	XXX
99306	Initial nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and high level of medical decision making. When using total time on the date of the encounter for code selection, XX minutes must be met or exceeded. (For services ZZ minutes or longer, use prolonged services code 993X0)	XXX
99307	Subsequent nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and straightforward medical decision making. When using total time on the date of encounter for code selection, XX minutes must be met or exceeded.	XXX
99308	Subsequent nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and low level of medical decision making. When using total time on the date of encounter for code selection, XX minutes must be met or exceeded.	XXX
99309	Subsequent nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. When using total time on the date of encounter for code selection, XX minutes must be met or exceeded.	XXX
99310	Subsequent nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and high level of medical decision making. When using total time on the date of encounter for code selection, XX minutes must be met or exceeded. (For services ZZ minutes or longer, use prolonged services code 993X0)	XXX

Vignette(s) (*vignette required even if PE only code(s)***):**

CPT Code	Vignette
99304	Initial nursing facility visit for a patient with limited supports at home receiving post-acute care for an operative procedure that was uncomplicated.
99305	Initial nursing facility visit for a patient with recovering from an illness or acute injury that requires ongoing medical management of their multiple stable problems.
99306	Initial nursing facility visit for patient with multiple morbidities requiring intensive management
99307	Subsequent nursing facility visit for a patient with a self-limited or minor problem

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC) PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

99308	Subsequent nursing facility visit for a patient with a stable chronic illness or recovering from an acute uncomplicated injury.
99309	Subsequent nursing facility visit for a patient with a new or progressing illness or acute injury that requires diagnostic evaluation, medical management, or potential surgical treatment.
99310	Subsequent nursing facility visit for a patient with a chronic illness with severe exacerbation that poses a threat to life or bodily function.

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

   The specialty society expert panel, comprised of advisors from the participating specialties, met and discussed recommendations for practice expense both via phone and over email. The expert panel reviewed the existing PE inputs for the code family and made revisions as necessary to reflect current practice.

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code, but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here (*for service reviewed prior to the implementation of clinical activity codes, detail is not provided in the RUC database, please contact Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org for PE spreadsheets for your reference codes*):

   Existing PE inputs from 2005 (99304-99310) were used as reference.

3. Is this code(s) typically reported with an E/M service?

   No

4. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time:

   N/A

5. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies for the **code family**, please provide compelling evidence (please see *PE compelling evidence guidelines*) Please explain if the increase can be entirely accounted for because of an increase in physician time:

   N/A

6. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (*please see second worksheet in PE spreadsheet workbook*), please explain the difference here:

   Pre-Service
   All codes include time for an activity described in 2005 PE spreadsheets as "phone calls between visits with patient, family, pharmacy." This has been rolled into CA005 Complete pre-procedure phone calls and prescription.
   Several codes, specifically 99308, 99309 and 99310, include time for an activity described in the 2005 PE spreadsheets a "review/read x-ray, lab and pathology reports." This has been rolled into CA006 Confirm availability of prior images/studies.

Post-Service
All codes include time for an activity described in 2004 and 2005 PE spreadsheets as "phone calls between visits with patient, family, pharmacy." This has been rolled into CA037 Conduct patient communications.
Codes 99304-99310 included time for an activity described in the 2005 PE spreadsheet as "review/read x-ray, lab, and pathology reports" as well as "respond to consultant pharmacist or nutritionist reviews and recommendations" and "monitoring patient/notifying physician of change in condition" which have all be rolled into CA038 Coordinate post-procedure services.

7. Please provide a brief description of the clinical staff work for the following:
   a. Pre-Service period:

99304	**CA005 3 minutes** Clinical staff completes phone calls with family/caregiver and confirms medications. Relevant data is transferred from facility EMR to provider EMR.
99305	**CA005 3 minutes** Clinical staff completes phone calls with family/caregiver and confirms medications. Relevant data is transferred from facility EMR to provider EMR.
99306	**CA005 3 minutes** Clinical staff completes phone calls with family/caregiver and confirms medications. Relevant data is transferred from facility EMR to provider EMR.
99307	**CA005 3 minutes** Clinical staff completes phone calls with family/caregiver or nurse/care coordinator at the facility, confirms any procedures or services provided since last visit, and confirms medication changes since last visit.
99308	**CA005 3 minutes** Clinical staff completes phone calls with family/caregiver or nurse/care coordinator at the facility, confirms any procedures or services provided since last visit, and confirms medication changes since last visit. **CA006 3 minutes** Clinical staff confirms availability of any imaging completed since the last visit as well as any reports related to services or procedures provided.
99309	**CA005 3 minutes** Clinical staff completes phone calls with family/caregiver or nurse/care coordinator at the facility, confirms any procedures or services provided since last visit, and confirms medication changes since last visit. **CA006 3 minutes** Clinical staff confirms availability of any imaging completed since the last visit as well as any reports related to services or procedures provided.
99310	**CA005 6 minutes** Clinical staff completes phone calls with family/caregiver or nurse/care coordinator at the facility, confirms any procedures or services provided since last visit, and confirms medication changes since last visit.

	CA006 3 minutes Clinical staff confirms availability of any imaging completed since the last visit as well as any reports related to services or procedures provided.

b. Service period (includes pre, intra and post):

c. Post-service period:

99304	**CA037 3 minutes** Clinical staff completes follow-up phone calls with family/caregiver and/or facility nurse/therapist/care coordinator. **CA038 8 minutes** Staff confirms new procedure/therapy/DME orders and medication updates/prior authorizations are directed correctly. Staff assists in coordination of care between providers. Staff assists in interfacing between documentation in facility EMR and physician EMR.
99305	**CA037 3 minutes** Clinical staff completes follow-up phone calls with family/caregiver and/or facility nurse/therapist/care coordinator. **CA038 8 minutes** Staff confirms new procedure/therapy/DME orders and medication updates/prior authorizations are directed correctly. Staff assists in coordination of care between providers. Staff assists in interfacing between documentation in facility EMR and physician EMR.
99306	**CA037 3 minutes** Clinical staff completes follow-up phone calls with family/caregiver and/or facility nurse/therapist/care coordinator. **CA038 8 minutes** Staff confirms new procedure/therapy/DME orders and medication updates/prior authorizations are directed correctly. Staff assists in coordination of care between providers. Staff assists in interfacing between documentation in facility EMR and physician EMR.
99307	**CA037 3 minutes** Clinical staff completes follow-up phone calls with family/caregiver and/or facility nurse/therapist/care coordinator. **CA038 8 minutes** Staff confirms new procedure/therapy/DME orders and medication updates/prior authorizations are directed correctly. Staff assists in coordination of care between providers. Staff assists in interfacing between documentation in facility EMR and physician EMR.
99308	**CA037 3 minutes** Clinical staff completes follow-up phone calls with family/caregiver and/or facility nurse/therapist/care coordinator. **CA038 8 minutes** Staff confirms new procedure/therapy/DME orders and medication updates/prior authorizations are directed correctly. Staff assists in coordination of care between providers. Staff assists in interfacing between documentation in facility EMR and physician EMR.

99309	**CA037 3 minutes** Clinical staff completes follow-up phone calls with family/caregiver and/or facility nurse/therapist/care coordinator. **CA038 8 minutes** Staff confirms new procedure/therapy/DME orders and medication updates/prior authorizations are directed correctly. Staff assists in coordination of care between providers. Staff assists in interfacing between documentation in facility EMR and physician EMR.
99310	**CA037 6 minutes** Clinical staff completes follow-up phone calls with family/caregiver and/or facility nurse/therapist/care coordinator. **CA038 8 minutes** Staff confirms new procedure/therapy/DME orders and medication updates/prior authorizations are directed correctly. Staff assists in coordination of care between providers. Staff assists in interfacing between documentation in facility EMR and physician EMR.

8. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (*please see second worksheet in PE spreadsheet workbook*):

N/A

9. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov.

N/A

INVOICES

10. ☐ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

11. ☐ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

12. If you wish to include a supply that is not on the list (*please see fourth worksheet in PE spreadsheet workbook*) please provide a paid invoice. Identify and explain the invoice here:

N/A

13. Are you recommending a PE supply pack for this recommendation? Yes or No.
If Yes, please indicate if the pack is an established package of supplies as defined by CMS (eg, SA047 *pack, E/M visit*) or a pack that is commercially available?

N/A

14. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation. Please include the description, CMS supply code, unit, item quantity and unit price (if

available). See documents two and three under PE reference materials on the RUC Collaboration Website for information on the contents of kits, packs and trays.

N/A

15. If you wish to include an equipment item that is not on the list (*please see fifth worksheet in PE spreadsheet workbook*) please provide a paid invoice and the useful life. Identify and explain the invoice here:

N/A

16. Have you recommended equipment minutes for a computer or equivalent laptop/integrated computer, equipment item computer, desktop, w-monitor, ED021 or notebook (Dell Latitute D600), ED038?
    a. If yes, please explain how the computer is used for this service(s).
    b. Is the computer used exclusively as an integral component of the service or is it also used for other purposes not specific to the code?
    c. Does the computer include code specific software that is typically used to provide the service(s)?

N/A

17. List all the equipment included in your recommendation and the equipment formula chosen *(*please see document titled *Calculating equipment time).* If you have selected "other formula" for any of the equipment please explain here:

N/A

18. If there is any other item(s) on your spreadsheet not covered in the categories above that require greater detail/explanation, please include here:

N/A

PROFESSIONAL LIABILITY INSURANCE (PLI) INFORMATION

19. If this is a PE only code please select a crosswalk based on a similar specialty mix:

N/A

ITEMIZED LIST OF CHANGES (FOLLOWING THE PE SUBCOMMITTEE MEETING

During and immediately following the review of this tab at the PE Subcommittee meeting please revise the summary of recommendation (PE SOR) based on modifications made during the meeting. Please submit the revised form electronically to Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org immediately following the close of business the same day that the tab is reviewed. On the PE spreadsheet, please highlight the cells and/or use red font to show the changes made during the PE Subcommittee meeting (if you have provided any of this highlighting based on changes from the reference code prior to the PE Subcommittee meeting please remove it, so not to be confused with changes made during the meeting). In addition to those revisions please also provide an itemized list of the modifications made to the PE spreadsheet during the PE Subcommittee meeting in the space below (e.g. clinical activity CA010 *obtain vital signs* was reduced from 5 minutes to 3 minutes).

FACILITY DIRECT PE INPUTS **CPT CODE(S):99304-99310**

SPECIALTY SOCIETY(IES):_AAPM&R, ACP, AGS, AMDA, ANA, APMA

PRESENTER(S): Brooke Bisbee, DPM; Charles Crecelius, MD, PhD, CMD; Audrey Chun, MD; and Carlo Milani, MD

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

NOTE: The virtual meetings have provided for real-time updates to the PE spreadsheets. PE SORs must still be updated and resubmitted asap.

NON-FACILITY DIRECT PE INPUTS **CPT CODE(S):__99304-99310**

SPECIALTY SOCIETY(IES):_AAPM&R, ACP, AGS, AMDA, ANA, APMA_

PRESENTER(S): Brooke Bisbee, DPM; Charles Crecelius, MD, PhD, CMD; Audrey Chun, MD; and Carlo Milani, MD

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC) PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

Meeting Date: April, 2021

CPT Code	Long Descriptor	Global Period
99304	Initial nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and straightforward or low level of medical decision making. When using total time on the date of the encounter for code selection, XX minutes must be met or exceeded.	XXX
99305	Initial nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. When using total time on the date of the encounter for code selection, XX minutes must be met or exceeded.	XXX
99306	Initial nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and high level of medical decision making. When using total time on the date of the encounter for code selection, XX minutes must be met or exceeded. (For services ZZ minutes or longer, use prolonged services code 993X0)	XXX
99307	Subsequent nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and straightforward medical decision making. When using total time on the date of encounter for code selection, XX minutes must be met or exceeded.	XXX
99308	Subsequent nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and low level of medical decision making. When using total time on the date of encounter for code selection, XX minutes must be met or exceeded.	XXX
99309	Subsequent nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. When using total time on the date of encounter for code selection, XX minutes must be met or exceeded.	XXX
99310	Subsequent nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and high level of medical decision making. When using total time on the date of encounter for code selection, XX minutes must be met or exceeded. (For services ZZ minutes or longer, use prolonged services code 993X0)	XXX

Vignette(s) (*vignette required even if PE only code(s)***):**

CPT Code	Vignette
99304	Initial nursing facility visit for a patient with limited supports at home receiving post-acute care for an operative procedure that was uncomplicated.
99305	Initial nursing facility visit for a patient with recovering from an illness or acute injury that requires ongoing medical management of their multiple stable problems.
99306	Initial nursing facility visit for patient with multiple morbidities requiring intensive management
99307	Subsequent nursing facility visit for a patient with a self-limited or minor problem

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC) PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

99308	Subsequent nursing facility visit for a patient with a stable chronic illness or recovering from an acute uncomplicated injury.
99309	Subsequent nursing facility visit for a patient with a new or progressing illness or acute injury that requires diagnostic evaluation, medical management, or potential surgical treatment.
99310	Subsequent nursing facility visit for a patient with a chronic illness with severe exacerbation that poses a threat to life or bodily function.

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

   The specialty society expert panel, comprised of advisors from the participating specialties, met and discussed recommendations for practice expense both via phone and over email. The expert panel reviewed the existing PE inputs for the code family and made revisions as necessary to reflect current practice.

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code, but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here (*for service reviewed prior to the implementation of clinical activity codes, detail is not provided in the RUC database, please contact Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org for PE spreadsheets for your reference codes*):

   Existing PE inputs from 2005 (99304-99310) were used as reference.

3. Is this code(s) typically reported with an E/M service?
   Is this code(s) typically reported with the E/M service in the nonfacility?
   (Please see provided data titled *Medicare Same Day NF EM Billed Together - NF Dom Spec* in the RUC Review Resource Materials)

   No

4. What specialty is the dominant provider in the nonfacility?
   What percent of the time does the dominant provider provide the service(s) in the nonfacility?
   Is the dominant provider in the nonfacility different than for the global?
   (Please see provided data titled *Medicare Same Day NF EM Billed Together - NF Dom Spec* in the RUC Review Resource Materials)

   Non-Facility Dominant Specialties

99304	Non-Facility Dominant Specialties – podiatry (31.4%), family medicine (17%) and nurse practitioner (13.5%)
99305	Non-Facility Dominant Specialties – internal medicine (23.6%), nurse practitioner (22.6%), family medicine (19.2%)
99306	Non-Facility Dominant Specialties – internal medicine (38.9%), family medicine (19.1%) and nurse practitioner (17.2%)
99307	Non-Facility Dominant Specialties – podiatry (22.4%), nurse practitioner (20.9%), family medicine (19.1%), internal medicine (17.4%)
99308	Non-Facility Dominant Specialties – nurse practitioner (41.5%), internal medicine (19.1%), family medicine (15.5%)

99309	Non-Facility Dominant Specialties – nurse practitioner (48.4%), internal medicine (18.8%), family medicine (14%)
99310	Non-Facility Dominant Specialties – nurse practitioner (49.5%), internal medicine (17.3%), family medicine (12.9%)

There are small differences in the percentages and order of the dominant specialties when comparing non-facility to global dominant specialties.

Global Dominant Specialties

99304	Non-Facility Dominant Specialties – podiatry (22.8%), family medicine (18.4%) and internal medicine (12.5%)
99305	Non-Facility Dominant Specialties – internal medicine (29.8%), family medicine (19.3%), nurse practitioner (13.8%)
99306	Non-Facility Dominant Specialties – internal medicine (42.6%), family medicine (19.5%) and nurse practitioner (9.8%)
99307	Non-Facility Dominant Specialties –nurse practitioner (24.8%), family medicine (19.1%), internal medicine (17.4%)
99308	Non-Facility Dominant Specialties – nurse practitioner (37.5%), internal medicine (22.1%), family medicine (13%)
99309	Non-Facility Dominant Specialties – nurse practitioner (45.3%), internal medicine (21.6%), family medicine (12%)
99310	Non-Facility Dominant Specialties – nurse practitioner (50.2%), internal medicine (18.8%), family medicine (10.6%)

5. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time:

N/A

6. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies for the **code family**, please provide compelling evidence (please see *PE compelling evidence guidelines*) Please explain if the increase can be entirely accounted for because of an increase in physician time:

N/A

7. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (*please see second worksheet in PE spreadsheet workbook*), please explain the difference here:

Pre-Service All codes include time for an activity described in 2004 and 2005 PE spreadsheets as "phone calls between visits with patient, family, pharmacy." This has been rolled into CA005 Complete pre-procedure phone calls and prescription. Several codes, specifically 99308, 99309 and 99310, include time for an activity described in the 2005 PE spreadsheets a "review/read x-ray, lab and pathology reports." This has been rolled into CA006 Confirm availability of prior images/studies.

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

Post-Service
All codes include time for an activity described in 2004 and 2005 PE spreadsheets as "phone calls between visits with patient, family, pharmacy." This has been rolled into CA037 Conduct patient communications.
Codes 99304-99310 included time for an activity described in the 2005 PE spreadsheet as "review/read x-ray, lab, and pathology reports" as well as "respond to consultant pharmacist or nutritionist reviews and recommendations" and "monitoring patient/notifying physician of change in condition" which have all be rolled into CA038 Coordinate post-procedure services.

8. How much time was allocated to clinical activity, *obtain vital signs* (CA010) prior to CMS increasing the clinical activity to 5 minutes for calendar year 2018? The standard for clinical activity, obtains vital signs remains 0, 3 and 5 based on the number of vital signs taken. Please provide a rationale for the clinical staff time that you are requesting for obtain vital signs here:

N/A

9. Please provide a brief description of the clinical staff work for the following:
   a. Pre-Service period:

99304	**CA005 3 minutes** Clinical staff completes phone calls with family/caregiver and confirms medications. Relevant data is transferred from facility EMR to provider EMR.
99305	**CA005 3 minutes** Clinical staff completes phone calls with family/caregiver and confirms medications. Relevant data is transferred from facility EMR to provider EMR.
99306	**CA005 3 minutes** Clinical staff completes phone calls with family/caregiver and confirms medications. Relevant data is transferred from facility EMR to provider EMR.
99307	**CA005 3 minutes** Clinical staff completes phone calls with family/caregiver or nurse/care coordinator at the facility, confirms any procedures or services provided since last visit, and confirms medication changes since last visit.
99308	**CA005 3 minutes** Clinical staff completes phone calls with family/caregiver or nurse/care coordinator at the facility, confirms any procedures or services provided since last visit, and confirms medication changes since last visit. **CA006 3 minutes** Clinical staff confirms availability of any imaging completed since the last visit as well as any reports related to services or procedures provided.
99309	**CA005 3 minutes** Clinical staff completes phone calls with family/caregiver or nurse/care coordinator at the facility, confirms any procedures or services provided since last visit, and confirms medication changes since last visit. **CA006 3 minutes**

	Clinical staff confirms availability of any imaging completed since the last visit as well as any reports related to services or procedures provided.
99310	**CA005 6 minutes** Clinical staff completes phone calls with family/caregiver or nurse/care coordinator at the facility, confirms any procedures or services provided since last visit, and confirms medication changes since last visit. **CA006 3 minutes** Clinical staff confirms availability of any imaging completed since the last visit as well as any reports related to services or procedures provided.

b. Service period (includes pre, intra and post):

c. Post-service period:

99304	**CA037 3 minutes** Clinical staff completes follow-up phone calls with family/caregiver and/or facility nurse/therapist/care coordinator. **CA038 8 minutes** Staff confirms new procedure/therapy/DME orders and medication updates/prior authorizations are directed correctly. Staff assists in coordination of care between providers. Staff assists in interfacing between documentation in facility EMR and physician EMR.
99305	**CA037 3 minutes** Clinical staff completes follow-up phone calls with family/caregiver and/or facility nurse/therapist/care coordinator. **CA038 8 minutes** Staff confirms new procedure/therapy/DME orders and medication updates/prior authorizations are directed correctly. Staff assists in coordination of care between providers. Staff assists in interfacing between documentation in facility EMR and physician EMR.
99306	**CA037 3 minutes** Clinical staff completes follow-up phone calls with family/caregiver and/or facility nurse/therapist/care coordinator. **CA038 8 minutes** Staff confirms new procedure/therapy/DME orders and medication updates/prior authorizations are directed correctly. Staff assists in coordination of care between providers. Staff assists in interfacing between documentation in facility EMR and physician EMR.
99307	**CA037 3 minutes** Clinical staff completes follow-up phone calls with family/caregiver and/or facility nurse/therapist/care coordinator. **CA038 8 minutes** Staff confirms new procedure/therapy/DME orders and medication updates/prior authorizations are directed correctly. Staff assists in coordination of care between providers. Staff assists in interfacing between documentation in facility EMR and physician EMR.
99308	**CA037 3 minutes**

	Clinical staff completes follow-up phone calls with family/caregiver and/or facility nurse/therapist/care coordinator. **CA038 8 minutes** Staff confirms new procedure/therapy/DME orders and medication updates/prior authorizations are directed correctly. Staff assists in coordination of care between providers. Staff assists in interfacing between documentation in facility EMR and physician EMR.
99309	**CA037 3 minutes** Clinical staff completes follow-up phone calls with family/caregiver and/or facility nurse/therapist/care coordinator. **CA038 8 minutes** Staff confirms new procedure/therapy/DME orders and medication updates/prior authorizations are directed correctly. Staff assists in coordination of care between providers. Staff assists in interfacing between documentation in facility EMR and physician EMR.
99310	**CA037 6 minutes** Clinical staff completes follow-up phone calls with family/caregiver and/or facility nurse/therapist/care coordinator. **CA038 8 minutes** Staff confirms new procedure/therapy/DME orders and medication updates/prior authorizations are directed correctly. Staff assists in coordination of care between providers. Staff assists in interfacing between documentation in facility EMR and physician EMR.

10. Please provide granular detail regarding what the clinical staff is doing during the intra-service (of service period) clinical activity, *assist physician or other qualified healthcare professional---directly related to physician work time* or *Perform procedure/service---NOT directly related to physician work time:*

N/A

11. If you have used a percentage of the physician intra-service work time other then 100 or 67 percent for the intra-service (of service period) clinical activity, please indicate the percentage and explain why the alternate percentage is needed and how it was derived.

N/A

12. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (*please see second worksheet in PE spreadsheet workbook*):

N/A

13. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov.

INVOICES

14. ☐ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

15. ☐ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

16. If you wish to include a supply that is not on the list (*please see fourth worksheet in PE spreadsheet workbook*) please provide a paid invoice. Identify and explain the invoice here:
    N/A

17. Are you recommending a PE supply pack for this recommendation? Yes or No.
    If Yes, please indicate if the pack is an established package of supplies as defined by CMS (eg, SA047 *pack, E/M visit*) or a pack that is commercially available?
    N/A

18. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation. Please include the description, CMS supply code, unit, item quantity and unit price (if available). See documents two and three under PE reference materials on the RUC Collaboration Website for information on the contents of kits, packs and trays.
    N/A

19. If you wish to include an equipment item that is not on the list (*please see fifth worksheet in PE spreadsheet workbook*) please provide a paid invoice and the useful life. Identify and explain the invoice here:
    N/A

20. Have you recommended equipment minutes for a computer or equivalent laptop/integrated computer, equipment item computer, desktop, w-monitor, ED021 or notebook (Dell Latitute D600), ED038?
    a. If yes, please explain how the computer is used for this service(s).
    b. Is the computer used exclusively as an integral component of the service or is it also used for other purposes not specific to the code?
    c. Does the computer include code specific software that is typically used to provide the service(s)?
    N/A

21. List all the equipment included in your recommendation and the equipment formula chosen *(*please see document titled *Calculating equipment time).* If you have selected "other formula" for any of the equipment please explain here:
    N/A

22. If there is any other item(s) on your spreadsheet not covered in the categories above that require greater detail/explanation, please include here:
    N/A

AMA/Specialty Society RVS Update Committee Summary of Recommendations

October 2021

Home and Residence Services – Tab 13

In February 2021, the CPT Editorial Panel deleted twelve of the domiciliary, rest home (e.g., boarding home) and custodial care services to merge these services with the home visit services. The eight revised codes describe home and residence services and align with the principles included in the office or other outpatient E/M office visits by documenting and selecting level of service based on total time or medical decision making.

In April 2021, the specialty societies surveyed the eight home and residence codes but did not obtain the required number of survey responses for the established patients (99347, 99348, 99349 and 99350). More importantly, responses from the predominant provider, such as nurse practitioners, for some of the services were not achieved (99344, 99345, 99349 and 99350). The specialty societies worked with the Research Subcommittee and developed a targeted survey sample methodology, using the Medicare Claims database to identify qualified healthcare professionals, focusing on nurse practitioners, who predominantly perform home visit services and matched them with societies to survey those individuals. The specialty societies also requested to limit the additional surveys to focus on obtaining valid responses from the predominant providers for codes 99344-99450. The Research Subcommittee approved the request to use a targeted survey sample in conjunction with their ongoing use of a random sample methodology. The RUC recommended that the home and residence services be postponed until October 2021 until valid responses were obtained.

New Patient

99341 ***Home or residence visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and straightforward medical decision making. When using total time on the date of the encounter for code selection, 15 minutes must be met or exceeded.***

The RUC surveyed 93 physicians, podiatrists and nurse practitioners and determined that the survey 25th percentile work RVU of 1.00 appropriately accounts for the physician or other qualified healthcare professional(QHP) work required to perform this service. The RUC recommends 6 minutes pre-service time, 15 minutes intra-service time and 6 minutes post-service time. The RUC noted that this service is currently performed by podiatrists 88% of the time based on 2019 Medicare utilization data, however, only 34% of the survey responses were from podiatrists. Therefore, the RUC recommends using the survey 25th percentile intra-service time of 15 minutes, instead of the median of 25 minutes. The 15 minutes of intra-service time is also the median intra-service time specified by the podiatrists who completed the survey. The RUC agreed that this adjustment in time represents a more appropriate intensity for this service. The RUC noted that podiatrists typically perform another CPT code in addition to these codes and any overlap in pre or post-service time would be reduced in the procedure code.

The RUC compared the surveyed code to the top key reference service 99202 *Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and straightforward medical decision making. When using time for code selection, 15-29 minutes of total time is spent on the date of the encounter* (work RVU = 0.93 and 20 minutes total time) and determined that the home or residence visit requires somewhat more physician/QHP work and is more complex than the office visit because the

patient population is more vulnerable, their conditions are more complex, and the physician/QHP is adjusting to providing all necessary care in an environment away from the office or hospital setting requiring them to bring all necessary supplies. In addition, the surveyed code typically involves 2 more minutes of total time relative to 99202.

The RUC compared the surveyed code to the second key reference service 99203 *Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and low level of medical decision making. When using time for code selection, 30-44 minutes of total time is spent on the date of the encounter* (work RVU = 1.60 and 35 minutes total time) and determined that the surveyed code is appropriately lower because it requires less time and a lower level of medical decision-making.

For additional support, the RUC referenced CPT codes 95907 *Nerve conduction studies; 1-2 studies* (work RVU = 1.00 and 15 minutes intra-service time) and 91111 *Gastrointestinal tract imaging, intraluminal (eg, capsule endoscopy), esophagus with interpretation and report* (work RVU = 1.00 and 18 minutes intra-service time) as these services require the same physician work and similar time to perform. **The RUC recommends a work RVU of 1.00 for CPT code 99341.**

99342 ***Home or residence visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and low medical decision making. When using total time on the date of the encounter for code selection, 30 minutes must be met or exceeded.***
The RUC surveyed 97 physicians, podiatrists and nurse practitioners and determined that the survey 25th percentile work RVU of 1.65 appropriately accounts for the physician or other qualified healthcare professional (QHP) work required to perform this service. The RUC recommends 10 minutes pre-service time, 32 minutes intra-service time and 10 minutes post-service time.

The RUC compared the surveyed code to the top key reference service 99203 *Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and low level of medical decision making. When using time for code selection, 30-44 minutes of total time is spent on the date of the encounter* (work RVU = 1.60 and 35 minutes total time) and determined that the home or residence visit requires somewhat more physician/QHP work and is more complex than the office visit because the patient population is more vulnerable, their conditions are more complex, and the physician/QHP is adjusting to providing all necessary care in an adjusting to providing all necessary care in an environment away from the office or hospital setting requiring them to bring all necessary supplies. In addition, the surveyed code typically involves 17 more minutes of total time relative to 99203.

The RUC compared the surveyed code to the second key reference service 99204 *Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. When using time for code selection, 45-59 minutes of total time is spent on the date of the encounter.* (work RVU = 2.60 and 60 minutes total time) and determined that the surveyed code is appropriately lower because it requires less time and a lower level of medical decision-making.

For additional support, the RUC referenced CPT codes 76873 *Ultrasound, transrectal; prostate volume study for brachytherapy treatment planning (separate procedure)* (work RVU = 1.55 and 30 minutes intra-service time) and 95924 *Testing of autonomic nervous system function; combined parasympathetic and sympathetic adrenergic function testing with at least 5 minutes of passive tilt* (work RVU = 1.73 and 30 minutes intra-service time). **The RUC recommends a work RVU of 1.65 for CPT code 99342.**

99344 ***Home or residence visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and moderate medical decision making. When using total time on the date of the encounter for code selection, 60 minutes must be met or exceeded.***
The RUC surveyed 72 physicians, podiatrists and nurse practitioners and determined that the survey 25th percentile work RVU of 2.87 appropriately accounts for the physician or other qualified healthcare professional (QHP) work required to perform this service. The RUC recommends 15 minutes pre-service time, 60 minutes intra-service time and 17 minutes post-service time.

The RUC compared the surveyed code to the top key reference service 99204 *Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. When using time for code selection, 45-59 minutes of total time is spent on the date of the encounter.* (work RVU = 2.60 and 60 minutes total time) and determined that the home or residence visit requires more physician/QHP work and is more complex than the office visit because the patient population is more vulnerable, their conditions are more complex, and the physician/QHP is adjusting to providing all necessary care in an environment away from the office or hospital setting requiring them to bring all necessary supplies. In addition, the surveyed code typically involves 32 more minutes of total time relative to 99204.

The RUC compared the surveyed code to the second top key reference service 99205 *Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and high level of medical decision making. When using time for code selection, 60-74 minutes of total time is spent on the date of the encounter.* (work RVU = 3.50 and 88 minutes total time) and determined that the surveyed code is appropriately lower because it requires less physician/QHP work and a lower level of medical decision-making.

For additional support, the RUC referenced CPT codes 74712 *Magnetic resonance (eg, proton) imaging, fetal, including placental and maternal pelvic imaging when performed; single or first gestation* (work RVU = 3.00 and 60 minutes intra-service time), 75563 *Cardiac magnetic resonance imaging for morphology and function without contrast material(s), followed by contrast material(s) and further sequences; with stress imaging* (work RVU = 3.00 and 60 minutes intra-service time), and 95912 *Nerve conduction studies; 11-12 studies* (work RVU = 3.00 and 60 minutes intra-service time) and noted that these services require the same intra-service time and similar work to perform. **The RUC recommends a work RVU of 2.87 for CPT code 99344.**

99345 ***Home or residence visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and high medical decision making. When using total time on the date of the encounter for code selection, 75 minutes must be met or exceeded.***
The RUC surveyed 72 physicians, podiatrists and nurse practitioners and determined that the survey 25th percentile work RVU of 3.88 appropriately accounts for the physician or other qualified healthcare professional (QHP) work required to perform this service. The RUC recommends 25 minutes pre-service time, 74 minutes intra-service time and 27 minutes post-service time.

The RUC compared the surveyed code to the top key reference service 99205 *Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and high level of medical decision making. When using time for code selection, 60-74 minutes of total time is spent on the date of the encounter.* (work RVU = 3.50 and 88 minutes total time) and determined

that the home or residence visit requires more physician/QHP work and is more complex than the office visit because the patient population is more vulnerable, their conditions are more complex, and the physician/QHP is adjusting to providing all necessary care in an environment away from the office or hospital setting requiring them to bring all necessary supplies. In addition, the surveyed code typically involves 38 more minutes of total time relative to 99205.

The RUC compared the surveyed code to the second top key reference service 99291 *Critical care, evaluation and management of the critically ill or critically injured patient; first 30-74 minutes.* (work RVU = 4.50 and 40 minutes intra-service time) and determined that the surveyed code is appropriately lower because it is a less intense service and requires less work to perform.

For additional support, the RUC referenced CPT codes 95720 *Electroencephalogram (EEG), continuous recording, physician or other qualified health care professional review of recorded events, analysis of spike and seizure detection, each increment of greater than 12 hours, up to 26 hours of EEG recording, interpretation and report after each 24-hour period; with video (VEEG)* (work RVU = 3.86 and 55 minutes intra-service time) and 38240 *Hematopoietic progenitor cell (HPC); allogeneic transplantation per donor* (work RVU = 4.00 and 60 minutes intra-service time) and noted that these services require similar physician work and time to perform and should be valued similarly. **The RUC recommends a work RVU of 3.88 for CPT code 99345.**

Established Patient

99347 ***Home or residence visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination straightforward medical decision making. When using total time on the date of the encounter for code selection, 20 minutes must be met or exceeded.***
The RUC surveyed 84 physicians, podiatrists and nurse practitioners and determined that the survey 25th percentile work RVU of 0.90 appropriately accounts for the physician or other qualified healthcare provider (QHP) work required to perform this service. The RUC recommends 5 minutes pre-service time, 20 minutes intra-service time and 5 minutes post-service time.

The RUC compared the surveyed code to the top key reference service 99212 *Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and straightforward medical decision making. When using time for code selection, 10-19 minutes of total time is spent on the date of the encounter.* (work RVU = 0.70 and 16 minutes total time) and determined that the home or residence visit requires more physician/QHP work and is more complex than the analogous established office visit with similar medical decision making, because the patient population is more vulnerable, their conditions are more complex, and the physician/QHP is adjusting to providing all necessary care in an environment away from the office or hospital setting requiring them to bring all necessary supplies. In addition, the surveyed code typically involves 14 more minutes of total time relative to 99212.

The RUC compared the surveyed code to the second top key reference service 99213 *Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and low level of medical decision making. When using time for code selection, 20-29 minutes of total time is spent on the date of the encounter.* (work RVU = 1.30 and 30 minutes total time) and determined that, even though both services have identical total times, the surveyed code is appropriately valued lower because it requires less physician/QHP work and a lower level of medical decision-making.

For additional support, the RUC referenced CPT codes 78227 *Hepatobiliary system imaging, including gallbladder when present; with pharmacologic intervention, including quantitative measurement(s) when performed* (work RVU = 0.90 and 15 minutes intra-service time) and 93307 *Echocardiography, transthoracic, real-time with image documentation (2D), includes M-mode recording, when performed, complete, without spectral or color Doppler echocardiography* (work RVU = 0.92 and 15 minutes intra-service time) and noted that these services require similar physician work and time to perform and should be valued similarly. **The RUC recommends a work RVU of 0.90 for CPT code 99347.**

99348 ***Home or residence visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination low medical decision making. When using total time on the date of the encounter for code selection, 30 minutes must be met or exceeded.***
The RUC surveyed 84 physicians, podiatrists and nurse practitioners and determined that the survey 25th percentile work RVU of 1.50 appropriately accounts for the physician or other qualified healthcare professional (QHP) work required to perform this service. The RUC recommends 7 minutes pre-service time, 29 minutes intra-service time and 10 minutes post-service time.

The RUC compared the surveyed code to the top key reference service 99213 *Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and low level of medical decision making. When using time for code selection, 20-29 minutes of total time is spent on the date of the encounter.* (work RVU = 1.30 and 30 minutes total time) and determined that the home or residence visit requires more physician/QHP work and is more complex than the analogous established office visit with similar medical decision making, because the patient population is more vulnerable, their conditions are more complex, and the physician/QHP is adjusting to providing all necessary care in an environment away from the office or hospital setting requiring them to bring all necessary supplies. In addition, the surveyed code typically involves 16 more minutes of total time relative to 99213.

The RUC compared the surveyed code to the second top key reference service 99214 *Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. When using time for code selection, 30-39 minutes of total time is spent on the date of the encounter.* (work RVU = 1.92 and 47 minutes total time) and determined that the surveyed code is appropriately valued lower because it requires less physician/QHP work and a lower level of medical decision-making.

For additional support, the RUC referenced CPT codes 72195 *Magnetic resonance (eg, proton) imaging, pelvis; without contrast material(s)* (work RVU = 1.46 and 20 minutes intra-service time) and 78491 *Myocardial imaging, positron emission tomography (PET), perfusion study (including ventricular wall motion[s] and/or ejection fraction[s], when performed); single study, at rest or stress (exercise or pharmacologic)* (work RVU = 1.56 and 15 minutes intra-service time) and noted that these services require similar physician work and should be valued similarly **The RUC recommends a work RVU of 1.50 for CPT code 99348.**

99349 ***Home or residence visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination moderate medical decision making. When using total time on the date of the encounter for code selection, 40 minutes must be met or exceeded.***
The RUC surveyed 76 physicians, podiatrists and nurse practitioners and determined that the survey 25th percentile work RVU of 2.44 appropriately accounts for the physician or other qualified healthcare professional (QHP) work required to perform this service. The RUC recommends 12 minutes pre-service time, 41 minutes intra-service time and 15 minutes post-service time.

The RUC compared the surveyed code to the top key reference service 99214 *Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. When using time for code selection, 30-39 minutes of total time is spent on the date of the encounter.* (work RVU = 1.92 and 47 minutes total time) and determined that the home or residence visit requires more physician/QHP work and is more complex than the analogous established office visit with similar medical decision making, because the patient population is more vulnerable, their conditions are more complex, and the physician/QHP is adjusting to providing all necessary care in an environment away from the office or hospital setting requiring them to bring all necessary supplies. In addition, the surveyed code typically involves 21 more minutes of total time relative to 99214.

The RUC compared the surveyed code to the second top key reference service 99215 *Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and high level of medical decision making. When using time for code selection, 40-54 minutes of total time is spent on the date of the encounter.* (work RVU = 2.80 and 70 minutes total time) and determined that the surveyed code is appropriately valued lower because it requires less physician/QHP work and a lower level of medical decision-making.

For additional support, the RUC referenced MPC code 75635 *Computed tomographic angiography, abdominal aorta and bilateral iliofemoral lower extremity runoff, with contrast material(s), including noncontrast images, if performed, and image postprocessing* (work RVU = 2.40 and 39 minutes intra-service time) and CPT code 95718 *Electroencephalogram (EEG), continuous recording, physician or other qualified health care professional review of recorded events, analysis of spike and seizure detection, interpretation and report, 2-12 hours of EEG recording; with video (VEEG)* (work RVU = 2.50 and 35 minutes intra-service time). **The RUC recommends a work RVU of 2.44 for CPT code 99349.**

99350 ***Home or residence visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination high medical decision making. When using total time on the date of the encounter for code selection, 60 minutes must be met or exceeded.***
The RUC surveyed 75 physicians, podiatrists and nurse practitioners and determined that the survey median work RVU of 3.60 appropriately accounts for the physician or other qualified healthcare professional (QHP) work required to perform this service. The RUC recommends 17 minutes pre-service time, 60 minutes intra-service time and 20 minutes post-service time.

The RUC compared the surveyed code to the top key reference service 99215 *Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and high level of medical decision making. When using time for code selection, 40-54 minutes of total time is spent on the date of the encounter.* (work RVU = 2.80 and 70 minutes total time) and determined that the home or residence visit requires more physician/QHP work, time and is more complex than the analogous established office

visit with similar medical decision making, because the patient population is more vulnerable, their conditions are more complex, and the physician/QHP is adjusting to providing all necessary care in an environment away from the office or hospital setting requiring them to bring all necessary supplies. In addition, the surveyed code typically involves 27 more minutes of total time relative to 99214.

The RUC compared the surveyed code to the second top key reference service 99205 *Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and high level of medical decision making. When using time for code selection, 60-74 minutes of total time is spent on the date of the encounter.* (work RVU = 3.50 and 88 minutes total time) and determined that the surveyed code requires the same level of medical decision-making, but requires slightly more time to perform, therefore is appropriately valued slightly higher. This service is the most intense of the home or residence services, these are patients who could reach hospital level care because they are hospital-adverse or because of the characteristics of their care goals, the plan is to keep them in the home environment.

For additional support, the RUC referenced CPT codes 75959 *Placement of distal extension prosthesis(s) (delayed) after endovascular repair of descending thoracic aorta, as needed, to level of celiac origin, radiological supervision and interpretation* (work RVU = 3.50 and 45 minutes intra-service time) and 50329 *Backbench reconstruction of cadaver or living donor renal allograft prior to transplantation; ureteral anastomosis, each* (work RVU = 3.34 and 45 minutes intra-service time). **The RUC recommends a work RVU of 3.60 for CPT code 99350.**

CPT Descriptor Time
The RUC recommends the following times for the CPT descriptors based on the survey medians. The times in the CPT descriptors were rounded from the survey intra-service time to be an increment between this family of services for the ease of those who may report these services based on time.

CPT Code	Descriptor	Time on the Date of Encounter Recommendation to CPT
99341	Home or residence visit new pt, straightforward MDM	**15**
99342	Home or residence visit new pt, low MDM	**30**
99344	Home or residence visit new pt, moderate MDM	**60**
99345	Home or residence visit new pt, high MDM	**75**
99347	Home or residence visit est pt, straightforward MDM	**20**
99348	Home or residence visit est pt, low MDM	**30**
99349	Home or residence visit est pt, moderate MDM	**40**
99350	Home or residence visit est pt, high MDM	**60**

Practice Expense
The Practice Expense Subcommittee reviewed the non-facility direct practice expense inputs and adjusted the supplies for the typical patient by removing SM025 *specula tip, otoscope,* SK062 *patient education booklet* and SJ061 *tongue depressor* for established patient codes 99347, 99348, 99349 and 99350. The Subcommittee also made a revision to 99347 to remove the phone call for CA038 *Coordinate post-procedure services* reflecting the typical specialty (podiatry). **The RUC recommends the direct practice expense inputs as modified by the Practice Expense Subcommittee.**

Work Neutrality
The RUC's recommendation for this family of codes will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

CPT Code	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
Evaluation and Management **Domiciliary, Rest Home (eg, Boarding Home), or Custodial Care Services** ~~The following codes are used to report evaluation and management services in a facility which provides room, board and other personal assistance services, generally on a long-term basis. These codes include evaluation and management services provided in an assisted living facility, group home, custodial care, and intermediate care facilities.~~ ~~The facility's services do not include a medical component.~~ ~~For definitions of key components and commonly used terms, please see **Evaluation and Management Services Guidelines.**~~ ~~(For care plan oversight services provided to a patient in a domiciliary facility under the care of a home health agency, see 99374, 99375, and for hospice agency, see 99377, 99378. For care plan oversight provided to a patient not under hospice or home health agency care, see 99339, 99340)~~ **New Patient** (99324, 99325, 99326, 99327, 99328 have been deleted. For domiciliary, rest home [eg, boarding home], or custodial care services, new patient, see home and residence services codes 99341, 99342, 99344, 99345)				
~~99324~~	-	~~Domiciliary or rest home visit for the evaluation and management of a new patient, which requires these 3 key components:~~ • ~~**A problem focused history;**~~ • ~~**A problem focused examination; and**~~	~~XXX~~	~~N/A~~ (2021 work RVU = 1.01)

		• **Straightforward medical decision making.** Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of low severity. Typically, 20 minutes are spent with the patient and/or family or caregiver.		
99325	-	Domiciliary or rest home visit for the evaluation and management of a new patient, which requires these 3 key components: • **An expanded problem focused history;** • **An expanded problem focused examination; and** • **Medical decision making of low complexity.** Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate severity. Typically, 30 minutes are spent with the patient and/or family or caregiver.	XXX	N/A (2021 work RVU = 1.52)
99326	-	Domiciliary or rest home visit for the evaluation and management of a new patient, which requires these 3 key components: • **A detailed history;** • **A detailed examination; and** • **Medical decision making of moderate complexity.** Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Typically, 45 minutes are spent with the patient and/or family or caregiver.	XXX	N/A (2021 work RVU = 2.63)

~~99327~~	-	~~Domiciliary or rest home visit for the evaluation and management of a new patient, which requires these 3 key components:~~ • ~~**A comprehensive history;**~~ • ~~**A comprehensive; and**~~ • ~~**Medical decision making of moderate complexity.**~~ ~~Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs.~~ ~~Usually, the presenting problem(s) are of high severity. Typically, 60 minutes are spent with the patient and/or family or caregiver.~~	~~XXX~~	~~N/A~~ (2021 work RVU = 3.46)
~~99328~~	-	~~Domiciliary or rest home visit for the evaluation and management of a new patient, which requires these 3 key components:~~ • ~~**A comprehensive history;**~~ • ~~**A comprehensive; and**~~ • ~~**Medical decision making of high complexity.**~~ ~~Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs.~~ ~~Usually, the patient is unstable or has developed a significant new problem requiring immediate physician attention. Typically, 75 minutes are spent with the patient and/or family or caregiver.~~	~~XXX~~	~~N/A~~ (2021 work RVU = 4.09)
Established Patient (99334, 99335, 99336, 99337 have been deleted. For domiciliary, rest home [eg, boarding home], or custodial care services, established patient, see home and residence services codes 99347, 99348, 99349, 99350)				
~~99334~~	-	~~Domiciliary or rest home visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components:~~ • ~~**A problem focused history;**~~	~~XXX~~	~~N/A~~ (2021 work RVU = 1.07)

		• **A problem focused examination;** • **Straightforward medical decision making.** Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are self-limited or minor. Typically, 15 minutes are spent with the patient and/or family or caregiver.		
99335	-	Domiciliary or rest home visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: • **An expanded problem focused history;** • **An expanded problem focused examination;** • **Medical decision making of low complexity.** Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of low to moderate severity. Typically, 25 minutes are spent with the patient and/or family or caregiver.	XXX	N/A (2021 work RVU = 1.72)
99336	-	Domiciliary or rest home visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: • **A detailed interval history;** • **A detailed examination;** • **Medical decision making of moderate complexity.** Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Typically, 40 minutes are spent with the patient and/or family or	XXX	N/A (2021 work RVU = 2.46)

		~~caregiver.~~		
~~99337~~	-	~~Domiciliary or rest home visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components:~~ • ~~**A comprehensive interval history;**~~ • ~~**A comprehensive examination;**~~ • ~~**Medical decision making of moderate to high complexity.**~~ ~~Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs.~~ ~~Usually, the presenting problem(s) are of moderate to high severity. ~~99339~~	-	~~Individual physician supervision of a patient (patient not present) in home, domiciliary or rest home (eg, assisted living facility) requiring complex and multidisciplinary care modalities involving regular physician development and/or revision of care plans, review of subsequent reports of patient status, review of related laboratory and other studies, communication (including telephone calls) for purposes of assessment or care decisions with health care professional(s), family member(s), surrogate decision maker(s) (eg, legal guardian) and/or key caregiver(s) involved in patient's care, integration of new information into the medical treatment plan and/or adjustment of medical therapy,~~	~~XXX~~	~~N/A~~ (2021 work RVU = 1.25)

		~~within a calendar month; 15-29 minutes~~		
~~99340~~	-	~~30 minutes or more~~ ~~(Do not report 99339, 99340 for patients under the care of a home health agency, enrolled in a hospice program, or for nursing facility residents)~~ ~~(Do not report 99339, 99340 during the same month with 99487-99489)~~	~~XXX~~	~~N/A~~ (2021 work RVU = 1.80)

Home and Residence Services

The following codes are used to report evaluation and management services provided in a home or residence. Home may be defined as a private residence, temporary lodging, or short term accommodation (eg, hotel, campground, hostel, or cruise ship).

For definitions of ~~key components and~~ commonly used terms, ~~please~~ see **Evaluation and Management Services Guidelines.**

~~(For care plan oversight services provided to a patient in the home under the care of a home health agency, see 99374, 99375, and for hospice agency, see 99377, 99378. For care plan oversight provided to a patient under hospice or home health agency care, see 99339, 99340)~~

These codes are also used when the residence is an assisted living facility, group home (that is not licensed as an intermediate care facility for individuals with intellectual disabilities), custodial care facility, or residential substance abuse treatment facility.

For services in an intermediate care facility for individuals with intellectual disabilities and services provided in a psychiatric residential treatment center, see **Nursing Facility Services**.

When selecting code level using time, do not count any travel time.

To report services when a patient is admitted to hospital inpatient, observation status, or to a nursing facility in the course of an encounter in another setting, see **Initial Hospital Inpatient and Observation Care** or **Initial Nursing Facility Care**.

New Patient				
▲99341	J1	**Home or residence visit** for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and straightforward medical decision making. ~~these 3 key components:~~ • ~~**A problem focused history;**~~ • ~~**A problem focused examination; and**~~ • ~~**Straightforward medical decision making.**~~ ~~Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs.~~ ~~Usually, the presenting problem(s) are of low severity. Typically, 20 minutes are spent with the patient and/or family or caregiver.~~ When using total time on the date of the encounter for code selection, 15 minutes must be met or exceeded.	XXX	1.00
▲99342	J2	**Home or residence visit** for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and low level of medical decision making. ~~these 3 key components:~~ • ~~**An expanded problem focused history;**~~ • ~~**An expanded problem focused examination; and**~~ • ~~**Medical decision making of low complexity.**~~ ~~Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs.~~ ~~Usually, the presenting problem(s) are of moderate severity. ~~99343~~	-	~~**Home visit** for the evaluation and management of a new patient, which requires these 3 key components:~~ • ~~**A detailed history;**~~ • ~~**A detailed examination; and**~~ • ~~**Medical decision making of moderate complexity.**~~ ~~Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs.~~ ~~Usually, the presenting problem(s) are of moderate to high severity. Typically, 45 minutes are spent face-to-face with the patient and/or family.~~ (99343 has been deleted. To report, see 99341, 99342, 99344, 99345)	~~XXX~~	~~N/A~~
▲99344	J3	**Home or residence visit** for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. ~~these 3 key components:~~ • ~~**A comprehensive history;**~~ • ~~**A comprehensive examination; and**~~ • ~~**Medical decision making of moderate complexity.**~~ ~~Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs.~~ ~~Usually, the presenting problem(s) are of high severity. Typically, 60 minutes are spent face-to-face with the patient and/or family.~~ When using total time on the date of the encounter for code selection, 60 minutes must be met or exceeded.	XXX	2.87

▲99345	J4	**Home or residence visit** for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and high level of medical decision making. ~~these 3 key components:~~ • ~~**A comprehensive history;**~~ • ~~**A comprehensive examination; and**~~ • ~~**Medical decision making of high complexity.**~~ ~~Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs.~~ ~~Usually, the patient is unstable or has developed a significant new problem requiring immediate physician attention. Typically, 75 minutes are spent face-to-face with the patient and/or family.~~ When using total time on the date of the encounter for code selection, 75 minutes must be met or exceeded. (For services 90 minutes or longer, see prolonged services code 99417)	XXX	3.88
Established Patient				
▲99347	J5	**Home or residence visit** for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination straightforward medical decision making. ~~at least 2 of these 3 key components:~~ • ~~**A problem focused history;**~~ • ~~**A problem focused examination; and**~~ • ~~**Straightforward medical decision making.**~~ ~~Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs.~~ ~~Usually, the presenting problem(s) are self limited or minor. Typically, 15 minutes are spent face-to-face with the patient and/or family.~~ When using total time on the date of the encounter for code selection, 20 minutes must be met or exceeded.	XXX	0.90

▲99348	J6	**Home or residence visit** for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and low level of medical decision making. ~~at least 2 of these 3 key components:~~ • ~~**An expanded problem focused interval history;**~~ • ~~**An expanded problem focused examination;**~~ • ~~**Medical decision making of low complexity.**~~ ~~Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs.~~ ~~Usually, the presenting problem(s) are of low to moderate severity. Typically, 25 minutes are spent face-to-face with the patient and/or family.~~ When using total time on the date of the encounter for code selection, 30 minutes must be met or exceeded.	XXX	1.50
▲99349	J7	**Home or residence visit** for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. ~~at least 2 of these 3 key components:~~ • ~~**A detailed interval history;**~~ • ~~**A detailed examination;**~~ • ~~**Medical decision making of moderate complexity.**~~ ~~Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs.~~ ~~Usually, the presenting problem(s) are moderate to high severity. Typically, 40 minutes are spent face-to-face with the patient and/or family.~~ When using total time on the date of the encounter for code selection, 40 minutes must be met or exceeded.	XXX	2.44

▲99350	J8	**Home <u>or residence</u> visit** for the evaluation and management of an established patient, which requires <u>a medically appropriate history and/or examination and high level of medical decision making.</u> ~~at least 2 of these 3 key components:~~ • ~~**A comprehensive interval history;**~~ • ~~**A comprehensive examination;**~~ • ~~**Medical decision making of moderate to high complexity.**~~ ~~Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs.~~ ~~Usually, the presenting problem(s) are of moderate to high severity. The patient may be unstable or may have developed a significant new problem requiring immediate physician attention. Typically, 60 minutes are spent face-to-face with the patient and/or family.~~ <u>When using total time on the date of the encounter for code selection, 60 minutes must be met or exceeded.</u> <u>(For services 75 minutes or longer, see prolonged service code 99417)</u>	XXX	3.60

CPT 2023 E/M Guidelines

Category I
Evaluation and Management (E/M) Services Guidelines

In addition to the information presented in the Introduction, several other items unique to this section are defined or identified here.

E/M Guidelines Overview

The E/M guidelines have sections that are common to all E/M categories and sections that are category specific. Most of the categories and many of the subcategories of service have special guidelines or instructions unique to that category or subcategory. Where these are indicated, eg, "Hospital Inpatient and Observation Care," special instructions are presented before the listing of the specific E/M services codes. It is important to review the instructions for each category or subcategory. These guidelines are to be used by the reporting physician or other qualified health care professional to select the appropriate level of service. These guidelines do not establish documentation requirements or standards of care. The main purpose of documentation is to support care of the patient by current and future health care team(s). These guidelines are for services that require a face-to-face encounter. (For 99211 and 99281 the face-to-face services may be performed by clinical staff).

In the **Evaluation and Management** section (99202-99499) there are many code categories. Each category may have specific guidelines, or the codes may include specific details. These E/M guidelines are written for the following categories:

- Office or Other Outpatient Services
- Hospital Inpatient and Observation Care Services
- Consultations
- Emergency Department Services
- Nursing Facility Services
- Home and Residence Services
- Prolonged Service With or Without Direct Contact on the Date of an Evaluation and Management Service

Classification of Evaluation and Management (E/M) Services

The E/M section is divided into broad categories such as office visits, hospital inpatient or observation care visits, and consultations. Most of the categories are further divided into two or more subcategories of E/M services. For example, there are two subcategories of office visits (new patient and established patient) and there are two subcategories of hospital inpatient and observation care visits (initial and subsequent). The subcategories of E/M services are further classified into levels of E/M services that are identified by specific codes.

The basic format of codes with levels of E/M services based on medical decision making (MDM) or time is the same. First, a unique code number is listed. Second, the place and/or type of service is specified, eg, office or other outpatient visit. Third, the content of the service is defined. Fourth, time is specified. (A detailed discussion of time is provided following the Decision Tree for New vs Established Patients.)

The place of service and service type is defined by the location where the face-to-face encounter occurs. For example, service provided to a nursing facility resident brought to the office is reported with an office or other outpatient code.

New and Established Patients

Solely for the purposes of distinguishing between new and established patients, professional services are those face-to-face services rendered by physicians and other qualified health care professionals who may report evaluation and management services. A new patient is one who has not received any professional services from the physician or other qualified health care professional or another physician or other qualified health care professional of the exact same specialty and subspecialty who belongs to the same group practice, within the past three years.

An established patient is one who has received professional services from the physician or other qualified health care professional or another physician or other qualified health care professional of the exact same specialty and subspecialty who belongs to the same group practice, within the past three years. See Decision Tree for New vs Established Patients.

In the instance where a physician or other qualified health care professional is on call for or covering for another physician or other qualified health care professional, the patient's encounter will be classified as it would have been by the physician or other qualified health care professional who is not available. When advanced practice nurses and physician assistants are working with physicians, they are considered as working in the exact same specialty and subspecialty as the physician.

No distinction is made between new and established patients in the emergency department. E/M services in the emergency department category may be reported for any new or established patient who presents for treatment in the emergency department.

The Decision Tree for New vs Established Patients is provided to aid in determining whether to report the E/M service provided as a new or an established patient encounter.

Coding Tip

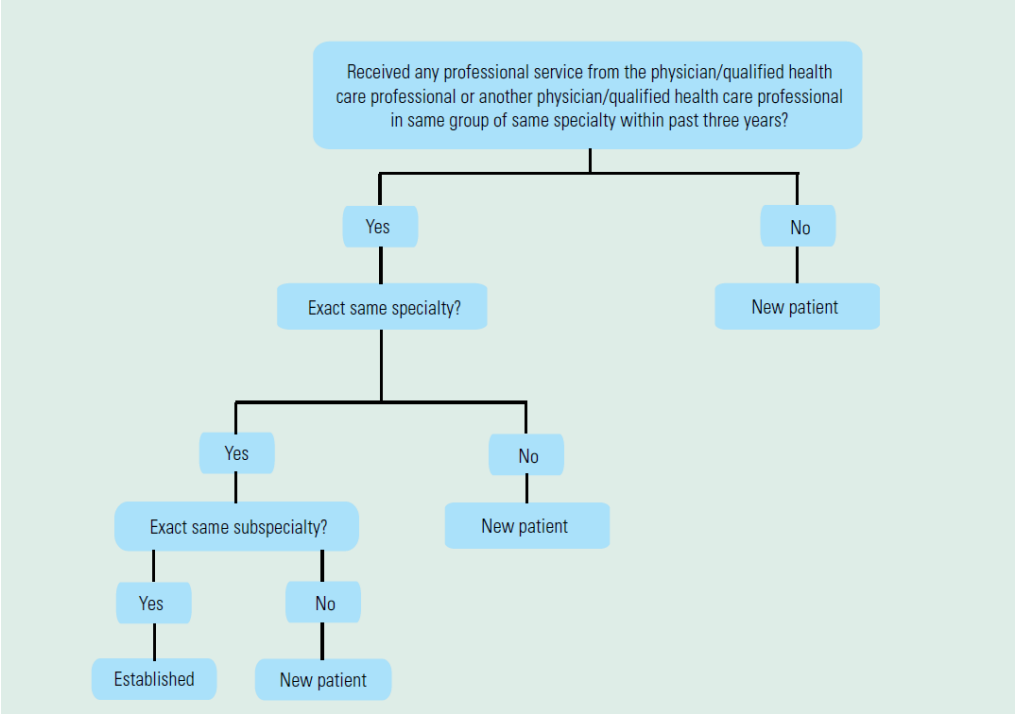
Instructions for Use of the CPT Codebook

When advanced practice nurses and physician assistants are working with physicians, they are considered as working in the exact same specialty and exact same subspecialty as the physician. A "physician or other qualified health care professional" is an individual who is qualified by education, training, licensure/regulation (when applicable), and facility privileging (when applicable) who performs a professional service within his or her scope of practice and independently reports that professional service. These professionals are distinct from "clinical staff." A clinical staff member is a person who works under the supervision of a physician or other qualified health care professional, and who is allowed by law, regulation and facility policy to perform or assist in the performance of a specific professional service but does not individually report that professional service. Other policies may also affect who may report specific services.

CPT Coding Guidelines, Introduction, Instructions for Use of the CPT Codebook

---

Decision Tree for New vs Established Patients



Initial and Subsequent Services

Some categories apply to both new and established patients (eg, hospital inpatient or observation care). These categories differentiate services by whether the service is the initial service or a subsequent service. For the purpose of distinguishing between initial or subsequent visits, professional services are those face-to-face services rendered by physicians and other qualified health care professionals who may report evaluation and management services. An initial service is when the patient has not received any professional services from the physician or other qualified health care professional or another physician or other qualified health care professional of the exact same specialty and subspecialty who belongs to the same group practice, during the inpatient or observation or nursing facility admission and stay.

A subsequent service is when the patient has received professional service(s) from the physician or other qualified health care professional or another physician or other qualified health care professional of the exact same specialty and subspecialty who belongs to the same group practice, during the admission and stay.

In the instance where a physician or other qualified health care professional is on call for or covering for another physician or other qualified health care professional, the patient's encounter will be classified as it would have been by the physician or other qualified health care professional who is not available. When advanced practice nurses and physician assistants are working with physicians, they are considered as working in the exact same specialty and subspecialty as the physician.

For reporting hospital inpatient or observation care services, a stay that includes a transition from observation to inpatient is a single stay. For reporting nursing facility services, a stay that includes transition(s) between skilled nursing facility and nursing facility level of care is the same stay.

Services Reported Separately

Any specifically identifiable procedure or service (ie, identified with a specific CPT code) performed on the date of E/M services may be reported separately.

The ordering and actual performance and/or interpretation of diagnostic tests/studies during a patient encounter are not included in determining the levels of E/M services when the professional interpretation

of those tests/studies is reported separately by the physician or other qualified health care professional reporting the E/M service. Tests that do not require separate interpretation (eg, tests that are results only) and are analyzed as part of MDM do not count as an independent interpretation and may be counted as ordered or reviewed for selecting an MDM level.

The performance of diagnostic tests/studies for which specific CPT codes are available may be reported separately, in addition to the appropriate E/M code. The interpretation of the results of diagnostic tests/studies (ie, professional component) with preparation of a separate distinctly identifiable signed written report may also be reported separately, using the appropriate CPT code and, if required, with modifier 26 appended.

See Instructions for Selecting a Level Based on MDM or Time.

The physician or other qualified health care professional may need to indicate that on the day a procedure or service identified by a CPT code was performed, the patient's condition required a significant separately identifiable E/M service. The E/M service may be caused or prompted by the symptoms or condition for which the procedure and/or service was provided. This circumstance may be reported by adding modifier 25 to the appropriate level of E/M service. As such, different diagnoses are not required for reporting of the procedure and the E/M services on the same date.

History and/or Examination

These E/M services include a medically appropriate history and/or physical examination, when performed. The nature and extent of the history and/or physical examination are determined by the treating physician or other qualified health care professional reporting the service. The care team may collect information, and the patient or caregiver may supply information directly (eg, by electronic health record [EHR] portal or questionnaire) that is reviewed by the reporting physician or other qualified health care professional. The extent of history and physical examination is not an element in selection of the level of these E/M service codes.

Levels of E/M Services

Select the appropriate level of E/M services based on the following:

1. The level of the MDM as defined for each service, **or**

2. The total time for E/M services performed on the date of the encounter.

Within each category or subcategory of E/M service based on MDM or time, there are three to five levels of E/M services available for reporting purposes. Levels of E/M services are **not** interchangeable among the different categories or subcategories of service. For example, the first level of E/M services in the subcategory of office visit, new patient, does not have the same definition as the first level of E/M services in the subcategory of office visit, established patient. Each level of E/M services may be used by all physicians or other qualified health care professionals.

Guidelines for Selecting a level service based on Medical Decision Making

Four types of MDM are recognized: straightforward, low, moderate, and high. The concept of the level of MDM does not apply to 99211 or 99281.

MDM includes establishing diagnoses, assessing the status of a condition, and/or selecting a management option. MDM is defined by three elements. The elements are:

- ***The number and complexity of problem(s) that are addressed during the encounter***.
- ***The amount and/or complexity of data to be reviewed and analyzed.*** These data include medical records, tests, and/or other information that must be obtained, ordered, reviewed, and analyzed for the encounter. This includes information obtained from multiple sources or interprofessional communications that are not reported separately and interpretation of tests that are not reported

separately. Ordering a test is included in the category of test result(s) and the review of the test result is part of the encounter and not a subsequent encounter. Ordering a test may include those considered, but not selected after shared decision making. For example, a patient may request diagnostic imaging that is not necessary for their condition and discussion of the lack of benefit may be required. Alternatively, a test may normally be performed, but due to risk for a specific patient is not ordered. These considerations must be documented. Data are divided into three categories:

- Tests, documents, orders, or independent historian(s). (Each unique test, order, or document is counted to meet a threshold number.)
- Independent interpretation of tests (not separately reported)
- Discussion of management or test interpretation with external physician or other qualified health care professional or appropriate source (not separately reported)

- **The risk of complications and/or morbidity or mortality of patient management:** This includes decisions made at the encounter associated with the diagnostic procedure(s) and treatment(s). This includes the possible management options selected and those considered but not selected, after shared decision making with the patient and/or family. For example, a decision about hospitalization includes consideration of alternative levels of care. Examples may include a psychiatric patient with a sufficient degree of support in the outpatient setting or the decision to not hospitalize a patient with advanced dementia with an acute condition that would generally warrant inpatient care, but for whom the goal is palliative treatment.

Shared decision making involves eliciting patient and/or family preferences, patient and/or family education, and explaining risks and benefits of management options.

MDM may be impacted by role and management responsibility.

When the physician or other qualified health care professional is reporting a separate CPT code that includes interpretation and/or report, the interpretation and/or report is not counted toward the MDM when selecting a level of E/M services.

When the physician or other qualified health care professional is reporting a separate service for discussion of management with a physician or another qualified health care professional, the discussion is not counted toward the MDM when selecting a level of E/M services.

The Levels of Medical Decision Making (MDM) table (Table 2) is a guide to assist in selecting the level of MDM for reporting an E/M services code. The table includes the four levels of MDM (ie, straightforward, low, moderate, high) and the three elements of MDM (ie, number and complexity of problems addressed at the encounter, amount and/or complexity of data reviewed and analyzed, and risk of complications and/or morbidity or mortality of patient management). To qualify for a particular level of MDM, two of the three elements for that level of MDM must be met or exceeded.

Examples in the table may be more or less applicable to specific settings of care. For example, the decision to hospitalize applies to the outpatient or nursing facility encounters, whereas the decision to escalate hospital level of care (eg, transfer to ICU) applies to the hospitalized or observation care patient.

See also the introductory guidelines of each code family section.

Table 2: Levels of Medical Decision Making (MDM)

Level of MDM (Based on 2 out of 3 Elements of MDM)	Elements of Medical Decision Making		
	Number and Complexity of Problems Addressed at the Encounter	Amount and/or Complexity of Data to be Reviewed and Analyzed **Each unique test, order, or document contributes to the combination of 2 or combination of 3 in Category 1 below.*	Risk of Complications and/or Morbidity or Mortality of Patient Management
N/A	N/A	N/A	N/A
Straightforward	Minimal • 1 self-limited or minor problem	Minimal or none	Minimal risk of morbidity from additional diagnostic testing or treatment
Low	Low • 2 or more self-limited or minor problems; or • 1 stable, chronic illness; or • 1 acute, uncomplicated illness or injury or • 1 stable acute illness or • 1 acute, uncomplicated illness or injury requiring hospital inpatient or observation level of care	Limited *(Must meet the requirements of at least 1 of the 2 categories*) Category 1: Tests and documents • Any combination of 2 from the following: ○ Review of prior external note(s) from each unique source*; ○ Review of the result(s) of each unique test*; ○ Ordering of each unique test* or Category 2: Assessment requiring an independent historian(s) *(For the categories of independent interpretation of tests and discussion of management or test interpretation, see moderate or high)*	Low risk of morbidity from additional diagnostic testing or treatment

Moderate	Moderate
	• 1 or more chronic illnesses with exacerbation, progression, or side effects of treatment;
	or
	• 2 or more stable, chronic illnesses;
	or
	• 1 undiagnosed new problem with uncertain prognosis;
	or
	• 1 acute illness with systemic symptoms;
	or
	• 1 acute, complicated injury
		Moderate
		(Must meet the requirements of at least 1 out of 3 categories)
		Category 1: Tests, documents, or independent historian(s)
		• Any combination of 3 from the following:
		  ○ Review of prior external note(s) from each unique source*;
		  ○ Review of the result(s) of each unique test*;
		  ○ Ordering of each unique test*;
		  ○ Assessment requiring an independent historian(s)
		or
		Category 2: Independent interpretation of tests
		• Independent interpretation of a test performed by another physician/other qualified health care professional (not separately reported);
		or
		Category 3: Discussion of management or test interpretation
		• Discussion of management or test interpretation with external physician/other qualified health care professional/appropriate source (not separately reported)
			Moderate risk of morbidity from additional diagnostic testing or treatment
			
			Examples only:
			• Prescription drug management
			• Decision regarding minor surgery with identified patient or procedure risk factors
			• Decision regarding elective major surgery without identified patient or procedure risk factors
			• Diagnosis or treatment significantly limited by social determinants of health

High	High
	• 1 or more chronic illnesses with severe exacerbation, progression, or side effects of treatment;
	or
	• 1 acute or chronic illness or injury that poses a threat to life or bodily function
		Extensive
		(Must meet the requirements of at least 2 out of 3 categories)
		
		Category 1: Tests, documents, or independent historian(s)
		• Any combination of 3 from the following:
		  ○ Review of prior external note(s) from each unique source*;
		  ○ Review of the result(s) of each unique test*;
		  ○ Ordering of each unique test*;
		  ○ Assessment requiring an independent historian(s)
		or
		Category 2: Independent interpretation of tests
		• Independent interpretation of a test performed by another physician/other qualified health care professional (not separately reported);
		or
		Category 3: Discussion of management or test interpretation
		• Discussion of management or test interpretation with external physician/other qualified health care professional/appropriate source (not separately reported)
			High risk of morbidity from additional diagnostic testing or treatment
			
			Examples only:
			• Drug therapy requiring intensive monitoring for toxicity
			• Decision regarding elective major surgery with identified patient or procedure risk factors
			• Decision regarding emergency major surgery
			• Decision regarding hospitalization or escalation of hospital-level of care
			• Decision not to resuscitate or to de-escalate care because of poor prognosis
			• Parenteral controlled substances

Number and Complexity of Problems Addressed at the Encounter

One element used in selecting the level of services is the number and complexity of the problems that are addressed at the encounter. Multiple new or established conditions may be addressed at the same time and may affect MDM. Symptoms may cluster around a specific diagnosis and each symptom is not necessarily a unique condition. Comorbidities and underlying diseases, in and of themselves, are not considered in selecting a level of E/M services **unless** they are addressed, and their presence increases the amount and/or complexity of data to be reviewed and analyzed or the risk of complications and/or morbidity or mortality of patient management. The final diagnosis for a condition does not, in and of itself, determine the complexity or risk, as extensive evaluation may be required to reach the conclusion that the signs or symptoms do not represent a highly morbid condition. Therefore, presenting symptoms which are likely to represent a highly morbid condition may drive MDM even when the ultimate diagnosis is not highly morbid. The evaluation and /or treatment should be consistent with the likely nature of the condition. Multiple problems of a lower severity may, in the aggregate, create higher risk due to interaction.

The term "risk" as used in these definitions relates to risk from the condition. While condition risk and management risk may often correlate, the risk from the condition is distinct from the risk of the management.

Definitions for the elements of MDM (see Table 2, Levels of Medical Decision Making) are:

Problem: *A problem is a disease, condition, illness, injury, symptom, sign, finding, complaint, or other matter addressed at the encounter, with or without a diagnosis being established at the time of the encounter.*

Problem addressed: A problem is addressed or managed when it is evaluated or treated at the encounter by the physician or other qualified health care professional reporting the service. This includes consideration of further testing or treatment that may not be elected by virtue of risk/benefit analysis or patient/parent/guardian/surrogate choice. Notation in the patient's medical record that another professional is managing the problem without additional assessment or care coordination documented does not qualify as being addressed or managed by the physician or other qualified health care professional reporting the service. Referral without evaluation (by history, examination, or diagnostic study[ies]) or consideration of treatment does not qualify as being addressed or managed by the physician or other qualified health care professional reporting the service. For hospital inpatient and observation care services, the problem addressed is the problem status on the date of the encounter, which may be significantly different than on admission. It is the problem being managed or co-managed by the reporting physician or qualified health care professional and may not be the cause of admission or continued stay.

Minimal problem: A problem that may not require the presence of the physician or other qualified health care professional, but the service is provided under the physician's or other qualified health care professional's supervision (see 99211, 99281).

Self-limited or minor problem: *A problem that runs a definite and prescribed course, is transient in nature, and is not likely to permanently alter health status.*

Stable, chronic illness: A problem with an expected duration of at least one year or until the death of the patient. For the purpose of defining chronicity, conditions are treated as chronic whether or not stage or severity changes (eg, uncontrolled diabetes and controlled diabetes are a single chronic condition). "Stable" for the purposes of categorizing MDM is defined by the specific treatment goals for an individual patient. A patient who is not at his or her treatment goal is not stable, even if the condition has not changed and there is no short-term threat to life or function. For example, a patient with persistently poorly controlled blood pressure for whom better control is a goal is not stable, even if the pressures are not changing and the patient is asymptomatic. The risk of morbidity **without** treatment is significant.

Acute, uncomplicated illness or injury: A recent or new short-term problem with low risk of morbidity for which treatment is considered. There is little to no risk of mortality with treatment, and full recovery without functional impairment is expected. A problem that is normally self-limited or minor but is not resolving consistent with a definite and prescribed course is an acute, uncomplicated illness.

Acute, uncomplicated illness or injury requiring hospital inpatient or observation level care: A recent or new short-term problem with low risk of morbidity for which treatment is required. There is little to no risk of mortality with treatment, and full recovery without functional impairment is expected. The treatment required is delivered in a hospital inpatient or observation level setting.

Stable, acute illness: A problem that is new or recent for which treatment has been initiated. The patient is improved and while resolution may not be complete is stable with respect to this condition.

Chronic illness with exacerbation, progression, or side effects of treatment: A chronic illness that is acutely worsening, poorly controlled, or progressing with an intent to control progression and requiring additional supportive care or requiring attention to treatment for side effects.

Undiagnosed new problem with uncertain prognosis: A problem in the differential diagnosis that represents a condition likely to result in a high risk of morbidity without treatment.

Acute illness with systemic symptoms: An illness that causes systemic symptoms and has a high risk of morbidity without treatment. For systemic general symptoms, such as fever, body aches, or fatigue in a minor illness that may be treated to alleviate symptoms, see the definitions for **self-limited or minor problem** or **acute, uncomplicated illness or injury.** Systemic symptoms may not be general but may be single system.

Acute, complicated injury: An injury which requires treatment that includes evaluation of body systems that are not directly part of the injured organ, the injury is extensive, or the treatment options are multiple and/or associated with risk of morbidity.

Chronic illness with severe exacerbation, progression, or side effects of treatment: The severe exacerbation or progression of a chronic illness or severe side effects of treatment that have significant risk of morbidity and may require escalation in level of care.

Acute or chronic illness or injury that poses a threat to life or bodily function: An acute illness with systemic symptoms, an acute complicated injury, or a chronic illness or injury with exacerbation and/or progression or side effects of treatment, that poses a threat to life or bodily function in the near term without treatment. Some symptoms may represent a condition that is significantly probable and poses a potential threat to life or bodily function. These may be included in this category when the evaluation and treatment is consistent with this degree of potential severity.

Amount and/or Complexity of Data to be Reviewed and Analyzed

One element used in selecting the level of services is the amount and/or complexity of data to be reviewed or analyzed at an encounter.

Analyzed: Analyzed is a term describing the process of using the data as part of the MDM. The data element itself may not be subject to analysis (eg, glucose), but it is instead included in the thought processes for diagnosis, evaluation, or treatment. Tests ordered are presumed to be analyzed when the results are reported. Therefore, when they are ordered during an encounter, they are counted in that encounter. Tests that are ordered outside of an encounter may be counted in the encounter where they are analyzed. In the case of a recurring order, each new result may be counted in the encounter at which it is analyzed. For example, an encounter that includes an order for monthly prothrombin times would count for one prothrombin time ordered and reviewed. Additional future results, if analyzed in a subsequent encounter, may be counted as a single test in that subsequent encounter. Any service for which the professional component is separately reported by the physician or other qualified health care professional

reporting the E/M services is not counted as a data element ordered, reviewed, analyzed, or independently interpreted for the purposes of determining the level of MDM.

Test: Tests are imaging, laboratory, psychometric, or physiologic data. A clinical laboratory panel (eg, basic metabolic panel [80047]) is a single test. The differentiation between single or multiple tests is defined in accordance with the CPT code set. For the purposes of data reviewed and analyzed, pulse oximetry is not a test.

Unique: A unique test is defined by the CPT code set. When multiple results of the same unique test (eg, serial blood glucose values) are compared during an E/M service, only count one unique test. Tests that have overlapping elements are not unique, even if they are identified with distinct CPT codes. For example, a CBC with differential would incorporate the set of hemoglobin, CBC without differential, and platelet count. A unique source is defined as a physician or qualified heath care professional in a distinct group or different specialty or subspecialty, or a unique entity. Review of all materials from any unique source counts as one element towards MDM.

Combination of Data Elements: A combination of different data elements, for example a combination of notes reviewed, tests ordered, tests reviewed, or independent historian, allows these elements to be summed. It does not require each item type or category to be represented. A unique test ordered, plus a note reviewed and an independent historian would be a combination of three elements.

External: *External records, communications and/or test results are from an external physician, other qualified health care professional, facility, or health care organization.*

External physician or other qualified health care professional: *An external physician or other qualified health care professional who is not in the same group practice or is of a different specialty or subspecialty. This includes licensed professionals who are practicing independently. The individual may also be a facility or organizational provider such as from a hospital, nursing facility, or home health care agency.*

Discussion: Discussion requires an interactive exchange. The exchange must be direct and not through intermediaries (eg, clinical staff or trainees). Sending chart notes or written exchanges that are within progress notes does not qualify as an interactive exchange. The discussion does not need to be on the date of the encounter but is counted only once and only when it is used in the decision making of the encounter. It may be asynchronous (ie, does not need to be in person), but it must be initiated and completed within a short time period (eg, within a day or two).

Independent historian(s): An individual (eg, parent, guardian, surrogate, spouse, witness) who provides a history in addition to a history provided by the patient who is unable to provide a complete or reliable history (eg, due to developmental stage, dementia, or psychosis) or because a confirmatory history is judged to be necessary. In the case where there may be conflict or poor communication between multiple historians and more than one historian is needed, the independent historian requirement is met. It does not include translation services. The independent history does not need to be obtained in person but does need to be obtained directly from the historian providing the independent information.

Independent interpretation: The interpretation of a test for which there is a CPT code, and an interpretation or report is customary. This does not apply when the physician or other qualified health care professional who reports the E/M service is reporting or has previously reported the test. A form of interpretation should be documented but need not conform to the usual standards of a complete report for the test.

Appropriate source: *For the purpose of the* ***discussion of management*** *data element (see Table 2, Levels of Medical Decision Making), an appropriate source includes professionals who are not health care professionals but may be involved in the management of the patient (eg, lawyer, parole officer, case manager, teacher). It does not include discussion with family or informal caregivers.*

Risk of Complications and/or Morbidity or Mortality of Patient Management

One element used in selecting the level of services is the risk of complications and/or morbidity or mortality of patient management at an encounter. This is distinct from the risk of the condition itself.

Risk: The probability and/or consequences of an event. The assessment of the level of risk is affected by the nature of the event under consideration. For example, a low probability of death may be high risk, whereas a high chance of a minor, self-limited adverse effect of treatment may be low risk. Definitions of risk are based upon the usual behavior and thought processes of a physician or other qualified health care professional in the same specialty. Trained clinicians apply common language usage meanings to terms such as high, medium, low, or minimal risk and do not require quantification for these definitions (though quantification may be provided when evidence-based medicine has established probabilities). For the purposes of MDM, level of risk is based upon consequences of the problem(s) addressed at the encounter when appropriately treated. Risk also includes MDM related to the need to initiate or forego further testing, treatment, and/or hospitalization. The risk of patient management criteria applies to the patient management decisions made by the reporting physician or other qualified health care professional as part of the reported encounter.

Morbidity: *A state of illness or functional impairment that is expected to be of substantial duration during which function is limited, quality of life is impaired, or there is organ damage that may not be transient despite treatment.*

Social determinants of health: *Economic and social conditions that influence the health of people and communities. Examples may include food or housing insecurity.*

Surgery (minor or major, elective, emergency, procedure or patient risk):

> ***Surgery-Minor or Major:*** The classification of surgery into minor or major is based upon the common meaning of such terms when used by trained clinicians, similar to the use of the term "risk". These terms are not defined by a surgical package classification.
>
> ***Surgery-Elective or Emergency:*** Elective procedures and emergent or urgent procedures describe the timing of a procedure when the timing is related to the patient's condition. An elective procedure is typically planned in advance (eg, scheduled for weeks later), while an emergent procedure is typically performed immediately or with minimal delay to allow for patient stabilization. Both elective and emergent procedures may be minor or major procedures.
>
> ***Surgery-Risk Factors, Patient or Procedure:*** Risk factors are those that are relevant to the patient and procedure. Evidence-based risk calculators may be used, but are not required, in assessing patient and procedure risk.

Drug therapy requiring intensive monitoring for toxicity: A drug that requires intensive monitoring is a therapeutic agent that has the potential to cause serious morbidity or death. The monitoring is performed for assessment of these adverse effects and not primarily for assessment of therapeutic efficacy. The monitoring should be that which is generally accepted practice for the agent but may be patient-specific in some cases. Intensive monitoring may be long-term or short-term. Long-term intensive monitoring is not performed less than quarterly. The monitoring may be performed with a laboratory test, a physiologic test, or imaging. Monitoring by history or examination does not qualify. The monitoring affects the level of MDM in an encounter in which it is considered in the management of the patient. An example may be monitoring for cytopenia in the use of an antineoplastic agent between dose cycles. Examples of monitoring that do not qualify include monitoring glucose levels during insulin therapy, as the primary reason is the therapeutic effect (unless severe hypoglycemia is a current, significant concern); or annual electrolytes and renal function for a patient on a diuretic, as the frequency does not meet the threshold.

Guidelines for Selecting Level of Service Based on Time

Certain categories of time-based E/M codes that do not have levels of services based on MDM (eg, Critical Care Services) in the E/M section use time differently. It is important to review the instructions for each category.

Time is **not** a descriptive component for the emergency department levels of E/M services because emergency department services are typically provided on a variable intensity basis, often involving multiple encounters with several patients over an extended period of time.

When time is used for reporting E/M services codes, the time defined in the service descriptors is used for selecting the appropriate level of services. The E/M services for which these guidelines apply require a face-to-face encounter with the physician or other qualified health care professional. For office or other outpatient services, if the physician's or other qualified health care professional's time is spent in the supervision of clinical staff who perform the face-to-face services of the encounter, use 99211.

For coding purposes, time for these services is the total time on the date of the encounter. It includes both the face-to-face and non-face-to-face time personally spent by the physician and/or other qualified health care professional(s) on the day of the encounter (includes time in activities that require the physician or other qualified health care professional and does not include time in activities normally performed by clinical staff). It does not include any time spent in the performance of other separately reported service(s).

A shared or split visit is defined as a visit in which a physician and other qualified health care professional(s) both provide the face-to-face and non-face-to-face work related to the visit. When time is being used to select the appropriate level of services for which time-based reporting of shared or split visits is allowed, the time personally spent by the physician and other qualified health care professional(s) assessing and managing the patient on the date of the encounter is summed to define total time. Only distinct time should be summed for shared or split visits (ie, when two or more individuals jointly meet with or discuss the patient, only the time of one individual should be counted).

When prolonged time occurs, the appropriate prolonged services code may be reported. The total time on the date of the encounter spent caring for the patient should be documented in the medical record when it is used as the basis for code selection.

Physician or other other qualified health care professional time includes the following activities, when performed:

- preparing to see the patient (eg, review of tests)
- obtaining and/or reviewing separately obtained history
- performing a medically appropriate examination and/or evaluation
- counseling and educating the patient/family/caregiver
- ordering medications, tests, or procedures
- referring and communicating with other health care professionals (when not separately reported)
- documenting clinical information in the electronic or other health record
- independently interpreting results (when not separately reported) and communicating results to the patient family/caregiver
- care coordination (when not separately reported)

Do not count time spent on the following:

- the performance of other services reported separately

- travel
- teaching that is general and not limited to discussion that is required for the management of the specific patient

Unlisted Service

An E/M service may be provided that is not listed in this section of the CPT codebook. When reporting such a service, the appropriate unlisted code may be used to indicate the service, identifying it by "Special Report," as discussed in the following paragraph. The "Unlisted Services" and accompanying codes for the E/M section are as follows:

***99429 Unlisted preventive** medicine service*

***99499 Unlisted evaluation and management** service*

Special Report

An unlisted service or one that is unusual, variable, or new may require a special report demonstrating the medical appropriateness of the service. Pertinent information should include an adequate definition or description of the nature, extent, and need for the procedure and the time, effort, and equipment necessary to provide the service. Additional items that may be included are complexity of symptoms, final diagnosis, pertinent physical findings, diagnostic and therapeutic procedures, concurrent problems, and follow-up care.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:99341 Tracking Number J1 Original Specialty Recommended RVU: **1.50**
Presented Recommended RVU: **1.00**
Global Period: XXX Current Work RVU: **1.01** RUC Recommended RVU: **1.00**

CPT Descriptor: Home or residence visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and straightforward medical decision making.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: Home or residence visit for a new patient with a self-limited problem.

Percentage of Survey Respondents who found Vignette to be Typical: 86%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Review available prior medical records and/or data. Place requests for other records and data as necessary. Coordinate with other members of the health care team regarding the home or residence service.

Description of Intra-Service Work: Confirm patient's identity. Obtain vital signs. Obtain a medically appropriate history. Update pertinent components of HPI, review of systems, social history, family history, and allergies, and reconcile the patient's medications. Perform a medically appropriate examination. Synthesize all the information, the relevant history and physical examination to formulate a differential diagnosis and treatment plan requiring straightforward medical decision making [MDM]. Discuss the treatment plan with patient and/or family/caregiver. Provide patient education and respond to questions from the patient and/or family/caregiver. Write orders, as necessary, for diagnostic imaging, labs, tests and/or therapeutic intervention(s). [Note: This service is provided in a home or residence. Home may be defined as a private residence, temporary lodging, or short term accommodation (eg, hotel, campground, hostel, or cruise ship). A residence is an assisted living facility, group home (that is not licensed as an intermediate care facility for individuals with intellectual disabilities), custodial care facility, or residential substance abuse treatment facility.]

Description of Post-Service Work: Document the encounter in the medical record. Communicate imaging/labs/test results and additional care plans to other health care professionals and to the patient and/or family/caregiver. Perform electronic data capture and reporting to comply with quality payment program and other electronic mandates. Answer follow-up questions from patient and/or family/caregiver and respond to treatment failures.

Modifier -51 Exempt Status
Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? No

TOP KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99202	XXX	0.93	**RUC Time**

CPT Descriptor Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and straightforward medical decision making. When using time for code selection, 15-29 minutes of total time is spent on the date of the encounter.

SECOND HIGHEST KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99203	XXX	1.60	**RUC Time**

CPT Descriptor Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and low level of medical decision making. When using time for code selection, 30-44 minutes of total time is spent on the date of the encounter.

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
73721	XXX	1.35	**RUC Time**	670,662

CPT Descriptor 1 Magnetic resonance (eg, proton) imaging, any joint of lower extremity; without contrast material

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
93351	XXX	1.75	**RUC Time**	241,940

CPT Descriptor 2 Echocardiography, transthoracic, real-time with image documentation (2D), includes M-mode recording, when performed, during rest and cardiovascular stress test using treadmill, bicycle exercise and/or pharmacologically induced stress, with interpretation and report; including performance of continuous electrocardiographic monitoring, with supervision by a physician or other qualified health care professional

Other Reference CPT Code	Global	Work RVU	Time Source

Other time if appropriate			

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	49%	49%	2%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	9%	51%	40%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	80%	20%
Physical effort required	0%	47%	53%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	69%	31%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	47%	40%	13%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	7%	60%	33%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	7%	77%	17%
Physical effort required	0%	30%	70%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	7%	37%	57%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

For CPT 2023, the home and domiciliary E/M codes will be revised to delete codes 99324-99328, 99334-99337, 99343 and revise codes 99341, 99342, 99344, 99345, 99347-99350 to include services provided in assisted living facilities, group homes, custodial care facilities, and residential substance abuse treatment facilities. These changes include combining the domiciliary and rest home codes with the home visit codes so there is now a single code that describes these types of visits. In addition, the descriptors were revised to allow reporting that is based on medical decision making or time alone—similar to the office/outpatient visit codes.

The following societies participated in surveying the revised codes: American Geriatrics Society, American Nurses Association, American Podiatric Medical Association (only 99341, 99342, 99347, 99348), and the American Academy of Home Care Medicine.

Survey Analysis

The surveying societies established an expert panel that reviewed the survey data for all eight home visit codes. The expert panel noted that the key reference services chosen by respondents were typically office visit codes that had been revalued for CY 2021.

The expert panel determined that comparing the survey times to the current times would be inappropriate because the current intra-service times are simply the CPT times - they are not based on survey data. Therefore, the expert panel focused its review on comparing the survey times to other comparator codes.

In addition, the expert panel agreed that home visits are typically performed when patients are ill, cannot be seen in the office for a variety of health and socioeconomic situations and that typically they are more intense than office visits.

Recommendation - 99341

We recommend the survey median work RVU of 1.00 and pre/intra/post times 6/15/6.

Key Reference Code Comparison

Code 99202 involves straightforward MDM similar to survey code 99341, however, the intra-service time required for 99341 is 10 minutes (66%) greater than 99202 and the total time is 17 minutes (85%) greater than 99202, and therefore, code 99341 should be valued similar to 99202.

Code 99203 requires the same intra-service time and almost identical total time compared with 99341. However, 99203 involves low complexity MDM. Therefore, the expert panel believes that 99341 should be valued less than 99203.

CPT	DESCRIPTOR	RVW	IWPUT	WPUT	TOTAL TIME	PRE	INTRA	POST
99202	Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and straightforward medical decision making. When using time for code selection, 15-29 minutes of total time is spent on the date of the encounter.	**0.93**	0.047	0.047	20	2	15	3
99341	Home or residence visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and straightforward medical decision making.	**1.00**	**0.049**	**0.037**	**27**	**6**	**15**	**6**
99203	Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and low level of medical decision making. When using time for code selection, 30-44 minutes of total time is spent on the date of the encounter.	**1.60**	0.046	0.046	35	5	25	5

MPC Code Comparison

CPT	DESCRIPTOR	RVW	IWPUT	WPUT	TOTAL TIME	PRE	INTRA	POST
73721	Magnetic resonance (eg, proton) imaging, any joint of lower extremity; without contrast material	**1.35**	0.056	0.045	30	5	20	5
99341	Home or residence visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and straightforward medical decision making.	**1.00**	**0.049**	**0.037**	**27**	**6**	**15**	**6**

93351	Echocardiography, transthoracic, real-time with image documentation (2D), includes M-mode recording, when performed, during rest and cardiovascular stress test using treadmill, bicycle exercise and/or pharmacologically induced stress, with interpretation and report; including performance of continuous electrocardiographic monitoring, with supervision by a physician or other qualified health care professional	**1.75**	0.065	0.044	40	10	20	10

Other Code Comparisons

CPT	DESCRIPTOR	RVW	IWPUT	WPUT	TOTAL TIME	PRE	INTRA	POST
95907	Nerve conduction studies; 1-2 studies	**1.00**	0.037	0.029	35	10	15	10
91111	Gastrointestinal tract imaging, intraluminal (eg, capsule endoscopy), esophagus with interpretation and report	**1.00**	0.031	0.026	38	5	18	15

The expert panel agrees that the survey median work RVU of 1.00 places 99341 in proper rank order to the key reference, MPC and other reference codes.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 99324, 99341

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty podiatry How often? Commonly

Specialty nurse practitioner How often? Commonly

Specialty geriatric medicine How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National frequency data not available

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 65,027
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2019 Medicare data for codes 99324 and 99341 - see specialty distribution for each code on the last page

Specialty Podiatry Frequency 57582 Percentage 88.55 %

Specialty Nurse Practitioner Frequency 3091 Percentage 4.75 %

Specialty Physicians Assistant Frequency 1241 Percentage 1.90 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Evaluation Management

BETOS Sub-classification:
Home visit

BETOS Sub-classification Level II:
NA

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 99341

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:99342 Tracking Number J2 Original Specialty Recommended RVU: **2.00**
Presented Recommended RVU: **1.65**
Global Period: XXX Current Work RVU: **1.52** RUC Recommended RVU: **1.65**

CPT Descriptor: Home or residence visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and low level of medical decision making.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: Home or residence visit for a new patient with an acute uncomplicated illness or injury.

Percentage of Survey Respondents who found Vignette to be Typical: 85%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Review available prior medical records and/or data. Place requests for other records and data as necessary. Coordinate with other members of the health care team regarding the home or residence service.

Description of Intra-Service Work: Confirm patient's identity. Obtain vital signs. Obtain a medically appropriate history. Update pertinent components of HPI, review of systems, social history, family history, and allergies, and reconcile the patient's medications. Perform a medically appropriate examination. Synthesize all the information, the relevant history and physical examination to formulate a differential diagnosis and treatment plan requiring low complexity medical decision making [MDM]. Discuss the treatment plan with patient and/or family/caregiver. Provide patient education and respond to questions from the patient and/or family/caregiver. Write orders, as necessary, for diagnostic imaging, labs, tests and/or therapeutic intervention(s). [Note: This service is provided in a home or residence. Home may be defined as a private residence, temporary lodging, or short term accommodation (eg, hotel, campground, hostel, or cruise ship). A residence is an assisted living facility, group home (that is not licensed as an intermediate care facility for individuals with intellectual disabilities), custodial care facility, or residential substance abuse treatment facility.]

Description of Post-Service Work: Document the encounter in the medical record. Communicate imaging/labs/test results and additional care plans to other health care professionals and to the patient and/or family/caregiver. Perform electronic data capture and reporting to comply with quality payment program and other electronic mandates. Answer follow-up questions from patient and/or family/caregiver and respond to treatment failures.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

For CPT 2023, the home and domiciliary E/M codes will be revised to delete codes 99324-99328, 99334-99337, 99343 and revise codes 99341, 99342, 99344, 99345, 99347-99350 to include services provided in assisted living facilities, group homes, custodial care facilities, and residential substance abuse treatment facilities. These changes include combining the domiciliary and rest home codes with the home visit codes so there is now a single code that describes

these types of visits. In addition, the descriptors were revised to allow reporting that is based on medical decision making or time alone—similar to the office/outpatient visit codes.

The following societies participated in surveying the revised codes: American Geriatrics Society, American Nurses Association, American Podiatric Medical Association (only 99341, 99342, 99347, 99348), and the American Academy of Home Care Medicine

Survey Analysis

The surveying societies established an expert panel that reviewed the survey data for all eight home visit codes. The expert panel noted that the key reference services chosen by respondents were typically office visit codes that had been revalued for CY 2021.

The expert panel determined that comparing the survey times to the current times would be inappropriate because the current intra-service times are simply the CPT times - they are not based on survey data. Therefore, the expert panel focused its review on comparing the survey times to other comparator codes.

In addition, the expert panel agreed that home visits are typically performed when patients are ill, cannot be seen in the office for a variety of health and socioeconomic situation and that typically they are more intense than office visits.

Recommendation - 99342

We recommend the survey median work RVU of 1.65 and pre/intra/post times 10/32/10.

Key Reference Code Comparison

Code 99203 and survey code 99342 both involve low complexity MDM, however, the intra-service time required for 99342 is 7 minutes (28%) greater than 99203 and the total time is 17 minutes (49%) greater than 99203, and therefore, code 99342 should be valued higher than 99203.

Code 99204 requires moderate complexity MDM compared with 99342 which requires low complexity MDM. Both intra-service time and total time for 99204 are greater than 99342, and therefore 99342 should be valued less than 99204.

CPT	DESCRIPTOR	RVW	IWPUT	WPUT	TOTAL TIME	PRE	INTRA	POST
99203	Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and low level of medical decision making. When using time for code selection, 30-44 minutes of total time is spent on the date of the encounter.	**1.60**	0.046	0.046	35	5	25	5
99342	Home or residence visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and low level of medical decision making.	**1.65**	**0.038**	**0.032**	**52**	**10**	**32**	**10**
99204	Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. When using time for code selection, 45-59 minutes of total time is spent on the date of the encounter.	**2.60**	0.043	0.043	60	10	40	10

MPC Code Comparison

CPT	DESCRIPTOR	RVW	IWPUT	WPUT	TOTAL TIME	PRE	INTRA	POST
99460	Initial hospital or birthing center care, per day, for evaluation and management of normal newborn infant	**1.92**	0.049	0.038	50	10	30	10
99342	Home or residence visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and low level of medical decision making.	**1.65**	**0.038**	**0.032**	**52**	**10**	**32**	**10**
75635	Computed tomographic angiography, abdominal aorta and bilateral iliofemoral lower extremity runoff, with contrast material(s), including noncontrast images, if performed, and image postprocessing	**2.40**	0.051	0.042	57	10	39	8

Other Code Comparisons

CPT	DESCRIPTOR	RVW	IWPUT	WPUT	TOTAL TIME	PRE	INTRA	POST
76873	Ultrasound, transrectal; prostate volume study for brachytherapy treatment planning (separate procedure)	**1.55**	0.029	0.026	60	20	30	10
95924	Testing of autonomic nervous system function; combined parasympathetic and sympathetic adrenergic function testing with at least 5 minutes of passive tilt	**1.73**	0.035	0.029	60	15	30	15

The expert panel agrees that the survey median work RVU of 1.65 places 99342 in proper rank order to the key reference, MPC and other reference codes.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 99325, 99342

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty podiatry How often? Commonly

Specialty nurse practitioner How often? Commonly

Specialty geriatric medicine How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and <u>percentage</u> for each specialty. Please explain the rationale for this estimate. National frequency data not available

Specialty Frequency Percentage %

Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 93,646 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2019 Medicare data for codes 99325 and 99342 - see specialty distribution for each code on the last page

Specialty Internal Medicine	Frequency 3904	Percentage 4.16 %
Specialty Nurse Practitioner	Frequency 12391	Percentage 13.23 %
Specialty Physicians Assistant	Frequency 4111	Percentage 4.38 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Evaluation Management

BETOS Sub-classification:
Home visit

BETOS Sub-classification Level II:
NA

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 99342

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

CPT Descriptor: Home or residence visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: Home or residence visit for a new patient with a progressing illness or acute injury that requires diagnostic evaluation, medical management, or potential surgical treatment..

Percentage of Survey Respondents who found Vignette to be Typical: 81%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Review available prior medical records and/or data. Place requests for other records and data as necessary. Coordinate with other members of the health care team regarding the home or residence service.

Description of Intra-Service Work: Confirm patient's identity. Obtain vital signs. Obtain a medically appropriate history. Update pertinent components of HPI, review of systems, social history, family history, and allergies, and reconcile the patient's medications. Perform a medically appropriate examination. Synthesize all the information, the relevant history and physical examination to formulate a differential diagnosis and treatment plan requiring moderate medical decision making [MDM]. Discuss the treatment plan with patient and/or family/caregiver. Provide patient education and respond to questions from the patient and/or family/caregiver. Write orders, as necessary, for diagnostic imaging, labs, tests and/or therapeutic intervention(s). [Note: This service is provided in a home or residence. Home may be defined as a private residence, temporary lodging, or short term accommodation (eg, hotel, campground, hostel, or cruise ship). A residence is an assisted living facility, group home (that is not licensed as an intermediate care facility for individuals with intellectual disabilities), custodial care facility, or residential substance abuse treatment facility.]

Description of Post-Service Work: Document the encounter in the medical record. Communicate imaging/labs/test results and additional care plans to other health care professionals and to the patient and/or family/caregiver. Perform electronic data capture and reporting to comply with quality payment program and other electronic mandates. Answer follow-up questions from patient and/or family/caregiver and respond to treatment failures.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	11%	63%	26%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	29%	71%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	3%	43%	54%
Physical effort required	0%	23%	77%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	20%	80%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	4%	4%	4%	67%	21%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	8%	29%	62%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	4%	33%	72%
Physical effort required	0%	25%	75%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	8%	4%	87%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

For CPT 2023, the home and domiciliary E/M codes will be revised to delete codes 99324-99328, 99334-99337, 99343 and revise codes 99341, 99342, 99344, 99345, 99347-99350 to include services provided in assisted living facilities, group homes, custodial care facilities, and residential substance abuse treatment facilities. These changes include combining the domiciliary and rest home codes with the home visit codes so there is now a single code that describes these types of visits. In addition, the descriptors were revised to allow reporting that is based on medical decision making or time alone—similar to the office/outpatient visit codes.

The following societies participated in surveying the revised codes: American Geriatrics Society, American Nurses Association, American Podiatric Medical Association (only 99341, 99342, 99347, 99348), and the American Academy of Home Care Medicine.

Survey Analysis

The surveying societies established an expert panel that reviewed the survey data for all eight home visit codes. The expert panel noted that the key reference services chosen by respondents were typically office visit codes that had been revalued for CY 2021.

The expert panel determined that comparing the survey times to the current times would be inappropriate because the current intra-service times are simply the CPT times - they are not based on survey data. Therefore, the expert panel focused its review on comparing the survey times to other comparator codes.

In addition, the expert panel agreed that home visits are typically performed when patients are ill, cannot be seen in the office for a variety of health and socioeconomic situations and that typically they are more intense than office visits.

Recommendation - 99344

We recommend the 25th survey value for a work RVU of 2.87 and pre/intra/post times 15/60/17.

There were 72 respondents of whom 81% found the vignette to be typical. The survey times were 15/60/17/92.

Key Reference Code Comparison

Code 99204 involves moderate MDM similar to survey code 99344, however, the intra-service time required for 99344 is 20 minutes greater than 99204 and the total time is 32 minutes greater than 99204, and therefore, code 99344 should be valued higher than 99204.

Code 99205 requires the similar intra-service time and 4 less minutes of total time compared with 99344. However, 99205 involves high complexity MDM. Therefore, the expert panel believes that 99344 should be valued slightly less than 99205.

CPT	DESCRIPTOR	RVW	IWPUT	WPUT	TOTAL TIME	PRE	INTRA	POST
99204	Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 99326, 99327, 99343, 99344

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty NURSE PRACTITIONER How often? Commonly

Specialty FAMILY MEDICINE How often? Sometimes

Specialty INTERNAL MEDICINE How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National frequency data not available

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?
257,046 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2019 Medicare data for codes 99326, 99343, 99344 - see specialty distribution for each code on the last page

Specialty podiatry Frequency 50124 Percentage 19.50 %

Specialty Internal Medicine Frequency 28918 Percentage 11.25 %

Specialty Nurse Practitioner Frequency 106675 Percentage 41.50 %

Do many physicians perform this service across the United States? Yes

Global Period: XXX Current Work RVU: **4.09** RUC Recommended RVU: **3.88**

CPT Descriptor: Home or residence visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and high level of medical decision making.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: Home or residence visit for a new patient with a chronic illness with severe exacerbation that poses a threat to life or bodily function, or an acute illness/injury that poses a threat to life or bodily function.

Percentage of Survey Respondents who found Vignette to be Typical: 89%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Review available prior medical records and/or data. Place requests for other records and data as necessary. Coordinate with other members of the health care team regarding the home or residence service.

Description of Intra-Service Work: Confirm patient's identity. Obtain vital signs. Obtain a medically appropriate history. Update pertinent components of HPI, review of systems, social history, family history, and allergies, and reconcile the patient's medications. Perform a medically appropriate examination. Synthesize all the information, the relevant history and physical examination to formulate a differential diagnosis and treatment plan requiring high medical decision making [MDM]. Discuss the treatment plan with patient and/or family/caregiver. Provide patient education and respond to questions from the patient and/or family/caregiver. Write orders, as necessary, for diagnostic imaging, labs, tests and/or therapeutic intervention(s). [Note: This service is provided in a home or residence. Home may be defined as a private residence, temporary lodging, or short term accommodation (eg, hotel, campground, hostel, or cruise ship). A residence is an assisted living facility, group home (that is not licensed as an intermediate care facility for individuals with intellectual disabilities), custodial care facility, or residential substance abuse treatment facility.]

Description of Post-Service Work: Document the encounter in the medical record. Communicate imaging/labs/test results and additional care plans to other health care professionals and to the patient and/or family/caregiver. Perform electronic data capture and reporting to comply with quality payment program and other electronic mandates. Answer follow-up questions from patient and/or family/caregiver and respond to treatment failures.

INTENSITY/COMPLEXITY MEASURES

(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	0%	12%	24%	65%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	21%	79%

Technical Skill/Physical Effort	**Less**	**Identical**	**More**
Technical skill required	0%	35%	65%

Physical effort required	0%	15%	85%

Psychological Stress	**Less**	**Identical**	**More**
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	17%	83%

Survey Code Compared to 2nd Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	6%	28%	11%	45%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	11%	56%	33%

Technical Skill/Physical Effort	**Less**	**Identical**	**More**
Technical skill required	11%	50%	39%
Physical effort required	0%	33%	67%

Psychological Stress	**Less**	**Identical**	**More**
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	6%	50%	44%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

For CPT 2023, the home and domiciliary E/M codes will be revised to delete codes 99324-99328, 99334-99337, 99343 and revise codes 99341, 99342, 99344, 99345, 99347-99350 to include services provided in assisted living facilities,

group homes, custodial care facilities, and residential substance abuse treatment facilities. These changes include combining the domiciliary and rest home codes with the home visit codes so there is now a single code that describes these types of visits. In addition, the descriptors were revised to allow reporting that is based on medical decision making or time alone—similar to the office/outpatient visit codes.

The following societies participated in surveying the revised codes: American Geriatrics Society, American Nurses Association, American Podiatric Medical Association (only 99341, 99342, 99347, 99348), and the American Academy of Home Care Medicine.

Survey Analysis

The surveying societies established an expert panel that reviewed the survey data for all eight home visit codes. The expert panel noted that the key reference services chosen by respondents were typically office visit codes that had been revalued for CY 2021.

The expert panel determined that comparing the survey times to the current times would be inappropriate because the current intra-service times are simply the CPT times - they are not based on survey data. Therefore, the expert panel focused its review on comparing the survey times to other comparator codes.

In addition, the expert panel agreed that home visits are typically performed when patients are ill, cannot be seen in the office for a variety of health and socioeconomic situations and that typically they are more intense than office visits.

Recommendation - 99345

We recommend the survey 25th percentile work RVU of 3.88 and pre/intra/post times 15/60/17.

There were 72 respondents of whom 81% found the vignette to be typical. The survey times were 15/60/17/92 and the median and 25th percentile work RVUs were 3.50 and 2.87 respectively.

Key Reference Code Comparison

Code 99205 involves high MDM similar to survey code 99345, however, the intra-service time required for 99345 is 15 minutes greater than 99205 and the total time is 38 minutes greater than 99205, and therefore, code 99345 should be valued higher than 99205.

Code 99291 requires less intra-service and total time compared with 99345. However, 99291 involves high complexity MDM. Therefore, the expert panel believes that 99345 should be valued less than 99291.

CPT	DESCRIPTOR	RVW	IWPUT	WPUT	TOTAL TIME	PRE	INTRA	POST
99205	Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and high level of medical decision making. When using time for code selection, 60-74 minutes of total time is spent on the date of the encounter.	**3.50**	0.040	0.040	88	14	59	15
99345	Home or residence visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and high medical decision making.	**3.88**	**0.037**	**0.031**	**126**	**25**	**74**	**27**
99291	Critical care, evaluation and management of the critically ill or critically injured patient; first 30-74 minutes	**4.50**	**0.096**	**0.064**	**70**	**15**	**40**	**15**

MPC Code Comparison

CPT	DESCRIPTOR	RVW	IWPUT	WPUT	TOTAL TIME	PRE	INTRA	POST
90962	End-stage renal disease (ESRD) related services monthly, for patients 20 years of age and older; with 1 face-to-face visit by a physician or other qualified health care professional **per month**	**3.57**	**0.051**	**0.051**	**70**	**0**	**70**	**0**
99345	Home or residence visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and high medical decision making.	**3.88**	**0.037**	**0.031**	**126**	**25**	**74**	**27**
99291	Critical care, evaluation and management of the critically	**4.50**	**0.096**	**0.064**	**70**	**15**	**40**	**15**

	ill or critically injured patient; **first 30-74 minutes**							

Other Code Comparisons

CPT	DESCRIPTOR	RVW	IWPUT	WPUT	TOTAL TIME	PRE	INTRA	POST
95720	Electroencephalogram (EEG), continuous recording, physician or other qualified health care professional review of recorded events, analysis of spike and seizure detection, each increment of greater than 12 hours, up to 26 hours of EEG recording, interpretation and report after each 24-hour period; with video (VEEG)	**3.86**	0.051	0.029	75	10	55	10
38240	Hematopoietic progenitor cell (HPC); allogeneic transplantation per donor	**4.00**	0.044	0.033	120	30	60	30

The expert panel agrees that the survey 25th percentile work RVU of 3.88 places 99345 in proper rank order to the key reference, MPC and other reference codes.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 99328, 99345

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty NURSE PRACTITIONER How often? Commonly

Specialty FAMILY MEDICINE How often? Sometimes

Specialty INTERNAL MEDICINE How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period?

Write orders, as necessary, for diagnostic imaging, labs, tests and/or therapeutic intervention(s). [Note: This service is provided in a home or residence. Home may be defined as a private residence, temporary lodging, or short term accommodation (eg, hotel, campground, hostel, or cruise ship). A residence is an assisted living facility, group home (that is not licensed as an intermediate care facility for individuals with intellectual disabilities), custodial care facility, or residential substance abuse treatment facility.]

Description of Post-Service Work: Document the encounter in the medical record. Communicate imaging/labs/test results and additional care plans to other health care professionals and to the patient and/or family/caregiver .Perform electronic data capture and reporting to comply with quality payment program and other electronic mandates. Answer follow-up questions from patient and/or family/caregiver and respond to treatment failures.

Modifier -51 Exempt Status
Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? No

TOP KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99212	XXX	0.70	**RUC Time**

CPT Descriptor Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and straightforward medical decision making. When using time for code selection, 10-19 minutes of total time is spent on the date of the encounter.

SECOND HIGHEST KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99213	XXX	1.30	**RUC Time**

CPT Descriptor Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and low level of medical decision making. When using time for code selection, 20-29 minutes of total time is spent on the date of the encounter.

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99202	XXX	0.93	**RUC Time**	2,490,658

CPT Descriptor 1 Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and straightforward medical decision making. When using time for code selection, 15-29 minutes of total time is spent on the date of the encounter.

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	0%	50%	50%	0%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	3%	53%	44%

Technical Skill/Physical Effort	**Less**	**Identical**	**More**
Technical skill required	0%	72%	28%
Physical effort required	0%	36%	64%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	67%	33%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	50%	43%	7%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	11%	46%	43%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	18%	50%	32%
Physical effort required	0%	39%	61%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	4%	25%	71%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

For CPT 2023, the home and domiciliary E/M codes will be revised to delete codes 99324-99328, 99334-99337, 99343 and revise codes 99341, 99342, 99344, 99345, 99347-99350 to include services provided in assisted living facilities, group homes, custodial care facilities, and residential substance abuse treatment facilities. These changes include combining the domiciliary and rest home codes with the home visit codes so there is now a single code that describes

these types of visits. In addition, the descriptors were revised to allow reporting that is based on medical decision making or time alone—similar to the office/outpatient visit codes.

The following societies participated in surveying the revised codes: American Geriatrics Society, American Nurses Association, American Podiatric Medical Association (only 99341, 99342, 99347, 99348), and the American Academy of Home Care Medicine

Survey Analysis

The surveying societies established an expert panel that reviewed the survey data for all eight home visit codes. The expert panel noted that the key reference services chosen by respondents were typically office visit codes that had been revalued for CY 2021.

The expert panel determined that comparing the survey times to the current times would be inappropriate because the current intra-service times are simply the CPT times - they are not based on survey data. Therefore, the expert panel focused its review on comparing the survey times to other comparator codes.

In addition, the expert panel agreed that home visits are typically performed when patients are ill, cannot be seen in the office for a variety of health and socioeconomic situations and that typically they are more intense than office visits.

Recommendation - 99347

We recommend the survey 25th percentile work RVU of 0.90 and pre/intra/post times 5/20/5.

Key Reference Code Comparison

Code 99212 and survey code 99347 both involve straightforward MDM, however, the intra-service time required for 99347 is 9 minutes (45%) greater than 99212 and the total time is 14 minutes (88%) greater than 99212, and therefore, code 99347 should be valued higher than 99212.

Code 99213 requires low complexity MDM compared with 99347 which requires straightforward MDM. Both codes require the same pre/intra/post-time. This service is typically billed with a procedure.

CPT	DESCRIPTOR	RVW	IWPUT	WPUT	TOTAL TIME	PRE	INTRA	POST
99212	Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and straightforward medical decision making. When using time for code selection, 10-19 minutes of total time is spent on the date of the encounter.	**0.70**	0.053	0.044	16	2	11	3
99347	Home or residence visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination straightforward medical decision making.	**0.90**	**0.034**	**0.030**	**30**	**5**	**20**	**5**
99213	Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and low level of medical decision making. When using time for code selection, 20-29 minutes of total time is spent on the date of the encounter.	**1.30**	0.054	0.043	30	5	20	5

MPC Code Comparison

CPT	DESCRIPTOR	RVW	IWPUT	WPUT	TOTAL TIME	PRE	INTRA	POST
99202	Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and straightforward medical decision making. When using time for code selection, 15-29 minutes of total time is spent on the date of the encounter.	**0.93**	0.055	0.047	20	2	15	3
99347	Home or residence visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination straightforward medical decision making.	**0.90**	**0.034**	**0.030**	**30**	**5**	**20**	**5**
73721	Magnetic resonance (eg, proton) imaging, any joint of lower extremity; without contrast material	**1.35**	0.056	0.045	30	5	20	5

Other Code Comparisons

CPT	DESCRIPTOR	RVW	IWPUT	WPUT	TOTAL TIME	PRE	INTRA	POST
78227	Hepatobiliary system imaging, including gallbladder when present; with pharmacologic intervention, including quantitative measurement(s) when performed	**0.90**	0.044	0.035	25	6	15	5
93307	Echocardiography, transthoracic, real-time with image documentation (2D), includes M-mode recording, when performed, complete, without spectral or color Doppler echocardiography	**0.92**	0.046	0.037	25	5	15	5

The expert panel agrees that the survey 25th percentile work RVU of 0.90 places 99347 in proper rank order to the key reference, MPC and other reference codes.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 99334, 99347

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty podiatry How often? Commonly

Specialty nurse practitioner How often? Commonly

Specialty geriatric medicing How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and <u>percentage</u> for each specialty. Please explain the rationale for this estimate. National frequency data not available

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 678,108 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2019 Medicare data for codes 99334 and 99347 - see specialty distribution for each code on the last page

Specialty Podiatry Frequency 261411 Percentage 38.55 %

Specialty Internal Medicine Frequency 60962 Percentage 8.99 %

Specialty Nurse Practioner Frequency 171494 Percentage 25.29 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Evaluation Management

BETOS Sub-classification:
Home visit

BETOS Sub-classification Level II:
NA

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 99342

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:99348 Tracking Number J6 Original Specialty Recommended RVU: **1.92**
Presented Recommended RVU: **1.50**
Global Period: XXX Current Work RVU: **1.56** RUC Recommended RVU: **1.50**

CPT Descriptor: Home or residence visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and low level of medical decision making.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: Home or residence visit for an established patient with a stable chronic illness or acute uncomplicated injury.

Percentage of Survey Respondents who found Vignette to be Typical: 89%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Review interval correspondence, referral notes, and/or medical records generated since the last home or residence service. Coordinate with other members of the health care team regarding the home or residence service.

Description of Intra-Service Work: Confirm patient's identity. Review prior clinical notes. Obtain vital signs. Obtain a medically appropriate history. Update pertinent components of HPI, review of systems, social history, family history, and allergies, and reconcile the patient's medications. Perform a medically appropriate examination. Synthesize all the information, the relevant history and physical examination to formulate a differential diagnosis and treatment plan requiring low complexity medical decision making [MDM]. Discuss the treatment plan with patient and/or family/caregiver. Provide patient education and respond to questions from the patient and/or family/caregiver. Write orders, as necessary, for diagnostic imaging, labs, tests and/or therapeutic intervention(s). [Note: This service is provided in a home or residence. Home may be defined as a private residence, temporary lodging, or short term accommodation (eg, hotel, campground, hostel, or cruise ship). A residence is an assisted living facility, group home (that is not licensed as an intermediate care facility for individuals with intellectual disabilities), custodial care facility, or residential substance abuse treatment facility.]

Description of Post-Service Work: Document the encounter in the medical record. Communicate imaging/labs/test results and additional care plans to other health care professionals and to the patient and/or family/caregiver .Perform electronic data capture and reporting to comply with quality payment program and other electronic mandates. Answer follow-up questions from patient and/or family/caregiver and respond to treatment failures.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	41%	57%	2%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	2%	41%	57%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	66%	34%
Physical effort required	0%	34%	66%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	55%	45%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	4%	21%	50%	25%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	4%	17%	79%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	8%	38%	54%
Physical effort required	0%	17%	83%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	4%	8%	88%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

For CPT 2023, the home and domiciliary E/M codes will be revised to delete codes 99324-99328, 99334-99337, 99343 and revise codes 99341, 99342, 99344, 99345, 99347-99350 to include services provided in assisted living facilities, group homes, custodial care facilities, and residential substance abuse treatment facilities. These changes include combining the domiciliary and rest home codes with the home visit codes so there is now a single code that describes

these types of visits. In addition, the descriptors were revised to allow reporting that is based on medical decision making or time alone—similar to the office/outpatient visit codes.

The following societies participated in surveying the revised codes: American Geriatrics Society, American Nurses Association, American Podiatric Medical Association (only 99341, 99342, 99347, 99348), and the American Academy of Home Care Medicine

Survey Analysis

The surveying societies established an expert panel that reviewed the survey data for all eight home visit codes. The expert panel noted that the key reference services chosen by respondents were typically office visit codes that had been revalued for CY 2021.

The expert panel determined that comparing the survey times to the current times would be inappropriate because the current intra-service times are simply the CPT times - they are not based on survey data. Therefore, the expert panel focused its review on comparing the survey times to other comparator codes.

In addition, the expert panel agreed that home visits are typically performed when patients are ill, cannot be seen in the office for a variety of health and socioeconomic situations and that typically they are more intense than office visits.

Recommendation - 99348

We recommend the survey 25th percentile work RVU of 1.50 and pre/intra/post times 7/29/10.

Key Reference Code Comparison

Code 99213 and survey code 99348 both involve low MDM, however, the intra-service time required for 99348 is 9 minutes (45%) greater than 99213 and the total time is 16 minutes (53%) greater than 99213, and therefore, code 99348 should be valued higher than 99213.

Code 99214 requires moderate complexity MDM compared with 99348 which requires low complexity MDM. Both codes require almost identical pre/intra/post-time.

CPT	DESCRIPTOR	RVW	IWPUT	WPUT	TOTAL TIME	PRE	INTRA	POST
99213	Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and low level of medical decision making. When using time for code selection, 20-29 minutes of total time is spent on the date of the encounter.	**1.30**	0.054	0.043	30	5	20	5
99348	Home or residence visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and low level of medical decision making.	**1.50**	**0.039**	**0.033**	**46**	**7**	**29**	**10**
99214	Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. When using time for code selection, 30-39 minutes of total time is spent on the date of the encounter.	**1.92**	0.051	0.041	47	7	30	10

MPC Code Comparison

CPT	DESCRIPTOR	RVW	IWPUT	WPUT	TOTAL TIME	PRE	INTRA	POST
74170	Computed tomography, abdomen; without contrast material, followed by contrast material(s) and further sections	**1.40**	0.065	0.050	28	5	18	5
99348	Home or residence visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and low level of medical decision making.	**1.50**	**0.039**	**0.033**	**46**	**7**	**29**	**10**
99460	Initial hospital or birthing center care, per day, for evaluation and management of normal newborn infant	**1.92**	0.049	0.038	50	10	30	10

Other Code Comparisons

CPT	DESCRIPTOR	RVW	IWPUT	WPUT	TOTAL TIME	PRE	INTRA	POST

72195	Magnetic resonance (eg, proton) imaging, pelvis; without contrast material(s)	**1.46**	0.062	0.049	30	5	20	5
78491	Myocardial imaging, positron emission tomography (PET), perfusion study (including ventricular wall motion[s] and/or ejection fraction[s], when performed); single study, at rest or stress (exercise or pharmacologic)	**1.56**	0.082	0.052	30	8	15	7

The expert panel agrees that the survey 25th percentile work RVU of 1.50 places 99348 in proper rank order to the key reference, MPC and other reference codes.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 99335, 99348

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty podiatry How often? Commonly

Specialty nurse practitioner How often? Commonly

Specialty geriatric medicine How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National frequency data not available

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?
1,737,978 If this is a recommendation from multiple specialties please estimate frequency and percentage for each

specialty. Please explain the rationale for this estimate. 2019 Medicare data for codes 99335 and 99348 - see specialty distribution for each code on the last page

Specialty Podiatry Frequency 337855 Percentage 19.43 %

Specialty Internal Medicine Frequency 278336 Percentage 16.01 %

Specialty Nurse Practioner Frequency 648539 Percentage 37.31 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Evaluation Management

BETOS Sub-classification:
Home visit

BETOS Sub-classification Level II:
NA

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 99348

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

SUMMARY OF RECOMMENDATION

CPT Code:99349 Tracking Number J7 Original Specialty Recommended RVU: **2.70**
Presented Recommended RVU: **2.44**
Global Period: XXX Current Work RVU: **2.33** RUC Recommended RVU: **2.44**

CPT Descriptor: Home or residence visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: Home or residence visit for an established patient with a progressing illness or acute injury that requires medical management or potential surgical treatment.

Percentage of Survey Respondents who found Vignette to be Typical: 87%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Review interval correspondence, referral notes, and/or medical records generated since the last home or residence service. Coordinate with other members of the health care team regarding the home or residence service.

Description of Intra-Service Work: Confirm patient's identity. Review prior clinical notes. Obtain vital signs. Obtain a medically appropriate history. Update pertinent components of HPI, review of systems, social history, family history, and allergies, and reconcile the patient's medications. Perform a medically appropriate examination. Synthesize all the information, the relevant history and physical examination to formulate a differential diagnosis and treatment plan requiring moderate complexity medical decision making [MDM]. Discuss the treatment plan with patient and/or family/caregiver. Provide patient education and respond to questions from the patient and/or family/caregiver. Write orders, as necessary, for diagnostic imaging, labs, tests and/or therapeutic intervention(s). [Note: This service is provided in a home or residence. Home may be defined as a private residence, temporary lodging, or short term accommodation (eg, hotel, campground, hostel, or cruise ship). A residence is an assisted living facility, group home (that is not licensed as an intermediate care facility for individuals with intellectual disabilities), custodial care facility, or residential substance abuse treatment facility.]

Description of Post-Service Work: Document the encounter in the medical record. Communicate imaging/labs/test results and additional care plans to other health care professionals and to the patient and/or family/caregiver .Perform electronic data capture and reporting to comply with quality payment program and other electronic mandates. Answer follow-up questions from patient and/or family/caregiver and respond to treatment failures.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	9%	73%	18%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	21%	79%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	42%	58%
Physical effort required	0%	21%	79%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	15%	85%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	4%	4%	0%	67%	25%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	8%	8%	84%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	4%	33%	63%
Physical effort required	0%	20%	80%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	8%	4%	87%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

For CPT 2023, the home and domiciliary E/M codes will be revised to delete codes 99324-99328, 99334-99337, 99343 and revise codes 99341, 99342, 99344, 99345, 99347-99350 to include services provided in assisted living facilities, group homes, custodial care facilities, and residential substance abuse treatment facilities. These changes include combining the domiciliary and rest home codes with the home visit codes so there is now a single code that describes these types of visits. In addition, the descriptors were revised to allow reporting that is based on medical decision making or time alone—similar to the office/outpatient visit codes.

The following societies participated in surveying the revised codes: American Geriatrics Society, American Nurses Association, American Podiatric Medical Association (only 99341, 99342, 99347, 99348), and the American Academy of Home Care Medicine.

Survey Analysis

The surveying societies established an expert panel that reviewed the survey data for all eight home visit codes. The expert panel noted that the key reference services chosen by respondents were typically office visit codes that had been revalued for CY 2021.

The expert panel determined that comparing the survey times to the current times would be inappropriate because the current intra-service times are simply the CPT times - they are not based on survey data. Therefore, the expert panel focused its review on comparing the survey times to other comparator codes.

In addition, the expert panel agreed that home visits are typically performed when patients are ill, cannot be seen in the office for a variety of health and socioeconomic situations and that typically they are more intense than office visits.

Recommendation - 99349

We recommend the survey 25th percentile work RVU of 2.44 and pre/intra/post times 12/41/15.

There were 76 respondents of whom 87% found the vignette to be typical. The survey times were 12/41/15/68 and the median and 25th percentile work RVUs were 2.70 and 2.44 respectively.

Key Reference Code Comparison

Code 99214 involves moderate MDM similar to survey code 99349, however, the intra-service time required for 99314 is 11 minutes greater than 99214 and the total time is 21 minutes greater than 99214, and therefore, code 99349 should be valued higher than 99214.

Code 99215 requires the slightly more intra-service and total time compared with 99349. However, 99214 involves high complexity MDM. Therefore, the expert panel believes that 99349 should be valued less than 99215.

CPT	DESCRIPTOR	RVW	IWPUT	WPUT	TOTAL TIME	PRE	INTRA	POST
99214	Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. When using time for code selection, 30-39 minutes of total time is spent on the date of the encounter.	**1.92**	0.051	0.041	47	7	30	10
99349	Home or residence visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making.	**2.44**	**0.045**	**0.036**	**68**	**12**	**41**	**15**
99215	Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and high level of medical decision making. When using time for code selection, 40-54 minutes of total time is spent on the date of the encounter.	**2.80**	0.050	0.040	70	10	45	15

MPC Code Comparison

CPT	DESCRIPTOR	RVW	IWPUT	WPUT	TOTAL TIME	PRE	INTRA	POST
75635	Computed tomographic angiography, abdominal aorta and bilateral iliofemoral lower extremity runoff, with contrast	**2.40**	**0.051**	**0.042**	**57**	**10**	**39**	**8**

	material(s), including noncontrast images, if performed, and image postprocessing							
99349	Home or residence visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making.	**2.44**	**0.045**	**0.036**	**68**	**12**	**41**	**15**
99215	Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and high level of medical decision making. When using time for code selection, 40-54 minutes of total time is spent on the date of the encounter.	**2.80**	0.050	0.040	70	10	45	15

Other Code Comparisons

CPT	DESCRIPTOR	RVW	IWPUT	WPUT	TOTAL TIME	PRE	INTRA	POST
75635	Computed tomographic angiography, abdominal aorta and bilateral iliofemoral lower extremity runoff, with contrast material(s), including noncontrast images, if performed, and image postprocessing	**2.40**	0.051	0.042	57	10	39	8
95718	Electroencephalogram (EEG), continuous recording, physician or other qualified health care professional review of recorded events, analysis of spike and seizure detection, interpretation and report, 2-12 hours of EEG recording; with video (VEEG)	**2.50**	0.059	0.045	55	10	35	10

The expert panel agrees that the survey 25th percentile work RVU of 2.44 places 99349 in proper rank order to the key reference, MPC and other reference codes.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 99336, 99349

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty NURSE PRACTITIONER How often? Commonly

Specialty FAMILY MEDICINE How often? Sometimes

Specialty INTERNAL MEDICINE How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National frequency data not available

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?
2,829,152 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2019 Medicare data for codes 99336, 99349 - see specialty distribution for each code on the last page

Specialty Internal medicine Frequency 483678 Percentage 17.09 %

Specialty Family Medicine Frequency 372415 Percentage 13.16 %

Specialty Nurse Practioner Frequency 1425785 Percentage 50.39 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Evaluation Management

BETOS Sub-classification:
Home visit

BETOS Sub-classification Level II:
NA

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 99349

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

CPT Descriptor: Home or residence visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and high level of medical decision making.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: Home or residence visit for an established patient with a chronic illness with severe exacerbation that poses a threat to life or bodily function, or an acute illness/injury that poses a threat to life or bodily function.

Percentage of Survey Respondents who found Vignette to be Typical: 86%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Review interval correspondence, referral notes, and/or medical records generated since the last home or residence service. Coordinate with other members of the health care team regarding the home or residence service.

Description of Intra-Service Work: Confirm patient's identity. Review prior clinical notes. Obtain vital signs. Obtain a medically appropriate history. Update pertinent components of HPI, review of systems, social history, family history, and allergies, and reconcile the patient's medications. Perform a medically appropriate examination. Synthesize all the information, the relevant history and physical examination to formulate a differential diagnosis and treatment plan requiring high complexity medical decision making [MDM]. Discuss the treatment plan with patient and/or family/caregiver. Provide patient education and respond to questions from the patient and/or family/caregiver. Write orders, as necessary, for diagnostic imaging, labs, tests and/or therapeutic intervention(s). [Note: This service is provided in a home or residence. Home may be defined as a private residence, temporary lodging, or short term accommodation (eg, hotel, campground, hostel, or cruise ship). A residence is an assisted living facility, group home (that is not licensed as an intermediate care facility for individuals with intellectual disabilities), custodial care facility, or residential substance abuse treatment facility.]

Description of Post-Service Work: Document the encounter in the medical record. Communicate imaging/labs/test results and additional care plans to other health care professionals and to the patient and/or family/caregiver .Perform electronic data capture and reporting to comply with quality payment program and other electronic mandates. Answer follow-up questions from patient and/or family/caregiver and respond to treatment failures.

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	8%	8%	84%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

For CPT 2023, the home and domiciliary E/M codes will be revised to delete codes 99324-99328, 99334-99337, 99343 and revise codes 99341, 99342, 99344, 99345, 99347-99350 to include services provided in assisted living facilities, group homes, custodial care facilities, and residential substance abuse treatment facilities. These changes include combining the domiciliary and rest home codes with the home visit codes so there is now a single code that describes these types of visits. In addition, the descriptors were revised to allow reporting that is based on medical decision making or time alone—similar to the office/outpatient visit codes.

The following societies participated in surveying the revised codes: American Geriatrics Society, American Nurses Association, American Podiatric Medical Association (only 99341, 99342, 99347, 99348), and the American Academy of Home Care Medicine.

Survey Analysis

The surveying societies established an expert panel that reviewed the survey data for all eight home visit codes. The expert panel noted that the key reference services chosen by respondents were typically office visit codes that had been revalued for CY 2021.

The expert panel determined that comparing the survey times to the current times would be inappropriate because the current intra-service times are simply the CPT times - they are not based on survey data. Therefore, the expert panel focused its review on comparing the survey times to other comparator codes.

In addition, the expert panel agreed that home visits are typically performed when patients are ill, cannot be seen in the office for a variety of health and socioeconomic situations and that typically they are more intense than office visits.

Recommendation - 99350

We recommend between the survey median and 25th percentile with a crosswalk to CPT 75959 work RVU of 3.50 and survey pre/intra/post times 17/60/20.

There were 76 respondents of whom 87% found the vignette to be typical. The survey times were 17/60/209/97 and the median and 25th percentile work RVUs were 3.60 and 3.10 respectively.

Key Reference Code Comparison

Code 99215 involves high MDM similar to survey code 99350, however, the intra-service time required for 99350 is 15 minutes greater than 99215 and the total time is 27 minutes greater than 99215, and therefore, code 99350 should be valued higher than 99215.

Code 99205 requires the slightly more intra-service and total time compared with 99350. We also offer a crosswalk to CPT 75959 and 99205.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 99337, 99350

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty NURSE PRACTITIONER How often? Commonly

Specialty FAMILY MEDICINE How often? Sometimes

Specialty HOSPICE AND PALLIATIVE CARE How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National frequency data not available

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 1,037,857 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2019 Medicare data for codes 99337, 99350 - see specialty distribution for each code on the last page

Specialty Internal Medicine Frequency 176136 Percentage 16.97 %

Specialty Family Medicine Frequency 91816 Percentage 8.84 %

Specialty Nurse Practitioner Frequency 512633 Percentage 49.39 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Evaluation Management

BETOS Sub-classification:
Home visit

BETOS Sub-classification Level II:
NA

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 99350

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

	exacerbation that poses a threat to life or bodily function, or an acute illness/injury that poses a threat to life or bodily function.

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

The joint societies met via email and zoom meeting as an expert panel to make recommendations. The RUC and PE survey tool did have an extensive survey component for PE. Of note, our experts believe combining these two in one link did complicate our ability to obtain the required number of completed surveys for the April 2021 meeting. The joint societies did review all the final data, using as a model, the E/M format analysis for outpatient PE survey. Specifically, to consider first median total times and to accept supplies where the data supported more than 50%, as a final step they confirmed the recommendation from their experiences. Of note, we did clarify during our virtual presentation for PE, our recommendations were derived from survey data first, then confirmed by expert panel.

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code, but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here (*for service reviewed prior to the implementation of clinical activity codes, detail is not provided in the RUC database, please contact Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org for PE spreadsheets for your reference codes*):

Current codes are used as reference plus compare to E/M outpatient visit code 99213

3. Is this code(s) typically reported with an E/M service?
Is this code(s) typically reported with the E/M service in the nonfacility?
(Please see provided data titled *Medicare Same Day NF EM Billed Together - NF Dom Spec* in the RUC Review Resource Materials)

No
No
We did supply a detailed billed together list identifying, CPT 99341, 99342, 99344 and 99347 would typically have a procedure performed on the SDOS. For those CPT services we removed supplies that would be duplicative, such as gloves, alcohol wipes, booklet and tongue depressor.

4. What specialty is the dominant provider in the nonfacility?
What percent of the time does the dominant provider provide the service(s) in the nonfacility?
Is the dominant provider in the nonfacility different than for the global?
(Please see provided data titled *Medicare Same Day NF EM Billed Together - NF Dom Spec* in the RUC Review Resource Materials)

	Dominant	% NF	Different than global?
▲99341	podiatry	88%	no
▲99342	podiatry	77%	no
▲99344	nurse practitioner	52%	no
▲99345	nurse practitioner	55%	no
▲99347	podiatry	72%	no
▲99348	podiatry	40%	no
▲99349	nurse practitioner	50%	no
▲99350	nurse practitioner	55%	no

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

5. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time:

n/a

6. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies for the **code family**, please provide compelling evidence (please see *PE compelling evidence guidelines*) Please explain if the increase can be entirely accounted for because of an increase in physician time:

n/a

7. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (*please see second worksheet in PE spreadsheet workbook*), please explain the difference here:

CA008 *perform regulatory mandated quality assurance,* historically contained 6 minutes (two phone calls) in total across this family of home visit services. This PE input was from prior crosswalks of older inputs. With todays updated PE options, a more accurate representation of the services is CA005 *complete pre procedure phone calls and prescription* and CA048 *identify need for x-rays, labs other test results,* therefore the six minutes were split into three for each of these across the family of codes. It was discussed during the presentation that both of these calls are necessary for each of the codes and if there was typically a procedure, then time would be removed from the procedure not from the visit. Similarly, for post services, CA038 *Coordinate post procedure services* which contained 6 minutes was divided 3 minutes to be retained and 3 minutes to be placed in CA037 *Conduct patient communications* across the family.

8. How much time was allocated to clinical activity, *obtain vital signs* (CA010) prior to CMS increasing the clinical activity to 5 minutes for calendar year 2018? The standard for clinical activity, obtains vital signs remains 0, 3 and 5 based on the number of vital signs taken. Please provide a rationale for the clinical staff time that you are requesting for obtain vital signs here:

N/A

9. Please provide a brief description of the clinical staff work for the following:
   a. Pre-Service period:

Determine/gather test results, confirm by telephone patient visit, examples, X-rays (foot, chest, etc). Preparation for a home visit includes confirmation of arrival time and discussion for moving or removing Pets, any other items the provider needs to be aware of regarding access to location as well as, providing clear access to the patient.

   b. Service period (includes pre, intra and post):

   c. Post-service period:

-follow up calls to pharmacies, other offices for testing, follow up appointment etc.
-the staff calls patient next day- especially if a debridement was done - to check the dressing and/or make sure the patient/family doesn't have new questions on how to change the dressing or any other home instructions that the physician/QHP gave during visit.
- follow up calls post visit occur, for a home visit there are typically caregivers/family members, and the call would be to confirm understanding of next steps as well as answer both patient and

caregivers/family additional questions, which are common and typical.

10. Please provide granular detail regarding what the clinical staff is doing during the intra-service (of service period) clinical activity, *assist physician or other qualified healthcare professional---directly related to physician work time* or *Perform procedure/service---NOT directly related to physician work time:*

N/A

11. If you have used a percentage of the physician intra-service work time other then 100 or 67 percent for the intra-service (of service period) clinical activity, please indicate the percentage and explain why the alternate percentage is needed and how it was derived.

N/A

12. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (*please see second worksheet in PE spreadsheet workbook*):

N/A

13. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov.

N/A

INVOICES

14. ☐ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

15. ☐ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

16. If you wish to include a supply that is not on the list (*please see fourth worksheet in PE spreadsheet workbook*) please provide a paid invoice. Identify and explain the invoice here:

N/A

17. Are you recommending a PE supply pack for this recommendation? Yes or No.
If Yes, please indicate if the pack is an established package of supplies as defined by CMS (eg, SA047 *pack, E/M visit*) or a pack that is commercially available?

N/A

18. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation. Please include the description, CMS supply code, unit, item quantity and unit price (if available). See documents two and three under PE reference materials on the RUC Collaboration Website for information on the contents of kits, packs and trays.

CPT CODE(S): 99341, 99342, 99344, 99345, 99347, 99348, 99349, 99350
SPECIALTY SOCIETY(IES): American Academy of Home Care Medicine, American Geriatrics Society, American Nurses Association, American Podiatric Medical Association (99341, 99342, 99348, 99349 only)
PRESENTER(S): Audrey Chun, MD (AGS), Michael Perskin, MD (AGS), Korinne Van Keuren, DNP, APRN (ANA), Elizabeth Volpert, DNP, APRN (ANA), Brooke Bisbee, DPM (APMA)

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

the PE spreadsheet during the PE Subcommittee meeting in the space below (e.g. clinical activity CA010 *obtain vital signs* was reduced from 5 minutes to 3 minutes).

The following supplies were removed from all home established codes regardless of, if they were typically preformed with a procedure or not. The PE committee stated they did not believe they would be necessary on established patient home visits.
SM025 specula tip, otoscope
SK062 patient education booklet
SJ061 tongue depressor
The PE committee also removed 3 minutes for the phone call for CA038 for only CPT 99347.

NOTE: The virtual meetings have provided for real-time updates to the PE spreadsheets. PE SORs must still be updated and resubmitted asap.

AMA/Specialty Society RVS Update Committee Summary of Recommendations
Screen: CMS Request – Final Rule for 2020

October 2021

Prolonged Service - on Date Other Than the Face-to-Face EM Service Without Direct Patient Contact – Tab 14

In September 2019, the CPT Editorial Panel added a new table to the CPT introductory language for Prolonged Services that illustrates the elements of all existing and new prolonged care services and how they are to be reported. This clarification was in response to a request from CMS in the July 2019 Proposed Rule for the 2020 Medicare Physician Payment Schedule. In this 2020 Proposed Rule, CMS also stated that the valuation of CPT codes 99358 and 99359 should be reviewed. In the Final Rule for 2020, CMS noted its belief that the CPT guidelines for 99358 and 99359 needed to be revised for clarity and finalized the proposal that CPT codes 99358-99359 would not be payable in association with office/outpatient Evaluation and Management (E/M) visits.

In January 2020, no specialty societies indicated an interest in surveying these services. In the Final Rule, CMS expressed ongoing concern and confusion with 99358 and 99359 and their guidelines, even in the wake of the CPT Editorial Panel's action in September 2019. Further, the specialty societies wanted to address questions and concerns that CMS has in this regard, so these prolonged service codes may be appropriately used in conjunction with the E/M office visit codes in 2021 and beyond, after needed CPT clarification. Therefore, the specialty societies recommended that these services be referred to CPT prior to a resurvey of these services. The RUC discussed this issue and recommended that CPT codes 99358 and 99359 be referred to the May 2020 CPT Editorial Panel to clarify how these services may be reported with other E/M services. In May 2020, the CPT Editorial Panel revised the existing Prolonged Service section to remove references to typical times to reflect the new total time definition for office visits. In October 2020, the RUC recommended that CPT codes 99358 and 99359 be referred to the CPT Editorial Panel for February 2021, to be examined and surveyed along with the other E/M services for the 2023 Medicare Physician Payment Schedule.

In February 2021, the CPT Editorial Panel (1) deleted Prolonged Service With Direct Patient Contact (Except with Office or Other Outpatient Services) subsection including codes 99354-99357; (2) revised the Prolonged Service Without Direct Patient Contact heading and guidelines; (3) revised the Prolonged Clinical Staff Services With Physician or Other Qualified Health Care Professional Supervision guidelines; (4) revised the Prolonged Service With or Without Direct Patient Contact on the Date of an Office or Other Outpatient Service heading and guidelines.

99358 ***Prolonged evaluation and management service before and/or after direct patient care; first hour***
The RUC reviewed the survey results from 61 physicians and other qualified healthcare professionals (QHP) and recommends the 25th percentile work RVU of 1.80 for CPT code 99358. The RUC recommends 50 minutes of intra-service and total time. The RUC noted that this time-based code should be reported by itself for between 30 minutes and 74 minutes of time on a date other than the face-to-face EM service without direct patient contact and noted that the survey median of 50 minutes appropriately falls just under the midpoint of that time range. The RUC noted that, although this is a non-face-to-face service, for a patient to require so much physician or other QHP time on a separate date before and/or after direct patient care, the patient would most typically be complex. This is reflected in 89 percent of the survey respondents indicating that the

following complex patient is typical: “An 85-year-old new patient with multiple complicated medical problems has moved to the area to live closer to her daughter. The physician or other qualified healthcare professional indicated that past medical records are needed from the patient's prior physicians or other qualified healthcare professionals, and they are reviewed upon arrival.” Although this service is not face-to-face, the specialties noted, and the RUC concurred, that this service has a moderate level of complexity, as it often involves reviewing records that are in disparate formats from the provider’s EMR system, clarifying test results and diagnoses, locating records, and understanding and interpreting imaging and diagnostic tests.

The RUC noted that the CPT parentheticals state that this service is not to be reported on the same date of service as codes 99202, 99203, 99204, 99205, 99212, 99213, 99214, 99215, 99221, 99222, 99223, 99231, 99232, 99233, 99234, 99235, 99236, 99242, 99243, 99244, 99245, 99252, 99253, 99254, 99255, 99281, 99282, 99283, 99284, 99285, 99304, 99305, 99306, 99307, 99308, 99309, 99310, 99341, 99342, 99344, 99345, 99347, 99348, 99349, 99350, 99417, 99483 and 993X0. Also, the CPT introductory language specifically states the following: “If the prolonged service relates to an evaluation and management service that uses total time to select the service on the date of the encounter, the prolonged service without direct patient contact may not be reported. Prolonged service without direct patient contact may only be reported when it occurs on a date other than the date of the evaluation and management service.”

To justify a work RVU of 1.80, the RUC compared the surveyed code to the second key reference code 99204 *Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. When using time for code selection, 45-59 minutes of total time is spent on the date of the encounter.* (work RVU= 2.60, 60 minutes total time) and noted that the surveyed code involves 10 minutes less of intra-service time and the work per unit of time of the recommendation would be appropriately less than the face-to-face office visit reference code. The RUC also compared the surveyed code to CPT code 99214 *Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. When using time for code selection, 30-39 minutes of total time is spent on the date of the encounter.* (work RVU= 1.92, 48 minutes total time) and noted that although both services involve a similar amount of time, the surveyed code is somewhat less intense to perform. The RUC noted that the work per unit of time of the recommendation would be appropriately less than the face-to-face office visit reference code. The RUC also compared the surveyed code to CPT code 93351 *Echocardiography, transthoracic, real-time with image documentation (2D), includes M-mode recording, when performed, during rest and cardiovascular stress test using treadmill, bicycle exercise and/or pharmacologically induced stress, with interpretation and report; including performance of continuous electrocardiographic monitoring, with supervision by a physician or other qualified health care professional* (work RVU=1.75 minutes, 40 minutes total time) and noted that although the surveyed code involves 10 minutes more total time, a similar value of 1.80 for the surveyed code would be appropriate as the surveyed code is a somewhat less intense service to perform. **The RUC recommends a work RVU of 1.80 for CPT code 99358.**

99359 ***Prolonged evaluation and management service before and/or after direct patient care; each additional 30 minutes (List separately in addition to code for prolonged service)***

The RUC reviewed the survey results from 54 physicians and other qualified healthcare professionals (QHP) and recommends the 25th percentile work RVU of 0.75 for CPT code 99359. The RUC recommends 30 minutes of intra-service and total time for this add-on service. The RUC noted that the first unit of this time-based add-on code would be reported along with the base code if the prolonged service is between 75 minutes and 104 minutes and took these reporting rules into account when determining an appropriate relative value for this service. It was noted that this is a relatively very low volume service for an E/M code, with only 7,861 Medicare utilization in 2019. Although this service is not face-to-face, the specialties noted, and the RUC concurred, that this service has a moderate level of complexity as it often involves reviewing records that are in disparate formats from the provider's EMR system, clarifying test results and diagnoses, locating records, and understanding and interpreting imaging and diagnostic tests.

The RUC noted that the CPT parentheticals state that this service is not to be reported on the same date of service as codes 99202, 99203, 99204, 99205, 99212, 99213, 99214, 99215, 99221, 99222, 99223, 99231, 99232, 99233, 99234, 99235, 99236, 99242, 99243, 99244, 99245, 99252, 99253, 99254, 99255, 99281, 99282, 99283, 99284, 99285, 99304, 99305, 99306, 99307, 99308, 99309, 99310, 99341, 99342, 99344, 99345, 99347, 99348, 99349, 99350, 99417, 99483 and 993X0. Also, the CPT introductory language specifically states the following: "If the prolonged service relates to an evaluation and management service that uses total time to select the service on the date of the encounter, the prolonged service without direct patient contact may not be reported. Prolonged service without direct patient contact may only be reported when it occurs on a date other than the date of the evaluation and management service."

To justify a work RVU of 0.75, the RUC compared the surveyed code to the second key reference code 99458 *Remote physiologic monitoring treatment management services, clinical staff/physician/other qualified health care professional time in a calendar month requiring interactive communication with the patient/caregiver during the month; each additional 20 minutes (List separately in addition to code for primary procedure)* (work RVU=0.61, intra-service and total time of 20 minutes) and noted that the surveyed code involves 10 more minutes of total time, justifying a higher value. The RUC also compared the surveyed code to CPT code 99498 *Advance care planning including the explanation and discussion of advance directives such as standard forms (with completion of such forms, when performed), by the physician or other qualified health care professional; each additional 30 minutes (List separately in addition to code for primary procedure)* (work RVU=1.40, intra-service and total time of 30 minutes) and noted that the reference code is a more intense service to perform and that a value of 0.75 for the surveyed code would have appropriate relativity with this reference service. **The RUC recommends a work RVU of 0.75 for CPT code 99359.**

Practice Expense

The Practice Expense Subcommittee reviewed the direct practice expenses and made modifications to remove the equipment input ED021 *Computer, desktop, w-monitor* from codes 99358 and 99359 on the basis that this is an indirect expense. EQ189 *otoscope-ophthalmoscope (wall unit)* and EF023 *exam table* were also removed from the recommended inputs since the patient is not present for these services as they are not face to face. **The RUC recommends the direct practice expense inputs as modified by the Practice Expense Subcommittee.**

Work Neutrality
The RUC's recommendation for this family of codes will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

CPT Code	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
Evaluation and Management **Prolonged Services** ~~**Prolonged Service With Direct Patient Contact (Except with Office or Other Outpatient Services)**~~ ~~Codes 99354-99357 are used when a physician or other qualified health care professional provides prolonged service(s) involving direct patient contact that is provided beyond the usual service in either the inpatient, observation or outpatient setting, except with office or other outpatient services (99202, 99203, 99204, 99205, 99212, 99213, 99214, 99215). Direct patient contact is face-to-face and includes additional non-face-to-face services on the patient's floor or unit in the hospital or nursing facility during the same session. This service is reported in addition to the primary procedure. Appropriate codes should be selected for supplies provided or other procedures performed in the care of the patient during this period.~~ ~~Codes 99354-99355 are used to report the total duration of face-to-face time spent by a physician or other qualified health care professional on a given date providing prolonged service in the outpatient setting, even if the time spent by the physician or other qualified health care professional on that date is not continuous. Codes 99356-99357 are used to report the total duration of time spent by a physician or other qualified health care professional at the bedside and on the patient's floor or unit in the hospital or nursing facility on a given date providing prolonged service to a patient, even if the time spent by the physician or other qualified health care professional on that date is not continuous.~~ ~~Time spent performing separately reported services other than the E/M or psychotherapy service is not counted toward the prolonged services time.~~ ~~Code 99354 or 99356 is used to report the first hour of prolonged service on a given date, depending on the place of service.~~ ~~Either code should be used only once per date, even if the time spent by the physician or other qualified health care professional is not continuous on that date. Prolonged service of less than 30 minutes total duration on a given date is not separately reported.~~ ~~Code 99355 or 99357 is used to report each additional 30 minutes beyond the first hour, depending on the place of service. Either code may also be used to report the final 15-30 minutes of prolonged service on a given date. Prolonged service of less than 15 minutes beyond the first hour or less than 15 minutes beyond the final 30 minutes is not reported separately.~~				

The use of the time based add-on codes requires that the primary evaluation and management service have a typical or specified time published in the CPT codebook.

For E/M services that require prolonged clinical staff time and may include face-to-face services by the physician or other qualified health care professional, use 99415, 99416. Do not report 99354, 99355 with 99415, 99416, 99417.

For prolonged total time in addition to office or other outpatient services (ie, 99205, 99215), use 99417.

The following table illustrates the correct reporting of prolonged physician or other qualified health care professional service with direct patient contact in the inpatient or observation setting beyond the usual service time.

Total Duration of Prolonged Services	**Code(s)**
less than 30 minutes	Not reported separately
30-74 minutes (30 minutes - 1 hr. 14 min.)	99356 X 1
75-104 minutes (1 hr. 15 min. - 1 hr. 44 min.)	99356 X 1 AND 99357 X 1
105 or more (1 hr. 45 min. or more)	99356 X 1 AND 99357 X 2 or more for each additional 30 minutes.

+ 99354	-	Prolonged evaluation and management or psychotherapy service(s) (beyond the typical service time of the primary procedure) in the office or other outpatient setting requiring direct patient contact beyond the usual service; first hour (List separately in addition to code for office or other outpatient **Evaluation and Management** or psychotherapy service) (Use 99354 in conjunction with 90837, 90847, 99241-99245, 99324-99337, 99341-99350, 99483) (Do not report 99354 in conjunction with 99202, 99203, 99204, 99205, 99212, 99213, 99214, 99215, 99415, 99416, 99417)	ZZZ	N/A

~~+99355~~	-	~~each additional 30 minutes (List separately in addition to code for prolonged service)~~ ~~(Use 99355 in conjunction with 99354)~~ ~~(Do not report 99355 in conjunction with 99202, 99203, 99204, 99205, 99212, 99213, 99214, 99215, 99415, 99416, 99417)~~	~~ZZZ~~	~~N/A~~
~~+99356~~	-	~~Prolonged service in the inpatient or observation setting, requiring unit/floor time beyond the usual service; first hour (List separately in addition to code for inpatient **Evaluation and Management** service)~~ ~~(Use 99356 in conjunction with 90837, 90847, 99218-99220, 99221-99223, 99224-99226, 99231-99233, 99234-99236, 99251-99255, 99304-99310)~~	~~ZZZ~~	~~N/A~~
~~+99357~~	-	~~each additional 30 minutes (List separately in addition to code for prolonged service)~~ ~~(Use 99357 in conjunction with 99356)~~ (99354, 99355 have been deleted. For prolonged evaluation and management services on the date of an office or other outpatient service, home and residence service, or cognitive assessment and care plan, use 99417. For prolonged psychotherapy, use 908X0) (99356, 99357 have been deleted. For prolonged service on the date of an inpatient or observation or nursing facility service, use 993X0. For prolonged psychotherapy, use 908X0)	~~ZZZ~~	~~N/A~~

Prolonged Service on Date Other Than the Face-to-Face E/M Service Without Direct Patient Contact

Codes 99358 and 99359 are used when a prolonged service is provided ~~that is neither face-to-face time in the outpatient, inpatient, or observation setting, nor additional unit/floor time in the hospital or nursing facility setting. Codes 99358, 99359 may be used during the same session of an evaluation and management service, except office or other outpatient services (99202, 99203, 99204, 99205, 99212, 99213, 99214, 99215). For prolonged total time in addition to office or other outpatient services (ie, 99205, 99215) on the same date of service without direct patient contact, use 99417. Codes 99358, 99359 may also be used for prolonged services~~ on a date other than the date of a face-to face evaluation and management encounter. Codes 99358, 99359 may be reported for prolonged services in relation to any evaluation and management service whether or not time was used to select the level of the face-to-face service.

This service is to be reported in relation to other physician or other qualified health care professional services, including evaluation and management services at any level. This prolonged service may be reported on a different date than the primary service to which it is related. If the prolonged service relates to an evaluation and management service that uses total time to select the service on the date of the encounter, the prolonged service without direct patient contact may not be reported. Prolonged service without direct patient contact may only be reported when it occurs on a date other than the date of the evaluation and management service. For example, extensive record review may relate to a previous evaluation and management service performed at an earlier date. However, it must relate to a service or patient where (face-to-face) patient care has occurred or will occur and relate to ongoing patient management.

Codes 99358 and 99359 are used to report the total duration of non-face-to-face time spent by a physician or other qualified health care professional on a given date providing prolonged service, even if the time spent by the physician or other qualified health care professional on that date is not continuous. Code 99358 is used to report the first hour of prolonged service on a given date regardless of the place of service. It should be used only once per date.

Prolonged service of less than 30 minutes total duration on a given date is not separately reported.

Code 99359 is used to report each additional 30 minutes beyond the first hour. It may also be used to report the final 15 to 30 minutes of prolonged service on a given date.

Prolonged service of less than 15 minutes beyond the first hour or less than 15 minutes beyond the final 30 minutes is not reported separately.

Do not report 99358, 99359 for time without direct patient contact reported in other services such as ~~and the Remote Physiologic code~~ care plan oversight services (99339, 99340, 99374-99380), chronic care management by a physician or other qualified health care professional (*99X21,* 99491), principal care management by a physician or other qualified health care professional (*99X22, 99X23, 99X24, 99X25*), home and outpatient INR monitoring (93792, 93793), medical team conferences (99366-99368), interprofessional telephone/Internet/electronic health record consultations (99446, 99447, 99448, 99449, 99451, 99452), or online digital evaluation and management services (99421, 99422, 99423).

(f)99358	K1	Prolonged evaluation and management service before and/or after direct patient care; first hour	XXX	1.80
(f)✚99359	K2	each additional 30 minutes (List separately in addition to code for prolonged service) (Use 99359 in conjunction with 99358) ~~(Do not report 99358, 99359 on the same date of service as 99202, 99203, 99204, 99205, 99212, 99213, 99214, 99215, 99417)~~ (Do not report 99358, 99359 on the same date of service as 99202, 99203, 99204, 99205, 99212, 99213, 99214, 99215, 99221, 99222,	ZZZ	0.75

99223, 99231, 99232, 99233, 99234, 99235, 99236, 99242, 99243, 99244, 99245, 99252, 99253, 99254, 99255, 99281, 99282, 99283, 99284, 99285, 99304, 99305, 99306, 99307, 99308, 99309, 99310, 99341, 99342, 99344, 99345, 99347, 99348, 99349, 99350, 99417, 99483, 993X0)

Total Duration of Prolonged Services Without Direct Face-to-Face Contact	**Code(s)**
less than 30 minutes	Not reported separately
30-74 minutes (30 minutes - 1 hr. 14 min.)	99358 X 1
75-104 minutes (1 hr. 15 min. - 1 hr. 44 min.)	99358 X 1 AND 99359 X 1
105 or more (1 hr. 45 min. or more)	99358 X 1 AND 99359 X 2 or more for each additional 30 minutes.

~~**Comparison of Prolonged Services Codes 99354, 99355, 99356, 99357, 99358, 99359, 99417 Table**~~

Code	Patient Contact	Minimum Reportable Prolonged Services Time (Single Date of Service)	Use In Conjunction With	*Do Not Report With	Other Prolonged Service(s) Reportable On Same Date Of Service
+99354	Face-to-Face Only	30 minutes (Beyond listed typical time)	90837, 90847, 99241-99245, 99324-99337, 99341-99350, 99483	99202-99215, 99415, 99416, 99417	99358, 99359
+99355	Face-to-Face Only	Each additional 15 minutes (Beyond 99354)	99354	99202-99215, 99415, 99416, 99417	99358, 99359
+99356	Face-to-Face and Unit/ Floor Time	30 minutes (Beyond listed typical time)	90837, 90847, 99218-99220, 99221-99223, 99224-99226, 99231-99233, 99234-99236, 99251-99255, 99304-99310		99358, 99359
+99357	Face-to-Face and Unit/ Floor Time	Each additional 15 minutes (Beyond 99356)	99356		99358, 99359
99358	Non-Face-to-Face Only	30 minutes	Must relate to a service where face-to-face care has or will occur. This is not an add-on code and is not used in conjunction with a base code.	99202-99215, 99417 On same date of service	99354, 99356
+99359	Non-Face-to-Face Only	Each additional 15 minutes (Beyond 99358)	99358	99202-99215, 99417 On same date of service	99354, 99356

+99417	Both	Reported with 99205: 75 minutes or more Reported with 99215: 55 minutes or more ***(Total time on the date of encounter)***	99205, 99215	99354, 99355, 99358, 99359, 99415, 99416	N/A
*Do not count the time of any separately reported service as Prolonged Services time 99355 is for prolonged services time beyond 99354 and may be reported in multiple units 99357 is for prolonged services time beyond 99356 and may be reported in multiple units 99359 is for prolonged services time beyond 99358 and may be reported in multiple units 99417 is for prolonged services time beyond 99205 or 99215 and may be reported in multiple units of at least 15 minutes					

CPT 2023 E/M Guidelines

Category I
Evaluation and Management (E/M) Services Guidelines

In addition to the information presented in the Introduction, several other items unique to this section are defined or identified here.

E/M Guidelines Overview

The E/M guidelines have sections that are common to all E/M categories and sections that are category specific. Most of the categories and many of the subcategories of service have special guidelines or instructions unique to that category or subcategory. Where these are indicated, eg, "Hospital Inpatient and Observation Care," special instructions are presented before the listing of the specific E/M services codes. It is important to review the instructions for each category or subcategory. These guidelines are to be used by the reporting physician or other qualified health care professional to select the appropriate level of service. These guidelines do not establish documentation requirements or standards of care. The main purpose of documentation is to support care of the patient by current and future health care team(s). These guidelines are for services that require a face-to-face encounter. (For 99211 and 99281 the face-to-face services may be performed by clinical staff).

In the **Evaluation and Management** section (99202-99499) there are many code categories. Each category may have specific guidelines, or the codes may include specific details. These E/M guidelines are written for the following categories:

- Office or Other Outpatient Services
- Hospital Inpatient and Observation Care Services
- Consultations
- Emergency Department Services
- Nursing Facility Services
- Home and Residence Services
- Prolonged Service With or Without Direct Contact on the Date of an Evaluation and Management Service

Classification of Evaluation and Management (E/M) Services

The E/M section is divided into broad categories such as office visits, hospital inpatient or observation care visits, and consultations. Most of the categories are further divided into two or more subcategories of E/M services. For example, there are two subcategories of office visits (new patient and established patient) and there are two subcategories of hospital inpatient and observation care visits (initial and subsequent). The subcategories of E/M services are further classified into levels of E/M services that are identified by specific codes.

The basic format of codes with levels of E/M services based on medical decision making (MDM) or time is the same. First, a unique code number is listed. Second, the place and/or type of service is specified, eg, office or other outpatient visit. Third, the content of the service is defined. Fourth, time is specified. (A detailed discussion of time is provided following the Decision Tree for New vs Established Patients.)

The place of service and service type is defined by the location where the face-to-face encounter occurs. For example, service provided to a nursing facility resident brought to the office is reported with an office or other outpatient code.

New and Established Patients

Solely for the purposes of distinguishing between new and established patients, professional services are those face-to-face services rendered by physicians and other qualified health care professionals who may report evaluation and management services. A new patient is one who has not received any professional services from the physician or other qualified health care professional or another physician or other qualified health care professional of the exact same specialty and subspecialty who belongs to the same group practice, within the past three years.

An established patient is one who has received professional services from the physician or other qualified health care professional or another physician or other qualified health care professional of the exact same specialty and subspecialty who belongs to the same group practice, within the past three years. See Decision Tree for New vs Established Patients.

In the instance where a physician or other qualified health care professional is on call for or covering for another physician or other qualified health care professional, the patient's encounter will be classified as it would have been by the physician or other qualified health care professional who is not available. When advanced practice nurses and physician assistants are working with physicians, they are considered as working in the exact same specialty and subspecialty as the physician.

No distinction is made between new and established patients in the emergency department. E/M services in the emergency department category may be reported for any new or established patient who presents for treatment in the emergency department.

The Decision Tree for New vs Established Patients is provided to aid in determining whether to report the E/M service provided as a new or an established patient encounter.

Coding Tip

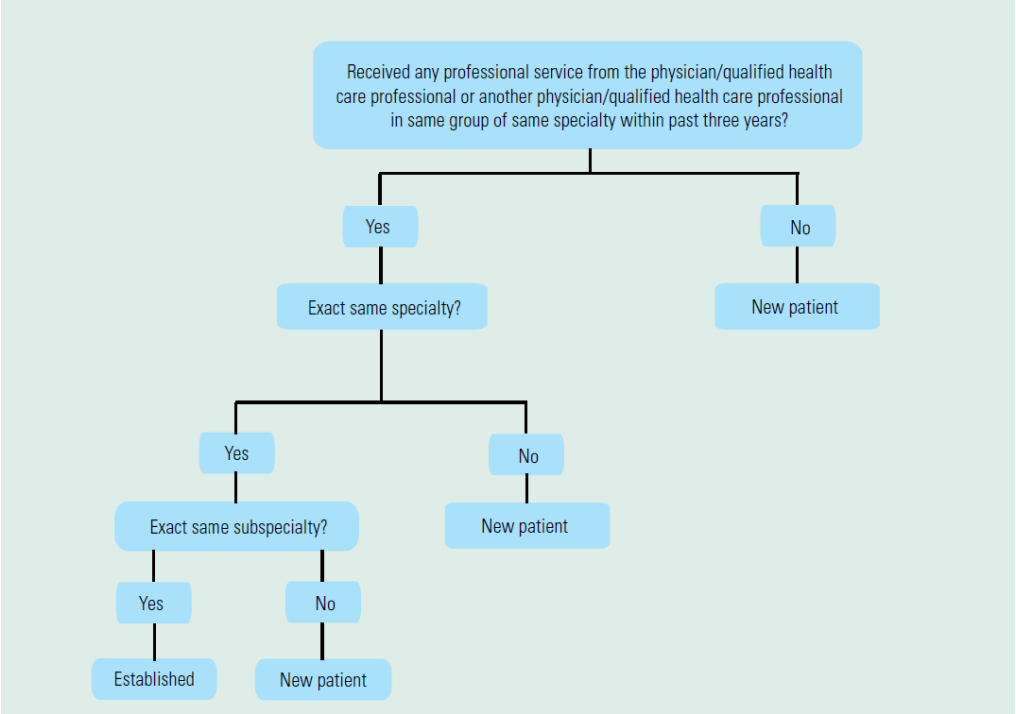
Instructions for Use of the CPT Codebook

When advanced practice nurses and physician assistants are working with physicians, they are considered as working in the exact same specialty and exact same subspecialty as the physician. A "physician or other qualified health care professional" is an individual who is qualified by education, training, licensure/regulation (when applicable), and facility privileging (when applicable) who performs a professional service within his or her scope of practice and independently reports that professional service. These professionals are distinct from "clinical staff." A clinical staff member is a person who works under the supervision of a physician or other qualified health care professional, and who is allowed by law, regulation and facility policy to perform or assist in the performance of a specific professional service but does not individually report that professional service. Other policies may also affect who may report specific services.

CPT Coding Guidelines, Introduction, Instructions for Use of the CPT Codebook

---

Decision Tree for New vs Established Patients



Initial and Subsequent Services

Some categories apply to both new and established patients (eg, hospital inpatient or observation care). These categories differentiate services by whether the service is the initial service or a subsequent service. For the purpose of distinguishing between initial or subsequent visits, professional services are those face-to-face services rendered by physicians and other qualified health care professionals who may report evaluation and management services. An initial service is when the patient has not received any professional services from the physician or other qualified health care professional or another physician or other qualified health care professional of the exact same specialty and subspecialty who belongs to the same group practice, during the inpatient or observation or nursing facility admission and stay.

A subsequent service is when the patient has received professional service(s) from the physician or other qualified health care professional or another physician or other qualified health care professional of the exact same specialty and subspecialty who belongs to the same group practice, during the admission and stay.

In the instance where a physician or other qualified health care professional is on call for or covering for another physician or other qualified health care professional, the patient's encounter will be classified as it would have been by the physician or other qualified health care professional who is not available. When advanced practice nurses and physician assistants are working with physicians, they are considered as working in the exact same specialty and subspecialty as the physician.

For reporting hospital inpatient or observation care services, a stay that includes a transition from observation to inpatient is a single stay. For reporting nursing facility services, a stay that includes transition(s) between skilled nursing facility and nursing facility level of care is the same stay.

Services Reported Separately

Any specifically identifiable procedure or service (ie, identified with a specific CPT code) performed on the date of E/M services may be reported separately.

The ordering and actual performance and/or interpretation of diagnostic tests/studies during a patient encounter are not included in determining the levels of E/M services when the professional interpretation

of those tests/studies is reported separately by the physician or other qualified health care professional reporting the E/M service. Tests that do not require separate interpretation (eg, tests that are results only) and are analyzed as part of MDM do not count as an independent interpretation and may be counted as ordered or reviewed for selecting an MDM level.

The performance of diagnostic tests/studies for which specific CPT codes are available may be reported separately, in addition to the appropriate E/M code. The interpretation of the results of diagnostic tests/studies (ie, professional component) with preparation of a separate distinctly identifiable signed written report may also be reported separately, using the appropriate CPT code and, if required, with modifier 26 appended.

See Instructions for Selecting a Level Based on MDM or Time.

The physician or other qualified health care professional may need to indicate that on the day a procedure or service identified by a CPT code was performed, the patient's condition required a significant separately identifiable E/M service. The E/M service may be caused or prompted by the symptoms or condition for which the procedure and/or service was provided. This circumstance may be reported by adding modifier 25 to the appropriate level of E/M service. As such, different diagnoses are not required for reporting of the procedure and the E/M services on the same date.

History and/or Examination

These E/M services include a medically appropriate history and/or physical examination, when performed. The nature and extent of the history and/or physical examination are determined by the treating physician or other qualified health care professional reporting the service. The care team may collect information, and the patient or caregiver may supply information directly (eg, by electronic health record [EHR] portal or questionnaire) that is reviewed by the reporting physician or other qualified health care professional. The extent of history and physical examination is not an element in selection of the level of these E/M service codes.

Levels of E/M Services

Select the appropriate level of E/M services based on the following:

1. The level of the MDM as defined for each service, **or**

2. The total time for E/M services performed on the date of the encounter.

Within each category or subcategory of E/M service based on MDM or time, there are three to five levels of E/M services available for reporting purposes. Levels of E/M services are **not** interchangeable among the different categories or subcategories of service. For example, the first level of E/M services in the subcategory of office visit, new patient, does not have the same definition as the first level of E/M services in the subcategory of office visit, established patient. Each level of E/M services may be used by all physicians or other qualified health care professionals.

Guidelines for Selecting a level service based on Medical Decision Making

Four types of MDM are recognized: straightforward, low, moderate, and high. The concept of the level of MDM does not apply to 99211 or 99281.

MDM includes establishing diagnoses, assessing the status of a condition, and/or selecting a management option. MDM is defined by three elements. The elements are:

- ***The number and complexity of problem(s) that are addressed during the encounter***.
- ***The amount and/or complexity of data to be reviewed and analyzed.*** These data include medical records, tests, and/or other information that must be obtained, ordered, reviewed, and analyzed for the encounter. This includes information obtained from multiple sources or interprofessional communications that are not reported separately and interpretation of tests that are not reported

separately. Ordering a test is included in the category of test result(s) and the review of the test result is part of the encounter and not a subsequent encounter. Ordering a test may include those considered, but not selected after shared decision making. For example, a patient may request diagnostic imaging that is not necessary for their condition and discussion of the lack of benefit may be required. Alternatively, a test may normally be performed, but due to risk for a specific patient is not ordered. These considerations must be documented. Data are divided into three categories:

- Tests, documents, orders, or independent historian(s). (Each unique test, order, or document is counted to meet a threshold number.)
- Independent interpretation of tests (not separately reported)
- Discussion of management or test interpretation with external physician or other qualified health care professional or appropriate source (not separately reported)

- **The risk of complications and/or morbidity or mortality of patient management:** This includes decisions made at the encounter associated with the diagnostic procedure(s) and treatment(s). This includes the possible management options selected and those considered but not selected, after shared decision making with the patient and/or family. For example, a decision about hospitalization includes consideration of alternative levels of care. Examples may include a psychiatric patient with a sufficient degree of support in the outpatient setting or the decision to not hospitalize a patient with advanced dementia with an acute condition that would generally warrant inpatient care, but for whom the goal is palliative treatment.

Shared decision making involves eliciting patient and/or family preferences, patient and/or family education, and explaining risks and benefits of management options.

MDM may be impacted by role and management responsibility.

When the physician or other qualified health care professional is reporting a separate CPT code that includes interpretation and/or report, the interpretation and/or report is not counted toward the MDM when selecting a level of E/M services.

When the physician or other qualified health care professional is reporting a separate service for discussion of management with a physician or another qualified health care professional, the discussion is not counted toward the MDM when selecting a level of E/M services.

The Levels of Medical Decision Making (MDM) table (Table 2) is a guide to assist in selecting the level of MDM for reporting an E/M services code. The table includes the four levels of MDM (ie, straightforward, low, moderate, high) and the three elements of MDM (ie, number and complexity of problems addressed at the encounter, amount and/or complexity of data reviewed and analyzed, and risk of complications and/or morbidity or mortality of patient management). To qualify for a particular level of MDM, two of the three elements for that level of MDM must be met or exceeded.

Examples in the table may be more or less applicable to specific settings of care. For example, the decision to hospitalize applies to the outpatient or nursing facility encounters, whereas the decision to escalate hospital level of care (eg, transfer to ICU) applies to the hospitalized or observation care patient.

See also the introductory guidelines of each code family section.

Table 2: Levels of Medical Decision Making (MDM)

Level of MDM (Based on 2 out of 3 Elements of MDM)	Elements of Medical Decision Making		
	Number and Complexity of Problems Addressed at the Encounter	Amount and/or Complexity of Data to be Reviewed and Analyzed **Each unique test, order, or document contributes to the combination of 2 or combination of 3 in Category 1 below.*	Risk of Complications and/or Morbidity or Mortality of Patient Management
N/A	N/A	N/A	N/A
Straightforward	Minimal • 1 self-limited or minor problem	Minimal or none	Minimal risk of morbidity from additional diagnostic testing or treatment
Low	Low • 2 or more self-limited or minor problems; or • 1 stable, chronic illness; or • 1 acute, uncomplicated illness or injury or • 1 stable acute illness or • 1 acute, uncomplicated illness or injury requiring hospital inpatient or observation level of care	Limited *(Must meet the requirements of at least 1 of the 2 categories*) Category 1: Tests and documents • Any combination of 2 from the following: ○ Review of prior external note(s) from each unique source*; ○ Review of the result(s) of each unique test*; ○ Ordering of each unique test* or Category 2: Assessment requiring an independent historian(s) *(For the categories of independent interpretation of tests and discussion of management or test interpretation, see moderate or high)*	Low risk of morbidity from additional diagnostic testing or treatment

Moderate	Moderate
	• 1 or more chronic illnesses with exacerbation, progression, or side effects of treatment;
	or
	• 2 or more stable, chronic illnesses;
	or
	• 1 undiagnosed new problem with uncertain prognosis;
	or
	• 1 acute illness with systemic symptoms;
	or
	• 1 acute, complicated injury
		Moderate
		(Must meet the requirements of at least 1 out of 3 categories)
		Category 1: Tests, documents, or independent historian(s)
		• Any combination of 3 from the following:
		  ○ Review of prior external note(s) from each unique source*;
		  ○ Review of the result(s) of each unique test*;
		  ○ Ordering of each unique test*;
		  ○ Assessment requiring an independent historian(s)
		or
		Category 2: Independent interpretation of tests
		• Independent interpretation of a test performed by another physician/other qualified health care professional (not separately reported);
		or
		Category 3: Discussion of management or test interpretation
		• Discussion of management or test interpretation with external physician/other qualified health care professional/appropriate source (not separately reported)
			Moderate risk of morbidity from additional diagnostic testing or treatment
			
			Examples only:
			• Prescription drug management
			• Decision regarding minor surgery with identified patient or procedure risk factors
			• Decision regarding elective major surgery without identified patient or procedure risk factors
			• Diagnosis or treatment significantly limited by social determinants of health

High	High
	• 1 or more chronic illnesses with severe exacerbation, progression, or side effects of treatment;
	or
	• 1 acute or chronic illness or injury that poses a threat to life or bodily function
		Extensive
		(Must meet the requirements of at least 2 out of 3 categories)
		
		Category 1: Tests, documents, or independent historian(s)
		• Any combination of 3 from the following:
		  ○ Review of prior external note(s) from each unique source*;
		  ○ Review of the result(s) of each unique test*;
		  ○ Ordering of each unique test*;
		  ○ Assessment requiring an independent historian(s)
		or
		Category 2: Independent interpretation of tests
		• Independent interpretation of a test performed by another physician/other qualified health care professional (not separately reported);
		or
		Category 3: Discussion of management or test interpretation
		• Discussion of management or test interpretation with external physician/other qualified health care professional/appropriate source (not separately reported)
			High risk of morbidity from additional diagnostic testing or treatment
			
			Examples only:
			• Drug therapy requiring intensive monitoring for toxicity
			• Decision regarding elective major surgery with identified patient or procedure risk factors
			• Decision regarding emergency major surgery
			• Decision regarding hospitalization or escalation of hospital-level of care
			• Decision not to resuscitate or to de-escalate care because of poor prognosis
			• Parenteral controlled substances

Number and Complexity of Problems Addressed at the Encounter

One element used in selecting the level of services is the number and complexity of the problems that are addressed at the encounter. Multiple new or established conditions may be addressed at the same time and may affect MDM. Symptoms may cluster around a specific diagnosis and each symptom is not necessarily a unique condition. Comorbidities and underlying diseases, in and of themselves, are not considered in selecting a level of E/M services **unless** they are addressed, and their presence increases the amount and/or complexity of data to be reviewed and analyzed or the risk of complications and/or morbidity or mortality of patient management. The final diagnosis for a condition does not, in and of itself, determine the complexity or risk, as extensive evaluation may be required to reach the conclusion that the signs or symptoms do not represent a highly morbid condition. Therefore, presenting symptoms which are likely to represent a highly morbid condition may drive MDM even when the ultimate diagnosis is not highly morbid. The evaluation and /or treatment should be consistent with the likely nature of the condition. Multiple problems of a lower severity may, in the aggregate, create higher risk due to interaction.

The term "risk" as used in these definitions relates to risk from the condition. While condition risk and management risk may often correlate, the risk from the condition is distinct from the risk of the management.

Definitions for the elements of MDM (see Table 2, Levels of Medical Decision Making) are:

Problem: *A problem is a disease, condition, illness, injury, symptom, sign, finding, complaint, or other matter addressed at the encounter, with or without a diagnosis being established at the time of the encounter.*

Problem addressed: A problem is addressed or managed when it is evaluated or treated at the encounter by the physician or other qualified health care professional reporting the service. This includes consideration of further testing or treatment that may not be elected by virtue of risk/benefit analysis or patient/parent/guardian/surrogate choice. Notation in the patient's medical record that another professional is managing the problem without additional assessment or care coordination documented does not qualify as being addressed or managed by the physician or other qualified health care professional reporting the service. Referral without evaluation (by history, examination, or diagnostic study[ies]) or consideration of treatment does not qualify as being addressed or managed by the physician or other qualified health care professional reporting the service. For hospital inpatient and observation care services, the problem addressed is the problem status on the date of the encounter, which may be significantly different than on admission. It is the problem being managed or co-managed by the reporting physician or qualified health care professional and may not be the cause of admission or continued stay.

Minimal problem: A problem that may not require the presence of the physician or other qualified health care professional, but the service is provided under the physician's or other qualified health care professional's supervision (see 99211, 99281).

Self-limited or minor problem: *A problem that runs a definite and prescribed course, is transient in nature, and is not likely to permanently alter health status.*

Stable, chronic illness: A problem with an expected duration of at least one year or until the death of the patient. For the purpose of defining chronicity, conditions are treated as chronic whether or not stage or severity changes (eg, uncontrolled diabetes and controlled diabetes are a single chronic condition). "Stable" for the purposes of categorizing MDM is defined by the specific treatment goals for an individual patient. A patient who is not at his or her treatment goal is not stable, even if the condition has not changed and there is no short-term threat to life or function. For example, a patient with persistently poorly controlled blood pressure for whom better control is a goal is not stable, even if the pressures are not changing and the patient is asymptomatic. The risk of morbidity **without** treatment is significant.

Acute, uncomplicated illness or injury: A recent or new short-term problem with low risk of morbidity for which treatment is considered. There is little to no risk of mortality with treatment, and full recovery without functional impairment is expected. A problem that is normally self-limited or minor but is not resolving consistent with a definite and prescribed course is an acute, uncomplicated illness.

Acute, uncomplicated illness or injury requiring hospital inpatient or observation level care: A recent or new short-term problem with low risk of morbidity for which treatment is required. There is little to no risk of mortality with treatment, and full recovery without functional impairment is expected. The treatment required is delivered in a hospital inpatient or observation level setting.

Stable, acute illness: A problem that is new or recent for which treatment has been initiated. The patient is improved and while resolution may not be complete is stable with respect to this condition.

Chronic illness with exacerbation, progression, or side effects of treatment: A chronic illness that is acutely worsening, poorly controlled, or progressing with an intent to control progression and requiring additional supportive care or requiring attention to treatment for side effects.

Undiagnosed new problem with uncertain prognosis: A problem in the differential diagnosis that represents a condition likely to result in a high risk of morbidity without treatment.

Acute illness with systemic symptoms: An illness that causes systemic symptoms and has a high risk of morbidity without treatment. For systemic general symptoms, such as fever, body aches, or fatigue in a minor illness that may be treated to alleviate symptoms, see the definitions for **self-limited or minor problem** or **acute, uncomplicated illness or injury.** Systemic symptoms may not be general but may be single system.

Acute, complicated injury: An injury which requires treatment that includes evaluation of body systems that are not directly part of the injured organ, the injury is extensive, or the treatment options are multiple and/or associated with risk of morbidity.

Chronic illness with severe exacerbation, progression, or side effects of treatment: The severe exacerbation or progression of a chronic illness or severe side effects of treatment that have significant risk of morbidity and may require escalation in level of care.

Acute or chronic illness or injury that poses a threat to life or bodily function: An acute illness with systemic symptoms, an acute complicated injury, or a chronic illness or injury with exacerbation and/or progression or side effects of treatment, that poses a threat to life or bodily function in the near term without treatment. Some symptoms may represent a condition that is significantly probable and poses a potential threat to life or bodily function. These may be included in this category when the evaluation and treatment is consistent with this degree of potential severity.

Amount and/or Complexity of Data to be Reviewed and Analyzed

One element used in selecting the level of services is the amount and/or complexity of data to be reviewed or analyzed at an encounter.

Analyzed: Analyzed is a term describing the process of using the data as part of the MDM. The data element itself may not be subject to analysis (eg, glucose), but it is instead included in the thought processes for diagnosis, evaluation, or treatment. Tests ordered are presumed to be analyzed when the results are reported. Therefore, when they are ordered during an encounter, they are counted in that encounter. Tests that are ordered outside of an encounter may be counted in the encounter where they are analyzed. In the case of a recurring order, each new result may be counted in the encounter at which it is analyzed. For example, an encounter that includes an order for monthly prothrombin times would count for one prothrombin time ordered and reviewed. Additional future results, if analyzed in a subsequent encounter, may be counted as a single test in that subsequent encounter. Any service for which the professional component is separately reported by the physician or other qualified health care professional

reporting the E/M services is not counted as a data element ordered, reviewed, analyzed, or independently interpreted for the purposes of determining the level of MDM.

Test: Tests are imaging, laboratory, psychometric, or physiologic data. A clinical laboratory panel (eg, basic metabolic panel [80047]) is a single test. The differentiation between single or multiple tests is defined in accordance with the CPT code set. For the purposes of data reviewed and analyzed, pulse oximetry is not a test.

Unique: A unique test is defined by the CPT code set. When multiple results of the same unique test (eg, serial blood glucose values) are compared during an E/M service, only count one unique test. Tests that have overlapping elements are not unique, even if they are identified with distinct CPT codes. For example, a CBC with differential would incorporate the set of hemoglobin, CBC without differential, and platelet count. A unique source is defined as a physician or qualified heath care professional in a distinct group or different specialty or subspecialty, or a unique entity. Review of all materials from any unique source counts as one element towards MDM.

Combination of Data Elements: A combination of different data elements, for example a combination of notes reviewed, tests ordered, tests reviewed, or independent historian, allows these elements to be summed. It does not require each item type or category to be represented. A unique test ordered, plus a note reviewed and an independent historian would be a combination of three elements.

External: *External records, communications and/or test results are from an external physician, other qualified health care professional, facility, or health care organization.*

External physician or other qualified health care professional: *An external physician or other qualified health care professional who is not in the same group practice or is of a different specialty or subspecialty. This includes licensed professionals who are practicing independently. The individual may also be a facility or organizational provider such as from a hospital, nursing facility, or home health care agency.*

Discussion: Discussion requires an interactive exchange. The exchange must be direct and not through intermediaries (eg, clinical staff or trainees). Sending chart notes or written exchanges that are within progress notes does not qualify as an interactive exchange. The discussion does not need to be on the date of the encounter but is counted only once and only when it is used in the decision making of the encounter. It may be asynchronous (ie, does not need to be in person), but it must be initiated and completed within a short time period (eg, within a day or two).

Independent historian(s): An individual (eg, parent, guardian, surrogate, spouse, witness) who provides a history in addition to a history provided by the patient who is unable to provide a complete or reliable history (eg, due to developmental stage, dementia, or psychosis) or because a confirmatory history is judged to be necessary. In the case where there may be conflict or poor communication between multiple historians and more than one historian is needed, the independent historian requirement is met. It does not include translation services. The independent history does not need to be obtained in person but does need to be obtained directly from the historian providing the independent information.

Independent interpretation: The interpretation of a test for which there is a CPT code, and an interpretation or report is customary. This does not apply when the physician or other qualified health care professional who reports the E/M service is reporting or has previously reported the test. A form of interpretation should be documented but need not conform to the usual standards of a complete report for the test.

Appropriate source: *For the purpose of the* ***discussion of management*** *data element (see Table 2, Levels of Medical Decision Making), an appropriate source includes professionals who are not health care professionals but may be involved in the management of the patient (eg, lawyer, parole officer, case manager, teacher). It does not include discussion with family or informal caregivers.*

Risk of Complications and/or Morbidity or Mortality of Patient Management

One element used in selecting the level of services is the risk of complications and/or morbidity or mortality of patient management at an encounter. This is distinct from the risk of the condition itself.

Risk: The probability and/or consequences of an event. The assessment of the level of risk is affected by the nature of the event under consideration. For example, a low probability of death may be high risk, whereas a high chance of a minor, self-limited adverse effect of treatment may be low risk. Definitions of risk are based upon the usual behavior and thought processes of a physician or other qualified health care professional in the same specialty. Trained clinicians apply common language usage meanings to terms such as high, medium, low, or minimal risk and do not require quantification for these definitions (though quantification may be provided when evidence-based medicine has established probabilities). For the purposes of MDM, level of risk is based upon consequences of the problem(s) addressed at the encounter when appropriately treated. Risk also includes MDM related to the need to initiate or forego further testing, treatment, and/or hospitalization. The risk of patient management criteria applies to the patient management decisions made by the reporting physician or other qualified health care professional as part of the reported encounter.

Morbidity: *A state of illness or functional impairment that is expected to be of substantial duration during which function is limited, quality of life is impaired, or there is organ damage that may not be transient despite treatment.*

Social determinants of health: *Economic and social conditions that influence the health of people and communities. Examples may include food or housing insecurity.*

Surgery (minor or major, elective, emergency, procedure or patient risk):

> ***Surgery-Minor or Major:*** The classification of surgery into minor or major is based upon the common meaning of such terms when used by trained clinicians, similar to the use of the term "risk". These terms are not defined by a surgical package classification.
>
> ***Surgery-Elective or Emergency:*** Elective procedures and emergent or urgent procedures describe the timing of a procedure when the timing is related to the patient's condition. An elective procedure is typically planned in advance (eg, scheduled for weeks later), while an emergent procedure is typically performed immediately or with minimal delay to allow for patient stabilization. Both elective and emergent procedures may be minor or major procedures.
>
> ***Surgery-Risk Factors, Patient or Procedure:*** Risk factors are those that are relevant to the patient and procedure. Evidence-based risk calculators may be used, but are not required, in assessing patient and procedure risk.

Drug therapy requiring intensive monitoring for toxicity: A drug that requires intensive monitoring is a therapeutic agent that has the potential to cause serious morbidity or death. The monitoring is performed for assessment of these adverse effects and not primarily for assessment of therapeutic efficacy. The monitoring should be that which is generally accepted practice for the agent but may be patient-specific in some cases. Intensive monitoring may be long-term or short-term. Long-term intensive monitoring is not performed less than quarterly. The monitoring may be performed with a laboratory test, a physiologic test, or imaging. Monitoring by history or examination does not qualify. The monitoring affects the level of MDM in an encounter in which it is considered in the management of the patient. An example may be monitoring for cytopenia in the use of an antineoplastic agent between dose cycles. Examples of monitoring that do not qualify include monitoring glucose levels during insulin therapy, as the primary reason is the therapeutic effect (unless severe hypoglycemia is a current, significant concern); or annual electrolytes and renal function for a patient on a diuretic, as the frequency does not meet the threshold.

Guidelines for Selecting Level of Service Based on Time

Certain categories of time-based E/M codes that do not have levels of services based on MDM (eg, Critical Care Services) in the E/M section use time differently. It is important to review the instructions for each category.

Time is **not** a descriptive component for the emergency department levels of E/M services because emergency department services are typically provided on a variable intensity basis, often involving multiple encounters with several patients over an extended period of time.

When time is used for reporting E/M services codes, the time defined in the service descriptors is used for selecting the appropriate level of services. The E/M services for which these guidelines apply require a face-to-face encounter with the physician or other qualified health care professional. For office or other outpatient services, if the physician's or other qualified health care professional's time is spent in the supervision of clinical staff who perform the face-to-face services of the encounter, use 99211.

For coding purposes, time for these services is the total time on the date of the encounter. It includes both the face-to-face and non-face-to-face time personally spent by the physician and/or other qualified health care professional(s) on the day of the encounter (includes time in activities that require the physician or other qualified health care professional and does not include time in activities normally performed by clinical staff). It does not include any time spent in the performance of other separately reported service(s).

A shared or split visit is defined as a visit in which a physician and other qualified health care professional(s) both provide the face-to-face and non-face-to-face work related to the visit. When time is being used to select the appropriate level of services for which time-based reporting of shared or split visits is allowed, the time personally spent by the physician and other qualified health care professional(s) assessing and managing the patient on the date of the encounter is summed to define total time. Only distinct time should be summed for shared or split visits (ie, when two or more individuals jointly meet with or discuss the patient, only the time of one individual should be counted).

When prolonged time occurs, the appropriate prolonged services code may be reported. The total time on the date of the encounter spent caring for the patient should be documented in the medical record when it is used as the basis for code selection.

Physician or other other qualified health care professional time includes the following activities, when performed:

- preparing to see the patient (eg, review of tests)
- obtaining and/or reviewing separately obtained history
- performing a medically appropriate examination and/or evaluation
- counseling and educating the patient/family/caregiver
- ordering medications, tests, or procedures
- referring and communicating with other health care professionals (when not separately reported)
- documenting clinical information in the electronic or other health record
- independently interpreting results (when not separately reported) and communicating results to the patient family/caregiver
- care coordination (when not separately reported)

Do not count time spent on the following:

- the performance of other services reported separately

- travel
- teaching that is general and not limited to discussion that is required for the management of the specific patient

Unlisted Service

An E/M service may be provided that is not listed in this section of the CPT codebook. When reporting such a service, the appropriate unlisted code may be used to indicate the service, identifying it by "Special Report," as discussed in the following paragraph. The "Unlisted Services" and accompanying codes for the E/M section are as follows:

***99429 Unlisted preventive** medicine service*

***99499 Unlisted evaluation and management** service*

Special Report

An unlisted service or one that is unusual, variable, or new may require a special report demonstrating the medical appropriateness of the service. Pertinent information should include an adequate definition or description of the nature, extent, and need for the procedure and the time, effort, and equipment necessary to provide the service. Additional items that may be included are complexity of symptoms, final diagnosis, pertinent physical findings, diagnostic and therapeutic procedures, concurrent problems, and follow-up care.

Original Specialty Recommended RVU: **1.80**
Presented Recommended RVU: **1.80**
RUC Recommended RVU: **1.80**

Global Period: XXX Current Work RVU: **2.10**

CPT Descriptor: Prolonged evaluation and management service before and/or after direct patient care; first hour

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: An 85-year-old new patient with multiple complicated medical problems has moved to the area to live closer to her daughter. The physician or other qualified healthcare professional indicated that past medical records are needed from the patient's prior physicians or other qualified healthcare professionals and they are reviewed upon arrival.

Percentage of Survey Respondents who found Vignette to be Typical: 89%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: (not applicable)

Description of Intra-Service Work: Continue or prepare for the work of face-to-face evaluation and management on a date of service different from that of the face-to-face evaluation and management. Spend 30 to 74 minutes in non-face-to-face tasks, such as extensive record review, review of imaging studies, discussions with other physicians and qualified healthcare professionals, and ongoing, disease-specific patient management.

Description of Post-Service Work: (not applicable)

Median Total Time	**50.00**	**88.00**	**60.00**
Other time if appropriate			

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	16%	32%	28%	24%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	12%	40%	48%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	20%	48%	32%
Physical effort required	16%	56%	28%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	20%	20%	60%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	33%	42%	25%	0%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	33%	33%	33%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	17%	75%	8%
Physical effort required	58%	42%	0%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	42%	42%	16%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Code 99358 describes "Prolonged evaluation and management service before and/or after direct patient care; first hour," and code 99359 describes "Prolonged evaluation and management service before and/or after direct patient care; each additional 30 minutes (List separately in addition to code for prolonged service)."

The expert panel noted that 99358 is reported for the first hour of prolonged services on a date other than the date of the face-to-face encounter for all types of evaluation and management services. It may be reported when the prolonged services are performed on a date before or after the face-to-face encounter. It may be reported in conjunction with any level of visit, not just the higher level of visit in a family. 99358 is only reported when at least 30 minutes of time is spent on prolonged services. 99359 is reported in conjunction with 99358 for each additional 30 minutes of prolonged services. It is not reported unless an additional 15 minutes is spent on prolonged services beyond the first 60 minutes (i.e., 75 minutes). All the time for each code is considered intra-service time.

For code 99358, there were 61 respondents of whom 89% found the vignette to be typical. The survey times were 0/50/0/50, the median RVW was 2.45, and the 25th percentile RVW was 1.80.

The current times and RVW for 99358 are: 0/60/0/60/2.10.

The two key reference services were 99205, Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and high level of medical decision making. When using time for code selection, 60-74 minutes of total time is spent on the date of the encounter, with times and RVW of 14/59/15/88/3.50, and 99204, Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. When using time for code selection, 45-59 minutes of total time is spent on the date of the encounter, with times and RVW of 10/40/10/60/2.60.

The expert panel agreed that the work of 99358 has not increased since the last survey. In addition, the survey time of 50 minutes is 83% of the current time (60 minutes). This alone supported the survey 25th percentile RVW of 1.80 which is 85% of the current RVW (2.10).

An RVW of 1.80 also places 99358 in proper rank order with 99205 because the intra-service and total times are less, and the intensity is lower. Similarly, while the intra-service time is more than that of 99204, the total is less, as is the intensity. In fact, the WPUT with an RVW of 1.80 is 0.036 which is practically identical to the current WPUT.

Therefore, the expert panel recommends 50 minutes of time, all intra-service, and an RVW of 1.80.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 99358

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Nurse Practitioner How often? Sometimes

Specialty Internal Medicine How often? Sometimes

Specialty Family Medicine How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 1574289
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. (See attached spreadsheet)

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 211,314 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. (See attached spreadsheet; frequency and percentages are from the 2019 Medicare utilization in the RUC database.)

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Evaluation Management

BETOS Sub-classification:

BETOS Sub-classification Level II:
NA

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 99358

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	12%	40%	36%	12%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	12%	36%	52%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	24%	52%	24%
Physical effort required	28%	52%	20%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	20%	40%	40%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	22%	33%	33%	11%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	11%	67%	22%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	11%	67%	22%
Physical effort required	38%	38%	25%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	22%	33%	44%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Code 99358 describes "Prolonged evaluation and management service before and/or after direct patient care; first hour," and code 99359 describes "Prolonged evaluation and management service before and/or after direct patient care; each additional 30 minutes (List separately in addition to code for prolonged service)."

The expert panel noted that 99358 is reported for the first hour of prolonged services on a date other than the date of the face-to-face encounter for all types of evaluation and management services. It may be reported when the prolonged services are performed on a date before or after the face-to-face encounter. It may be reported in conjunction with any level of visit, not just the higher level of visit in a family. 99358 is only reported when at least 30 minutes of time is spent on prolonged services. 99359 is reported in conjunction with 99358 for each additional 30 minutes of prolonged services. It is not reported unless an additional 15 minutes is spent on prolonged services beyond the first 60 minutes (i.e., 75 minutes). All the time for each code is considered intra-service time.

For code 99359, there were 54 respondents of whom 92% found the vignette to be typical. The survey times were 0/30/0/30, the median RVW was 1.12. and the 25th percentile RVW was 0.75.

The current times and RVW are 0/30/0/30/1.00.

The two key reference services were 99214, Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. When using time for code selection, 30-39 minutes of total time is spent on the date of the encounter, with times and RVW of 7/30/10/47/1.92, and 95939, Central motor evoked potential study (transcranial motor stimulation); in upper and lower limbs, with times and RVW of 15/30/15/60/2.25.

The expert panel agreed that the work of 99359 has not increased since the last survey. They also noted that the survey time is identical to the current time. The expert panel agreed it was important to maintain proper rank order with 99358. They noted that the survey time of 30 minutes is 60% of the survey time for 99358 and that 60% of the recommended 99358 RVW (1.80) is 1.08 which supports maintaining the current RVW of 1.00. This would also place the WPUT for 99359 in proper rank order to 99358 (.033 vs. .036).

The expert panel also reviewed other RUC reviewed ZZZ global codes with 20-40 minutes intra-time, and an RVW between 0.5 and 1.5. Of the 51 codes found, the expert panel agreed that the most appropriate comparator was 99458, Remote Physiologic Monitoring, each additional 20 minutes that can be performed by a qualified health professional or clinical staff, which has times and RVW of 0/20/0/20/0.61. These values support maintaining the current RVW of 1.00 because the time and RVW of 99458 are 67% and 61% that of 99359.

Therefore, the expert panel recommends a time of 30 minutes, all intra-service, and an RVW of 1.00.

(NOTE: After deliberation by the RUC, the specialties subsequently recommended and the RUC approved an RVW of 0.75 with a time of 30 minutes, all intra-service.)

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

	Code	Global	Work RVU	Pre-Time	Intra-Time	Post-Time
3.	99358	XXX	1.80	0	50	0
4.	99359	ZZZ	0.75	0	30	0
5.	Total		2.55	0	80	0

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 99359

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Nurse Practitioner How often? Rarely

Specialty Internal Medicine How often? Rarely

Specialty Family Medicine How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 58564
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. (see attached spreadsheet)

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 7,861
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2019 Medicare claims data

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? No

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Evaluation Management

BETOS Sub-classification:

BETOS Sub-classification Level II:
NA

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 99359

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

Meeting Date: October 2019
Tab 14
Revised: October 6, 2021

****** No PE inputs are recommended for code 993X0 ******

CPT Code	Long Descriptor	Global Period
+99417	Prolonged outpatient evaluation and management service(s) time with or without direct patient contact beyond the required time of the primary service when the primary service level has been selected using total time, each 15 minutes of total time (List separately in addition to the code of the outpatient Evaluation and Management services) (Use 99417 in conjunction with 99205, 99215, 99245, 99345, 99350, 99483) (Do not report 99417 on the same date of service as 90833, 90836, 90838, 99358, 99359, 99415, 99416) (Do not report 99417 for any time unit less than 15 minutes)	ZZZ
+993X0	Prolonged inpatient evaluation and management service(s) time with or without direct patient contact beyond the required time of the primary service when the primary service level has been selected using total time, each 15 minutes of total time (List separately in addition to the code of the inpatient Evaluation and Management services) (Use 993X0 in conjunction with 99223, 99233, 99236, 99255, 99306, 99310) (Do not report 993X0 on the same date of service as 90833, 90836, 90838, 99358, 99359) (Do not report 993X0 for any time unit less than 15 minutes) (For prolonged psychotherapy services, use 908X0)	ZZZ
99358	Prolonged evaluation and management service before and/or after direct patient care; first hour	XXX
+99359	Prolonged evaluation and management service before and/or after direct patient care; each additional 30 minutes (List separately in addition to code for prolonged service) (Use 99359 in conjunction with 99358) (Do not report 99358, 99359 on the same date of service as 99202, 99203, 99204, 99205, 99212, 99213, 99214, 99215, 99221, 99222, 99223, 99231, 99232, 99233, 99234, 99235, 99236, 99242, 99243, 99244, 99245, 99252, 99253, 99254, 99255, 99281, 99282, 99283, 99284, 99285, 99304, 99305, 99306, 99307, 99308, 99309, 99310, 99341, 99342, 99344, 99345, 99347, 99348, 99349, 99350, 99483, 993X0, 99417)	ZZZ

Vignette(s) (*vignette required even if PE only code(s)*):

CPT Code	Vignette
+99417	Office visit for a patient with a chronic illness with severe exacerbation that poses a threat to life or bodily function, or an acute illness/injury that poses a threat to life or bodily function.
+993X0	Hospital visit for a patient with a chronic illness with severe exacerbation that poses a threat to life or bodily function, or an acute illness/injury that poses a threat to life or bodily function.
99358	An 85-year-old new patient with multiple complicated medical problems has moved to the area to live closer to her daughter. The physician or other qualified healthcare professional indicated that

	past medical records are needed from the patient's prior physicians or other qualified healthcare professionals and they are reviewed upon arrival.
+99359	An 85-year-old new patient with multiple complicated medical problems has moved to the area to live closer to her daughter. The physician or other qualified healthcare professional indicated that past medical records are needed from the patient's prior physicians or other qualified healthcare professionals and they are reviewed upon arrival.

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

   A consensus panel consisting of RUC advisors and subject matter experts from the surveying societies met via conference calls to review any data and existing PE inputs to develop the final recommendations presented in the PE worksheet.

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here (NOTE: *For services reviewed prior to the implementation of clinical activity codes, detail is not provided in the RUC database, please contact Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org for PE spreadsheets for your reference codes*):

   Current codes, plus recent E/M April 2019 survey RUC approved and CMS final recommendations.

3. Is this code(s) typically reported with an E/M service?
   Is this code(s) typically reported with the E/M service in the nonfacility?
   (Please see the *Billed Together* tab in the RUC Database)

   Codes 99358 and 99359 are not typically reported on the same day of service as an E/M code. Codes 99417 and 993X0 are add-on codes for certain E/M services, which are identified in parentheticals following the code descriptors.

4. What specialty is the dominant provider in the nonfacility?
   What percent of the time does the dominant provider provide the service(s) in the nonfacility?
   Is the dominant provider in the nonfacility different than for the global?
   (Please see the *Billed Together* tab in the RUC Database)

		PULMONARY DISEASE	1.1%		

5. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment, and supplies, please provide compelling evidence (please see *PE compelling evidence guidelines*) Please explain if the increase can be entirely accounted for because of an increase in physician time:

Not applicable.

(NOTE: CMS does not currently recognize code 99417 for payment. The recommended inputs for code 99417 are the same as those that CMS currently includes in G2212 (Prolonged office or other outpatient evaluation and management service(s) beyond the maximum required time of the primary procedure which has been selected using total time on the date of the primary service; each additional 15 minutes by the physician or qualified healthcare professional, with or without direct patient contact (list separately in addition to CPTcodes 99205, 99215 for office or other outpatient evaluation and management services) (do not report g2212 on the same date of service as 99354, 99355, 99358, 99359, 99415, 99416). (do not report g2212 for any time unit less than 15 minutes).)

CLINICAL STAFF ACTIVITIES

The RUC has agreed that there is a presumption of zero pre-service clinical staff time unless the specialty can provide evidence to the PE Subcommittee that any pre-service time is appropriate. The RUC agreed that with evidence some subset of codes may require minimal or extensive use of clinical staff and has allocated time when appropriate (for example when a service describes a major surgical procedure). If the package times are not applicable, alternate times may be presented and should be justified for consideration by the Subcommittee.

6. Are the global periods of the codes transitioning? Information about the amount of pre-service clinical staff time and a rationale for the change from a 090-day global to a 000 or 010 day global should be described below.

N/A

7. If you are recommending more minutes than the PE Subcommittee standards for clinical activities, you must provide rationale to justify the time:

N/A

8. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (*please see second worksheet in PE spreadsheet workbook*), please explain the difference here:

N/A

PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

9. How much time was allocated to clinical activity, *obtain vital signs* (CA010) prior to CMS increasing the clinical activity to 5 minutes for calendar year 2018? The standard for clinical activity, obtains vital signs remains 0, 3 and 5 based on the number of vital signs taken. Please provide a rationale for the clinical staff time that you are requesting for obtain vital signs here:

N/A

10. Please provide a brief description of the clinical staff work for the following:
    a. Pre-Service period:

    b. Service period (includes pre, intra and post):

    c. Post-service period:

Can be a combination of additional time for additional notes in the appropriate charts, and or calls above the E/M.

11. Please provide granular detail regarding what the clinical staff is doing during the intra-service (of service period) clinical activity, *assist physician or other qualified healthcare professional---directly related to physician work time* or *Perform procedure/service---NOT directly related to physician work time:*

N/A

12. If you have used a percentage of the physician intra-service work time other then 100 or 67 percent for the intra-service (of service period) clinical activity, please indicate the percentage and explain why the alternate percentage is needed and how it was derived.

N/A

13. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (*please see second worksheet in PE spreadsheet*):

N/A

14. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov.

N/A

MEDICAL SUPPLIES & EQUIPMENT/INVOICES

15. ☐ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

16. ☐ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

17. If you wish to include a supply that is not on the list (*please see fourth worksheet in PE spreadsheet*) please provide a paid invoice. Identify and explain the supply input and invoice here:

18. Are you recommending a PE supply pack for this recommendation? Yes or No.
If Yes, please indicate if the pack is an established package of supplies as defined by CMS (eg, SA047 *pack, E/M visit*) or a pack that is commercially available?

N/A

19. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation. Please include the description, CMS supply code, unit, item quantity and unit price (if available). See documents two and three under PE reference materials on the RUC Collaboration Website for information on the contents of kits, packs and trays.

20. If you wish to include an equipment item that is not on the list (*please see fifth worksheet in PE spreadsheet*) please provide a paid invoice. Identify and explain the equipment input and invoice here:

N/A

21. Please provide an estimate of the useful life of the new equipment item as required to calculate the equipment cost per minute (*please see fifth worksheet in PE spreadsheet*):

N/A

22. Have you recommended equipment minutes for a computer or equivalent laptop/integrated computer, equipment item computer, desktop, w-monitor, ED021 or notebook (Dell Latitute D600), ED038?
    a. If yes, please explain how the computer is used for this service(s).
    b. Is the computer used exclusively as an integral component of the service or is it also used for other purposes not specific to the code?
    c. Does the computer include code specific software that is typically used to provide the service(s)?

No equipment minutes are recommended for a computer or equivalent laptop/integrated computer, equipment item computer, desktop, w-monitor, ED021 or notebook (Dell Latitute D600), ED038.

23. List all the equipment included in your recommendation and the equipment formula chosen *(*please see document titled *Calculating equipment time)*. If you have selected "other formula" for any of the equipment please explain here:

The use of some space to conduct the prolonged services is necessary. We followed the guidance of the E/M outpatient services below: The specialty societies recommend the "Office Visits" equipment formula for EQ189 otoscope-ophthalmoscope (wall unit) and EF023 table, exam for code 99417.

ADDITIONAL INFORMATION

25. If there is any other item(s) on your spreadsheet not covered in the categories above that requires greater detail/explanation, please include here:

ITEMIZED LIST OF CHANGES (FOLLOWING THE PE SUBCOMMITTEE MEETING)
NOTE: The virtual meetings have provided for real-time updates to the PE spreadsheets. PE SORs must still be updated after the meeting and resubmitted asap.

During and immediately following the review of this tab at the PE Subcommittee meeting, please revise the summary of recommendation (PE SOR) based on modifications made during the meeting. Please submit the revised form electronically to Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org immediately following the close of business. In addition, please also provide an itemized list of the modifications made to the PE spreadsheet during the PE Subcommittee meeting in the space below (e.g. clinical activity CA010 *obtain vital signs* was reduced from 5 minutes to 3 minutes).

- All direct practice expense inputs were removed from code 993X0 since it is a facility-only code.
- Equipment ED021, *Computer, desktop, w-monitor,* was removed from the recommended inputs for codes 99417, 99358, and 99359 on the basis that this is an indirect expense.
- Equipment EQ189, *otoscope-ophthalmoscope (wall unit)*, and EF023, *exam table*, were removed from the recommended inputs for 99358 and 99359 since the patient is not present for these services.
- Consistent with the current inputs for G2212 and the RUC's prior recommendations for 99417, equipment EQ189, *otoscope-ophthalmoscope (wall unit)*, and EF023, *exam table*, were included in the recommended inputs for code 99417 in the non-facility setting, since it is an add-on to a face-to-face evaluation and management service in the outpatient (i.e., non-facility) setting and the patient will typically be occupying an exam room during the prolonged service.

AMA/Specialty Society RVS Update Committee Summary of Recommendations
Screen: CMS Request – Final Rule for 2020

October 2021

Prolonged Services – on the Date of an E/M – Tab 15

In February 2021, the CPT Editorial Panel deleted Prolonged Service with Direct Patient Contact (Except with Office or Other Outpatient Services) subsection including codes 99354-99357, revised CPT code 99417 and created a new prolonged inpatient service code 993X0. In October 2021, the specialty societies surveyed the two prolonged service on the date of an E/M codes (99417, 993X0) but did not obtain the required number of survey responses for code 993X0. The specialty noted, and the RUC concurred, that the January 2022 meeting is still within the current cycle and would not delay recommendations pertinent to the 2023 Medicare Physician Payment Schedule.

The RUC recommends that the prolonged services on the date of an E/M codes be postponed until January 2022 so the specialty societies can obtain the required number of survey responses for CPT codes 99417 and 993X0.

CPT Code	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
Evaluation and Management **Prolonged Services** ~~**Prolonged Service With Direct Patient Contact (Except with Office or Other Outpatient Services)**~~ ~~Codes 99354-99357 are used when a physician or other qualified health care professional provides prolonged service(s) involving direct patient contact that is provided beyond the usual service in either the inpatient, observation or outpatient setting, except with office or other outpatient services (99202, 99203, 99204, 99205, 99212, 99213, 99214, 99215). Direct patient contact is face-to-face and includes additional non-face-to-face services on the patient's floor or unit in the hospital or nursing facility during the same session. This service is reported in addition to the primary procedure. Appropriate codes should be selected for supplies provided or other procedures performed in the care of the patient during this period.~~ ~~Codes 99354-99355 are used to report the total duration of face-to-face time spent by a physician or other qualified health care professional on a given date providing prolonged service in the outpatient setting, even if the time spent by the physician or other qualified health care professional on that date is not continuous. Codes 99356-99357 are used to report the total duration of time spent by a physician or other qualified health care professional at the bedside and on the patient's floor or unit in the hospital or nursing facility on a given date providing prolonged service to a patient, even if the time spent by the physician or other qualified health care professional on that date is not continuous.~~ ~~Time spent performing separately reported services other than the E/M or psychotherapy service is not counted toward the prolonged services time.~~				

~~Code 99354 or 99356 is used to report the first hour of prolonged service on a given date, depending on the place of service.~~

~~Either code should be used only once per date, even if the time spent by the physician or other qualified health care professional is not continuous on that date. Prolonged service of less than 30 minutes total duration on a given date is not separately reported.~~

~~Code 99355 or 99357 is used to report each additional 30 minutes beyond the first hour, depending on the place of service. Either code may also be used to report the final 15-30 minutes of prolonged service on a given date. Prolonged service of less than 15 minutes beyond the first hour or less than 15 minutes beyond the final 30 minutes is not reported separately.~~

~~The use of the time based add-on codes requires that the primary evaluation and management service have a typical or specified time published in the CPT codebook.~~

~~For E/M services that require prolonged clinical staff time and may include face-to-face services by the physician or other qualified health care professional, use 99415, 99416. Do not report 99354, 99355 with 99415, 99416, 99417.~~

~~For prolonged total time in addition to office or other outpatient services (ie, 99205, 99215), use 99417.~~

~~The following table illustrates the correct reporting of prolonged physician or other qualified health care professional service with direct patient contact in the inpatient or observation setting beyond the usual service time.~~

~~**Total Duration of Prolonged Services**~~	~~**Code(s)**~~
~~less than 30 minutes~~	~~Not reported separately~~
~~30-74 minutes (30 minutes - 1 hr. 14 min.)~~	~~99356 X 1~~
~~75-104 minutes (1 hr. 15 min. - 1 hr. 44 min.)~~	~~99356 X 1 AND 99357 X 1~~
~~105 or more (1 hr. 45 min. or more)~~	~~99356 X 1 AND 99357 X 2 or more for each additional 30 minutes.~~

~~+ 99354~~	-	~~Prolonged evaluation and management or psychotherapy service(s) (beyond the typical service time of the primary procedure) in the office or other outpatient setting requiring direct patient contact beyond the usual service; first hour (List separately in addition to code for office or~~	~~ZZZ~~	~~N/A~~

		~~other outpatient **Evaluation and Management** or psychotherapy service)~~ ~~(Use 99354 in conjunction with 90837, 90847, 99241-99245, 99324-99337, 99341-99350, 99483)~~ ~~(Do not report 99354 in conjunction with 99202, 99203, 99204, 99205, 99212, 99213, 99214, 99215, 99415, 99416, 99417)~~		
~~+99355~~	-	~~each additional 30 minutes (List separately in addition to code for prolonged service)~~ ~~(Use 99355 in conjunction with 99354)~~ ~~(Do not report 99355 in conjunction with 99202, 99203, 99204, 99205, 99212, 99213, 99214, 99215, 99415, 99416, 99417)~~	~~ZZZ~~	~~N/A~~
~~+99356~~	-	~~Prolonged service in the inpatient or observation setting, requiring unit/floor time beyond the usual service; first hour (List separately in addition to code for inpatient **Evaluation and Management** service)~~ ~~(Use 99356 in conjunction with 90837, 90847, 99218-99220, 99221-99223, 99224-99226, 99231-99233, 99234-99236, 99251-99255, 99304-99310)~~	~~ZZZ~~	~~N/A~~
~~+99357~~	-	~~each additional 30 minutes (List separately in addition to code for prolonged service)~~ ~~(Use 99357 in conjunction with 99356)~~ (99354, 99355 have been deleted. For prolonged evaluation and management services on the date of an office or other outpatient service, home and residence service, or cognitive assessment and care plan, use 99417. For prolonged psychotherapy, use 908X0) (99356, 99357 have been deleted. For prolonged service on the date of an inpatient or observation or nursing facility service, use 993X0. For prolonged psychotherapy, use 908X0)	~~ZZZ~~	~~N/A~~

Prolonged Service With or Without Direct Patient Contact on the Date of an Evaluation and Management ~~Office or Other Outpatient~~ Service

Code 99417 is used to report prolonged total time (ie, combined time with and without direct patient contact) provided by the physician or other qualified health care professional on the date of office or other outpatient services, office consultation or other outpatient evaluation and management service (ie, 99205, 99215, 99245, 99345, 99350, 99483). Code 993X0 is used to report prolonged total time (ie, combined time with and without direct patient contact) provided by the physician or other qualified health care professional on the date of an inpatient service (ie, 99223, 99233, 99236, 99255, 99306, 99310). Prolonged total time is time that is 15 minutes beyond the time required to report the highest-level primary service. Codes 99417 and 993X0 ~~is~~ are only used when the primary ~~office or other outpatient~~ service has been selected using time alone as the basis and only after the ~~minimum~~ time required to report the highest-level service ~~(ie, 99205 or 99215)~~ has been exceeded by 15 minutes. To report a unit of 99417 or 993X0, 15 minutes of ~~additional~~ time must have been attained. Do not report 99417 or 993X0 for any ~~additional~~ time increment of less than 15 minutes.

~~The listed time ranges for 99205 (ie, 60-74 minutes) and 99215 (ie, 40-54 minutes) represent the complete range of time for which each code may be reported. Therefore,~~ When reporting 99417 or 993X0, the initial time unit of 15 minutes should be added once the ~~minimum~~ time in the primary E/M code has been surpassed by 15 minutes. For example, to report the initial unit of 99417 for a new patient encounter (99205), do not report 99417 until at least 15 minutes of time has been accumulated beyond 60 minutes (ie, 75 minutes) on the date of the encounter. For an established patient encounter (99215), do not report 99417 until at least 15 minutes of time has been accumulated beyond 40 minutes (ie, 55 minutes) on the date of the encounter.

Time spent performing separately reported services other than the primary E/M service and prolonged E/M service is not counted toward the primary E/M and ~~time to report 99205, 99215 and~~ prolonged services time.

For prolonged services on a date other than the date of a face-to-face evaluation and management encounter, ~~including office or other outpatient services (99202, 99203, 99204, 99205, 99212, 99213, 99214, 99215),~~ see 99358, 99359. For E/M services that require prolonged clinical staff time and may include face-to-face services by the physician or other qualified health care professional ~~QHP~~, see 99415, 99416. Do not report 99417 or 993X0 in conjunction with ~~99354, 99355,~~ 99358, 99359, 99415, 99416.

~~Prolonged services of less than 15 minutes total time is not reported. on the date of office or other outpatient service when the highest level is reached (ie, 99205, 99215).~~

✚▲99417	K5	Prolonged ~~office or other~~ outpatient evaluation and management service(s) time with or without direct patient contact beyond the ~~minimum~~ required time ~~with or without direct patient contact beyond the usual service~~ of the primary service ~~procedure encounter which~~ when the primary service level has been selected using total time, ~~requiring total time with or without direct patient contact beyond the usual service, on the date of the primary service,~~ each 15 minutes of total time (List separately in addition to ~~codes 99205, 99215 for office or other~~ the code of the outpatient Evaluation and Management services) (Use 99417 in conjunction with 99205, 99215, 99245, 99345, 99350, 99483) (Do not report 99417 on the same date of service as ~~99354, 99355,~~ 90833, 90836, 90838, 99358, 99359, 99415, 99416)	ZZZ	Postpone until January 2022 (2021 work RVU = 0.00)

Chicago, IL 60611

RE: Prolonged Services – on the Date of an E/M (99417, 993X0) (Tab 15)

Dear Dr. Silva:

The specialty societies listed below submitted a Level of Interest of "1" for the codes for prolonged services on the date of an evaluation and management service (i.e., codes 99417 and 993X0), which represent Tab 15 on the upcoming RUC agenda. Based on anticipated Medicare utilization, a valid RUC survey requires at least 75 respondents for each of these codes.

We have kept the survey for these two codes open as long as possible to get as many responses as possible. However, we did not reach our required minimum for code 993X0 in time to send summary data to the RUC by the deadline for handouts for the meeting. Despite our best efforts, which included RUC-approved reminders to surveyees, (as well as adding more potential surveyees), we have been unable to obtain the required number of responses for code 993X0. To date, we have 84 responses for code 99417 and 59 responses for 993X0.

Accordingly, the specialty societies involved in this survey are writing to request more time so we can reach the required number of responses for 993X0 and present valid results for both codes to the RUC. Specifically, we request a deferral of Tab 15 to the January 2022 RUC meeting, by which time we expect to have the necessary number of responses. We note that the January 2022 meeting is still within the current cycle and won't delay recommendations pertinent to the 2023 Medicare physician fee schedule.

Thank you for your time and consideration. We look forward to successfully completing these surveys and presenting to the RUC in January.

Sincerely,

AMA/Specialty Society RVS Update Committee Summary of Recommendations
High Volume Growth

October 2021

Contrast X-Ray of Knee Joint – Tab 16

CPT code 73580 was first identified via the high-volume growth screen in 2008. The long history of this code is detailed in the Summary of Recommendation (SOR) form. Most recently, the specialty societies noted that the increased growth in volume was due to miscoding of the related CPT code 27370 *Injection of contrast for knee arthrography*. To address this miscoding, CPT code 27370 was deleted and replaced with the new CPT code 27369 *Injection procedure for contrast knee arthrography or contrast enhanced CT/MRI knee arthrography* which was valued by the RUC in October 2017. In 2019, CPT code 27370 was deleted and a *CPT Assistant* article for CPT code 27369 was published in August 2019. Utilization of CPT code 73580 subsequently decreased in 2019 concurrent with the deletion of 27370 and clarification of the appropriate use of these codes.

CPT code 73580 describes the work involved with radiologic supervision and interpretation of x-ray images obtained during arthrography of the knee, as well as fluoroscopic guidance for the arthrogram procedure. The RUC noted that there is a separate CPT code 77002 *Fluoroscopic guidance for needle placement (eg, biopsy, aspiration, injection, localization device) (List separately in addition to code for primary procedure)* which describes fluoroscopic guidance for an arthrogram performed with CT or MR. However, surveyed code 73580 includes the work of fluoroscopic guidance. The injection for the arthrogram procedure is reported separately for x-ray, CT, and MR arthrography. The RUC noted that CPT code 73580 is typically (91.6%) reported with CPT code 27369 and was careful to avoid duplication of either physician work and/or practice expense inputs in the recommendation for 73580. In October 2020, the RAW had recommended that CPT code 73580 be referred to CPT to be bundled with CPT code 27369. In February 2021, the specialty society notified AMA staff that they would not be taking these services to CPT to bundle. They noted that the RUC rationale for CPT code 27369 provides additional information, including why these services were not previously bundled. Specifically, CPT found that bundling the injection code into the arthrography base procedure would not be ideal because it would involve edits to over 70 CPT codes.

In March 2021, the Relativity Assessment Workgroup (RAW) noted that code 73580 was never surveyed and remains CMS/Other sourced, while the specialty societies indicated that they would like to see if utilization decreases further when additional data are available. The RAW recommended, and the RUC agreed, that CPT code 73580 be surveyed for the October 2021 RUC meeting and that the effectiveness of the *CPT Assistant* article should be reexamined in two years (October 2023).

In March 2021, the RAW also noted that although CPT code 73580 describes *Radiologic examination, knee, arthrography, radiological supervision and interpretation*, based on Medicare claims data, it is reported by Diagnostic Radiology only 2.3% of the time. The primary providers are Rheumatology, Family Medicine, Orthopedic Surgery and Physical Medicine and Rehabilitation. Prior to the October 2021 RUC meeting, a letter was submitted on behalf of the family medicine, orthopaedic surgeons, physiatry and rheumatology regarding this code. The letter states that that these specialties did not submit interest in surveying, despite being the primary providers of the service per Medicare claims data, as they believe the reporting of this code associated with their specialties is likely due to misreporting and that radiology is the most appropriate

specialty to survey this service. CPT code 73580 was identified to be surveyed for the October 2021 RUC meeting, and radiology elected to survey.

Compelling Evidence
The RUC reviewed and agreed that there is compelling evidence to support a change in physician work for CPT code 73580 based on evidence that: (1) incorrect assumptions were made in the previous valuation and (2) physician work has increased due to changes in technique, knowledge/technology, and the patient population. The RUC noted that CPT code 73580 has never been surveyed and is the result of CMS/Other inputs, thus the methodology for valuation is unknown. Further, the CMS/Other time source is inappropriate to compare the current physician time and work to the survey results.

There has been a change in physician work for CPT code 73580 since CMS assigned a value and times based on the patient population and technology in 1995. In 1995, the typical patient underwent an x-ray arthrogram as an initial diagnostic exam following physician exam and knee radiographs. Today, the patient population has changed. CT and MR arthrography is significantly more common and has largely replaced x-ray arthrography for most patients. X-ray arthrography is reserved for more complex patients who have indwelling hardware from prior surgery that would result in artifact on MR or CT. Whereas it used to be commonly performed, code 73580 now represents a rare procedure that is primarily performed for exceptional patients who cannot receive CT or MR arthrography. Fluoroscopic equipment has also advanced in the past 25 years, allowing for analysis of finer detail and more subtle pathology in these patients. **The RUC concurred that there is compelling evidence that the physician work for this service has changed due to flawed methodology in the CMS valuation and a change in the patient population.**

73580 ***Radiologic examination, knee, arthrography, radiological supervision and interpretation***
The RUC reviewed the survey results from 41 radiologists and determined that the survey 25th percentile work RVU of 0.59 appropriately accounts for the physician work involved in this service. The RUC recommends 5 minutes of pre-service time, 14 minutes of intra-service time and 5 minutes of post-service time as supported by the survey.

The RUC compared CPT code 73580 to the top key reference code 72265 *Myelography, lumbosacral, radiological supervision and interpretation* (work RVU = 0.83- and 15-minutes intra-service time) which is a clinically similar radiological supervision and interpretation service that compares favorably to the survey code times. The key reference service has nearly identical times, but is more intense, as it involves assessment of the central nervous system as compared to the knee joint. Similarly, survey respondents reported that the surveyed code was "somewhat less" intense overall than the key reference code. The surveyed code has one minute less intra-service time and is less intense and complex than the reference code and is therefore appropriately valued lower. The RUC also compared 73580 to the second highest key reference code 74022 *Radiologic examination, complete acute abdomen series, including 2 or more views of the abdomen (eg, supine, erect, decubitus), and a single view chest* (work RVU = 0.32- and 5-minutes intra-service time) and noted that the surveyed code requires more intra-service and total time than the reference code and therefore is appropriately valued higher.

For additional support, the RUC compared CPT code 73580 to MPC codes 76519 *Ophthalmic biometry by ultrasound echography, A-scan; with intraocular lens power calculation* (work RVU = 0.54 and 10 minutes intra-service time) and 74220 *Radiologic examination, esophagus, including scout chest radiograph(s) and delayed image(s), when performed; single-contrast (eg, barium) study* (work RVU = 0.60 and 10 minutes intra-service time) and noted that the multi-specialty points of comparison services have less intra-service and total time yet the amount of

physician work closely brackets the surveyed code. The RUC concluded that CPT code 73580 should be valued at the 25th percentile work RVU as supported by the survey. **The RUC recommends a work RVU of 0.59 for CPT code 73580.**

Practice Expense
The Practice Expense Subcommittee reviewed the direct practice expense inputs and made no modifications. **The RUC recommends the direct practice expense inputs as submitted by the specialty society.**

CPT Code	CPT Descriptor	Global Period	Work RVU Recommendation
73580	Radiologic examination, knee, arthrography, radiological supervision and interpretation	XXX	0.59

September 8, 2021

Ezequiel Silva, MD
Chair, AMA RUC
AMA Plaza
330 N. Wabash Ave
Chicago, IL 60511

Dear Dr. Silva,

On behalf of the American Academy of Family Physicians, American Academy of Orthopaedic Surgeons, American Academy of Physical Medicine & Rehabilitation, and American College of Rheumatology, we are reaching out regarding CPT code 73580 *Radiological examination, knee, arthrography, radiological supervision and interpretation*. This code was identified to be surveyed for the October 2021 RUC meeting, and the American College of Radiology elected to survey. The above listed specialties did not submit interest in surveying, despite being the primary providers of the service per Medicare claims data in the RUC database. Our societies agree the bulk of, if not all, the billing of this code associated with our specialties is likely due to miscoding. We believe radiology is the most appropriate specialty to survey this code since radiologists are most likely to be the specialists billing this service appropriately.

As described in the background provided on the Level of Interest form for this code, we believe the previous increase in billing of code 73580 by our specialties was due to miscoding of the related CPT code 27370 *Injection of contrast for knee arthrography*. To address this issue, CPT code 27370 was deleted and replaced by a new CPT code, 27369 *Injection procedure for contrast knee arthrography or contrast enhanced CT/MRI knee arthrography*. Additionally, a *CPT Assistant* article was published in August 2019 describing these changes and the correct use of codes 73580 and 27369. CPT code 73580 utilization decreased in 2019 concurrent with the deletion of 27370 and clarification of the appropriate use of these codes. Claims went from a high of 49,095 in 2018 down to 30,453, which is the lowest volume for this code since 2012. The societies believe the steps taken in recent years will result in a continued decline in inappropriate use of 73580 by our specialties as more physicians become familiar with the revised coding and instructions and integrate it into their practices.

However, we recognize additional approaches may be needed and the societies have each reviewed the billing associated with their specialties. Based on billing patterns, the societies have agreed that different educational strategies are appropriate.

For instance, in the case of the American College of Rheumatology, the 2018 billing of this code is associated with a single rheumatologist. As it is a single-physician issue, the American College of Rheumatology will be sending communication directly to that member alerting them to the appropriate usage of this code. For the other three societies, billing of 73580 is associated with more than one physician. The three societies intend to provide member education in 2021 via their respective online and/or print newsletter publications to encourage correct coding of 73580. We believe that action in combination with the 2019 coding changes and *CPT Assistant* article should sufficiently address any miscoding.

The societies appreciate your consideration of this letter.

Sincerely,

Megan Adamson, MD
RUC Advisor, American Academy of Family Physicians

William Creevy, MD

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:73580 Tracking Number Original Specialty Recommended RVU: **0.59**
Presented Recommended RVU: **0.59**
Global Period: XXX Current Work RVU: **0.54** RUC Recommended RVU: **0.59**

CPT Descriptor: Radiologic examination, knee, arthrography, radiological supervision and interpretation

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 55-year-old female with osteoarthritis of the knee is referred for radiologic examination following contrast injection into the joint (injection coded separately). Images from the procedure are interpreted.

Percentage of Survey Respondents who found Vignette to be Typical: 83%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Review the reason for the examination, any pertinent clinical history, and prior imaging studies to become familiar with the patient's anatomy. Confirm that an arthrogram examination is appropriate and plan for the procedure including assessing potential contraindications. Dress in protective radiation attire. Ensure that the fluoroscopic equipment is prepared with proper settings.

Description of Intra-Service Work: The physician provides fluoroscopic guidance for the contrast injection. After contrast has been injected into the joint (reported separately), the physician obtains or supervises the acquisition of the images necessary for evaluation of the bones, joint, and surrounding structures. The physician reviews images for adequate positioning, contrast opacification of the joint space, and pathology. Additional images are obtained, as needed. All images are interpreted (typically 4 radiographs, in addition to any stored fluoroscopic images).

Description of Post-Service Work: Review, edit, and sign the report for the medical record. Communicate results to the referring physician and the patient, when appropriate. Record radiation dose for quality reporting.

• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	50%	0%	50%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

- In 2008, CPT code 73580 *(Radiologic examination, knee, arthrography, radiological supervision and interpretation)* was identified via the high-volume growth screen. The specialty commented the increase

in utilization is due to a non-coverage decision for arthroscopic lavage. Physicians were using this code to report different procedures.

- In February 2009, these procedures were referred to CPT for possible deletion of 73580 and 27370 *(Injection of contrast for knee arthrography)* and creation of a new code accurately describing the procedure that is being performed, including the radiologic guidance in the procedure codes.
- In October 2009, the RUC recommended that the specialty society develop a CPT Assistant article to address misreporting of arthrography codes. An article was published in June 2012.
- In April 2015, the RAW reviewed the services, and the RUC recommended that a CPT Assistant article be developed. The Workgroup requested that the specialty societies develop an action plan to address the increase in utilization and effectiveness of a CPT Assistant article.
- In October 2015, the RAW recommended to review this issue in 2017 to determine if the 2015 CPT Assistant article was effective. At that time, the specialty societies noted that the increased utilization was due to persistent miscoding of CPT code 27370. To address this miscoding, CPT code 27370 was deleted and replaced with a new CPT code, 27369 *(Injection procedure for contrast knee arthrography or contrast enhanced CT/MRI knee arthrography)*. The new CPT code was valued by the RUC in October 2017.
- CPT code 27370 was deleted in 2019 (replaced by 27369) and a CPT Assistant article was published in August 2019. CPT code 73580 utilization had decreased in 2019 by roughly 39%, concurrent with the deletion of 27370 and clarification of the appropriate use of these codes.
- In October 2020, the Workgroup recommended that CPT code 73580 be referred to CPT to be bundled with CPT code 27369.
- In February 2021, the specialty society notified AMA staff that they will not be taking these services to CPT to bundle. They noted that the RUC rationale for CPT code 27369 provides additional information, including why these services were not previously bundled. Specifically, CPT found that bundling the injection code into the arthrography base procedure would not be ideal because it would involve edits to over 70 CPT codes.
- In April 2021, the RAW recommended that CPT code 73580 be surveyed and that the effectiveness of the CPT Assistant article for CPT code 27369 should be reexamined in two years (October 2023).

The surveyed code, 73580, describes the work involved with radiologic supervision and interpretation of x-ray images obtained during arthrography of the knee, as well as fluoroscopic guidance for the arthrogram procedure. It is important to note that there is a separate CPT code, 77002 *(Fluoroscopic guidance for needle placement (eg, biopsy, aspiration, injection, localization device) (List separately in addition to code for primary procedure)),* which describes fluoroscopic guidance for an arthrogram performed with CT or MR. However, survey code 73580 includes the work of fluoroscopic guidance. The injection for the arthrogram procedure is billed separately for x-ray, CT, and MR arthrography.

Survey Process

The ACR surveyed a total of 1500 members (a random sample of 750 members and a separate random sample of 750 members who indicated that they perform musculoskeletal and interventional radiology procedures).

Compelling Evidence

We believe that there is compelling evidence to consider an increase in the value for CPT code 73580 based on evidence that: (1) incorrect assumptions were made in the previous valuation and (2) physician work has increased due to changes in technique, knowledge/technology, and patient population.

(1) **Flawed methodology.** CPT code 73580 has never been surveyed and is the result of CMS/Other inputs.

(2) **Changes in physician work.** We believe that there has been a change in physician work

for CPT code 73580 since CMS assigned a value and time based on the patient population and technology in 1995. In 1995, the typical patient underwent an x-ray arthrogram as an initial diagnostic exam following physician exam and knee radiographs. Today, the patient population has changed. CT and MR arthrography is significantly more common and has largely replaced x-ray arthrography for the vast majority of patients. X-ray arthrography is reserved for more complex patients who have indwelling hardware from prior surgery that would result in artifact on MR or CT. Fluoroscopic equipment has advanced in the past 25 years, allowing for analysis of finer detail and more subtle pathology in these patients.

Work RVU and Time Recommendations

The expert panel recommends the survey 25th percentile value at 0.59 work RVU and survey median times of 5 minutes pre-service, 14 minutes intra-service, and 5 minutes post-service.

Key Reference Services

Our recommended work RVU of 0.59 compares favorably to the most commonly chosen key reference service, CPT code 72265 *(Myelography, lumbosacral, radiological supervision and interpretation),* which is a clinically similar RS&I code. CPT code 72265 has nearly identical survey times of 5 minutes pre-service, 15 minutes intra-service, and 5 minutes post-service time, but is more intense as it involves assessment of the central nervous system as compared to the knee joint. This increased complexity is reflected in the higher work RVU of 0.83 for key reference code 72265 compared to the recommended 0.59 work RVU for the surveyed code. Similarly, survey respondents reported that the surveyed code was "somewhat less" intense overall than key reference code 72265.

The second key reference service code, CPT code 74022 *(Radiologic examination, complete acute abdomen series, including 2 or more views of the abdomen (eg, supine, erect, decubitus), and a single view chest)* was chosen by 9.7% of respondents. This code supports the recommendation as well, noting that there are not many RS&I codes from which to choose. Survey times (5 minutes pre-service, 14 minutes intra-service, and 5 minutes post-service time) are higher for the surveyed code, 73580, than those for second key reference code, 74022 (1 minute pre-service, 5 minutes intra-service, and 1 minute post-service time). Additionally, the recommended 0.59 work RVU is appropriately higher than that of key reference code 74022 at 0.32 work RVU. Survey respondents reported that the overall intensity of the surveyed code is identical (50%) or somewhat more (50%) than that of 74022, which in combination with the increased times, supports the recommended work RVU for CPT code 73580.

CPT Code	Descriptor	Work RVU	Pre	Intra	Post	Total Time	IWPUT	WPUT
74022	Radiologic examination, complete acute abdomen series, including 2 or more views of the abdomen (eg, supine, erect, decubitus), and a single view chest	0.32	1	5	1	7	0.055	0.046
73580	**Radiologic examination, knee, arthrography, radiological supervision and interpretation**	**0.59**	**5**	**14**	**5**	**24**	**0.026**	**0.025**
72265	Myelography, lumbosacral, radiological supervision and interpretation	0.83	5	15	5	25	0.040	0.033

MPC Codes

Our recommendation for surveyed code 73580 compares favorably to the MPC codes depicted in the table below. In comparison to MPC codes 74220 *(Radiologic examination, esophagus, including scout chest radiograph(s) and delayed image(s), when performed; single-contrast (eg, barium) study)* and 76830

(Ultrasound, transvaginal), the value recommendation for CPT code 73580 has slightly higher intra-service and total times, but a similar work RVU. The surveyed code 73580 has 4 more minutes of intra-service time and 2 more minutes of total time when compared to MPC code 76519 *(Ophthalmic biometry by ultrasound echography, A-scan; with intraocular lens power calculation),* with a nearly identical recommended work RVU.

CPT Code	Descriptor	Work RVU	Pre	Intra	Post	Total Time	IWPUT	WPUT
76519	Ophthalmic biometry by ultrasound echography, A-scan; with intraocular lens power calculation	0.54	2	10	10	22	0.027	0.025
73580	**Radiologic examination, knee, arthrography, radiological supervision and interpretation**	**0.59**	**5**	**14**	**5**	**24**	**0.026**	**0.025**
74220	Radiologic examination, esophagus, including scout chest radiograph(s) and delayed image(s), when performed; single-contrast (eg, barium) study	0.60	3	10	3	16	0.047	0.038
76830	Ultrasound, transvaginal	0.69	5	10	8	23	0.040	0.030

Summary

In summary, our expert panel recommends the 25th survey percentile at 0.59 work RVU with survey median times of 5 minutes pre-service, 14 minutes intra-service, and 5 minutes post-service. The recommended value compares favorably with the key reference services, 72265 and 74022, and maintains relativity within the RBRVS.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☒ Other reason (please explain) The surveyed code is typically reported with the injection code 27369. However, these codes have a complicated history and CPT chose not to bundle these services due to the overlap of multiple associated codes which would require edits to 70+ codes.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. 73580 (RS&I for arthrography of the knee) is typically reported with 27369 (injection for arthrogram). We included 27369 as a reference code on the PE spreadsheet and were careful to avoid duplication of both physician work and PE inputs in our recommendations for 73580.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 73580

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Diagnostic Radiology How often? Rarely

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 2060
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This service described by CPT code 73580 is estimated to be provided 2,060 times nationally in a one-year period.

Specialty Diagnostic Radiology Frequency 2060 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 687 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2019 utilization for CPT code 73580 is estimated around 29,300, of which Radiology is 2.3%. However, the top specialties indicated in the RUC DB (rheumatology, family medicine, orthopedic surgery, etc.,) indicate that they do not perform this procedure and there must be miscoding. Therefore, the service described by CPT code 73580 is estimated to be provided 687 times in a one-year period to Medicare patients.

Specialty Diagnostic Radiology Frequency 687 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Imaging

BETOS Sub-classification:
Imaging/procedure

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 73722

NONFACILITY DIRECT PE INPUTS

CPT CODE(S): 73580
SPECIALTY SOCIETY(IES): ACR
PRESENTER(S): Lauren Golding, MD; Andy Moriarity, MD

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

Meeting Date: October 2021

CPT Code	Long Descriptor	Global Period
73580	Radiologic examination, knee, arthrography, radiological supervision and interpretation	**XXX**

Vignette(s) (*vignette required even if PE only code(s)***):**

CPT Code	Vignette
73580	A 55-year-old female with osteoarthritis of the knee is referred for radiologic examination following contrast injection into the joint (injection coded separately). Images from the procedure are interpreted.

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

   The American College of Radiology convened a panel that included a number of experts familiar with this service to evaluate the direct practice expense inputs for contrast x-ray of the knee joint.

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here (NOTE: *For services reviewed prior to the implementation of clinical activity codes, detail is not provided in the RUC database, please contact Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org for PE spreadsheets for your reference codes*):

   For our reference codes, the ACR is providing the current code as well as CPT codes 27369, 77002, and 73564, which are clinically similar to and/or included in the service described by CPT code 73580. CPT code 27369 describes the injection procedure performed for the arthrogram and was included to ensure there was no duplication of PE inputs between this code and the surveyed code. The surveyed code can be thought of as a combination of the other two reference codes, 77002 and 73564. CPT code 77002 describes the fluoroscopic guidance for the arthrogram, which is part of the surveyed code (unlike in the case of CT or MR arthrography in which the fluoroscopic guidance is billed separately). CPT code 73564 describes an x-ray exam of the knee, which is clinically similar to the interpretation component of the surveyed RS&I code.

3. Is this code(s) typically reported with an E/M service?
   Is this code(s) typically reported with the E/M service in the nonfacility?
   (Please see the *Billed Together* tab in the RUC Database)

   CPT code 73580 is typically reported with an E/M service at 62.3%.
   CPT code 73580 is typically reported with an E/M service in the nonfacility at 63.3%.

4. What specialty is the dominant provider in the nonfacility?
   What percent of the time does the dominant provider provide the service(s) in the nonfacility?
   Is the dominant provider in the nonfacility different than for the global?
   (Please see the *Billed Together* tab in the RUC Database)

   According to the RUC database in the non-facility (Global & 26), Rheumatology is the dominant specialty at 20%. Rheumatology is also the dominant specialty for the global (all sites) at 19.6%.

However, Rheumatology has indicated that they believe this to be an error due to possible miscoding. We believe Radiology should be the dominant provider for this procedure.

5. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment, and supplies, please provide compelling evidence (please see *PE compelling evidence guidelines*) Please explain if the increase can be entirely accounted for because of an increase in physician time:

N/A.

CLINICAL STAFF ACTIVITIES

The RUC has agreed that there is a presumption of zero pre-service clinical staff time unless the specialty can provide evidence to the PE Subcommittee that any pre-service time is appropriate. The RUC agreed that with evidence some subset of codes may require minimal or extensive use of clinical staff and has allocated time when appropriate (for example when a service describes a major surgical procedure). If the package times are not applicable, alternate times may be presented and should be justified for consideration by the Subcommittee.

6. Are the global periods of the codes transitioning? Information about the amount of pre-service clinical staff time and a rationale for the change from a 090-day global to a 000 or 010 day global should be described below.

No.

7. If you are recommending more minutes than the PE Subcommittee standards for clinical activities, you must provide rationale to justify the time:

N/A.

8. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (*please see second worksheet in PE spreadsheet workbook*), please explain the difference here:

The following clinical activities, totaling 17 minutes, have been rolled into CA021 "Perform procedure/service –NOT directly related to physician time." The specialty is only recommending 12 minutes for CA021.

- (OLD) Assist physician in performing procedure- Acquire images (scout radiographs): 6 minutes
- (OLD) Review scout radiographs with physician: 1 minute
- (OLD) Assist physician in performing procedure- Obtain post injection radiographs: 10 minutes

9. How much time was allocated to clinical activity, *obtain vital signs* (CA010) prior to CMS increasing the clinical activity to 5 minutes for calendar year 2018? The standard for clinical activity, obtains vital signs remains 0, 3 and 5 based on the number of vital signs taken. Please provide a rationale for the clinical staff time that you are requesting for obtain vital signs here:

N/A.

10. Please provide a brief description of the clinical staff work for the following:
    a. Pre-Service period:

Confirm availability of prior images. Review clinical history and questionnaire.

b. Service period (includes pre, intra and post):

Prepare room and equipment. Position patient. Obtain and review scout images (typically 2). Operate or assist physician with operation of fluoroscopic equipment. Obtain post-injection images (typically 4).

c. Post-service period:

Clean room/equipment. QC images in PACS. Review exam with interpreting MD. Scan documents into PACS. Complete exam in RIS system.

11. Please provide granular detail regarding what the clinical staff is doing during the intra-service (of service period) clinical activity, *assist physician or other qualified healthcare professional---directly related to physician work time* or *Perform procedure/service---NOT directly related to physician work time:*

Bring patient into x-ray room and have patient sit/lie on x-ray table. Place first cassette behind patient's knee. Position patient's anatomy for the scout view. Step behind shielding to control panel. Set appropriate exposure parameters. Instruct patient to hold still. Take exposure for first view. Step from behind shielding. Take first cassette from behind patient and place second cassette as needed. Position patient's anatomy for lateral view. Step behind shielding to control panel. Set appropriate exposure parameters. Instruct patient to hold still. Take exposure for second view (typically 2). Step from behind shielding. Take second cassette out behind patient. Run all cassettes through reader. Check all images for adequate exposure, positioning, coverage, etc. Repeat any views as needed. Operate or assist physician with operation of the fluoroscopic equipment during the injection of contrast. Repeat the steps for radiograph acquisition above for the post-injection views (typically 4). Run all cassettes through reader. Check all images for adequate exposure, positioning, coverage, etc. Repeat any views as needed.

Note: Radiology codes typically assume 2 minutes of technologist time required to obtain radiographs of appendicular structures (e.g. the knee). The 12 minutes for CA021 accounts for 2 minutes to obtain each of the typical 2 scout images and 4 post-injection radiographs included in 73580.

12. If you have used a percentage of the physician intra-service work time other then 100 or 67 percent for the intra-service (of service period) clinical activity, please indicate the percentage and explain why the alternate percentage is needed and how it was derived.

N/A.

13. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (*please see second worksheet in PE spreadsheet*):

N/A.

14. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov.

PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

15. ☐ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

16. ☐ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

17. If you wish to include a supply that is not on the list (*please see fourth worksheet in PE spreadsheet*) please provide a paid invoice. Identify and explain the supply input and invoice here:

N/A.

18. Are you recommending a PE supply pack for this recommendation? Yes or No.
If Yes, please indicate if the pack is an established package of supplies as defined by CMS (eg, SA047 *pack, E/M visit*) or a pack that is commercially available?

No.

19. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation. Please include the description, CMS supply code, unit, item quantity and unit price (if available). See documents two and three under PE reference materials on the RUC Collaboration Website for information on the contents of kits, packs and trays.

N/A.

20. If you wish to include an equipment item that is not on the list (*please see fifth worksheet in PE spreadsheet*) please provide a paid invoice. Identify and explain the equipment input and invoice here:

N/A.

21. Please provide an estimate of the useful life of the new equipment item as required to calculate the equipment cost per minute (*please see fifth worksheet in PE spreadsheet*):

N/A.

22. Have you recommended equipment minutes for a computer or equivalent laptop/integrated computer, equipment item computer, desktop, w-monitor, ED021 or notebook (Dell Latitute D600), ED038?
    a. If yes, please explain how the computer is used for this service(s).
    b. Is the computer used exclusively as an integral component of the service or is it also used for other purposes not specific to the code?
    c. Does the computer include code specific software that is typically used to provide the service(s)?

N/A.

23. List all the equipment included in your recommendation and the equipment formula chosen *(*please see document titled *Calculating equipment time).* If you have selected "other formula" for any of the equipment please explain here:

- **Technologist PACS workstation (ED050)** = PACS formula
- **Professional PACS workstation (ED053)** = Sum of half of pre-service physician time and full intra-service physician time
- **Room, radiographic-fluoroscopic (EL014)** = Highly technical formula

AMA/Specialty Society RVS Update Committee Summary of Recommendations
CMS Request – Final Rule for 2021

October 2021

3D Rendering with Interpretation and Report – Tab 17

In the Final Rule for the CY 2020 Medicare Physician Fee Schedule, CMS nominated CPT code 76377 *3D rendering with interpretation and reporting of computed tomography, magnetic resonance imaging, ultrasound, or other tomographic modality with image postprocessing under concurrent supervision; requiring image postprocessing on an independent workstation* as potentially misvalued. The Agency views CPT code 76377 to be part of the same family as CPT code 76376 *3D rendering with interpretation and reporting of computed tomography, magnetic resonance imaging, ultrasound, or other tomographic modality with image postprocessing under concurrent supervision; not requiring image postprocessing on an independent workstation*, which was recently reviewed at the April 2018 RUC meeting. CMS requested that CPT code 76377 also be reviewed to maintain relativity within the code family.

The specialty societies surveyed CPT code 76377, as requested by CMS, yet disagree with the Agency's rationale for the nomination of the code as potentially misvalued, as they still do not believe that CPT codes 76376 and 76377 are part of the same code family. During discussion of CPT code 76376 in April 2018, it was noted that "CPT code 76377 was not surveyed for the April 2018 RUC meeting with 76376 for several reasons. CPT code 76376 is performed by technologists on the diagnostic workstation for a wide variety of clinical exams with the images subsequently interpreted by the radiologist to answer specific clinical questions at the request of the referring physician. CPT code 76377 is for technically demanding reconstructions typically performed by the radiologist on an independent workstation. These are much more involved data reconstructions on a few specific types of exams. The patient population undergoing CPT code 76376 is much different than the 76377 code."

At the October 2021 meeting, the family for CPT codes 76376 and 76377 was questioned again. The specialty societies resolutely maintain that these two services are not a code family. CPT code 76377 involves the creation of 3D reconstructions of the organs of interest using an independent workstation, requiring complex software post processing, such as for surface rendering or tractography. This specialized hardware and software is never utilized when performing the work of 76376. Despite similar descriptors, the societies emphasized that the two codes are different due to the different clinical indications for each code, different patient populations, and fundamental differences in both the equipment needed to perform the work and the type of provider that performs the rendering. The typical patient for 76377 is a patient with a renal cell carcinoma and those patients where the surgeons are considering nephron-sparing surgery. Code 76377 is used for very intricate detailing of the tumor for pre-surgical planning. It is important to isolate the tumor and discern the relationship between the vessels, requiring more time and effort on the physician's part than for code 76376. It was further noted that the technical and professional resources required for 76376 and 76377 are significantly different. The specialties maintained that the physician work required for these two services is inherently different and not part of the same family.

Compelling Evidence
The specialty societies chose to address compelling evidence, although not required, in order to support their recommendation for maintaining the current value of CPT code 76377 despite decreases in intra-service and immediate post-service time. The argument for compelling evidence was based upon a change in technique and patient population. CPT code 76377 was last reviewed in 2005 when 3D rendering was first becoming a possibility in routine clinical care. Over the intervening years, there have been many changes in both the quality of the source imaging (e.g., increasing use of multiparametric and dynamic MRI, thinner slice CT source images, etc.) and the capabilities of postprocessing software. These changes have allowed for finer anatomical detail and have increased the requirements and expectations of ordering clinicians. Additionally, there has been a significant increase in patients eligible for nephron-sparing surgery for renal cell carcinoma since 2005. With modern treatment options, accurate and detailed 3D rendering is now a more significant component of surgical planning. The RUC reviewed and agreed that there has been a significant increase in imaging technology since the code was initially valued in 2005, including an increase in the number and complexity of software programs that can be used to reformat the types of imaging and an increase in the number and quantity of data obtained from the source imaging. The significant changes in technology (dynamic MRI, multi parametric MRI, and more advanced CT imaging), and creation and review of these images, results in more complexity overall in performing this code. **The RUC concurred that there is compelling evidence that the physician work for this service has changed due to a change in technique.** Although the recommendation does not request an increase in value, compelling evidence was established to justify the decreases in time and establish an increase in intensity and complexity.

76377 ***3D rendering with interpretation and reporting of computed tomography, magnetic resonance imaging, ultrasound, or other tomographic modality with image postprocessing under concurrent supervision; requiring image postprocessing on an independent workstation***
The RUC reviewed the survey results from 53 radiologists and neuroradiologists and determined that maintaining the current work RVU of 0.79, which falls below the survey 25th percentile, appropriately accounts for the physician work involved in this service. The RUC recommends 5 minutes pre-service evaluation time, 15 minutes intra-service time and 5 minutes post-service time as supported by the survey. As referenced above, the technology and expectations for performing this service have changed since it was last valued in 2005. As a result, the RUC believes that maintaining work value while slightly lowering total time is appropriate given the increase in intensity. The specialty asserted that the survey respondents accurately identified that this service has seen some increase in work efficiency and time based on improvements in postprocessing workflow but that the intensity and complexity of the work has increased.

The RUC compared CPT code 76377 to the top key reference code 71270 *Computed tomography, thorax, diagnostic; without contrast material, followed by contrast material(s) and further sections* (work RVU = 1.25, 5 minutes pre-service evaluation time, 18 minutes intra-service time and 4 minutes immediate post-service time) and noted that the surveyed code has slightly less intra-service time and is less intense than the reference code and therefore is appropriately valued lower. The RUC also compared 76377 to the second top key reference code 70450 *Computed tomography, head or brain; without contrast material* (work RVU = 0.85, 4 minutes pre-service evaluation time, 10 minutes intra-service time and 4 minutes immediate post-service time) and noted that the surveyed code has more intra-service time yet is much less intense than the reference code and therefore is appropriately valued lower.

For additional support, the RUC compared CPT code 76377 to MPC codes 74246 *Radiologic examination, upper gastrointestinal tract, including scout abdominal radiograph(s) and delayed image(s), when performed; double-contrast (eg, high-density barium and effervescent agent) study, including glucagon, when administered* (work RVU = 0.90, 4 minutes pre-service evaluation time, 15 minutes intra-service time and 3 minutes

immediate post-service time) and 95819 *Electroencephalogram (EEG); including recording awake and asleep* (work RVU = 1.08, 5 minutes pre-service evaluation time, 15 minutes intra-service time and 6 minutes immediate post-service time) and noted that the multi-specialty points of comparison values have identical intra-service time and are both more intense than the surveyed code, justifying the recommendation. The RUC concluded that the value of CPT code 76377 should be maintained at 0.79 work RVUs, below the 25th percentile of the survey. **The RUC recommends a work RVU of 0.79 for CPT code 76377.**

Practice Expense

The Practice Expense (PE) Subcommittee discussed and accepted the compelling evidence argument that this service has changed based on change in technology and patient population. CPT code 76377 was last reviewed by the RUC in 2005. In the past 16 years, there have been significant changes in both technology and patient population. Specifically, the number and complexity of available post-processing software packages has increased since 2005, requiring more time to reconstruct and review images. The change in patient population is based largely on the typical patient who has a renal cell carcinoma which now, since the code was originally surveyed, can be treated with nephron-sparing surgery; therefore, this code is now used for very intricate detailing of the tumor for pre surgical planning. These changes have resulted in increased times for this service. There have also been changes in RUC methodology with standardization of times for practice expense inputs since the code was last valued. In addition, the current equipment inputs for this code erroneously omit a professional PACS workstation. However, the work of this service includes dictating the report, which is done on a professional PACS workstation and therefore 18 minutes are recommended based on the professional PACS formula. **The RUC recommends the direct practice expense inputs as submitted by the specialty society.**

SUMMARY OF RECOMMENDATION

CPT Code:76377 Tracking Number Original Specialty Recommended RVU: **0.79**
Presented Recommended RVU: **0.79**
Global Period: XXX Current Work RVU: **0.79** RUC Recommended RVU: **0.79**

CPT Descriptor: 3D rendering with interpretation and reporting of computed tomography, magnetic resonance imaging, ultrasound, or other tomographic modality with image postprocessing under concurrent supervision; requiring image postprocessing on an independent workstation

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 50-year-old male presented to his physician with hematuria. Renal ultrasound (coded separately) identified a 3-cm lower pole right renal mass consistent with renal cell carcinoma, previously diagnosed with ultrasound. The patient is a possible candidate for nephron-sparing partial nephrectomy. A CT scan of the abdomen is ordered by the patient's urologist. Three-dimensional rendering is requested for further evaluation. A CT examination of the abdomen, both before and after the use of contrast media, is performed (coded separately). Subsequent postprocessing and 3D reconstruction is performed demonstrating the patient is a candidate for partial nephrectomy.

Percentage of Survey Respondents who found Vignette to be Typical: 72%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Review protocol with technologist. Review any prior imaging studies. Review source imaging data.

Description of Intra-Service Work: Supervise and/or create 3D reconstructions of the organs of interest using an independent workstation. Adjust the projection of the 3D reconstructions to optimize visualization of anatomy or pathology. Interpret the 3D reformatted images resulting from the study, typically including cine review. Compare to all pertinent available prior studies. Dictate report for medical record.

Description of Post-Service Work: Review and sign report. Communicate results to the referring physician and the patient, when appropriate.

SURVEY DATA

RUC Meeting Date (mm/yyyy)	10/2021		
Presenter(s):	Lauren Golding, MD; Andy Moriarity, MD; Melissa Chen, MD; Ryan Lee, MD		
Specialty Society(ies):	ACR, ASNR		
CPT Code:	76377		
Sample Size:	3650	**Resp N:**	53
Description of Sample:	The ACR surveyed a total of 1,250 members (a random sample of 625 members and a separate random sample of 625 members who perform abdominal imaging, gastrointestinal, genitourinary, neuro imaging, neurointerventional, thoracic, and interventional radiology procedures). The ASNR surveyed a random sample of 2,400 from its membership.

• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	23%	46%	31%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

In the Final Rule for the CY 2020 Medicare Physician Fee Schedule, CMS nominated CPT code 76377 *(3D rendering with interpretation and reporting of computed tomography, magnetic resonance imaging, ultrasound, or other tomographic modality with image postprocessing under concurrent supervision;*

requiring image postprocessing on an independent workstation) as potentially misvalued. The Agency viewed CPT code 76377 to be part of the same family as CPT code 76376 *(3D rendering with interpretation and reporting of computed tomography, magnetic resonance imaging, ultrasound, or other tomographic modality with image postprocessing under concurrent supervision; not requiring image postprocessing on an independent workstation)*, which was recently reviewed at the April 2018 RUC meeting. CMS requested that CPT code 76376 also be reviewed to maintain relativity within the code family. The specialty societies disagreed with CMS' rationale for the nomination of CPT code 76377 as potentially misvalued and the specialties do not believe that CPT codes 76376 and 76377 are in the same code family, although the descriptors are similar. The societies noted that the two codes are different because they are utilized on different patient populations (as evidenced by the ICD-10 diagnoses). They also noted that the technical and professional resources required for 76376 and 76377 are significantly different. For these reasons, the specialty societies recommended, and the RUC agreed to refer CPT codes 76377 and 76376 to the CPT Editorial Panel for further review and potential revision. The specialty societies noted that they will determine the family of services including whether the codes remain a family, based on the recommendations of the CPT Editorial Panel**.** In February 2021, the specialty society notified AMA staff that they will not bring a CCA to CPT. As this was a CMS request on the October 2021 LOI, the American College of Radiology (ACR) and American Society of Neuroradiology (ASNR) agreed to survey CPT code 76377 for the October 2021 RUC meeting.

Survey Process
The ACR surveyed a total of 1,250 members (a random sample of 625 members and a separate random sample of 625 members who perform abdominal imaging, gastrointestinal, genitourinary, neuro imaging, neurointerventional, thoracic, and interventional radiology procedures). The ASNR surveyed a random sample of 2,400 individuals from its membership.

Compelling Evidence
The societies believe that there is compelling evidence to consider an increase in the value for CPT code 76377 based on: technique and knowledge/technology. CPT code 76377 was last updated in 2005 when 3D rendering was first becoming a possibility in routine clinical care. Over the intervening years, there have been many changes in both the quality of the source imaging (e.g., increasing use of multiparametric and dynamic MRI, thinner slice CT source images, etc.) and the capabilities of postprocessing software. These changes have allowed for finer anatomical detail and have increased the requirements and expectations of ordering clinicians. It should be noted that 72% of respondents agreed with the vignette that a partial nephrectomy evaluation is the typical clinical situation. Throughout the years, renal cell carcinoma has been described in literature as becoming the "radiologists' tumor rather than the internists'" [1] and AUA Guidelines have concluded that compelling data exists for consideration of nephron-sparing surgery in all patients [2]. This has led to changes in the inclusion criteria for partial nephrectomy evaluation and the requisite complexity of technology needed to adequately guide surgical intervention.

Work RVU and Time Recommendations
The expert panel recommends maintaining the current value at 0.79 work RVU and survey median times of 5 minutes pre-service, 15 minutes intra-service, and 5 minutes post-service. As referenced above, the technology and expectations of performing this service have changed since it was last valued in 2005. As a result, the societies believe that maintaining work value while lowering total time is appropriate despite an increase in IWPUT. We believe our survey respondents have accurately identified that this service has seen some increase in work efficiency and time based on improvements in postprocessing workflow but that the intensity and complexity of the work has increased.

Key Reference Services
In comparison to the first key reference service CPT code 71270, the surveyed code's work RVU of 0.79 and IWPUT of 0.038 compares favorably, as individual and overall components of intensity and complexity were surveyed higher for the surveyed code than in the key reference service. In comparison to the second key reference service CPT code 70450, the surveyed code's work RVU of 0.79 and IWPUT of 0.038 compares

favorably, as individual and overall components of intensity and complexity were surveyed higher for the surveyed code than in the key reference service. It should be noted that our recommendations would place this service below the work RVU, IWPUT, and WPUT of both key reference services despite being surveyed as more intense and complex.

CPT Code	Descriptor	Work RVU	Pre	Intra	Post	Total Time	IWPUT	WPUT
76377	**3D rendering with interpretation and reporting of computed tomography, magnetic resonance imaging, ultrasound, or other tomographic modality with image postprocessing under concurrent supervision; requiring image postprocessing on an independent workstation**	**0.79**	**5**	**15**	**5**	**25**	**0.038**	**0.032**
70450	Computed tomography, head or brain; without contrast material	0.85	4	10	4	18	0.067	0.047
71270	Computed tomography, thorax, diagnostic; without contrast material, followed by contrast material(s) and further sections	1.25	5	18	4	27	0.058	0.046

MPC Codes

CPT code 76377 compares favorably with MPC codes 74246 and 95819. All three codes share identical intra-service times and similar pre- and post- times respectively, with CPT code 76377 having the lowest work RVU and IWPUT amongst the three codes.

CPT Code	Descriptor	Work RVU	Pre	Intra	Post	Total Time	IWPUT	WPUT
76377	**3D rendering with interpretation and reporting of computed tomography, magnetic resonance imaging, ultrasound, or other tomographic modality with image postprocessing under concurrent supervision; requiring image postprocessing on an independent workstation**	**0.79**	**5**	**15**	**5**	**25**	**0.038**	**0.032**
74246	Radiologic examination, upper gastrointestinal tract, including scout abdominal radiograph(s) and delayed image(s), when performed; double-contrast (eg, high-density barium and effervescent agent) study, including glucagon, when administered	0.90	4	15	3	22	0.050	0.041
95819	Electroencephalogram (EEG); including recording awake and asleep	1.08	5	15	6	26	0.056	0.042

Summary

In summary, our expert panel recommends maintaining the current value at 0.79 work RVU and survey median times of 5 minutes pre-service, 15 minutes intra-service, and 5 minutes post-service. The recommended value compares favorably with the key reference services, 71270 and 70450, and maintains relativity within the RBRVS.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 76377

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Diagnostic Radiology How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 571029
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. The service described by CPT code 76377 is estimated to be provided 571,029 times nationally in a one-year period.

Specialty Diagnostic Radiology Frequency 435695 Percentage 76.30 %

Specialty Cardiology Frequency 42827 Percentage 7.50 %

Specialty Urology Frequency 17130 Percentage 3.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 190,343 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The service described by CPT code 76377 is estimated to be provided 190,343 times nationally in a one-year period to Medicare patients.

Specialty Diagnostic Radiology Frequency 145231 Percentage 76.30 %

Specialty Cardiology Frequency 14275 Percentage 7.50 %

Specialty Urology Frequency 5710 Percentage 3.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Imaging

BETOS Sub-classification:

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 76377

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

SPECIALTY SOCIETY(IES): ACR, ASNR

PRESENTER(S):

Lauren Golding, MD; Andrew Moriarity, MD; Melissa Chen, MD; Ryan Lee, MD

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC) PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

Meeting Date: October 2021

CPT Code	Long Descriptor	Global Period
76377	3D rendering with interpretation and reporting of computed tomography, magnetic resonance imaging, ultrasound, or other tomographic modality with image postprocessing under concurrent supervision; requiring image postprocessing on an independent workstation	XXX

Vignette(s) (*vignette required even if PE only code(s)***):**

CPT Code	Vignette
76377	A 50-year-old male presented to his physician with hematuria. Renal ultrasound (coded separately) identified a 3-cm lower pole right renal mass consistent with renal cell carcinoma, previously diagnosed with ultrasound. The patient is a possible candidate for nephron-sparing partial nephrectomy. A CT scan of the abdomen is ordered by the patient's urologist. Three-dimensional rendering is requested for further evaluation. A CT examination of the abdomen, both before and after the use of contrast media, is performed (coded separately). Subsequent postprocessing and 3D reconstruction is performed demonstrating the patient is a candidate for partial nephrectomy.

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

   The American College of Radiology and the American Society of Neuroradiology convened a panel that included a number of experts familiar with this service to evaluate the direct practice expense inputs for this procedure.

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here (NOTE: *For services reviewed prior to the implementation of clinical activity codes, detail is not provided in the RUC database, please contact Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org for PE spreadsheets for your reference codes*):

   The specialties will be using the current inputs for CPT code 76377 as the reference code for our proposed inputs. Although the specialties do not consider CPT codes 76376 and 76377 to be a code family due to differences in clinical nature as well as patient populations, we included CPT code 76376 as a reference code per AMA staff request.

3. Is this code(s) typically reported with an E/M service?
   Is this code(s) typically reported with the E/M service in the nonfacility?
   (Please see the *Billed Together* tab in the RUC Database)

   No, this code is not typically reported with an E/M.

4. What specialty is the dominant provider in the nonfacility?
   What percent of the time does the dominant provider provide the service(s) in the nonfacility?
   Is the dominant provider in the nonfacility different than for the global?
   (Please see the *Billed Together* tab in the RUC Database)

   Diagnostic Radiology is the dominant provider in both the non-facility and global settings.

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

Diagnostic Radiology performs the service 74.7% of the time in the non-facility.
Diagnostic Radiology performs the service 76.3% of the time for all sites (Global&26).

5. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment, and supplies, please provide compelling evidence (please see *PE compelling evidence guidelines*) Please explain if the increase can be entirely accounted for because of an increase in physician time:

CPT code 76377 was last reviewed by the RUC in 2005. In the past 16 years, there have been significant changes in both technology and patient population, as well as changes in RUC methodology with standardization of times for practice expense inputs. These changes have resulted in increased times for this service. Specifically, the number and complexity of available post-processing software packages has increased since 2005, requiring more time to reconstruct and review images. Additionally, there has been a significant increase in patients eligible for nephron-sparing surgery for renal cell carcinoma since 2005. With modern treatment options, accurate and detailed 3D rendering is now a more significant component of surgical planning.

Specific PE inputs that have increased include:
CA013: The RUC standard is 2 minutes however we are requesting 1 minute. A separate workstation needs to be prepared, but this is less work than preparing the CT room equipment, so we reduced the standard and are requesting 1 minute for CA013.
CA014: The RUC standard is 1 minute. There is a separate order and protocol for this service, so it is not duplicative of work accounted for in the CT code.
CA030, CA031, CA032: These three clinical activities correspond to the old clinical activity *"Process films, hang films, and review study with interpreting MD prior to patient discharge."* Previously, 5 minutes were allotted for this clinical activity; however, we have updated our recommendations per new standards/baselines for the three clinical activities: We are recommending 3 minutes for CA030 (RUC standard for CT/MRI), 2 minutes for CA031 (RUC standard) and 1 minutes for CA032 (RUC standard), which totals 6 minutes.
ED053: The current inputs for this code does not include a professional PACS workstation. However, the work of this service includes dictating the report, which is done on a professional PACS workstation. Therefore, we are recommending 18 minutes based on the professional PACS formula.

CLINICAL STAFF ACTIVITIES

The RUC has agreed that there is a presumption of zero pre-service clinical staff time unless the specialty can provide evidence to the PE Subcommittee that any pre-service time is appropriate. The RUC agreed that with evidence some subset of codes may require minimal or extensive use of clinical staff and has allocated time when appropriate (for example when a service describes a major surgical procedure). If the package times are not applicable, alternate times may be presented and should be justified for consideration by the Subcommittee.

6. Are the global periods of the codes transitioning? Information about the amount of pre-service clinical staff time and a rationale for the change from a 090-day global to a 000 or 010 day global should be described below.

No.

7. If you are recommending more minutes than the PE Subcommittee standards for clinical activities, you must provide rationale to justify the time:

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

The specialties are proposing 3 minutes for CA030 – Technologist QC of images. The baseline is 2 minutes, but 3 minutes is the standard for procedures involving CT/MR.

8. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (*please see second worksheet in PE spreadsheet workbook*), please explain the difference here:

The following April 2005 clinical activities for CPT code 76377 are being transitioned to these new clinical activity codes:

- The 33 minutes from "Assist physician in performing procedure/Computer post processing" (Old – April 2005) is being reassigned to CA021 "Perform procedure/service-NOT directly related to physician work time".
- The 5 minutes from "Process films, hang films, and review study with interpreting MD prior to patient discharge" (Old – April 2005) is being reassigned to "Technologist QC's images in PACS, checking for all images, reformats, and dose page" (CA030), "Review examination with interpreting MD/DO" (CA031), and "Scan exam documents into PACS. Complete exam in RIS system to populate images into work queue" (CA032). Per updated standards/baselines, this results in a total of 6 minutes for these clinical activities.

9. How much time was allocated to clinical activity, *obtain vital signs* (CA010) prior to CMS increasing the clinical activity to 5 minutes for calendar year 2018? The standard for clinical activity, obtains vital signs remains 0, 3 and 5 based on the number of vital signs taken. Please provide a rationale for the clinical staff time that you are requesting for obtain vital signs here:

N/A.

10. Please provide a brief description of the clinical staff work for the following:
    a. Pre-Service period:

N/A.

    b. Service period (includes pre, intra and post):

The technologist reviews the appropriateness of the request with the radiologist and obtains the source image files for 3D rendering on an independent workstation. The technologist prepares and manipulates the source images for 3D rendering and physician interpretation. The technologist reviews the examination with the interpreting physician as needed. The technologist transmits the 3D renderings into PACS, performs quality check of the images in PACS, and checks all images. The technologist completes the exam in the RIS system to populate images into the work queue.

    c. Post-service period:

N/A.

11. Please provide granular detail regarding what the clinical staff is doing during the intra-service (of service period) clinical activity, *assist physician or other qualified healthcare professional---directly related to physician work time* or *Perform procedure/service---NOT directly related to physician work time:*

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

The technologist prepares and manipulates the source images for 3D rendering and physician interpretation. This service addresses complex renderings such as shaded surface rendering, volumetric rendering, maximum intensity projections, fusion of images from other modalities, and quantitative analysis (segmental volumes and surgical planning) that will best display the anatomy/pathology. The technologist then creates the appropriate 3D imaging dataset. This includes detailed manipulation of images in three dimensions to determine what anatomy to "cut out" and what to include. For example, in assessing a renal mass, the adjacent vasculature would be included but other anatomy which may or may not be in the same plane would be removed to optimally visualize vascular invasion or variant vascular anatomy in preparation for surgery. This process is labor intensive, requires special training, and may require several trial-and-error attempts to produce high quality 3D images. In addition to the renal cell carcinoma example in the vignette, this code is also used for tractography to generate white matter tracts in the brain to plan for surgery.

12. If you have used a percentage of the physician intra-service work time other then 100 or 67 percent for the intra-service (of service period) clinical activity, please indicate the percentage and explain why the alternate percentage is needed and how it was derived.
    N/A.

13. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (*please see second worksheet in PE spreadsheet*):
    N/A.

14. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov.
    N/A.

MEDICAL SUPPLIES & EQUIPMENT/INVOICES

15. ☐ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

16. ☐ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

17. If you wish to include a supply that is not on the list (*please see fourth worksheet in PE spreadsheet*) please provide a paid invoice. Identify and explain the supply input and invoice here:
    N/A.

18. Are you recommending a PE supply pack for this recommendation? Yes or No.
    If Yes, please indicate if the pack is an established package of supplies as defined by CMS (eg, SA047 *pack, E/M visit*) or a pack that is commercially available?
    N/A.

19. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation. Please include the description, CMS supply code, unit, item quantity and unit price (if

available). See documents two and three under PE reference materials on the RUC Collaboration Website for information on the contents of kits, packs and trays.

N/A.

20. If you wish to include an equipment item that is not on the list (*please see fifth worksheet in PE spreadsheet*) please provide a paid invoice. Identify and explain the equipment input and invoice here:

N/A.

21. Please provide an estimate of the useful life of the new equipment item as required to calculate the equipment cost per minute (*please see fifth worksheet in PE spreadsheet*):

N/A.

22. Have you recommended equipment minutes for a computer or equivalent laptop/integrated computer, equipment item computer, desktop, w-monitor, ED021 or notebook (Dell Latitute D600), ED038?
    a. If yes, please explain how the computer is used for this service(s).
    b. Is the computer used exclusively as an integral component of the service or is it also used for other purposes not specific to the code?
    c. Does the computer include code specific software that is typically used to provide the service(s)?

N/A.

23. List all the equipment included in your recommendation and the equipment formula chosen *(*please see document titled *Calculating equipment time)*. If you have selected "other formula" for any of the equipment please explain here:

Computer Workstation, 3D Reconstruction CT-MR (ED014) – Highly Technical Formula
Professional PACS Workstation (ED053) – sum of ½ physician pre time + full physician intra time
