RUC Referrals to CPT Editoral Panel - Outstanding Issues

		Screen	RUC Meeting	Specialty Society:	CPT Meeting
20985	**Computer-assisted surgical navigational procedure for musculoskeletal procedures, image-less (List separately in addition to code for primary procedure)**	High Volume Growth10	September 2024	AAOS	February 2025

Background: In September 2024 the RUC recommended that this issue be referred to CPT. The specialty society would like to modify the descriptor and address any overlap with codes 0054T and 0055T. It is expected that revising code 20985 will result in a decrease of the reporting of the T codes.

		Screen	RUC Meeting	Specialty Society:	CPT Meeting
36557	**Insertion of tunneled centrally inserted central venous catheter, without subcutaneous port or pump; younger than 5 years of age**	Site of Service Anomaly - 2023	January 2024	ACR, ACS, APSA, OEIS, SIR, SVS	February 2025

Background: In April 2023, the Relativity Assessment Workgroup (RAW) identified CPT code 36558 via the site of service anomaly screen, for services with Medicare utilization over 10,000 in 2019-2021 that are typically performed in the inpatient hospital setting, yet only include a half discharge day management visit (99238). The RAW reviewed the action plan in September 2023, and agreed with the specialty societies that the entire family of services (36557-36566) be surveyed for the January 2024 RUC meeting. The specialty societies also requested changing the global period from a 010-day to a 000-day to account for variability in site of service based on the patient presentation and specialty performing the procedure. However, when the specialty societies were preparing to survey the services, they determined they could not proceed and instead requested to revise the codes through the CPT process prior to surveying. The specialty societies noted that the ages listed within some of the current code descriptors do not accurately reflect the variation of physician work (e.g., babies versus infants versus children versus adults). Additionally, some of the code descriptors are antiquated and include outdated practices and techniques technology that no longer exist or are incorrectly described, which may cause incorrect reporting. For example, patients are receiving central lines at multiple points in time with no way to accurately and appropriately capture work based on the current code family structure. Finding an access location in a patient in which access issues have become harder, takes more time, includes more risk, and potentially requires additional interventions. The RUC recommends that CPT codes 36557, 36558, 36560, 36561, 36563, 36565, and 36566 be referred to the May 2024 CPT Editorial Panel meeting for revision. In September 2024 the applicants withdrew the CCA citing that the specialties that most frequently use these codes were not involved in development of the code structure. The applicants requested a workgroup to be formed to develop a unified code structure.

55705	**Biopsy, prostate, any approach, nonimaging-guided**	Codes Reported Together 75% or More-Part5	September 2024	ACR, AUA, OEIS, SIR	February 2025; May 2024 (Tab 15)

Background: In September 2024, the RUC recommended to refer this entire code family to the CPT Editorial Panel for restructuring in the CPT 2027 cycle. Specifically, to ensure that the long descriptor language and related guidelines appropriately describe the services and number of biopsies performed per service. Additionally, the language of “first targeted lesion” was not clear to RUC members and the survey respondents as indicated by the identical intra-service times for services were few biopsies were obtained and services were numerous biopsies were obtained. Another RUC member noted that the language “Biopsy” and “Biopsies” was confusing as well. Additionally, the add-on code was thought to present a potential issue for improper coding due to lack of clarity on the number of biopsies performed, per service. The societies informed the RUC that they have a Coding Change Application prepared for the February 2025 CPT Editorial Panel meeting for the CPT 2027 cycle.

55707		Codes Reported Together 75% or More-Part5	September 2024	ACR, AUA, OEIS, SIR	February 2025; May 2024 (Tab 15)

Background: In September 2024, the RUC recommended to refer this entire code family to the CPT Editorial Panel for restructuring in the CPT 2027 cycle. Specifically, to ensure that the long descriptor language and related guidelines appropriately describe the services and number of biopsies performed per service. Additionally, the language of "first targeted lesion" was not clear to RUC members and the survey respondents as indicated by the identical intra-service times for services were few biopsies were obtained and services were numerous biopsies were obtained. Another RUC member noted that the language "Biopsy" and "Biopsies" was confusing as well. Additionally, the add-on code was thought to present a potential issue for improper coding due to lack of clarity on the number of biopsies performed, per service. The societies informed the RUC that they have a Coding Change Application prepared for the February 2025 CPT Editorial Panel meeting for the CPT 2027 cycle.

Screen	RUC Meeting	Specialty Society:	CPT Meeting
CMS High Expenditure Procedural Codes2 / Codes Reported Together 75% or More-Part5	April 2024	ACR, ASNR, SIR	February 2025

Background: In April 2022, the Relativity Assessment Workgroup identified services performed by the same physician on the same date of service 75% of the time or more. Only groups that totaled allowed charges of $5 million or more were included. As with previous iterations, any code pairs in which one of the codes was either below 1,000 in 2020 Medicare claims data and/or contained at least one ZZZ global service were removed. The Workgroup requested action plans for September 2022 to determine if specific codes bundling solutions should occur for 70547 and 70544. In September 2022, the Workgroup recommended review in 2 years (2021-2022 data) after practice patterns in the inpatient and outpatient setting go back to how it was prior to the pandemic. (Note: 2019 reported together data was 66%). In April 2024, the RAW noted that the rate these services are reported together continues to increase (2020=77%, 2021=79% and 2022=81%). The specialty societies recommended, and the Workgroup agreed that 70547 and 70544 be referred to the CPT Editorial Panel (Feb 2025) to create a code bundling solution.

90901	**Biofeedback training by any modality**	High Volume Growth9	April 2024	ACOG, APTA, AUA	Feb 2025; Sep 2024

Background: In April 2023, the Relativity Assessment Workgroup (RAW) identified CPT code 90901 via the high volume growth screen with 2021 Medicare utilization of 10,000 or more than increased by at least 100% from 2016 through 2021. In September 2023, the Workgroup reviewed the action plan for CPT code 90901 and agreed with the specialty societies that 90901, along with the other services in this code family (90912 and 90913) be surveyed for the April 2024 RUC meeting. The specialty society also requested changing the global period from 010-day to a 000-day global period to account for variability in the site of service based on the patient presentation and specialty societies performing the procedure. However, when the specialty societies were preparing to survey the services, they determined they could not proceed and instead requested to revise the code family through the CPT process before surveying. The specialty societies noted that the current code descriptor for CPT code 90901 is not well understood based on their review of past RUC rationales for valuation, claims data, and the vignettes used for review in 1995 and 1996 by the RUC and HCPAC. In the 1995 RUC rationale, the vignette described 45–60-minute sessions (and brief 30-minute sessions) and included information about psychiatrists and psychologists, though it is unclear who was surveyed. However, the 1996 RUC rationale of the HCPAC review is based on a different vignette, considered a CMD five-year-review comment, and was surveyed by physical therapists, which led to a reduction of the work RVU from 0.89 to 0.41 based on comparison to a time-based therapy code, CPT code 97110. The specialty societies note that although 90901 is not time-based, the comparison for the current value was to a 15-minute time-based code despite the current intra-service time being 45 minutes. In their letter to request a referral to CPT for this code family, the specialty societies proposed revising the code descriptor for CPT code 90901 to be consistent with other physical therapy time-based and modality codes, as well as similar to other biofeedback training codes. Additionally, code descriptor clarification may resolve the continued confusion about the intent and correct coding for 90901. The RUC recommends that CPT codes 90901, 90902 and 90903 be referred to the September 2024 CPT Editorial Panel meeting for revision. In September 2024, the CPT Editorial Panel postponed this issue and indicated clarifications necessary for the submitters to address prior to the next submission.

95800	**Sleep study, unattended, simultaneous recording; heart rate, oxygen saturation, respiratory analysis (eg, by airflow or peripheral arterial tone), and sleep time**	CMS Fastest Growing / High Volume Growth10	September 2024	ACNS, AAN, ACCP/ATS, AASM	February 2025

Background: In April 2024, this service was identified via the high volume growth screen, with Medicare utilization of 10,000 or more that has increased by at least 100% from 2017 through 2022. The Workgroup requests that the specialty societies submit an action plan for codes for September 2024. In September 2024, the RUC recommended referral to CPT. The specialty societies submitted a CCA for Sept 2024 CPT meeting to delete the current code family and replace it with a set of codes that more accurately reflect current medical practice and technologies. However, this tab was withdrawn at CPT due to the many issues identified by the Panel reviewers. The specialty societies indicated that they have drafted a new CCA and plan to submit it for the February 2025 CPT meeting.

		Screen	RUC Meeting	Specialty Society:	CPT Meeting
95921	**Testing of autonomic nervous system function; cardiovagal innervation (parasympathetic function), including 2 or more of the following: heart rate response to deep breathing with recorded R-R interval, Valsalva ratio, and 30:15 ratio**	Different Performing Specialty from Survey / Codes Reported Together 75% or More-Part1 / Different Performing Specialty from Survey3 / Codes Reported Together 75% or More-Part7	September 2024	AAFP, AAN, AANEM, ACNS, ACP	February 2025

Background: For code pair 95921/95922, the Relativity Assessment Workgroup acknowledged that the rationale for increased utilization remains unclear. Thus, the dominant specialties for these two codes (Family Medicine and Internal Medicine) were requested to provide the following information regarding 95921 and 95922: What are the clinically appropriate scenarios for reporting each service? What is the description of service? What are the clinically appropriate scenarios when these servic AAFP and ACP indicated that they do not have an explanation for the increased utilization as their physicians indicated that they do not typically perform these services. In 2008, a CPT Assistant article was published to correct inappropriate reporting by clarifying that a tilt table is required in the provision of the service. However, Medicare claims data indicate that the attempted coding education was not effective. In April 2011, the RUC recommended this code be referred to CPT to revise the descriptor to include the use of a tilt table and refer those who do not use a tilt table in autonomic testing to use an unlisted code, which was addressed at the February 2012 (Tab 17) CPT meeting. In January 2020, the RUC recommended to refer codes 95921-95924 to CPT Assistant in 2020 to clarify correct coding on how to report these services. The RAW would review the specialty mix again in 3 years of those reporting the services (Sept 2023). In September 2023, the specialty societies indicated that the article included correct coding for autonomic testing services when a tilt table was used, clarity on terminology used in the code descriptor language of the code set, and clinical examples for each code. The intent of the article was to reduce the occurrence of any miscoding that may be contributing to the total utilization and understand if the shift in dominant specialties was now typical. The Workgroup examined these services and indicated that the decrease in utilization in 2020 may not be attributable to the CPT article but to due to the COVID-19 pandemic. The RUC noted that these services are typically reported with one another and the code family should be referred to CPT to be restructured. In September 2024, the Relativity Assessment Workgroup identified 95921 and 95923 as via the Codes Reported Together 75% or more screen. In September 2024, the RUC recommended referral to CPT. The specialty societies noted that they submitted a CCA for the Sept 2024 CPT meeting with revisions to the current autonomic function testing code set and the creation of a new Category I code to more accurately reflect current clinical practice and technologies. However, this issue was withdrawn from CPT based on feedback from specialty society comments and Editorial Panel reviewers. The specialty societies will revise the CCA to address concerns with reported together utilization The specialty societies will resubmit a CCA for the February 2025 CPT meeting.

The Workgroup noted that these services are typically reported with one another and the code family should be referred to CPT to be restructured. In September 2024, the Relativity Assessment Workgroup identified 95921 and 95923 as via the Codes Reported Together 75% or more screen. In September 2024, the RUC recommended referral to CPT. The specialty societies noted that they submitted a CCA for the Sept 2024 CPT meeting with revisions to the current autonomic function testing code set and the creation of a new Category I code to more accurately reflect current clinical practice and technologies. However, this issue was withdrawn from CPT based on feedback from specialty society comments and Editorial Panel reviewers. The specialty societies will revise the CCA to address concerns with reported together utilization The specialty societies will resubmit a CCA for the February 2025 CPT meeting.

		Screen	RUC Meeting	Specialty Society:	CPT Meeting
95924	**Testing of autonomic nervous system function; combined parasympathetic and sympathetic adrenergic function testing with at least 5 minutes of passive tilt**	Codes Reported Together 75% or More-Part1	September 2023	AAFP, AAN, AANEM, ACNS, ACP	February 2025

Background: CPT Feb 2012 the CPT Editorial Panel established two new codes with instructional guidelines to report autonomic function testing. In April 2012, The RUC determined that the survey results for 95924 was too low (26 responses). There was also confusion about what is described in 95924 which may have resulted in invalid physician time for this service. The RUC recommended an interim value for 95924. In January 2020, the RUC recommended to refer codes 95921-95924 to CPT Assistant in 2020 to clarify correct coding on how to report these services. The RAW would review the specialty mix again in 3 years of those reporting the services (Sept 2023). In September 2023, the specialty societies indicated that the article included correct coding for autonomic testing services when a tilt table was used, clarity on terminology used in the code descriptor language of the code set, and clinical examples for each code. The intent of the article was to reduce the occurrence of any miscoding that may be contributing to the total utilization and understand if the shift in dominant specialties was now typical. The Workgroup examined these services and indicated that the decrease in utilization in 2020 may not be attributable to the CPT article but to due to the COVID-19 pandemic. The Workgroup noted that these services are typically reported with one another and the code family should be referred to CPT to be restructured.

		Screen	RUC Meeting	Specialty Society:	CPT Meeting
G0396	**Alcohol and/or substance (other than tobacco) misuse structured assessment (e.g., audit, dast), and brief intervention 15 to 30 minutes**	CMS-Other - Utilization over 30,000	January 2018	AAFP, ASA	Time Uncertain

Background: In October 2017, the RAW requested that AMA staff compile a list of CMS/Other codes with Medicare utilization of 30,000 or more. This list resulted in 34 services and the RAW requested action plans to be reviewed at the January 2018 meeting. In January 2018, the RUC recommended to maintain the physician work and refer to CPT to editorially remove "screening" from 99408 and 99409 to "assessment" to mirror G0396. At the February 2018 CPT meeting, the Panel postponed until time uncertain this request to revise codes 99408-99409 to identify assessment of alcohol and/or substance abuse. As a rationale for postponement, the Panel said that the service described in this application did not meet the General Criteria for Category I because the proposed service is not unique or well defined, and does not describe a service that is clearly identified and distinguished from existing services already described in CPT by other codes. The Panel's additional rationale for postponement of this item was to allow the relevant specialty societies an opportunity to submit a new code change application to address the differences between assessment and screening services.

RUC Recommendations to Develop CPT Assistant Articles - Outstanding Issues

		Screen:	RUC Meeting:	RUC Rec:	Specialty Society:	CPT Asst Status:
11305	**Shaving of epidermal or dermal lesion, single lesion, scalp, neck, hands, feet, genitalia; lesion diameter 0.5 cm or less**	CMS High Expenditure Procedural Codes1 / Different Performing Specialty from Survey6	September 2024	Refer to CPT Assistant. 0.80	AAD	

Background: Validated physician work for April 2012 prior to review of Mohs surgery codes (17311-17315) in April 2013. In April 2024, the Relativity Assessment Workgroup identified this service it based on 2022 Medicare utilization more than 10,000 and where the top specialty performing over 50% of the Medicare claims did not survey the service or the top two specialties did not survey the service. The Workgroup requests action plans for September 2024. In September 2024, the RUC recommended referral to CPT Assistant to specifically address correct coding for shaving versus paring and accurate reporting of 11300-11313 versus 11055-11057.

		Screen:	RUC Meeting:	RUC Rec:	Specialty Society:	CPT Asst Status:

**If the procedure does not require local anesthesia, 1 minute should be removed from pre-service time

1 Straightforward Patient/Straightforward Procedure (No anesthesia care)
2 Difficult Patient/Straightforward Procedure (No anesthesia care)
3 Straightforward Patient/Difficult Procedure
4 Difficult Patient/Difficult Procedure
5 Procedure with minimal anesthesia care (If no anesthesia care deduct 1 minute)
6 Procedure with local/topical anesthesia care requiring wait time for anesthesia to take effect

Additional Positioning Times for Spinal Surgical Procedures

SS1	Anterior Neck Surgery (Supine) (eg ACDF)	15 Minutes
SS2	Posterior Neck Surgery (Prone) (eg laminectomy)	25 Minutes
SS3	Posterior Thoracic/Lumbar (Prone) (eg laminectomy)	15 Minutes
SS4	Lateral Thoracic/Lumbar (Lateral) (eg corpectomy)	25 Minutes
SS5	Anterior Lumbar (Supine) (eg ALIF)	15 Minutes

Additional Positioning Times for Spinal Injection Procedures

SI1	Anterior Neck Injection (Supine) (eg discogram)	7 Minutes
SI2	Posterior Neck Injection (Prone) (eg facet)	5 Minutes
SI3	Posterior Thoracic/Lumbar (Prone) (eg epidural)	5 Minutes
SI4	Lateral Thoracic/Lumbar (Lateral) (eg discogram)	7 Minutes

Additional Positioning Times for Urological Procedures

U1	Dorsal Lithotomy	5 Minutes

Notes:

- Roll-over cells for additional detail where available
- Straightforward procedure: Integumentary, Non-incisional endoscopy, natural orifice

67516	Suprachoroidal space injection of pharmacologic agent (separate procedure)	Jan 2023	Suprachoroidal Injection	10	CPT 2024	April 2028	There is currently only one FDA-approved medication for this procedure, triamcinolone acetonide, and it is approved for only one indication: macular edema associated with uveitis. The relevant HCPCS code is J-3299. Medicare claims volume for this indication is expected to be low. However, if other drugs for more common indications obtain FDA approval, claims volume may grow substantially. Thus, CPT code 6X000 will be placed on the New Technology list and will be re-reviewed by the RUC in three years to ensure correct valuation and utilization assumptions. The RUC recommended that if there are new drugs that have an associated J-code that these also be considered by the Relativity Assessment Workgroup as part of the New Technology screen.	☐

78072	Parathyroid planar imaging (including subtraction, when performed); with tomographic (spect), and concurrently acquired computed tomography (ct) for anatomical localization	Apr 2012	Parathyroid Imaging	23	CPT 2013	October 2018	In April 2011, CPT Code 78007, Thyroid imaging, with uptake; multiple determinations was identified in the Harvard Valued-Utilization over 30,000 screen. As part of the review of the entire endocrine family, the specialty societies determined that revisions to the parathyroid imaging procedures were necessary to reflect current bundling policies, guideline changes and new technology. AMA Staff reviewed the work neutrality impacts for codes reviewed in the CPT 2013 cycle. It appeared that was only one issue where there was a large growth in utilization in the first year. For CPT 2013 the Parathyroid Imaging codes were not work neutral, and it was initially estimated as a savings overall. It appears that there was 40% increase from what was projected. The specialty societies submitted an action plan indicating that literature supporting parathyroid scintigraphy as an	☑

							effective diagnostic study for parathyroid disease has recently emerged and supports the clinical utility thus increasing utilization. Secondly, the availability of SPECT/CT cameras has increased and is greater than initially predicted, allowing for a higher utilization. The Workgroup agreed and also noted that these services are conducted on patients who are referred to the radiologists or nuclear medicine physicians. The physicians providing these services do not control the number of patients referred to them who receive these services. The Workgroup recommends that the specialty societies develop a CPT Assistant article to address potential current use of 78803 rather than the new codes 78071 and 78072. The Workgroup noted that these services are on the new technology list for review later this year and should be postponed and reviewed in 2 years

93297	Interrogation device evaluation(s), (remote) up to 30 days; implantable cardiovascular physiologic monitor system, including analysis of 1 or more recorded physiologic cardiovascular data elements from all internal and external sensors, analysis, review(s) and report(s) by a physician or other qualified health care professional	Jan 2023	Remote Interrogation Device Evaluation - Cardiovascular (PE Only)	20	CPT 2020	April 2027	This service was first flagged at the April 2008 meeting, Tab 23 Cardiac Device Monitoring, for CPT 2009 and reviewed at the RAW in September 2012. An Ad Hoc Workgroup was developed to determine how to address the work neutrality failure and establish guidelines for further RAW review of retrospective work neutralilty. In October 2018, 93297 and 93298 were reviewed and placed on the new technology/new services list for April 2024. CMS did not accept the practice expense for these services and instead created G2066 to report the practice expense associated with these services. In January 2023, the RUC affirmed the work RVUs and recommended direct PE inputs for 93297, 93298 and G2066. These services were placed back on the new technology/new services list to assess the work and PE in 3 years (April 2027).	☐

CPT Code	Long Descriptor	RUC Meeting	Issue	Tab	CPT Year	Date to Re-Review	RUC Rec	Complete
99492	Initial psychiatric collaborative care management, first 70 minutes in the first calendar month of behavioral health care manager activities, in consultation with a psychiatric consultant, and directed by the treating physician or other qualified health care professional, with the following required elements: outreach to and engagement in treatment of a patient directed by the treating physician or other qualified health care professional, initial assessment of the patient, including administration of validated rating scales, with the development of an individualized treatment plan, review by the psychiatric consultant with modifications of the plan if recommended, entering patient in a registry and tracking patient follow-up and progress using the registry, with appropriate documentation, and participation in weekly caseload consultation with the psychiatric consultant, and provision of brief interventions using evidence-based techniques such as behavioral activation, motivational interviewing, and other focused treatment strategies.	Jan 2017	Psychiatric Collaborative Care Management Services	20	CPT 2018	April 2023	In January 2020, the RUC identified Psychiatric Collaborative Care Management Services via the work neutrality process. These codes show a 468% increase in work RVUs for 2018. In reviewing the utilization data for these services, it appears one independent clinic is performing most of these services in the pediatric population. The Workgroup recommended that CMS investigate the reporting of services by this specific independent clinic. The specialty society indicated, and the Workgroup agreed, that a new CPT Assistant article on the appropriate usage of these codes be developed in 2020. However, due to the incorrect reporting of these services by one specific provider, the referral for a CPT Assistant article was removed. This family is on the new technology/new services screen and is scheduled for review at the April 2023	☑

G2066	Interrogation device evaluation(s), (remote) up to 30 days; implantable cardiovascular physiologic monitor system, implantable loop recorder system, or subcutaneous cardiac rhythm monitor system, remote data acquisition(s), receipt of transmissions and technician review, technical support and distribution of results	Jan 2023	Remote Interrogation Device Evaluation - Cardiovascular (PE Only)	20		April 2027	Codes 93297 and 93298 were first flagged at the April 2008 meeting, Tab 23 Cardiac Device Monitoring, for CPT 2009 and reviewed at the RAW in September 2012. An Ad Hoc Workgroup was developed to determine how to address the work neutrality failure and establish guidelines for further RAW review of retrospective work neutralilty. In October 2018, 93297 and 93298 were reviewed and placed on the new technology/new services list for April 2024. CMS did not accept the practice expense for these services and instead created G2066 to report the practice expense associated with these services. In January 2023, the RUC affirmed the work RVUs and recommended direct PE inputs for 93297, 93298 and G2066. These services were placed back on the new technology/new services list to assess the work and PE in 3 years (April 2027).	☐

CPT Code	Long Descriptor	RUC Meeting	Issue	Tab	CPT Year	Date to Re-Review	RUC Rec	Complete

New Technology/Services Timeline

1. Code is identified as a new technology/service at the RUC meeting in which it is initially reviewed.
2. Code is flagged in the next version of the RUC database with date to be reviewed
3. Code will be reviewed in 5 years (depending on what meeting in the CPT/RUC cycle it is initially reviewed) after at least three years of data are available.

AMA/Specialty Society RVS Update Committee Summary of Recommendations

September 2024

Limb Lengthening/Shortening-Femur – Tab 4

In May 2024, the CPT Editorial Panel created a new Category I code, 27458, for reporting femur lengthening using the insertion of an externally controlled intramedullary lengthening device, including imaging. Though lengthening of long bones is a well-established treatment for clinically significant limb inequalities, the emergence of this new technology has fundamentally changed the preoperative planning, intraoperative technical requirements, and postoperative management for these lengthening procedures. CPT code 27458 and the other codes within this code family, including 27465, 27466, and 27468, were surveyed for the September 2024 RUC Meeting.

Compelling Evidence
The RUC agreed with the specialty society that there is compelling evidence to support a change in physician work for CPT codes 27465 and 27466 based on the argument that there was a flawed mechanism or methodology used in the previous evaluation. In their summary of recommendation, the specialty society articulated that pediatric orthopaedic surgeons (who typically perform the service on children with congenital limb length discrepancies) were not involved nor was their input included in the original valuation of these services. The RUC recognized that the survey conducted for the September 2024 RUC Meeting included orthopaedic pediatric surgeons, along with general and trauma orthopaedic surgeons, who are all experienced in orthopaedic reconstructive surgery and experienced in performing these low-volume procedures. **The RUC agrees with the compelling evidence presented that the physician work for these services has changed based on evidence that incorrect assumptions were made in the previous valuation of these services.**

27458 ***Osteotomy(ies), femur, unilateral, with insertion of an externally controlled intramedullary lengthening device, including iliotibial band release when performed, imaging, alignment assessments, computations of adjustment schedules, and management of the intramedullary lengthening device***
The RUC reviewed survey results from 46 orthopaedic surgeons and determined the survey median work RVU of 26.65 appropriately accounted for the physician work required to perform this service. The RUC recommends 50 minutes pre-service evaluation time, 15 minutes pre-service positioning time, 15 minutes scrub/dress/wait time, 180 minutes intra-service time, 30 minutes immediate post-service time, 1-99232, 1-99231, 1-99238, 1-99215, 1-99214, and 6-99213 visits for this service, which equals 621 minutes of total time.

The specialty society selected pre-service time package 3 *FAC Straightforward Patient/Difficult Procedure* and post-service time package *9B General Anes or Complex Regional Blk/Cmplx Proc*. The selected time packages were modified to more accurately reflect pre-and post-service time involved with this service. The additional 17 minutes of pre-service evaluation time above the standard pre-time package time of 33 minutes accounts for the additional time necessary for tasks including preoperative discussion with the patient's parents regarding the surgery and review/obtain informed consent; reexamination of the patient to ensure that the physical findings have not changed by reviewing imaging and confirming prior measurements related to device selection; sterile setup of the intramedullary lengthening device and sterile testing of the remote

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

controller magnetic field generator for proper function before implantation; and verification that other hardware required for this service is available. The specialty society confirmed that 17 additional minutes of pre-service evaluation time is consistent and maintains relativity with other reconstructive device-intensive codes and operations on children within the Medicare Physician Payment Schedule. An additional 12 minutes of pre-service positioning time is required above the standard package time of 3 minutes to account for padding of bony prominences, positioning and bolstering the patient's leg to allow for surgical exposure and manipulation of the limb and imaging equipment during surgery. The specialty society confirmed that 12 additional minutes of pre-service positioning time is consistent with femur procedures.

The RUC agreed with the surveying society that the post-operative office visits typically involve assessing the progress of ambulation and counseling the family regarding wound care, therapy protocol, and review of narcotic pain medication. For CPT code 27458, the physician will also interpret the radiographs and confirm the calculation for the planned lengthening protocols, as well as update the external remote controller (ERC) device programming.

To justify a work RVU value of 26.65, the RUC compared CPT code 27458 to top key reference service and MPC code 22633 *Arthrodesis, combined posterior or posterolateral technique with posterior interbody technique including laminectomy and/or discectomy sufficient to prepare interspace (other than for decompression), single interspace, lumbar;* (work RVU = 26.80, 180 minutes intra-service time and 509 minutes total time) and the second highest key reference service 27284 *Arthrodesis, hip joint (including obtaining graft);* (work RVU = 25.06, 180 minutes intra-service time and 497 minutes total time). The RUC recognizes that the surveyed code is an appropriate comparator relative to the two key reference services, bracketing the survey median work RVU and having identical intra-service time. For additional support, the RUC referenced MPC code 54438 *Replantation, penis, complete amputation including urethral repair* (work RVU = 24.50, 180 minutes intra-service time and 531 minutes total time) noting that this service requires similar physician work and has identical intra-service time as the surveyed code. **The RUC recommends a work RVU of 26.65 for CPT code 27458.**

27465 *Osteoplasty, femur; shortening (excluding 64876)*
The RUC reviewed survey results from 38 orthopaedic surgeons and determined the survey median work RVU of 21.13 appropriately accounted for the physician work required to perform this service. The RUC recommends 40 minutes pre-service evaluation time, 15 minutes pre-service positioning time, 15 minutes scrub/dress/wait time, 143 minutes intra-service time, 30 minutes immediate post-service time, 1-99232, 1-99231, 1-99238, 1-99214, and 3-99213 visits for this service, which equals 450 minutes of total time.

The specialty society selected pre-service time package *3 FAC Straightforward Patient/Difficult Procedure* and post-service time package *9B General Anes or Complex Regional Blk/Cmplx Proc*. The selected time packages were modified to more accurately reflect pre-and post-service time involved with this service. The additional 7 minutes of pre-service evaluation time above the standard pre-time package time of 33 minutes accounts for the additional time necessary for tasks including reexamination of the patient to ensure that the physical findings have not changed (range of motion of the hip and knee, neurovascular status, length and rotation of the limb); precise pre-operative marking, including confirmation of the harvest location of bone graft; and verification that other hardware required for this service are available. Less pre-service evaluation time is required for this service compared to CPT code 27458 because this service does not require the preliminary steps required for using the externally controlled intramedullary lengthening device, including sterile testing of the device. An additional 12 minutes of pre-service positioning time is

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

required above the standard package time of 3 minutes to account for padding of bony prominences, positing and bolstering the patient's leg to allow for surgical exposure and manipulation of the limb and imaging equipment during surgery. The specialty society confirmed that 12 additional minutes of pre-service positioning time is consistent with femur procedures.

The RUC agreed with the survey specialty society that the post-operative visits typically involve standard procedures such as assessing the progress of ambulation and counseling the family regarding wound care, therapy protocol, and review of narcotic pain medication. Fewer follow-up office visits are required for CPT code 27465 because there is no reprogramming of the device and controller.

To justify a work RVU value of 21.13, the RUC compared CPT code 27465 to top key reference service 27244 *Treatment of intertrochanteric, peritrochanteric, or subtrochanteric femoral fracture; with plate/screw type implant, with or without cerclage* (work RVU = 18.18, 75 minutes intra-service time and 438 minutes total time) and the second highest key reference service and MPC code 22630 *Arthrodesis, posterior interbody technique, including laminectomy and/or discectomy to prepare interspace (other than for decompression), single interspace, lumbar;* (work RVU = 22.09, 150 minutes intra-service time and 479 minutes total time). The RUC recognizes that the surveyed code is an appropriate comparator relative to the two key reference services, bracketing the survey median work RVU, as well as in terms of intra-service time and intra-operative intensity. For additional support, the RUC referenced MPC code 35301 *Thromboendarterectomy, including patch graft, if performed; carotid, vertebral, subclavian, by neck incision* (work RVU = 21.16, 120 minutes intra-service time and 404 minutes total time), noting that this reference code requires similar intra-service time and has a nearly identical work RVU as the survey median. **The RUC recommends a work RVU of 21.13 for CPT code 27465.**

27466 *Osteoplasty, femur; lengthening*

The RUC reviewed survey results from 30 orthopaedic surgeons and determined the survey median work RVU of 22.65 appropriately accounted for the physician work required to perform this service. The RUC recommends 40 minutes pre-service evaluation time, 15 minutes pre-service positioning time, 15 minutes scrub/dress/wait time, 150 minutes intra-service time, 30 minutes immediate post-service time, 1-99232, 1-99231, 1-99238, 1-99214, and 3-99213 visits for this service, which equals 457 minutes of total time.

The specialty society selected pre-service time package 3 *FAC Straightforward Patient/Difficult Procedure* and post-service time package *9B General Anes or Complex Regional Blk/Cmplx Proc*. The selected time packages were modified to more accurately reflect pre-and post-service time involved with this service. The additional 7 minutes of pre-service evaluation time above the standard pre-time package time of 33 minutes accounts for the additional time necessary for tasks including reexamination of the patient to ensure that the physical findings have not changed (range of motion of the hip and knee, neurovascular status, length and rotation of the limb); precise pre-operative marking, including confirmation of the harvest location of bone graft; and verification that other hardware required for this service are available. Like CPT code 27465, less pre-service evaluation time is required for this service compared to CPT code 27458 because this service does not require the preliminary steps required for using the externally controlled intramedullary lengthening device, including sterile testing of the device. The additional 12 minutes of pre-service positioning time is required above the standard package time of 3 minutes to account for padding of bony prominences, positing and bolstering the patient's leg to allow for surgical exposure and manipulation of the limb and imaging equipment during surgery. The specialty society confirmed that 12 additional minutes of pre-service positioning time is consistent with femur procedures.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The RUC agreed with the survey specialty society that the post-operative visits typically involve standard procedures such as assessing the progress of ambulation and counseling the family regarding wound care, therapy protocol, and review of narcotic pain medication. Fewer follow-up office visits are required for CPT code 27466 because there is no reprogramming of the device and controller.

To justify a work RVU value of 22.65, the RUC compared CPT code 27466 to top key reference service 27280 *Arthrodesis, sacroiliac joint, open, includes obtaining bone graft, including instrumentation, when performed* (work RVU = 20.00, 120 minutes intra-service time and 383 minutes total time) and the second highest key reference service and MPC code 22630 *Arthrodesis, posterior interbody technique, including laminectomy and/or discectomy to prepare interspace (other than for decompression), single interspace, lumbar;* (work RVU = 22.09, 150 minutes intra-service time and 479 minutes total time). The RUC recognizes that the surveyed code is an appropriate comparator relative to the two key reference services. The surveyed code requires identical intra-service time to the second key reference service and is bracketed by the two reference services in terms of total time and as well physician work.

For additional support, the RUC referenced MPC code 34705 *Endovascular repair of infrarenal aorta and/or iliac artery(ies) by deployment of an aorto-bi-iliac endograft including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, all endograft extension(s) placed in the aorta from the level of the renal arteries to the iliac bifurcation, and all angioplasty/stenting performed from the level of the renal arteries to the iliac bifurcation; for other than rupture (eg, for aneurysm, pseudoaneurysm, dissection, penetrating ulcer)* (work RVU = 29.58, 150 minutes intra-service time and 512 minutes total time), noting that this reference code requires identical intra-service time as the surveyed code, though the greater work RVU is attributable to the MPC code, which is more intense and complex to perform. **The RUC recommends a work RVU of 22.65 for CPT code 27466.**

RUC Referral to CPT Editorial Panel
27468 *Osteoplasty, femur; combined, lengthening and shortening with femoral segment transfer*
The specialty society submitted a letter to request that CPT code 27468 be contractor priced. The survey was sent to a random sample of 2,201 members and an additional random sample of 602, however, the specialty society was unable to meet the survey minimum threshold of 30 responses. The specialty society letter indicated that the work of both shortening one leg and lengthening the contralateral leg is quite variable. Proper reporting of this work should instead be based on the procedures performed as there are several methods for both shortening and lengthening that may be utilized based on the discrepancy of leg length, the age and comorbidities of the patient, and the pathology associated with the leg length discrepancy. Moreover, the specialty society recommends that CPT code 27468 be sent to CPT for deletion in CY 2027. **The RUC recommends contractor pricing for CPT code 27468 and that the specialty society submit a CCA to the CPT Editorial Panel to delete CPT code 27468 for CY 2027.**

Practice Expense
The Practice Expense (PE) Subcommittee concurred that there is compelling evidence to support an increase over the aggregate current cost for clinical staff time, supplies and equipment for the code family based on changes in physician time due to changes in the number/level of post-operative visits, per the survey, and consequent increases in equipment time.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The PE Subcommittee reviewed the direct practice expense inputs for CPT codes 27458, 27465 and 27466, and made no modifications to the standard 090-day global inputs. The PE Subcommittee noted that CPT code 27468 has no recommended PE inputs as the recommendation is to have this code be contractor priced until it can be deleted through a CPT code application. **The RUC recommends the direct practice expense inputs as submitted by the specialty society.**

New Technology
CPT code 27458 will be placed on the New Technology list to be reviewed by the RUC in three years to ensure correct valuation, patient population, and utilization assumptions.

Ezequiel Silva III, MD
Chair, AMA/Specialty Society RVS Update Committee
American Medical Association
330 N. Wabash Avenue, Suite 39300
Chicago, IL 60611

Subject: Tab 4, Limb Lengthening/Shortening-Femur, CPT Code 27468

Dear Dr. Silva:

The AAOS is recommending contractor pricing for CPT code 27468, *Osteoplasty, femur; combined, lengthening and shortening with femoral segment transfer* for CY 2026. We were unable to obtain more than 10 survey responses and believe that the work of both shortening one leg and lengthening the contralateral leg is quite variable. This work should instead be reported based on the procedures performed as there are several methods for both shortening and lengthening that may be utilized based on the discrepancy of leg length, the age and comorbidities of the patient, and the pathology that resulted in leg length discrepancy. As such, we also recommend code 27468 be sent to CPT for deletion in CY 2027. We have provided the survey data for 27468 in the Summary Spreadsheet for information.

Sincerely,

Hussein Elkousy, MD

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:27458 Tracking Number F1 Original Specialty Recommended RVU: **26.65**
Presented Recommended RVU: **26.65**
Global Period: 090 Current Work RVU: **n/a** RUC Recommended RVU: **26.65**

CPT Descriptor: Osteotomy(ies), femur, unilateral, with insertion of an externally controlled intramedullary lengthening device, including iliotibial band release when performed, imaging, alignment assessments, computations of adjustment schedules, and management of the intramedullary lengthening device

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 16-year-old male presents with a congenitally short right femur. At skeletal maturity, he continues to have a limb length discrepancy of 6 cm. He walks with a limp and has activity-related pain in the right hip and low back.

Percentage of Survey Respondents who found Vignette to be Typical: 85%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 100% , In the ASC 0%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 0% , Overnight stay-less than 24 hours 46% , Overnight stay-more than 24 hours 54%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 93%

Description of Pre-Service Work: The appropriate antibiotic(s) are selected and ordered, and timing and administration are confirmed. Results of preadmission testing are reviewed, including laboratory tests, X rays, CT scans, and/or MRIs, with special attention to radiographs and scaled radiographs used to template an appropriate intramedullary lengthening device diameter and length, the appropriate osteotomy location, and to determine the amount of lengthening that will be required. The patient is re-examined to make sure that physical findings have not changed, including range of motion of the hip and knee, neurovascular status, and length and rotation of the limb. The history and physical are updated. The planned procedure and postoperative management are reviewed with the patient and parents; questions and concerns are addressed with the family; and parent informed consent for the minor is reviewed and consent obtained. It is verified that all required instruments and supplies are available, including intraoperative imaging/fluoroscopy for guidance and documentation of the implant. The intramedullary lengthening device and external remote controller magnetic field generator are tested for proper functioning. It is ensured that an array of plates and screws are available for possible use. An estimate of the appropriate-size component is determined by templating with radiographs. The patient is positioned, bony prominences are padded, and thermal regulation drapes are applied. The position of the extremities and head are assessed and adjusted as needed. The patient's leg is placed properly on the table and positioned with proper bolstering to aid surgical exposure. Areas of skin to be prepared are indicated, and surgical incisions are marked. A surgical "time out" is performed with the operating surgical team.

Description of Intra-Service Work: A longitudinal incision is made directly over the patellar tendon and dissection is carried through the subcutaneous tissue. The patellar tendon is split in its midline to enter the knee joint. A guidepin is placed in the notch of the trochlea and the position adjusted on multiplane fluoroscopy until it is found to be adequate. The guidepin is then driven into the distal femur toward the medial metaphyseal cortex. Next, a longitudinal incision is made on the lateral aspect of the leg over the osteotomy site and dissection is carried through to the subcutaneous tissue. The iliotibial band is released transversely to allow unrestricted femoral lengthening. Subperiosteal dissection is performed at the lateral distal femur. Multiple holes are drilled across the femur at the osteotomy site to provide ventilation for reaming. The guidepin is then reamed to the osteotomy site beginning with a starter reamer and progressing to a reamer diameter that

is 1.5 mm to 2.0 mm greater than the chosen device. Transverse K wires are placed percutaneously proximally and distally to assess rotation. The osteotomy is completed using osteotomes. The guidepin is then placed across the osteotomy site and up the femoral canal with the knee in correct position. The guide rod is then again reamed up to 14.5 mm and then removed. An externally controlled intramedullary lengthening device is then placed through the knee and up the femur across the osteotomy site. Rotation is confirmed to be neutral using the previously placed K wires. Two proximal locking screws are placed transversely through percutaneous incisions to achieve adequate proximal fixation. Two distal transverse pegs are placed percutaneously to maintain correct limb alignment. Final check of implant placement and position of the osteotomy is confirmed with multiplane fluoroscopy. Acute distraction of 1 to 2 mm of the device is performed intraoperatively with the external remote controller magnetic field generator to document proper functioning of the magnetic lengthening mechanism. The wounds are copiously irrigated. The patellar tendon is repaired. All wounds are closed in layers. The internal magnet is identified using fluoroscopy is marked with a permanent surgical skin marker

Description of Post-Service Work:
Facility:
Apply sterile dressings; remove drapes; assess limb alignment compared to the opposite extremity; asses limb perfusion and pulses; wait for reversal of anesthesia and extubation; assist in transfer of the patient from the OR table to a stretcher or bed; assist in transport of patient from operating room to recovery room; monitor patient stabilization in the recovery room; complete a careful neurologic and vascular examination of the extremity; discuss postoperative recovery care with anesthesia and nursing staff, including regional blocks; enter a brief operative note and a full operative report in the medical record; call referring physician and/or send a copy of the operative note; write comprehensive orders for PACU and floor care; complete medication reconciliation; order and review postoperative radiographs; enter procedure data, including implant details, into longitudinal outcome registries (eg, NSQIP, local registry); and discuss procedure and outcome with patient and family. Later the same day: Examine the patient and perform a vascular assessment of the operated limb; assess pain scores and adequacy of analgesia; review nursing/other staff patient chart notes; adjust orders for pain control, DVT prophylaxis, diet, and ambulation; answer patient and family questions; answer nursing/other staff questions; and chart patient progress notes. On the next day and any subsequent visits before discharge: Examine the patient and perform a neurovascular assessment of the operated limb; assess pain scores and adequacy of analgesia; review nursing/other staff patient chart notes; adjust orders as needed; answer patient and family questions; answer nursing/other staff questions; and chart patient progress notes. Counsel the patient/family on expectations of pain, swelling, signs of compartment syndrome, and techniques for mitigation. Discharge day management: The patient is discharged when there is adequate pain control with oral analgesics, adequate solid and liquid intake, normal voiding of urine, and independent ambulation. Reconcile medications and write orders for medications needed after discharge. Home restrictions (ie, diet, activity, bathing) are discussed with the patient / family and the discharging nurse. All appropriate medical records are completed, including day of discharge progress notes, discharge summary and discharge instructions, and insurance forms.

Office:
The first postoperative office visit occurs 5-10 days after surgery. The patient / family is interviewed and data obtained by clinical staff is reviewed. The findings at surgery and details of the procedure are reviewed with the patient/family. A new postoperative radiograph is ordered and taken, then interpreted by the surgeon. The postoperative dressings are removed and assessment performed of wound status, drainage, hematoma, and signs of infection. The circulation, sensation, and motor function status is assessed. The wounds are cleaned and redressed. Adequacy of analgesia is assessed, the PDMP is checked and orders are made for narcotic and nonnarcotic pain medication as needed. The patient/family will be counseled on appropriate multi-modal pain management (ie, narcotic, nonnarcotic). The patient/family will be counseled on expectations of pain, swelling, signs of compartment syndrome, and techniques for mitigation. The patient/family will be counseled on the findings of the radiograph. Imaging for the next visit will be ordered. The initial alignment computations for the planned adjustment schedule will be reviewed and modified if needed based on patient exam and imaging. The patient/family will be trained on the use of the external remote controller (ERC) magnetic field generator and provided written specific instructions. A physical therapy plan will be developed and ordered. Activity limitations (ambulation, bathing, etc.) are discussed with the patient/family. Patient/family questions are answered. Medical record progress notes are dictated, reviewed, and signed. An update is provided to the PCP and/or referring provider. The second postoperative office visit occurs 10-21 days after surgery. The patient / family is interviewed and data obtained by clinical staff is reviewed. Interval chart notes, including calls from the patient/family and physical therapy notes are reviewed. The postoperative dressings are removed and assessment performed of wound status, drainage, hematoma, and signs of infection. The circulation, sensation, and motor function status is assessed. Sutures are removed and wounds are cleaned and redressed as needed. Adequacy of analgesia is assessed, the PDMP is checked and orders are made for narcotic and nonnarcotic pain medication as needed. The patient/family will be counseled on appropriate multi-modal pain management (ie, narcotic, nonnarcotic). The patient/family will be counseled on expectations of pain and swelling and techniques for mitigation. Imaging will be reviewed. Imaging for the next visit will be ordered. The alignment computations for the

planned adjustment schedule will be reviewed and modified if needed based on patient exam and imaging. PT progress is assessed and orders revised as needed. Management of the patient and updates to the care plan is discussed with the PT. Activity limitations are reinforced with the patient. Patient/family questions are answered. Medical record progress notes are dictated, reviewed, and signed. An update is provided to the PCP and/or referring provider. At subsequent postoperative office visits, the patient / family is interviewed and data obtained by clinical staff is reviewed. Interval chart notes, including calls from the patient/family and physical therapy notes are reviewed. The circulation, sensation, and motor function status is assessed. Adequacy of analgesia is assessed, the PDMP is checked and orders are written for pain medication if needed. Imaging will be reviewed and ordered for the next visit. The alignment computations for the planned adjustment schedule will be reviewed and modified if needed based on patient exam and imaging. PT progress is assessed and orders revised as needed. Management of the patient and updates to the care plan is discussed with the PT as needed. Activity limitations are reinforced with the patient. Patient/family questions are answered. Medical record progress notes are dictated, reviewed, and signed. An update is provided to the PCP and/or referring provider.

Note that patient care will continue after the 90-day global period to follow the bone consolidation phase and bone hardening phase which can take 6 to 12 months

• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	13%	88%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

Lengthening of long bones is a well-established treatment for clinically significant limb length inequalities. The advent of new technology—externally-controlled intramedullary lengthening nails—has fundamentally changed the preoperative planning, intraoperative technical requirements, and postoperative management for these lengthening procedures. At the May 2024 CPT meeting, the Editorial Panel approved a new code 27458 for reporting femur lengthening using with insertion of an externally controlled intramedullary lengthening device. The new global code includes all alignment assessments, computations and lengthening adjustment schedules, and management of the device. Although not included in the CPT application, codes 27465, 27466, and 27468 were added as family codes for review.

Recommendation – 27458

We recommend the survey median work RVU of 26.65, although the relative comparison to reference codes suggests this value underestimates the total work that includes significant postoperative office work.

Pre-time

Package 3 is selected with the following modifications:

Evaluation time: Total of 50 minutes that includes an additional 17 minutes above the standard package time to account for: (1) Additional time to set up (using sterile technique) the intramedullary lengthening device and use the external remote controller magnetic field generator to test for proper function for the expected range of lengthening prior to implantation; (2) Additional time related to preoperative discussion with both the minor patient and patient's parents to review the possible complications, the expected outcome, the postoperative lengthening process, and to review consent. This discussion importantly reemphasizes the amount of postoperative management that this procedure entails; (3) Additional time to reexamined the patient to make sure that physical findings have not changed, including range of motion of the hip and knee, neurovascular status, and length and rotation of the limb–this information is used to review imaging and confirm prior measurements related to device selection; and (4) Additional time is also required to ensure that hardware (reamers, drills, saws, rods, nails, plates, screws) and intraoperative imaging equipment are available. The additional preoperative time is consistent with other reconstructive device intensive operations.

Positioning time: Total of 15 minutes that includes 12 additional minutes above the standard package time to account for padding of bony prominences, positing and bolstering patient leg to allow for surgical exposure and manipulation of the limb and imaging equipment during surgery. A total of 15 minutes is consistent with other femur procedures (eg, 27236, 27269, 27511-27514)

Scrub, dress, wait time: Package time of 15 minutes is consistent with survey median.

Immediate Post-time through discharge from recovery

Package 9b: Subtract 3 minutes to be consistent with the survey median.

Postoperative visits after discharge from recovery

It is important to note that for most procedures, the intraoperative work is the treatment and the postoperative work is related to recovery. However, for 27458, the intraoperative work is only the beginning of treatment with continued treatment (lengthening) during the postoperative period. Thus, the need for many / intense visits with significant MDM to prevent treatment failure—lengthen too slow leads to premature consolidation, lengthen too fast leads to poor regenerate.

27458 Summary of Postop E/M	Selected Visit Level CPT Code	Estimate of Visit Minutes	MDM

1. Although MDM supports 99232; code 99231 selected to be consistent with survey data
2. Although MDM supports 99214; code 99213 selected to be consistent with survey data

Hospital Visit Later Same Day (99231): Review nursing notes; discuss status and progress with nursing staff. Review vital signs, I/O, labs and other related data. Review operative findings, radiographs and outcome with patient and/or family; answers questions. Assess pain control and response to current medications; modify orders accordingly. Assess urinary and GI function. Exam surgical site; reinforce/change dressing as needed. Assess limb position and alignment; repositioning the limb as needed. Check neurovascular status. Counsel patient and/or family regarding therapy protocol. Counsel patient and/or family regarding OOB/ambulation, incentive spirometry, upright position in bed and use of sequential compressive devices. Counsel patient and/or family regarding discharge planning. Communicate and coordinate care with medical nurses, other physicians and PT/OT. Communicate and coordinate pain control with anesthesia, including status of current modalities. Update orders. Write "postoperative check" progress note. Enter CPT and ICD-10 codes in billing system.

Hospital Visit, Day 1 (99232): Review nursing notes; discuss status and progress with nursing staff. Review vital signs, I/O, labs and other related data. Assess pain control and response to current medications; modify orders accordingly. Assess urinary and GI function. Examine surgical site; reinforce/change dressing as needed. Assess limb position and alignment; repositioning the limb as needed. Check neurovascular status. Counsel patient and/or family regarding therapy protocol. Counsel patient and/or family regarding OOB/ambulation, incentive spirometry, upright position in bed and use of sequential compressive devices. Counsel patient and/or family regarding discharge planning. Communicate and coordinate care with nurses, other physicians, PT/OT and case management. Communicate and coordinate pain control with anesthesia, including status of current modalities. Update orders. Write progress note. Enter CPT and ICD-10 codes in billing system.

Discharge Management, Day 2 (99238): Review nursing notes; discuss status and progress with nursing staff. Review PT/OT notes; discuss status and progress with PT/OT staff. Review case manager discharge plan notes; discuss status and progress with case management. Review notes from other physicians and discussing as appropriate. Review vital signs, I/O, labs and other related data. Interview patient and obtaining interval history. Assess pain control and response to current medications. Assess gastrointestinal and urinary function. Examine surgical site; changing dressing as needed. Assess limb position and ROM; repositioning limb as needed. Check neurovascular status. Finalize and confirm discharge plans with patient and/or family. Counsel patient and/or family regarding therapy protocol and activity limitations after discharge. Review postoperative instructions (eg, wound care, pain medications, VTE prophylaxis). Complete daily progress note. Complete discharge summary and associated forms and documents. Write prescriptions for medications and devices / equipment. Check narcotic prescription registries. Complete medication reconciliation. Write order for discharge. Coordinate postoperative appointment with patient and/or family and office staff. Communicate and coordinate follow-up care with other physicians and/or PT/OT. Enter postoperative data into longitudinal outcome databases or registries (eg, NSQIP).

Office Visit #1 (99215): Discuss findings at surgery and review procedure details; answer questions. Review post-operative radiographs with patient and/or family. Interview patient and obtain history and/or review data obtained by clinical staff. Assess pain control, response to current medications and side-effects. Assess function, mobility and progress with ambulation. Assess gastrointestinal and urinary function to assess for medication side effects. Remove dressing; examine surgical site. Apply sterile dressing and compressive wrap or stockings. Assess limb alignment, swelling, strength and ROM. Check neurovascular status. Counsel patient and/or family regarding wound care, therapy protocol and activity (eg, driving, bathing, leg elevation). Counsel patient and/or family regarding planned or emergent invasive procedures (eg, dental, GI) about need for prophylactic antibiotics; review instruction sheet. Counsel patient/family regarding multi-modal pain management and use of narcotic pain medication with tapering. Fit and apply knee extension splint. Review and confirm calculations for planned lengthening protocol; program ERC device. Counsel patient and family on use of external remote control (ERC). Monitor while family and patient perform initial lengthening with ERC to confirm instructions are clear and answer any questions. Assess neurovascular status, motor function, limb alignment and pain status after lengthening. Order, review and personally interpret radiographs; review with patient and/or family. Check narcotic prescription registries. Write order for narcotic prescription; re-fill or new medication. Write order for nonnarcotic prescription as appropriate (e.g. NSAIDs). Discussion of need for VTE prophylaxis based on patient risk assessment and mobilization; refill or new medication. Complete medication reconciliation. Counsel patient/family regarding timing of next office visit and communicate interval care plan based on synthesis of interval history, physical exam, wound assessment, pain control and therapy progression . Complete forms/referrals for continued PT/OT and/or home care services (e.g. VNA). Complete disability, FMLA, out of/return to work/school and

other related forms. Communicate and coordinate care with other physicians and health care providers (e.g. PT/OT, PCP). Enter diagnosis code(s) and office visit codes in the EHR or other similar system. Write or dictate and sign progress note.

Office Visit #2 (99214): Review PT/OT and/or VNA notes to assess progress with therapy. Interview patient and obtain history and/or review data obtained by clinical staff. Assess pain control, response to current medications and side-effects. Assess function, mobility and progress with ambulation. Remove dressing; examine surgical site. Remove sutures; apply steri-strips. Apply compressive wrap or stockings. Assess limb alignment, swelling, strength and ROM. Assess knee extension splint. Check neurovascular status. Counsel patient and/or family regarding wound care, therapy protocol and activity (eg, driving, bathing, leg elevation). Counsel patient and/or family regarding planned or emergent invasive procedures (e.g, dental, GI) about need for prophylactic antibiotics; review instruction sheet. Counsel patient/family regarding multi-modal pain management and use of narcotic pain medication with tapering. Order, review and personally interpret radiographs; review with patient and/or family. Based upon radiographs, review and confirm calculations for planned lengthening protocol; update ERC device program. Check narcotic prescription registries. Write order for narcotic prescription; re-fill or new medication. Write order for nonnarcotic prescription as appropriate (e.g. NSAIDs). Discussion of need for VTE prophylaxis based on patient risk assessment and mobilization; re-fill or new medication. Complete medication reconciliation. Counsel patient/family regarding timing of next office visit and communicate interval care plan based on synthesis of interval history, physical exam, wound assessment, pain control and therapy progression . Complete forms/referrals for continued PT/OT and/or home care services (e.g. VNA). As required, complete disability, FMLA, out of/return to work/school and other related forms. Communicate and coordinate care with other physicians and health care providers (e.g. PT/OT, PCP). Enter diagnosis code(s) and office visit codes in the EHR or other similar system. Write or dictate and sign progress note

Office Visits #3-#8 (99213): Review PT/OT and/or VNA notes to assess progress with therapy. Interview patient and obtain history and/or review data obtained by clinical staff. Assess pain control, response to current medications and side-effects. Assess function, mobility and progress with ambulation. Examine surgical site; remove and replace dressing as needed. Assess limb alignment, swelling, strength and ROM. Check neurovascular status. Assess knee extension splint. Counsel patient and/or family regarding wound care, therapy protocol and activity (e.g. driving, bathing, leg elevation). Counsel patient and/or family regarding planned or emergent invasive procedures (e.g. dental, GI) about need for prophylactic antibiotics; review instruction sheet. Counsel patient/family regarding multi-modal pain management and narcotic pain medication cessation. Order, review and personally interpret radiographs; review with patient and/or family. Based upon radiographs, review and confirm calculations for planned lengthening protocol; update ERC device program. Write order for nonnarcotic prescription as appropriate (e.g. NSAIDs). Complete forms/referrals for continued PT/OT and/or home care services (e.g. VNA). As required, complete disability, FMLA, out of/return to work/school and other related forms. Communicate and coordinate care with other physicians and health care providers (e.g., PT/OT, PCP). Enter diagnosis code(s) and office visit codes in the EHR or other similar system. Write or dictate and sign progress note.

Note that patient care will continue after the 90-day global period to follow the bone consolidation phase and bone hardening phase which can take 6 to 12 months.

Key Reference Code Comparison

For both reference codes, the respondents indicated the intensity and complexity of the procedure to be more than the survey code. Unfortunately, when estimating the total work for the survey code, the respondents underestimated the work related to the many postoperative office visits. The survey reference list was hindered by a lack of available codes with an intraoperative time that is 3 hours and that include significant postoperative office work.

CPT	DESCRIPTOR	RVW	IWPUT	TOTAL TIME	PRE	INTRA	IMM POST	99232	99231	99238	99215	99214	99213

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 27599 Unlisted procedure, femur or knee

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty orthopaedic surgery How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 722
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. 50% of 2022 data for all ages based on device company sales

Specialty orthopaedic surgery Frequency 722 Percentage 100.00 %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 73 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. specialty estimate of 10% of national estimated utilization

Specialty orthopaedic surgery Frequency 73 Percentage 100.00 %

Specialty Frequency Percentage %

Specialty Frequency 0 Percentage %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Orthopedic - other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 27468

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:27465 Tracking Number F2 Original Specialty Recommended RVU: **21.13**
Presented Recommended RVU: **21.13**
Global Period: 090 Current Work RVU: **18.60** RUC Recommended RVU: **21.13**

CPT Descriptor: Osteoplasty, femur; shortening (excluding 64876)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 45-year-old female has a leg length discrepancy of 2.5 cm. She undergoes a shortening osteoplasty with internal fixation to equalize limb lengths.

Percentage of Survey Respondents who found Vignette to be Typical: 87%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 100% , In the ASC 0%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 0% , Overnight stay-less than 24 hours 45% , Overnight stay-more than 24 hours 55%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 95%

Description of Pre-Service Work: The appropriate antibiotic(s) are selected and ordered, and timing and administration are confirmed. Results of preadmission testing are reviewed, including laboratory tests, X rays, CT scans, and/or MRIs, with special attention to imaging used to determine the amount of femoral shortening needed to correct the leg length discrepancy and planned osteotomies. The patient is re-examined to make sure that physical findings have not changed, including range of motion of the hip and knee, neurovascular status, and length and rotation of the limb. The history and physical are updated. The locations of all previous scars are identified and marked. The planned procedure and postoperative management are reviewed with the patient /family. Informed consent is reviewed and consent obtained. It is verified that all required instruments and supplies are available, including intraoperative imaging/fluoroscopy for guidance and documentation. Availability of an array of plates and screws that may be needed is confirmed. The patient is positioned supine with care to pad bony prominences. Thermal regulation drapes are applied. The position of the extremities and head are assessed and adjusted as needed. The patient's leg is placed properly on the table and positioned with proper bolstering to aid surgical exposure. Areas of skin to be prepared are indicated, and surgical incisions are marked. A surgical "time out" is performed with the operating surgical team.

Description of Intra-Service Work: A longitudinal incision is made proximally over the greater trochanter. Blunt dissection is carried down through the deep tissue to the greater trochanter. A guidepin is placed into the greater trochanter and adjusted under fluoroscopic guidance until it is in appropriate position. The guidepin is overreamed using a 9 mm entry reamer. A ball-tipped guide rod is placed through this hole and down the femoral shaft. Guidepins are placed transversely proximally and distally to guide rotational alignment. Next, a longitudinal incision is made over the midshaft of the femur and dissection is carried through the subcutaneous tissue, through the iliotibial band, and through the vastus lateralis to the lateral femur. Circumferential subperiosteal dissection is performed. The ball-tipped guide rod is withdrawn and a transverse osteotomy is made using a saw. A second osteotomy is made to remove 2 cm of bone from the femoral shaft. The ball-tipped guide rod is then placed across the osteotomy site into the distal femur. The femur is compressed and shortened. The canal is reamed, beginning with a 7 mm starter reamer, and progressing up to a 12.5 mm reamer. A single locking screw is placed distally. A proximal nail is back-slapped to further close the osteotomy site. A single oblique proximal locking screw is placed. Final check of implant placement and osteotomy position is confirmed on multiplane fluoroscopy and found to be adequate. All wounds are copiously irrigated. The muscles and soft tissues over the femur are repaired. The skin is closed in layers and all wounds are infiltrated with a local anesthetic.

Description of Post-Service Work:
Facility:
Apply sterile dressings; remove drapes; assess limb alignment compared to the opposite extremity; asses limb perfusion and pulses; wait for reversal of anesthesia and extubation; assist in transfer of the patient from the OR table to a stretcher or bed; assist in transport of patient from operating room to recovery room; monitor patient stabilization in the recovery room; complete a careful neurologic and vascular examination of the extremity; discuss postoperative recovery care with anesthesia and nursing staff, including regional blocks; enter a brief operative note and a full operative report in the medical record; call referring physician and/or send a copy of the operative note; write comprehensive orders for PACU and floor care; complete medication reconciliation; order and review postoperative radiographs; enter procedure data, including implant details, into longitudinal outcome registries (eg, NSQIP, local registry); and discuss procedure and outcome with patient and family. Later the same day: Examine the patient and perform a vascular assessment of the operated limb; assess pain scores and adequacy of analgesia; review nursing/other staff patient chart notes; write orders for ambulation; answer patient and family questions; answer nursing/other staff questions; and chart patient progress notes. On the next day and any subsequent visits before discharge: Examine the patient and perform a neurovascular assessment of the operated limb; assess pain scores and adequacy of analgesia; review nursing/other staff patient chart notes; write orders for ambulation; write orders for therapy; write orders for imaging and review imaging; answer patient and family questions; answer nursing/other staff questions; and chart patient progress notes. Discharge day management: The patient is discharged when there is adequate pain control with oral analgesics, adequate solid and liquid intake, normal voiding of urine, and independent ambulation. Reconcile medications and write orders for medications needed after discharge. Home restrictions (ie, diet, activity, bathing) are discussed with the patient / family and the discharging nurse. All appropriate medical records are completed, including day of discharge progress notes, discharge summary and discharge instructions, and insurance forms.

Office:
The first postoperative office visit occurs 5-7 days after surgery. The patient / family is interviewed and data obtained by clinical staff is reviewed. The findings at surgery and details of the procedure are reviewed with the patient/family. The postoperative radiograph taken after surgery is reviewed with the patient/family. The postoperative dressings are removed and assessment performed of wound status, drainage, hematoma, and signs of infection. The circulation, sensation, and motor function status is assessed. The wounds are cleaned and redressed. Adequacy of analgesia is assessed, the PDMP is checked and orders are made for narcotic and nonnarcotic pain medication as needed. The patient/family will be counseled on appropriate multi-modal pain management (ie, narcotic, nonnarcotic). The patient/family will be counseled on expectations of pain and swelling and techniques for mitigation. Imaging will be ordered and reviewed. A physical therapy plan will be developed and ordered. Activity limitations (ambulation, bathing, etc.) are discussed with the patient/family. Patient/family questions are answered. Medical record progress notes are dictated, reviewed, and signed. An update is provided to the PCP and/or referring provider. At subsequent postoperative office visits, the patient / family is interviewed and data obtained by clinical staff is reviewed. Interval chart notes, including calls from the patient/family and physical therapy notes are reviewed. The postoperative dressings are removed and assessment performed of wound status, drainage, hematoma, and signs of infection. The circulation, sensation, and motor function status is assessed. Sutures are removed when appropriate. Wounds are cleaned and redressed as needed. Adequacy of analgesia is assessed, the PDMP is checked and orders are made for narcotic and nonnarcotic pain medication as needed. The patient/family will be counseled on appropriate multi-modal pain management (ie, narcotic, nonnarcotic). The patient/family will be counseled on expectations of pain and swelling and techniques for mitigation. Imaging will be ordered and reviewed. PT progress is assessed and orders revised as needed. Management of the patient and updates to the care plan is discussed with the PT. Activity limitations are reinforced with the patient. Patient/family questions are answered. Medical record progress notes are dictated, reviewed, and signed. An update is provided to the PCP and/or referring provider.

Note that patient care will continue after the 90-day global period to follow the bone consolidation phase and bone hardening phase which can take 6 to 12 months.

• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	43%	57%

Technical Skill/Physical Effort	**Less**	**Identical**	**More**
Technical skill required	14%	57%	29%
Physical effort required	0%	43%	57%

Psychological Stress	**Less**	**Identical**	**More**
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	43%	43%	14%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

At the May 2024 CPT meeting, the Editorial Panel approved a new code 27458 for reporting femur lengthening using with insertion of an externally controlled intramedullary lengthening device. Although not included in the CPT application, codes 27465, 27466, and 27468 were added as family codes for review.

Compelling Evidence – 27465

Flawed mechanism or methodology used in the previous valuation:

When code 27465 was reviewed during the third 5 year review in 2005 with other orthopaedic trauma codes, only orthopaedic trauma surgeons (OTA) and general orthopaedic surgeons (AAOS) were included in the survey sample and the typical patient was a post-trauma patient. In addition, the valuation of 27465 was based on a comparison to a code for open treatment of a femoral fracture. The procedure represented by code 27465 may also be performed on children by pediatric orthopaedic surgeons for congenital leg length discrepancies, but this group of surgeons was not included in the prior review. The current survey includes orthopaedic pediatric surgeons, along with general and trauma orthopaedic surgeons who are all experienced in orthopaedic reconstructive surgery and experienced in performing this very low volume procedure.

Recommendation – 27465

We recommend the survey median work RVU of 21.13. This value takes into account the increase in intraoperative time, increased total time, and increased intensity of postoperative work.

Pre-time

Package 3 is selected with the following modifications:

Evaluation time: Total of 40 minutes that includes an additional 7 minutes above the standard package time to account for: additional time to reexamined the patient to make sure that physical findings have not changed, including range of motion of the hip and knee, neurovascular status, and length and rotation of the limb –this information is used to re-review the extensive preoperative imaging and confirm prior measurements and planned bone cuts to shorten the limb. Precise preoperative marking is required for all incisions and planned femur resection. Additional time is also required to ensure that hardware (reamers, drills, saws, rods, nails, plates, screws) and intraoperative imaging equipment are available. The additional preoperative time is consistent with other reconstructive device intensive operations. Note that when this procedure is performed on a child, additional time not described above is required for review of the procedure and recovery with both the parents and the child prior to consent.

Positioning time: Total of 15 minutes that includes 12 additional minutes above the standard package time to account for padding of bony prominences, positing and bolstering patient leg to allow for surgical exposure and manipulation of the limb and imaging equipment during surgery. A total of 15 minutes is consistent with other femur procedures (eg, 27236, 27269, 27511-27514)

Scrub, dress, wait time: Package time of 15 minutes is consistent with survey median.

Immediate Post-time through discharge from recovery

Package 9b: Subtract 3 minutes to be consistent with the survey median.

Postoperative visits after discharge from recovery

27465 Summary of Postop E/M	Selected Visit Level CPT Code	Estimate of Visit Minutes	MDM			
			Problem	Data	Treatment / Risk	Overall
HV later same day	**99231**	26 to 34	Mod	Low	Mod	Mod[1]
HV (POD1)	**99232**	24 to 34	Mod	Low	Mod	Mod
Discharge (POD2)	**99238**	< 30	n/a	n/a	n/a	n/a
OV #1	**99214**	27 to 32	Mod	Mod	Mod	Mod
OV #2	**99213**	27 to 32	Mod	Low	Mod	Mod[2]
OVs #3 to #4	**99213**	23 to 26	Mod	Mod	Low	Mod[2]

1. Although MDM supports 99232; code 99231 selected to be consistent with survey data
2. Although MDM supports 99214; code 99213 selected to be consistent with survey data

Hospital Visit Later Same Day (99231): Review nursing notes; discuss status and progress with nursing staff. Review vital signs, I/O, labs and other related data. Review operative findings, radiographs and outcome with patient and/or family; answers questions. Assess pain control and response to current medications; modify orders accordingly. Assess urinary and GI function. Exam surgical site; reinforce/change dressing as needed. Assess limb position and alignment; repositioning the limb as needed. Check neurovascular status. Counsel patient and/or family regarding therapy protocol. Counsel patient and/or family regarding OOB/ambulation, incentive spirometry, upright position in bed and use of sequential compressive devices. Counsel patient and/or family regarding discharge planning. Communicate and coordinate care with medical nurses, other physicians and PT/OT. Communicate and coordinate pain control with anesthesia, including status of current modalities. Update orders. Write “postoperative check” progress note. Enter CPT and ICD-10 codes in billing system.

Hospital Visit, Day 1 (99232): Review nursing notes; discuss status and progress with nursing staff. Review vital signs, I/O, labs and other related data. Assess pain control and response to current medications; modify orders accordingly. Assess urinary and GI function. Examine surgical site; reinforce/change dressing as needed. Assess limb position and alignment; repositioning the limb as needed. Check neurovascular status. Counsel patient and/or family regarding therapy protocol. Counsel patient and/or family regarding OOB/ambulation, incentive spirometry, upright position in bed and use of sequential compressive devices. Counsel patient and/or family regarding discharge planning. Communicate and coordinate care with nurses, other physicians, PT/OT and case management. Communicate and coordinate pain control with anesthesia, including status of current modalities. Update orders. Write progress note. Enter CPT and ICD-10 codes in billing system.

Discharge Management, Day 2 (99238): Review nursing notes; discuss status and progress with nursing staff. Review PT/OT notes; discuss status and progress with PT/OT staff. Review case manager discharge plan notes; discuss status and progress with case management. Review notes from other physicians and discussing as appropriate. Review vital signs, I/O, labs and other related data. Interview patient and obtaining interval history. Assess pain control and response to current medications. Assess gastrointestinal and urinary function. Examine surgical site; changing dressing as needed. Assess limb position and ROM; repositioning limb as needed. Check neurovascular status. Finalize and confirm discharge plans with patient and/or family. Counsel patient and/or family regarding therapy protocol and activity limitations after discharge. Review postoperative instructions (eg wound care, pain medications, VTE prophylaxis). Complete daily progress note. Complete discharge summary and associated forms and documents. Write prescriptions for medications and devices / equipment. Check narcotic prescription registries. Complete medication reconciliation. Write order for discharge. Coordinate postoperative appointment with patient and/or family and office staff. Communicate and coordinate follow-up care with other physicians and/or PT/OT. Enter postoperative data into longitudinal outcome databases or registries (eg, NSQIP).

Office Visit #1 (99214): Discuss findings at surgery and review procedure details; answer questions. Review post-operative radiographs with patient and/or family. Interview patient and obtain history and/or review data obtained by clinical staff. Assess pain control, response to current medications and side-effects. Assess function, mobility and progress with ambulation. Assess gastrointestinal and urinary function to assess for medication side effects. Remove dressing; examine surgical site. Apply sterile dressing and compressive wrap or stockings. Assess limb alignment, swelling, strength and ROM. Check neurovascular status. Counsel patient and/or family regarding wound care, therapy protocol and activity (e.g. driving, bathing, leg elevation). Counsel patient and/or family regarding planned or emergent invasive procedures (e.g. dental, GI) about need for prophylactic antibiotics; review instruction sheet. Counsel patient/family regarding multi-modal pain management and use of narcotic pain medication with tapering. Check narcotic prescription registries. Write order for narcotic prescription; re-fill or new medication. Write order for nonnarcotic prescription as appropriate (e.g. NSAIDs). Discussion of need for VTE prophylaxis based on patient risk assessment and mobilization; re-fill or new medication. Complete medication reconciliation. Counsel patient/family regarding timing of next office visit and communicate interval care plan based on synthesis of interval history, physical exam, wound assessment, pain control and therapy progression . Complete forms/referrals for continued PT/OT and/or home care services (e.g. VNA). Complete disability, FMLA, out of/return to work/school and/or other related forms. Communicate and coordinate care with other physicians and health care providers (e.g. PT/OT, PCP). Enter diagnosis code(s) and office visit codes in the EHR or other similar system. Write or dictate and sign progress note.

Office Visit #2 (99213): Review PT/OT and/or VNA notes to assess progress with therapy. Interview patient and obtain history and/or review data obtained by clinical staff. Assess pain control, response to current medications and side-effects. Assess function, mobility and progress with ambulation. Remove dressing; examine surgical site. Remove

sutures or staples; apply steri-strips. Apply compressive wrap or stockings. Assess limb alignment, swelling, strength and ROM. Check neurovascular status. Counsel patient and/or family regarding wound care, therapy protocol and activity (e.g. driving, bathing, leg elevation). Counsel patient and/or family regarding planned or emergent invasive procedures (e.g. dental, GI) about need for prophylactic antibiotics; review instruction sheet. Counsel patient/family regarding multi-modal pain management and use of narcotic pain medication with tapering. Order, review and personally interpret radiographs; review with patient and/or family. Check narcotic prescription registries. Write order for narcotic prescription; refill or new medication. Write order for nonnarcotic prescription as appropriate (e.g. NSAIDs). Discussion of need for VTE prophylaxis based on patient risk assessment and mobilization; re-fill or new medication. Complete medication reconciliation. Counsel patient/family regarding timing of next office visit and communicate interval care plan based on synthesis of interval history, physical exam, wound assessment, pain control and therapy progression . Complete forms/referrals for continued PT/OT and/or home care services. As required, complete disability, FMLA, out of/return to work/school and/or other related forms. Communicate and coordinate care with other physicians and health care providers (e.g. PT/OT, PCP). Enter diagnosis code(s) and office visit codes in the EHR or other similar system. Write or dictate and sign progress note.

Office Visits #3-4 (99213): Review PT/OT and/or VNA notes to assess progress with therapy. Interview patient and obtain history and/or review data obtained by clinical staff. Assess pain control, response to current medications and side-effects. Assess function, mobility and progress with ambulation. Examine surgical site; remove and replace dressing as needed. Assess limb alignment, swelling, strength and ROM. Check neurovascular status. Counsel patient and/or family regarding wound care, therapy protocol and activity (e.g. driving, bathing, leg elevation). Counsel patient and/or family regarding planned or emergent invasive procedures (e.g. dental, GI) about need for prophylactic antibiotics; review instruction sheet. Counsel patient/family regarding multi-modal pain management and narcotic pain medication cessation. Order, review and personally interpret radiographs; review with patient and/or family. Write order for nonnarcotic prescription as appropriate (e.g. NSAIDs). Complete forms/referrals for continued PT/OT and/or home care services. As required, complete disability, FMLA, out of/return to work/school and/or other related forms. Communicate and coordinate care with other physicians and health care providers (e.g. PT/OT, PCP). Enter diagnosis code(s) and office visit codes in the EHR or other similar system. Write or dictate and sign progress note.

Key Reference Code Comparison

For both reference codes, the respondents indicated the intensity and complexity of the procedure to be similar/more than the survey code.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 27465

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty orthopaedic surgery How often? Rarely

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National utilization is not availble

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 34 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. RUC database (2022 utilization)

Specialty orthopaedic surgery Frequency 34 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

CPT Descriptor: Osteoplasty, femur; lengthening

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 7-year-old female has a congenital short right femur. She undergoes osteoplasty with intraoperative distraction, application of a graft and internal fixation to lengthen the short femur.

Percentage of Survey Respondents who found Vignette to be Typical: 63%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 100% , In the ASC 0%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 0% , Overnight stay-less than 24 hours 37% , Overnight stay-more than 24 hours 63%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 90%

Description of Pre-Service Work: The appropriate antibiotic(s) are selected and ordered, and timing and administration are confirmed. Results of preadmission testing are reviewed, including laboratory tests, X rays, CT scans, and/or MRIs, with special attention to imaging used to determine the amount of femoral lengthening needed to correct the leg length discrepancy and planned osteotomies. The patient is re-examined to make sure that physical findings have not changed, including range of motion of the hip and knee, neurovascular status, and length and rotation of the limb. The history and physical are updated. The planned procedure and postoperative management are reviewed with the patient /parents. Informed consent is reviewed and consent obtained. It is verified that all required instruments and supplies are available, including intraoperative imaging/fluoroscopy for guidance and documentation. Availability of an array of plates and screws that may be required is confirmed. The patient is positioned supine with care to pad bony prominences. Thermal regulation drapes are applied. The position of the extremities and head are assessed and adjusted as needed. The patient's leg is placed properly on the table and positioned with proper bolstering to aid surgical exposure, including the site for harvesting the autograft. Areas of skin to be prepared are indicated, and surgical incisions are marked. A surgical "time out" is performed with the operating surgical team.

Description of Intra-Service Work: A longitudinal incision is made on the lateral aspect of the leg overlying the distal femoral metaphysis with dissection carried through to the subcutaneous tissue. The iliotibial band is identified and split transversely in order to release it in its most distal aspect. Blunt dissection is then performed into the extraperiosteal and submuscular space. An osteotomy is performed at this level by making multiple drill holes and then using an osteotome. The femur segments are distracted to the desired distraction length. Autologous bone graft (eg, iliac crest) is harvested and packed into the osteotomy gap to fill any defects and enhance bone healing. After grafting, a submuscular plate is then slid submuscularly along the lateral aspect of the femur. This is locked with a single nonlocking screw into the most distal hole of the plate in the femoral metaphysis. Fluoroscopy is used to confirm alignment of bone and plate placement. It is revised if necessary and at least 5 more locking or nonlocking screws are placed to secure the construct. Final check of screws and plate is confirmed on multiplane fluoroscopy and found to be adequate. The wounds are copiously irrigated. The muscles and soft tissues over the femur are repaired. The skin is closed in layers and wounds are infiltrated with a local anesthetic.

Description of Post-Service Work:
Facility:

Apply sterile dressings; remove drapes; fashion and place well padded leg splint; assess limb alignment compared to the opposite extremity; asses limb perfusion and pulses; wait for reversal of anesthesia and extubation; assist in transfer of the patient from the OR table to a stretcher or bed; assist in transport of patient from operating room to recovery room; monitor patient stabilization in the recovery room; complete a careful neurologic and vascular examination of the extremity; discuss postoperative recovery care with anesthesia and nursing staff, including regional blocks; enter a brief operative note and a full operative report in the medical record; call referring physician and/or send a copy of the operative note; write comprehensive orders for PACU and floor care; complete medication reconciliation; order and review postoperative radiographs; enter procedure data, including implant details, into longitudinal outcome registries (eg, NSQIP, local registry); and discuss procedure and outcome with patient and family. Later the same day: Examine the patient and perform a vascular assessment of the operated limb; assess pain scores and adequacy of analgesia; review nursing/other staff patient chart notes; write orders for ambulation; answer patient and family questions; answer nursing/other staff questions; and chart patient progress notes. On the next day and any subsequent visits before discharge: Examine the patient and perform a neurovascular assessment of the operated limb; assess pain scores and adequacy of analgesia; review nursing/other staff patient chart notes; write orders for ambulation; write orders for therapy; write orders for imaging and review imaging; answer patient and family questions; answer nursing/other staff questions; and chart patient progress notes. Discharge day management: The patient is discharged when there is adequate pain control with oral analgesics, adequate solid and liquid intake, normal voiding of urine, and independent ambulation. Reconcile medications and write orders for medications needed after discharge. Home restrictions (ie, diet, activity, bathing) are discussed with the patient / family and the discharging nurse. All appropriate medical records are completed, including day of discharge progress notes, discharge summary and discharge instructions, and insurance forms.

Office:
The first postoperative office visit occurs 5-7 days after surgery. The patient / family is interviewed and data obtained by clinical staff is reviewed. The findings at surgery and details of the procedure are reviewed with the patient/family. The postoperative radiograph taken after surgery is reviewed with the patient/family. The postoperative splint and dressings are removed and assessment performed of wound status, drainage, hematoma, and signs of infection. The circulation, sensation, and motor function status is assessed. The wounds are cleaned and redressed. Adequacy of analgesia is assessed, the PDMP is checked and orders are made for narcotic and nonnarcotic pain medication as needed. The patient/family will be counseled on appropriate multi-modal pain management (ie, narcotic, nonnarcotic). The patient/family will be counseled on expectations of pain and swelling and techniques for mitigation. Imaging will be ordered and reviewed. A physical therapy plan will be developed and ordered. Activity limitations (ambulation, bathing, etc.) are discussed with the patient/family. Patient/family questions are answered. Medical record progress notes are dictated, reviewed, and signed. An update is provided to the PCP and/or referring provider. At subsequent postoperative office visits, the patient / family is interviewed and data obtained by clinical staff is reviewed. Interval chart notes, including calls from the patient/family and physical therapy notes are reviewed. The postoperative dressings are removed and assessment performed of wound status, drainage, hematoma, and signs of infection. The circulation, sensation, and motor function status is assessed. Sutures are removed when appropriate. Wounds are cleaned and redressed as needed. Adequacy of analgesia is assessed, the PDMP is checked and orders are made for narcotic and nonnarcotic pain medication as needed. The patient/family will be counseled on appropriate multi-modal pain management (ie, narcotic, nonnarcotic). The patient/family will be counseled on expectations of pain and swelling and techniques for mitigation. Imaging will be ordered and reviewed. PT progress is assessed and orders revised as needed. Management of the patient and updates to the care plan is discussed with the PT. Activity limitations are reinforced with the patient. Patient/family questions are answered. Medical record progress notes are dictated, reviewed, and signed. An update is provided to the PCP and/or referring provider.

Note that patient care will continue after the 90-day global period to follow the bone consolidation phase and bone hardening phase which can take 6 to 12 months.

RELATIONSHIP OF CODE BEING REVIEWED TO TOP TWO KEY REFERENCE SERVICES:

Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by percent distribution) of the service you are rating to the top two chosen key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Top Key Reference Code: 7 **% of respondents:** 23.3 **%**

Number of respondents who choose 2nd Key Reference Code: 6 **% of respondents:** 20.0 **%**

TIME ESTIMATES (Median)

	CPT Code: 27466	Top Key Reference CPT Code: 27280	2nd Key Reference CPT Code: **22630**
Median Pre-Service Time	70.00	73.00	75.00

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	43%	29%	29%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	46%	57%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	46%	57%
Physical effort required	0%	43%	54%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	14%	43%	43%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	50%	50%	0%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	17%	83%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	67%	33%
Physical effort required	0%	50%	50%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	50%	33%	17%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

At the May 2024 CPT meeting, the Editorial Panel approved a new code 27458 for reporting femur lengthening using with insertion of an externally controlled intramedullary lengthening device. Although not included in the CPT application, codes 27465, 27466, and 27468 were added as family codes for review.

Compelling Evidence – 27466

Flawed mechanism or methodology used in the previous valuation:

The value for code 27466 is based on a survey of intraoperative time estimate from 5 general orthopaedic surgeons in 1989 – pediatric surgeons (the typical provider) were not included in the study. In addition, pre- and post-work/time were not surveyed, but were instead imputed using an algorithm. There was no positioning time assigned which was consistent with the assignment of 0 minutes for positioning time for office procedures in this study. This is a rarely performed intense and complex operation, typically performed on children with congenital limb length discrepancy. We do not believe that 5 general orthopaedic surgeons could adequately respond to a work estimate reflective of the level of intensity/complexity of this procedure using magnitude estimation and the resulting relative work value was underestimated.

Recommendation – 27466

We recommend the survey median work RVU of 22.65. This value takes into account the correct intensity of all components of work using the relative current work RVUs for postoperative facility and office visits, complete accounting for preservice evaluation, positioning, and scrub/dress/wait time, and fairly compares the intraoperative intensity to other surgical procedures based on magnitude estimation.

Pre-time

Package 3 is selected with the following modifications:

Evaluation time: Total of 40 minutes that includes an additional 7 minutes above the standard package time to account for: additional time to reexamine the patient to make sure that physical findings have not changed, including range of motion of the hip and knee, neurovascular status, and length and rotation of the limb –this information is used to re-review the extensive preoperative imaging and confirm prior measurements and planned bone cuts to lengthen the limb. Precise preoperative marking is required for all incisions, including confirmation of the harvest location of bone graft. Additional time is also required to ensure that hardware (reamers, drills, saws, rods, nails, plates, screws) and intraoperative imaging equipment are available. The additional preoperative time is consistent with other reconstructive device intensive operations. Note that when this procedure is performed on a child, additional time not described above is required for review of the procedure and recovery with both the parents and the child prior to consent.

Positioning time: Total of 15 minutes that includes 12 additional minutes above the standard package time to account for padding of bony prominences, positing and bolstering patient leg to allow for surgical exposure and manipulation of the limb and imaging equipment during surgery. A total of 15 minutes is consistent with other femur procedures (eg, 27236, 27269, 27511-27514)

Scrub, dress, wait time: Package time of 15 minutes is consistent with survey median.

Immediate Post-time through discharge from recovery

Package 9b: Subtract 3 minutes to be consistent with the survey median.

Postoperative visits after discharge from recovery

27466 Summary of Postop E/M	Selected Visit Level CPT Code	Estimate of Visit Minutes	MDM			
			Problem	Data	Treatment / Risk	Overall
HV later same day	**99231**	26 to 34	Mod	Low	Mod	Mod[1]
HV (POD1)	**99232**	24 to 34	Mod	Low	Mod	Mod
Discharge (POD2)	**99238**	< 30	n/a	n/a	n/a	n/a

OV #2	**99213**	27 to 32	Mod	Low	Mod	Mod[2]
OVs #3 to #4	**99213**	23 to 26	Mod	Mod	Low	Mod[2]

1. Although MDM supports 99232; code 99231 selected to be consistent with survey data
2. Although MDM supports 99214; code 99213 selected to be consistent with survey data

Hospital Visit Later Same Day (99231): Review nursing notes; discuss status and progress with nursing staff. Review vital signs, I/O, labs and other related data. Review operative findings, radiographs and outcome with patient and/or family; answers questions. Assess pain control and response to current medications; modify orders accordingly. Assess urinary and GI function. Exam surgical site; reinforce/change dressing as needed. Assess limb position and alignment; repositioning the limb as needed. Check neurovascular status. Counsel patient and/or family regarding therapy protocol. Counsel patient and/or family regarding OOB/ambulation, incentive spirometry, upright position in bed and use of sequential compressive devices. Counsel patient and/or family regarding discharge planning. Communicate and coordinate care with medical nurses, other physicians and PT/OT. Communicate and coordinate pain control with anesthesia, including status of current modalities. Update orders. Write "postoperative check" progress note. Enter CPT and ICD-10 codes in billing system.

Hospital Visit, Day 1 (99232): Review nursing notes; discuss status and progress with nursing staff. Review vital signs, I/O, labs and other related data. Assess pain control and response to current medications; modify orders accordingly. Assess urinary and GI function. Examine surgical site; reinforce/change dressing as needed. Assess limb position and alignment; repositioning the limb as needed. Check neurovascular status. Counsel patient and/or family regarding therapy protocol. Counsel patient and/or family regarding OOB/ambulation, incentive spirometry, upright position in bed and use of sequential compressive devices. Counsel patient and/or family regarding discharge planning. Communicate and coordinate care with nurses, other physicians, PT/OT and case management. Communicate and coordinate pain control with anesthesia, including status of current modalities. Update orders. Write progress note. Enter CPT and ICD-10 codes in billing system.

Discharge Management, Day 2 (99238): Review nursing notes; discuss status and progress with nursing staff. Review PT/OT notes; discuss status and progress with PT/OT staff. Review case manager discharge plan notes; discuss status and progress with case management. Review notes from other physicians and discussing as appropriate. Review vital signs, I/O, labs and other related data. Interview patient and obtaining interval history. Assess pain control and response to current medications. Assess gastrointestinal and urinary function. Examine surgical site; changing dressing as needed. Assess limb position and ROM; repositioning limb as needed. Check neurovascular status. Finalize and confirm discharge plans with patient and/or family. Counsel patient and/or family regarding therapy protocol and activity limitations after discharge. Review postoperative instructions (eg wound care, pain medications, VTE prophylaxis). Complete daily progress note. Complete discharge summary and associated forms and documents. Write prescriptions for medications and devices / equipment. Check narcotic prescription registries. Complete medication reconciliation. Write order for discharge. Coordinate postoperative appointment with patient and/or family and office staff. Communicate and coordinate follow-up care with other physicians and/or PT/OT. Enter postoperative data into longitudinal outcome databases or registries (eg, NSQIP).

Office Visit #1 (99214): Discuss findings at surgery and review procedure details; answer questions. Review post-operative radiographs with patient and/or family. Interview patient and obtain history and/or review data obtained by clinical staff. Assess pain control, response to current medications and side-effects. Assess function, mobility and progress with ambulation. Assess gastrointestinal and urinary function to assess for medication side effects. Remove dressing; examine surgical site. Apply sterile dressing and compressive wrap or stockings. Assess limb alignment, swelling, strength and ROM. Check neurovascular status. Counsel patient and/or family regarding wound care, therapy protocol and activity (e.g. driving, bathing, leg elevation). Counsel patient and/or family regarding planned or emergent invasive procedures (e.g. dental, GI) about need for prophylactic antibiotics; review instruction sheet. Counsel patient/family regarding multi-modal pain management and use of narcotic pain medication with tapering. Check narcotic prescription registries. Write order for narcotic prescription; refill or new medication. Write order for nonnarcotic prescription as appropriate (e.g. NSAIDs). Complete medication reconciliation. Counsel patient/family regarding timing of next office visit and communicate interval care plan based on synthesis of interval history, physical exam, wound assessment, pain control and therapy progression . Complete forms/referrals for continued PT/OT and/or home care services (e.g. VNA). Complete disability, FMLA, out of/return to work/school and other related forms. Communicate and coordinate care with other physicians and health care providers (e.g. PT/OT, PCP). Enter diagnosis code(s) and office visit codes in the EHR or other similar system. Write or dictate and sign progress note.

Office Visit #2 (99213): Review PT/OT and/or VNA notes to assess progress with therapy. Interview patient and obtain history and/or review data obtained by clinical staff. Assess pain control, response to current medications and side-effects. Assess function, mobility and progress with ambulation. Remove dressing; examine surgical site. Remove sutures or staples; apply steri-strips. Apply compressive wrap or stockings. Assess limb alignment, swelling, strength and ROM. Check neurovascular status. Counsel patient and/or family regarding wound care, therapy protocol and activity (e.g. driving, bathing, leg elevation). Counsel patient and/or family regarding planned or emergent invasive procedures (e.g. dental, GI) about need for prophylactic antibiotics; review instruction sheet. Counsel patient/family regarding multi-modal pain management and use of narcotic pain medication with tapering. Order, review and personally interpret radiographs; review with patient and/or family. Check narcotic prescription registries. Write order for narcotic prescription; re-fill or new medication. Write order for nonnarcotic prescription as appropriate (e.g. NSAIDs). Complete medication reconciliation. Counsel patient/family regarding timing of next office visit and communicate interval care plan based on synthesis of interval history, physical exam, wound assessment, pain control and therapy progression . Complete forms/referrals for continued PT/OT and/or home care services. As required, complete disability, FMLA, out of/return to work/school and/or other related forms. Communicate and coordinate care with other physicians and health care providers (e.g. PT/OT, PCP). Enter diagnosis code(s) and office visit codes in the EHR or other similar system. Write or dictate and sign progress note.

Office Visits #3-4 (99213): Review PT/OT and/or VNA notes to assess progress with therapy. Interview patient and obtain history and/or review data obtained by clinical staff. Assess pain control, response to current medications and side-effects. Assess function, mobility and progress with ambulation. Examine surgical site; remove and replace dressing as needed. Assess limb alignment, swelling, strength and ROM. Check neurovascular status. Counsel patient and/or family regarding wound care, therapy protocol and activity (e.g. driving, bathing, leg elevation). Counsel patient and/or family regarding planned or emergent invasive procedures (e.g. dental, GI) about need for prophylactic antibiotics; review instruction sheet. Counsel patient/family regarding multi-modal pain management and narcotic pain medication cessation. Order, review and personally interpret radiographs; review with patient and/or family. Write order for nonnarcotic prescription as appropriate (e.g. NSAIDs). Complete forms/referrals for continued PT/OT and/or home care services. As required, complete disability, FMLA, out of/return to work/school and/or other related forms. Communicate and coordinate care with other physicians and health care providers (e.g. PT/OT, PCP). Enter diagnosis code(s) and office visit codes in the EHR or other similar system. Write or dictate and sign progress note.

Key Reference Code Comparison

For both reference codes, the respondents indicated the intensity and complexity of the procedure to be similar/more than the survey code.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 27466

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty orthopaedic surgery How often? Rarely

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and <u>percentage</u> for each specialty. Please explain the rationale for this estimate. National utilization is not availble

Specialty Frequency Percentage %

Specialty Frequency Percentage %

CPT CODE(S): 27458, 27465. 27466, 27468
SPECIALTY SOCIETY(IES): AAOS
PRESENTER(S): William Creevy MD, Hussein Elkousy MD , Kevin Neal MD

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

Meeting Date: 09/2024

CPT Code	Long Descriptor	Global Period
27458	Osteotomy(ies), femur, unilateral, with insertion of an externally controlled intramedullary lengthening device, including iliotibial band release when performed, imaging, alignment assessments, computations of adjustment schedules, and management of the intramedullary lengthening device	90
27465	Osteoplasty, femur; shortening (excluding 64876)	90
27466	Osteoplasty, femur; lengthening	90
27468	Osteoplasty, femur; combined, lengthening and shortening with femoral segment transfer	90

Vignette(s) (*vignette required even if PE only code(s)***):**

CPT Code	Vignette
27458	A 16-year-old male presents with a congenitally short right femur. At skeletal maturity, he continues to have a limb length discrepancy of 6 cm. He walks with a limp and has activity-related pain in the right hip and low back.
27465	A 45-year-old female has a leg length discrepancy of 2.5 cm. She undergoes a shortening osteoplasty with internal fixation to equalize limb lengths.
27466	A 7-year-old female has a congenital short right femur. She undergoes osteoplasty with intraoperative distraction, application of a graft and internal fixation to lengthen the short femur.
27468	A 25-year-old male has a 10 cm segmental bone loss and a bone defect of the femur after an open fracture. Osteoplasty with resection of a 5 cm segment of bone and shortening of the contralateral longer femur is performed with internal fixation for stabilization. The 5 cm resected segment of bone is then transferred to the shorter femur spanning the bone defect with internal fixation thereby equalizing limb lengths.

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:
   Society advisors and content experts reviewed the PE details for current codes.

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here:
   Current codes used current code PE details as reference. New code 27458 used the survey key reference code 22633 which includes standard 90-day global PE inputs.
   NOTE: For services reviewed prior to the implementation of clinical activity codes in 2016-17, detail is not provided in the RUC database, please contact *Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org* for PE spreadsheets for your older reference codes.

3. Is this code(s) typically reported with an E/M service?
   no
   See the *Billed Together* tab in the RUC Database.

PRESENTER(S): William Creevy MD, Hussein Elkousy MD , Kevin Neal MD

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

4. If you are requesting an increase over the aggregate current cost for clinical activities, supplies and equipment, please provide compelling evidence:

The increase over current cost is due solely to changes in number/level of postop office visits per the survey.

See the *PE compelling evidence guidelines* on the RUC Collaboration website. Be sure to explain if the increase can be entirely accounted for because of an increase in physician time.

CLINICAL STAFF ACTIVITIES

The RUC has agreed that there is a presumption of zero pre-service clinical staff time unless the specialty can provide evidence to the PE Subcommittee that any pre-service time is appropriate. The RUC agreed that with evidence some subset of codes may require either minimal or extensive use of clinical staff and has allocated time when appropriate (for example when a service describes a major surgical procedure). If the package times are not applicable, alternate times may be presented and should be justified for consideration by the Subcommittee.

5. Are the global periods of the codes transitioning? Information about the amount of pre-service clinical staff time and a rationale for the change from a 090-day global to a 000 or 010 day global should be described below.

no

6. If you are recommending more minutes than the PE Subcommittee standards for clinical activities, you must provide rationale to justify the time:

n/a

7. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (*please see 2nd worksheet tab in PE spreadsheet*), please explain the difference here:

n/a

8. Please provide a brief description of the clinical staff work for the following:
   a. Pre-Service period:

Clinical Staff Work Clinical staff reviews all forms with patient and family to ensure all relevant history and diagnostic information is included. Staff coordinates collection and documentation of imaging/lab results, patient specific information and other relevant patient information for a surgical procedure including conducting requisite pre-surgery assessment with anesthesiologist. Enter and record all clinical updates in EHR. Staff interacts with facility to schedule space, supplies, equipment, and review checklists. Staff reviews procedure, complication risk, process of recovery, and answers patient/family questions. Staff reviews preoperative medication changes, preop diet restrictions, reviews patient medical status and answers final pre-admission questions.

   b. Service period (includes pre, intra and post):

Prior to discharge, office clinical staff will assist with necessary post-discharge care coordination, such as: Responding to patient/family questions about home activity restrictions. Confirmation of discharge antibiotics if needed, and pain medication. Coordination with other physicians and QHPs involved in the care of the patient for transfer of records. Transitioning discharge information to the surgeon office

medical record, including medication list, correspondence and imaging or lab results pending at discharge.

c. Post-service period:

The clinical staff work includes the standard activities involved in any E/M visit including ensuring the appropriate supplies are available in the room, ensuring imaging and lab reports are available, rooming and gowning the patient, reviewing current medications/allergies in EHR, obtaining vital signs, assisting with positioning, wound care, coordination of care, and cleaning of the room.

9. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (*please see 2nd worksheet tab in PE spreadsheet*):

n/a

10. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov.

MEDICAL SUPPLIES & EQUIPMENT/INVOICES

11. ☐ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

12. ☐ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

13. If you wish to include a supply that is not on the Direct PE Inputs Medical Supplies Listing (*please see 4th worksheet tab in PE spreadsheet*), a paid invoice is required. Identify and explain the supply input and invoice here:

n/a

14. Are you recommending a PE supply pack for this recommendation? **Yes** or No.
If Yes, please indicate if the pack is an established package of supplies as defined by CMS (eg, SA047 *pack, E/M visit*) or a pack that is commercially available?

SA048	pack, minimum multi-specialty visit
SA054	pack, post-op incision care (suture)

15. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation (*please see 8-10th worksheet tabs in PE spreadsheet*). Please include the description, CMS supply code, unit, item quantity and unit price (if available).

DESCRIPTION	Code	Unit	Item Qty
pack, minimum multi-specialty visit	**SA048**	**pack**	
paper, exam table		foot	7

gloves, non-sterile		pair	2
gown, patient		item	1
pillow case		item	1
cover, thermometer probe		item	1

DESCRIPTION	**Code**	**Unit**	**Item Qty**
pack, post-op incision care (suture)	**SA054**	**pack**	
kit, suture removal *metal Littauer (hook-tipped) scissors* *Posi-Grip plastic forceps* *3" x 3" gauze sponge* *tray*		kit	1
povidone soln (Betadine)		ml	10
gauze, sterile 4in x 4in		item	2
gloves, sterile		pair	1
steri-strip (6 strip uou)		item	2
swab-pad, alcohol		item	2
tape, surgical paper 1in (Micropore)		inch	12
tincture of benzoin, swab		item	1

16. If you wish to include an equipment item that is not on the Direct PE Inputs Equipment Listing (*please see 5th worksheet tab in PE spreadsheet*), a paid invoice is required. Identify and explain the equipment input and invoice here:

n/a

17. Please provide an estimate of the useful life of the new equipment item as required to calculate the equipment cost per minute:

n/a

18. Have you recommended equipment minutes for a computer or equivalent laptop/integrated computer, equipment item computer, desktop, w-monitor, ED021 or notebook (Dell Latitute D600), ED038?
    a. If yes, please explain how the computer is used for this service(s).
    b. Is the computer used exclusively as an integral component of the service or is it also used for other purposes not specific to the code?
    c. Does the computer include code specific software that is typically used to provide the service(s)?

n/a

19. List all the equipment included in your recommendation and the equipment formula chosen *(please see 7th worksheet tab in PE spreadsheet: Equipment minute formulas).* If you have selected "other formula" for any of the equipment please explain here:

ITEMIZED LIST OF CHANGES (FOLLOWING THE PE SUBCOMMITTEE MEETING)

NOTE: The PE spreadsheets will be updated and finalized in real-time at the meeting. PE SORs must be updated based on modifications made during the meeting and resubmitted asap. The PE SOR should match the updated PE spreadsheet. Please provide a list of the modifications made to the PE spreadsheet during the PE Subcommittee meeting in the space below with brief justification for the modification (e.g. Equipment item EF023 *table, exam* was changed to EF031 *table, power* as the power table is typical in the surgeon's office).

The PE SOR serves as key support for the spreadsheet and should include any important details/explanation for the inputs as these cannot be elaborated upon in the excel document itself.

Please submit the revised form electronically to Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org.

AMA/Specialty Society RVS Update Committee Summary of Recommendations

September 2024

Limb Lengthening/Shortening-Tibia – Tab 5

In May 2024, the CPT Editorial Panel created a new Category I code, 27713, for reporting tibia lengthening using the insertion of an externally controlled intramedullary lengthening device, including imaging. Though lengthening of long bones is a well-established treatment for clinically significant limb inequalities, the emergence of this new technology has fundamentally changed the preoperative planning, intraoperative technical requirements, and postoperative management for these lengthening procedures. CPT code 27713 and the other code within this code family 27715, were surveyed for the September 2024 RUC Meeting.

Compelling Evidence
The RUC agreed with the specialty society that there is compelling evidence to support a change in physician work for CPT code 27715 based on the argument that there was a flawed methodology used in the previous evaluation. In their summary of recommendation, the specialty society articulated that pediatric orthopaedic surgeons (who typically perform the service on children with congenital limb length discrepancies) were not involved nor was their input included in the original valuation of this service. The RUC recognized that the survey conducted for the September 2024 RUC meeting included orthopaedic pediatric surgeons, along with general and trauma orthopaedic surgeons who are all experienced in orthopaedic reconstructive surgery and experienced in performing these low-volume procedures. **The RUC agrees with the compelling evidence presented that the physician work for these services has changed based on evidence that incorrect assumptions were made in the previous valuation of these services.**

27713 ***Osteotomy(ies), tibia, including fibula when performed, unilateral, with insertion of an externally controlled intramedullary lengthening device, including imaging, alignment assessments, computations of adjustment schedules, and management of the intramedullary lengthening device***
The RUC reviewed survey results from 45 orthopaedic surgeons and determined the survey median work RVU of 28.00 appropriately accounted for the physician work required to perform this service. The RUC recommends 50 minutes pre-service evaluation time, 15 minutes pre-service positioning time, 15 minutes scrub/dress/wait time, 200 minutes intra-service time, 30 minutes immediate post-service time, 1-99231, 1-99232, 1-99238, 6-99213, 1-99214 and 1-99215 visits for this service, which equals 641 minutes of total time.

The specialty society selected pre-service time package *3 FAC Straightforward Patient/Difficult Procedure* and post-service time package *9B General Anes or Complex Regional Blk/Cmplx Proc*. The selected time packages were modified to more accurately reflect pre-and post-service time involved with this service. The additional 17 minutes of pre-service evaluation time above the standard pre-time package time of 33 minutes accounts for the additional time necessary for tasks including preoperative discussion with the patient's parents regarding the surgery and review/obtain informed consent; reexamination of the patient to ensure that physical findings have not changed to review imaging and confirm prior measurements related to device selection; sterile setup of the intramedullary lengthening device and sterile testing of the remote controller magnetic field generator for proper function before implantation; and verification that other hardware required for this service or available. The

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

specialty society confirmed that 17 additional minutes of pre-service evaluation time is consistent with other device-intensive codes and operations on children. An additional 12 minutes of pre-service positioning time is required above the standard package time of 3 minutes to account for padding of bony prominences, positioning and bolstering the patient's leg to allow for surgical exposure and manipulation of the limb and imaging equipment during surgery. The specialty society confirmed that 12 additional minutes of pre-service positioning time is consistent with femur procedures.

The RUC agreed with the surveying society that the post-operative office visits typically involve assessing the progress of ambulation and counseling the family regarding wound care, therapy protocol, and review of narcotic pain medication. For CPT code 27713, the physician will also interpret the radiographs and confirm the calculation for the planned lengthening protocols, as well as update the external remote controller (ERC) device programming.

To justify a work RVU value of 28.00, the RUC compared CPT code 27713 to top key reference service and MPC code 22633 *Arthrodesis, combined posterior or posterolateral technique with posterior interbody technique including laminectomy and/or discectomy sufficient to prepare interspace (other than for decompression), single interspace, lumbar;* (work RVU = 26.80, 180 minutes intra-service time and 509 minutes total time) and the second highest key reference service and MPC code 27284 *Arthrodesis, hip joint (including obtaining graft);* (work RVU = 25.06, 180 minutes intra-service time and 497 minutes total time). The RUC recognizes that the surveyed code is an appropriate comparator relative to the two key reference services, bracketing the survey median work RVU, as well as in terms of intra-service time and intraoperative intensity. For additional support, the RUC referenced MPC codes 55845 *Prostatectomy, retropubic radical, with or without nerve sparing; with bilateral pelvic lymphadenectomy, including external iliac, hypogastric, and obturator nodes* (work RVU = 25.18, 198 minutes intra-service time and 466 minutes total time) and 33426 *Valvuloplasty, mitral valve, with cardiopulmonary bypass; with prosthetic ring* (work RVU = 43.28, 205 minutes intra-service time and 776 minutes total time), noting that together these two codes also bracket the survey median work RVU and have identical intra-service time as the surveyed code. **The RUC recommends a work RVU of 28.00 for CPT code 27713.**

27715 ***Osteoplasty, tibia and fibula, lengthening or shortening***
The RUC reviewed survey results from 45 orthopaedic surgeons and determined the survey median work RVU of 22.50 appropriately accounted for the physician work required to perform this service. The RUC recommends 40 minutes pre-service evaluation time, 15 minutes pre-service positioning time, 15 minutes scrub/dress/wait time, 150 minutes intra-service time, 30 minutes immediate post-service time, 1-99231, 1-99232, 1-99238, 3-99213 and 1-99214 visits for this service, which equals 457 minutes of total time.

The specialty society selected pre-service time package 3 *FAC Straightforward Patient/Difficult Procedure* and post-service time package *9B General Anes or Complex Regional Blk/Cmplx Proc*. The selected time packages were modified to more accurately reflect pre-and post-service time involved with this service. The additional 7 minutes of pre-service evaluation time above the standard pre-time package time of 33 minutes accounts for the additional time necessary for tasks including reexamination of the patient to ensure that the physical findings have not changed (range of motion of the hip and knee, neurovascular status, length and rotation of the limb); precise pre-operative marking, including confirmation of the harvest location of bone graft; and verification that other hardware required for this service are available. Less pre-service evaluation time is required for this service compared to CPT code 27713 because this service does not require the preliminary steps required for using the externally

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

controlled intramedullary lengthening nails device, including sterile testing of the device. The additional 12 minutes of pre-service positioning time is required above the standard package time of 3 minutes to account for padding of bony prominences, positing and bolstering the patient's leg to allow for surgical exposure and manipulation of the limb and imaging equipment during surgery. The specialty society confirmed that 12 additional minutes of pre-service positioning time is consistent with femur procedures.

The RUC agreed with the surveying society that these follow-up office visits typically involve standard procedures such as assessing the progress of ambulation and counseling the family regarding wound care, therapy protocol, and review of narcotic pain medication. Fewer office visits are required for CPT code 27715 than 27713 because there is no reprogramming of the device and controller.

To justify a work RVU value of 22.50, the RUC compared CPT code 27715 to top key reference service 27269 *Open treatment of femoral fracture, proximal end, head, includes internal fixation, when performed* (work RVU = 18.89, 125 minutes intra-service time and 404 minutes total time) and the second highest key reference service and MPC code 22630 *Arthrodesis, posterior interbody technique, including laminectomy and/or discectomy to prepare interspace (other than for decompression), single interspace, lumbar;* (work RVU = 22.09, 150 minutes intra-service time and 479 minutes total time). The RUC recognizes that the surveyed code is an appropriate comparator relative to the two key reference services, bracketing the survey median work RVU, as well as in terms of intra-service time and intraoperative intensity. For additional support, the RUC referenced MPC code 32669 *Thoracoscopy, surgical; with removal of a single lung segment (segmentectomy)* (work RVU = 23.53, 150 minutes intra-service time and 502 minutes total time), noting that this reference code requires similar intra-service time and has similar physician work as the surveyed code. **The RUC recommends a work RVU of 22.50 for CPT code 27715.**

Practice Expense
The Practice Expense (PE) Subcommittee concurred that there is compelling evidence to support an increase over the aggregate current cost for clinical staff time, supplies and equipment for the code family based on changes in physician time due to changes in the number/level of post-operative visits, per the survey, and consequent increases in equipment time.

The PE Subcommittee reviewed the direct practice expense inputs and made no modifications to the standard 090-day global inputs. The PE Subcommittee noted that the use of the 12-minute standard for CA036 *Discharge day management* is appropriate. **The RUC recommends the direct practice expense inputs as submitted by the specialty society.**

New Technology
CPT code 27713 will be placed on the New Technology list and be re-reviewed by the RUC in three years to ensure correct valuation, patient population, and utilization assumptions.

SUMMARY OF RECOMMENDATION

CPT Code:27713 Tracking Number G1 Original Specialty Recommended RVU: **28.00**
Presented Recommended RVU: **28.00**
Global Period: 090 Current Work RVU: **n/a** RUC Recommended RVU: **28.00**

CPT Descriptor: Osteotomy(ies), tibia, including fibula when performed, unilateral, with insertion of an externally controlled intramedullary lengthening device, including imaging, alignment assessments, computations of adjustment schedules, and management of the intramedullary lengthening device

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 15-year-old presents with a congenital right fibular hemimelia. At skeletal maturity, she continues to have a limb length discrepancy of 4 cm. She walks with a limp and has activity-related pain in the right hip and low back.

Percentage of Survey Respondents who found Vignette to be Typical: 84%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 100% , In the ASC 0%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 0% , Overnight stay-less than 24 hours 33% , Overnight stay-more than 24 hours 67%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 91%

Description of Pre-Service Work: The appropriate antibiotic(s) are selected and ordered, and timing and administration are confirmed. Results of preadmission testing are reviewed, including laboratory tests, X rays, CT scans, and/or MRIs, with special attention to radiographs and scaled radiographs used to determine an appropriate intramedullary lengthening device diameter and length, the appropriate osteotomy location, and to determine the amount of lengthening required. The patient is re-examined to make sure that physical findings have not changed, including range of motion of the hip and knee, neurovascular status, and length and rotation of the limb. The history and physical are updated. The planned procedure and postoperative management are reviewed with the patient and parents; questions and concerns are addressed with the family; and parent informed consent for the minor is reviewed and consent obtained. It is verified that all required instruments and supplies are available, including intraoperative imaging/fluoroscopy for guidance and documentation. The intramedullary lengthening device and external remote controller magnetic field generator are tested for proper functioning. It is ensured that an array of plates and screws are available for possible use. An estimate of the appropriate-size component is determined by templating with radiographs. The patient is positioned, bony prominences are padded, and thermal regulation drapes are applied. The position of the extremities and head are assessed and adjusted as needed. The patient's leg is placed properly on the table and positioned with proper bolstering to aid surgical exposure. A tourniquet is placed on the proximal thigh. Areas of skin to be prepared are indicated, and surgical incisions are marked. A surgical "time out" is performed with the operating surgical team.

Description of Intra-Service Work: A longitudinal incision is made in the midline over the patellar tendon and dissection is carried through the subcutaneous tissue. The patellar tendon is split sharply in its midline. A guidepin is placed in the midline at the anterior crest of the tibia. The guidepin is adjusted on multiplane fluoroscopy and driven into the proximal metaphysis. The guidepin is overreamed with a starter reamer. A ball-tipped guide rod is placed down the canal of the tibia to the distal metaphysis. Next, a longitudinal incision is made laterally at the junction of the middle and distal one third of the fibula and dissection is carried through the subcutaneous tissue. Blunt dissection is performed through the lateral compartment to the fibula. Circumferential subperiosteal dissection is performed. Next, an osteotomy of the fibula is performed under direct visualization using a saw. Fluoroscopy confirms adequate osteotomy. Next, a longitudinal incision

is made medially over the subcutaneous border of the tibia and dissection is carried through the subcutaneous tissue. Circumferential subperiosteal dissection is performed. Multiple holes are drilled transversely across the tibia at the osteotomy site to provide ventilation for reaming. The ball-tipped guide rod is then overreamed, beginning with a starter reamer and progressing to a reamer diameter that is 1.5 mm to 2.0 mm greater than the chosen device. The guide rod is then withdrawn proximally. An osteotome is used to complete the tibial osteotomy. Fluoroscopy confirms adequate osteotomy. An externally controlled intramedullary lengthen device is then placed down the canal in the tibia, across the osteotomy site, and gently advanced to the distal tibia. Neutral rotation is confirmed. Two proximal locking pegs and two distal medial to lateral locking pegs are placed through small incisions. An incision is made over the distal fibula. A guidepin is placed transversely across the distal syndesmosis, through four cortices. The guidepin is overreamed. A fully threaded cannulated screw is placed over the guidepin across the distal syndesmosis. An incision is made proximally over the fibular head, taking care to remain anterior to avoid the peroneal nerve. A guidepin is placed transversely across the proximal syndesmosis, through four cortices. The guidepin is overreamed. A fully threaded cannulated screw is placed over the guidewire across the proximal syndesmosis. A 3-cut percutaneous Achilles tendon lengthening is performed using a scalpel. The first cut is just proximal to the calcaneal insertion of the tendon and directed medially. The second cut is 1 cm proximal and directed laterally. The 3rd cut is 1 cm further proximal and again directed medially. Maximum dorsiflexion is placed through the ankle to achieve Achilles tendon lengthening. Final check of all implants on multiplane fluoroscopy is found to be adequate. Acute distraction of 1 to 2 mm of the device is performed intraoperatively with the external remote controller magnetic field generator to document proper functioning of the magnetic lengthening mechanism. The wounds are copiously irrigated. The patellar tendon is repaired. All wounds are closed in layers. The internal magnet is identified using fluoroscopy and is marked with a permanent surgical skin marker. The skin incisions are infiltrated with local anesthetic.

Description of Post-Service Work:
Facility:
Apply sterile dressings; remove drapes; assess limb alignment compared to the opposite extremity; asses limb perfusion and pulses; wait for reversal of anesthesia and extubation; assist in transfer of the patient from the OR table to a stretcher or bed; assist in transport of patient from operating room to recovery room; monitor patient stabilization in the recovery room; complete a careful neurologic and vascular examination of the extremity; discuss postoperative recovery care with anesthesia and nursing staff, including regional blocks; enter a brief operative note and a full operative report in the medical record; call referring physician and/or send a copy of the operative note; write comprehensive orders for PACU and floor care; complete medication reconciliation; order and review postoperative radiographs; enter procedure data, including implant details, into longitudinal outcome registries (eg, NSQIP, local registry); and discuss procedure and outcome with patient and family. Later the same day: Examine the patient and perform a vascular assessment of the operated limb; assess pain scores and adequacy of analgesia; review nursing/other staff patient chart notes; adjust orders for pain control, DVT prophylaxis, diet, and ambulation; answer patient and family questions; answer nursing/other staff questions; and chart patient progress notes. On the next day and any subsequent visits before discharge: Examine the patient and perform a neurovascular assessment of the operated limb; assess pain scores and adequacy of analgesia; review nursing/other staff patient chart notes; adjust orders as needed; answer patient and family questions; answer nursing/other staff questions; and chart patient progress notes. Counsel the patient/family on expectations of pain, swelling, signs of compartment syndrome, and techniques for mitigation. Discharge day management: The patient is discharged when there is adequate pain control with oral analgesics, adequate solid and liquid intake, normal voiding of urine, and independent ambulation. Reconcile medications and write orders for medications needed after discharge. Home restrictions (ie, diet, activity, bathing) are discussed with the patient / family and the discharging nurse. All appropriate medical records are completed, including day of discharge progress notes, discharge summary and discharge instructions, and insurance forms.

Office:
The first postoperative office visit occurs 5-10 days after surgery. The patient / family is interviewed and data obtained by clinical staff is reviewed. The findings at surgery and details of the procedure are reviewed with the patient/family. A new postoperative radiograph is ordered and taken, then interpreted by the surgeon. The postoperative dressings are removed and assessment performed of wound status, drainage, hematoma, and signs of infection. The circulation, sensation, and motor function status is assessed. The wounds are cleaned and redressed. Adequacy of analgesia is assessed, the PDMP is checked and orders are made for narcotic and nonnarcotic pain medication as needed. The patient/family will be counseled on appropriate multi-modal pain management (ie, narcotic, nonnarcotic). The patient/family will be counseled on expectations of pain, swelling, signs of compartment syndrome, and techniques for mitigation. The patient/family will be counseled on the findings of the radiograph. Imaging for the next visit will be ordered. The initial alignment computations for the planned adjustment schedule will be reviewed and modified if needed based on patient exam and imaging. The patient/family will be trained on the use of the external remote controller (ERC) magnetic field generator and provided written specific instructions. A physical therapy plan will be developed and ordered. Activity limitations (ambulation,

bathing, etc.) are discussed with the patient/family. Patient/family questions are answered. Medical record progress notes are dictated, reviewed, and signed. An update is provided to the PCP and/or referring provider. The second postoperative office visit occurs 10-21 days after surgery. The patient / family is interviewed and data obtained by clinical staff is reviewed. Interval chart notes, including calls from the patient/family and physical therapy notes are reviewed. The postoperative dressings are removed and assessment performed of wound status, drainage, hematoma, and signs of infection. The circulation, sensation, and motor function status is assessed. Sutures are removed and wounds are cleaned and redressed as needed. Adequacy of analgesia is assessed, the PDMP is checked and orders are made for narcotic and nonnarcotic pain medication as needed. The patient/family will be counseled on appropriate multi-modal pain management (ie, narcotic, nonnarcotic). The patient/family will be counseled on expectations of pain and swelling and techniques for mitigation. Imaging will be reviewed. Imaging for the next visit will be ordered. The alignment computations for the planned adjustment schedule will be reviewed and modified if needed based on patient exam and imaging. PT progress is assessed and orders revised as needed. Management of the patient and updates to the care plan is discussed with the PT. Activity limitations are reinforced with the patient. Patient/family questions are answered. Medical record progress notes are dictated, reviewed, and signed. An update is provided to the PCP and/or referring provider. At subsequent postoperative office visits, the patient / family is interviewed and data obtained by clinical staff is reviewed. Interval chart notes, including calls from the patient/family and physical therapy notes are reviewed. The circulation, sensation, and motor function status is assessed. Adequacy of analgesia is assessed, the PDMP is checked and orders are written for pain medication if needed. Imaging will be reviewed and ordered for the next visit. The alignment computations for the planned adjustment schedule will be reviewed and modified if needed based on patient exam and imaging. PT progress is assessed and orders revised as needed. Management of the patient and updates to the care plan is discussed with the PT as needed. Activity limitations are reinforced with the patient. Patient/family questions are answered. Medical record progress notes are dictated, reviewed, and signed. An update is provided to the PCP and/or referring provider.

Note that patient care will continue after the 90-day global period to follow the bone consolidation phase and bone hardening phase which can take 6 to 12 months.

Technical skill required	0%	33%	67%
Physical effort required	11%	44%	44%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	11%	89%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

Lengthening of long bones is a well-established treatment for clinically significant limb length inequalities. The advent of new technology—externally-controlled intramedullary lengthening nails—has fundamentally changed the preoperative planning, intraoperative technical requirements, and postoperative management for these lengthening procedures. At the May 2024 CPT meeting, the Editorial Panel approved a new code 27713 for reporting tibia/fibula lengthening using with insertion of an externally controlled intramedullary lengthening device. The new global code includes all alignment assessments, computations and lengthening adjustment schedules, and management of the device. Although not included in the CPT application, code 27715 was added as family codes for review.

Recommendation – 27713

We recommend the survey median work RVU of 28.00, although the relative comparison to reference codes suggests this value underestimates the total work that includes significant postoperative office work.

Pre-time

Package 3 is selected with the following modifications:

Evaluation time: Total of 50 minutes that includes an additional 17 minutes above the standard package time to account for: (1) Additional time to set up (using sterile technique) the intramedullary lengthening device and use the external remote controller magnetic field generator to test for proper function for the expected range of lengthening prior to implantation; (2) Additional time related to preoperative discussion with both the minor patient and patient's parents to review the possible complications, the expected outcome, the postoperative lengthening process, and to review consent. This discussion importantly reemphasizes the amount of postoperative management that this procedure entails; (3) Additional time to reexamined the patient to make sure that physical findings have not changed, including range of motion of the hip and knee, neurovascular status, and length and rotation of the limb–this information is used to review imaging and confirm prior measurements related to device selection; and (4) Additional time is also required to ensure that hardware (reamers, drills, saws, rods, nails, plates, screws) and intraoperative imaging equipment are available. The additional preoperative time is consistent with other reconstructive device intensive operations.

Positioning time: Total of 15 minutes that includes 12 additional minutes above the standard package time to account for padding of bony prominences, positing and bolstering patient leg to allow for surgical exposure and manipulation of the limb and imaging equipment during surgery. A total of 15 minutes is consistent with other femur procedures (eg, 27236, 27269, 27511-27514)

Scrub, dress, wait time: Subtract 5 minutes (total time = 15 minutes) to be consistent with survey median.

Immediate Post-time through discharge from recovery

Package 9b: Subtract 3 minutes to be consistent with the survey median.

Postoperative visits after discharge from recovery

It is important to note that for most procedures, the intraoperative work is the treatment and the postoperative work is related to recovery. However, for 27458, the intraoperative work is only the beginning of treatment with continued treatment (lengthening) during the postoperative period. Thus, the need for many / intense visits with significant MDM to prevent treatment failure—lengthen too slow leads to premature consolidation, lengthen too fast leads to poor regenerate.

27713 Summary of Postop E/M	Visit CPT	Estimate of Visit Minutes	MDM			
			Problem	Data	Treatment / Risk	Overall
HV later same day	**99231**	26 to 34	Mod	Low	Mod	Mod[1]

1. Although MDM supports 99232; code 99231 selected to be consistent with survey data
2. Although MDM supports 99214; code 99213 selected to be consistent with survey data

Hospital Visit Later Same Day (99231): Review nursing notes; discuss status and progress with nursing staff. Review vital signs, I/O, labs and other related data. Review operative findings, radiographs and outcome with patient and/or family; answers questions. Assess pain control and response to current medications; modify orders accordingly. Assess urinary and GI function. Exam surgical site; reinforce/change dressing as needed. Assess limb position and alignment; repositioning the limb as needed. Check neurovascular status. Counsel patient and/or family regarding therapy protocol. Counsel patient and/or family regarding OOB/ambulation, incentive spirometry, upright position in bed and use of sequential compressive devices. Counsel patient and/or family regarding discharge planning. Communicate and coordinate care with medical nurses, other physicians and PT/OT. Communicate and coordinate pain control with anesthesia, including status of current modalities. Update orders. Write "postoperative check" progress note. Enter CPT and ICD-10 codes in billing system.

Hospital Visit, Day 1 (99232): Review nursing notes; discuss status and progress with nursing staff. Review vital signs, I/O, labs and other related data. Assess pain control and response to current medications; modify orders accordingly. Assess urinary and GI function. Examine surgical site; reinforce/change dressing as needed. Assess limb position and alignment; repositioning the limb as needed. Check neurovascular status. Counsel patient and/or family regarding therapy protocol. Counsel patient and/or family regarding OOB/ambulation, incentive spirometry, upright position in bed and use of sequential compressive devices. Counsel patient and/or family regarding discharge planning. Communicate and coordinate care with nurses, other physicians, PT/OT and case management. Communicate and coordinate pain control with anesthesia, including status of current modalities. Update orders. Write progress note. Enter CPT and ICD-10 codes in billing system.

Discharge Management, Day 2 (99238): Review nursing notes; discuss status and progress with nursing staff. Review PT/OT notes; discuss status and progress with PT/OT staff. Review case manager discharge plan notes; discuss status and progress with case management. Review notes from other physicians and discussing as appropriate. Review vital signs, I/O, labs and other related data. Interview patient and obtaining interval history. Assess pain control and response to current medications. Assess gastrointestinal and urinary function. Examine surgical site; changing dressing as needed. Assess limb position and ROM; repositioning limb as needed. Check neurovascular status. Finalize and confirm discharge plans with patient and/or family. Counsel patient and/or family regarding therapy protocol and activity limitations after discharge. Review postoperative instructions (eg wound care, pain medications, VTE prophylaxis). Complete daily progress note. Complete discharge summary and associated forms and documents. Write prescriptions for medications and devices / equipment. Check narcotic prescription registries. Complete medication reconciliation. Write order for discharge. Coordinate postoperative appointment with patient and/or family and office staff. Communicate and coordinate follow-up care with other physicians and/or PT/OT. Enter postoperative data into longitudinal outcome databases or registries (eg, NSQIP).

Office Visit #1 (99215): Discuss findings at surgery and review procedure details; answer questions. Review post-operative radiographs with patient and/or family. Interview patient and obtain history and/or review data obtained by clinical staff. Assess pain control, response to current medications and side-effects. Assess function, mobility and progress with ambulation. Assess gastrointestinal and urinary function to assess for medication side effects. Remove dressing; examine surgical site. Apply sterile dressing and compressive wrap or stockings. Assess limb alignment, swelling, strength and ROM. Check neurovascular status. Counsel patient and/or family regarding wound care, therapy protocol and activity (eg, driving, bathing, leg elevation). Counsel patient and/or family regarding planned or emergent invasive procedures (eg, dental, GI) about need for prophylactic antibiotics; review instruction sheet. Counsel patient/family regarding multi-modal pain management and use of narcotic pain medication with tapering. Fit and apply walker boot and/or AFO. Review and confirm calculations for planned lengthening protocol; program ERC device. Counsel patient and family on use of external remote control (ERC). Monitor while family and patient perform initial lengthening with ERC to confirm instructions are clear and answer any questions. Assess neurovascular status, motor function, limb alignment and pain status after lengthening. Order, review and personally interpret radiographs; review with patient and/or family. Check narcotic prescription registries. Write order for narcotic prescription; re-fill or new medication. Write order for nonnarcotic prescription as appropriate (e.g. NSAIDs). Discussion of need for VTE prophylaxis based on patient risk assessment and mobilization; refill or new medication. Complete medication reconciliation. Counsel patient/family regarding timing of next office visit and communicate interval care plan based on synthesis of interval history, physical exam, wound assessment, pain control and therapy progression . Complete forms/referrals for continued PT/OT and/or home care services (e.g. VNA). Complete disability, FMLA, out of/return to

work/school and other related forms. Communicate and coordinate care with other physicians and health care providers (e.g. PT/OT, PCP). Enter diagnosis code(s) and office visit codes in the EHR or other similar system. Write or dictate and sign progress note.

Office Visit #2 (99214): Review PT/OT and/or VNA notes to assess progress with therapy. Interview patient and obtain history and/or review data obtained by clinical staff. Assess pain control, response to current medications and side-effects. Assess function, mobility and progress with ambulation. Remove dressing; examine surgical site. Remove sutures; apply steri-strips. Apply compressive wrap or stockings. Assess limb alignment, swelling, strength and ROM. Assess walker boot and/or AFO. Check neurovascular status. Counsel patient and/or family regarding wound care, therapy protocol and activity (eg, driving, bathing, leg elevation). Counsel patient and/or family regarding planned or emergent invasive procedures (e.g, dental, GI) about need for prophylactic antibiotics; review instruction sheet. Counsel patient/family regarding multi-modal pain management and use of narcotic pain medication with tapering. Order, review and personally interpret radiographs; review with patient and/or family. Based upon radiographs, review and confirm calculations for planned lengthening protocol; update ERC device program. Check narcotic prescription registries. Write order for narcotic prescription; re-fill or new medication. Write order for nonnarcotic prescription as appropriate (e.g. NSAIDs). Discussion of need for VTE prophylaxis based on patient risk assessment and mobilization; re-fill or new medication. Complete medication reconciliation. Counsel patient/family regarding timing of next office visit and communicate interval care plan based on synthesis of interval history, physical exam, wound assessment, pain control and therapy progression . Complete forms/referrals for continued PT/OT and/or home care services (e.g. VNA). As required, complete disability, FMLA, out of/return to work/school and/or other related forms. Communicate and coordinate care with other physicians and health care providers (e.g. PT/OT, PCP). Enter diagnosis code(s) and office visit codes in the EHR or other similar system. Write or dictate and sign progress note

Office Visits #3-#8 (99213): Review PT/OT and/or VNA notes to assess progress with therapy. Interview patient and obtain history and/or review data obtained by clinical staff. Assess pain control, response to current medications and side-effects. Assess function, mobility and progress with ambulation. Examine surgical site; remove and replace dressing as needed. Assess limb alignment, swelling, strength and ROM. Check neurovascular status. Assess walker boot and/or AFO. Counsel patient and/or family regarding wound care, therapy protocol and activity (e.g. driving, bathing, leg elevation). Counsel patient and/or family regarding planned or emergent invasive procedures (e.g. dental, GI) about need for prophylactic antibiotics; review instruction sheet. Counsel patient/family regarding multi-modal pain management and narcotic pain medication cessation. Order, review and personally interpret radiographs; review with patient and/or family. Based upon radiographs, review and confirm calculations for planned lengthening protocol; update ERC device program. Write order for nonnarcotic prescription as appropriate (e.g. NSAIDs). Complete forms/referrals for continued PT/OT and/or home care services (e.g. VNA). As required, complete disability, FMLA, out of/return to work/school and/or other related forms. Communicate and coordinate care with other physicians and health care providers (e.g., PT/OT, PCP). Enter diagnosis code(s) and office visit codes in the EHR or other similar system. Write or dictate and sign progress note.

Note that patient care will continue after the 90-day global period to follow the bone consolidation phase and bone hardening phase which can take 6 to 12 months.

Key Reference Code Comparison

For both reference codes, the respondents indicated the intensity and complexity of the procedure to be more than the survey code. Unfortunately, when estimating the total work for the survey code, the respondents underestimated the work related to the many postoperative office visits. The survey reference list was hindered by a lack of available codes with an intraoperative time that is 3 hours and that include significant postoperative office work.

CPT	DESCRIPTOR	RVW	IWPUT	TOTAL TIME	PRE	INTRA	IMM POST	99232	99231	99238	99215	99214	99213

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 27899 Unlisted procedure, leg or ankle

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty orthopaedic surgery How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 722
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. 50% of 2022 data for all ages based on device company sales

Specialty orthopaedic surgery Frequency 722 Percentage 100.00 %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 73 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. specialty estimate of 10% of national estimated utilization

Specialty orthopaedic surgery Frequency 73 Percentage 100.00 %

Specialty Frequency Percentage %

Specialty Frequency 0 Percentage %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Orthopedic - other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 27468

SUMMARY OF RECOMMENDATION

CPT Code:27715 Tracking Number G2 Original Specialty Recommended RVU: **22.50**
Presented Recommended RVU: **22.50**
Global Period: 090 Current Work RVU: **15.50** RUC Recommended RVU: **22.50**

CPT Descriptor: Osteoplasty tibia and fibula, lengthening or shortening

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 15-year-old male with adolescent Blount's disease has shortening and deformity of the tibia. Osteoplasty with internal fixation is performed to correct the angular deformity and length of the affected limb.

Percentage of Survey Respondents who found Vignette to be Typical: 80%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 100% , In the ASC 0%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 0% , Overnight stay-less than 24 hours 44% , Overnight stay-more than 24 hours 56%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 93%

Description of Pre-Service Work: The appropriate antibiotic(s) are selected and ordered, and timing and administration are confirmed. Results of preadmission testing are reviewed, including laboratory tests, X rays, CT scans, and/or MRIs, with special attention to imaging used to determine the amount of tibial lengthening needed to correct the leg length discrepancy and planned osteotomies. The patient is re-examined to make sure that physical findings have not changed, including range of motion of the hip and knee, neurovascular status, and length and rotation of the limb. The history and physical are updated. The planned procedure and postoperative management are reviewed with the patient /parents. Informed consent is reviewed and consent obtained. It is verified that all required instruments and supplies are available, including intraoperative imaging/fluoroscopy for guidance and documentation. Availability of an array of plates and screws that may be needed is confirmed. The patient is positioned supine with care to pad bony prominences. Thermal regulation drapes are applied. The position of the extremities and head are assessed and adjusted as needed. The patient's leg is placed properly on the table and positioned with proper bolstering to aid surgical exposure. A tourniquet is placed on the proximal thigh. Areas of skin to be prepared are indicated, and surgical incisions are marked. A surgical "time out" is performed with the operating surgical team.

Description of Intra-Service Work: Longitudinal incisions are made at the medial and lateral borders of the tibia proximally, with dissection carried through to the subcutaneous tissue and deep fascia. Circumferential subperiosteal dissection is performed a this level. A Gigli saw is passed behind the tibial metaphysis. Intraoperative ultrasound of the dorsalis pedi pulse confirms adequate pulses. Upward pressure is placed on the saw and the patient maintained an adequate pulse. While protecting the skin, a transverse osteotomy is performed on the proximal tibial metaphysis using the Gigli saw. Intraoperative ultrasound of the dorsalis pedis following the osteotomy confirms normal pulse. The bone ends are distracted to create a gap equal to the desired amount of lengthening. Wedges of bone are removed as needed from the lateral side to correct the varus deformity. If required. autologous bone graft (eg, iliac crest) is harvested and packed into the osteotomy gap to fill any defects and enhance bone healing. The tibia is realigned into the correct position. A submuscular plate is then placed along the medial aspect of the tibia and locked with a single nonlocking screw into the most distal hole of the plate. Fluoroscopy is used to confirm alignment of bone and plate placement. It is revised if necessary and at least 5 more locking or nonlocking screws are placed to secure the construct. Final check of screws and plate is confirmed on multiplane fluoroscopy and found to be adequate. The wounds are copiously irrigated. The muscles and soft tissues over are repaired. The skin is closed in layers and wounds are infiltrated with a local anesthetic.

Description of Post-Service Work:
Facility:
Apply sterile dressings; remove drapes; fashion and place well padded leg splint; assess limb alignment compared to the opposite extremity; asses limb perfusion and pulses; wait for reversal of anesthesia and extubation; assist in transfer of the patient from the OR table to a stretcher or bed; assist in transport of patient from operating room to recovery room; monitor patient stabilization in the recovery room; complete a careful neurologic and vascular examination of the extremity; discuss postoperative recovery care with anesthesia and nursing staff, including regional blocks; enter a brief operative note and a full operative report in the medical record; call referring physician and/or send a copy of the operative note; write comprehensive orders for PACU and floor care; complete medication reconciliation; order and review postoperative radiographs; enter procedure data, including implant details, into longitudinal outcome registries (eg, NSQIP, local registry); and discuss procedure and outcome with patient and family. Later the same day: Examine the patient and perform a vascular assessment of the operated limb; assess pain scores and adequacy of analgesia; review nursing/other staff patient chart notes; write orders for ambulation; answer patient and family questions; answer nursing/other staff questions; and chart patient progress notes. On the next day and any subsequent visits before discharge: Examine the patient and perform a neurovascular assessment of the operated limb; assess pain scores and adequacy of analgesia; review nursing/other staff patient chart notes; write orders for ambulation; write orders for therapy; write orders for imaging and review imaging; answer patient and family questions; answer nursing/other staff questions; and chart patient progress notes. Discharge day management: The patient is discharged when there is adequate pain control with oral analgesics, adequate solid and liquid intake, normal voiding of urine, and independent ambulation. Reconcile medications and write orders for medications needed after discharge. Home restrictions (ie, diet, activity, bathing) are discussed with the patient / family and the discharging nurse. All appropriate medical records are completed, including day of discharge progress notes, discharge summary and discharge instructions, and insurance forms.

Office:
The first postoperative office visit occurs 5-7 days after surgery. The patient / family is interviewed and data obtained by clinical staff is reviewed. The findings at surgery and details of the procedure are reviewed with the patient/family. The postoperative radiograph taken after surgery is reviewed with the patient/family. The postoperative splint and dressings are removed and assessment performed of wound status, drainage, hematoma, and signs of infection. The circulation, sensation, and motor function status is assessed. The wounds are cleaned and redressed. Adequacy of analgesia is assessed, the PDMP is checked and orders are made for narcotic and nonnarcotic pain medication as needed. The patient/family will be counseled on appropriate multi-modal pain management (ie, narcotic, nonnarcotic). The patient/family will be counseled on expectations of pain and swelling and techniques for mitigation. Imaging will be ordered and reviewed. A physical therapy plan will be developed and ordered. Activity limitations (ambulation, bathing, etc.) are discussed with the patient/family. Patient/family questions are answered. Medical record progress notes are dictated, reviewed, and signed. An update is provided to the PCP and/or referring provider. At subsequent postoperative office visits, the patient / family is interviewed and data obtained by clinical staff is reviewed. Interval chart notes, including calls from the patient/family and physical therapy notes are reviewed. The postoperative dressings are removed and assessment performed of wound status, drainage, hematoma, and signs of infection. The circulation, sensation, and motor function status is assessed. Sutures are removed when appropriate. Wounds are cleaned and redressed as needed. Adequacy of analgesia is assessed, the PDMP is checked and orders are made for narcotic and nonnarcotic pain medication as needed. The patient/family will be counseled on appropriate multi-modal pain management (ie, narcotic, nonnarcotic). The patient/family will be counseled on expectations of pain and swelling and techniques for mitigation. Imaging will be ordered and reviewed. PT progress is assessed and orders revised as needed. Management of the patient and updates to the care plan is discussed with the PT. Activity limitations are reinforced with the patient. Patient/family questions are answered. Medical record progress notes are dictated, reviewed, and signed. An update is provided to the PCP and/or referring provider.

Note that patient care will continue after the 90-day global period to follow the bone consolidation phase and bone hardening phase which can take 6 to 12 months.

Physical effort required	0%	50%	50%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	33%	50%	17%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

At the May 2024 CPT meeting, the Editorial Panel approved a new code 27713 for reporting tibia/fibula lengthening using with insertion of an externally controlled intramedullary lengthening device. Although not included in the CPT application, code 27715 was added as family codes for review.

Compelling Evidence – 27715

Flawed mechanism or methodology used in the previous valuation:

The value for code 27715 is based on a survey of intraoperative time estimate from 6 general orthopaedic surgeons in 1989 – pediatric surgeons (the typical provider) were not included in the study. In addition, pre- and post-work/time were not surveyed, but were instead imputed using an algorithm. There was no positioning time assigned which was consistent with the assignment of 0 minutes for positioning time for office procedures in this study. This is a rarely performed intense and complex operation, typically performed on children with congenital limb length discrepancy/deformity. We do not believe that 6 general orthopaedic surgeons could adequately respond to a work estimate reflective of the level of intensity/complexity of this procedure using magnitude estimation, resulting in both time and a relative work value that was underestimated.

Recommendation – 27715

We recommend the survey median work RVU of 22.50. This value takes into account the correct intensity of all components of work using the relative current work RVUs for postoperative facility and office visits, complete accounting for preservice evaluation, positioning, and scrub/dress/wait time, and fairly compares the intraoperative intensity to other surgical procedures based on magnitude estimation.

Pre-time

Package 3 is selected with the following modifications:

Evaluation time: Total of 40 minutes that includes an additional 7 minutes above the standard package time to account for: additional time to reexamined the patient to make sure that physical findings have not changed, including range of motion of the hip and knee, neurovascular status, and length and rotation of the limb –this information is used to re-review the extensive preoperative imaging and confirm prior measurements and planned bone cuts to lengthen the limb. Precise preoperative marking is required for all incisions, including confirmation of the harvest location of bone graft. Additional time is also required to ensure that hardware (reamers, drills, saws, rods, nails, plates, screws) and intraoperative imaging equipment are available. The additional preoperative time is consistent with other reconstructive device intensive operations. Note that when this procedure is performed on a child, additional time not described above is required for review of the procedure and recovery with both the parents and the child prior to consent.

Positioning time: Total of 15 minutes that includes 12 additional minutes above the standard package time to account for padding of bony prominences, positing and bolstering patient leg to allow for surgical exposure and manipulation of the limb and imaging equipment during surgery. A total of 15 minutes is consistent with other femur procedures (eg, 27236, 27269, 27511-27514)

Scrub, dress, wait time: Package time of 15 minutes is consistent with survey median.

Immediate Post-time through discharge from recovery

Package 9b: Subtract 3 minutes to be consistent with the survey median.

Postoperative visits after discharge from recovery

27465 Summary of Postop E/M	Selected Visit Level CPT Code	Estimate of Visit Minutes	MDM			
			Problem	Data	Treatment / Risk	Overall
HV later same day	**99231**	26 to 34	Mod	Low	Mod	Mod[1]
HV (POD1)	**99232**	24 to 34	Mod	Low	Mod	Mod

OV #2	**99213**	27 to 32	Mod	Low	Mod	Mod[2]
OVs #3 to #4	**99213**	23 to 26	Mod	Mod	Low	Mod[2]

1. Although MDM supports 99232; code 99231 selected to be consistent with survey data
2. Although MDM supports 99214; code 99213 selected to be consistent with survey data

Hospital Visit Later Same Day (99231): Review nursing notes; discuss status and progress with nursing staff. Review vital signs, I/O, labs and other related data. Review operative findings, radiographs and outcome with patient and/or family; answers questions. Assess pain control and response to current medications; modify orders accordingly. Assess urinary and GI function. Exam surgical site; reinforce/change dressing as needed. Assess limb position and alignment; repositioning the limb as needed. Check neurovascular status. Counsel patient and/or family regarding therapy protocol. Counsel patient and/or family regarding OOB/ambulation, incentive spirometry, upright position in bed and use of sequential compressive devices. Counsel patient and/or family regarding discharge planning. Communicate and coordinate care with medical nurses, other physicians and PT/OT. Communicate and coordinate pain control with anesthesia, including status of current modalities. Update orders. Write “postoperative check” progress note. Enter CPT and ICD-10 codes in billing system.

Hospital Visit, Day 1 (99232): Review nursing notes; discuss status and progress with nursing staff. Review vital signs, I/O, labs and other related data. Assess pain control and response to current medications; modify orders accordingly. Assess urinary and GI function. Examine surgical site; reinforce/change dressing as needed. Assess limb position and alignment; repositioning the limb as needed. Check neurovascular status. Counsel patient and/or family regarding therapy protocol. Counsel patient and/or family regarding OOB/ambulation, incentive spirometry, upright position in bed and use of sequential compressive devices. Counsel patient and/or family regarding discharge planning. Communicate and coordinate care with nurses, other physicians, PT/OT and case management. Communicate and coordinate pain control with anesthesia, including status of current modalities. Update orders. Write progress note. Enter CPT and ICD-10 codes in billing system.

Discharge Management, Day 2 (99238): Review nursing notes; discuss status and progress with nursing staff. Review PT/OT notes; discuss status and progress with PT/OT staff. Review case manager discharge plan notes; discuss status and progress with case management. Review notes from other physicians and discussing as appropriate. Review vital signs, I/O, labs and other related data. Interview patient and obtaining interval history. Assess pain control and response to current medications. Assess gastrointestinal and urinary function. Examine surgical site; changing dressing as needed. Assess limb position and ROM; repositioning limb as needed. Check neurovascular status. Finalize and confirm discharge plans with patient and/or family. Counsel patient and/or family regarding therapy protocol and activity limitations after discharge. Review postoperative instructions (eg wound care, pain medications, VTE prophylaxis). Complete daily progress note. Complete discharge summary and associated forms and documents. Write prescriptions for medications and devices / equipment. Check narcotic prescription registries. Complete medication reconciliation. Write order for discharge. Coordinate postoperative appointment with patient and/or family and office staff. Communicate and coordinate follow-up care with other physicians and/or PT/OT. Enter postoperative data into longitudinal outcome databases or registries (eg, NSQIP).

Office Visit #1 (99214): Discuss findings at surgery and review procedure details; answer questions. Review post-operative radiographs with patient and/or family. Interview patient and obtain history and/or review data obtained by clinical staff. Assess pain control, response to current medications and side-effects. Assess function, mobility and progress with ambulation. Assess gastrointestinal and urinary function to assess for medication side effects. Remove dressing; examine surgical site. Apply sterile dressing and compressive wrap or stockings. Assess limb alignment, swelling, strength and ROM. Check neurovascular status. Counsel patient and/or family regarding wound care, therapy protocol and activity (e.g. driving, bathing, leg elevation). Counsel patient and/or family regarding planned or emergent invasive procedures (e.g. dental, GI) about need for prophylactic antibiotics; review instruction sheet. Counsel patient/family regarding multi-modal pain management and use of narcotic pain medication with tapering. Check narcotic prescription registries. Write order for narcotic prescription; re-fill or new medication. Write order for nonnarcotic prescription as appropriate (e.g. NSAIDs). Discussion of need for VTE prophylaxis based on patient risk assessment and mobilization; re-fill or new medication. Complete medication reconciliation. Counsel patient/family regarding timing of next office visit and communicate interval care plan based on synthesis of interval history, physical exam, wound assessment, pain control and therapy progression . Complete forms/referrals for continued PT/OT and/or home care services (e.g. VNA). Complete disability, FMLA, out of/return to work/school and other related forms.

Communicate and coordinate care with other physicians and health care providers (e.g. PT/OT, PCP). Enter diagnosis code(s) and office visit codes in the EHR or other similar system. Write or dictate and sign progress note.

Office Visit #2 (99213): Review PT/OT and/or VNA notes to assess progress with therapy. Interview patient and obtain history and/or review data obtained by clinical staff. Assess pain control, response to current medications and side-effects. Assess function, mobility and progress with ambulation. Remove dressing; examine surgical site. Remove sutures or staples; apply steri-strips. Apply compressive wrap or stockings. Assess limb alignment, swelling, strength and ROM. Check neurovascular status. Counsel patient and/or family regarding wound care, therapy protocol and activity (e.g. driving, bathing, leg elevation). Counsel patient and/or family regarding planned or emergent invasive procedures (e.g. dental, GI) about need for prophylactic antibiotics; review instruction sheet. Counsel patient/family regarding multi-modal pain management and use of narcotic pain medication with tapering. Order, review and personally interpret radiographs; review with patient and/or family. Check narcotic prescription registries. Write order for narcotic prescription; re-fill or new medication. Write order for nonnarcotic prescription as appropriate (e.g. NSAIDs). Discussion of need for VTE prophylaxis based on patient risk assessment and mobilization; re-fill or new medication. Complete medication reconciliation. Counsel patient/family regarding timing of next office visit and communicate interval care plan based on synthesis of interval history, physical exam, wound assessment, pain control and therapy progression . Complete forms/referrals for continued PT/OT and/or home care services. As required, complete disability, FMLA, out of/return to work/school and/or other related forms. Communicate and coordinate care with other physicians and health care providers (e.g. PT/OT, PCP). Enter diagnosis code(s) and office visit codes in the EHR or other similar system. Write or dictate and sign progress note.

Office Visits #3-4 (99213): Review PT/OT and/or VNA notes to assess progress with therapy. Interview patient and obtain history and/or review data obtained by clinical staff. Assess pain control, response to current medications and side-effects. Assess function, mobility and progress with ambulation. Examine surgical site; remove and replace dressing as needed. Assess limb alignment, swelling, strength and ROM. Check neurovascular status. Counsel patient and/or family regarding wound care, therapy protocol and activity (e.g. driving, bathing, leg elevation). Counsel patient and/or family regarding planned or emergent invasive procedures (e.g. dental, GI) about need for prophylactic antibiotics; review instruction sheet. Counsel patient/family regarding multi-modal pain management and narcotic pain medication cessation. Order, review and personally interpret radiographs; review with patient and/or family. Write order for nonnarcotic prescription as appropriate (e.g. NSAIDs). Complete forms/referrals for continued PT/OT and/or home care services. As required, complete disability, FMLA, out of/return to work/school and/or other related forms. Communicate and coordinate care with other physicians and health care providers (e.g. PT/OT, PCP). Enter diagnosis code(s) and office visit codes in the EHR or other similar system. Write or dictate and sign progress note.

Key Reference Code Comparison

For both reference codes, the respondents indicated the intensity and complexity of the procedure to be similar/more than the survey code.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 27715

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty orthopaedic surgery How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and <u>percentage</u> for each specialty. Please explain the rationale for this estimate. National utilization is not availble

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 39 If this is a recommendation from multiple specialties please estimate frequency <u>and percentage</u> for each specialty. Please explain the rationale for this estimate. RUC database (2022 utilization)

Specialty orthopaedic surgery Frequency 39 Percentage 100.00 %

Specialty Frequency Percentage %

Specialty Frequency 0 Percentage %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Orthopedic - other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 27715

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

CPT CODE(S): 27713, 27715
SPECIALTY SOCIETY(IES): AAOS
PRESENTER(S): William Creevy MD, Hussein Elkousy MD , Kevin Neal MD

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

Meeting Date: 09/2024

CPT Code	Long Descriptor	Global Period
27713	Osteotomy(ies), tibia, including fibula when performed, unilateral, with insertion of an externally controlled intramedullary lengthening device, including imaging, alignment assessments, computations of adjustment schedules, and management of the intramedullary lengthening device	90
27715	Osteoplasty tibia and fibula, lengthening or shortening	90

Vignette(s) (*vignette required even if PE only code(s)***):**

CPT Code	Vignette
27713	A 15-year-old presents with a congenital right fibular hemimelia. At skeletal maturity, she continues to have a limb length discrepancy of 4 cm. She walks with a limp and has activity-related pain in the right hip and low back.
27715	A 15-year-old male with adolescent Blount's disease has shortening and deformity of the tibia. Osteoplasty with internal fixation is performed to correct the angular deformity and length of the affected limb.

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:
   Society advisors and content experts reviewed the PE details for current codes.

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here:
   Current codes used current code PE details as reference. New code 27713 used the survey key reference code 22633 which includes standard 90-day global PE inputs.
   NOTE: For services reviewed prior to the implementation of clinical activity codes in 2016-17, detail is not provided in the RUC database, please contact *Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org* for PE spreadsheets for your older reference codes.

3. Is this code(s) typically reported with an E/M service?
   no
   See the *Billed Together* tab in the RUC Database.

4. If you are requesting an increase over the aggregate current cost for clinical activities, supplies and equipment, please provide compelling evidence:
   The increase over current cost is due solely to changes in number/level of postop office visits per the survey.
   See the *PE compelling evidence guidelines* on the RUC Collaboration website. Be sure to explain if the increase can be entirely accounted for because of an increase in physician time.

CLINICAL STAFF ACTIVITIES

CPT CODE(S): 27713, 27715
SPECIALTY SOCIETY(IES): AAOS
PRESENTER(S): William Creevy MD, Hussein Elkousy MD , Kevin Neal MD

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

The RUC has agreed that there is a presumption of zero pre-service clinical staff time unless the specialty can provide evidence to the PE Subcommittee that any pre-service time is appropriate. The RUC agreed that with evidence some subset of codes may require either minimal or extensive use of clinical staff and has allocated time when appropriate (for example when a service describes a major surgical procedure). If the package times are not applicable, alternate times may be presented and should be justified for consideration by the Subcommittee.

5. Are the global periods of the codes transitioning? Information about the amount of pre-service clinical staff time and a rationale for the change from a 090-day global to a 000 or 010 day global should be described below.

no

6. If you are recommending more minutes than the PE Subcommittee standards for clinical activities, you must provide rationale to justify the time:

n/a

7. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (*please see 2nd worksheet tab in PE spreadsheet*), please explain the difference here:

n/a

8. Please provide a brief description of the clinical staff work for the following:
    a. Pre-Service period:

Clinical Staff Work Clinical staff reviews all forms with patient and family to ensure all relevant history and diagnostic information is included. Staff coordinates collection and documentation of imaging/lab results, patient specific information and other relevant patient information for a surgical procedure including conducting requisite pre-surgery assessment with anesthesiologist. Enter and record all clinical updates in EHR. Staff interacts with facility to schedule space, supplies, equipment, and review checklists. Staff reviews procedure, complication risk, process of recovery, and answers patient/family questions. Staff reviews preoperative medication changes, preop diet restrictions, reviews patient medical status and answers final pre-admission questions.

    b. Service period (includes pre, intra and post):

Prior to discharge, office clinical staff will assist with necessary post-discharge care coordination, such as: Responding to patient/family questions about home activity restrictions. Confirmation of discharge antibiotics if needed, and pain medication. Coordination with other physicians and QHPs involved in the care of the patient for transfer of records. Transitioning discharge information to the surgeon office medical record, including medication list, correspondence and imaging or lab results pending at discharge.

    c. Post-service period:

The clinical staff work includes the standard activities involved in any E/M visit including ensuring the appropriate supplies are available in the room, ensuring imaging and lab reports are available, rooming and gowning the patient, reviewing current medications/allergies in EHR, obtaining vital signs, assisting with positioning, wound care, coordination of care, and cleaning of the room.

PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

9. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (*please see 2nd worksheet tab in PE spreadsheet*):

n/a

10. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov.

n/a

MEDICAL SUPPLIES & EQUIPMENT/INVOICES

11. ☐ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

12. ☐ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

13. If you wish to include a supply that is not on the Direct PE Inputs Medical Supplies Listing (*please see 4th worksheet tab in PE spreadsheet*), a paid invoice is required. Identify and explain the supply input and invoice here:

n/a

14. Are you recommending a PE supply pack for this recommendation? **Yes** or No.
If Yes, please indicate if the pack is an established package of supplies as defined by CMS (eg, SA047 *pack, E/M visit*) or a pack that is commercially available?

SA048	pack, minimum multi-specialty visit
SA054	pack, post-op incision care (suture)

15. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation (*please see 8-10th worksheet tabs in PE spreadsheet*). Please include the description, CMS supply code, unit, item quantity and unit price (if available).

DESCRIPTION	Code	Unit	Item Qty
pack, minimum multi-specialty visit	**SA048**	**pack**	
paper, exam table		foot	7
gloves, non-sterile		pair	2

16. If you wish to include an equipment item that is not on the Direct PE Inputs Equipment Listing (*please see 5th worksheet tab in PE spreadsheet*), a paid invoice is required. Identify and explain the equipment input and invoice here:

n/a

17. Please provide an estimate of the useful life of the new equipment item as required to calculate the equipment cost per minute:

n/a

18. Have you recommended equipment minutes for a computer or equivalent laptop/integrated computer, equipment item computer, desktop, w-monitor, ED021 or notebook (Dell Latitute D600), ED038?
    a. If yes, please explain how the computer is used for this service(s).
    b. Is the computer used exclusively as an integral component of the service or is it also used for other purposes not specific to the code?
    c. Does the computer include code specific software that is typically used to provide the service(s)?

n/a

19. List all the equipment included in your recommendation and the equipment formula chosen *(please see 7th worksheet tab in PE spreadsheet: Equipment minute formulas).* If you have selected "other formula" for any of the equipment please explain here:

EF031	table, power	office visits

PE-ONLY CODES ADDITIONAL INFORMATION

20. (a) Estimate the number of times this service might be provided nationally in a one-year period?
    (b) Estimate the number of times this service might be provided to Medicare patients nationally in a one-year period?

n/a

21. Please select a Professional Liability Insurance (PLI) crosswalk based on a similar specialty mix:

PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

ITEMIZED LIST OF CHANGES (FOLLOWING THE PE SUBCOMMITTEE MEETING)

NOTE: The PE spreadsheets will be updated and finalized in real-time at the meeting. PE SORs must be updated based on modifications made during the meeting and resubmitted asap. The PE SOR should match the updated PE spreadsheet. Please provide a list of the modifications made to the PE spreadsheet during the PE Subcommittee meeting in the space below with brief justification for the modification (e.g. Equipment item EF023 *table, exam* was changed to EF031 *table, power* as the power table is typical in the surgeon's office).

The PE SOR serves as key support for the spreadsheet and should include any important details/explanation for the inputs as these cannot be elaborated upon in the excel document itself.

Please submit the revised form electronically to Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org.

AMA/Specialty Society RVS Update Committee Summary of Recommendations

September 2024

Laparoscopic Prostatectomy – Tab 06

In April 2023, the Relativity Assessment Workgroup identified CPT codes 38571 and 55866 as typically reported together 75% or more based on 2021 Medicare claims data. In September 2023, the RUC recommended that 38571 and 55866 be referred to the CPT Editorial Panel to possibly develop a code bundling solution. In May 2024, the CPT Editorial Panel created two new codes to report laparoscopic prostatectomy with lymph node biopsy(ies) (limited pelvic lymphadenectomy) and with bilateral pelvic lymphadenectomy, including external iliac, hypogastric, and obturator nodes, respectively. The societies surveyed codes 55840-55845, 55846-55847 and 55868-55869 for the September 2024 RUC meeting.

Prostatectomy for prostate cancer requires complete removal of the prostate and seminal vesicles. Careful dissection and preservation of the neurovascular bundles coursing along the contour of the prostate in an attempt to limit post-operative side effects, including urinary incontinence and erectile dysfunction and careful posterior dissection, to prevent rectal injury in a narrow anatomic space. Following excision of the prostate, the bladder and urethra are reconstructed to allow appropriate passage of urine through the urethra without urinary extravasation into the abdomen. Lymphadenectomy requires removal of all lymph tissue distal to the bifurcation of the common iliac and extending into the obturator fossa surrounding the obturator nerve and extending to the pubic bone.

Code Family

The specialty societies indicated that CPT codes 38570, 38571, 38572, and 38573 are predominately performed by gynecological oncology and obstetrics/gynecology, with the exception of CPT code 38571. While CPT code 38571 is currently reported by urologists 85% of the time, 82% of these claims are reported together with 55866. CPT code 38571 will switch to a code rarely reported by urologists due to the creation of bundled codes 55868 and 55869. The RUC discussed whether CPT codes 38570-38573 should be affirmed or whether they should be considered separately from codes 55840-55847, 55868 and 55869. **The RUC agreed that 38570-38573 should not be reviewed with this family of services and instead should be flagged for review by the RAW in April 2028, when 2026 utilization data are available.**

Pre-operative and Post-operative care

Each service in this code family (55840-55847; 55868-55869) typically requires 15 minutes of pre-service positioning time. This time is warranted to prepare and drape abdomen and genitalia, pad the patient's wrists, elbows, shoulders, and legs, the place, test sequential compression devices, tuck the patient's arms under sheets place the patient in a slightly hyperextended supine position and pad all pressure points.

Further, each procedure described in this code family except for 55867 typically requires two 99214 post-operative office visits. During both post-operative office visits, moderate medical decision making takes place. At each visit, the evaluation of undiagnosed new problems with uncertain prognoses and the management of chronic illness with progression or side effects of treatment are addressed. During the first visit, pathology results and next steps for prostate cancer management are discussed. Furthermore, interventions of moderate risk of morbidity take place during both post-operative visits, including prescription and drug management. The risks, benefits, and potential side effects of medications are discussed

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

for penile rehabilitation for post-operative erectile dysfunction and potential medication management for urinary incontinence. The option of pelvic floor physical therapy for urinary incontinence is also discussed. During the second post-op office visit, results of a prostate-specific antigen (PSA) test are typically evaluated to determine the successful nature of the cancer operation.

55840 ***Prostatectomy, retropubic radical, with or without nerve sparing;***
The RUC reviewed the survey results from 33 urologists and determined that the current work RVU of 21.36, which falls below the survey 25th percentile, appropriately accounts for the physician work to perform this service. The RUC recommends 30 minutes pre-service evaluation time, 15 minutes pre-service positioning time, 10 minutes pre-service scrub/dress/wait time, 180 minutes intra-service time, 25 minutes immediate post-service time, 1 x 99232 post-operative hospital visit, 1x 99238 discharge visit and 2x 99214 post-operative office visits. The RUC noted that although the number of post-operative visits slightly decreased, the level of respective post-operative visits increased. Even though the total time decreased, the average intensity of that post-operative care increased; therefore, maintaining the current value would be appropriate.

To support the recommended work RVU, the RUC compared the surveyed code to CPT code 43279 *Laparoscopy, surgical, esophagomyotomy (Heller type), with fundoplasty, when performed* (work RVU= 22.10, intra-service time of 150 and total time of 404) and noted that the surveyed code includes more intra-service time and total time. The RUC also compared the surveyed code to CPT code 42420 *Excision of parotid tumor or parotid gland; total, with dissection and preservation of facial nerve* (work RVU= 19.53, intra-service time of 180 minutes and total time of 383 minutes) and noted that although both services typically involve the same amount of intra-service time, the surveyed code typically involves 35 more minutes of total time. The RUC recommended times and values for the surveyed code would assign it a work intensity that is identical to code 42420. **The RUC recommends a work RVU of 21.36 for CPT code 55840.**

55842 ***Prostatectomy, retropubic radical, with or without nerve sparing; with lymph node biopsy(s) (limited pelvic lymphadenectomy)***The RUC reviewed the survey results from 33 urologists and determined that the current work RVU of 21.36, which falls below the survey 25th percentile, appropriately accounts for the physician work required to perform this service. The RUC recommends 30 minutes pre-service evaluation time, 15 minutes pre-service positioning time, 10 minutes pre-service scrub/dress/wait time, 200 minutes intra-service time, 25 minutes immediate post-service time, 1 x 99232 post-operative hospital visit, 1 x 99238 discharge visit and 2 x 99214 post-operative office visits.

Although this service also includes a limited lymphadenectomy (unlike 55840), the specialties noted that CMS has maintained the same value for this code relative to 55840 for over a decade and noted that the additional work required for performing a limited lymphadenectomy is relatively negligible for this low volume code. Therefore, the specialty proposed, and the RUC agreed, that it would be appropriate to maintain the current value for this service.

To support the recommended work RVU, the RUC compared the surveyed code to CPT code 43279 *Laparoscopy, surgical, esophagomyotomy (Heller type), with fundoplasty, when performed* (work RVU= 22.10, intra-service time of 150 and total time of 404) and noted that the surveyed code includes more intra-service time and total time. **The RUC recommends a work RVU of 21.36 for CPT code 55842.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

55845 ***Prostatectomy, retropubic radical, with or without nerve sparing; with bilateral pelvic lymphadenectomy, including external iliac, hypogastric, and obturator nodes***
The RUC reviewed the survey results from 34 urologists and determined that the current work RVU of 25.18, which falls below the survey 25th percentile, appropriately accounts for the physician work required to perform this service. The RUC recommends 34 minutes pre-service evaluation time, 15 minutes pre-service positioning time, 10 minutes pre-service scrub/dress/wait time, 210 minutes intra-service time, 25 minutes immediate post-service time, 1 x 99232 post-operative hospital visit, 1 x 99238 discharge visit and 2 x 99214 post-operative office visits.

The specialty noted that the utilization of 55845 has decreased significantly over the past ten years from 2,296 claims in 2012 to 497 claims in 2022. This change in utilization has been driven by the wide adoption of robotic surgical instruments for pelvic surgery over the past decade. This decrease in utilization has led to increased complexity and intensity when performing the open procedure, due to the decreasing frequency with which the open procedure is performed. This change in utilization helps explain the increase in intra-service time identified in the survey.

To support the recommended work RVU, the RUC compared the surveyed code to CPT code 43281 *Laparoscopy, surgical, repair of paraesophageal hernia, includes fundoplasty, when performed; without implantation of mesh* (work RVU= 26.60, intra-service time of 180 minutes, total time of 424) and noted that the surveyed code involves more intra-service time and total time and that both major surgical procedures are typically performed in the inpatient setting. The RUC acknowledged the limited number of potential reference codes that are major surgical procedures with similar service period times and physician work, limiting the pool of potential reference codes. **The RUC recommends a work RVU of 25.18 for CPT code 55845.**

55866 ***Laparoscopy, surgical prostatectomy, retropubic radical, including nerve sparing, includes robotic assistance, when performed;***
The RUC reviewed the survey results from 72 urologists and determined that the current work RVU of 22.46, which falls below the survey 25th percentile, appropriately accounts for the physician work required to perform this service. The RUC recommends 35 minutes pre-service evaluation time, 15 minutes pre-service positioning time, 10 minutes pre-service scrub/dress/wait time, 200 minutes intra-service time, 45 minutes immediate post-service time, 0.5 x 99238 discharge visit and 2 x 99214 post-operative office visits. Survey respondents indicated, and the RUC concurred, that an overnight stay and same-day post-operative hospital visit are typical. The RUC noted that, due to the code structure change, a majority of the former volume for 55866 will instead be reported with new bundled codes 55868 and 55869 going forward.

To support the recommended work RVU, the RUC compared the surveyed code to CPT code 43335 *Repair, paraesophageal hiatal hernia (including fundoplication), via thoracotomy, except neonatal; with implantation of mesh or other prosthesis* (work RVU= 23.97, intra-service time of 200 minutes, total time of 569 minutes) and noted that both services involve the same amount of intra-service time, whereas the reference code involves more total time. The RUC also compared the surveyed code to CPT code 42420 *Excision of parotid tumor or parotid gland; total, with dissection and preservation of facial nerve* (work RVU= 19.53, intra-service time of 180 minutes and total time of 383 minutes) and noted that the surveyed code is appropriately valued higher as it typically involves more intra-service and total time. **The RUC recommends a work RVU of 22.46 for CPT code 55846.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

55868 ***Laparoscopy, surgical prostatectomy, retropubic radical, including nerve sparing, includes robotic assistance, when performed; with lymph node biopsy(ies) (limited pelvic lymphadenectomy)***
The RUC reviewed the survey results from 69 urologists and determined that the current work RVU of 22.46 from 55866 (the primary code bundled into 55868), which falls below the survey 25th percentile, appropriately accounts for the physician work required to perform this service. The specialty noted and the RUC concurred that the increase in work to biopsy the pelvic nodes without complete dissection, is a minimal increase in work and intensity relative to 55866. The specialty noted and the RUC concurred that 55868 is significantly less intense than the full lymph node dissection code 55869, which requires complete circumferential mobilization of the external iliac vessels and complete identification and mobilization of the obturator nerve. Therefore, the specialty proposed and the RUC agreed that it would be appropriate to use the current value for 55866, which is being bundled into 55868, as the new value for the new code as well.

The RUC recommends 35 minutes pre-service evaluation time, 15 minutes pre-service positioning time, 10 minutes pre-service scrub/dress/wait time, 210 minutes intra-service time, 45 minutes immediate post-service time, 0.5 x 99238 discharge visit and 2 x 99214 post-operative office visits. Survey respondents indicated, and the RUC concurred, that an overnight stay and same-day post-operative hospital visit are typical.

To support the recommended work RVU, the RUC compared the surveyed code to CPT code 43335 *Repair, paraesophageal hiatal hernia (including fundoplication), via thoracotomy, except neonatal; with implantation of mesh or other prosthesis* (work RVU= 23.97, intra-service time of 200 minutes, total time of 569 minutes) and noted that although the surveyed code typically involves 10 more minutes of intra-service time, the reference code involves more total time and is appropriately valued more. The RUC also compared the surveyed code to CPT code 42420 *Excision of parotid tumor or parotid gland; total, with dissection and preservation of facial nerve* (work RVU= 19.53, intra-service time of 180 minutes and total time of 383 minutes) and noted that the surveyed code is appropriately valued higher as it typically involves more intra-service and total time. **The RUC recommends a work RVU of 22.46 for CPT code 55868.**

55869 ***Laparoscopy, surgical prostatectomy, retropubic radical, including nerve sparing, includes robotic assistance, when performed; with bilateral pelvic lymphadenectomy, including external iliac, hypogastric, and obturator nodes***
The RUC reviewed the survey results from 71 urologists and determined a direct work RVU crosswalk to CPT code 27059 *Radical resection of tumor (eg, sarcoma), soft tissue of pelvis and hip area; 5 cm or greater* (work RVU= 29.35, intra-service time of 220 minutes) appropriately accounts for the work required to perform this service. Both services typically involve a similar amount of intra-service time and the same overall amount of physician work. The RUC recommends 35 minutes pre-service evaluation time, 15 minutes pre-service positioning time, 10 minutes pre-service scrub/dress/wait time, 230 minutes intra-service time, 50 minutes immediate post-service time, 0.5x 99238 discharge visit and 2x 99214 post-operative office visits. Survey respondents indicated, and the RUC concurred, that an overnight stay and same-day post-operative hospital visit are typical.

The specialty noted and the RUC concurred that CPT code 55869 is significantly more intense than the partial lymph node dissection code 55868, as a complete extended bilateral pelvic lymph node dissection adds significant technical complexity and intensity to robotic prostatectomy as nodes must be carefully removed from the external iliac vessels, the area surrounding the obturator nerve, and proximally to the bifurcation of the common iliac. This dissection requires significant care and explains the increase in intra-service time for this procedure compared to 55868.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The RUC noted that the current value for 55869 would be the full value of 55866 and half the value of 38572 due to a surgical multiple procedure payment reduction (a total of 28.46). The RUC noted that the intra-service time of this bundled code is higher, and the average intensity of the post-operative care has increased.

To support the recommended work RVU, the RUC compared the surveyed code to top key reference code 58575 *Laparoscopy, surgical, total hysterectomy for resection of malignancy (tumor debulking), with omentectomy including salpingo-oophorectomy, unilateral or bilateral, when performed* (work RVU= 32.60, intra-service time of 240 minutes, total time of 510 minutes) and noted that the reference code is appropriately valued somewhat higher due to it involving somewhat more intra-service time and more total time. The RUC also compared the surveyed code to CPT code 43282 *Laparoscopy, surgical, repair of paraesophageal hernia, includes fundoplasty, when performed; with implantation of mesh* (work RVU= 30.10, intra-service time of 210 minutes, total time of 454 minutes) and noted that although the surveyed code typically involves more intra-service time, the reference code involves somewhat more total time. **The RUC recommends a work RVU of 29.35 for CPT code 55869.**

55867 ***Laparoscopy, surgical prostatectomy, simple subtotal (including control of postoperative bleeding, vasectomy, meatotomy, urethral calibration and/or dilation, and internal urethrotomy), includes robotic assistance, when performed***
The RUC reviewed the survey results from 61 urologists and determined that the current work RVU of 19.53, which falls below the survey 25th percentile, appropriately accounts for the physician work required to perform this service. The RUC recommends 35 minutes pre-service evaluation time, 15 minutes pre-service positioning time, 10 minutes pre-service scrub/dress/wait time, 180 minutes intra-service time, 50 minutes immediate post-service time, 0.5 x 99238 discharge visit, 1 x 99214 and 1 x 99213 post-operative office visit. Survey respondents indicated, and the RUC concurred, that an overnight stay and same-day post-operative hospital visit are typical.

To support the recommended work RVU, the RUC compared the surveyed code to CPT code 43279 *Laparoscopy, surgical, esophagomyotomy (Heller type), with fundoplasty, when performed* (work RVU= 22.10, intra-service time of 150 and total time of 404) and noted that the surveyed code includes more intra-service time and total time, though is somewhat less intense to perform. The RUC also compared the surveyed code to CPT code 42420 *Excision of parotid tumor or parotid gland; total, with dissection and preservation of facial nerve* (work RVU= 19.53, intra-service time of 180 minutes and total time of 383 minutes) and noted that although both services typically involve the same amount of intra-service time and a similar amount of total time. The RUC recommended times and values for the surveyed code would assign it a work intensity that is identical to code 42420. **The RUC recommends a work RVU of 19.53 for CPT code 55867.**

RAW Flag
The RUC recommends that CPT codes 38570, 38571, 38572 and 38573 be reviewed by the Relativity Assessment Workgroup in April 2028 when 2026 Medicare utilization data is available to review new claims data. This will follow the implementation of bundled codes 55868 and 55869 and determine which specialties are reporting 38570-38573, the patient population, and typical diagnoses for each code.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Practice Expense
The Practice Expense (PE) Subcommittee reviewed the direct practice expense inputs and made no modifications to the standard 090-day global inputs. **The RUC recommends the direct practice expense inputs as submitted by the specialty societies.**

Work Neutrality
The RUC's recommendation for these codes will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

CPT Code	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
Surgery **Hemic and Lymphatic Systems** **Lymph Nodes and Lymphatic Channels** **Laparoscopy** *Surgical laparoscopy always includes diagnostic laparoscopy. To report a diagnostic laparoscopy (peritoneoscopy) (separate procedure), use 49320.*

Chair, AMA / Specialty Society Relative Value Update Committee
AMA Department of Physician Payment Policy and Systems
330 North Wabash, Office 45-372
Chicago, IL 60611

Attention: Sherry Smith and Michael Morrow

Dear Ms. Smith and Mr. Morrow,

Thank you for meeting with our American Urological Association (AUA) RUC advisors and staff to discuss surveys the AUA will be conducting in preparation for the September 2024 RUC meeting. Tab 6 Laparoscopic Prostatectomy includes CPT codes 38570, 38571, 38572, and 38573. While 38571 is currently reported by urologists over 80% of the time, 81.6% of these claims are billed together with 55866. This issue is being resolved with the creation of new bundled codes 558X1 and 558X2. The AUA expects urology utilization of 38571 to decrease substantially with the creation of new codes. Historically, 38571 was used by urologists for prostate cancer staging but this procedure is no longer typically performed for staging as it has been replaced by modern imaging techniques to evaluate the pelvic lymph nodes.

Code 38570 is currently billed by gynecology 83% of the time, 38572 is billed by gynecology 70.5% of the time, and 38573 is billed by gynecology 95.2% of the time. While we appreciate that it is general practice to survey all codes in a family, attempting to survey these lymph node dissection codes in a tab for laparoscopic prostatectomy will lead to significant confusion as the specialty utilization of 38571 will be changing with the addition of 558X1 and 558X2 and gynecologists do not perform prostatectomy services.

As recommended, we are writing to request that CPT codes 38570, 38571, 38572, and 38573 be removed from the survey for Tab 6 Laparoscopic Prostatectomy. The AUA and ACOG recommend three actions for this set of codes; 1) affirm the values, 2) remove the codes from the survey for laparoscopic prostatectomy, and 3) refer the codes to the RAW in three years to review the utilization. With the bundling of the procedures captured in the revision of the laparoscopic prostatectomy, it is expected that the volume for the other services in the code family will decrease.

Thank you for your consideration of this request. We look forward to collaborating with you on these important issues.

Jonathan Kiechle, MD

RUC Advisor and Presenter for the American Urological Association

MD/PhD

RUC Advisor for the American College of Obstetricians and Gynecologists

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:55840 Tracking Number H5 Original Specialty Recommended RVU: **23.00**
Presented Recommended RVU: **21.36**
Global Period: 090 Current Work RVU: **21.36** RUC Recommended RVU: **21.36**

CPT Descriptor: Prostatectomy, retropubic radical, with or without nerve sparing;

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 65-year-old male with elevated prostate-specific antigen (PSA) levels undergoes biopsy, which shows a Gleason score of 3 + 3, low-risk prostate cancer. After counseling about treatment options, the patient undergoes open radical retropubic prostatectomy.

Percentage of Survey Respondents who found Vignette to be Typical: 52%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 97% , In the ASC 3%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 0% , Overnight stay-less than 24 hours 44% , Overnight stay-more than 24 hours 56%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 90%

Description of Pre-Service Work: On the day before the surgery, review patient's medical record, preoperative lab results, transrectal ultrasound images, and pathology reports. Write preoperative orders and send electronically to the hospital. Dictate a preoperative H&P. On the day of surgery, review the surgical procedure and postoperative recovery in and out of the hospital with the patient and/or family. Answer questions from the patient and/or family and obtain informed consent. Discuss the expected duration of the procedure and any special concerns about this particular patient (eg, teeth, positioning, unusual medical problems) with the anesthesiologist. Verify the availability of all necessary instruments. Speak to anesthesiologist about expected length of procedure and any special concerns about this particular patient (eg, teeth, positioning, unusual medical problems). Verify all necessary instruments are available. Prepare and drape abdomen and genitalia in standard fashion. General anesthesia is induced. Pad patient's wrists, elbows, shoulders, and legs and place and test sequential compression devices. Tuck patient's arms under sheets. Place patient in slightly hyperextended supine position and pad all pressure points and adjust as needed. The surgeon scrubs and gowns.

Description of Intra-Service Work: Place a Foley catheter into the bladder and inflate the ballon. Make a lower midline incision. Develop the retropubic space and place a retractor. Incise the endopelvic fascia bilaterally. Develop the puboprostatic ligaments and divide close to the pubis. Pinch the tissue anterior to the urethra and posterior to the pubis between the thumb and forefinger of the left hand to develop the dorsal vein complex distal to the prostatic apex. Pass a right-angled clamp anterior to the urethra and ligate the previously developed dorsal vein complex. Perform suture ligation on the bundle at the prostatic apex with polyglactin 910, taking care to avoid the neurovascular posterior and lateral to the prostate. Perform suture ligation on the dorsal vein complex with polyglactin 910 on a 5/8th circle taper needle in a figure of eight. Divide the dorsal vein complex. Perform a suture ligation on it again until hemostasis is obtained. Develop the plane between the neurovascular bundles and the apex of the prostate and urethra. Pass a McDougal clamp over the neurovascular bundle under the urethra and over the neurovascular bundle, grasp an umbilical tape, and withdraw the clamp with the tape to elevate the urethra. Avoid the rectum. Dissect the urethra for up to a centimeter into the prostate. Divide the urethra just enough to expose the Foley catheter, which is about half way across the urethra. Lubricate the Foley catheter at the urethral meatus and pass a right-angled clamp under the Foley catheter at the level of the incised urethra and draw the Foley catheter into the field. Clamp the Foley catheter with a Kocher clamp and cut the Foley catheter so the clamp is on the bladder end of the catheter, keeping the Foley balloon inflated within the bladder, taking care not to stretch

the neurovascular bundles. Divide the rest of the urethra. Release the rest of the neurovascular bundles from the posterior lateral aspect of the prostate. Rotate the prostate supero-anteriorly and divide the recto-urethralis muscles. With a combination of blunt and sharp dissection, release the prostate from the anterior layer of the rectum until the seminal vesicles and ampullae of the vasa are encountered. Dissect laterally to free the prostatic fascia and neurovascular bundles up to the lateral pedicles. Ligate and divide the vessels on the lateral surface of the seminal vesicles near the base of the prostate. Rotate the prostate inferiorly and identify the bladder neck by palpating the Foley balloon within the bladder. Dissect the bladder neck into the prostate circumferentially. Divide the anterior bladder neck, release the water from the Foley balloon, pull the catheter and clamp both ends to use it for anterior traction on the prostate. Dissect the posterior bladder neck off the prostate if this has not already been done. Find and dissect the ampulla of the vas on one side and dissect it proximally till the tip of the seminal vesicle has been reached. Clip and divide the vas deferens. Starting at the junction of the seminal vesicle and the prostate dissect the former off of the latter. Clip the end of the seminal vesicle and divide it, assure that the seminal vesicular artery is secure. Repeat the process for the other side. Remove the specimen and assure hemostasis. Close any rectal laceration if necessary, with polyglactin 910, in a two layered interrupted fashion. Tailor the bladder neck with interrupted or running polyglactin 910, if necessary, in a tennis racquet or fish-mouth fashion, assuring that the ureteral orifices are not incorporated in the closure. Insert a Greenwald sound into the urethra until it is visualized at the cut urethral edge within the pelvis. Place six double-armed 3-0 purple monocryl sutures, from inside to the outside of the urethra, taking care to encompass the urethral mucosa. A straight mosquito clamp can be used to label the passed needle. Create the anastomosis by passing the three posteriorly placed needles through the posterior bladder neck. Remove the Greenwald sound. Pass a 20 French Foley catheter with a 30-ml balloon into the bladder and leave the balloon deflated for now. Pass the three anteriorly placed 3-0 monocryl sutures through the anterior bladder neck incorporating the bladder mucosa, for a mucosal to mucosal anastomosis. Inflate the Foley balloon to 30 ml. Place a long Allis clamp just proximal to the bladder neck. Tie the sutures starting posteriorly, push the bladder with the Allis clamp, and pull the bladder with traction on the Foley catheter while tying the knots. Exit a drain through a separate stab wound incision. Close the incision with a looped polydioxanone suture for the fascia. Close the skin with a subcutaneous running 4-0 absorbable suture. Place sterile dressings over the incision and around the drain. Secure the catheter to the thigh with a catheter strap.

Description of Post-Service Work: Apply dressings. Transfer the patient from the operating table to the postoperative stretcher. Accompany patient to the recovery area and transfer to the recovery area bed. Write postoperative orders and review recovery area care and medications with recovery staff. Discuss results of the procedure, expected outcome, and planned postoperative care in and out of the hospital with patient's family. After patient is awake, discuss the outcome of the surgery with the patient. Notify the referring physician of the outcome of the procedure and of any unusual aspects of postoperative care (eg, cardiac disease, diabetes management). Dictate a detailed operative report for the patient's medical record. After discharge from recovery, examine the patient and check the wound and patient's progress. Review hospital notes (ie, nursing, pharmacy, dietary, discharge planner). Answer questions from patient, patient's family, and nursing and other staff. Write orders as necessary. Write a progress note for patient's medical record. During the patient's stay in the hospital, examine the patient and check laboratory results and vital signs. Check urine output and output from the drain and remove the drain if appropriate. Check wounds and dressings and discuss patient's progress with the patient and/or family. Review patient's hospital medical records. Discuss postoperative care of the wound at home. Answer questions from patient, patient's family, and nursing and other staff. Write orders as necessary. Write progress notes for the patient's medical record. On day of discharge, examine the patient. Check the wounds and patient's progress. Review all patient hospital medical records and answer questions from patient and/or family. Write orders for postdischarge care and prescriptions for postoperative medications. Discuss postoperative care of the wound with patient and/or family. Dictate a detailed hospital discharge summary.

During the initial post-operative office visit, examine the patient. Check vital signs and inspect all surgical incisions. Prior to removal of the Foley catheter, fill the bladder with 250 ml of sterile saline with a Toomey syringe. then remove the urinary catheter. Review in detail the final pathology report, implications, follow-up plan, and the possible need for additional prostate cancer therapy. Review usage of pain medications, including discontinuance of narcotic analgesic medications and focusing discussion on utilization of non-narcotic analgesic medications as additional options for any persistent discomfort. Discuss expectations for the return of bladder control following the removal of the catheter and proper performance of Kegel exercises. Discuss penile rehabilitation therapy, including timing, options of oral therapies, injections, and vacuum pump, and write prescriptions for chosen medications, inclusive of phosphodiesterase 5 (PDE5) inhibitors. Answer questions from the patient and/or family. Schedule the next office visit. Mark the appropriate diagnosis and CPT code on the encounter form (superbill). Dictate patient progress notes for the office medical record and a letter to the referring physician.

At the second post-operative office visit, review bladder control and continence. Review bladder control exercises and additional therapies, inclusive of writing a referral for pelvic floor physical therapy. Review erectile function and determine

if additional alterations should be made to the previously prescribed therapies; consider changing PDE5 inhibitor prescription medication and/or dosage. Discuss utility of obtaining PSA blood tests in monitoring the prostate cancer disease state, inclusive of writing a referral for a PSA blood test be obtained just prior to the next scheduled visit. Schedule the next office visit. Mark the appropriate diagnosis and CPT code on the encounter form (superbill). Dictate patient progress notes for the office medical record and a letter to the referring physician.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	14%	14%	72%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	14%	86%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	14%	0%	86%
Physical effort required	0%	14%	86%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	14%	86%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	17%	67%	16%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	33%	67%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	50%	50%
Physical effort required	0%	33%	67%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	17%	83%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background:
55840 was recommended for survey as part of the family of prostatectomy codes. Survey of this family of codes was required due to 55866 (laparoscopic radical prostatectomy) and 35871 (pelvic lymph node dissection) being billed together greater than 75% of the time.

Prostate cancer at the time of intervention has undergone a migration towards a more aggressive, advanced disease-state. This is multi-factorial, inclusive of decreased PSA-screening and higher utilization of active surveillance for low-risk disease (i.e., Gleason 3+3=6 prostate cancer). National treatment guidelines no longer support radical prostatectomy or radiation therapy for patients with low-risk prostate cancer as first line therapy due to multiple studies demonstrating the safety of active surveillance protocols. The urologic community has accepted this change in treatment algorithm as demonstrated by a 2023 article in JAMA demonstrating an increase in active surveillance utilization from 26.5% in 2014 to 59.6% in 2021 (Cooperberg, et al). While urologists are appropriately moving away from surgical intervention for low-risk disease, in parallel, the decrease in PSA-screening has also yielded more patients presenting for prostatectomy with

advanced disease states. Data published in 2019 and 2020 found a decline in the incidence of localized prostate cancer and an increase in the incidence of de novo metastatic disease (Butler, et al and Sheng, et al). In 2021, a study examined 528 patients who underwent radical prostatectomy for prostate cancer, noting a significant decrease in the proportion of low-risk disease and a trend toward a higher proportion of intermediate-risk disease (Hoeh, et al). Another 2021 study looked at 447 patients undergoing radical prostatectomy, finding a shift in these patients from years prior, inclusive of unfavorable disease characteristics such as higher PSA and tumor grade at the time of surgical intervention (Garg, et al). Similarly, a 2021 JAMA article examined 5700 radical prostatectomy patients treated at the VA from 2000 to 2017, demonstrating that the proportion of low-risk tumors decreased by 44%, while intermediate risk tumors increased by 29%, and high-risk tumors increased by 15% (Vaculik, et al). Surgery for intermediate and high-risk prostate cancer is significantly more intense and technically challenging secondary to the increased tumor burden, with goals of obtaining negative margins, while also maintaining potency and continence.

Vaculik K, Luu M, Howard LE, Aronson W, Terris M, Kane C, Amling C, Cooperberg M, Freedland SJ, Daskivich TJ. Time Trends in Use of Radical Prostatectomy by Tumor Risk and Life Expectancy in a National Veterans Affairs Cohort. JAMA Netw Open. 2021 Jun 1;4(6):e2112214. doi: 10.1001/jamanetworkopen.2021.12214. PMID: 34081138; PMCID: PMC8176332.

Recommendation:
We recommend maintaining the current RVW of 21.36. We had a strong survey with 33 respondents. Median survey experience was 0, with a maximum procedure number of 50. This survey experience data makes sense given the decreasing utilization of this code over the past twelve years. With increasing utilization of robotic prostatectomy, the open procedure has become less commonly performed and is now typically only performed for patients who are not candidates for robotic surgery. The most common KRS selected was 58548. 72% of survey respondents selecting this KRS felt 55840 was much more intense and complex than the KRS.

Utilization of 55840 has decreased by about 50% over the past ten years from 2,095 claims in 2012 to 1,119 claims in 2022. This change in utilization has been driven by the wide adoption of robotic surgical instruments for pelvic surgery over the past decade. This decrease in utilization has led to increased complexity and intensity when performing the open procedure, due to the decreasing frequency with which the open procedure is performed.

Median intraservice time from the survey was 180 minutes, a total time of 418 minutes, with one 99232, and one discharge day 99238. The 90 day global period includes two level four office visits. A RUC database search of RUC reveiwed 090 day global codes since 2014 reveals 16 codes with an intraservice time between 170 and 190 minutes. The RVW range for these codes is 16.03-45.00. The highest utilization code within this set is 22633 with a RVW of 26.80, intraservice time of 180 minutes and total time of 509 minutes. 55840 continues to fit well within the fee schedule with a maintained value of 21.36.

Pre-time package 3 and Post-time package 9B are selected. Times are adjusted to not exceed median survey values. Positioning time is increased due to dorsal lithotomy positioning.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 55840

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Urology How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 1000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate.

Specialty Urology Frequency Percentage 100.00 %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 645
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate.

Specialty urology Frequency Percentage 100 %

Specialty	Frequency	Percentage	%
Specialty	Frequency 0	Percentage	%

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 55840

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:55842 Tracking Number H6 Original Specialty Recommended RVU: **27.41**
Presented Recommended RVU: **21.36**
Global Period: 090 Current Work RVU: **21.36** RUC Recommended RVU: **21.36**

CPT Descriptor: Prostatectomy, retropubic radical, with or without nerve sparing; with lymph node biopsy(s) (limited pelvic lymphadenectomy)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: : A 65-year-old male with elevated prostate-specific antigen (PSA) levels undergoes biopsy that shows Gleason score of 3 + 4, intermediate-risk prostate cancer. After counseling about treatment options, he undergoes open radical retropubic prostatectomy with limited pelvic lymph node dissection

Percentage of Survey Respondents who found Vignette to be Typical: 94%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 100% , In the ASC 0%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 0% , Overnight stay-less than 24 hours 39% , Overnight stay-more than 24 hours 61%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 91%

Description of Pre-Service Work: On the day before the surgery, review patient's medical record, preoperative lab results, transrectal ultrasound images, and pathology reports. Write preoperative orders and send electronically to the hospital. Dictate a preoperative H&P. On the day of surgery, review the surgical procedure and postoperative recovery in and out of the hospital with the patient and/or family. Answer questions from the patient and/or family and obtain informed consent. Discuss the expected duration of the procedure and any special concerns about this particular patient (eg, teeth, positioning, unusual medical problems) with the anesthesiologist. Verify the availability of all necessary instruments. Speak to anesthesiologist about expected length of procedure and any special concerns about this particular patient (eg, teeth, positioning, unusual medical problems). Verify all necessary instruments are available. General anesthesia is induced. Prepare and drape abdomen and genitalia in standard fashion. Pad patient's wrists, elbows, shoulders, and legs and place and test sequential compression devices. Tuck patient's arms under sheets. Place patient in slightly hyperextended supine position and pad all pressure points and adjust as needed. The surgeon scrubs and gowns.

Description of Intra-Service Work: Place a Foley catheter into the bladder and inflate the ballon. Make a lower midline incision. Develop the retropubic space and place a retractor. Develop a space between the bladder and develop the iliac vessels. Using a combination of blunt and sharp dissection, dissect the peritoneum from the internal inguinal ring, the iliopsoas region, and the anterior abdominal wall and sweep superiorly. Isolate the spermatic cord to the point where the vas courses medially. The vas may or may not be ligated and divided. Place retractors to hold the bladder medially and the peritoneum superiorly. Divide the fibrofatty tissue surrounding the iliac vein anteriorly from the bifurcaton to the node of Cloquet residing near the inguineal canal. Separate the tissue between the iliac artery and vein exposing the iliac artery along its medial and anterior surfaces. Pass this tissue behind the iliac vein. Using a combination of blunt and sharp dissection, dissect the nodal packet to the obturator nerve. Ligate the lymphatics coming from the leg and divide the distal edge of the nodal packet. Rotate the packet superiorly and then divide at the bifurcation of the iliac artery. Reposition the retractor blades from this side and place on the other side for a bilateral limited pelvic node dissection. Attention is then turned to the radical retropubic prostatectomy. Place the retractor to facilitate the removal of the prostate. Incise the endopelvic fascia bilaterally. Develop the puboprostatic ligaments and divide close to the pubis. Pinch the tissue anterior to the urethra and posterior to the pubis between the thumb and forefinger of the left hand to develop the dorsal vein complex

distal to the prostatic apex. Pass a right-angled clamp anterior to the urethra and ligate the previously developed dorsal vein complex. Perform a suture ligation on the bundle at the prostatic apex with polyglactin 910, taking care to avoid the neurovascular posterior and lateral to the prostate. Perform a suture ligation on the dorsal vein complex with polyglactin 910 on a 5/8th circle taper needle in a figure of eight. Divide the dorsal vein complex. Perform a suture ligation on it again until hemostasis is obtained. Develop the plane between the neurovascular bundles and the apex of the prostate and urethra. Pass a McDougal clamp over the neurovascular bundle under the urethra and over the neurovascular bundle, grasp an umbilical tape and withdraw the clamp with the tape to elevate the urethra. Avoid the rectum. Dissect the urethra for up to a centimeter into the prostate. Divide the urethra just enough to expose the Foley catheter, which is about half way across the urethra. Lubricate the Foley catheter at the urethral meatus and pass a right-angled clamp under the Foley catheter at the level of the incised urethra and draw the Foley catheter into the field. Clamp the Foley catheter with a Kocher clamp and cut it so the clamp is on the bladder end of the catheter, keeping the Foley balloon inflated within the bladder, taking care not to stretch the neurovascular bundles. Divide the rest of the urethra. Release the rest of the neurovascular bundles from the posterior lateral aspect of the prostate. Rotate the prostate supero-anteriorly and divide the recto-urethralis muscles. With a combination of blunt and sharp dissection, release the prostate from the anterior layer of the rectum until the seminal vesicles and ampullae of the vasa are encountered. Dissect laterally to free the prostatic fascia and neurovascular bundles up to the lateral pedicles. Ligate and divide the vessels on the lateral surface of the seminal vesicles near the base of the prostate. Rotate the prostate inferiorly and identify the bladder neck by palpating the Foley balloon within the bladder. Dissect the bladder neck into the prostate circumferentially. Divide the anterior bladder neck, release the water from the Foley balloon, pull the catheter, and clamp both ends to use it for anterior traction on the prostate. Dissect the posterior bladder neck off the prostate if this has not already been done. Find and dissect the ampulla of the vas on one side and dissect it proximally until the tip of the seminal vesicle has been reached. Clip and divide the vas deferens. Starting at the junction of the seminal vesicle and the prostate, dissect the former off of the latter. Clip the end of the seminal vesicle and divide it, assure that the seminal vesicular artery is secure. Repeat the process for the other side. Remove the specimen. Assure hemostasis. Close any rectal laceration if necessary, with 2-0 Vicryl, in a two layered interrupted fashion. Tailor the bladder neck with interrupted or running polyglactin 910 suture, if necessary, in a tennis racquet or fish-mouth fashion, assuring that the ureteral orifices are not incorporated in the closure. Insert a Greenwald sound into the urethra until it is visualized at the cut urethral edge within the pelvis. Place six double-armed 3-0 purple monocryl sutures from inside to the outside of the urethra, taking care to encompass the urethral mucosa. A straight mosquito clamp can be used to label the passed needle. Create the anastomosis by passing the three posteriorly placed needles through the posterior bladder neck. Remove the Greenwald sound. Pass a 20 French Foley catheter with a 30-ml balloon into the bladder and leave the balloon deflated for now. Pass the three anteriorly placed 3-0 monocryl sutures through the anterior bladder neck incorporating the bladder mucosa for a mucosal to mucosal anastomosis. Inflate the Foley balloon to 30 ml. Place a long Allis clamp just proximal to the bladder neck. Tie the sutures starting posteriorly, push the bladder with the Allis clamp, and pull the bladder with traction on the Foley catheter while tying the knots. Exit a drain through a separate stab wound incision. Close the incision with a looped polydioxanone for the fascia. Close the skin with a subcutaneous running 4-0 absorbable suture. Place sterile dressings over the incision and around the drain. Secure the catheter to the thigh with a catheter strap.

Description of Post-Service Work: Apply dressings. Transfer the patient from the operating table to the postoperative stretcher. Accompany patient to the recovery area and transfer to the recovery area bed. Write postoperative orders and review recovery area care and medications with recovery staff. Discuss results of the procedure, expected outcome, and planned postoperative care in and out of the hospital with patient's family. After patient is awake, discuss the outcome of the surgery with the patient. Notify the referring physician of the outcome of the procedure and of any unusual aspects of postoperative care (eg, cardiac disease, diabetes management). Dictate a detailed operative report for the patient's medical record. After discharge from recovery, examine the patient and check the wound and patient's progress. Review hospital notes (ie, nursing, pharmacy, dietary, discharge planner). Answer questions from patient, patient's family, and nursing and other staff. Write orders as necessary. Write a progress note for patient's medical record. During the patient's stay in the hospital, examine the patient and check laboratory results and vital signs. Check urine output and output from the drain and remove the drain if appropriate. Check wounds and dressings and discuss patient's progress with the patient and/or family. Review patient's hospital medical records. Discuss postoperative care of the wound at home. Answer questions from patient, patient's family, and nursing and other staff. Write orders as necessary. Write progress notes for the patient's medical record. On day of discharge, examine the patient. Check the wounds and patient's progress. Review all patient hospital medical records and answer questions from patient and/or family. Write orders for postdischarge care and prescriptions for postoperative medications. Discuss postoperative care of the wound with patient and/or family. Dictate a detailed hospital discharge summary.

During the initial post-operative office visit, examine the patient. Check vital signs and inspect all surgical incisions. Prior to removal of the Foley catheter, fill the bladder with 250 ml of sterile saline with a Toomey syringe. then remove the urinary catheter. Review in detail the final pathology report, implications, follow-up plan, and the possible need for

additional prostate cancer therapy. Review usage of pain medications, including discontinuance of narcotic analgesic medications and focusing discussion on utilization of non-narcotic analgesic medications as additional options for any persistent discomfort. Discuss expectations for the return of bladder control following the removal of the catheter and proper performance of Kegel exercises. Discuss penile rehabilitation therapy, including timing, options of oral therapies, injections, and vacuum pump, and write prescriptions for chosen medications, inclusive of phosphodiesterase 5 (PDE5) inhibitors. Answer questions from the patient and/or family. Schedule the next office visit. Mark the appropriate diagnosis and CPT code on the encounter form (superbill). Dictate patient progress notes for the office medical record and a letter to the referring physician.

At the second post-operative office visit, review bladder control and continence. Review bladder control exercises and additional therapies, inclusive of writing a referral for pelvic floor physical therapy. Review erectile function and determine if additional alterations should be made to the previously prescribed therapies; consider changing PDE5 inhibitor prescription medication and/or dosage. Discuss utility of obtaining PSA blood tests in monitoring the prostate cancer disease state, inclusive of writing a referral for a PSA blood test be obtained just prior to the next scheduled visit. Schedule the next office visit. Mark the appropriate diagnosis and CPT code on the encounter form (superbill). Dictate patient progress notes for the office medical record and a letter to the referring physician.

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	14%	57%	29%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	43%	57%
Physical effort required	0%	14%	86%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	14%	14%	72%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background:
55842 was recommended for survey as part of the family of prostatectomy codes. Survey of this family of codes was required due to 55866 (laparoscopic radical prostatectomy) and 35871 (pelvic lymph node dissection) being billed together greater than 75% of the time.

Prostate cancer at the time of intervention has undergone a migration towards a more aggressive, advanced disease-state. This is multi-factorial, inclusive of decreased PSA-screening and higher utilization of active surveillance for low-risk disease (i.e., Gleason 3+3=6 prostate cancer). National treatment guidelines no longer support radical prostatectomy or radiation therapy for patients with low-risk prostate cancer as first line therapy due to multiple studies demonstrating the safety of active surveillance protocols. The urologic community has accepted this change in treatment algorithm as demonstrated by a 2023 article in JAMA demonstrating an increase in active surveillance utilization from 26.5% in 2014 to

59.6% in 2021 (Cooperberg, et al). While urologists are appropriately moving away from surgical intervention for low-risk disease, in parallel, the decrease in PSA-screening has also yielded more patients presenting for prostatectomy with advanced disease states. Data published in 2019 and 2020 found a decline in the incidence of localized prostate cancer and an increase in the incidence of de novo metastatic disease (Butler, et al and Sheng, et al). In 2021, a study examined 528 patients who underwent radical prostatectomy for prostate cancer, noting a significant decrease in the proportion of low-risk disease and a trend toward a higher proportion of intermediate-risk disease (Hoeh, et al). Another 2021 study looked at 447 patients undergoing radical prostatectomy, finding a shift in these patients from years prior, inclusive of unfavorable disease characteristics such as higher PSA and tumor grade at the time of surgical intervention (Garg, et al). Similarly, a 2021 JAMA article examined 5700 radical prostatectomy patients treated at the VA from 2000 to 2017, demonstrating that the proportion of low-risk tumors decreased by 44%, while intermediate risk tumors increased by 29%, and high-risk tumors increased by 15% (Vaculik, et al). Surgery for intermediate and high-risk prostate cancer is significantly more intense and technically challenging secondary to the increased tumor burden, with goals of obtaining negative margins, while also maintaining potency and continence. Given this migration towards an increased-risk, aggressive prostate cancer disease state, the population undergoing prostatectomy has changed, meeting the threshold for compelling evidence.

PMID: 34081138; PMCID: PMC8176332.

Recommendation:

We recommend maintaining the current RVW of 21.36. We had a strong survey with 33 respondents. Median survey experience was 0, with a maximum procedure number of 50. This survey experience data makes sense given the decreasing utilization of this code over the past twelve years. With increasing utilization of robotic prostatectomy, the open procedure has become less commonly performed and is now typically only performed for patients who are not candidates for robotic surgery. The most common KRS selected was 58548. 56% of survey respondents selecting this KRS felt 55842 was much more intense and complex than the KRS.

Utilization of 55842 has decreased by about 75% over the past ten years from 308 claims in 2012 to 78 claims in 2022. This change in utilization has been driven by the wide adoption of robotic surgical instruments for pelvic surgery over the past decade. This decrease in utilization has led to increased complexity and intensity when performing the open procedure, due to the decreasing frequency with which the open procedure is performed. This likely explains the increase in intra-service time identified in the survey.

Median intraservice time from the survey was 200 minutes, a total time of 438 minutes, with one 99232, and one discharge day 99238. The 90 day global period includes two level four office visits. A RUC database search of RUC reviewed 090

day global codes since 2014 reveals 4 codes with an intraservice time between 190 and 210 minutes. The RVW range for these codes is 22.00-41.50. 55842 would continue to fit well within the fee schedule at its current value of 21.36.

Pre-time package 3 and Post-time package 9B are selected. Times are adjusted to not exceed median survey values. Positioning time is increased due to dorsal lithotomy positioning.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 55842

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Urology How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 60
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate.

Specialty Urology Frequency 120 Percentage 100.00 %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 38 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate.

Specialty Urology	Frequency 70	Percentage 100.00 %	
Specialty	Frequency	Percentage	%
Specialty	Frequency 0	Percentage	%

Do many physicians perform this service across the United States?

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 55842

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:55845 Tracking Number H7 Original Specialty Recommended RVU: **29.50**
Presented Recommended RVU: **25.18**
Global Period: 090 Current Work RVU: **25.18** RUC Recommended RVU: **25.18**

CPT Descriptor: Prostatectomy, retropubic radical, with or without nerve sparing; with bilateral pelvic lymphadenectomy, including external iliac, hypogastric, and obturator nodes.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 65-year-old man with elevated prostate-specific antigen (PSA) levels undergoes biopsy that shows a Gleason score of 4 + 4, high-risk prostate cancer. After negative staging evaluation and counseling of management options, he undergoes open radical retropubic prostatectomy with bilateral pelvic lymphadenectomy, including external iliac, hypogastric, and obturator nodes.

Percentage of Survey Respondents who found Vignette to be Typical: 94.12%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 100% , In the ASC 0%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 0% , Overnight stay-less than 24 hours 38% , Overnight stay-more than 24 hours 61%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 91%

Description of Pre-Service Work: On the day before the surgery, review patient's medical record, preoperative lab results, transrectal ultrasound images, and pathology reports. Write preoperative orders and send electronically to the hospital. Dictate a preoperative H&P. On the day of surgery, review the surgical procedure and postoperative recovery in and out of the hospital with the patient and/or family. Answer questions from the patient and/or family and obtain informed consent. Discuss the expected duration of the procedure and any special concerns about this particular patient (eg, teeth, positioning, unusual medical problems) with the anesthesiologist. Verify the availability of all necessary instruments. Speak to anesthesiologist about expected length of procedure and any special concerns about this particular patient (eg, teeth, positioning, unusual medical problems). Verify all necessary instruments are available. General anesthesia is induced. Prepare and drape abdomen and genitalia in standard fashion. Pad patient's wrists, elbows, shoulders, and legs and place and test sequential compression devices. Tuck patient's arms under sheets. Place patient in slightly hyperextended supine position and pad all pressure points and adjust as needed. The surgeon scrubs and gowns.

Description of Intra-Service Work: Place a Foley catheter into the bladder and inflate the balloon. Make a lower midline incision. Develop the retropubic space and place a retractor. Develop a space between the bladder and the iliac vessels. Using a combination of blunt and sharp dissection, dissect the peritoneum from the internal inguinal ring, the iliopsoas region, and the anterior abdominal wall and sweep superiorly. Isolate the spermatic cord to the point where the vas courses medially. The vas may or may not be ligated or divided. Place retractors to hold the bladder medially and the peritoneum superiorly. Divide the fibrofatty tissue surrounding the iliac vein anteriorly from the bifurcation to the node of Cloquet residing near the inguinal canal. Separate the tissue between the iliac artery and vein exposing the iliac artery along its medial and anterior surfaces. Pass this tissue behind the iliac vein. Using a combination of blunt and sharp dissection, dissect the nodal packet to the obturator nerve. Ligate the lymphatics coming from the leg and divide the distal edge of the nodal packet. Rotate the packet superiorly and then divide at the bifurcation of the iliac artery. For an extended dissection, the incision may need to be extended cephalad. After a limited pelvic lymph node dissection has been performed and the decision has been made to perform an extended lymph node dissection, divide up the tissue over the common iliac artery up to the bifurcation of the aorta. Locate the ureter on this side and free it of its attachments. Gently retract it medially or

laterally depending on the stage of dissection. The lateral limits of dissection are the gonadal veins. Dissect the nodal tissue medial to these structures off of the psoas muscle taking care not to injure the genitofemoral nerve. Pass the packet under the common iliac artery. Carry out the dissection to the midline over the sacrum and up to the bifurcation of the aorta. If a limited pelvic node dissection has already been carried out, end the inferior limit of this dissection at the superior limit of that dissection. In the event the decision to perform an extended pelvic lymph node dissection is made, the dissection starts at the bifurcation of the aorta then is carried laterally to the gonadal vessels. Split the tissue over the common iliac artery and pass it underneath from lateral to medial. Proceed with the dissection from superiorly to inferiorly and from the midline at the level of the sacrum to the common iliac, and from the gonadal vessels laterally to the common iliac. Split the fibrofatty tissue over the external iliac artery and pass it under the artery. Carry the dissection inferiorly further down the internal and external iliac vessels in the same fashion as the limited pelvic node dissection. Attention is then turned to the radical retropubic prostatectomy. Place the retractor to facilitate the removal of the prostate. Incise the endopelvic fascia bilaterally. Develop the puboprostatic ligaments and divide close to the pubis. Pinch the tissue anterior to the urethra and posterior to the pubis between the thumb and forefinger of the left hand to develop the doral vein complext distal to the prostatic apex. Pass a right-angled clamp anterior to the urethra and ligate the previously developed dorsal vein complex. Perform a suture ligation on the bundle at the prostatic apex with polyglactin 910, taking care to avoid the neurovascular posterior and lateral to the prostate. Perform a suture ligation on the dorsal vein complex with polyglactin 910 on a 5/8th circle taper needle in a figure of eight. Divide the dorsal vein complex. Suture ligate it again until hemostasis is obtained. Develop the plane between the neurovascular bundles and the apex of the prostate and urethra. Pass a McDougal clamp over the neurovascular bundle under the urethra and over the neurovascular bundle, grasp an umbilical tape, and withdraw the clamp with the tape to elevate the urethra. Avoid the rectum. Dissect the urethra for up to a centimeter into the prostate. Divide the urethra just enough to expose the Foley catheter, which is about half way across the urethra. Lubricate the Foley catheter at the urethral meatus and pass a right-angled clamp under the Foley at the level of the incised urethra and draw it into the field. Clamp the Foley catheter with a Kocher clamp and cut it so the clamp is on the bladder end of the catheter, keeping the Foley balloon inflated within the bladder, taking care not to stretch the neurovascular bundles. Divide the rest of the urethra. Release the rest of the neurovascular bundles from the posterior lateral aspect of the prostate. Rotate the prostate supero-anteriorly and divide the recto-urethralis muscles. With a combination of blunt and sharp dissection, release the prostate from the anterior layer of the rectum until the seminal vesicles and ampullae of the vasa are encountered. Dissect laterally to free the prostatic fascia and neurovascular bundles up to the lateral pedicles. Ligate and divide the vessels on the lateral surface of the seminal vesicles near the base of the prostate. Rotate the prostate inferiorly and identify the bladder neck by palpating the Foley balloon within the bladder. Dissect the bladder neck into the prostate circumferentially. Divide the anterior bladder neck, release the water from the Foley balloon, pull the catheter, and clamp both ends to use it for anterior traction on the prostate. Dissect the posterior bladder neck off the prostate if this has not already been done. Find and dissect the ampulla of the vas on one side and dissect it proximally till the tip of the seminal vesicle has been reached. Clip and divide the vas deferens. Starting at the junction of the seminal vesicle and the prostate, dissect the former off of the latter. Clip the end of the seminal vesicle and divide it, assure that the seminal vesicular artery is secure. Repeat the process for the other side.

Remove the specimen and assure hemostasis. Close any rectal laceration if necessary, with polyglactin 910, in a two layered interrupted fashion. Tailor the bladder neck with interrupted or running polyglactin 910 suture, if necessary, in a tennis racquet or fish-mouth fashion, assuring that the ureteral orifices are not incorporated in the closure. Insert a Greenwald sound into the urethra until it is visualized at the cut urethral edge within the pelvis.

Place six double-armed 3-0 purple monocryl sutures from inside to the outside of the urethra, taking care to encompass the urethral mucosa. A straight mosquito clamp can be used to label the passed needle. Create the anastomosis by passing the three posteriorly placed needles through the posterior bladder neck. Remove the Greenwald sound. Pass a 20 French Foley catheter with a 30-ml balloon into the bladder and leave the balloon deflated for now. Pass the three anteriorly placed 3-0 monocryl sutures through the anterior bladder neck incorporating the bladder mucosa for a mucosal to mucosal anastomosis. Inflate the Foley balloon to 30 ml.

Place a long Allis clamp just proximal to the bladder neck. Tie the sutures starting posteriorly, push the bladder with the Allis clamp, and pull the bladder with traction on the Foley catheter while tying the knots. Exit a drain through a separate stab wound incision. Close the incision with a looped polydioxanone for the fascia. Close the skin with a subcutaneous running 4-0 absorbable suture. Place sterile dressings over the incision and around the drain. Secure the catheter to the thigh with a catheter strap.

Description of Post-Service Work: Apply dressings. Transfer the patient from the operating table to the postoperative stretcher. Accompany patient to the recovery area and transfer to the recovery area bed. Write postoperative orders and review recovery area care and medications with recovery staff. Discuss results of the procedure, expected outcome, and

planned postoperative care in and out of the hospital with patient's family. After patient is awake, discuss the outcome of the surgery with the patient. Notify the referring physician of the outcome of the procedure and of any unusual aspects of postoperative care (eg, cardiac disease, diabetes management). Dictate a detailed operative report for the patient's medical record. After discharge from recovery, examine the patient and check the wound and patient's progress. Review hospital notes (ie, nursing, pharmacy, dietary, discharge planner). Answer questions from patient, patient's family, and nursing and other staff. Write orders as necessary. Write a progress note for patient's medical record. During the patient's stay in the hospital, examine the patient and check laboratory results and vital signs. Check urine output and output from the drain and remove the drain if appropriate. Check wounds and dressings and discuss patient's progress with the patient and/or family. Review patient's hospital medical records. Discuss postoperative care of the wound at home. Answer questions from patient, patient's family, and nursing and other staff. Write orders as necessary. Write progress notes for the patient's medical record. On day of discharge, examine the patient. Check the wounds and patient's progress. Review all patient hospital medical records and answer questions from patient and/or family. Write orders for postdischarge care and prescriptions for postoperative medications. Discuss postoperative care of the wound with patient and/or family. Dictate a detailed hospital discharge summary.

During the initial post-operative office visit, examine the patient. Check vital signs and inspect all surgical incisions. Prior to removal of the Foley catheter, fill the bladder with 250 ml of sterile saline with a Toomey syringe. then remove the urinary catheter. Review in detail the final pathology report, implications, follow-up plan, and the possible need for additional prostate cancer therapy. Review usage of pain medications, including discontinuance of narcotic analgesic medications and focusing discussion on utilization of non-narcotic analgesic medications as additional options for any persistent discomfort. Discuss expectations for the return of bladder control following the removal of the catheter and proper performance of Kegel exercises. Discuss penile rehabilitation therapy, including timing, options of oral therapies, injections, and vacuum pump, and write prescriptions for chosen medications, inclusive of phosphodiesterase 5 (PDE5) inhibitors. Answer questions from the patient and/or family. Schedule the next office visit. Mark the appropriate diagnosis and CPT code on the encounter form (superbill). Dictate patient progress notes for the office medical record and a letter to the referring physician.

At the second post-operative office visit, review bladder control and continence. Review bladder control exercises and additional therapies, inclusive of writing a referral for pelvic floor physical therapy. Review erectile function and determine if additional alterations should be made to the previously prescribed therapies; consider changing PDE5 inhibitor prescription medication and/or dosage. Discuss utility of obtaining PSA blood tests in monitoring the prostate cancer disease state, inclusive of writing a referral for a PSA blood test be obtained just prior to the next scheduled visit. Schedule the next office visit. Mark the appropriate diagnosis and CPT code on the encounter form (superbill). Dictate patient progress notes for the office medical record and a letter to the referring physician.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	7%	29%	64%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	29%	71%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	8%	8%	84%
Physical effort required	0%	23%	77%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	7%	93%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	33%	33%	34%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	56%	44%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	44%	56%
Physical effort required	0%	33%	67%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	11%	33%	56%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background:
55845 was recommended for survey as part of the family of prostatectomy codes. Survey of this family of codes was required due to 55866 (laparoscopic radical prostatectomy) and 35871 (pelvic lymph node dissection) being billed together greater than 75% of the time.

Compelling Evidence:
Prostate cancer at the time of intervention has undergone a migration towards a more aggressive, advanced disease-state. This is multi-factorial, inclusive of decreased PSA-screening and higher utilization of active surveillance for low-risk disease (i.e., Gleason 3+3=6 prostate cancer). National treatment guidelines no longer support radical prostatectomy or radiation therapy for patients with low-risk prostate cancer as first line therapy due to multiple studies demonstrating the safety of active surveillance protocols. The urologic community has accepted this change in treatment algorithm as demonstrated by a 2023 article in JAMA demonstrating an increase in active surveillance utilization from 26.5% in 2014 to 59.6% in 2021 (Cooperberg, et al). While urologists are appropriately moving away from surgical intervention for low-risk

disease, in parallel, the decrease in PSA-screening has also yielded more patients presenting for prostatectomy with advanced disease states. Data published in 2019 and 2020 found a decline in the incidence of localized prostate cancer and an increase in the incidence of de novo metastatic disease (Butler, et al and Sheng, et al). In 2021, a study examined 528 patients who underwent radical prostatectomy for prostate cancer, noting a significant decrease in the proportion of low-risk disease and a trend toward a higher proportion of intermediate-risk disease (Hoeh, et al). Another 2021 study looked at 447 patients undergoing radical prostatectomy, finding a shift in these patients from years prior, inclusive of unfavorable disease characteristics such as higher PSA and tumor grade at the time of surgical intervention (Garg, et al). Similarly, a 2021 JAMA article examined 5700 radical prostatectomy patients treated at the VA from 2000 to 2017, demonstrating that the proportion of low-risk tumors decreased by 44%, while intermediate risk tumors increased by 29%, and high-risk tumors increased by 15% (Vaculik, et al). Surgery for intermediate and high-risk prostate cancer is significantly more intense and technically challenging secondary to the increased tumor burden, with goals of obtaining negative margins, while also maintaining potency and continence. Given this migration towards an increased-risk, aggressive prostate cancer disease state, the population undergoing prostatectomy has changed, meeting the threshold for compelling evidence.

Recommendation:

We recommend maintaining the current work RVU of 25.18. We had a strong survey with 34 respondents. Median survey experience was 1, with a maximum procedure number of 50. This survey experience data makes sense given the decreasing utilization of this code over the past twelve years. With increasing utilization of robotic prostatectomy, the open procedure has become less commonly performed and is now typically only performed for patients who are not candidates for robotic surgery. The most common KRS selected was 58575. 64% of survey respondents selecting this KRS felt 55845 was much more intense and complex than the KRS.

Utilization of 55845 has decreased significantly over the past ten years from 2296 claims in 2012 to 497 claims in 2022. This change in utilization has been driven by the wide adoption of robotic surgical instruments for pelvic surgery over the past decade. This decrease in utilization has led to increased complexity and intensity when performing the open procedure, due to the decreasing frequency with which the open procedure is performed. This change in utilization helps to explain the increase in intra-service time identified in the survey.

Median intraservice time from the survey was 210 minutes, a total time of 452 minutes, with one 99232, and one discharge day 99238. The 90 day global period includes two level four office visits. A RUC database search of RUC reviewed 090

day global codes since 2014 reveals 4 codes with an intraservice time between 190 and 210 minutes. The RVW range for these codes is 22.00-41.50. 55845 would fit well within the fee schedule at its current value of 25.18

Pre-time package 3 and Post-time package 9B are selected. Times are adjusted to not exceed median survey values. Positioning time is increased due to dorsal lithotomy positioning.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No
