Inspect the pocket for hemostasis and then irrigate with solution. Put appropriate leads into the cardiac contractility modulation device header and tighten the set screws. Interrogate cardiac contractility modulation generator and program to settings appropriate to the underlying conditions of the patient. Wrap leads carefully beneath the pacemaker and place the generator into the pocket. Awaken the patient to assess for chest discomfort to ensure appropriate positioning of leads.

If the patient has a concomitant ICD or pacemaker, testing is performed to confirm that function or the cardiac contractility modulation device does not impact appropriate function of the ICD and vice versa, commonly referred to as crosstalk between the two devices If crosstalk is observed, multiple remedial steps may be performed including reprogramming of either or both the ICD (or pacemaker) and cardiac contractility modulation device or reposition of either or both pacemaker leads.

Once appropriate function without crosstalk has been confirmed, close pocket utilizing suture, staples, and/or medical adhesive as appropriate. Apply an appropriate dressing, with consideration for a pressure dressing if anticoagulation is anticipated. Re-interrogate generator to ensure lead connections are correct and tight.

Description of Post-Service Work: Ensure BP and HR are stable and normal upon arrival to recovery area. Write postoperative orders. Communicate with family and referring physicians. Review results of procedure with patient when sedation wears off. Dictate procedure note, including interpretation of lead, pulse generator, and rhythm status. Review, revise, and sign final report. Send formal report to PCP and referring providers. Review postoperative PA and lateral chest X ray for lead position. Review telemetry or Holter monitor recordings obtained until discharge. Prior to discharge, test ventricular sensing and capture functions, battery function, device diagnostics. Ensure patient understands process for charging of the device. Document the function in a device follow-up database. Check the incision and pocket for bleeding, hematoma, and cellulitis prior to discharge. Manage discharge day, including communication with PCP, patient and/or family, and staff. Hold extensive discussions with patient about timing of follow-up visits, monitoring by remote and in-clinic evaluations, and keeping the incision clean and dry, and reporting signs of infection. At post-op visit(s) assess the wound with respect to appropriate healing, remove the dressing, prescribe any required antibiotics or analgesic medications.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	6%	63%	25%	6%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	6%	69%	25%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	6%	75%	19%
Physical effort required	6%	75%	19%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	62%	38%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	20%	40%	10%	30%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	10%	50%	40%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	10%	50%	40%
Physical effort required	10%	40%	50%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	50%	50%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background:

CPT approved a new family of Category I codes for implantation, removal, and replacement of cardiac contractility modulation (CCM) systems, generators, and leads in several combinations. Those 11 codes constitute the first portion of this tab. A separate set of four codes was created for programming, interrogation,

and remote interrogation PC/TC.

This heart failure therapy was approved by the FDA in 2019, but only recently met CPT Category I criteria. The service utilization remains modest and the societies deployed a targeted survey of physicians identified by the vendor paired with a random list of physicians for each set of services. Each code met the minimum survey threshold of 30 responses. Only one of the device hardware codes—the main implantation code—was performed by a majority of survey respondents. Each of the other ten device hardware codes survey responses are broken out by performers and non-performers in the summary spreadsheet, because the typical respondent had not actually provided the service.

As we often see in the cardiology space for new and uncommon services like this, times and RVUs do not completely align at the 25th or median RVUs. Recommendations are based on both of those survey data points or crosswalks, but in a manner that should maintain relativity within the family and in a manner that generally comports with reference services and comparators.

33X02: Insertion of CCM system, pulse generator only
The societies convened a panel of physicians to review the survey data. Code 33X02 will be used to report insertion of a cardiac contractility modulation system, pulse generator only. As described above, the panel reviewed the pre-service time and selected package 4 for a difficult patient/difficult procedure and post-service package 9B for complex anesthesia procedures with time removed based on the survey.

Respondents indicated the patient will be discharged the same day and seen once in the office during the 90-day global period. This comports with the experience of the panel. Therefore, we recommend one 99213 office visit.

The societies recommend a wRVU of 5.80 by crosswalk from code 33240 for placement of an ICD generator with times of 58/40/16, plus one 99213, and one half-day discharge. This value creates a proper rank order for the family, with generator placement being less work than single-lead placement which is less than dual-lead placement which is less than system placement.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 0409T

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Electrophysiologist How often? Sometimes

Specialty Cardiologist How often? Sometimes

Specialty Interventional Cardiologist How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 20
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Service typicallly was performed 10 times or less during last three years as a Category III code. With pending Medicare NCD and promotion to Category I code we anticipate significant growth from that floor.

Specialty Electophysiologist Frequency 12 Percentage 60.00 %

Specialty Cardiologist Frequency 6 Percentage 30.00 %

Specialty Interventional Cardiologist Frequency 2 Percentage 10.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 15 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimate based on majority of patients being Medicare beneficiaries as vignette for typical patient is of Medicare age.

Specialty Electrophysiologist Frequency 9 Percentage 60.00 %

Specialty Cardiologist Frequency 5 Percentage 33.33 %

Specialty Interventional Cardiologist Frequency 1 Percentage 6.66 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Cardiovascular-Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 33208

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:33X03 Tracking Number J3 Original Specialty Recommended RVU: **7.88**
Presented Recommended RVU: **6.00**
Global Period: 090 Current Work RVU: **N/A** RUC Recommended RVU: **6.00**

CPT Descriptor: Insertion of permanent cardiac contractility modulation system, including fluoroscopic guidance and programming of sensing and therapeutic parameters, with evaluation when performed; transvenous electrode, single

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 65-year-old male has a history of symptomatic heart failure with fatigue and is not a candidate for cardiac resynchronization therapy. the patient had a previous placement of a cardiac contractility modulation system with improvement in symptoms and now has fracture of one transvenous lead. the decision is made to insert a single new lead.

Percentage of Survey Respondents who found Vignette to be Typical: 98%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 93% , In the ASC 5%, In the office 2%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 57% , Overnight stay-less than 24 hours 43% , Overnight stay-more than 24 hours 0%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 94%

Description of Pre-Service Work: Surgical: Review patient's history and pertinent noninvasive diagnostic studies, with special attention to cerebrovascular symptoms, cardiac symptoms, and other comorbidities that would place patient at high risk for surgery. Perform physical examination to determine if the patient has had prior procedures that required subclavian vein cannulation, evidence of subclavian vein occlusion, prior mastectomy or breast augmentation, and any current central venous lines, rashes, infection, and other implanted devices. Carefully inspect the area over the previous cardiac contractility modulation device. Also, pay attention to other implantable devices such as pacemakers and implantable cardioverter-defibrillators that may need reprogramming in the peri-procedural period. Pay special attention to medications, including antiplatelet agents and anticoagulants that the patient may be taking or needs to be taking. Review all pre-procedural blood tests, focusing on coagulation and renal function studies. Consider that renal insufficiency is present, and pay attention to whether patient has received appropriate renal protective agents and hydration.
Based on review of all previous diagnostic studies, estimate the range of introducer sheaths, guiding catheters, leads, programmers, pacing system analyzer, external defibrillator, and recording equipment that may be required, and ensure all items are available for use. Pay attention to other implantable devices such as pacemakers and implantable cardioverter-defibrillators that may need reprogramming in the peri-procedural period. Discuss procedure details, including alternatives and risks, with patient and/or family. Obtain informed consent. Assess patient's airway and respiratory status to evaluate the type of intravenous sedation that is required and safe. If intravenous sedation will not be adequate, then arrange for and provide general anesthesia support.

Radiological: Check interventional suite to ensure proper function and configuration of imaging equipment, including compliance with all radiation safety issues. Ensure all technical personnel have been familiarized with the implantation technique and are fully familiar with all required devices, especially the external defibrillator, recording equipment, programmer for the cardiac contractility modulation device, programmer for other implanted devices, and pacing system analyzer. Supervise selection of all equipment, including leads and generator, and verify all needed equipment is available. Locate and review prior films and diagnostic studies. Don radiation protection. Supervise proper positioning of patient.

Anesthesia: Discuss with anesthesia provider or support staff (i.e., RN) performing sedation that procedure and need for adjustment of level of sedation throughout the procedure to ensure safety and avoid long-term adverse effects after implantation (i.e., chest discomfort with stimulation).
Ensure ECG and hemodynamic monitors are in place and functioning Position transcutaneous defibrillation patches. Supervise or prepare and drape the patient for sterile procedure.

Description of Intra-Service Work: All of the following steps are performed under fluoroscopic guidance. Direct technical personnel throughout procedure. Infiltrate skin inferior to the clavicle with local anesthetic. Make a skin incision over the previously placed cardiac contractility modulation device. Using standard dissection techniques and electrocautery open the previously placed generator and leads. Use electrocautery for hemostasis. Under fluoroscopic and anatomic guidance for landmarks, access axillary, cephalic, or subclavian veins usually via needle puncture. Take care to avoid puncture of the subclavian artery or to enter the pleural space and stay lateral to the subclavius muscle to avoid complications. Advance a J-wire into the vein and position in the right atrium under fluoroscopy. Introduce the atrial or ventricular lead into the vein through a peel-away introducer and advanced into the appropriate chamber. Utilized pre-shaped or manually shaped stylets and/or pre-formed sheaths to direct the lead. Appropriately position the lead in the pre-determined location. Assess the lead position by electrogram morphology, slew rate, pacing impedance, capture thresholds, and electrogram amplitude. If a second ventricular lead was placed, ensure the two leads have appropriate separation under fluoroscopy and through the programmer. If the patient has a concomitant ICD or pacemaker, testing is performed to confirm that function or the cardiac contractility modulation device does not impact appropriate function of the ICD and vice versa, commonly referred to as crosstalk between the two devices If crosstalk is observed, multiple remedial steps may be performed including reprogramming of either or both the ICD (or pacemaker) and cardiac contractility modulation device or reposition of either or both pacemaker leads. The leads may require repositioning to ensure adequate sensing and impedance characteristics are confirmed with a pacing system analyzer.

Position the suture tie-down sleeve and suture to the lead and the pectoralis major muscle fascia, allowing for the appropriate amount of slack in the lead to reduce the likelihood of dislodgement.

Inspect the pocket for hemostasis and then irrigate with solution. Put appropriate leads into the cardiac contractility modulation header and tighten the set screws. Interrogate cardiac contractility modulation generator and program to settings appropriate to the underlying conditions of the patient. Wrap leads carefully beneath the pacemaker and place the generator into the pocket. Awaken the patient to assess for chest discomfort to ensure appropriate positioning of leads. Close pocket utilizing suture, staples, and/or medical adhesive as appropriate. Apply an appropriate dressing, with consideration for a pressure dressing if anticoagulation is anticipated. Re-interrogate generator to ensure lead connections are correct and tight.

Description of Post-Service Work: Ensure BP and HR are stable and normal upon arrival to recovery area. Write postoperative orders. Communicate with family and referring physicians. Review results of procedure with patient when sedation wears off. Dictate procedure note, including interpretation of lead, pulse generator, and rhythm status. Review, revise, and sign final report. Send formal report to PCP and referring providers. Review postoperative PA and lateral chest X ray for lead position. Review telemetry or Holter monitor recordings obtained until discharge. Prior to discharge, test ventricular sensing and capture functions, battery function, device diagnostics. Ensure patient understands process for charging of the device. Document the function in a pacemaker follow-up database. Check the incision and pocket for bleeding, hematoma, and cellulitis prior to discharge. Manage discharge day, including communication with PCP, patient and/or family, and staff. Hold extensive discussions with patient about timing of follow-up visits, monitoring by remote and in-clinic evaluations, and keeping the incision clean and dry, and reporting signs of infection. At post-op visit(s) assess the wound with respect to appropriate healing, remove the dressing, prescribe any required antibiotics or analgesic medications.

INTENSITY/COMPLEXITY MEASURES

(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	17%	67%	16%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	8%	42%	50%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	8%	17%	75%
Physical effort required	8%	25%	67%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	25%	75%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	11%	22%	56%	11%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	11%	11%	78%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	11%	11%	78%
Physical effort required	0%	22%	78%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	11%	22%	67%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background:

CPT approved a new family of Category I codes for implantation, removal, and replacement of cardiac contractility modulation (CCM) systems, generators, and leads in several combinations. Those 11 codes constitute the first portion of this tab. A separate set of four codes was created for programming, interrogation, and remote interrogation PC/TC.

This heart failure therapy was approved by the FDA in 2019, but only recently met CPT Category I criteria. The service utilization remains modest and the societies deployed a targeted survey of physicians identified by the vendor paired with a random list of physicians for each set of services. Each code met the minimum survey threshold of 30 responses. Only one of the device hardware codes—the main implantation code—was performed by a majority of survey respondents. Each of the other ten device hardware codes survey responses are broken out by performers and non-performers in the summary spreadsheet, because the typical respondent had not actually provided the service.

As we often see in the cardiology space for new and uncommon services like this, times and RVUs do not completely align at the 25th or median RVUs. Recommendations are based on both of those survey data points, but in a manner that should maintain relativity within the family and in a manner that generally comports with reference services and comparators.

33X03: Insertion of CCM system, transvenous electrode, single
The societies convened a panel of physicians to review the survey data. Code 33X03 will be used to report insertion of a cardiac contractility modulation system, transvenous electrode, single. As described above, the panel reviewed the pre-service time and selected package 4 for a difficult patient/difficult procedure and post-service package 9B for complex anesthesia procedures with time removed based on the survey.

Respondents indicated the patient will be discharged the same day and seen once in the office during the 90-day global period. This comports with the experience of the panel. Therefore, we recommend one 99213 office visit.

Clinically, the 33X03 procedure should fall between 33X01 and 33X02 to maintain rank order within the family. The survey 25th percentile work RVU for 33X03 is 6.00. This falls between our recommended values for 33X01 at 8.83 and 33X02 at 5.80.

The survey 25th percentile for 33X03 of 6.00 also falls between the two key reference services of 33208 at 8.52 and 33218 at 5.82.

The societies recommend the survey 25th-percentile wRVU of 6.00 with times of 58/50/17, plus one 99213, and one half-day discharge visit. This value correctly builds family rank order by assigning single-lead implant more work than generator implant and less than 2-lead implant, which is less than system implant.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 0410T

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Electrophysiologist How often? Sometimes

Specialty Cardiologist How often? Sometimes

Specialty Interventional Cardiologist How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 50
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Service was performed approximately 25 times per year the last three years as a category III code. With pending Medicare NCD and promotion to Category I code we anticipate significant growth from that floor.

Specialty Electrophyisiologists Frequency 30 Percentage 60.00 %

Specialty Cardiologists Frequency 15 Percentage 30.00 %

Specialty Interventional Cardiologists Frequency 5 Percentage 10.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 35 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimate based on majority of patients being Medicare beneficiaries as vignette for typical patient is of Medicare age.

Specialty Electrophysiologists Frequency 21 Percentage 60.00 %

Specialty Cardiologist Frequency 11 Percentage 31.42 %

Specialty Interventional Cardiologist Frequency 3 Percentage 8.57 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Cardiovascular-Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 33208

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:33X04 Tracking Number J4 Original Specialty Recommended RVU: **6.23**
Presented Recommended RVU: **6.23**
Global Period: 090 Current Work RVU: **N/A** RUC Recommended RVU: **6.23**

CPT Descriptor: Insertion of permanent cardiac contractility modulation system, including fluoroscopic guidance and programming of sensing and therapeutic parameters, with evaluation when performed; transvenous electrode, dual

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 65-year-old male has a history of symptomatic heart failure with fatigue and is not a candidate for cardiac resynchronization therapy. the patient had a previous placement of a cardiac contractility modulation system with improvement in symptoms and now has fracture of two transvenous leads. the decision is made to insert a dual lead.

Percentage of Survey Respondents who found Vignette to be Typical: 98%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 92% , In the ASC 5%, In the office 3%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 53% , Overnight stay-less than 24 hours 47% , Overnight stay-more than 24 hours 0%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 94%

Description of Pre-Service Work: Surgical: Review patient's history and pertinent noninvasive diagnostic studies, with special attention to cerebrovascular symptoms, cardiac symptoms, and other comorbidities that would place patient at high risk for surgery. Perform physical examination to determine if the patient has had prior procedures that required subclavian vein cannulation, evidence of subclavian vein occlusion, prior mastectomy or breast augmentation, and any current central venous lines, rashes, infection, and other implanted devices. Carefully inspect the area over the previous cardiac contractility modulation device. Also, pay attention to other implantable devices such as pacemakers and implantable cardioverter-defibrillators that may need reprogramming in the peri-procedural period. Pay special attention to medications, including antiplatelet agents and anticoagulants that the patient may be taking or needs to be taking. Review all pre-procedural blood tests, focusing on coagulation and renal function studies. Consider that renal insufficiency is present, and pay attention to whether patient has received appropriate renal protective agents and hydration.
Based on review of all previous diagnostic studies, estimate the range of introducer sheaths, guiding catheters, leads, pacemakers, programmers, pacing system analyzer, external defibrillator, and recording equipment that may be required, and ensure all items are available for use. Pay attention to other implantable devices such as pacemakers and implantable cardioverter-defibrillators that may need reprogramming in the peri-procedural period. Discuss procedure details, including alternatives and risks, with patient and/or family. Obtain informed consent. Assess patient's airway and respiratory status to evaluate the type of intravenous sedation that is required and safe. If intravenous sedation will not be adequate, then arrange for and provide general anesthesia support.

Radiological: Check interventional suite to ensure proper function and configuration of imaging equipment, including compliance with all radiation safety issues. Ensure all technical personnel have been familiarized with the implantation technique and are fully familiar with all required devices, especially the external defibrillator, recording equipment, programmer for the cardiac contractility modulation device, programmer for other implanted devices, and pacing system analyzer. Supervise selection of all equipment, including leads and generator, and verify all needed equipment is available. Locate and review prior films and diagnostic studies. Don radiation protection. Supervise proper positioning of patient.

Anesthesia: Discuss with anesthesia provider or support staff (i.e., RN) performing sedation that procedure and need for adjustment of level of sedation throughout the procedure to ensure safety and avoid long-term adverse effects after implantation (i.e., chest discomfort with stimulation).

Ensure ECG and hemodynamic monitors are in place and functioning Position transcutaneous defibrillation patches. Supervise or prepare and drape the patient for sterile procedure.

Description of Intra-Service Work: All of the following steps are performed under fluoroscopic guidance. Direct technical personnel throughout procedure. Infiltrate skin inferior to the clavicle with local anesthetic. Make a skin incision over the previously placed cardiac contractility modulation device. Using standard dissection techniques and electrocautery open the previously placed generator and leads. Use electrocautery for hemostasis. Under fluoroscopic and/or ultrasound guidance and utilizing anatomic guidance for landmarks, access axillary, cephalic, or subclavian veins usually via needle puncture. Repeatedly access the vein or retain guidewires to ensure access for each of the leads that are intended to be placed. Take care to avoid puncture of the subclavian artery or to enter the pleural space and stay lateral to the subclavius muscle to avoid complications. Advance a J-wire into the vein and position in the right atrium under fluoroscopy. Introduce a peel-away introducer. Advance the first right ventricular lead into position either utilizing shaped lead stylets or preformed shaped inner sheaths. Place the lead along the right ventricular septum and deploy the active fixation mechanism as appropriate. Assess the lead position by electrogram morphology, slew rate, pacing impedance, capture thresholds, and electrogram amplitude. Position the suture tie-down sleeve and suture to the lead and the pectoralis major muscle fascia, allowing for the appropriate amount of slack in the lead to reduce the likelihood of dislodgement. Advance the second lead (atrial or ventricular) into position either utilizing preshaped or manually shaped lead stylets and/or preformed shaped inner sheaths. Place the lead along the right ventricular septum or right atrium as appropriate and fixate as appropriate. Assess the lead position by electrogram morphology, slew rate, pacing impedance, capture thresholds, and electrogram amplitude. Ensure the two right ventricular leads have appropriate separation under fluoroscopy and through the programmer. If the patient has a concomitant ICD or pacemaker, testing is performed to confirm that function or the cardiac contractility modulation device does not impact appropriate function of the ICD and vice versa, commonly referred to as crosstalk between the two devices If crosstalk is observed, multiple remedial steps may be performed including reprogramming of either or both the ICD (or pacemaker) and cardiac contractility modulation device or reposition of either or both pacemaker leads. The leads may require repositioning to ensure adequate sensing and impedance characteristics are confirmed with a pacing system analyzer. Position the suture tie-down sleeve and suture to the lead and the pectoralis major muscle fascia, allowing for the appropriate amount of slack in the lead to reduce the likelihood of dislodgement.

Inspect the pocket for hemostasis and then irrigate with solution. Interrogate cardiac contractility modulation generator and program to settings appropriate to the underlying conditions of the patient. Put appropriate leads into the cardiac contractility modulation header and tighten the set screws. Wrap leads carefully beneath the pacemaker and place the generator into the pocket. Awaken the patient to assess for chest discomfort to ensure appropriate positioning of leads. Close pocket utilizing suture, staples, and/or medical adhesive as appropriate. Apply an appropriate dressing, with consideration for a pressure dressing if anticoagulation is anticipated. Re-interrogate generator to ensure lead connections are correct and tight.

Description of Post-Service Work: Ensure BP and HR are stable and normal upon arrival to recovery area. Write postoperative orders. Communicate with family and referring physicians. Review results of procedure with patient when sedation wears off. Dictate procedure note, including interpretation of lead, pulse generator, and rhythm status. Review, revise, and sign final report. Send formal report to PCP and referring providers. Review postoperative PA and lateral chest X ray for lead position. Review telemetry or Holter monitor recordings obtained until discharge. Prior to discharge, test ventricular sensing and capture functions, battery function, device diagnostics. Ensure patient understands process for charging of the device. Document the function in a pacemaker follow-up database. Check the incision and pocket for bleeding, hematoma, and cellultiis prior to discharge. Manage discharge day, including communication with PCP, patient and/or family, and staff. Hold extensive discussions with patient about timing of follow-up visits, monitoring by remote and in-clinic evaluations, and keeping the incision clean and dry, and reporting signs of infection. At post-op visit(s) assess the wound with respect to appropriate healing, remove the dressing, prescribe any required antibiotics or analgesic medications.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background:

CPT approved a new family of Category I codes for implantation, removal, and replacement of cardiac contractility modulation (CCM) systems, generators, and leads in several combinations. Those 11 codes constitute the first portion of this tab. A separate set of four codes was created for programming, interrogation, and remote interrogation PC/TC.

This heart failure therapy was approved by the FDA in 2019, but only recently met CPT Category I criteria. The service utilization remains modest and the societies deployed a targeted survey of physicians identified by the vendor paired with a random list of physicians for each set of services. Each code met the minimum survey threshold of 30 responses. Only one of the device hardware codes—the main implantation code—was

performed by a majority of survey respondents. Each of the other ten device hardware codes survey responses are broken out by performers and non-performers in the summary spreadsheet, because the typical respondent had not actually provided the service.

As we often see in the cardiology space for new and uncommon services like this, times and RVUs do not completely align at the 25th or median RVUs. Recommendations are based on both of those survey data points, but in a manner that should maintain relativity within the family and in a manner that generally comports with reference services and comparators.

33X04: Insertion of CCM system, transvenous electrodes, dual

The societies convened a panel of physicians to review the survey data. Code 33X04 will be used to report insertion of a cardiac contractility modulation system, transvenous electrodes, dual. As described above, the panel reviewed the pre-service time and selected package 4 for a difficult patient/difficult procedure and post-service package 9B for complex anesthesia procedures with time removed based on the survey.

Respondents indicated the patient will be discharged the same day and seen once in the office during the 90-day global period. This comports with the experience of the panel. Therefore, we recommend one 99213 office visit.

The survey 25th percentile for 33X04 is 6.23 wRVUs. This falls between the 1st key reference service of 33217 (5.59) and the 2nd key reference service of 33208 (8.52). 76% of respondents reported the 33X04 procedure was overall more intense and complex than the key reference service which supports the higher wRVU and IWPUT at the survey 25th percentile.

The societies recommend the survey 25th percentile wRVU of 6.23 with times of 58/60/20, one 99213, and one half-day discharge visit for patients discharged the same day as procedure.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 0411T

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Electrophysiology How often? Sometimes

Specialty Cardiology How often? Sometimes

Specialty Interventional Cardiology How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 50
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Service typically performed 25 times the last three years as a category III code. With pending Medicare NCD and promotion to category I code we anticpate significnat growth from that floor.

Specialty Electrophysiology Frequency 30 Percentage 60.00 %

Specialty Cardiology Frequency 15 Percentage 30.00 %

Specialty Interventional Cardiology Frequency 5 Percentage 10.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 35 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimate based on majority of patients being Medicare beneficiaries as vignette for typical patient is of Medicare age.

Specialty Electrophysiology Frequency 21 Percentage 60.00 %

Specialty Cardiology Frequency 11 Percentage 31.42 %

Specialty Interventional Cardiology Frequency 3 Percentage 8.57 %

Do many physicians perform this service across the United States? Yes

---

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:33X05 Tracking Number J5 Original Specialty Recommended RVU: **9.90**
Presented Recommended RVU: **9.90**
Global Period: 090 Current Work RVU: **N/A** RUC Recommended RVU: **9.90**

CPT Descriptor: Removal of a permanent cardiac contractility modulation system; pulse generator and transvenous electrodes (do not report 33X05 in conjunction with 33X06, 33X07, 33X08, 93X01, 93X02, 93286, 93287)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 65-year-old male has a history of symptomatic heart failure with fatigue and is not a candidate for cardiac resynchronization therapy. patient had a previously implanted cardiac contractility modulation system that needs to be removed due to infection.

Percentage of Survey Respondents who found Vignette to be Typical: 97%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 92% , In the ASC 5%, In the office 3%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 33% , Overnight stay-less than 24 hours 53% , Overnight stay-more than 24 hours 14%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 100%

Description of Pre-Service Work: Surgical: Review patient's history and pertinent noninvasive diagnostic studies, with special attention to cerebrovascular symptoms, cardiac symptoms, and other comorbidities that would place patient at high risk for surgery. Perform physical examination particularly focusing on device area and other areas that may impact extraction of the device. Pay special attention to medications, including antiplatelet agents and anticoagulants that the patient may be taking or needs to be taking. Review all pre-procedural blood tests, focusing on coagulation and renal function studies. Consider that renal insufficiency is present, and pay attention to whether patient has received appropriate renal protective agents and hydration.
Pay attention to other implantable devices such as pacemakers and implantable cardioverter-defibrillators that may need reprogramming in the peri-procedural period. Discuss procedure details, including alternatives and risks, with patient and/or family. Obtain informed consent. Assess patient's airway and respiratory status to evaluate the type of intravenous sedation that is required and safe. If intravenous sedation will not be adequate, then arrange for and provide general anesthesia support.

Radiological: Check interventional suite to ensure proper function and configuration of imaging equipment, including compliance with all radiation safety issues. Ensure all technical personnel have been familiarized with the implantation technique and are fully familiar with all required devices, especially the external defibrillator, recording equipment, programmer for the cardiac contractility modulation device, programmer for other implanted devices, and pacing system analyzer. Supervise selection of all equipment, including leads and cardiac contractility generator, and verify all needed equipment is available. Locate and review prior films and diagnostic studies. Don radiation protection. Supervise proper positioning of patient.

Anesthesia: Discuss with anesthesia provider or support staff (i.e., RN) performing sedation that procedure

Ensure ECG and hemodynamic monitors are in place and functioning Position transcutaneous defibrillation patches. Supervise or prepare and drape the patient for sterile procedure.

Description of Intra-Service Work: An incision is made over the previously made generator pocket, and the pulse generator is exposed and removed from the fibrous capsule. The leads, including suture ties, are freed from the capsule. The generator is disconnected from the leads and removed from the pocket. The leads are cut to expose their inner cores and are then sized to accept the locking stylet which is passed through the inner core of the lead to its distal end where it is engaged under gentle traction. A firm plastic sheath is placed over the stylet and lead, freeing the lead from intravascular adhesions as it is advanced toward the lead's distal end. Firm traction is applied to the locking stylet while countertraction is applied to the endocardial surface with the plastic sheath. This process is repeated for a possible second and third transvenous lead as part of the cardiac contractility modulation system. Alternatively, and at times in the same setting, leads are extracted from the femoral approach. A large bore sheath is inserted in the femoral vein and advanced to the right atrium. A deflectable tip wire and a dotter basket where they are ensnared. While applying traction to the lead, the sheath is passed over the wire, basket, and lead to the endocardial surface for countertraction. Once freed, a lead is withdrawn into the sheath, and both are removed from the vein where pressure is applied and hemostasis is achieved. (Leads can also be removed with a laser lead extraction system. The proximal portion of the lead is cut, and the laser sheath is placed over the body of the lead. The laser sheath is then advanced over the lead through the vascular system into the heart to break up adhesions and free and lead from the endocardial surface. The laser sheath and lead are then removed from the heart and venous system). The wounds are closed and dressed.

Description of Post-Service Work: The patient must be monitored throughout the anesthesia and surgical recovery period for potential postoperative complications which include pericardial effusion with tamponade. Such patients often undergo this procedure because there is a problem with integrity of the device or infection is present and the implantable defibrillator is removed. Therefore, life-threatening ventricular arrhythmias are a significant risk and must be treated appropriately until a new device can be placed. The physician documents these services, generates a report, and communicates with the referring physician and family.At post-op visit(s) assess the wound with respect to appropriate healing, remove the dressing, prescribe any required antibiotics or analgesic medications.

INTENSITY/COMPLEXITY MEASURES

(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	56%	38%	6%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	62%	38%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	3%	59%	38%
Physical effort required	3%	65%	32%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	59%	41%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	25%	0%	75%	0%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	25%	0%	75%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	0%	100%
Physical effort required	0%	25%	75%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	25%	75%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background:

CPT approved a new family of Category I codes for implantation, removal, and replacement of cardiac contractility modulation (CCM) systems, generators, and leads in several combinations. Those 11 codes constitute the first portion of this tab. A separate set of four codes was created for programming, interrogation, and remote interrogation PC/TC.

This heart failure therapy was approved by the FDA in 2019, but only recently met CPT Category I criteria. The service utilization remains modest and the societies deployed a targeted survey of physicians identified by the vendor paired with a random list of physicians for each set of services. Each code met the minimum survey threshold of 30 responses. Only one of the device hardware codes—the main implantation code—was performed by a majority of survey respondents. Each of the other ten device hardware codes survey responses are broken out by performers and non-performers in the summary spreadsheet, because the typical respondent had not actually provided the service.

As we often see in the cardiology space for new and uncommon services like this, times and RVUs do not completely align at the 25th or median RVUs. Recommendations are based on both of those survey data points, but in a manner that should maintain relativity within the family and in a manner that generally comports with reference services and comparators.

33X05: Removal of CCM system, pulse generator and transvenous electrodes
The societies convened a panel of physicians to review the survey data. Code 33X05 will be used to report removal of a cardiac contractility modulation system including pulse generator and transvenous electrodes. As described above, the panel reviewed the pre-service time and selected package 4 for a difficult patient/difficult procedure and post-service package 9B for complex anesthesia procedures with time removed based on the survey.

The survey indicates 1 99232 visit is typical. However, the survey also indicates that the typical patient stays overnight but not more than 24 hours post-op. Therefore, per RUC policy/instructions we have removed the 99232 visit from our calculations and added 20 minutes to the post-service time. Respondents indicated the patient will be seen once in the office during the 90-day global period. This comports with the experience of the panel. Therefore, we recommend one 99214 office visit.

The survey 25th percentile wRVU aligns exactly with the 1st key reference service wRVU. This key reference service was selected by 87% of survey respondents.

The societies recommend the survey 25th percentile wRVU of 9.90 with times of 58/114/40, plus one 99214 for more complicated management after removal of the entire system, and half day discharge visit.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 0414T/0415T

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Electrophysiology How often? Sometimes

Specialty Cardiology How often? Sometimes

Specialty Interventional Cardiology How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 20
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Service typicallly was performed 10 times or less during last three years as a Category III code. With pending Medicare NCD and promotion to Category I code we anticipate significant growth from that floor.

Specialty Electrophysiology Frequency 12 Percentage 60.00 %

Specialty Cardiology Frequency 6 Percentage 30.00 %

Specialty Interventional Cardiology Frequency 2 Percentage 10.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 15 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimate based on majority of patients being Medicare beneficiaries as vignette for typical patient is of Medicare age.

Specialty Electrphysiology Frequency 9 Percentage 60.00 %

Specialty Cardiology Frequency 5 Percentage 33.33 %

Specialty Interventional Cardiology Frequency 1 Percentage 6.66 %

Do many physicians perform this service across the United States? Yes

CPT Descriptor: Removal of a permanent cardiac contractility modulation system; pulse generator only

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 65-year-old male has a history of symptomatic heart failure with fatigue and is not a candidate for cardiac resynchronization therapy. patient needs radiation therapy to be applied in the pectoral region in which the cardiac contractility modulation pulse generator resides and needs to have his cardiac contractility modulation pulse generator removed.

Percentage of Survey Respondents who found Vignette to be Typical: 97%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 90% , In the ASC 7%, In the office 3%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 83% , Overnight stay-less than 24 hours 17% , Overnight stay-more than 24 hours 0%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 100%

Description of Pre-Service Work: Surgical: Review patient's history and pertinent noninvasive diagnostic studies, with special attention to cerebrovascular symptoms, cardiac symptoms, and other comorbidities that would place patient at high risk for surgery. Perform physical examination, focusing particularly on the site of device pocket. Pay special attention to medications, including antiplatelet agents and anticoagulants that the patient may be taking or needs to be taking. Review all pre-procedural blood tests, focusing on coagulation and renal function studies. Pay attention to other implantable devices such as pacemakers and implantable cardioverter-defibrillators that may need reprogramming in the peri-procedural period. Discuss procedure details, including alternatives and risks, with patient and/or family. Obtain informed consent. Assess patient's airway and respiratory status to evaluate the type of intravenous sedation that is required and safe. If intravenous sedation will not be adequate, then arrange for and provide general anesthesia support.

Radiological: Check interventional suite to ensure proper function and configuration of imaging equipment, including compliance with all radiation safety issues. Ensure all technical personnel have been familiarized with the implantation technique and are fully familiar with all required devices, especially the external defibrillator, recording equipment, programmer for the cardiac contractility modulation device, programmer for other implanted devices, and pacing system analyzer. Locate and review prior films and diagnostic studies. Don radiation protection. Supervise proper positioning of patient.

Anesthesia: Discuss with anesthesia provider or support staff (i.e., RN) performing sedation that procedure and need for adjustment of level of sedation throughout the procedure to ensure safety and avoid long-term adverse effects after implantation (i.e., chest discomfort with stimulation).

Ensure ECG and hemodynamic monitors are in place and functioning Position transcutaneous defibrillation patches. Supervise or prepare and drape the patient for sterile procedure.

Description of Intra-Service Work: Infiltrate skin inferior to the clavicle with local anesthetic. Make a skin incision over the previously placed cardiac contractility modulation device. Using standard dissection techniques and electrocautery

open the previously placed generator and leads. Use electrocautery for hemostasis. Locate the previously placed generator. Disconnect the generator from pacing leads (if present).

Inspect the pocket for hemostasis and then irrigate with solution. Close pocket utilizing suture, staples, and/or medical adhesive as appropriate. Apply an appropriate dressing, with consideration for a pressure dressing if anticoagulation is anticipated.

Description of Post-Service Work: Ensure BP and HR are stable and normal upon arrival to recovery area. Write postoperative orders. Communicate with family and referring physicians. Review results of procedure with patient when sedation wears off. Dictate procedure note, including interpretation of lead, pulse generator, and rhythm status. Review, revise, and sign final report. Send formal report to PCP and referring providers. Review telemetry or Holter monitor recordings obtained until discharge. Check the incision and pocket for bleeding, hematoma, and cellulitis prior to discharge. Manage discharge day, including communication with PCP, patient and/or family, and staff. Hold extensive discussions with patient about timing of follow-up visits and keeping the incision clean and dry, and reporting signs of infection. At post-op visit(s) assess the wound with respect to appropriate healing, remove the dressing, prescribe any required antibiotics or analgesic medications.

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	83%	17%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background:

CPT approved a new family of Category I codes for implantation, removal, and replacement of cardiac contractility modulation (CCM) systems, generators, and leads in several combinations. Those 11 codes constitute the first portion of this tab. A separate set of four codes was created for programming, interrogation, and remote interrogation PC/TC.

This heart failure therapy was approved by the FDA in 2019, but only recently met CPT Category I criteria. The service utilization remains modest and the societies deployed a targeted survey of physicians identified by the vendor paired with a random list of physicians for each set of services. Each code met the minimum survey threshold of 30 responses. Only one of the device hardware codes—the main implantation code—was

performed by a majority of survey respondents. Each of the other ten device hardware codes survey responses are broken out by performers and non-performers in the summary spreadsheet, because the typical respondent had not actually provided the service.

As we often see in the cardiology space for new and uncommon services like this, times and RVUs do not completely align at the 25th or median RVUs. Recommendations are based on both of those survey data points or crosswalks, but in a manner that should maintain relativity within the family and in a manner that generally comports with reference services and comparators.

33X06: Removal of CCM system, pulse generator only

The societies convened a panel of physicians to review the survey data. Code 33X06 will be used to report removal of a cardiac contractility modulation system, pulse generator only. As described above, the panel reviewed the pre-service time and selected package 4 for a difficult patient/difficult procedure and post-service package 9B for complex anesthesia procedures with time removed based on the survey.

Respondents indicated the patient will be discharged the same day and seen once in the office during the 90-day global period. This comports with the experience of the panel. Therefore, we recommend one 99213 office visit.

The societies recommend a wRVU of 4.91 by way of crosswalk to code 21040 for excision of a benign tumor with times of 53/38/18, plus one 99213, and one half-day discharge visit for patients discharged the same day as procedure. This alteration from our original submission brings order to the code family rank order by assigning a value for generator explant that is lower than generator implant. (The inverse is true for leads, as lead extraction is more work than lead placement.) It is also the shortest service, and should be less work than explant of 1 lead, explant of 2 leads, and explant of an entire system.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 0412T

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Electrophysiology How often? Sometimes

Specialty Cardiology How often? Sometimes

Specialty Interventional Cardiology How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 20
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Service typicallly was performed 10 times or less during last three years as a Category III code. With pending Medicare NCD and promotion to Category I code we anticipate significant growth from that floor.

Specialty Electrophysiology Frequency 12 Percentage 60.00 %

Specialty Cardiology Frequency 9 Percentage 45.00 %

Specialty Interventional Cardiology Frequency 2 Percentage 10.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 15 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimate based on majority of patients being Medicare beneficiaries as vignette for typical patient is of Medicare age.

Specialty Electrophysiology Frequency 9 Percentage 60.00 %

Specialty Cardiology Frequency 5 Percentage 33.33 %

Specialty Interventional Cardiology Frequency 1 Percentage 6.66 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Cardiovascular-Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 33223

SUMMARY OF RECOMMENDATION

CPT Code:33X07 Tracking Number J7 Original Specialty Recommended RVU: **7.66**
Presented Recommended RVU: **7.70**
Global Period: 090 Current Work RVU: **N/A** RUC Recommended RVU: **7.49**

CPT Descriptor: Removal of a permanent cardiac contractility modulation system; transvenous electrode, single

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 65-year-old male has a history of symptomatic heart failure with fatigue and is not a candidate for cardiac resynchronization therapy. patient has an infection and needs to have a cardiac contractility modulation electrode removed.

Percentage of Survey Respondents who found Vignette to be Typical: 83%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 92% , In the ASC 6%, In the office 2%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 36% , Overnight stay-less than 24 hours 55% , Overnight stay-more than 24 hours 9%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 100%

Description of Pre-Service Work: Surgical: Review patient's history and pertinent noninvasive diagnostic studies, with special attention to cerebrovascular symptoms, cardiac symptoms, and other comorbidities that would place patient at high risk for surgery. Perform physical examination particularly focusing on device area and other areas that may impact extraction of the device. Pay special attention to medications, including antiplatelet agents and anticoagulants that the patient may be taking or needs to be taking. Review all pre-procedural blood tests, focusing on coagulation and renal function studies. Consider that renal insufficiency is present, and pay attention to whether patient has received appropriate renal protective agents and hydration.
Pay attention to other implantable devices such as pacemakers and implantable cardioverter-defibrillators that may need reprogramming in the peri-procedural period. Discuss procedure details, including alternatives and risks, with patient and/or family. Obtain informed consent. Assess patient's airway and respiratory status to evaluate the type of intravenous sedation that is required and safe. If intravenous sedation will not be adequate, then arrange for and provide general anesthesia support.

Radiological: Check interventional suite to ensure proper function and configuration of imaging equipment, including compliance with all radiation safety issues. Ensure all technical personnel have been familiarized with the implantation technique and are fully familiar with all required devices, especially the external defibrillator, recording equipment, programmer for the cardiac contractility modulation device, programmer for other implanted devices, and pacing system analyzer. Supervise selection of all equipment, including leads and cardiac contractility generator, and verify all needed equipment is available. Locate and review prior films and diagnostic studies. Don radiation protection. Supervise proper positioning of patient.

Anesthesia: Discuss with anesthesia provider or support staff (i.e., RN) performing sedation that procedure

Ensure ECG and hemodynamic monitors are in place and functioning Position transcutaneous defibrillation patches. Supervise or prepare and drape the patient for sterile procedure.

Description of Intra-Service Work: An incision is made over the previously made generator pocket, and the pulse generator is exposed and removed from the fibrous capsule (if a generator is present). The leads, including suture ties, are freed from

the capsule. The generator is disconnected from the leads and removed from the pocket (if generator present). The lead to be removed is cut to expose its inner core and are then sized to accept the locking stylet which is passed through the inner core of the lead to its distal end where it is engaged under gentle traction. A firm plastic sheath is placed over the stylet and lead, freeing the lead from intravascular adhesions as it is advanced toward the lead's distal end. Firm traction is applied to the locking stylet while countertraction is applied to the endocardial surface with the plastic sheath. Alternatively, and at times in the same setting, leads are extracted from the femoral approach. A large bore sheath is inserted in the femoral vein and advanced to the right atrium. A deflectable tip wire and a dotter basket where they are ensnared. While applying traction to the lead, the sheath is passed over the wire, basket, and lead to the endocardial surface for countertraction. Once freed, the lead is withdrawn into the sheath, and both are removed from the vein where pressure is applied and hemostasis is achieved. (Leads can also be removed with a laser lead extraction system. The proximal portion of the lead is cut, and the laser sheath is placed over the body of the lead. The laser sheath is then advanced over the lead through the vascular system into the heart to break up adhesions and free and lead from the endocardial surface. The laser sheath and lead are then removed from the heart and venous system). The wounds are closed and dressed.

Description of Post-Service Work: The patient must be monitored throughout the anesthesia and surgical recovery period for potential postoperative complications which include pericardial effusion with tamponade. Such patients often undergo this procedure because there is a problem with integrity of the device or infection is present and the implantable defibrillator is removed. Therefore, life-threatening ventricular arrhythmias are a significant risk and must be treated appropriately until a new device can be placed. A minimum of 24 hours of ICU care is required, and the patient is then transferred to a telemetry unit. The physician documents these services, generates a report, and communicates with the referring physician and family. At post-op visit(s) assess the wound with respect to appropriate healing, remove the dressing, prescribe any required antibiotics or analgesic medications.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background:

CPT approved a new family of Category I codes for implantation, removal, and replacement of cardiac contractility modulation (CCM) systems, generators, and leads in several combinations. Those 11 codes constitute the first portion of this tab. A separate set of four codes was created for programming, interrogation, and remote interrogation PC/TC.

This heart failure therapy was approved by the FDA in 2019, but only recently met CPT Category I criteria. The service utilization remains modest and the societies deployed a targeted survey of physicians identified by the vendor paired with a random list of physicians for each set of services. Each code met the minimum survey threshold of 30 responses. Only one of the device hardware codes—the main implantation code—was performed by a majority of survey respondents. Each of the other ten device hardware codes survey responses are broken out by performers and non-performers in the summary spreadsheet, because the typical respondent had not actually provided the service.

As we often see in the cardiology space for new and uncommon services like this, times and RVUs do not completely align at the 25th or median RVUs. Recommendations are based on both of those survey data points or crosswalk, but in a manner that should maintain relativity within the family and in a manner that generally comports with reference services and comparators

33X07: Removal of CCM system, transvenous electrode, single
The societies convened a panel of physicians to review the survey data. Code 33X07 will be used to report removal of a cardiac contractility modulation system, transvenous electrode, single. As described above, the panel reviewed the pre-service time and selected package 4 for a difficult patient/difficult procedure and post-service package 9B for complex anesthesia procedures with time removed based on the survey.

The survey indicates 1 99232 visit is typical. However, the survey also indicates that the typical patient stays overnight but not more than 24 hours post-op. Therefore, per RUC policy/instructions we have removed the 99232 visit from our calculations and added 20 minutes to the post-service time. Respondents indicated the patient will be seen twice in the office during the 90-day global period. This comports with the experience of the panel. Therefore, we recommend two 99213 office visits.

70% or more of survey respondents selected identical/somewhat more/much more than the 1st key reference service in all categories including overall intensity/complexity, mental effort and judgement, technical skill required, physical effort required, and psychological stress.

The societies recommend the survey 25th-percentile wRVU of 7.70 with times of 58/62/40, plus two 99213s for management of infection and device function after a lead extraction (similar to the KRSs), and one half day discharge visit.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 0413T

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Electrophysiology How often? Sometimes

Specialty Cardiology How often? Sometimes

Specialty Interventional Cardiology How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 20
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Service typicallly was performed 10 times or less during last three years as a Category III code. With pending Medicare NCD and promotion to Category I code we anticipate significant growth from that floor.

Specialty Electrophysiology Frequency 12 Percentage 60.00 %

Specialty Cardiology Frequency 6 Percentage 30.00 %

Specialty Interventional Cardiology Frequency 2 Percentage 10.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 15 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimate based on majority of patients being Medicare beneficiaries as vignette for typical patient is of Medicare age.

Specialty Electrophysiology Frequency 9 Percentage 60.00 %

Specialty Cardiology Frequency 5 Percentage 33.33 %

Specialty Interventional Cardiology Frequency 1 Percentage 6.66 %

Do many physicians perform this service across the United States? Yes

CPT Descriptor: Removal of a permanent cardiac contractility modulation system; transvenous electrode, dual

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: a 65-year-old male has a history of symptomatic heart failure with fatigue and is not a candidate for cardiac resynchronization therapy. patient has an infection and needs to have two cardiac contractility modulation electrodes removed.

Percentage of Survey Respondents who found Vignette to be Typical: 92%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 92% , In the ASC 5%, In the office 3%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 34% , Overnight stay-less than 24 hours 57% , Overnight stay-more than 24 hours 9%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 100%

Description of Pre-Service Work: Surgical: Review patient's history and pertinent noninvasive diagnostic studies, with special attention to cerebrovascular symptoms, cardiac symptoms, and other comorbidities that would place patient at high risk for surgery. Perform physical examination particularly focusing on device area and other areas that may impact extraction of the device. Pay special attention to medications, including antiplatelet agents and anticoagulants that the patient may be taking or needs to be taking. Review all pre-procedural blood tests, focusing on coagulation and renal function studies. Consider that renal insufficiency is present, and pay attention to whether patient has received appropriate renal protective agents and hydration.
Pay attention to other implantable devices such as pacemakers and implantable cardioverter-defibrillators that may need reprogramming in the peri-procedural period. Discuss procedure details, including alternatives and risks, with patient and/or family. Obtain informed consent. Assess patient's airway and respiratory status to evaluate the type of intravenous sedation that is required and safe. If intravenous sedation will not be adequate, then arrange for and provide general anesthesia support.

Radiological: Check interventional suite to ensure proper function and configuration of imaging equipment, including compliance with all radiation safety issues. Ensure all technical personnel have been familiarized with the implantation technique and are fully familiar with all required devices, especially the external defibrillator, recording equipment, programmer for the cardiac contractility modulation device, programmer for other implanted devices, and pacing system analyzer. Supervise selection of all equipment, including leads and cardiac contractility generator, and verify all needed equipment is available. Locate and review prior films and diagnostic studies. Don radiation protection. Supervise proper positioning of patient.

Anesthesia: Discuss with anesthesia provider or support staff (i.e., RN) performing sedation that procedure

Ensure ECG and hemodynamic monitors are in place and functioning Position transcutaneous defibrillation patches. Supervise or prepare and drape the patient for sterile procedure.

Description of Intra-Service Work: An incision is made over the previously made generator pocket, and the pulse generator is exposed and removed from the fibrous capsule. The leads, including suture ties, are freed from the capsule. The

generator is disconnected from the leads and removed from the pocket. The leads are cut to expose their inner cores and are then sized to accept the locking stylet which is passed through the inner core of the lead to its distal end where it is engaged under gentle traction. A firm plastic sheath is placed over the stylet and lead, freeing the lead from intravascular adhesions as it is advanced toward the lead's distal end. Firm traction is applied to the locking stylet while countertraction is applied to the endocardial surface with the plastic sheath. This process is repeated for the second transvenous lead as part of the cardiac contractility modulation system. Alternatively, and at times in the same setting, leads are extracted from the femoral approach. A large bore sheath is inserted in the femoral vein and advanced to the right atrium. A deflectable tip wire and a dotter basket where they are ensnared. While applying traction to the lead, the sheath is passed over the wire, basket, and lead to the endocardial surface for countertraction. Once freed, a lead is withdrawn into the sheath, and both are removed from the vein where pressure is applied and hemostasis is achieved. (Leads can also be removed with a laser lead extraction system. The proximal portion of the lead is cut, and the laser sheath is placed over the body of the lead. The laser sheath is then advanced over the lead through the vascular system into the heart to break up adhesions and free and lead from the endocardial surface. The laser sheath and lead are then removed from the heart and venous system). The wounds are closed and dressed.

Description of Post-Service Work: The patient must be monitored throughout the anesthesia and surgical recovery period for potential postoperative complications which include pericardial effusion with tamponade. Such patients often undergo this procedure because there is a problem with integrity of the device or infection is present and the implantable defibrillator is removed. Therefore, life-threatening ventricular arrhythmias are a significant risk and must be treated appropriately until a new device can be placed. A minimum of 24 hours of ICU care is required, and the patient is then transferred to a telemetry unit. The physician documents these services, generates a report, and communicates with the referring physician and family. At post-op visit(s) assess the wound with respect to appropriate healing, remove the dressing, prescribe any required antibiotics or analgesic medications.

SURVEY DATA

INTENSITY/COMPLEXITY MEASURES

(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	57%	34%	9%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	69%	31%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	63%	37%
Physical effort required	0%	66%	34%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	3%	60%	37%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	0%	100%	0%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	100%	0%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	100%	0%
Physical effort required	0%	100%	0%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	100%	0%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background:

CPT approved a new family of Category I codes for implantation, removal, and replacement of cardiac contractility modulation (CCM) systems, generators, and leads in several combinations. Those 11 codes constitute the first portion of this tab. A separate set of four codes was created for programming, interrogation, and remote interrogation PC/TC.

This heart failure therapy was approved by the FDA in 2019, but only recently met CPT Category I criteria. The service utilization remains modest and the societies deployed a targeted survey of physicians identified by the vendor paired with a random list of physicians for each set of services. Each code met the minimum survey threshold of 30 responses. Only one of the device hardware codes—the main implantation code—was performed by a majority of survey respondents. Each of the other ten device hardware codes survey responses are broken out by performers and non-performers in the summary spreadsheet, because the typical respondent had not actually provided the service.

As we often see in the cardiology space for new and uncommon services like this, times and RVUs do not completely align at the 25th or median RVUs. Recommendations are based on both of those survey data points and crosswalks, but in a manner that should maintain relativity within the family and in a manner that generally comports with reference services and comparators.

33X08: Removal of CCM system, transvenous electrode, dual
The societies convened a panel of physicians to review the survey data. Code 33X08 will be used to report removal of a cardiac contractility modulation system, transvenous electrodes, dual. As described above, the panel reviewed the pre-service time and selected package 4 for a difficult patient/difficult procedure and post-service package 9B for complex anesthesia procedures with time removed based on the survey.

The survey indicates 1 99232 visit is typical. However, the survey also indicates that the typical patient stays overnight but not more than 24 hours post-op. Therefore, per RUC policy/instructions we have removed the 99232 visit from our calculations and added 20 minutes to the post-service time.

The survey 25th percentile work RVU of 9.90 would create a rank order anomaly in the family if it was the same as the 9.90 for 33X05.

The societies recommend a wRVU of 8.59 crosswalked from code 26449 for tenolysis that has identical intraservice time, similar post-service time, and would build correct rank order in this family. Recommended times are 58/90/40, plus two 99213s for management of infection and device function after a lead extraction (similar to the KRSs), and one half day discharge visit.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 0413T

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Electrophysiology How often? Sometimes

Specialty Cardiology How often? Sometimes

Specialty Interventional Cardiology How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 20
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Service typicallly was performed 10 times or less during last three years as a Category III code. With pending Medicare NCD and promotion to Category I code we anticipate significant growth from that floor.

Specialty Electrophysiology Frequency 12 Percentage 60.00 %

Specialty Cardiology Frequency 6 Percentage 30.00 %

Specialty Interventional Cardiology Frequency 2 Percentage 10.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 15 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimate based on majority of patients being Medicare beneficiaries as vignette for typical patient is of Medicare age.

Specialty Electrophysiology Frequency 9 Percentage 60.00 %

Specialty Cardiology Frequency 5 Percentage 33.33 %

Specialty Interventional Cardiology Frequency 1 Percentage 6.66 %

Do many physicians perform this service across the United States? Yes

CPT Descriptor: Removal and replacement of permanent cardiac contractility modulation system, pulse generator only

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 65-year-old male has a history of symptomatic heart failure with fatigue and is not a candidate for cardiac resynchronization therapy. patient had a previously implanted pulse generator that needs to be replaced. his device requires replacement due to battery depletion, and he wishes to continue receiving cardiac contractility modulation therapy with a replacement device.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 90% , In the ASC 7%, In the office 3%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 78% , Overnight stay-less than 24 hours 22% , Overnight stay-more than 24 hours 0%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 88%

Description of Pre-Service Work: Surgical: Review patient's history and pertinent noninvasive diagnostic studies, with special attention to cerebrovascular symptoms, cardiac symptoms, and other comorbidities that would place patient at high risk for surgery. Perform physical examination, focusing particularly on the site of device pocket. Pay special attention to medications, including antiplatelet agents and anticoagulants that the patient may be taking or needs to be taking. Review all pre-procedural blood tests, focusing on coagulation and renal function studies. Pay attention to other implantable devices such as pacemakers and implantable cardioverter-defibrillators that may need reprogramming in the peri-procedural period. Discuss procedure details, including alternatives and risks, with patient and/or family. Obtain informed consent. Assess patient's airway and respiratory status to evaluate the type of intravenous sedation that is required and safe. If intravenous sedation will not be adequate, then arrange for and provide general anesthesia support.

Radiological: Check interventional suite to ensure proper function and configuration of imaging equipment, including compliance with all radiation safety issues. Ensure all technical personnel have been familiarized with the implantation technique and are fully familiar with all required devices, especially the external defibrillator, recording equipment, programmer for the cardiac contractility modulation device, programmer for other implanted devices, and pacing system analyzer. Locate and review prior films and diagnostic studies. Don radiation protection. Supervise proper positioning of patient.

Anesthesia: Discuss with anesthesia provider or support staff (i.e., RN) performing sedation that procedure and need for adjustment of level of sedation throughout the procedure to ensure safety and avoid long-term adverse effects after implantation (i.e., chest discomfort with stimulation).

Ensure ECG and hemodynamic monitors are in place and functioning Position transcutaneous defibrillation patches. Supervise or prepare and drape the patient for sterile procedure.

Description of Intra-Service Work: Infiltrate skin inferior to the clavicle with local anesthetic. Make a skin incision over the previously placed cardiac contractility modulation device. Using standard dissection techniques and electrocautery

open the previously placed generator and leads. Use electrocautery for hemostasis. Locate the previously placed generator. Disconnect the generator from pacing leads. Connect a new generator to the existing leads.

Inspect the pocket for hemostasis and then irrigate with solution. Place the leads and generator into the existing pocket. Close pocket utilizing suture, staples, and/or medical adhesive as appropriate. Apply an appropriate dressing, with consideration for a pressure dressing if anticoagulation is anticipated.

Description of Post-Service Work: Ensure BP and HR are stable and normal upon arrival to recovery area. Write postoperative orders. Communicate with family and referring physicians. Review results of procedure with patient when sedation wears off. Dictate procedure note, including interpretation of lead, pulse generator, and rhythm status. Review, revise, and sign final report. Send formal report to PCP and referring providers. Review telemetry or Holter monitor recordings obtained until discharge. Check the incision and pocket for bleeding, hematoma, and cellulitis prior to discharge. Manage discharge day, including communication with PCP, patient and/or family, and staff. Hold extensive discussions with patient about timing of follow-up visits and keeping the incision clean and dry, and reporting signs of infection. At post-op visit(s) assess the wound with respect to appropriate healing, remove the dressing, prescribe any required antibiotics or analgesic medications.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	83%	8%	9%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	83%	17%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	8%	75%	17%
Physical effort required	0%	83%	17%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician	0%	92%	8%

- Estimated risk of malpractice suit with poor outcome

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	11%	22%	22%	33%	11%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	33%	56%	11%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	22%	67%	11%
Physical effort required	11%	78%	11%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	22%	56%	22%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background:

CPT approved a new family of Category I codes for implantation, removal, and replacement of cardiac contractility modulation (CCM) systems, generators, and leads in several combinations. Those 11 codes constitute the first portion of this tab. A separate set of four codes was created for programming, interrogation, and remote interrogation PC/TC.

This heart failure therapy was approved by the FDA in 2019, but only recently met CPT Category I criteria. The service utilization remains modest and the societies deployed a targeted survey of physicians identified by the vendor paired with a random list of physicians for each set of services. Each code met the minimum survey threshold of 30 responses. Only one of the device hardware codes—the main implantation code—was

performed by a majority of survey respondents. Each of the other ten device hardware codes survey responses are broken out by performers and non-performers in the summary spreadsheet, because the typical respondent had not actually provided the service.

As we often see in the cardiology space for new and uncommon services like this, times and RVUs do not completely align at the 25th or median RVUs. Recommendations are based on both of those survey data points, but in a manner that should maintain relativity within the family and in a manner that generally comports with reference services and comparators.

33X09: Removal and replacement of CCM system, pulse generator only
The societies convened a panel of physicians to review the survey data. Code 33X09 will be used to report removal and replacement of a cardiac contractility modulation system, pulse generator only. As described above, the panel reviewed the pre-service time and selected package 4 for a difficult patient/difficult procedure and post-service package 9B for complex anesthesia procedures with time removed based on the survey.

Respondents indicated the patient will be discharged the same day and seen once in the office during the 90-day global period. This comports with the experience of the panel. Therefore, we recommend one 99213 office visit.

The 1st key reference service of 61885 has a wRVU of 6.05. The survey 25th percentile for 33X09 is 6.00. The services have identical intra-service times of 45 minutes.

The societies recommend the survey 25th percentile wRVU of 6.00 with times of 57/45/18, plus one 99213, and one half-day discharge visit.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 0414T

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Electrophysiology How often? Sometimes

Specialty Cardiology How often? Sometimes

Specialty Interventional Cardiology How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 20
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Service typicallly was performed 10 times or less during last three years as a Category III code. With pending Medicare NCD and promotion to Category I code we anticipate significant growth from that floor.

Specialty Electrophysiology Frequency 12 Percentage 60.00 %

Specialty Cardiology Frequency 6 Percentage 30.00 %

Specialty Interventional Cardiology Frequency 2 Percentage 10.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 15 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimate based on majority of patients being Medicare beneficiaries as vignette for typical patient is of Medicare age.

Specialty Electrophysiology Frequency 9 Percentage 60.00 %

Specialty Cardiology Frequency 5 Percentage 33.33 %

Specialty Interventional Cardiology Frequency 1 Percentage 6.66 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Cardiovascular-Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 33208

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:33X10 Tracking Number J10 Original Specialty Recommended RVU: **4.92**
Presented Recommended RVU: **5.00**
Global Period: 090 Current Work RVU: **N/A** RUC Recommended RVU: **5.00**

CPT Descriptor: Repositioning of previously implanted cardiac contractility modulation transvenous electrode(s), including fluoroscopic guidance and programming of sensing and therapeutic parameters

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 65-year-old male has a history of symptomatic heart failure with fatigue and is not a candidate for cardiac resynchronization therapy. patient had a previously implanted cardiac contractility modulation system and an electrode needs to be repositioned due to dislodgement.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 93% , In the ASC 5%, In the office 2%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 56% , Overnight stay-less than 24 hours 44% , Overnight stay-more than 24 hours 0%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 100%

Description of Pre-Service Work: Surgical: Review patient's history and pertinent noninvasive diagnostic studies, with special attention to cerebrovascular symptoms, cardiac symptoms, and other comorbidities that would place patient at high risk for surgery. Perform physical examination to determine if the patient has had prior procedures that required subclavian vein cannulation, evidence of subclavian vein occlusion, prior mastectomy or breast augmentation, and any current central venous lines, rashes, infection, and other implanted devices. Carefully inspect the area over the previous cardiac contractility modulation device. Also, pay attention to other implantable devices such as pacemakers and implantable cardioverter-defibrillators that may need reprogramming in the peri-procedural period. Pay special attention to medications, including antiplatelet agents and anticoagulants that the patient may be taking or needs to be taking. Review all pre-procedural blood tests, focusing on coagulation and renal function studies. Consider that renal insufficiency is present, and pay attention to whether patient has received appropriate renal protective agents and hydration.

Based on review of all previous diagnostic studies, estimate the range of introducer sheaths, guiding catheters, leads, pacemakers, programmers, pacing system analyzer, external defibrillator, and recording equipment that may be required, and ensure all items are available for use. Pay attention to other implantable devices such as pacemakers and implantable cardioverter-defibrillators that may need reprogramming in the peri-procedural period. Discuss procedure details, including alternatives and risks, with patient and/or family. Obtain informed consent. Assess patient's airway and respiratory status to evaluate the type of intravenous sedation that is required and safe. If intravenous sedation will not be adequate, then arrange for and provide general anesthesia support.

Radiological: Check interventional suite to ensure proper function and configuration of imaging equipment, including compliance with all radiation safety issues. Ensure all technical personnel have been familiarized with the implantation technique and are fully familiar with all required devices, especially the external defibrillator, recording equipment, programmer for the cardiac contractility modulation device, programmer for other implanted devices, and pacing system analyzer. Locate and review prior films and diagnostic studies. Don radiation protection. Supervise proper positioning of patient.

Anesthesia: Discuss with anesthesia provider or support staff (i.e., RN) performing sedation that procedure and need for adjustment of level of sedation throughout the procedure to ensure safety and avoid long-term adverse effects after implantation (i.e., chest discomfort with stimulation).

Ensure ECG and hemodynamic monitors are in place and functioning Position transcutaneous defibrillation patches. Supervise or prepare and drape the patient for sterile procedure.

Description of Intra-Service Work: All of the following steps are performed under fluoroscopic guidance. Direct technical personnel throughout procedure. Infiltrate skin inferior to the clavicle with local anesthetic. Make a skin incision over the previously placed cardiac contractility modulation device. Using standard dissection techniques and electrocautery open the previously placed generator and leads. Use electrocautery for hemostasis. Disconnect the leads from the generator. Advance a stylet into the lead requiring repositioning and retract the active fixation mechanism using a standard wrench. Using manual traction withdraw the lead and then advance into the new location. Fixate the lead. Assess the lead position by electrogram morphology, slew rate, pacing impedance, capture thresholds, and electrogram amplitude. Position the suture tie-down sleeve and suture to the lead and the pectoralis major muscle fascia, allowing for the appropriate amount of slack in the lead to reduce the likelihood of dislodgement. Ensure the two right ventricular leads have appropriate separation under fluoroscopy and through the programmer. If the patient has a concomitant ICD or pacemaker, testing is performed to confirm that function or the cardiac contractility modulation device does not impact appropriate function of the ICD and vice versa, commonly referred to as crosstalk between the two devices If crosstalk is observed, multiple remedial steps may be performed including reprogramming of either or both the ICD (or pacemaker) and cardiac contractility modulation device or reposition of either or both pacemaker leads. The leads may require repositioning to ensure adequate sensing and impedance characteristics are confirmed with a pacing system analyzer. Position the suture tie-down sleeve and suture to the lead and the pectoralis major muscle fascia, allowing for the appropriate amount of slack in the lead to reduce the likelihood of dislodgement.

Inspect the pocket for hemostasis and then irrigate with solution. Interrogate cardiac contractility modulation generator and program to settings appropriate to the underlying conditions of the patient. Put appropriate leads into the cardiac contractility modulation header and tighten the set screws. Wrap leads carefully beneath the pacemaker and place the generator into the pocket. Awaken the patient to assess for chest discomfort to ensure appropriate positioning of leads. Close pocket utilizing suture, staples, and/or medical adhesive as appropriate. Apply an appropriate dressing, with consideration for a pressure dressing if anticoagulation is anticipated. Re-interrogate generator to ensure lead connections are correct and tight.

Description of Post-Service Work: Ensure BP and HR are stable and normal upon arrival to recovery area. Write postoperative orders. Communicate with family and referring physicians. Review results of procedure with patient when sedation wears off. Dictate procedure note, including interpretation of lead, pulse generator, and rhythm status. Review, revise, and sign final report. Send formal report to PCP and referring providers. Review postoperative PA and lateral chest X ray for lead position. Review telemetry or Holter monitor recordings obtained until discharge. Prior to discharge, test ventricular sensing and capture functions, battery function, device diagnostics. Ensure patient understands process for charging of the device. Document the function in a pacemaker follow-up database. Check the incision and pocket for bleeding, hematoma, and cellultiis prior to discharge. Manage discharge day, including communication with PCP, patient and/or family, and staff. Hold extensive discussions with patient about timing of follow-up visits, monitoring by remote and in-clinic evaluations, and keeping the incision clean and dry, and reporting signs of infection. At post-op visit(s) assess the wound with respect to appropriate healing, remove the dressing, prescribe any required antibiotics or analgesic medications.

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background:

CPT approved a new family of Category I codes for implantation, removal, and replacement of cardiac contractility modulation (CCM) systems, generators, and leads in several combinations. Those 11 codes constitute the first portion of this tab. A separate set of four codes was created for programming, interrogation, and remote interrogation PC/TC.

This heart failure therapy was approved by the FDA in 2019, but only recently met CPT Category I criteria. The service utilization remains modest and the societies deployed a targeted survey of physicians identified by the vendor paired with a random list of physicians for each set of services. Each code met the minimum survey threshold of 30 responses. Only one of the device hardware codes—the main implantation code—was performed by a majority of survey respondents. Each of the other ten device hardware codes survey responses are broken out by performers and non-performers in the summary spreadsheet, because the typical respondent had not actually provided the service.

As we often see in the cardiology space for new and uncommon services like this, times and RVUs do not completely align at the 25th or median RVUs. Recommendations are based on both of those survey data points, but in a manner that should maintain relativity within the family and in a manner that generally comports with reference services and comparators.

33X10: Repositioning of previously implanted CCM transvenous electrode(s)
The societies convened a panel of physicians to review the survey data. Code 33X10 will be used to report repositioning of previously implanted cardiac contractility modulation system. As described above, the panel reviewed the pre-service time and selected package 4 for a difficult patient/difficult procedure and post-service package 9B for complex anesthesia procedures with time removed based on the survey.

Respondents indicated the patient will be discharged the same day and seen twice in the office during the 90-day global period. This comports with the experience of the panel. Therefore, we recommend two 99213 office visits.

The 1st KRS is 33215 with a wRVU of 4.92 and intra-service time of 60 minutes. The survey median time for 33X10 is also 60 minutes. The survey 25th percentile wRVU for 33X10 is 5.00. 67% of survey respondents chose 33215 as the key reference service. The 2nd key reference service was chosen by less than 10% of respondents.

The societies recommend the 25th-percentile RVU of 5.00 that compares well to the survey 1st key reference service of 33215 with a wRVU of 4.92, with times of 55/60/18, plus two 99213s for wound care and management of device function after a lead repositioning, and half-day discharge visit for patients discharged the same day as procedure, as supported by the survey.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 0415T

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Electrophysiology How often? Sometimes

Specialty Cardiology How often? Sometimes

Specialty Interventional Cardiology How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 20
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Service typicallly was performed 10 times or less during last three years as a Category III code. With pending Medicare NCD and promotion to Category I code we anticipate significant growth from that floor.

Specialty Electrophysiology Frequency 12 Percentage 60.00 %

Specialty Cardiology Frequency 6 Percentage 30.00 %

Specialty Interventional Cardiology Frequency 2 Percentage 10.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 15 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimate based on majority of patients being Medicare beneficiaries as vignette for typical patient is of Medicare age.

Specialty Electrophysiology Frequency 9 Percentage 60.00 %

Specialty Cardiology Frequency 5 Percentage 33.33 %

Specialty Interventional Cardiology Frequency 1 Percentage 6.66 %

Do many physicians perform this service across the United States? Yes

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:33X11 Tracking Number J11 Original Specialty Recommended RVU: **6.30**
Presented Recommended RVU: **5.25**
Global Period: 090 Current Work RVU: **N/A** RUC Recommended RVU: **5.25**

CPT Descriptor: Relocation or revision of skin pocket for implanted cardiac contractility modulation pulse generator

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 65-year-old male has a history of symptomatic heart failure with fatigue and is not a candidate for cardiac resynchronization therapy. patient had a previously implanted cardiac contractility modulation system and the pulse generator needs to be relocated due to local discomfort.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 90% , In the ASC 7%, In the office 2%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 82% , Overnight stay-less than 24 hours 18% , Overnight stay-more than 24 hours 0%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 86%

Description of Pre-Service Work: Surgical: Review patient's history and pertinent noninvasive diagnostic studies, with special attention to cerebrovascular symptoms, cardiac symptoms, and other comorbidities that would place patient at high risk for surgery. Perform physical examination particularly focusing on device area and other areas that may impact extraction of the device. Pay special attention to medications, including antiplatelet agents and anticoagulants that the patient may be taking or needs to be taking. Review all pre-procedural blood tests, focusing on coagulation and renal function studies. Consider that renal insufficiency is present, and pay attention to whether patient has received appropriate renal protective agents and hydration.
Pay attention to other implantable devices such as pacemakers and implantable cardioverter-defibrillators that may need reprogramming in the peri-procedural period. Discuss procedure details, including alternatives and risks, with patient and/or family. Obtain informed consent. Assess patient's airway and respiratory status to evaluate the type of intravenous sedation that is required and safe. If intravenous sedation will not be adequate, then arrange for and provide general anesthesia support.

Radiological: Check interventional suite to ensure proper function and configuration of imaging equipment, including compliance with all radiation safety issues. Ensure all technical personnel have been familiarized with the implantation technique and are fully familiar with all required devices, especially the external defibrillator, recording equipment, programmer for the cardiac contractility modulation device, programmer for other implanted devices, and pacing system analyzer. Supervise selection of all equipment, including leads and cardiac contractility generator, and verify all needed equipment is available. Locate and review prior films and diagnostic studies. Don radiation protection. Supervise proper positioning of patient.

Anesthesia: Discuss with anesthesia provider or support staff (i.e., RN) performing sedation that procedure

Ensure ECG and hemodynamic monitors are in place and functioning Position transcutaneous defibrillation patches. Supervise or prepare and drape the patient for sterile procedure.

Description of Intra-Service Work: Direct technical personnel throughout procedure. Infiltrate skin inferior to the clavicle with local anesthetic. Make a skin incision over the previously placed cardiac contractility modulation device. Using

standard dissection techniques and electrocautery open the previously pocket and isolate the previously placed generator and leads. Use electrocautery for hemostasis.

After appropriate local anesthetic infusion, make a new incision in a new location in proximity to the previous pocket. Using electrocautery and standard dissection techniques, create a new pocket. Place the existing device and leads into the new pocket.

Inspect the pocket for hemostasis and then irrigate with solution. Interrogate the cardiac contractility generator and program to settings appropriate to the underlying conditions of the patient. Wrap leads carefully beneath the generator and place the generator into the pocket. Close both pockets utilizing suture, staples, and/or medical adhesive as appropriate. Apply an appropriate dressing, with consideration for a pressure dressing if anticoagulation is anticipated. Re-interrogate generator to ensure lead connections are correct and tight.

Description of Post-Service Work: Ensure BP and HR are stable and normal upon arrival to recovery area. Write postoperative orders. Communicate with family and referring physicians. Review results of procedure with patient when sedation wears off. Dictate procedure note, including interpretation of lead, pulse generator, and rhythm status. Review, revise, and sign final report. Send formal report to PCP and referring providers. Review postoperative PA and lateral chest X ray for lead position. Review telemetry or Holter monitor recordings obtained until discharge. Prior to discharge, test ventricular sensing and capture functions, battery function, device diagnostics. Ensure patient understands process for charging of the device. Document the function in a pacemaker follow-up database. Check the incision and pocket for bleeding, hematoma, and cellultiis prior to discharge. Manage discharge day, including communication with PCP, patient and/or family, and staff. Hold extensive discussions with patient about timing of follow-up visits, monitoring by remote and in-clinic evaluations, and keeping the incision clean and dry, and reporting signs of infection. At post-op visit(s) assess the wound with respect to appropriate healing, remove the dressing, prescribe any required antibiotics or analgesic medications.

Technical skill required			
Physical effort required			

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome			

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background:

CPT approved a new family of Category I codes for implantation, removal, and replacement of cardiac contractility modulation (CCM) systems, generators, and leads in several combinations. Those 11 codes constitute the first portion of this tab. A separate set of four codes was created for programming, interrogation, and remote interrogation PC/TC.

This heart failure therapy was approved by the FDA in 2019, but only recently met CPT Category I criteria. The service utilization remains modest and the societies deployed a targeted survey of physicians identified by the vendor paired with a random list of physicians for each set of services. Each code met the minimum survey threshold of 30 responses. Only one of the device hardware codes—the main implantation code—was performed by a majority of survey respondents. Each of the other ten device hardware codes survey responses are broken out by performers and non-performers in the summary spreadsheet, because the typical respondent

had not actually provided the service.

As we often see in the cardiology space for new and uncommon services like this, times and RVUs do not completely align at the 25th or median RVUs. Recommendations are based on both of those survey data points or crosswalks, but in a manner that should maintain relativity within the family and in a manner that generally comports with reference services and comparators.

33X11: Relocation or revision of skin pocket for implanted CCM pulse generator
The societies convened a panel of physicians to review the survey data. Code 33X11 will be used to report relocation or revision of skin pocket for implanted cardiac contractility modulation system. As described above, the panel reviewed the pre-service time and selected package 4 for a difficult patient/difficult procedure and post-service package 9B for complex anesthesia procedures with time removed based on the survey.

Respondents indicated the patient will be discharged the same day and seen once in the office during the 90-day global period. This comports with the experience of the panel. Therefore, we recommend one 99213 office visit.

The 1st key reference service of 33223 with a wRVU of 6.30 was chosen by 100% of survey respondents. 6.30 was also the median and the 25th percentile survey wRVU.

Finding the KRS and the survey 25th-percentile value to be too high, the societies recommend the a crosswalk value of 5.25 from code 33227 for single-lead pacemaker generator replacement. Recommended times from the survey are 55/45/18, plus one 99213, and one half-day discharge visit for patients discharged the same day as procedure.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:93X01 Tracking Number J12 Original Specialty Recommended RVU: **0.90**
Presented Recommended RVU: **0.90**
Global Period: XXX Current Work RVU: **N/A** RUC Recommended RVU: **0.90**

CPT Descriptor: Programming of the cardiac contractility modulation system (in person) with iterative adjustment of the implantable device to test the function of the device and select optimal permanent programmed values with analysis, including review and report by a physician or other qualified health care professional (do not report 93X01 in conjunction with 33X01, 33X02, 33X03, 33X04, 33X05, 33X06, 33X07, 33X08, 33X09)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 65-year-old male has a history of symptomatic heart failure with fatigue and is not a candidate for cardiac resynchronization therapy. implantation of a cardiac contractility modulation system was performed in the past and requires adjustment in programming of parameters.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 0% , In the ASC 0%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Pre-Service: Patient history is assessed for CCM indications and for changes in symptoms or development of interval symptoms or clinical episodes of ventricular tachyarrhythmia. Prior history and previous programmed settings of the device as well as interim remote assessments, if available, are reviewed.

Description of Intra-Service Work: Communication between the cardiac contractility modulation device and the programmer is initiated. Cardiac contractility modulation parameters are recorded and assessed. Detailed physician analysis is made of the stored cardiac contractility modulation data, including contractility data. Other device parameters are reviewed, including device alerts with regard to battery and lead function, battery voltage, lead impedance, and current. Additional measurements are made when necessary to assess the status of the insulation and conductors of the leads. Appropriate lead polarity for sensing and capture parameters is assessed. The sensing threshold is measured by recording the signal from a single lead and chamber and by iterative (stepwise) adjustment of the cardiac contractility modulation sensing value, in order to determine the appropriate sensing safety margin. After detailed analysis of each of the above parameters, a decision is made about the adequacy of the initial programmed cardiac contractility modulation parameters, and any changes that need to be made in order to optimize the device performance relative to the patient's clinical condition are identified. The device-programming changes are made, and any additional recommendations for further cardiac evaluation or treatment are provided.

Description of Post-Service Work: Documentation of the patients clinical status and device data elements including all or some of the following is performed: sensing amplitudes, lead impedances, trends, battery status including discharges, %CCM therapy delivery, # of CCM drivetrains delivered, any error codes detected by patient charger, patient activity level, average heart rate variability, patient posture, programmed parameters, and any programmed changes.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	27%	62%	11%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	42%	58%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	38%	62%
Physical effort required	0%	69%	31%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	54%	46%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	9%	36%	45%	9%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	9%	27%	64%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	9%	45%	46%
Physical effort required	9%	73%	18%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	9%	55%	36%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

The societies convened a panel of physicians to review the survey data. Code 93X01 will be used to report programming of the CCM system with iterative adjustment of device including review and report by physician or other qualified healthcare professional. Survey respondents reported six minutes of pre-service time and eight minutes of post-service time which comported with the experience of the panel.

The survey 25th percentile wRVU for 93X01 of 0.90 is slightly higher than the 1st key reference service code 93281 (0.85). This comports with the survey findings that 73% of respondents identified 93X01 as somewhat more or much more intense/complex than 93281.

The societies recommend the survey 25th percentile wRVU of 0.90 with times of 6/15/8.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☒ Other reason (please explain) While this is a brand new code set with low volume overall, our expert panel believes that the typical patient receiving the CCM system also would have an ICD. As such, it is presumed the ICD would also be programmed at the same visit as the CCM is leading to 93283 likely being billed on the same visit as 93X01.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 0417T

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Electrphyisologist How often? Sometimes

Specialty Cardiology How often? Sometimes

Specialty Interventional Cardiology How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 6600
If the recommendation is from multiple specialties, please provide the frequency and <u>percentage</u> for each specialty. Please explain the rationale for this estimate. 2023 had the highest utilization of this service as a category III code at 3,300. With a pending Medicare NCD and promotion of the service to a category I code we anticipate significant growth from that floor.

Specialty Electrophysiology Frequency 3960 Percentage 60.00 %

Specialty Cardiology Frequency 1980 Percentage 30.00 %

Specialty Interventional Cardiology Frequency 660 Percentage 10.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 4,950
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimate based on majority of patients being Medicare beneficiaries as vignette for typical patient is of Medicare age.

Specialty Electrophysiology Frequency 2970 Percentage 60.00 %

Specialty Cardiology Frequency 1485 Percentage 30.00 %

Specialty Interventional Cardiology Frequency 495 Percentage 10.00 %

Do many physicians perform this service across the United States? Yes

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:93X02 Tracking Number J13 Original Specialty Recommended RVU: **0.80**
Presented Recommended RVU: **0.80**
Global Period: XXX Current Work RVU: **N/A** RUC Recommended RVU: **0.80**

CPT Descriptor: Interrogation device evaluation (in person) with analysis, review and report by a physician or other qualified healthcare professional, includes connection, recording and disconnection per patient encounter, implantable cardiac contractility modulation system (do not report 93X02 in conjunction with 33X01, 33X02, 33X03, 33X04, 33X05, 33X06, 33X07, 33X08, 33X09)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 65-year-old male with a cardiac contractility modulation system for heart failure is followed with interrogation device evaluations (in person) for device functionality and performance.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 0% , In the ASC 0%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Patient history is assessed for CCM indications and for changes in symptoms or development of interval symptoms or clinical episodes of ventricular tachyarrhythmia. Prior history and previous programmed settings of the device as well as interim remote assessments, if available, are reviewed.

Description of Intra-Service Work: Information from the cardiac contractility modulation device is interrogated by telemetric communication and reviewed. The review includes assessment of the appropriateness of the cardiac contractility modulation system's function, current programmed parameters, and overall device function. Data reviewed include the following: appropriate sensing and capture; stored data of all cardiac contractility modulation parameters; alerts; battery voltage; lead impedance; and sensed voltage amplitude for each lead.

Description of Post-Service Work: Documentation of the patients clinical status and device data elements including all or some of the following is performed: sensing amplitudes, lead impedances, trends, battery status including discharges, %CCM therapy delivery, # of CCM drivetrains delivered, any error codes detected by patient charger, patient activity level, average heart rate variability, patient posture, and programmed parameters.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

The societies convened a panel of physicians to review the survey data. Code 93X02 will be used to report in-person interrogation device evaluation with analysis, review and report by physician or other qualified healthcare professional. Survey respondents reported five minutes of pre-service time and seven minutes of post-service time which comported with the experience of the panel.

The survey 25th percentile wRVU of 0.80 for 93X02 falls between the 1st key reference service of 93280 (0.77) and the 2nd key reference service of 93281 (0.85) and has identical intra-service time to each reference code. The survey respondents were nearly evenly split between the two reference codes with 20 of 47 respondents selecting 93280 and 19 of 47 choosing 93281. This supports a value between the two codes.

The societies recommend the survey 25th percentile wRVU of 0.80 with times of 6/15/7.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☒ Other reason (please explain) While this is a brand new code set with low volume overall, our expert panel believes that the typical patient receiving the CCM system also would have an ICD. As such, it is presumed the ICD would also be interrogated at the same visit as the CCM is leading to 93289 likely being billed on the same visit as 93X02.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 0418T

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Electrophysiology How often? Sometimes

Specialty Cardiology How often? Sometimes

Specialty Interventional Cardiology How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 600
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. 2023 had the highest utilization of this service as a category III code at 300. With a pending Medicare NCD and promotion of the service to a category I code we anticipate significant growth from that floor.

Specialty Electrophysiology Frequency 360 Percentage 60.00 %

Specialty Cardiology Frequency 180 Percentage 30.00 %

Specialty Interventional Cardiology Frequency 60 Percentage 10.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 450
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimate based on majority of patients being Medicare beneficiaries as vignette for typical patient is of Medicare age.

Specialty Electrophysiology Frequency 270 Percentage 60.00 %

Specialty Cardiology Frequency 135 Percentage 30.00 %

Specialty Interventional Cardiology Frequency 45 Percentage 10.00 %

Do many physicians perform this service across the United States? Yes

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 93289

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:93X03 Tracking Number J14 Original Specialty Recommended RVU: **0.80**
Presented Recommended RVU: **0.80**
Global Period: XXX Current Work RVU: **N/A** RUC Recommended RVU: **0.60**

CPT Descriptor: Interrogation device evaluation (remote), up to 90 days, cardiac contractility modulation system with interim analysis, review and report(s) by a physician or other qualified health care professional

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 65-year-old male has a history of symptomatic heart failure with fatigue and is not a candidate for cardiac resynchronization therapy. implantation of a cardiac contractility modulation system was performed in the past and requires adjustment in programming of parameters.

CORRECTED VIGNETTE RECOMMENDED IN LETTER: A 65-year-old male with a cardiac contractility modulation system for heart failure is followed with interrogation device evaluations (remote) for device functionality and performance.

Percentage of Survey Respondents who found Vignette to be Typical: 98%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 0% , In the ASC 0%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Patient history is assessed for CCM indications and for changes in symptoms or development of interval symptoms or clinical episodes of ventricular tachyarrhythmia. Prior history and previous programmed settings of the device as well as interim remote assessments, if available, are reviewed.

Description of Intra-Service Work: Communication between the cardiac contractility modulation device and the programmer is initiated via remote connectivity. Cardiac contractility modulation parameters are recorded and assessed. Detailed physician analysis is made of the stored cardiac contractility modulation data, including contractility data. Other device parameters are reviewed, including device alerts with regard to battery and lead function, battery voltage, lead impedance, and current. Additional measurements are made when necessary to assess the status of the insulation and conductors of the leads. Appropriate lead polarity for sensing and capture parameters is assessed. The sensing threshold is measured by recording the signal from a single lead and chamber and by iterative (stepwise) adjustment of the cardiac contractility modulation sensing value, in order to determine the appropriate sensing safety margin. After detailed analysis of each of the above parameters, a decision is made about the adequacy of the initial programmed cardiac contractility modulation parameters, and any changes that need to be made in order to optimize the device performance relative to the patient's clinical condition are identified. The device-programming changes are made remotely, and any additional recommendations for further cardiac evaluation or treatment are provided.

Description of Post-Service Work: Documentation of the patients clinical status and device data elements including all or some of the following is performed: sensing amplitudes, lead impedances, trends, battery status including discharges, %CCM therapy delivery, # of CCM drivetrains delivered, any error codes detected by patient charger, patient activity level, average heart rate variability, patient posture, and programmed parameters.

SURVEY DATA

RUC Meeting Date (mm/yyyy)	09/2025					
Presenter(s):	Dr. Richard Wright, Dr. Ed Tuohy, Dr. Mark Schoenfeld, Dr. David Slotwiner					
Specialty Society(ies):	ACC, HRS					
CPT Code:	93X03					
Sample Size:	1914	**Resp N:**	44			
Description of Sample:	Sample comprised of a targeted list of 512 known-user EPs provided by the manufacturer, 902 EPs randomly selected from ACC and HRS membership and 500 Heart Failure specialists randomly selected from ACC membership.

Modifier -51 Exempt Status
Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? Yes

TOP KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
93280	XXX	0.77	**RUC Time**

CPT Descriptor Programming device evaluation (in person) with iterative adjustment of the implantable device to test the function of the device and select optimal permanent programmed values with analysis, review and report by a physician or other qualified health care professional; dual lead pacemaker system

SECOND HIGHEST KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
93281	XXX	0.85	**RUC Time**

CPT Descriptor Programming device evaluation (in person) with iterative adjustment of the implantable device to test the function of the device and select optimal permanent programmed values with analysis, review and report by a physician or other qualified health care professional; multiple lead pacemaker system

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
76700	XXX	0.81	**RUC Time**	680,635

CPT Descriptor 1 Ultrasound, abdominal, real time with image documentation; complete

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
93015	XXX	0.75	**RUC Time**	816,351

CPT Descriptor 2 Cardiovascular stress test using maximal or submaximal treadmill or bicycle exercise, continuous electrocardiographic monitoring, and/or pharmacological stress; with supervision, interpretation and report

Other Reference CPT Code	Global	Work RVU	Time Source
		0.00	

CPT Descriptor

RELATIONSHIP OF CODE BEING REVIEWED TO TOP TWO KEY REFERENCE SERVICES:
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by percent distribution) of the service you are rating to the top two chosen key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Top Key Reference Code: 24 **% of respondents:** 54.5 **%**

Number of respondents who choose 2nd Key Reference Code: 14 **% of respondents:** 31.8 **%**

TIME ESTIMATES (Median)

	CPT Code: 93X03	Top Key Reference CPT Code: 93280	2nd Key Reference CPT Code: **93281**
Median Pre-Service Time	5.00	7.00	7.00

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	13%	46%	33%	8%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	17%	50%	33%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	13%	50%	37%
Physical effort required	8%	71%	21%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician	17%	54%	29%

• Estimated risk of malpractice suit with poor outcome

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	14%	43%	43%	0%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	14%	50%	36%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	14%	50%	36%
Physical effort required	29%	64%	7%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	7%	64%	29%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

The societies convened a panel of physicians to review the survey data. Code 93X03 will be used to report remote interrogation device evaluation of up to 90 days with interim analysis, review and report by physician or qualified healthcare professional. Survey respondents reported five minutes of pre-service time and five minutes of post-service time which comported with the experience of the panel.

The survey 25th percentile wRVU of 0.80 for 93X03 falls between the 1st key reference service of 93280 (0.77) and the 2nd key reference service of 93281 (0.85).

The societies recommend the survey 25th percentile wRVU of 0.80 with times of 5/11/5.

* Note: An incorrect vignette that referenced remote programming for this code was incorporated into the CCA,

CPT Coding Changes document and used in this survey. Remote programming is not possible. This code is only for remote interrogation. A letter advising of the details of the situation was submitted to the RUC chair.

98% of survey respondents indicated the vignette to be typical, which the panel believes indicates a focus on the type of patient rather than the mention of programming. At the survey 25th percentile, respondents aligned on work RVUs of 0.80 for both in-person and remote programming, which appears reasonable as interpretation is performed without both the longer time and informational benefit of seeing the patient during the service.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) N/A

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Electrophysiology How often? Sometimes

Specialty Cardiology How often? Sometimes

Specialty Interventional Cardiology How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 500
If the recommendation is from multiple specialties, please provide the frequency and <u>percentage</u> for each specialty. Please explain the rationale for this estimate. 2024 had the highest utilization of this service as a category III code at 250. With a pending Medicare NCD and promotion of the service to a category I code we anticipate significant growth from that floor.

Specialty Electrophysiology Frequency 300 Percentage 60.00 %

Specialty Cardiology Frequency 150 Percentage 30.00 %

Specialty Interventional Cardiology Frequency 50 Percentage 10.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 350
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimate based on majority of patients being Medicare beneficiaries as vignette for typical patient is of Medicare age.

Specialty Electrophysiology Frequency 210 Percentage 60.00 %

Specialty Cardiology Frequency 105 Percentage 30.00 %

Specialty Interventional Cardiology Frequency 35 Percentage 10.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Tests

BETOS Sub-classification:
Other tests

BETOS Sub-classification Level II:
Other

SPECIALTY SOCIETY(IES):_ACC, HRS
PRESENTER(S):_Drs. Slotwiner, Schoenfeld, Wright, Tuohy

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

Meeting Date: September 2025

CPT Code	Long Descriptor	Global Period
33X01	Insertion of permanent cardiac contractility modulation system, including fluoroscopic guidance and programming of sensing and therapeutic parameters, with evaluation when performed; pulse generator and transvenous electrodes (do not report 33x01 in conjunction with 33x02,33x03, 33x04, 33x09, 93x01, 93x02, 93286, 93287, 93452, 93453, 93458, 93459, 93460, 93461)	090
33X02	Insertion of permanent cardiac contractility modulation system, including fluoroscopic guidance and programming of sensing and therapeutic parameters, with evaluation when performed; pulse generator only	090
33X03	Insertion of permanent cardiac contractility modulation system, including fluoroscopic guidance and programming of sensing and therapeutic parameters, with evaluation when performed; transvenous electrode, single	090
33X04	Insertion of permanent cardiac contractility modulation system, including fluoroscopic guidance and programming of sensing and therapeutic parameters, with evaluation when performed; transvenous electrode, dual	090
33X05	Removal of a permanent cardiac contractility modulation system; pulse generator and transvenous electrodes (do not report 33x05 in conjunction with 33x06, 33x07, 33x08, 93x01, 93x02, 93286, 93287)	090
33X06	Removal of a permanent cardiac contractility modulation system; pulse generator only	090
33X07	Removal of a permanent cardiac contractility modulation system; transvenous electrode, single	090
33X08	Removal of a permanent cardiac contractility modulation system; transvenous electrode, dual	090
33X09	Removal and replacement of permanent cardiac contractility modulation system, pulse generator only	090
33X10	Repositioning of previously implanted cardiac contractility modulation transvenous electrode(s), including fluoroscopic guidance and programming of sensing and therapeutic parameters	090
33X11	Relocation or revision of skin pocket for implanted cardiac contractility modulation pulse generator	090

Vignette(s) (*vignette required even if PE only code(s)***):**

CPT Code	Vignette
33X01	A 65-year-old male has a history of symptomatic heart failure with fatigue and is not a candidate for cardiac resynchronization therapy. the cardiologist inserts a cardiac contractility modulation system.
33X02	A 65-year-old male has a history of symptomatic heart failure with fatigue and is not a candidate for cardiac resynchronization therapy. patient had previously implanted cardiac contractility modulation leads and has now completed radiation therapy in the chest, so a new pulse generator needs to be inserted
33X03	A 65-year-old male has a history of symptomatic heart failure with fatigue and is not a candidate for cardiac resynchronization therapy. the patient had a previous placement of a

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

	cardiac contractility modulation system with improvement in symptoms and now has fracture of one transvenous lead. the decision is made to insert a single new lead.
33X04	A 65-year-old male has a history of symptomatic heart failure with fatigue and is not a candidate for cardiac resynchronization therapy. the patient had a previous placement of a cardiac contractility modulation system with improvement in symptoms and now has fracture of two transvenous leads. the decision is made to insert a dual lead.
33X05	A 65-year-old male has a history of symptomatic heart failure with fatigue and is not a candidate for cardiac resynchronization therapy. patient had a previously implanted cardiac contractility modulation system that needs to be removed due to infection.
33X06	A 65-year-old male has a history of symptomatic heart failure with fatigue and is not a candidate for cardiac resynchronization therapy. patient needs radiation therapy to be applied in the pectoral region in which the cardiac contractility modulation pulse generator resides and needs to have his cardiac contractility modulation pulse generator removed.
33X07	A 65-year-old male has a history of symptomatic heart failure with fatigue and is not a candidate for cardiac resynchronization therapy. patient has an infection and needs to have a cardiac contractility modulation electrode removed.
33X08	A 65-year-old male has a history of symptomatic heart failure with fatigue and is not a candidate for cardiac resynchronization therapy. patient has an infection and needs to have two cardiac contractility modulation electrodes removed.
33X09	a 65-year-old male has a history of symptomatic heart failure with fatigue and is not a candidate for cardiac resynchronization therapy. patient had a previously implanted pulse generator that needs to be replaced. his device requires replacement due to battery depletion, and he wishes to continue receiving cardiac contractility modulation therapy with a replacement device.
33X10	A 65-year-old male has a history of symptomatic heart failure with fatigue and is not a candidate for cardiac resynchronization therapy. patient had a previously implanted cardiac contractility modulation system and an electrode needs to be repositioned due to dislodgement.
33X11	A 65-year-old male has a history of symptomatic heart failure with fatigue and is not a candidate for cardiac resynchronization therapy. patient had a previously implanted cardiac contractility modulation system and the pulse generator needs to be relocated due to local discomfort.

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

   The societies utilized a consensus panel process to develop recommended inputs.

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here:

   The new codes are compared to code 33212 for pacemaker generator insertion. It seemed appropriate to compare to another 90-day global code where a device is implanted into the patient to develop recommendations for standardized 90-day clinical staff inputs. All inputs are clinical staff standards for 90-day global codes that will be adjusted as needed pending discussion of number and level of visits by the RUC.

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

NOTE: For services reviewed prior to the implementation of clinical activity codes in 2016-17, detail is not provided in the RUC database, please contact *Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org* for PE spreadsheets for your older reference codes.

3. Is this code(s) typically reported with an E/M service?
   No.
   See the *Billed Together* tab in the RUC Database.

4. If you are requesting an increase over the aggregate current cost for clinical activities, supplies and equipment, please provide compelling evidence:
   n/a
   See the *PE compelling evidence guidelines* on the RUC Collaboration website. Be sure to explain if the increase can be entirely accounted for because of an increase in physician time.

CLINICAL STAFF ACTIVITIES

The RUC has agreed that there is a presumption of zero pre-service clinical staff time unless the specialty can provide evidence to the PE Subcommittee that any pre-service time is appropriate. The RUC agreed that with evidence some subset of codes may require either minimal or extensive use of clinical staff and has allocated time when appropriate (for example when a service describes a major surgical procedure). If the package times are not applicable, alternate times may be presented and should be justified for consideration by the Subcommittee.

5. Are the global periods of the codes transitioning? Information about the amount of pre-service clinical staff time and a rationale for the change from a 090-day global to a 000 or 010 day global should be described below.
   No.

6. If you are recommending more minutes than the PE Subcommittee standards for clinical activities, you must provide rationale to justify the time:
   n/a

7. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (*please see 2nd worksheet tab in PE spreadsheet*), please explain the difference here:
   n/a

8. Please provide a brief description of the clinical staff work for the following:
   a. Pre-Service period:

   Clinical staff standards for coordinating 90-day facility procedures: diagnostic/referral forms, pre-surgery services, scheduling, consent, phone calls and prescriptions

   b. Service period (includes pre, intra and post):

   The standard 6 minutes has been applied for these inpatient procedures for one half discharge day management related services when the patient is discharged the same day as the procedure, as indicated by the survey.

   c. Post-service period:

   Standard post-op office visit clinical staff time. We will adjust these, if necessary, as needed after discussion of number and level of post-op visits by the full RUC during discussions of physician work.

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

9. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (*please see 2nd worksheet tab in PE spreadsheet*):

n/a

10. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov.

n/a

MEDICAL SUPPLIES & EQUIPMENT/INVOICES

11. ☐ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

12. ☐ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

13. If you wish to include a supply that is not on the Direct PE Inputs Medical Supplies Listing (*please see 4th worksheet tab in PE spreadsheet*), a paid invoice is required. Identify and explain the supply input and invoice here:

n/a

14. Are you recommending a PE supply pack for this recommendation? Yes or No.
If Yes, please indicate if the pack is an established package of supplies as defined by CMS (eg, SA047 *pack, E/M visit*) or a pack that is commercially available?

Established pack SA048 (2 packs for 33X07 33X08 and 33X10 that have 2 visits) Established pack SA054 (2 packs for 33X07 33X08 and 33X10 that have 2 visits)

15. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation (*please see 8-10th worksheet tabs in PE spreadsheet*). Please include the description, CMS supply code, unit, item quantity and unit price (if available).

DESCRIPTION	Code	Unit	Item Qty
pack, minimum multi-specialty visit	**SA048**	**pack**	
paper, exam table		foot	7
gloves, non-sterile		pair	2
gown, patient		item	1
pillow case		item	1
cover, thermometer probe		item	1

DESCRIPTION	Code	Unit	Item Qty
pack, post-op incision care (suture)	**SA054**	**pack**	
kit, suture removal		kit	1
povidone soln (Betadine)		ml	10

gauze, sterile 4in x 4in	item	2
gloves, sterile	pair	1
steri-strip (6 strip uou)	item	2
swab-pad, alcohol	item	2
tape, surgical paper 1in (Micropore)	inch	12
tincture of benzoin, swab	item	1

16. If you wish to include an equipment item that is not on the Direct PE Inputs Equipment Listing (*please see 5th worksheet tab in PE spreadsheet*), a paid invoice is required. Identify and explain the equipment input and invoice here:

n/a

17. Please provide an estimate of the useful life of the new equipment item as required to calculate the equipment cost per minute:

n/a

18. Have you recommended equipment minutes for a computer or equivalent laptop/integrated computer, equipment item computer, desktop, w-monitor, ED021 or notebook (Dell Latitute D600), ED038?
    a. If yes, please explain how the computer is used for this service(s).
    b. Is the computer used exclusively as an integral component of the service or is it also used for other purposes not specific to the code?
    c. Does the computer include code specific software that is typically used to provide the service(s)?

No.

19. List all the equipment included in your recommendation and the equipment formula chosen *(please see 7th worksheet tab in PE spreadsheet: Equipment minute formulas)*. If you have selected "other formula" for any of the equipment please explain here:

PE-ONLY CODES ADDITIONAL INFORMATION

20. (a) Estimate the number of times this service might be provided nationally in a one-year period?
    (b) Estimate the number of times this service might be provided to Medicare patients nationally in a one-year period?

n/a

21. Please select a Professional Liability Insurance (PLI) crosswalk based on a similar specialty mix:

n/a

ADDITIONAL INFORMATION

22. If there is any other item(s) on your spreadsheet not covered in the categories above that requires greater detail/explanation, please include here:

ITEMIZED LIST OF CHANGES (FOLLOWING THE PE SUBCOMMITTEE MEETING)

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

NOTE: The PE spreadsheets will be updated and finalized in real-time at the meeting. PE SORs must be updated based on modifications made during the meeting and resubmitted asap. The PE SOR should match the updated PE spreadsheet. Please provide a list of the modifications made to the PE spreadsheet during the PE Subcommittee meeting in the space below with brief justification for the modification (e.g. Equipment item EF023 *table, exam* was changed to EF031 *table, power* as the power table is typical in the surgeon's office).

The PE SOR serves as key support for the spreadsheet and should include any important details/explanation for the inputs as these cannot be elaborated upon in the excel document itself.

Please submit the revised form electronically to Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org.

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

Meeting Date: September 2025

CPT Code	Long Descriptor	Global Period
93X01	Programming of the cardiac contractility modulation system (in person) with iterative adjustment of the implantable device to test the function of the device and select optimal permanent programmed values with analysis, including review and report by a physician or other qualified health care professional	XXX
93X02	Interrogation device evaluation (in person) with analysis, review, and report by a physician or other qualified healthcare professional, including connection, recording, and disconnection, per patient encounter, implantable cardiac contractility modulation system	XXX
93X03	Interrogation device evaluation (remote), up to 90 days, cardiac contractility modulation system, with interim analysis, review, and report(s) by a physician or other qualified health care professional	XXX
93X04	Interrogation device evaluation (remote), up to 90 days, cardiac contractility modulation system, remote data acquisition(s), receipt of transmissions, technician review, technical support, and distribution of results	XXX

Vignette(s) (*vignette required even if PE only code(s)***):**

CPT Code	Vignette
93X01	A 65-year-old male has a history of symptomatic heart failure with fatigue and is not a candidate for cardiac resynchronization therapy. Implantation of a cardiac contractility modulation system was performed in the past and requires adjustment in programming of parameters.
93X02	A 65-year-old male with a cardiac contractility modulation system for heart failure is followed with interrogation device evaluations (in person) for device functionality and performance.
93X03	**Surveyed:** A 65-year-old male has a history of symptomatic heart failure with fatigue and is not a candidate for cardiac resynchronization therapy. Implantation of a cardiac contractility modulation system was performed in the past and requires adjustment in programming of parameters. **Corrected:** A 65-year-old male with a cardiac contractility modulation system for heart failure is followed with interrogation device evaluations (remote) for device functionality and performance.
93X04	A 65-year-old male with a cardiac contractility modulation system for heart failure is followed with interrogation device evaluations (remote) for device functionality and performance.

If there is a significantly different patient population in the non-facility setting, a vignette should be provided for the non-facility setting in the PE SOR.

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

The multi-society RVS Committee utilized a consensus panel to develop recommended inputs.

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here:

93X01: 93284 used as reference code – CCM similarities to ICD programming
93X02: 93289 used as reference code – CCM similarities to ICD interrogation
93X03: 93295 used as reference code – CCM similarities to ICD remote interrogation
93X04: 93296 used as reference code – CCM similarities to ICD remote interrogation, PE only

NOTE: For services reviewed prior to the implementation of clinical activity codes in 2016-17, detail is not provided in the RUC database, please contact *Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org* for PE spreadsheets for your older reference codes.

3. Is this code(s) typically reported with an E/M service?
Is this code(s) typically reported with the E/M service in the non-facility?

No.

See the *Billed Together* tab in the RUC Database.

4. A. What specialty is the dominant provider *in the non-facility?* What percent of the time does the dominant provider provide the service(s) in the non-facility? Is the dominant provider in the non-facility different than for the global? Note: When discussing specialties that perform the code, they must perform 51% to be called the "typical" physicians. If no one specialty meets the 51% but is the top specialty with 27% (for example), then they are referred as the top or dominant specialty.

93X01-93X02: New codes with very low Category III utilization. Dominant specialty appears to be electrophysiology
93X03: Newly created codes, no utilization data. Electrophysiology presumed to be the dominant specialty
93X04: Technical component code, non-physician based work, no dominant specialty.

See the *Claims Data* tab in the RUC Database. Use the *Medicare Specialty (Non-Facility Only)* table.

5. If you are requesting an increase over the aggregate current cost for clinical activities, supplies and equipment, please provide compelling evidence:

N/A. New Category I codes

See the *PE compelling evidence guidelines* under PE Reference Materials on the RUC Collaboration website. Be sure to explain if the increase can be entirely accounted for because of an increase in physician time.

CLINICAL STAFF ACTIVITIES

The RUC has agreed that there is a presumption of zero pre-service clinical staff time unless the specialty can provide evidence to the PE Subcommittee that any pre-service time is appropriate. The RUC agreed that with evidence some subset of codes may require minimal or extensive use of clinical staff and has allocated time when appropriate (for example when a service describes a major surgical procedure). If the package times are not applicable, alternate times may be presented and should be justified for consideration by the Subcommittee.

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

6. Are the global periods of the codes transitioning? Information about the amount of pre-service clinical staff time and a rationale for the change from a 090-day global to a 000 or 010 day global should be described below.

No.

7. If you are recommending more minutes than the PE Subcommittee standards for clinical activities, you must provide rationale to justify the time:

N/A

8. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (*please see 2nd worksheet tab in PE spreadsheet*), please explain the difference here:

N/A

9. How much time was allocated to clinical activity, *obtain vital signs* (CA010) prior to CMS increasing the clinical activity to 5 minutes for calendar year 2018? The standard for clinical activity, obtains vital signs remains 0, 3 and 5 based on the number of vital signs taken. Please provide a rationale for the clinical staff time that you are requesting for obtain vital signs here:

N/A

10. Please provide a brief description of the clinical staff work for the following:
    a. Pre-Service period:

    b. Service period (includes pre, intra and post):

93X01: Prepare room/equipment/supplies 93X02: Prepare room/equipment/supplies 93X03: N/A 93X04: Clinical staff receives and reviews remote transmissions, prepares report and distribution of results;

    c. Post-service period:

11. Please provide granular detail regarding what the clinical staff is doing during the intra-service (of service period) clinical activity, *assist physician or other qualified healthcare professional---directly related to physician work time* or *Perform procedure/service---NOT directly related to physician work time:*

93X01 ▪ Bring patient into exam room ▪ Seat patient in chair or on exam table ▪ Hook up to EKG ▪ Plug in CCM programmer and boot it up ▪ Place telemetry wand over CCM device, establish telemetry and push button to interrogate ▪ Perform sensing and impedance tests ▪ Assess level of CCM therapy delivery and confirm it is adequate ▪ Confirm battery and charging status ▪ Interpret physiologic monitoring data as applicable ▪ Make any required permanent programming changes required

- Print results and/or record on CCM follow-up form
- End telemetry session
- Remove telemetry wand and EKG from patient
- Power down CCM program and turn off EKG machine
- Escort the patient from the exam room
- Document results in the patient's medical record

93X02

- Bring patient into exam room
- Seat patient in chair or on exam table
- Hook up to EKG
- Plug in CCM programmer and boot it up
- Place telemetry wand over CCM device, establish telemetry and push button to interrogate
- Assess level of CCM therapy delivery and confirm it is adequate
- Confirm battery and charging status
- Interpret physiologic monitoring data as applicable
- Print results and/or record on CCM follow-up form
- End telemetry session
- Remove telemetry wand and EKG from patient
- Power down CCM program and turn off EKG machine
- Escort the patient from the exam room
- Document results in the patient's medical record

93X04

- Log into remote follow-up platform
- Select desired patient from work queue and open the information for that patient
- Assess level of CCM therapy delivery and confirm it is adequate
- Interpret physiologic monitoring data as applicable
- Document the results of the follow-up
- Contact the patient to schedule an in-person office visit if follow-up results require one
- Log out of the desired patient's information on the platform page
- Log out of the platform page

12. If you have used a percentage of the physician intra-service work time other then 100 or 67 percent for the intra-service (of service period) clinical activity, please indicate the percentage and explain why the alternate percentage is needed and how it was derived.

N/A

13. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (*please see 2nd worksheet tab in PE spreadsheet*):

N/A

14. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov.

N/A

PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

MEDICAL SUPPLIES & EQUIPMENT/INVOICES

15. ☐ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

16. ☐ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

17. If you wish to include a supply that is not on the Direct PE Inputs Medical Supplies Listing (*please see 4th worksheet tab in PE spreadsheet*), a paid invoice is required. Identify and explain the supply input and invoice here:

N/A

18. Are you recommending a PE supply pack for this recommendation? Yes or No.
If Yes, please indicate if the pack is an established package of supplies as defined by CMS (eg, SA047 *pack, E/M visit*) or a pack that is commercially available?

No

19. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation (*please see 8-10th worksheet tabs in PE spreadsheet*). Please include the description, CMS supply code, unit, item quantity and unit price (if available).

20. If you wish to include an equipment item that is not on the Direct PE Inputs Equipment Listing (*please see 5th worksheet tab in PE spreadsheet*), a paid invoice is required. Identify and explain the equipment input and invoice here:

Vendor and doctor panel confirm that a device programmer is used but this equipment is provided at no cost by the vendor and vendor retains ownership of the device.

21. Please provide an estimate of the useful life of the new equipment item as required to calculate the equipment cost per minute:

22. Have you recommended equipment minutes for a computer or equivalent laptop/integrated computer, equipment item computer, desktop, w-monitor, ED021 or notebook (Dell Latitute D600), ED038?
    a. If yes, please explain how the computer is used for this service(s).
    b. Is the computer used exclusively as an integral component of the service or is it also used for other purposes not specific to the code?
    c. Does the computer include code specific software that is typically used to provide the service(s)?

No.

23. List all the equipment included in your recommendation and the equipment formula chosen *(please see 7th worksheet tab in PE spreadsheet: Equipment minute formulas).* If you have selected "other formula" for any of the equipment, please explain here:

93X01: exam table, Default Formula 93X02: exam table, Default Formula

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

PE-ONLY CODES ADDITIONAL INFORMATION

24. (a) Estimate the number of times this service might be provided nationally in a one-year period?
(b) Estimate the number of times this service might be provided to Medicare patients nationally in a one-year period?

93X04: 500 total. 350 Medicare

25. Please select a Professional Liability Insurance (PLI) crosswalk based on a similar specialty mix:

93X04: 93296

ADDITIONAL INFORMATION

26. If there is any other item(s) on your spreadsheet not covered in the categories above that requires greater detail/explanation, please include here:

ITEMIZED LIST OF CHANGES (FOLLOWING THE PE SUBCOMMITTEE MEETING)

NOTE: The PE spreadsheets will be updated and finalized in real-time at the meeting. PE SORs must be updated based on modifications made during the meeting and resubmitted asap. The PE SOR should match the updated PE spreadsheet. Please provide a list of the modifications made to the PE spreadsheet during the PE Subcommittee meeting in the space below with brief justification for the modification (e.g. Equipment item EF023 *table, exam* was changed to EF031 *table, power* as the power table is typical in the surgeon's office).

The PE SOR serves as key support for the spreadsheet and should include any important details/explanation for the inputs as these cannot be elaborated upon in the excel document itself.

-Removed time to greet patient, obtain vital signs, provide education, obtain consent. and completion of post-procedure forms from 93X01 and 93X02 due to overlap with other interrogation/programming codes, such as 93284 and 93289.
-Removed visit supply pack from 93X01 and 93X02 due to overlap with other interrogation/ programming codes, such as 93284 and 93289.
-Change staff type for CA021 from RN/LPN/MTA blend to Electrodiagnostic Technologist for 93X01, 93X02, 93X03.
-Reduced times for CA021 to 10, 5, 18 for 93X01, 93X02, 93X04, respectively.

Please submit the revised form electronically to Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org.

AMA/Specialty Society RVS Update Committee (RUC)
Vendor/Company Attestation Statement

This form needs to be completed by an authorized representative of any **Vendor or Company** that makes, markets or distributes a product or device utilized in performing the service being surveyed by the AMA/Specialty Society RVS Update Committee (RUC), as part of its CPT® code survey and valuation process, and which has supplied a list of users of such products or devices in connection with the survey and valuation process.

By submitting to the RUC a list of users of the undersigned's product or device as part of the RUC's CPT® code survey and valuation process, I attest that no employee, affiliate, or agent of the undersigned has contacted, and further covenant that they will not contact, any such user in connection with the survey. I hereby represent and warrant that I have the authority to sign this statement on behalf of the undersigned company and that the information herein is true and accurate. I understand that any false or inaccurate information will render the survey invalid, harming both the undersigned and the physicians who use the product or device.

AMA/Specialty Society RVS Update Committee Summary of Recommendations

September 2025

Diaphragm Repair – Tab 09

At the May 2025 CPT Editorial Panel meeting, one code was created to report thoracoscopic plication of the diaphragm for eventration or paralysis and CPT code 39545 was revised to specify plication of the diaphragm for eventration or paralysis, via thoracotomy. The transabdominal approach was deleted from CPT code 39545, and the transthoracic approach was clearly defined as via thoracotomy. These code changes more accurately capture the current procedures performed to treat symptomatic diaphragmatic eventration or paralysis.

Compelling Evidence

The specialty societies presented compelling evidence to support a change in physician work due to a change in patient population and a change in technique/technology. The prior code descriptor for 39545 describes both transabdominal and transthoracic approaches together. Transabdominal refers to an open laparotomy approach, and transthoracic refers to a thoracotomy approach. The transthoracic (ie, open thoracotomy) approach requires greater complexity with respect to anesthesia strategy, positioning, and incisional approach (thoracotomy) compared to a transabdominal approach (ie, open laparotomy). These distinct approaches represent differing surgical entrance points and operating within different body cavities, which do not represent similar physician work. Regarding a change in patient population and technology, Video-Assisted Thoracic Surgery (VATS) (thoracoscopic) diaphragm plication has been reported in the literature for over 20 years and has become common practice in most institutions and training programs. As a result, the open approach described by code 39545 is now used primarily in a complex patient population that cannot be safely treated with VATS thoracoscopic techniques due to adhesions, anatomy, inability to tolerate one lung ventilation, or other comorbidities. Based on Medicare claims data over the last 10 years, the volume has been slowly decreasing. However, there is no equivalent evidence to suggest a decreasing prevalence of this disease; therefore, the decrease likely represents a shift from open to thoracoscopic operations, which are difficult to directly measure as they are currently reported with an unlisted diaphragm code. Thoracoscopic and laparoscopic approaches were not available when 39545 was last valued, and these new technologies have shifted the patient population to a more technically complex cohort, resulting in longer intra-service times. **The RUC accepted compelling evidence based on a change in patient population and a change in technique/technology.**

39545 ***Plication of diaphragm for eventration or paralysis, via thoracotomy***

The RUC reviewed the survey results from 58 surgeons and recommends a work RVU of 18.45 based on the survey 25th percentile, which maintains relativity within the family for this code. The RUC recommends 45 minutes of pre-service evaluation time, 15 minutes positioning time, 10 minutes scrub/dress/wait time, 120 minutes intra-service time, 30 minutes immediate post-service time, 1-99233, 1-99232, 1-99231, 1-99238, 2-99213, totaling 419 minutes. The hospital visits are necessary to manage systemic symptoms, side effects from surgery, and risk management of the patient's hemodynamics, chest tube, and postoperative pain. Further, respiratory support is needed, which typically includes monitoring for complications such as respiratory distress, esophageal and bowel dysfunction, infection, bleeding, and other postoperative risk factors related to the thoracotomy and diaphragmatic plication. Post-operative imaging, most commonly chest x-rays, is ordered to assess the surgical outcome of

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

plication and rule out common complications. The post-operative office visits are necessary for the patient to be able to assess for changes from the plication and any adverse events such as pleural effusion.

For this procedure via the open thoracotomy approach, more time is spent opening and closing the much longer rib-cutting thoracotomy incision. Less time is spent plicating the diaphragm because of the bigger opening allowing for direct visualization and the ability to palpate the leaves of the diaphragm before each pass of the needle. Palpation of the diaphragm decreases the risk of injuring non-visualized intra-abdominal structures. This patient population is more complicated compared to the thoracoscopic approach, and it is specific to a population where the thoracoscopic approach cannot be performed.

To support the recommended work RVU, the RUC compared the surveyed code to top key reference service code 32505 *Thoracotomy; with therapeutic wedge resection (eg, mass, nodule), initial* (work RVU = 15.75, 90 minutes intra-service, and 427 minutes total time) and second top key reference service code 43334 *Repair, paraesophageal hiatal hernia (including fundoplication), via thoracotomy, except neonatal; without implantation of mesh or other prosthesis* (work RVU = 22.12, 180 minutes intra-service, and 549 minutes total time). For the first key reference code 32505, survey respondents indicated that the surveyed code was identical or somewhat more intense/complex than the reference code. Additionally, the survey respondents indicated that the surveyed code was identical, somewhat more, and much more intense when compared to the second key reference code 43334. Therefore, the surveyed code work RVU is appropriately bracketed by the intra-service time with slightly lower total time and significantly more intensity/complexity compared to the reference codes supporting the recommended work RVU.

For additional support, the RUC referenced MPC codes 37215 *Transcatheter placement of intravascular stent(s), cervical carotid artery, open or percutaneous, including angioplasty, when performed, and radiological supervision and interpretation; with distal embolic protection* (work RVU = 17.75, 103 minutes intra-service, and 337 minutes total time) and 35301 *Thromboendarterectomy, including patch graft, if performed; carotid, vertebral, subclavian, by neck incision* (work RVU = 21.16, 120 minutes intra-service, and 404 minutes total time). The surveyed code work RVU is appropriately bracketed by the MPC codes, given the similar intra-service times, although higher total time and slightly lower intensity and complexity of the surveyed code. The RUC also referenced CPT code 24160 *Removal of prosthesis, includes debridement and synovectomy when performed; humeral and ulnar components* (work RVU = 18.63, 120 minutes intra-service, and 405 minutes total time). The reference code and surveyed code have identical intra-service time and similar total time, and therefore should be valued similarly. **The RUC recommends a work RVU of 18.45 for CPT code 39545.**

395X2 *Thoracoscopy, surgical, with plication of diaphragm for eventration or paralysis*
The RUC reviewed the survey results from 73 surgeons and recommends a work RVU of 20.00 based on the survey 25th percentile, which maintains relativity within the family for this code. The RUC recommends 42 minutes of pre-service evaluation time, 15 minutes positioning time, 10 minutes scrub/dress/wait time, 120 minutes intra-service time, 30 minutes immediate post-service time, 1-99233, 1-99232, 1-99238, 2-99213, totaling 396 minutes. The hospital visits are necessary to manage systemic symptoms, side effects from surgery, and risk management of the patient's hemodynamics, chest tube, and postoperative pain. Further, respiratory support is needed, which typically includes monitoring for complications such as respiratory distress, esophageal and bowel dysfunction, infection, bleeding, and other postoperative risk factors related to the thoracotomy and diaphragmatic plication. Post-operative imaging, most commonly chest x-rays, is ordered to assess the surgical outcome of plication and rule out common complications. This procedure requires one less hospital stay due to the incision size of the thoracoscopic approach

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

compared to the larger incision for the thoracotomy approach. The post-operative office visits are necessary for the patient to be able to assess for changes from the plication and any adverse events, such as pleural effusion.

For this procedure performed via the thoracoscopic approach, less time is spent opening and closing the 3-5 significantly shorter thoracoscopic port sites. Specifically, more time is spent plicating the diaphragm because of a more challenging visualization field. This is due to a large, raised, billowing diaphragm, which continually needs repositioning and a decreased ability to palpate the leaves of the diaphragm increases worry of injuring the underlying abdominal contents. This procedure is more complex than family code 39545 due to the lack of tactile feedback and technical complexity of placing sutures in a minimally invasive manner.

To support the recommended work RVU, the RUC compared the surveyed code to the top key reference service codes 32673 *Thoracoscopy, surgical; with resection of thymus, unilateral or bilateral* (work RVU = 21.13, 150 minutes intra-service, and 447 minutes total time) and 32672 *Thoracoscopy, surgical; with resection-plication for emphysematous lung (bullous or non-bullous) for lung volume reduction (LVRS), unilateral includes any pleural procedure, when performed* (work RVU = 27.00, 120 minutes intra-service, and 567 minutes total time). Survey respondents indicated that the surveyed code had either identical or more stress, physical effort, and skill when compared to key reference service code 32673. Specifically, the surgical visualization for the surveyed code is not as clear as the reference code 32673. This increases overall intensity and complexity as the surgeon is placing blind stitches for repositioning the elevated diaphragm. Further, for the second reference code, 32672, which has a higher work RVU and total time than the surveyed code, the survey respondents indicated that the technical skill/physical effort was identical to, somewhat more, or more complex compared to the reference code. The technical skill and physical effort of the surveyed code are identical or more complex when compared to reference code 32673 because the end result of plication is a reduction in the size of the markedly redundant elevated diaphragm striving to get the correct tension, and the reference code is a resection of significantly over-inflated lung, but ultimately not resecting too much lung.

For additional support, the RUC referenced MPC codes 37215 *Transcatheter placement of intravascular stent(s), cervical carotid artery, open or percutaneous, including angioplasty, when performed, and radiological supervision and interpretation; with distal embolic protection* (work RVU = 17.75, 103 minutes intra-service, and 337 minutes total time) and 35301 *Thromboendarterectomy, including patch graft, if performed; carotid, vertebral, subclavian, by neck incision* (work RVU = 21.16, 120 minutes intra-service, and 404 minutes total time). The surveyed code work RVU is appropriately bracketed by the MPC codes, given the similar intra-service times and intensity/complexity, although lower total time of the surveyed code. The RUC also referenced CPT code 27280 *Arthrodesis, sacroiliac joint, open, includes obtaining bone graft, including instrumentation, when performed* (work RVU = 20.00, 120 minutes intra-service, and 383 minutes total time). The reference code and surveyed code have identical intra-service time and similar total time and therefore should be valued similarly. **The RUC recommends a work RVU of 20.00 for CPT code 395X2.**

Practice Expense

The Practice Expense (PE) Subcommittee reviewed the direct practice expense inputs and made no modifications to the standard 090-day global inputs. The specialties clarified that SA054 *pack, post-op incision care (suture)* is typical for removal of the retained suture at the chest tube site. **The RUC recommends the direct practice expense inputs as submitted by the specialty societies.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

New Technology
CPT code 395X2 will be placed on the New Technology list and be re-reviewed by the RUC in three years to ensure correct valuation, patient population, and utilization assumptions.

Global Period: 090 Current Work RVU: **14.67** RUC Recommended RVU: **18.45**

CPT Descriptor: Plication of diaphragm for eventration or paralysis, via thoracotomy

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 59-year-old female has increasing dyspnea including when lying flat. An elevated right hemidiaphragm is evident on chest X ray. Diagnostic testing is consistent with eventration. Thoracotomy with plication of diaphragm is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 88%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 98% , In the ASC 2%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 0% , Overnight stay-less than 24 hours 14% , Overnight stay-more than 24 hours 86%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 98%

Description of Pre-Service Work: Within 24 hours prior to surgery, preadmission work-up is reviewed including imaging studies and pulmonary function tests. The patient is seen and interval history and physical exam completed to rule out concurrent illness and any contraindication to surgery. Review indications, planned surgical procedure, expected recovery, and expected outcomes including possible complications with patient and family. Answer questions and obtain informed consent. Operative site marking is performed. Preoperative orders are completed including type and timing of antibiotics and DVT prophylaxis. Surgeon performs team briefing (anesthesia, OR staff, house staff). Surgeon dresses. Surgeon verifies all required instruments and supplies are available. Surgeon assists in transfer of patient from cart to operating table. Surgeon waits for institution of appropriate monitoring, epidural catheter, vascular access, induction of anesthesia, placement of double lumen endotracheal tube. Surgeon places patient in lateral decubitus position and directs the surgical field preparation. The surgeon scrubs, gowns, and drapes the patient. The surgeon confirms visualization of the surgical site marking and the preincision surgical pause is completed.

Description of Intra-Service Work: Single lung ventilation is instituted. A right posterolateral thoracotomy incision is performed, dividing extrathoracic muscles with electrocautery for hemostasis. The chest cavity is entered over the non-resected 8th rib. A small segment rib posteriorly is resected to facilitate rib spreading. The chest is explored. An elevated and attenuated right hemidiaphragm is visualized. The diaphragm was intact, without evidence of hernia, and amenable to plication. Starting at the medial side of the diaphragm and working to the lateral side, individual #1 permanent monofilament pledgetted sutures are weaved through the diaphragm in a U-shaped fashion. These sutures are placed going from posterior to anterior and then back posteriorly. A total of 6 to 8 individual U-stitches sutures are placed which when tied down results in a flattened taut diaphragm. The pledgets prevent the suture from tearing through the diaphragm. Additional pledgetted horizontal mattress sutures are placed if needed in areas of remaining laxity. Throughout the placement of the plication sutures, care is taken to protect the underlying abdominal contents from puncture, in this case the liver. The leaves of the diaphragm are carefully palpated before each needle pass. When the plication is completed, the chest cavity is carefully evaluated for hemostasis and then irrigated. A single chest tube is placed and connected to an appropriate drainage device. The right lung is reexpanded. The preclosure surgical pause which includes counting of instruments, needles, and sponges is completed. The ribs are carefully reapproximated with pericostal sutures, and the chest then closed in multiple layers with absorbable suture.

Description of Post-Service Work: Hospital: Sterile dressings are applied. The patient is returned to the supine position. The patient is monitored during reversal of anesthesia. Avoidance of sudden straining during extubation is stressed. Assistance is provided in transferring patient from OR table to cart. The surgeon conducts the postprocedure debriefing. Transport of patient from operating room to recovery room is monitored. Postoperative recovery care is discussed with anesthesia and nursing staff, including need for patient-controlled analgesia and antiemetics. Nursing staff is instructed in chest tube care. Immediate postoperative orders are written. A brief operative note is entered and saved to the chart. The procedure and outcome are discussed with the family. The final operative report is completed, and a copy sent to the referring physician(s). Postoperative chest X-ray and laboratory results are reviewed. Orders for transferring patient to an appropriate surgical floor are entered. Ongoing care is discussed with floor nurses. Later on the day of surgery, the surgeon performs a postoperative visit with patient where patient's status is assessed including adequacy of pain management, and the procedure discussed.

On a daily basis, and at other times as necessary, the patient is seen and examined including review of vital signs, respiratory and gastrointestinal status, incision and imaging as appropriate. Pain scores and adequacy of analgesia are assessed. Heart and lungs are auscultated. Chest tube is evaluated and criteria for removal assessed. Chart notes from nursing/other staff are reviewed. Advance diet as appropriate. Nursing/other staff questions answered. Patient and family questions answered. Patient progress notes charted. Enter daily orders as necessary. Orders for follow-up, post-discharge imaging, laboratory tests, home care, and physical therapy are entered in anticipation of discharge. Prescriptions for medications needed postdischarge are entered. Home instructions and restrictions are discussed with the patient, family, and discharge nurse. The patient is discharged when there is no evidence of infection, respiratory status stable, pain adequately controlled, and chest tube removed. All appropriate medical records are completed, including day-of- discharge progress notes, discharge summary, discharge instructions, and correspondence with all necessary providers.

Office: Perform and document an interval history and physical exam. Respiratory status is reviewed. Pain scores and adequacy of analgesia assessed. Imaging study(ies) reviewed and independently interpreted. Review other treating providers documentation. Incision examined, and remaining superficial wound closure materials are removed as needed. The patient's recovery from surgery including activities and restrictions are discussed with patient and family. Prescriptions for medication(s) and therapy are written as necessary. Complete and update leave-of-absence and short-term disability forms as required. Progress discussed as necessary with referring provider. Progress notes are entered into the medical record.

Technical skill required	40%	30%	30%
Physical effort required	10%	30%	60%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	20%	70%	10%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Diaphragmatic eventration and paralysis are distinct entities. Eventration is when all or part of the diaphragm becomes elevated due to decreased muscle fibers in the muscular portion of the diaphragm while peripheral attachments of the diaphragm to the sternum, ribs, and spine are preserved. The resulting elevation of the diaphragm can be quite marked, allowing abdominal organs to be displaced superiorly. Eventration can be congenital but most frequently occurs with increasing age. Idiopathic eventration was identified in 57% of reported cases of diaphragm elevation in one study. In contrast to eventration, diaphragmatic paralysis is an acquired condition with elevation of the diaphragm secondary to phrenic nerve injury or dysfunction. Trauma from iatrogenic causes (e.g. surgery) or non-iatrogenic causes (e.g., motor vehicle accident) can affect the phrenic nerve anywhere along its course resulting in mechanical disruption. Phrenic nerve disruption results in lack of innervation to the diaphragm with resultant atrophy of the muscle. Other causes of diaphragmatic paralysis include thoracic tumors, viral infections and other inflammatory processes. In both eventration and paralysis, the diaphragm remains intact which is in marked contrast to diaphragmatic hernia where there is complete disruption (a blowout) of the muscle.

Patients with unilateral diaphragmatic eventration or paralysis are often asymptomatic with hemidiaphragm elevation being an incidental finding on imaging studies, and they do not require surgical intervention. However, over time, those who develop

symptoms may require surgical intervention. Dyspnea on exertion is most common. Additionally, decreased lung volumes can cause restrictive pulmonary symptoms, hypoventilation, atelectasis, hypercarbia and hypoxemia. Symptoms are classically worse when lying supine or bending forward. If the left side is afflicted, digestive symptoms may be present due to rotation of the gastric fundus under the elevated diaphragm. Complete gastric volvulus with gastric outlet obstruction is also possible. Diagnostic testing requires imaging to confirm hemidiaphragm elevation and a functional study (e.g. sniff test) to confirm abnormal hemidiaphragm movement. In complex or idiopathic cases, diagnostic work-up can be quite extensive and may include tests to rule out other pulmonary, cardiac, muscular, or neurologic conditions that may contribute to exertional dyspnea. The clinical presentation of diaphragmatic eventration and paralysis is similar and distinguishing between the two sometimes impossible. Fortunately, the treatment for symptomatic eventration or paralysis is the same specifically surgical plication of the redundant but intact diaphragm which is most commonly accomplished via thoracotomy or Video-Assisted Thoracic Surgery (VATS) (thoracoscopy).

This recommendation proposes changes to the existing code 39545 (*Imbrication of diaphragm for eventration, transthoracic or transabdominal, paralytic or nonparalytic*), and the addition of new code 395X2 (*Thoracoscopy, surgical, with plication of diaphragm for eventration or paralysis*). At the May 2025 CPT meeting, the code descriptor for 39545 was changed to "*Plication of diaphragm for eventration or paralysis, via thoracotomy*." The transabdominal approach was deleted from 39545 and transthoracic clearly defined as thoracotomy. These code changes more accurately capture the current procedures commonly performed to treat symptomatic diaphragmatic eventration or paralysis.

Compelling Evidence
Code 39545 is a Harvard code that has never been RUC surveyed.

Since 39545 was last valued, there have been changes in the patient population as well as a shift in how the procedures are performed. Several compelling lines of evidence support the need to reassess the value of this service.

First, the valuation of code 39545 is currently based on flawed methodology that combines both transabdominal and transthoracic approaches together into one code. Since laparoscopic and thoracoscopic codes did not exist when 39545 was created, transabdominal means an open laparotomy approach and transthoracic a thoracotomy approach. Laparotomy and thoracotomy approaches represent entrance into and operating within totally different body cavities and do not represent similar physician work. Compared to a transabdominal approach (open laparotomy), a transthoracic (open thoracotomy) approach requires greater complexity with respect to anesthesia strategy (single lung ventilation), positioning (lateral decubitus), and incisional approach (thoracotomy). A single code incorporating two different approaches involving different body cavities would not be created today. The literature, our Expert Panel, and the American College of Surgeons (ACS) all agree that a laparotomy approach is now rarely performed for the treatment of diaphragmatic eventration or paralysis, and creation of a laparotomy approach code for diaphragmatic plication is not indicated. Having vastly differing surgical approaches within one code descriptor represents a flawed mechanism/methodology which was used in 39545's previous valuation.

Second, technological advances have changed the physician work related to code 39545. VATS (thoracoscopic) diaphragm plication has been reported in the literature for over 20 years and has become common practice in most institutions and training programs. As a result, the open thoracotomy approach described by code 39545 is now used primarily in a more complicated patient population that cannot be safely treated with VATS techniques. Reasons that a VATS plication may not be possible include distorted anatomy and adhesions from prior surgery (possibly the surgery leading to phrenic nerve dysfunction and resulting in diaphragm paralysis). Inability to tolerate one lung anesthesia is a contraindication to most VATS procedures. From the RUC Database, over the last 10-years, current code 39545 has had volumes ranging from 146 to 279 with slowly decreasing volumes since 2019. There is no evidence to suggest decreasing prevalence of this disease, therefore the decrease in 39545 to some extent represents a shift from open to thoracoscopic operations. However, VATS plications are difficult to directly measure as they are currently reported with an unlisted diaphragm code. The RUC database currently gives a Harvard based intra-service time of 113 minutes for the combined transabdominal and transthoracic 39545 code. The STS General Thoracic Surgery Database was queried for 39545. There were 2510 cases from 2012-2024. The median procedure time was 135 minutes and mean procedure time 179 minutes for the entire cohort. Of note, the procedure time was observed to increase in the later years of the cohort. While the STS General Thoracic Surgery Database (GTSD) contained time data on over 2500 cases, that was over 12 years reinforcing its low volume. Data entry into the GTSD is limited to participating hospitals and surgeons, and diaphragm plication is classified as a non-analyzed procedure within the registry meaning data entry is optional. It is supportive of time data but limited in most other regards. A thoracoscopic approach was not available when 39545 was valued by Harvard. This new technology has shifted the patient population treated with 39545 to a more complicated cohort of patients, which has resulted in longer intra-service times than when valued through the Harvard study.

In summary, we believe that because of incorrect assumptions made in the previous valuation, and advances in technology with resultant changes in intra-service time, compelling evidence supporting an increase in value for code 39545 has been met.

Rationale 39545
The descriptor of existing code 39545 was changed by CPT from *Imbrication of diaphragm for eventration, transthoracic or transabdominal, paralytic or nonparalytic* to *Plication of diaphragm for eventration or paralysis, via thoracotomy.* The descriptor change updated the terminology from imbrication to the more commonly used term plication and revises the approaches of transthoracic or transabdominal, both contained in the same descriptor to just a thoracotomy approach. Thoracotomy is the most

common open approach now used for diaphragm plication. Laparotomy is largely of historical interest. This was confirmed in discussions with our Expert Panel and the ACS. Both groups could not justify creation of a laparotomy approach plication code. In the rare event a laparotomy approach is used, correct coding would be 39599 (*Unlisted diaphragm).* If a laparotomy were to be added to a thoracotomy approach, with appropriate supporting documentation, the -22 modifier *(Increased procedural services*) could be used.

While a laparoscopic diaphragmatic plication approach has been described in the literature, it has not become a common way of plicating the diaphragm. The literature on laparoscopic plication is predominantly small case series with primarily one physician group reporting this approach and their work subsequently referenced in several articles. The STS and ACS discussed creation of a laparoscopic diaphragmatic plication Category I code but did not think the literature supported creating one. ACS did not believe laparoscopic plication is done by enough of its members to support creation and survey of a separate laparoscopic plication code and if performed, it would also be reported with the unlisted diaphragm code (39599).

ACS was supportive of STS' efforts to update code 39545 to reflect a single open approach via thoracotomy and creation of thoracoscopic code 395X2.

The Society of Thoracic Surgeons and the American Association for Thoracic Surgery conducted a RUC survey of U.S. members who self-identify as general thoracic surgeons and received 58 responses for 39545. They convened an Expert Panel of General Thoracic surgeons to review the results.

Code 39545 is a Harvard code that has never been surveyed or reviewed by the RUC. It has a current RVW of 14.67. For revised code 39545 diaphragm plication via thoracotomy, the survey respondents indicated a pre-service evaluation time of 45 minutes, positioning time of 15 minutes and scrub, dress and wait time of 10 minutes, a median intra-service time of 120 minutes and an immediate post-service time of 30 minutes. Interestingly, the surveyed median intra-service time for 39545 is exactly the same as the intra-service time for the new thoracoscopy plication code 395X2. While we can't explain the similar total intra-service times other than coincidence, we think it important to discuss the allocation of time within each procedure which is significantly different. For 39545, more time is spent opening and closing the much longer rib-cutting thoracotomy incision. Less time is spent plicating the diaphragm because of the bigger opening allowing for direct visualization and the ability to palpate the leaves of the diaphragm before each pass of the needle. Palpation of the diaphragm decreases the risk of injuring non-visualized intra-abdominal structures. In contrast, for 395X2, less time is spent opening and closing the 3 – 5 significantly shorter thoracoscopic port sites. In 395X2, more time is spent plicating the diaphragm because of more challenging visualization due to a large, raised billowing diaphragm and a decreased ability to palpate the leaves of the diaphragm increasing worry of injuring the underlying abdominal contents.

Pre-service Time
The specialty societies selected pre-service time package 4 facility for a difficult patient and difficult procedure. Symptomatic patients considered for surgery are typically complicated patients with a history of previous surgery and other comorbidities. Because of longstanding significant dyspnea, these patients typically present in a deconditioned state. Adjustments to the pre-service time package include an increase of 5 minutes of pre-evaluation time due to the complexity of the case, including review of additional studies such as PFT, sniff test, nerve conduction studies and/or ECHO that would not typically be reviewed for other procedures performed via thoracotomy. A detailed pre-procedure briefing is conducted including anesthesia (single lung anesthesia with good lung on the downside), nursing, other OR personnel discussing patient positioning prior to induction of anesthesia. For positioning, 12 minutes were added for a total of 15 minutes to account for placing the patient from supine to a lateral decubitus position. This is consistent with other procedures performed via thoracotomy. The scrub dress and wait time was decreased by 10 minutes based on the survey.

Post-service Time
The societies selected post-service time package 9B for general anesthesia and complex procedure. Per the survey respondents, the immediate post-service time was decreased by 3 minutes for a total of 30 minutes immediate post-service time.

98% of respondents indicated that the procedure is performed in the hospital and 89% of respondents indicated that the patient stays in the hospital overnight for more than 24 hours with 98% of respondents indicating that they provide a level three subsequent hospital visit to the patient on the same day as the procedure. The survey supports two additional E/M visits after the day of surgery, which include a level two subsequent hospital visit the day after surgery and a level one subsequent hospital visit the next day with discharge day management services of 30 minutes or less on the day of discharge and two level three office visits during the global period.

The first postop visit in the hospital the same day as the procedure requires high-level medical decision making with management of systemic symptoms and side effects from the surgery and risk related to management of the patient's hemodynamics, chest tube, postoperative pain, respiratory support which typically includes mechanical or non-invasive ventilation in the immediate post-operative period and monitoring the patient for complications including respiratory distress, esophageal and bowel dysfunction due to anatomical functional changes of the diaphragm, infection, bleeding and other postoperative risk factors related to the thoracotomy and diaphragmatic plication. Post-operative imaging, most commonly chest x-rays, are ordered and reviewed including independent interpretation of images to assess the surgical outcome of plication and rule-out common complications.

The second post-operative level two visit represents moderate medical decision making with many of the immediate high-level postoperative problems and risk beginning to resolve but still requiring close management related to systemic issues and risk related to hemodynamics, chest tube, respiratory, esophageal and bowel function, and pain including prescription drug management and review of chest x-rays and other imaging if needed to assess postoperative recovery.

The third post-operative level one visit represents low-level medical decision making with the majority of the postoperative systemic issues and risk related to hemodynamic, respiratory, esophageal and bowel function, and pain management resolving, the chest tube is removed, and imaging and labs as necessary are ordered and reviewed.

The survey respondents indicated two level three E/M office visits during the 90-day global procedure. Both visits require medical decision making requiring continued monitoring of the patient's respiratory, esophageal and bowel function as well as post-operative wound and pain management, and review of oxygen saturation. Review of chest x-ray or other imaging is performed as needed. The visits will typically include prescription drug management and continued management of the patient's respiratory status and recovery which may require other interventions such as respiratory therapy.

In summary, we feel that thoracotomy code 39545 is most commonly performed in a more complicated patient population in which VATS cannot typically be performed. More intra-service time is allocated to the opening and closing of the thoracotomy incision and less time to the plication because of the larger operative field yielding direct visualization and palpation of the diaphragm. Therefore, based on the survey results, the specialty societies are recommending the 25th RVW of 18.45 and median intra-service time of 120 minutes with 45 minutes for pre-service evaluation time, 15 minutes of positioning time, 10 minutes of scrub, dress and wait time with 30 minutes of immediate post-service time with three subsequent hospital visits, discharge day management and two office visits for a total time of 419 minutes.

The table below, provides several reference codes with 90-day global periods valued by the RUC in 2010 or later with the same or a lower intra-service time and similar total times that bracket the recommended values for code 39545.

39545 Reference Codes

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 39545

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Thoracic surgery How often? Sometimes

Specialty Cardiac Surgery How often? Sometimes

Specialty General Surgery How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 385
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. It is estimated that 60% of patients that undergo plication for diaphragmatic envetration or paralysis are under 65 years of age.

Specialty Thoracic surgery Frequency 279 Percentage 72.46 %

Specialty Cardiac surgery Frequency 91 Percentage 23.63 %

Specialty General Surgery Frequency 15 Percentage 3.89 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 241
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. This is based on the RUC Database 2023 Utilization of the code

Specialty Thoracic Surgery Frequency 176 Percentage 73.02 %

Specialty Cardiac Surgery Frequency 28 Percentage 11.61 %

Specialty General Surgery Frequency 37 Percentage 15.35 %

Do many physicians perform this service across the United States? Yes

---

CPT Descriptor: Thoracoscopy, surgical, with plication of diaphragm for eventration or paralysis

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 45-year-old female has increasing dyspnea and history of motor vehicle accident 5 years ago. An elevated right hemidiaphragm is evident on chest X ray. Diagnostic testing is consistent with right hemidiaphragm paralysis. Thoracoscopy with plication is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 93%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 99% , In the ASC 1%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 0% , Overnight stay-less than 24 hours 36% , Overnight stay-more than 24 hours 64%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 99%

Description of Pre-Service Work: Within 24 hours prior to surgery, preadmission work-up is reviewed including imaging studies and pulmonary function tests. The patient is seen and interval history and physical exam completed to rule out concurrent illness and any contraindication to surgery. Review indications, planned surgical procedure, expected recovery, and expected outcomes including possible complications with patient and family. Answer questions and obtain informed consent. Operative site marking is performed. Preoperative orders are completed including type and timing of antibiotics and DVT prophylaxis. Surgeon performs team briefing (anesthesia, OR staff, house staff). Surgeon dresses. Surgeon verifies all required instruments and supplies are available including reusable and disposable thoracoscopic equipment. Surgeon assists in transfer of patient from cart to operating table. Surgeon waits for institution of appropriate monitoring, vascular access, induction of anesthesia, placement of double lumen endotracheal tube. Surgeon places patient in lateral decubitus position and directs the surgical field preparation. The surgeon scrubs, gowns, and drapes the patient. The surgeon ensures all equipment necessary for thoracoscopy (e.g. thoracoscope(s), fiberoptic light cord, video camera, cautery cord) are placed sterilely in the surgical field, activated, and settings properly adjusted. The surgeon confirms visualization of the surgical site marking and the preincision surgical pause is completed.

Description of Intra-Service Work: Single lung ventilation is instituted. Using local infiltrative anesthetic, a small lateral access incision made over the top of the 6th rib and after digital palpation, a trocar placed. The thoracoscope advanced into the chest cavity and the chest is explored. An elevated and attenuated right hemidiaphragm is visualized. The diaphragm was intact, without evidence of hernia, and amenable to thoracoscopic plication. Two to four additional small incisions appropriately placed and under direct vision access gained to the chest cavity. Using a thoracoscopic forceps, the diaphragm is displaced downward and using permanent suture, multiple pledgeted running horizontal mattress sutures are individually placed. These extend from the cardiophrenic angle to the lateral chest wall. Care is taken to protect the intraabdominal contents during suture placement. These sutures are placed until the diaphragm is flat and taut. Five to eight sutures are placed with additional pledgetted mattress sutures placed as necessary in areas of laxity. Once the repair is completed, the pleural cavity explored to ensure hemostasis and irrigated. A chest tube placed and connected to an appropriate drainage device. The lung is reexpanded. The preclosure surgical pause which includes counting of instruments, needles, and sponges is completed. The individual thoracoscopic incisions are checked for hemostasis and then closed with multiple layers of absorbable suture.

Description of Post-Service Work: Hospital: Sterile dressings are applied. The patient is returned to the supine position. The patient is monitored during reversal of anesthesia. Avoidance of sudden straining during extubation is stressed. Assistance is provided in transferring patient from OR table to cart. The surgeon conducts the postprocedure debriefing. Transport of patient from operating room to recovery room is monitored. Postoperative recovery care is discussed with anesthesia and nursing staff, including need for patient-controlled analgesia and antiemetics. Nursing staff is instructed in chest tube care. Immediate postoperative orders are written. A brief operative note is entered and saved to the chart. The procedure and outcome are discussed with the family. The final operative report is completed, and a copy sent to the referring physician(s). Postoperative chest X-ray and laboratory results are reviewed. Orders for transferring patient to an appropriate surgical floor are entered. Ongoing care is discussed with floor nurses. Later on the day of surgery, the surgeon conducts a postoperative visit with the patient where patient status assessed including adequacy of pain management, and the procedure discussed.

On a daily basis, and at other times as necessary, the patient is seen and examined including review of vital signs, respiratory and gastrointestinal status, incision and imaging as appropriate. Pain scores and adequacy of analgesia are assessed. Heart and lungs are auscultated. Chest tube is evaluated and criteria for removal assessed. Chart notes from nursing/other staff are reviewed. Advance diet as appropriate. Nursing/other staff questions answered. Patient and family questions answered. Patient progress notes charted. Enter daily orders as necessary. Orders for follow-up, post-discharge imaging, laboratory tests, home care, and physical therapy are entered in anticipation of discharge. Prescriptions for medications needed postdischarge are entered. Home instructions and restrictions are discussed with the patient, family, and discharge nurse. The patient is discharged when there is no evidence of infection, respiratory status stable, pain adequately controlled, and chest tube removed. All appropriate medical records are completed, including day-of- discharge progress notes, discharge summary, discharge instructions, and correspondence with all necessary providers.

Office: Perform and document an interval history and physical exam. Respiratory status is reviewed. Pain scores and adequacy of analgesia assessed. . Imaging study(ies) reviewed and independently interpreted. Review other treating providers documentation. Incision examined, and remaining superficial wound closure materials are removed as needed. The patient’s recovery from surgery including activities and restrictions are discussed with patient and family. Prescriptions for medication(s) and therapy are written as necessary. Complete and update leave-of-absence and short-term disability forms as required. Progress discussed as necessary with referring provider. Progress notes are entered into the medical record.

INTENSITY/COMPLEXITY MEASURES

(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	4%	61%	32%	4%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	4%	54%	43%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	11%	57%	32%
Physical effort required	11%	61%	29%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	11%	54%	36%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	40%	50%	10%	0%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	50%	30%	20%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	10%	60%	30%
Physical effort required	10%	50%	40%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	40%	40%	20%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Diaphragmatic eventration and paralysis are distinct entities. Eventration is when all or part of the diaphragm becomes elevated due to decreased muscle fibers in the muscular portion of the diaphragm while peripheral attachments of the diaphragm to the sternum, ribs, and spine are preserved. The resulting elevation of the diaphragm can be quite marked allowing abdominal organs to be displaced superiorly. Eventration can be congenital but most frequently occurs with increasing age. Idiopathic eventration was identified in 57% of reported cases of diaphragm elevation in one study. In contrast to eventration, diaphragmatic paralysis is an acquired condition with elevation of the diaphragm secondary to phrenic nerve injury or dysfunction. Trauma from iatrogenic causes (e.g. surgery) or non-iatrogenic causes (e.g., motor vehicle accident) can affect the phrenic nerve anywhere along its course resulting in mechanical disruption. Phrenic nerve disruption results in lack of innervation to the diaphragm with resultant atrophy of the muscle. Other causes of diaphragmatic paralysis include thoracic tumors, viral infections and other inflammatory processes. In both eventration and paralysis, the diaphragm remains intact which is in contrast to diaphragmatic hernia where there is disruption (a blowout) of the muscle.

Patients with unilateral diaphragmatic eventration or paralysis are often asymptomatic with hemidiaphragm elevation being an incidental finding on imaging studies and they do not require surgical intervention. However, over time, those who develop symptoms may require surgical intervention. Dyspnea on exertion is most common. Additionally, decreased lung volumes can cause restrictive pulmonary symptoms, hypoventilation, atelectasis, hypercarbia and hypoxemia. Symptoms are classically worse when

lying supine or bending forward. If the left side is afflicted, digestive symptoms may be present due to rotation of the gastric fundus under the elevated diaphragm. Complete gastric volvulus with gastric outlet obstruction is also possible. Diagnostic testing requires imaging to confirm hemidiaphragm elevation and a functional study (e.g. sniff test) to confirm abnormal hemidiaphragm movement. In complex or idiopathic cases, diagnostic work-up can be quite extensive and may include tests to rule out other pulmonary, cardiac, muscular, or neurologic conditions that may contribute to exertional dyspnea. The clinical presentation of diaphragmatic eventration and paralysis is similar and distinguishing between the two is sometimes impossible. Fortunately, the treatment for symptomatic eventration or paralysis is the same specifically surgical plication of the redundant but intact diaphragm which is most commonly accomplished via Video-Assisted Thoracic Surgery (VATS) (thoracoscopy) or thoracotomy.

This recommendation proposes valuation of new code 395X2 (*Thoracoscopy, surgical, with plication of diaphragm for eventration or paralysis*) and the revised code 39545 (*Plication of diaphragm for eventration or paralysis, via thoracotomy*). These codes more accurately capture the current procedures commonly performed to treat symptomatic diaphragmatic eventration or paralysis.

Rationale 395X2
Code 395X2 Thoracoscopy, surgical, with plication of diaphragm for eventration or paralysis is a new code to account for diaphragm repair via thoracoscopy, which was not an approach available when code 39545 was initially created.

The Society of Thoracic Surgeons and the American Association for Thoracic Surgery conducted a RUC survey of U.S. members who self-identify as general thoracic surgeons and received 73 responses for 395X2. They convened an Expert Panel of General Thoracic surgeons to review the results.

For code 395X2 diaphragm plication via thoracoscopy, the survey respondents indicated a pre-service evaluation time of 42 minutes, positioning time of 15 minutes and scrub, dress and wait time of 10 minutes, a median intra-service time of 120 minutes and an immediate post-service time of 30 minutes. Interestingly, the surveyed median intra-service time for 395X2 is exactly the same as the intra-service time for code 39545. While we can't explain the similar total intra-service times other than coincidence, we think it important to discuss the significantly different allocation of time within each procedure. For 39545, more time is spent opening and closing the much longer rib-cutting thoracotomy incision. Less time is spent plicating the diaphragm because of the bigger opening allowing for direct visualization and ability to palpate the leaves of the diaphragm before each pass of the needle. Palpation of the diaphragm decreases the risk of injuring non-visualized intra-abdominal structures. In contrast, for 395X2, less time is spent opening and closing the 3 – 5 significantly shorter thoracoscopic port sites. In 395X2, more time is spent plicating the diaphragm because of more challenging visualization due to a large, raised billowing diaphragm which continually needs repositioning and a decreased ability to palpate the leaves of the diaphragm increasing worry of injuring the underlying abdominal contents.

Pre-service Time
The specialty societies selected pre-service time package 4 facility for a difficult patient and difficult procedure. Symptomatic patients considered for surgery are typically complicated patients who present in a deconditioned state due to prolonged breathing issues with significant dyspnea and a history of previous surgery and other comorbidities Adjustments to the pre-service time package include an increase of 2 minutes of pre-evaluation time due to the complexity of the case. Including review of additional studies such as PFT, sniff test, nerve conduction studies and/or ECHO that would not typically be reviewed for other procedures performed via thoracoscopy. These patients often have significant dyspnea particularly when supine. A detailed pre-procedure briefing including anesthesia (single lung anesthesia with good lung on the downside), nursing, other OR personnel discussing patient positioning prior to induction of anesthesia. For positioning, 12 minutes were added for a total of 15 minutes to account for placing the patient from supine to a lateral decubitus position. This is consistent with other procedures performed via thoracoscopy. The scrub dress and wait time was decreased by 10 minutes based on the survey.

Post-service Time
The societies selected post-service time package 9B for general anesthesia and complex procedure. Per the survey respondents, the immediate post-service time was decreased by 3 minutes for a total of 30 minutes immediate post-service time.

99% of respondents indicated that the procedure is performed in the hospital and 64% of respondents indicated that the patient stays in the hospital overnight for more than 24 hours with 99% of respondents indicating that they provide a level three subsequent hospital visit to the patient on the same day as the procedure. The survey supports an additional level two subsequent hospital visit the day after surgery, and discharge day management services of 30 minutes or less on the day of discharge and two level three office visits during the global period.

The first postop visit in the hospital the same day as the procedure requires high level medical decision making with management of systemic symptoms and side effects from the surgery and risk related to management of the patient's hemodynamics, chest tube, postoperative pain, respiratory support which typically includes mechanical or non-invasive ventilation in the immediate post-operative period and monitoring the patient for complications including respiratory distress, esophageal and bowel dysfunction due to anatomical functional changes of the diaphragm, infection, bleeding and other postoperative risk factors related to the thoracoscopy and diaphragmatic plication. Post operative imaging including most commonly chest x-rays are ordered and reviewed, including independent interpretation of images to assess the surgical outcome of plication and rule-out common complications.

The second post-operative level two visit represents moderate medical decision making with many of the immediate high-level postoperative problems and risk beginning to resolve but still requiring close management related to systemic issues and risk related to hemodynamics, chest tube removal, respiratory, esophageal and bowel function, and pain including prescription drug management and review of chest x-rays and other imaging if needed to assess postoperative recovery.

The survey shows one less hospital visit for 395X2 compared to 39545. This results in the decreased total time of 396 minutes for the VATS approach vs. 419 minutes for thoracotomy.

The survey respondents indicated two level three E/M office visits during the 90-day global procedure. Both visits require medical decision making requiring continued monitoring of the patient's respiratory, esophageal and bowl functions as well as post-operative wound and pain management, and review of oxygen saturation. Review of chest x-ray or other imaging is performed as needed. The visits will typically include prescription drug management and continued management of the patient's respiratory status and recovery which may require other interventions such as respiratory therapy.

The Expert Panel discussed the RVW of 20.00 for code 395X2 for an intra-service time of 120 minutes and total time of 396 minutes compared to the lower RVW recommendation of 18.45 for code 39545 with 120 minutes of intra-time and a total time of 419 minutes.

The VATS (thoracoscopic) approach (395X2)represents a technically more complex procedure while the open thoracotomy approach (39545) represents a more complicated patient population. 39545 has a population where VATS cannot be performed. Although the intra-service times are the same for the procedures, the time is allocated differently. For the thoracotomy procedure, the majority of the time is allocated to opening and closing of the thoracotomy incision and less time is allocated to the plication resulting in a lower overall intensity for the intra-operative portion of that procedure. In contrast to the thoracotomy procedure, the thoracoscopic procedure has increased intraoperative complexity because of, but not limited to, issues related to exposure and loss of tactile feedback. The surgeon can't easily palpate the leaves of the diaphragm and underlying abdominal contents through the small VATS trocar sites. Additionally, the surgical field is more restricted due to elevation of the diaphragm and having to operate within the confines of the rigid chest wall. There is no rib spreading. It is more difficult to push the elevated diaphragm downwards using thoracoscopic instruments compared to manual reduction with an open approach. This is particularly evident on the right side due to the liver. Because of the inability to palpate the diaphragm, the intensity of the thoracoscopy procedure is also higher because of the increased risk of puncturing the underlying abdominal contents (e.g. liver, spleen, stomach, colon) with each pass of the needle. Injury to intrathoracic structures out of the camera's field of view or on the non-visualized abdominal side of the diaphragm is therefore a greater concern with the thoracoscopic 395X2 procedure. Finally, assessment of diaphragm tension is more nuanced without manual palpation.

The increased complexity of the thoracoscopic diaphragm plication procedure is further reflected through the surveyees' responses to the intensity and complexity measures compared to the KRS codes. Code 32673 (Thoracoscopic resection of the thymus) was selected as KRS 1 by the survey respondents, and has a higher wRVU, intra-time, and total time, than the new procedure. The survey respondents indicated that new code 395X2 had either identical or more stress, physical effort, and skill than KRS 1. With VATS thymus resection, there is much clearer visualization of the thymus. 395X2 VATS diaphragm plication is accomplished though placement of blind stitches for repositioning the elevated diaphragm. The visualization is not as clear, and there is a higher risk of injury to the underlying abdominal structures. This results in a higher overall intensity for the new procedure compared to code 32673. For KRS 2, 32672 (Thoracoscopic LVRS), which has a higher wRVU and total time than KRS1 and the surveyed code, the survey respondents indicated that the overall intensity, mental effort and judgement and psychological stress was identical to, somewhat less or less than KRS 2 and the technical skill/physical effort was identical to, somewhat more, or more complex compared to the KRS 2. Similar to diaphragm plication, the LVRS code represents a VATS procedure that also has limited visualization due to the significantly over-inflated emphysematous lung within the confines of the rigid chest wall. With KRS 2, there are concerns for injuring the adjacent more normal lung. The technical skill and physical effort of 395X2 is identical or more complex because the end result of plication is a reduction in the size of the markedly redundant elevated diaphragm striving to get the correct tension, and KRS 2 which is a resection of significantly over-inflated lung but ultimately not resecting too much lung.

Therefore, based on the survey results, the specialty societies are recommending the 25th RVW of 20.00 and median intra-service time of 120 minutes with 42 minutes of pre-service evaluation time, 15 minutes of positioning time, 10 minutes of scrub, dress and wait time with 30 minutes of immediate post-service time with two subsequent hospital visits, discharge day management and two office visits for a total time of 396 minutes.

The table below provides several reference codes with 90-day global periods valued by the RUC in 2010 or later with the same or a lower intra-service time and similar total times that bracket the recommended values for code 395X2.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 39599

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Thoracic Surgery How often? Sometimes

Specialty Cardiac Surgery How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 90
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. It is estimated that volume of thoracoscopic eventration and paralysis repair is around 23% of those that are repaired via thoracotomy.

Specialty Thoracic surgery Frequency 74 Percentage 82.22 %

Specialty Cardiac surgery Frequency 16 Percentage 17.77 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 36 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. it is estimated that 40% of the population undergoing thoracoscopic plication are Medicare patients.

Specialty Thoracic surgery Frequency 30 Percentage 83.33 %

Specialty Cardiac surgery Frequency 6 Percentage 16.66 %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States?

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:

PRESENTER(S): Joseph Turek, MD: Vigneshwar Kasirajan, MD; Daniel McCarthy, MD; Matthew Reinserman, MD

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

Meeting Date: September 2025

CPT Code	Long Descriptor	Global Period
39545	Plication of diaphragm for eventration or paralysis, via thoracotomy	090
395X2	Thoracoscopy, surgical, with plication of diaphragm for eventration or paralysis	090

Vignette(s) (*vignette required even if PE only code(s)***):**

CPT Code	Vignette
39545	A 59-year-old female has increasing dyspnea including when lying flat. An elevated right hemidiaphragm is evident on chest X ray. Diagnostic testing is consistent with eventration. Thoracotomy with plication of diaphragm is performed.
395X2	A 45-year-old female has increasing dyspnea and history of motor vehicle accident 5 years ago. An elevated right hemidiaphragm is evident on chest X ray. Diagnostic testing is consistent with right hemidiaphragm paralysis. Thoracoscopy with plication is performed.

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:
   The specialty societies convened a consensus panel to develop the PE recommendations based on best practices and RUC guidelines.

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here:
   Code 39545 is an existing code. Code 395X2 is a new code and code 32673 was selected as the first key reference code for physician work. 32673 is a 90-day global thoracoscopic procedure that is also a facility only service.
   NOTE: For services reviewed prior to the implementation of clinical activity codes in 2016-17, detail is not provided in the RUC database, please contact *Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org* for PE spreadsheets for your older reference codes.

3. Is this code(s) typically reported with an E/M service?
   No
   See the *Billed Together* tab in the RUC Database.

4. If you are requesting an increase over the aggregate current cost for clinical activities, supplies and equipment, please provide compelling evidence:
   NA Code 39545 is an existing code that was re-surveyed due to a change in the descriptor. The practice expense goes down based on changes in the post-operative visits and application of RUC approved pre-service clinical staff time package for 90 day global procedures in the facility setting.
   See the *PE compelling evidence guidelines* on the RUC Collaboration website. Be sure to explain if the increase can be entirely accounted for because of an increase in physician time.

CLINICAL STAFF ACTIVITIES

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

The RUC has agreed that there is a presumption of zero pre-service clinical staff time unless the specialty can provide evidence to the PE Subcommittee that any pre-service time is appropriate. The RUC agreed that with evidence some subset of codes may require either minimal or extensive use of clinical staff and has allocated time when appropriate (for example when a service describes a major surgical procedure). If the package times are not applicable, alternate times may be presented and should be justified for consideration by the Subcommittee.

5. Are the global periods of the codes transitioning? Information about the amount of pre-service clinical staff time and a rationale for the change from a 090-day global to a 000 or 010 day global should be described below.

N/A

6. If you are recommending more minutes than the PE Subcommittee standards for clinical activities, you must provide rationale to justify the time:

N/A

7. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (*please see 2nd worksheet tab in PE spreadsheet*), please explain the difference here:

N/A

8. Please provide a brief description of the clinical staff work for the following:
   a. Pre-Service period:

Activity	**Clinical Staff Work**
Complete pre-service diagnostic and referral forms	Staff reviews all forms with patient and family to ensure all relevant history and diagnostic information is included.
Coordinate pre-surgery services (including test results)	Staff coordinates the collection and documentation of preservice imaging/lab results, patient specific information and other relevant patient information for the surgical procedure including the pre-surgery assessment from the anesthesiologist. Staff enters and records all clinical updates in EHR.
Schedule space and equipment in facility	Staff interacts with facility to schedule the operating room, supplies, equipment, and reviews checklists.
Provide pre-service education/obtain consent	Staff reviews the procedure, complications, risk, expected recovery, and answers the patient and family questions.
Complete pre-procedure phone calls and prescription	Staff reviews preoperative medication changes, preop diet restrictions, reviews patient medical status and answers final pre-admission questions.

   b. Service period (includes pre, intra and post):

Prior to discharge, office clinical staff will assist with necessary post-discharge care coordination, such as: Responding to patient/family questions about dietary restrictions if applicable, respiratory therapy if needed and home activity restrictions. Coordinates with other physicians and QHPs involved in the care of the patient for transfer of records. Transitions discharge information to the surgeon's office medical record, including medication list, correspondence and imaging or lab results pending at discharge.

   c. Post-service period:

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

The clinical staff work includes the standard activities involved in office E/M visits including ensuring the appropriate supplies are available in the room, ensuring imaging and lab reports are available, rooming and gowning the patient, reviewing current medications/allergies in EHR, obtaining vital signs, assisting with positioning, wound care, coordination of care, cleaning of the room, and home instructions.

9. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (*please see 2nd worksheet tab in PE spreadsheet*):

N/A

10. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov.

N/A

MEDICAL SUPPLIES & EQUIPMENT/INVOICES

11. ☐ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

12. ☐ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

13. If you wish to include a supply that is not on the Direct PE Inputs Medical Supplies Listing (*please see 4th worksheet tab in PE spreadsheet*), a paid invoice is required. Identify and explain the supply input and invoice here:

N/A

14. Are you recommending a PE supply pack for this recommendation? Yes or No.
If Yes, please indicate if the pack is an established package of supplies as defined by CMS (eg, SA047 *pack, E/M visit*) or a pack that is commercially available?

Yes, the specialty societies have included recommendations that include established PE supply packs (CMS defined) for each code:

- SA048 pack, minimum mutli-specialty visit
- SA054 pack, post-op incision care (suture)

15. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation (*please see 8-10th worksheet tabs in PE spreadsheet*). Please include the description, CMS supply code, unit, item quantity and unit price (if available).

DESCRIPTION	Code	Unit	Item Qty	Unit price
pack, minimum multi-specialty visit	**SA048**	**pack**		**5.02**
paper, exam table		foot	7	
gloves, non-sterile		pair	2	
gown, patient		item	1	
pillow case		item	1	
cover, thermometer probe		item	1	

DESCRIPTION	Code	Unit	Item Qty	Unit price
pack, post-op incision care (suture)	**SA054**	**pack**		**4.62**
kit, suture removal		kit	1	
povidone soln (Betadine)		ml	10	
gauze, sterile 4in x 4in		item	2	
gloves, sterile		pair	1	
steri-strip (6 strip uou)		item	2	
swab-pad, alcohol		item	2	
tape, surgical paper 1in (Micropore)		inch	12	
tincture of benzoin, swab		item	1	

16. If you wish to include an equipment item that is not on the Direct PE Inputs Equipment Listing (*please see 5th worksheet tab in PE spreadsheet*), a paid invoice is required. Identify and explain the equipment input and invoice here:

N/A

17. Please provide an estimate of the useful life of the new equipment item as required to calculate the equipment cost per minute:

N/A

18. Have you recommended equipment minutes for a computer or equivalent laptop/integrated computer, equipment item computer, desktop, w-monitor, ED021 or notebook (Dell Latitute D600), ED038?
    a. If yes, please explain how the computer is used for this service(s).
    b. Is the computer used exclusively as an integral component of the service or is it also used for other purposes not specific to the code?
    c. Does the computer include code specific software that is typically used to provide the service(s)?

N/A

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

19. List all the equipment included in your recommendation and the equipment formula chosen *(please see 7th worksheet tab in PE spreadsheet: Equipment minute formulas).* If you have selected "other formula" for any of the equipment please explain here:

The specialty societies are recommending time based on the 'office visit' equipment formula for EF014 light, surgical and EF031 table, power.

PE-ONLY CODES ADDITIONAL INFORMATION

20. (a) Estimate the number of times this service might be provided nationally in a one-year period?
(b) Estimate the number of times this service might be provided to Medicare patients nationally in a one-year period?

21. Please select a Professional Liability Insurance (PLI) crosswalk based on a similar specialty mix:

ADDITIONAL INFORMATION

22. If there is any other item(s) on your spreadsheet not covered in the categories above that requires greater detail/explanation, please include here:

The majority of cardiothoracic surgeons utilize RN's or advance practice providers (PA's or NP's) because of the complexity of triaging outpatient care for cardiothoracic surgery patients. Since CMS does not recognize PAs or NPs as clinical staff, the RN level has been traditionally accepted. This is a long-standing standard and is consistent in the family of cardiothoracic surgery codes that are not typically performed by multiple specialties. Codes 39545 and 395X2 are predominately performed by cardiothoracic surgeons and would not be considered multi-specialty procedures.

FACILITY DIRECT PE INPUTS

CPT CODE(S): 39545, 395X2
SPECIALTY SOCIETY(IES): AATS, STS
PRESENTER(S): Joseph Turek, MD: Vigneshwar Kasirajan, MD; Daniel McCarthy, MD; Matthew Reinserman, MD

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

ITEMIZED LIST OF CHANGES (FOLLOWING THE PE SUBCOMMITTEE MEETING)

NOTE: The PE spreadsheets will be updated and finalized in real-time at the meeting. PE SORs must be updated based on modifications made during the meeting and resubmitted asap. The PE SOR should match the updated PE spreadsheet. Please provide a list of the modifications made to the PE spreadsheet during the PE Subcommittee meeting in the space below with brief justification for the modification (e.g. Equipment item EF023 *table, exam* was changed to EF031 *table, power* as the power table is typical in the surgeon's office).

The PE SOR serves as key support for the spreadsheet and should include any important details/explanation for the inputs as these cannot be elaborated upon in the excel document itself.

Please submit the revised form electronically to Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org.

AMA/Specialty Society RVS Update Committee Summary of Recommendations

September 2025

Endoscopic Submucosal Dissection – Tab 10

Endoscopic submucosal dissection (ESD) is a minimally invasive endoscopic surgical procedure for the curative resection of larger and more histologically advanced epithelia-based lesions, including early cancer and submucosal carcinomas of the upper and lower gastrointestinal (GI) tract. This technique achieves oncologic outcomes traditionally associated with open or laparoscopic surgery for lesions that are too advanced for standard endoscopic mucosal resection (EMR). Considering the complexity, anesthesia requirements, specialized electrosurgical equipment, hemostatic/closure devices, the need for immediate access to multi-disciplinary rescue resources, and post-procedure monitoring, this service must be performed in the hospital outpatient setting. At its May 2025 meeting, the CPT Editorial Panel approved the creation of this new code family, which consists of two new codes to describe ESD of both the upper and lower GI tract, including mucosal closure. This new family of codes was surveyed for the September 2025 RUC meeting.

Global Period

The specialties maintained a 000-day global period for ESD is appropriate, as there is no scheduled postoperative care with the performing physician beyond immediate recovery, and any subsequent encounters are unrelated to the procedure. This preserves a resource-accurate work and practice expense valuation. A question was raised concerning what would happen if there were an immediate complication. The specialties noted that surgical staff would respond, but that delayed complications are uncommon, and pain and/or post-op bleeding are not typical. Patients who receive ESD are typically referred to by another physician, such as a gastroenterologist. On the day of the procedure, these patients are managed by the performing physician for signs of complications immediately or within the next 23 hours. After that, the patient will return to follow up with the physician who made the referral for ESD.

4XX01 ***Endoscopic submucosal dissection (ESD) of upper gastrointestinal tract, including mucosal closure, when performed***

The RUC reviewed survey results from 66 gastroenterologists and recommends the survey 25th percentile work RVU of 15.00, which appropriately accounts for the physician work typically required to perform this service. The RUC recommends 40 minutes of pre-service evaluation time, 3 minutes of pre-service positioning time, 10 minutes of scrub/dress/wait time, 150 minutes of intra-service time and 33 minutes of immediate post-service time, which equals 236 minutes of total time.

To support the recommended work RVU of 15.00, the RUC compared the surveyed code to the top key reference service 49596 *Repair of anterior abdominal hernia(s) (ie, epigastric, incisional, ventral, umbilical, spigelian), any approach (ie, open, laparoscopic, robotic), initial, including implantation of mesh or other prosthesis when performed, total length of defect(s); greater than 10 cm, incarcerated or strangulated* (work RVU = 18.67, 160 minutes intra-service time, 270 minutes total time) and second top key reference service 49615 *Repair of anterior abdominal hernia(s) (ie, epigastric, incisional, ventral, umbilical, spigelian), any approach (ie, open, laparoscopic, robotic), recurrent, including implantation of mesh or other prosthesis when performed, total length of defect(s); 3 cm to 10 cm, reducible* (work RVU = 11.46, 100 minutes intra-service time, 190 minutes total time). The RUC notes that together the two key reference services selected by survey respondents make for

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

strong comparator codes, recognizing they bracket the survey 25th percentile work RVU of 15.00, as well as total time. The top key reference service requires 160 minutes of intra-service time, which is comparable to the 150 minutes of intra-service time required for the surveyed code; considering CPT code 49596 requires more total time overall and is more intense/complex to perform, this is an appropriate comparison. In terms of intensity/complexity, the RUC also acknowledges that the surveyed code is less intense/complex to perform than both key reference services, which is appropriate based on the overall differences in physician work and time between these procedures. Moreover, the RUC acknowledges the dearth of potential reference codes that are major surgical procedures with the 000-day global period that involve similar times, so the pool of potential reference codes was limited for this code family. Overall, the RUC recommendation of the survey 25th percentile work RVU appropriately reflects the physician work and time required to perform CPT code 4XX01 and maintains relativity within this code family and across comparable services. **The RUC recommends a work RVU of 15.00 for CPT code 4XX01.**

4XX02 ***Endoscopic submucosal dissection (ESD) of lower gastrointestinal tract, including mucosal closure, when performed***
The RUC reviewed survey results from 68 gastroenterologists and recommends the survey 25th percentile work RVU of 16.38, which appropriately accounts for the physician work typically required to perform this service. The RUC recommends 40 minutes pre-service evaluation time, 3 minutes pre-service positioning time, 10 minutes scrub/dress/wait time, 180 minutes intra-service time and 33 minutes immediate post-service time, which equals 266 minutes of total time.

In their presentation, the specialty societies explained that ESD of the lower GI tract typically requires more physician work than ESD of the upper GI tract. Lesions in the lower GI tract are typically larger and are located in the colon and rectum. There is typically a need for significant irrigation and aspiration, and the scope is often in retroflexion for long periods of time, making performance in this position technically challenging. The specialty societies clarified that ESD in the lower GI tract takes longer due to more advanced maneuvering, stability, and paradoxical intraoperative movement, to which the RUC agreed.

To support the recommended work RVU of 16.38, the RUC compared the surveyed code to the top key reference service 49596 *Repair of anterior abdominal hernia(s) (ie, epigastric, incisional, ventral, umbilical, spigelian), any approach (ie, open, laparoscopic, robotic), initial, including implantation of mesh or other prosthesis when performed, total length of defect(s); greater than 10 cm, incarcerated or strangulated* (work RVU = 18.67, 160 minutes intra-service time, 270 minutes total time) and second key reference service 49615 *Repair of anterior abdominal hernia(s) (ie, epigastric, incisional, ventral, umbilical, spigelian), any approach (ie, open, laparoscopic, robotic), recurrent, including implantation of mesh or other prosthesis when performed, total length of defect(s); 3 cm to 10 cm, reducible* (work RVU = 11.46, 100 minutes intra-service time, 190 minutes total time). The RUC notes that together the two key reference services selected by survey respondents make for strong comparator codes, recognizing that they bracket the survey 25th percentile work RVU of 16.38, as well as total time. The top key reference service requires slightly less intra-service time but requires nearly identical total time compared to the surveyed code. The RUC also acknowledges that while CPT code 4XX02 requires more intra-service time than either of the key reference services, the surveyed code is less intense/complex to perform, which is appropriate based on the overall differences in physician work and time between these procedures. Moreover, the RUC acknowledges the dearth of potential reference codes that are major surgical procedures with the 000-day global period that involve similar times, so the pool of potential reference codes was limited for this code family. Overall, the RUC recommendation of the survey 25th percentile work RVU appropriately reflects

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

the physician work and time required to perform CPT code 4XX02 and maintains relativity within this code family and across comparable services. **The RUC recommends a work RVU of 16.38 for CPT code 4XX02.**

Practice Expense
The Practice Expense Subcommittee reviewed the direct practice expense inputs and made no modifications. The Subcommittee discussed the Extensive Use of Clinical Staff pre-service standard time package for the 000-day global period in the facility setting and agreed with the specialties that its use was warranted rather than the standard time package for endoscopy. ESD is endosurgery, not traditional diagnostic/therapeutic endoscopy, and is analogous to peroral endoscopic myotomy (POEM) and endoscopic sleeve gastroplasty (ESG). These 090-day global period services were included as PE reference codes to compare with the ESD procedures. **The RUC recommends the direct practice expense inputs as submitted by the specialty societies.**

New Technology
CPT codes 4XX01 and 4XX02 will be placed on the New Technology list to be reviewed by the RUC in three years. The specialty societies expect these to be low-volume services.

CPT Code	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
Surgery **Digestive System** **Esophagus** **Other Procedures**				
[43497]		*Lower esophageal myotomy, transoral (ie, peroral endoscopic myotomy [POEM])* *(Do not report [43497] in conjunction with [32665], [43191], [43197], [43200], [43235])*		
Endoscopic techniques [43497], *4XX04*, 4XX01 include the application of surgical techniques provided through an endoscope passed to the target lesion(s) via a transoral route. Surgical techniques include the following: use of a cutting tool (eg, electrosurgical knife, scissors) to cut and/or dissect tissue; excise lesions en-bloc with margin control; suturing; clipping; or insertion of a device to approximate tissue (eg, plication, transluminal anastomosis, closure). Code 4XX01 includes biopsy of same lesion, ablation of edges, hemorrhage control, when performed.

CPT Descriptor: Endoscopic submucosal dissection (ESD) of upper gastrointestinal tract, including mucosal closure, when performed

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 68-year-old male presents after surveillance upper GI endoscopy for Barrett's esophagus. The physician discovers a 2-cm slightly raised nodular region within a 4-cm segment of Barrett's esophagus which on biopsy has multifocal high-grade dysplasia. The patient is referred for endoscopic submucosal dissection of the lesion.

Percentage of Survey Respondents who found Vignette to be Typical: 94%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 98% , In the ASC 2%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 31% , Overnight stay-less than 24 hours 52% , Overnight stay-more than 24 hours 17%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 98%

Description of Pre-Service Work: Conduct a comprehensive review of the patient's clinical history and prior work-up, paying particular attention to available imaging reports (e.g., CT), relevant diagnostic tests (e.g., prior endoscopy, endoscopic ultrasound, and pathology reports) and laboratory studies, especially as they relate to coagulation status, CBC, and basic metabolic panel. Review the patient's allergies and medications noting use of antiplatelets or anticoagulants. Determine the need for and timing of preprocedure antibiotics. Perform a preprocedural examination, including vitals, body mass index (BMI), airway assessment, cardiopulmonary assessment, and abdominal examination. Document preprocedural history and physical. Review the risks, benefits, alternatives, and potential complications of the procedure with the patient and the patient's family. Document informed consent. Review the logistics of the planned procedure and the postoperative management including a pre-procedural briefing with the surgical team to align on lesion location, planned resection strategy, and anticipated complications. Review the length and type of anesthesia with the anesthesiologist and discuss the need for aspiration precaution measures. Verify that all required instruments and supplies are available, including the flexible endoscope, electrosurgical instruments, injection agents, hemostatic sprays, retraction devices, retrieval devices, and closure devices, and chromoendoscopy solutions are prepared to aid in demarcation of the lesion. Position the patient on the procedure table securing and supporting all pressure points. Position the endoscope, electrosurgical equipment, retraction devices, retrieval devices, closure devices, and monitoring equipment to provide access for the procedure. Apply appropriate protective attire and shielding to all in the suite, including the patient. Perform a preprocedure time out.

Description of Intra-Service Work: Place a bite-block in the patient's mouth. Confirm with anesthesiology that an adequate level of anesthesia is in place to begin intubation of the esophagus. Insert a flexible upper endoscope through the mouth into the oropharynx and into the esophagus to assess for esophageal anatomy, retained food, infections (candidiasis), and degree of esophageal dilation/tortuosity, removing and reinserting the scope. Advance the endoscope through the lower esophageal sphincter into the proximal stomach. Insufflate the stomach with carbon dioxide (CO_2) to allow for optimal visualization. Perform an examination of the gastric mucosa, evaluating all regions of the stomach in both forward and retroflexed positions to ensure complete visualization. Next, advance the endoscope through the pylorus into the duodenal bulb. After adequate insufflation, conduct a circumferential inspection of the duodenum, including both the bulb and second portion, to assess for any mucosal abnormalities, structural changes, or other pathology. Proceed after confirming that the initial evaluation reveals no contraindications to continuing with the planned intervention. Navigate to the lesion

and inspect using high-resolution white light endoscopy and enhanced with chromoendoscopy techniques (e.g., dye-spray or electronic image enhancement) to assess morphology and determine suitability for resection. Based on the lesion position, shape and characteristics, determine the optimal ESD resection strategy (e.g. conventional, pocket, saline-immersion, or traction-assisted). Reposition the patient to optimize the lesion position and configuration for dissection. Mark the planned resection margins using electrocautery to ensure appropriate boundaries for an en-bloc, R0 resection (complete removal). Perform a submucosal injection with appropriate lifting agent using an injection needle to create a cushion beneath the lesion separating it from the muscularis propria.

After an adequate fluid cushion is achieved, expose the submucosal layer using the electrosurgical knife selected at the appropriate energy settings to create an incision followed by repeated injection of fluid to expand the field. Dissect the layers of submucosal connective tissue underneath the lesion to free it from the deeper muscle layer, being careful to maintain optimal depth of incision to prevent injury to the muscle layer. Ensure meticulous hemostasis of submucosal vessels encountered during dissection using hemostatic forceps to prevent bleeding and ensure optimal visualization. Deploy retraction devices and reposition the patient as needed to facilitate dissection. Maintain critical attention to the planes of the muscle layer and mucosal layer to ensure complete resection and minimize risk of perforation.

Once the lesion is entirely dissected free from the muscle, retrieve the resected lesion using endoscopy distal attachments and/or through the channel tools (e.g., forceps, net). Prepare the specimen for pathology, orienting the specimen using surgical pins to delineate margins. Reintroduce the endoscope to inspect the resection site for evidence of full-thickness perforation and to ensure hemostasis. Close any identified perforations using clips or suturing systems, and coagulate or clip exposed vessels. Prophylactically close the resection bed using through-the-scope clips or sutures to minimize the risk of post-procedural bleeding or delayed perforation. Perform careful inspection of the resection site to assure adequate closure and hemostasis. After suctioning to deflate the stomach and esophagus, withdraw the endoscope.

Description of Post-Service Work: Assess patient's condition including post-procedure vital signs. When the patient has reached a suitable level of consciousness, transfer the patient to the observation area. Complete post-procedure orders. Complete pathology forms as necessary. Complete post-procedure specimen verification with detailed orientation, labeling and documentation and reporting for quality purposes. Review and label photographs. Generate a procedure report and forward to referral source and other appropriate parties. Enter data into the procedure registry. When patient is stable for discharge, review findings, recommendations, plans for follow-up, including surveillance endoscopy or additional interventions, with the patient and pertinent others. Provide orders for necessary prescriptions, follow-up tests, and appointments to the patient.

SURVEY DATA

RUC Meeting Date (mm/yyyy)	09/2025					
Presenter(s):	R.Bruce Cameron, MD, ACG RUC Advisor; Patricia Garcia, MD, AGA RUC Advisor; Seth A. Gross, MD, ASGE RUC Advisor; Srihav Mahadev, MD, ASGE subject matter expert; Ketan Sheth, MD, SAGES RUC Advisor					
Specialty Society(ies):	ACG, AGA, ASGE, SAGES

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	8%	21%	71%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	25%	75%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	4%	96%
Physical effort required	0%	8%	92%

Psychological Stress	**Less**	**Identical**	**More**
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	8%	92%

Survey Code Compared to 2nd Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	0%	9%	9%	82%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	18%	82%

Technical Skill/Physical Effort	**Less**	**Identical**	**More**
Technical skill required	0%	9%	91%
Physical effort required	0%	27%	73%

Psychological Stress	**Less**	**Identical**	**More**
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	18%	82%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

Code 4XX01 is a new code approved by the CPT Editorial Panel at its May 2025 CPT meeting. ESD is a minimally invasive technique that achieves oncologic outcomes traditionally associated with open or laparoscopic surgery for lesions that are too advanced for standard EMR. The procedure's complexity, anesthesia requirements, equipment intensity (specialized electrosurgical equipment, hemostatic/closure devices), and the need for immediate access to multidisciplinary rescue resources and post-procedure monitoring requires performance in the hospital outpatient setting.

The ACG, AGA, ASGE and SAGES conducted a survey of new CPT code 4XX01 *Endoscopic submucosal dissection (ESD) of upper gastrointestinal tract, including mucosal closure, when performed* for the September 2025 RUC meeting. Our multi-specialty consensus panel reviewed the survey data for code 4XX01, comparing the data and work RVUs (wRVUs) to the current data for similar 000-day global codes that were recently approved by the RUC. The consensus panel agreed with the overall survey data.

Survey Process

The ACG, AGA, ASGE and SAGES conducted a survey for the September 2025 RUC meeting including a random sample of subsets of ASGE and AGA society members plus a random sample of SAGES members totaling 1,500 physicians. A total of 1,454 physicians received the survey after accounting for failed deliveries, resulting in 66 completed surveys. The surveying societies convened an expert panel that evaluated survey results and developed the following recommendations

Recommendations

We recommend the survey 25th percentile wRVU of 15.00.

Pre- time package 4: We recommend a total of 53 minutes of pre-service evaluation time
Pre-service evaluation = 40 minutes, reflecting the package time.
Pre-service positioning = 3 minutes, reflecting the package time.
Pre-service scrub, dress, wait time = 10 minutes, reflecting the survey median which is less than the package time.

Post-time package 9B: 33 minutes of immediate post-service time, reflecting the package time.

Intra-service time: 150 minutes of intra-service time, reflecting the survey median.

Key reference services

Two reference services were selected more often than others, 49596 and 49615.

1. 49596 – *Repair of large incarcerated/strangulated anterior abdominal hernia (>10 cm)* (24/66)
2. 49615 – *Repair of recurrent anterior abdominal hernia (3–10 cm, reducible)* (11/66)

Comparable procedures

The recommended value is benchmarked to CPT code 61645 – *Percutaneous arterial transluminal mechanical thrombectomy and/or infusion for thrombolysis, intracranial* – wRVU 15.00–a procedure that reflects comparable duration, risk, and cognitive burden.

To further validate relativity, the recommended RVU was evaluated in relation to two additional anchor codes:

- 37244 – *Vascular embolization or occlusion for hemorrhage*, which requires real-time decision-making, complex imaging, and high technical demands but only reflects 90 minutes intra service time–13.75 wRVU
- 49617 – *Repair of large, recurrent anterior abdominal hernia (>10 cm, reducible)*, reflecting prolonged operative time and extensive tissue dissection – 150 minutes intra service time –16.03 wRVU

Positioning the 15.00 work RVU for 4XX01 within this range is consistent with its procedural complexity, sustained intensity, and risk profile.

To further validate the proposed 15.00 work RVU, the Panel considered the following benchmark codes:

- 33895 – *Endovascular stent repair of coarctation of the aorta* –14.54 wRVUs
- 49616 – *Repair of recurrent incarcerated anterior abdominal hernia (3–10 cm)* –15.55 wRVUs
- 93653 – *Comprehensive EP evaluation and ablation of SVT, including 3D mapping* –15.00 wRVUs

These codes reflect similar physician work in terms of time, technical intensity, intraoperative decision-making, and risk. The Panel agreed that CPT code 4XX01 requires equal or greater effort and supported both the 150-minute intra-service time and the 15.00 work RVU as accurate and appropriate.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43499

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gastroenterology How often? Commonly

Specialty Surgery, general How often? Rarely

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 13549
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Source is sales data from Boston Scientific, Creo Medical, Medtronic and Olympus.

Specialty Gastroenterology Frequency 12194 Percentage 89.99 %

Specialty Surgery, general Frequency 271 Percentage 2.00 %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 3,387
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. National volume is estimated to be three times Medicare volume.

Specialty Gastroenterology Frequency 3048 Percentage 89.99 %

Specialty Surgery, general Frequency 68 Percentage 2.00 %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:

CPT Descriptor: Endoscopic submucosal dissection (ESD) of lower gastrointestinal tract, including mucosal closure, when performed

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 68-year-old male presents after screening colonoscopy identified a 4-cm superficial spreading rectal polyp with foci of high-grade dysplasia but does does not appear to have invasive malignancy. The patient is referred for endoscopic submucosal dissection of the lesion.

Percentage of Survey Respondents who found Vignette to be Typical: 96%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 99% , In the ASC 1%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 34% , Overnight stay-less than 24 hours 46% , Overnight stay-more than 24 hours 19%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 98%

Description of Pre-Service Work: Conduct a comprehensive review of the patient's clinical history and prior work-up, paying attention to available imaging reports (e.g., CT), relevant diagnostic tests (e.g., prior endoscopy, endoscopic ultrasound, and pathology reports) and laboratory studies, especially as they relate to coagulation status, CBC, and basic metabolic panel. Review the patient's allergies and medications noting use of antiplatelets or anticoagulants. Determine the need for timing of preprocedure antibiotics. Perform a preprocedural examination, including vitals, body mass index (BMI), airway assessment, cardiopulmonary assessment, and abdominal examination. Document preprocedural history and physical. Review the risks, benefits alternatives, and potential complications of the procedure with the patient and the patient's family. Document informed consent. Review the logistics of the planned procedure and the postoperative management including a pre-procedural briefing with the surgical team to align on lesion location, planned resection strategy, and anticipated complications. Review the length and type of anesthesia with the anesthesiologist.Verify that all required instruments and supplies are available, including the flexible endoscope, electrosurgical knife, injection agents, hemostatic sprays, retraction devices, retrieval devices, and closure devices, and chromoendoscopy solutions are prepared to aid in demarcation of the lesion. Position the patient on the procedure table securing and supporting all pressure points. Position the endoscope, electrosurgical equipment, retraction devices, retrieval devices, closure devices, and monitoring equipment to provide access for the procedure. Apply appropriate protective attire and shielding to all in the suite, including the patient. Perform a preprocedure time out.

Description of Intra-Service Work: Confirm with anesthesiology that an adequate level of anesthesia is in place to begin intubation. Inspect the perianal area and perform a digital rectal examination. Lubricate a standard flexible colonoscope and insert it into the rectum. Advance the scope to the cecum using air insufflation, water flush, and suctioning as necessary to view the mucosa; identify the appendiceal orifice and ileo-cecal valve. Slowly withdraw the colonoscope through the ascending colon, hepatic flexure, transverse colon, splenic flexure, and sigmoid colon to allow circumferential examination of the colon mucosa. Obtain photodocumentation of appropriate normal landmarks and abnormalities. In the rectum, retroflex the colonoscope to allow examination of the rectal mucosa. Navigate to the lesion and inspect using high-resolution white light endoscopy and enhanced with chromoendoscopy techniques (e.g., dye-spray or electronic image enhancement) to assess morphology and determine suitability for resection. Based on the lesion position, shape and characteristics, determine the optimal ESD resection strategy (e.g. conventional, pocket, saline-immersion, or traction-

assisted). Reposition the patient to optimize the lesion position and configuration for dissection. Mark the planned resection margins using electrocautery to ensure appropriate boundaries for an en-bloc, R0 resection (complete removal). Perform a submucosal injection with appropriate lifting agent using an injection needle to create a cushion beneath the lesion separating it from the muscularis propria.
After an adequate fluid cushion is achieved, expose the submucosal layer using the electrosurgical knife selected at the appropriate energy settings to create an incision followed by repeated injection of fluid to expand the field. Dissect the layers of submucosal connective tissue underneath the lesion to free it from the deeper muscle layer, being careful to maintain optimal depth of incision to prevent injury to the muscle layer. Ensure meticulous hemostasis of submucosal vessels encountered during dissection using hemostatic forceps to prevent bleeding and ensure optimal visualization. Deploy retraction devices and reposition the patient as needed to facilitate dissection. Maintain critical attention to the planes of the muscle layer and mucosal layer to ensure complete resection and minimize risk of perforation. Once the lesion is entirely dissected free from the muscle, retrieve the resected lesion using endoscopy distal attachments and/or through the channel tools (e.g., forceps, net). Prepare the specimen for pathology, orienting the specimen using surgical pins to delineate margins. Reintroduce the endoscope to inspect the resection site for evidence of full-thickness perforation and to ensure hemostasis. Close any identified perforations using clips or suturing systems and coagulate or clip exposed vessels. Prophylactically close the resection bed using through-the-scope clips or sutures to minimize the risk of post-procedural bleeding or delayed perforation. Perform careful inspection of the resection site to assure adequate closure and hemostasis. After suctioning to deflate the colon and rectum, withdraw the endoscope.

Description of Post-Service Work: Assess patient's condition including post-procedure vital signs. When the patient has reached a suitable level of consciousness, transfer the patient to the observation area. Complete post-procedure orders. Complete pathology forms as necessary. Complete post-procedure specimen verification with detailed orientation, labeling and documentation and reporting for quality purposes. Review and label photographs. Generate a procedure report and forward to referral source and other appropriate parties. Enter data into the procedure registry. When patient is stable for discharge, review findings, recommendations, plans for follow-up, including surveillance endoscopy or additional interventions, with the patient and pertinent others. Provide orders for necessary prescriptions, follow-up tests, and appointments to the patient.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	6%	23%	71%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	3%	16%	81%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	3%	97%
Physical effort required	0%	13%	87%

Psychological Stress	**Less**	**Identical**	**More**
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	10%	90%

Survey Code Compared to 2nd Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	0%	11%	0%	89%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	11%	89%

Technical Skill/Physical Effort	**Less**	**Identical**	**More**
Technical skill required	0%	11%	89%
Physical effort required	0%	22%	78%

Psychological Stress	**Less**	**Identical**	**More**
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	11%	89%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

Code 4XX02 is a new CPT code approved by the CPT Editorial Panel at its May 2025 meeting. ESD is a minimally invasive technique that achieves oncologic outcomes traditionally associated with open or laparoscopic surgery for lesions that are too advanced for standard EMR. The procedure's complexity, anesthesia requirements, equipment intensity (specialized electrosurgical equipment, hemostatic/closure devices), and the need for immediate access to multidisciplinary rescue resources and post-procedure monitoring requires performance in the hospital outpatient setting.

The ACG, AGA, ASGE and SAGES conducted a survey of new CPT code 4XX02 *Endoscopic submucosal dissection (ESD) of lower gastrointestinal tract, including mucosal closure, when performed* for the September 2025 RUC meeting. Our multi-specialty consensus panel reviewed the survey data for code 4XX02, comparing the data and work RVUs (wRVUs) to the current data for similar 000-day global codes that were recently approved by the RUC. The consensus panel agreed with the overall survey data.

Survey Process

The ACG, AGA, ASGE and SAGES conducted a survey for the September 2025 RUC meeting including a random sample of subsets of ASGE and AGA society members plus a random sample of SAGES members totaling 1,500 physicians. A total of 1,454 physicians received the survey after accounting for failed deliveries, resulting in 68 completed surveys. The surveying societies convened an expert panel that evaluated survey results and developed the following recommendations

Recommendations

We recommend the survey 25th percentile wRVU of 16.38.

Pre- time package 4: We recommend a total of 53 minutes of pre-service evaluation time
Pre-service evaluation = 40 minutes, reflecting the package time.
Pre-service positioning = 3 minutes, reflecting the package time.
Pre-service scrub, dress, wait time = 10 minutes, reflecting the survey median which is lower than the package time.

Post-time package 9B: 33 minutes of immediate post-service time, reflecting the package time.

Intra-service time: 180 minutes of intra-service time, reflecting the survey median.

Key reference services

Two reference services were selected more often than others, 49596 and 49615.

1. 49596 – *Repair of large incarcerated/strangulated anterior abdominal hernia (>10 cm)* (31/68)
2. 49615 – *Repair of recurrent anterior abdominal hernia (3–10 cm, reducible)* (9/68)

Comparable procedures

The recommended value of 16.38 wRVUs is benchmarked to CPT code 33903 (*Percutaneous pulmonary artery revascularization by stent placement, initial; abnormal connections, bilateral*–wRVU-16.50 a procedure that reflects comparable duration, risk, and cognitive burden.
To further validate the relativity of the recommended work RVU for CPT code 4XX02, the proposed value was evaluated against two codes that represent similarly complex, high-intensity procedures:

- **49617** – *Repair of anterior abdominal hernia(s), recurrent, any approach, with implantation of mesh;total defect(s) >10 cm, reducible* –16.03 work RVUs
- **93656** – *Comprehensive electrophysiologic evaluation with transseptal catheterization and catheter ablation of atrial fibrillation, including 3D mapping and intracardiac echocardiography* – 17.00 work RVUs

These procedures were selected due to their comparable intra-service times, technical complexity, and cognitive demands. Both codes involve sustained physician focus, prolonged operative or procedural time, and significant intraoperative decision-making—features that closely parallel the requirements of lower GI ESD.

CPT 49617 represents a technically demanding surgical procedure involving extensive tissue dissection, prosthetic placement, and the need for careful management of recurrence and comorbidities. Similarly, CPT 93656 involves a multi-step electrophysiologic and ablation process that requires precision, complex mapping, and high levels of physician engagement throughout the case.

Positioning the recommended work RVU of 16.38 for CPT code 4XX02 within this established range reflects the intensity, risk profile, and sustained technical and cognitive work involved in performing endoscopic submucosal dissection in the lower GI tract. The valuation acknowledges the added procedural challenges unique to colorectal ESD—such as variable lesion morphology, bowel preparation constraints, and higher risk of adverse events—while maintaining relativity among similar 000 day global services.

To further validate the proposed 16.38 work RVU, the Panel considered the following benchmark codes:

- 49617- Repair of anterior abdominal hernia(s) (ie, epigastric, incisional, ventral, umbilical, spigelian), any approach (ie, open, laparoscopic, robotic), recurrent, including implantation of mesh or other prosthesis when performed, total length of defect(s); greater than 10 cm, reducible – 16.03 wRVUs
- 33903- Percutaneous pulmonary artery revascularization by stent placement, initial; abnormal connections, bilateral – 16.50 wRVUs
- 37182- Insertion of transvenous intrahepatic portosystemic shunt(s) (TIPS) (includes venous access, hepatic and portal vein catheterization, portography with hemodynamic evaluation, intrahepatic tract formation/dilatation, stent placement and all associated imaging guidance and documentation) – 16.97 wRVUs

These codes reflect similar physician work in terms of time, technical intensity, intraoperative decision-making, and risk. The Panel agreed that CPT code 4XX02 requires equal or greater effort and supported both the 180-minute intra-service time and the 16.38 work RVU as accurate and appropriate.

Comparison to Other RUC-Reviewed Codes with Similar Time and 000 global (Please see attachment A for a comparison table of RUC-reviewed codes with similar times and 000 global)

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 45399

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gastroenterology How often? Commonly

Specialty Surgery,Colon Rectal How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 15287
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Source is sales data from Boston Scientific, Creo Medical, Medtronic and Olympus.

Specialty Gastroenterology Frequency 13758 Percentage 89.99 %

Specialty Surgery, Colon Rectal Frequency 764 Percentage 4.99 %

Specialty l Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 3,822
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. National volume is estimated to be three times Medicare volume.

Specialty Gastroenterology Frequency 3440 Percentage 90.00 %

Specialty Surgery, Colon Rectal Frequency 191 Percentage 4.99 %

Specialty l Frequency 0 Percentage %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment
Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC) PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

Meeting Date: September 2025

CPT Code	Long Descriptor	Global Period
4XX01	Endoscopic submucosal dissection (ESD) of upper gastrointestinal tract, including mucosal closure, when performed	000
4XX02	Endoscopic submucosal dissection (ESD) of lower gastrointestinal tract, including mucosal closure, when performed	000

Vignette(s) (*vignette required even if PE only code(s)***):**

CPT Code	Vignette
4XX01	A 68-year-old male presents after surveillance upper GI endoscopy for Barrett's esophagus. The physician discovers a 2 cm slightly raised nodular region within a 4 cm segment of Barrett's esophagus which on biopsy has multifocal high-grade dysplasia. Endoscopic ultrasound of chest and abdomen have shown the lesion to be amenable to endoscopic resection. The patient is referred for endoscopic submucosal dissection of the lesion.
4XX02	A 68-year-old male presents after screening colonoscopy discovered a 4 cm superficial spreading rectal polyp with foci of high-grade dysplasia but does not appear to have invasive malignancy. The patient is referred for endoscopic submucosal dissection of the lesion.

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

   The ACG, AGA, ASGE and SAGES convened an RVS expert panel of the surveying specialty societies to review practice expense data for code 4XX01, 4XX02. The panel included both sub-specialists and generalists from within the specialties of a variety of settings across the United States. They also received input from practice managers and clinical staff familiar with the direct expense inputs.

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here:

   We selected 49596 (*Repair of anterior abdominal hernia(s) (ie, epigastric, incisional, ventral, umbilical, spigelian), any approach (ie, open, laparoscopic, robotic), initial, including implantation of mesh or other prosthesis when performed, total length of defect(s); greater than 10 cm, incarcerated or strangulated*) as the comparison code because it has similar global period and clinical staff activities. **updated practice expense spreadsheet includes comparison to CPT codes POEM (43497) and endoscopic sleeve gastroplasty (4XX04).**

   NOTE: For services reviewed prior to the implementation of clinical activity codes in 2016-17, detail is not provided in the RUC database, please contact *Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org* for PE spreadsheets for your older reference codes.

3. Is this code(s) typically reported with an E/M service?

   No, 4XX01 and 4XX02 are new surgical procedures and will not be reported with E/M service

   See the *Billed Together* tab in the RUC Database.

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

4. If you are requesting an increase over the aggregate current cost for clinical activities, supplies and equipment, please provide compelling evidence:

Not applicable

See the *PE compelling evidence guidelines* on the RUC Collaboration website. Be sure to explain if the increase can be entirely accounted for because of an increase in physician time.

CLINICAL STAFF ACTIVITIES

The RUC has agreed that there is a presumption of zero pre-service clinical staff time unless the specialty can provide evidence to the PE Subcommittee that any pre-service time is appropriate. The RUC agreed that with evidence some subset of codes may require either minimal or extensive use of clinical staff and has allocated time when appropriate (for example when a service describes a major surgical procedure). If the package times are not applicable, alternate times may be presented and should be justified for consideration by the Subcommittee.

5. Are the global periods of the codes transitioning? Information about the amount of pre-service clinical staff time and a rationale for the change from a 090-day global to a 000 or 010 day global should be described below.

No

6. If you are recommending more minutes than the PE Subcommittee standards for clinical activities, you must provide rationale to justify the time:

While we are not requesting additional time outside of approved pre-service packages, we would like to clarify the package selected. Endoscopic submucosal dissection ESD is not traditional diagnostic/therapeutic endoscopy; it is endosurgery—surgery performed via an endoscope—analogous to POEM (43497) and endoscopic sleeve gastroplasty (4XX04). Therefore, we have selected practice expense standard package 000day global "Extensive Use of Clinical Staff" not "Clinical Staff for Endoscopy". Given its surgical workflow, risk profile, resource intensity, and routine use of general anesthesia, the CPT Editorial Panel appropriately located ESD with endosurgical procedures in the "Other Procedures" subheading of the Surgery/Digestive section of the CPT book rather than within the GI endoscopy section. Endosurgical codes in the "Other Procedures" section provide the most appropriate PE comparators: procedures performed in a hospital setting, under general anesthesia or deep sedation; with prolonged room and staff time; advanced electrosurgical dissection and closure systems (caps, hemostatic tools, suturing/closure devices); higher nursing and anesthesia support; and continuous physiologic monitoring with immediate capability for intervention. Accordingly, PE comparison for ESD should reference these endosurgical codes, not routine endoscopy. We also maintain a 000-day global for ESD is appropriate, as there is no scheduled postoperative care with the performing physician beyond immediate recovery and any subsequent encounters are problem-oriented. This preserves a resource-accurate PE valuation without importing the 090-day global assumptions used for related—but postoperatively distinct—surgical endoscopy codes.

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

7. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (*please see 2nd worksheet tab in PE spreadsheet*), please explain the difference here:

Not applicable

8. Please provide a brief description of the clinical staff work for the following:
   a. Pre-Service period:

Codes 4XX01 and 4XX02 are 000-day global procedures that are performed in the facility only and therefore the PE reflects the standard clinical staff time package inputs as described below:

4XX01

Complete pre-service diagnostic and referral forms = 5 minutes (CA001)

- Obtain and reconcile referral materials in the EHR
- Confirm indication, relevant endoscopic/pathologic results, comorbidities, allergies
- Document risk factors (e.g., OSA, cardiopulmonary disease) that affect sedation/anesthesia plan
- Identify missing elements for RN review

Coordinate pre-surgery services (including test results) = 10 minutes (CA002)

- Review antiplatelet/anticoagulant and diabetes regimens
- Route protocol orders to the physician as needed
- Coordinate patient pre-procedure evaluation
- Coordinate required testing (e.g., labs, ECG, specialty clearance); confirm receipt and clinical acceptability
- Communicate patient-specific risks/findings to anesthesia team

Schedule space and equipment in facility = 5 minutes (CA003)

- Schedule the ESD procedure in a dedicated endoscopy suite equipped for advanced endoscopic procedures
- Allocate procedure time to ensure sufficient time
- Schedule anesthesia support based on the patient's risk assessment and procedure complexity
- GI office staff coordinate with hospital staff to ensure appropriate equipment and specialized nursing availability

Provide pre-service education/obtain consent = 7 minutes (CA004)

- Provide patient education including:
  - Diagnosis/indication for ESD and expected benefits
  - Procedure overview in plain language
  - Risks/complications: bleeding, perforation, stricture risk, and need for additional therapy
  - Opportunity to decline treatment
  - Sedation effects: expected post-sedation symptoms and when to seek help

- Pre-procedure instructions: fasting/NPO; coordination with medication holds per protocol
- Post-procedure expectations: sore throat, dietary advancement, activity guidance, and typical recovery timeline.
- Contact instructions for red-flag symptoms (heavy bleeding, severe pain, fever, dyspnea)
- Perform teach-back and document understanding

- Prepare consent materials for physician execution at check-in

Complete pre-procedure phone calls and prescription = 3 minutes (CA005)

- Confirm completion of pre-surgery instruction, NPO/fasting, driver/escort, and medication holds
- Facilitate protocol-based prescriptions and route to physician for signature when required

4XX02

Complete pre-service diagnostic and referral forms = 5 minutes (CA001)

- Obtain and reconcile referral materials in the EHR
- Confirm indication, relevant endoscopic/pathologic results, comorbidities, allergies
- Document risk factors (e.g., OSA, cardiopulmonary disease) that affect sedation/anesthesia plan
- Identify missing elements for RN review

Coordinate pre-surgery services (including test results) = 10 minutes (CA002)

- Review antiplatelet/anticoagulant and diabetes regimens
- Route protocol orders to the physician as needed
- Coordinate patient pre-procedure evaluation
- Coordinate required testing (e.g., labs, ECG, specialty clearance); confirm receipt and clinical acceptability
- Communicate patient-specific risks/findings to anesthesia team

Schedule space and equipment in facility = 5 minutes (CA003)

- Schedule the ESD procedure in a dedicated endoscopy suite equipped for advanced endoscopic procedures
- Allocate procedure time to ensure sufficient time
- Schedule anesthesia support based on the patient's risk assessment and procedure complexity
- GI office staff coordinate with hospital staff to ensure appropriate equipment and specialized nursing availability

Provide pre-service education/obtain consent = 7 minutes (CA004)

- Provide patient education including:
  - Diagnosis/indication for ESD and expected benefits
  - Procedure overview in plain language

- Risks/complications: bleeding, perforation, and need for additional therapy
- Opportunity to decline treatment
- Sedation effects: expected post-sedation symptoms and when to seek help
- Pre-procedure instructions: bowel prep; coordination with medication holds per protocol
- Post-procedure expectations: activity guidance and typical recovery timeline
- Contact instructions for red-flag symptoms (heavy bleeding, severe pain, fever, dyspnea)
- Perform teach-back and document understanding

- Prepare consent materials for physician execution at check-in

Complete pre-procedure phone calls and prescription = 3 minutes (CA005)

- Confirm completion of pre-surgery instruction, bowel prep, driver/escort, and medication holds
- Facilitate protocol-based prescriptions and route to physician for signature when required

b. Service period (includes pre, intra and post):

c. Post-service period:

9. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (*please see 2nd worksheet tab in PE spreadsheet*):

Not applicable

10. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov.

Not applicable

MEDICAL SUPPLIES & EQUIPMENT/INVOICES

11. ☐ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

12. ☐ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

13. If you wish to include a supply that is not on the Direct PE Inputs Medical Supplies Listing (*please see 4th worksheet tab in PE spreadsheet*), a paid invoice is required. Identify and explain the supply input and invoice here:

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC) PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

14. Are you recommending a PE supply pack for this recommendation? Yes or No.
    If Yes, please indicate if the pack is an established package of supplies as defined by CMS (eg, SA047 *pack, E/M visit*) or a pack that is commercially available?

15. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation (*please see 8-10th worksheet tabs in PE spreadsheet*). Please include the description, CMS supply code, unit, item quantity and unit price (if available).

16. If you wish to include an equipment item that is not on the Direct PE Inputs Equipment Listing (*please see 5th worksheet tab in PE spreadsheet*), a paid invoice is required. Identify and explain the equipment input and invoice here:

17. Please provide an estimate of the useful life of the new equipment item as required to calculate the equipment cost per minute:

18. Have you recommended equipment minutes for a computer or equivalent laptop/integrated computer, equipment item computer, desktop, w-monitor, ED021 or notebook (Dell Latitute D600), ED038?
    a. If yes, please explain how the computer is used for this service(s).
    b. Is the computer used exclusively as an integral component of the service or is it also used for other purposes not specific to the code?
    c. Does the computer include code specific software that is typically used to provide the service(s)?

19. List all the equipment included in your recommendation and the equipment formula chosen *(please see 7th worksheet tab in PE spreadsheet: Equipment minute formulas).* If you have selected "other formula" for any of the equipment please explain here:

PE-ONLY CODES ADDITIONAL INFORMATION

20. (a) Estimate the number of times this service might be provided nationally in a one-year period?
    (b) Estimate the number of times this service might be provided to Medicare patients nationally in a one-year period?

21. Please select a Professional Liability Insurance (PLI) crosswalk based on a similar specialty mix:

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

ADDITIONAL INFORMATION

22. If there is any other item(s) on your spreadsheet not covered in the categories above that requires greater detail/explanation, please include here:

ITEMIZED LIST OF CHANGES (FOLLOWING THE PE SUBCOMMITTEE MEETING)

NOTE: The PE spreadsheets will be updated and finalized in real-time at the meeting. PE SORs must be updated based on modifications made during the meeting and resubmitted asap. The PE SOR should match the updated PE spreadsheet. Please provide a list of the modifications made to the PE spreadsheet during the PE Subcommittee meeting in the space below with brief justification for the modification (e.g. Equipment item EF023 *table, exam* was changed to EF031 *table, power* as the power table is typical in the surgeon's office).

The PE SOR serves as key support for the spreadsheet and should include any important details/explanation for the inputs as these cannot be elaborated upon in the excel document itself.

Please submit the revised form electronically to Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org.

AMA/Specialty Society RVS Update Committee Summary of Recommendations

September 2025

Congenital Duodenal Obstruction Repair – Tab 11

At the May 2025 CPT Editorial Panel meeting, two new codes were created to report surgical treatment for congenital duodenal obstruction via an open or laparoscopic approach, that were previously reported using unlisted codes. These procedures are performed on infants and are not anticipated to be reported in the Medicare population.

44XX1 ***Duodenoduodenostomy or duodenojejunostomy for congenital duodenal obstruction***
The RUC reviewed the survey results from 83 surgeons and recommends a work RVU of 50.00 based on the survey median, which maintains relativity within the family for this code. The RUC recommends 60 minutes pre-service evaluation time, 12 minutes positioning time, 10 minutes scrub/dress/wait time, 120 minutes intra-service time, 30 minutes immediate post-service time, 2-99291 critical care visits, 3-99233, 6-99232, 10-99231 subsequent hospital inpatient visits, 1-99238 discharge visit, 1-99214 and 1-99213 post-operative office visits, totaling 1,078 minutes.

For this procedure, substantial pre-service work is required to ensure optimal clinical outcomes in the premature neonate for whom duodenoduodenostomy or duodenojejunostomy is lifesaving. The preoperative phase involves review of extensive diagnostic evaluation, including laboratory testing and advanced imaging studies, to delineate the anatomy and characterize the degree of congenital duodenal obstruction. These assessments are critical for operative planning and perioperative risk stratification. Coordination with pediatric anesthesia and the neonatal intensive care unit (NICU) team is essential to establish a comprehensive perioperative management plan. In addition, detailed discussions are undertaken with the parents or legal guardians to review the procedure, potential complications, and the anticipated postoperative course. Preoperative preparation includes careful patient positioning to allow optimal exposure of the operative field while maintaining the safety and integrity of the premature neonate. Due to the fragility of the patient's skin and peripheral nerves, additional time is devoted to achieving a stable and protective position to minimize the risk of pressure-related injury and to facilitate the intricate dissection required during the operation. The intra-service surgical component is technically complex and requires advanced operative skill. Achieving exposure of the retroperitoneal space in a premature infant weighing approximately two kilograms demands precise and delicate dissection. Mobilization of the colon and splenic flexure is necessary to access the duodenum. This dissection must be performed with extreme care to avoid injury to the critical vascular and biliary structures of the porta hepatis, including the portal vein, hepatic artery, common bile duct, inferior vena cava, and pancreas. The subsequent repair of the duodenal atresia involves meticulous suture technique under magnification to maintain patency and prevent leakage. Given the markedly limited circulating blood volume in a neonate, even a minor vascular injury carries significant mortality risk, underscoring the technical demands of the procedure. In the postoperative phase, the neonate remains critically ill and is managed primarily in the NICU. Premature neonates often experience delayed extubation because they are slow to recover from general anesthesia. Nutritional advancement is gradual, as feeding tolerance can be limited following relief of an obstruction that existed throughout gestation. Additionally, many of these patients have significant comorbidities, such as congenital heart disease or other gastrointestinal atresias, which complicate recovery and necessitate prolonged, intensive postoperative management.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

To support the recommended work RVU, the RUC compared the surveyed code to the top key reference service codes 44127 *Enterectomy, resection of small intestine for congenital atresia, single resection and anastomosis of proximal segment of intestine; with tapering* (work RVU = 49.30, 150 minutes intra-service, and 1,357 minutes total time) and 44126 *Enterectomy, resection of small intestine for congenital atresia, single resection and anastomosis of proximal segment of intestine; without tapering* (work RVU = 42.23, 120 minutes intra-service, and 1,125 minutes total time). Compared to the key reference services, the surveyed code is significantly more demanding and intense/complex. A duodenoduodenostomy or duodenojejunostomy for congenital duodenal obstruction usually requires greater technical skill and is considered more intense and complex than a standard single resection and anastomosis of the proximal small intestine, mostly because of anatomical size/difficulty, risk of injury to critical structures, and the requirement for precise mobilization in a highly confined retroperitoneal space with vital nearby structures (pancreas, bile duct, ampulla of Vater). The duodenum's fixed retroperitoneal position complicates exposure and manipulation. The surveyed code is technically more challenging, especially in premature neonates, due to the size and thickness of duodenal tissue and proximity to major vessels and ducts and is often considered one of the more complex neonatal gastrointestinal procedures due to challenging anatomy and high risk for intraoperative complications.

For additional support, the RUC referenced MPC codes 33534 *Coronary artery bypass, using arterial graft(s); 2 coronary arterial grafts* (work RVU = 39.88, 193 minutes intra-service, and 717 minutes total time) and 43117 *Partial esophagectomy, distal two-thirds, with thoracotomy and separate abdominal incision, with or without proximal gastrectomy; with thoracic esophagogastrostomy, with or without pyloroplasty (Ivor Lewis)* (work RVU = 57.50, 330 minutes intra-service, and 1,067 minutes total time). The surveyed code work RVU is appropriately bracketed by the MPC reference codes. While the intra-service time is lower than the reference codes, the intensity and complexity of the intra-service period is significant as previously described. Additionally, the total time of the surveyed code is higher than both MPC reference codes, which further supports the recommended work RVU. **The RUC recommends a work RVU of 50.00 for CPT code 44XX1.**

44XX2 *Laparoscopy, surgical; duodenoduodenostomy or duodenojejunostomy for congenital duodenal obstruction*
The RUC reviewed the survey results from 69 surgeons and recommends a work RVU of 52.60 based on the survey median, which maintains relativity within the family for this code. The RUC recommends 60 minutes pre-service evaluation time, 15 minutes positioning time, 10 minutes scrub/dress/wait time, 180 minutes intra-service time, 30 minutes immediate post-service time, 2-99291 critical care visits, 2-99233, 4-99232, 9-99231 subsequent hospital inpatient visits, 1-99238 discharge visit, 1-99214 and 1-99213 post-operative office visits, totaling 986 minutes.

The surgical management of congenital duodenal obstruction in a premature neonate via laparoscopic duodenoduodenostomy or duodenojejunostomy requires extensive pre-, intra-, and postoperative work due to the complexity and fragility of the patient. This procedure represents one of the most technically demanding neonatal laparoscopic operations. The surgeon's cognitive load, constant vigilance, and fine motor precision are exceptionally high due to the confined operative field, fragility of tissues, and critical anatomy involved. The perioperative mortality risk remains significant, and intraoperative complications may be rapidly fatal without immediate recognition and response. The postoperative period also requires extensive continued surgical oversight given the high risk of complications and prolonged recovery in the NICU. Pre-service work requires additional time to review comprehensive diagnostic testing and advanced imaging to define the anatomical defect and guide operative planning. Given that the procedure is essential for survival, these evaluations are performed urgently and in close coordination with a multidisciplinary team. Detailed counseling is conducted with the parents or legal guardians to review the planned surgical intervention, discuss potential risks, and outline postoperative recovery expectations. Collaborative preoperative planning with pediatric anesthesia and the

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

neonatal intensive care unit (NICU) team is critical to anticipate perioperative challenges. Additional time is required for precise patient positioning to achieve optimal laparoscopic access to the operative field while minimizing the risk of peripheral nerve injury and preserving the delicate skin integrity of the premature neonate. Intra-service work is exceptionally demanding, both technically and physiologically, in a premature neonate. Laparoscopic entry and port placement are performed with extreme caution due to the small operating space and proximity of critical structures. The colon and splenic flexure must be mobilized to expose the duodenum, requiring careful retraction and dissection under magnification. During mobilization, vital structures within and adjacent to the porta hepatis—such as the portal vein, hepatic artery, common bile duct, inferior vena cava, and pancreas—must be meticulously preserved. The duodenal atresia is then repaired using precise laparoscopic suturing techniques, ensuring tension-free anastomosis and maintaining luminal patency. The limited circulating blood volume in a neonate means that even a minor vascular injury can precipitate rapid hemodynamic collapse, making surgical precision critical. Post-service work entails intensive NICU management, as the neonate remains critically ill following the procedure. Premature neonates frequently demonstrate delayed emergence from anesthesia, often necessitating continued mechanical ventilation upon NICU arrival. Initiation and progression of enteral feeds are typically slow, given that the obstruction has been present for the entirety of gestation and intestinal motility is markedly immature. Recovery is further complicated in many cases by significant comorbidities, including congenital heart defects or additional gastrointestinal atresias, necessitating ongoing multidisciplinary monitoring and intervention throughout the hospitalization.

To support the recommended work RVU, the RUC compared the surveyed code to top key reference service codes 44127 *Enterectomy, resection of small intestine for congenital atresia, single resection and anastomosis of proximal segment of intestine; with tapering* (work RVU = 49.30, 150 minutes intra-service, and 1,357 minutes total time) and 44126 *Enterectomy, resection of small intestine for congenital atresia, single resection and anastomosis of proximal segment of intestine; without tapering* (work RVU = 42.23, 120 minutes intra-service, and 1,125 minutes total time). Compared to the key reference services, the surveyed code is significantly more demanding and intense/complex. A duodenoduodenostomy or duodenojejunostomy for congenital duodenal obstruction usually requires greater technical skill and is considered more intense and complex than a standard single resection and anastomosis of the proximal small intestine, mostly because of anatomical difficulty, risk of injury to critical structures, and the requirement for precise mobilization in a highly confined retroperitoneal space with vital nearby structures (pancreas, bile duct, ampulla of Vater). The duodenum's fixed retroperitoneal position complicates exposure and manipulation. The surveyed code is technically more challenging, especially in very small neonates, due to the size and thickness of duodenal tissue and proximity to major vessels and ducts and is often considered one of the more complex neonatal gastrointestinal procedures due to challenging anatomy and high risk for intraoperative complications. The laparoscopic approach further increases technical intensity as it involves operating within a very limited space and requires advanced skills. Challenges include limited visualization and the need for precise suturing and tissue manipulation with long, slender instruments. Errors in precision are not forgiving and may result in conversion to an open procedure.

For additional support, the RUC referenced codes 33534 *Coronary artery bypass, using arterial graft(s); 2 coronary arterial grafts* (work RVU = 39.88, 193 minutes intra-service, and 717 minutes total time) and 43117 *Partial esophagectomy, distal two-thirds, with thoracotomy and separate abdominal incision, with or without proximal gastrectomy; with thoracic esophagogastrostomy, with or without pyloroplasty (Ivor Lewis)* (work RVU = 57.50, 330 minutes intra-service, and 1,067 minutes total time). They surveyed code work RVU is appropriately bracketed by the MPC reference codes. While the intra-service time is lower than the reference codes, the intensity and complexity of the intra-service period is significant as previously described, which supports the recommended work RVU. **The RUC recommends a work RVU of 52.60 for CPT code 44XX2.**

CPT Descriptor: Duodenoduodenostomy or duodenojejunostomy for congenital duodenal obstruction

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 35-week gestation, 2 kg infant with a prenatal diagnosis of duodenal atresia that is confirmed on postnatal imaging. The infant undergoes duodenoduodenostomy for congenital duodenal obstruction.

Percentage of Survey Respondents who found Vignette to be Typical: 99%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 100% , In the ASC 0%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 100%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 100%

Description of Pre-Service Work: Preoperative testing is reviewed to confirm that both fluid and electrolyte derangements are adequately corrected. Medical history regarding any associated anomalies is again reviewed. Confirmation is made with blood bank that a type and screen has been received. Appropriate selection, timing, and administration of antibiotics are ensured. The planned procedure and postoperative management are reviewed with the infant's parent/guardian. Informed consent is reviewed and obtained from the parent/guardian, including witness confirmation. The length of anesthesia, including adjuncts to postoperative analgesia management, are reviewed with the anesthesiologist. The choice of analgesia, monitoring, and attention to hemodynamic changes and possible complications are extremely important to prevent any anesthetic complications and to be able to adapt to intraoperative physiological changes during the procedure. Verify that all required instruments and supplies are available. Confirm temperature equipment to preserve body temperature is available. Assistance is provided in transfer of the infant from isolette to operating table. Monitor/assist with positioning of patient with arms adducted or abducted less than 90 degrees, ensuring a neutral spine and neck alignment. Careful attention is given to preventing nerve injury and maintaining skin integrity. Assist anesthesia team with initiation of anesthesia, to ensure surgical access to upper abdomen. The areas of skin to be prepared and draped are indicated by the surgeon to ensure that all of the potential operative field is included in the preparation. The surgeon scrubs and gowns. A surgical time-out is performed with operating surgical team.

Description of Intra-Service Work: Under general anesthesia, a right transverse supraumbilical incision is made and carried through the abdominal wall. The umbilical vein is ligated and divided as needed for exposure. The right colon and hepatic flexure are mobilized. Bowel is explored to rule out additional distal atresias. Bowel and liver are retracted. Duodenum is mobilized to identify and protect the portal triad (vein, artery and main bile duct), IVC, and colon mesentery. A transverse enterotomy is made just proximal to the atresia and a longitudinal enterotomy is made just distal to the atresia, with care to avoid the ampulla. The distal bowel is irrigated with saline to confirm that there are no distal atresias. A "diamond shaped" anastomosis is performed with suture. The anastomosis is inspected for leak and patency. The NG tube is palpated in the stomach. A count of instruments, needles, sponges, and laparotomy pads is performed. The abdominal organs are returned to normal anatomical position. The omentum is draped over the abdominal contents. The fascia and the wound is closed in layers.

Description of Post-Service Work: Apply sterile dressings and participate in the post-procedure debrief (“time-out”). Write a brief operative note, then assist in transferring the intubated infant to an isolette and accompany the patient to the NICU.

Immediately communicate with the neonatologist and NICU team regarding postoperative care. Write initial postoperative orders, including laboratory studies and imaging. Discuss the surgery, its outcome, and the expected postoperative course with the parents/guardian. Dictate a detailed operative report.

The infant is critically ill following this procedure. During the initial postoperative period, complex decision-making is required to assess, support, and stabilize vital system functions in order to prevent life-threatening deterioration. This includes the risk of failure of major organ systems such as the central nervous system, cardiovascular system (shock or circulatory collapse), renal, hepatic, metabolic, and respiratory systems. Postoperatively, the infant remains intubated until extubation orders are given by the surgeon. Orders are written for ventilator settings in coordination with NICU respiratory staff, as well as for a postoperative chest X-ray to confirm ET and NG tube positioning and assess lung status. Arterial blood gases are checked and confirmed, and NG management is reassessed daily. The infant is kept NPO with IV fluids ordered, and electrolytes are adjusted daily according to laboratory results. Total parenteral nutrition is ordered in consultation with the pharmacist/dietitian, with strict intake/output charting and daily weights. Pain control medications are ordered based on weight-based dosing, and the infant is assessed for comfort. The need for continuation of perioperative antibiotics is reviewed daily, with orders updated as appropriate. Stress ulcer prophylaxis and antireflux medication is considered for gastric protection. Laboratory studies (CBC, BMP, and ABGs for ventilator or clinical changes) are ordered as required. Imaging is obtained and reviewed as clinically needed, including chest X-rays to confirm line and tube positions and abdominal studies if obstruction or anastomotic leak is suspected. Wound care is managed by the surgeon during routine checks, with additional dressing change orders written to monitor drainage, bleeding, and skin integrity by nursing staff. The care plan is reviewed often and updated in collaboration with the NICU team, with regular communication to the family/guardian. Daily patient assessment guides whether orders are escalated or de-escalated, acknowledging that the infant's clinical course may vary significantly over many weeks. The daily care plan includes ongoing evaluation of readiness for ventilator weaning and extubation; determination of whether supplemental oxygen is required and the method of delivery (CPAP, high-flow nasal cannula, or standard nasal cannula); management of fluids and TPN; assessment of bowel function and readiness to discontinue NG suction; planning for NG tube removal; and decisions regarding the initiation of enteral feedings. Feeding plans include the type of nutrition (breast milk or formula), formulation, volumes, frequency, and methods of administration (oral and/or gavage).

When the infant is ready for discharge, management includes a comprehensive physical exam and assessment of home needs, such as nursing visits if indicated. The feeding regimen is reviewed in detail with the parents/guardian. Hospital medications are reconciled, and in consultation with other treating providers, all outpatient medication orders are confirmed. Instructions are provided to the parents/guardian on monitoring for gastrointestinal complications such as vomiting, lack of stooling, or abdominal distension, and guidance is given on when to contact the surgeon or seek urgent hospital evaluation. Surgical follow-up appointments are arranged, and coordination with other specialists is completed as indicated. The medical record is finalized, including day-of-discharge progress notes, discharge summary, discharge instructions, and necessary insurance documentation.

At each follow-up office visit, the surgeon reviews documentation from all involved treating providers, obtains and records an interval history from the parents or guardian, and performs a physical examination that includes assessment of vital signs and growth parameters, particularly weight. Current medications are reviewed, with decisions made regarding the need for continued therapy (e.g., antireflux treatment). Findings and assessments are discussed with the parents or guardian, with dedicated time to address their questions and concerns. Laboratory studies are ordered as clinically indicated. Dietary guidance is provided, including the consideration of nutritional supplements if necessary. Parents are counseled on potential complications, both short-term and long-term, such as bowel obstruction due to adhesions, intestinal dysmotility, or duodenal dilation, and are advised on when to seek urgent evaluation by the surgeon or hospital team. The surgeon coordinates care with other members of the multidisciplinary team as appropriate and documents each visit thoroughly by dictating, reviewing, and signing progress notes in the medical record.

Median Total Time	**1078.00**	**1,357.00**	**1,125.00**
Other time if appropriate			

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	28%	55%	17%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	43%	57%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	2%	31%	67%
Physical effort required	2%	52%	46%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	45%	55%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	23%	66%	11%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	43%	57%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	26%	74%
Physical effort required	0%	51%	49%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	26%	74%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

For CPT 2027, two new Category I codes 44XX1, 44XX2 were approved to report surgical treatment of congenital duodenal obstruction via an open and a laparoscopic approach. A survey request was sent to a random selection of members from the American College of Surgeons self-designated as general surgeons and the American Pediatric Surgical Association.

Recommendation – 44XX1

We recommend the survey 25th percentile work RVU of 45.00.

Pre-time

Package 4 is selected with the following modifications:

Evaluation time: Add 20 minutes (total = 60 minutes) for extensive preoperative testing of the newborn and review of imaging to assist with preoperative planning. There is also extensive discussion with the parents/guardian about the planned procedure and expected postoperative recovery, with pediatric anesthesia, and with the NICU team.

Positioning time: Add 9 minutes (total time = 12 minutes) to account for additional time for positioning of the infant in relation to anesthesia lines, ensuring optimal access to the surgical field. Position the upper extremities in adduction or abduction of less than 90 degrees, maintain neutral alignment of the spine and cervical region, and implement measures to minimize the risk of peripheral nerve injury and preserve skin integrity.

Scrub, dress, wait time: Subtract 10 minutes (total time = 10 minutes) to be consistent with survey median.

Immediate Post-time

Package 9b: Subtract 3 minutes to be consistent with the survey median.

Key Reference Code Comparison

Survey respondents are well-acquainted with both the key reference codes and the new code 44XX1, and are therefore well-positioned to compare the services. Intensity and complexity measures clearly indicate that code 44XX1 represents a procedure significantly more demanding than the reference codes. A duodenoduodenostomy or duodenojejunostomy for congenital duodenal obstruction usually requires greater technical skill and is considered more intense and complex than a standard single resection and anastomosis of the proximal small intestine, mostly because of anatomical difficulty, risk of injury to critical structures, and the requirement for precise mobilization in a highly confined retroperitoneal space with vital nearby structures (pancreas, bile duct, ampulla of Vater). The duodenum's fixed retroperitoneal position complicates exposure and manipulation. 44XX1 is technically more challenging, especially in very small neonates due to the size and thickness of duodenal tissue and proximity to major vessels and ducts, and is often considered one of the more complex neonatal gastrointestinal procedures due to challenging anatomy and high risk for intraoperative complications.

MPC Code Comparison

Other Code Comparison

The table below presents codes reviewed over the past decade that are associated with substantial total times. These findings provide compelling support for the recommendation for code 44XX1 and underscore the necessity of accounting for all components of physician work—preoperative, intraoperative, and postoperative—when establishing an appropriate relative value.

CPT	DESC	Year	IWPUT	RVUs				Time

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.

☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 44799 Unlisted procedure, small intestine

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty general surgery How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 400
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. specialty estimate

CPT Descriptor: Laparoscopy, surgical; Duodenoduodenostomy or duodenojejunostomy for congenital duodenal obstruction

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 38-week gestation, 3 kg infant with a prenatal diagnosis of duodenal atresia that is confirmed on postnatal imaging. The infant undergoes laparoscopic duodenoduodenostomy for congenital duodenal obstruction.

Percentage of Survey Respondents who found Vignette to be Typical: 96%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 100% , In the ASC 0%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 100%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 100%

Description of Pre-Service Work: Preoperative testing is reviewed to confirm that both fluid and electrolyte derangements are adequately corrected. Medical history regarding any associated anomalies is again reviewed. Confirmation is made with blood bank that a type and screen has been received. Appropriate selection, timing, and administration of antibiotics are ensured. The planned procedure and postoperative management are reviewed with the infant's parent/guardian. Informed consent is reviewed and obtained from the parent/guardian, including witness confirmation. The length of anesthesia, including adjuncts to postoperative analgesia management, are reviewed with the anesthesiologist. The choice of analgesia, monitoring, and attention to hemodynamic changes and possible complications are extremely important to prevent any anesthetic complications and to be able to adapt to intraoperative physiological changes during the procedure. Verify that all required instruments and supplies are available. Confirm temperature equipment to preserve body temperature is available. Assistance is provided in transfer of the infant from isolette to operating table. Monitor/assist patient positioning, initially supine while upper extremity intravenous and arterial access points are dressed, padded and secured. The arms are then padded and tucked at the infant's sides. The infant may be secured to the table, including a soft chest and thigh strap, as it may be necessary to roll the table during the procedure to use gravity to assist with shifting the abdominal contents. There is also consideration of positioning the infant relative to laparoscopy equipment, including lines and video equipment and anesthesia lines relative to the rest of the equipment. Assist anesthesia team with initiation of anesthesia, to ensure surgical access to upper abdomen. Preposition all laparoscopic equipment for appropriate height and location. The areas of skin to be prepared and draped are indicated by the surgeon to ensure that all of the potential operative field is included in the preparation. The surgeon scrubs and gowns. A surgical time-out is performed with operating surgical team.

Description of Intra-Service Work: Under general anesthesia, a trans-umbilical incision is made. A Veress needle is cautiously inserted. The abdomen insufflated with carbon dioxide. Once the abdomen has reached an appropriate level of insufflation, a laparoscopic port with trocar is inserted at the umbilicus. Additional laparoscopic ports are inserted under direct visualization following infiltration of the skin and soft tissue with local anesthetic. The abdomen is thoroughly inspected. The falciform ligament is retracted by trans-abdominal suture placement. The right colon and hepatic flexure are mobilized delicately with laparoscopic instruments. The bowel is thoroughly explored to rule out additional distal atresias. Manipulation of the bed in addition to laparoscopic instruments are used to retract the bowel and liver. The duodenum is mobilized and the type and extent of the atresia is determined. A transverse enterotomy is made with ultrasonic shears just proximal to the atresia and a longitudinal enterotomy is made just distal to the atresia. Care is taken to avoid the ampulla of

Vater. A “diamond shaped” handsewn anastomosis is performed with suture. The anastomosis is inspected for leak and patency. Bowel is returned to normal anatomic position. A complete camera survey of the abdomen and contents is performed to inspect for bleeding and visceral injury from retraction. The laparoscopic ports are removed and the fascia is closed followed by closure of the skin incisions.

Description of Post-Service Work: Apply sterile dressings and participate in the post-procedure debrief (“time-out”). Write a brief operative note, then assist in transferring the intubated infant to an isolette and accompany the patient to the NICU. Immediately communicate with the neonatologist and NICU team regarding postoperative care. Write initial postoperative orders, including laboratory studies and imaging. Discuss the surgery, its outcome, and the expected postoperative course with the parents/guardian. Dictate a detailed operative report.

The infant is critically ill following this procedure. During the initial postoperative period, complex decision-making is required to assess, support, and stabilize vital system functions in order to prevent life-threatening deterioration. This includes the risk of failure of major organ systems such as the central nervous system, cardiovascular system (shock or circulatory collapse), renal, hepatic, metabolic, and respiratory systems. Postoperatively, the infant remains intubated until extubation orders are given by the surgeon. Orders are written for ventilator settings in coordination with NICU respiratory staff, as well as for a postoperative chest X-ray to confirm ET and NG tube positioning and assess lung status. Arterial blood gases are checked and confirmed, and NG management is reassessed daily. The infant is kept NPO with IV fluids ordered, and electrolytes are adjusted daily according to laboratory results. Total parenteral nutrition is ordered in consultation with the pharmacist/dietitian, with strict intake/output charting and daily weights. Pain control medications are ordered based on weight-based dosing, and the infant is assessed for comfort. The need for continuation of perioperative antibiotics is reviewed daily, with orders updated as appropriate. Stress ulcer prophylaxis and antireflux medication is considered for gastric protection. Laboratory studies (CBC, BMP, and ABGs for ventilator or clinical changes) are ordered as required. Imaging is obtained and reviewed as clinically needed, including chest X-rays to confirm line and tube positions and abdominal studies if obstruction or anastomotic leak is suspected. Wound care is managed by the surgeon during routine checks, with additional dressing change orders written to monitor drainage, bleeding, and skin integrity by nursing staff. The care plan is reviewed often and updated in collaboration with the NICU team, with regular communication to the family/guardian. Daily patient assessment guides whether orders are escalated or de-escalated, acknowledging that the infant’s clinical course may vary significantly over many weeks. The daily care plan includes ongoing evaluation of readiness for ventilator weaning and extubation; determination of whether supplemental oxygen is required and the method of delivery (CPAP, high-flow nasal cannula, or standard nasal cannula); management of fluids and TPN; assessment of bowel function and readiness to discontinue NG suction; planning for NG tube removal; and decisions regarding the initiation of enteral feedings. Feeding plans include the type of nutrition (breast milk or formula), formulation, volumes, frequency, and methods of administration (oral and/or gavage).

When the infant is ready for discharge, management includes a comprehensive physical exam and assessment of home needs, such as nursing visits if indicated. The feeding regimen is reviewed in detail with the parents/guardian. Hospital medications are reconciled, and in consultation with other treating providers, all outpatient medication orders are confirmed. Instructions are provided to the parents/guardian on monitoring for gastrointestinal complications such as vomiting, lack of stooling, or abdominal distension, and guidance is given on when to contact the surgeon or seek urgent hospital evaluation. Surgical follow-up appointments are arranged, and coordination with other specialists is completed as indicated. The medical record is finalized, including day-of-discharge progress notes, discharge summary, discharge instructions, and necessary insurance documentation.

At each follow-up office visit, the surgeon reviews documentation from all involved treating providers, obtains and records an interval history from the parents or guardian, and performs a physical examination that includes assessment of vital signs and growth parameters, particularly weight. Current medications are reviewed, with decisions made regarding the need for continued therapy (e.g., antireflux treatment). Findings and assessments are discussed with the parents or guardian, with dedicated time to address their questions and concerns. Laboratory studies are ordered as clinically indicated. Dietary guidance is provided, including the consideration of nutritional supplements if necessary. Parents are counseled on potential complications, both short-term and long-term, such as bowel obstruction due to adhesions, intestinal dysmotility, or duodenal dilation, and are advised on when to seek urgent evaluation by the surgeon or hospital team. The surgeon coordinates care with other members of the multidisciplinary team as appropriate and documents each visit thoroughly by dictating, reviewing, and signing progress notes in the medical record.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	14%	48%	38%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	41%	59%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	7%	93%
Physical effort required	0%	38%	62%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	17%	83%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	5%	68%	27%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	63%	37%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	11%	89%
Physical effort required	0%	16%	84%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	32%	68%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

For CPT 2027, two new Category I codes 44XX1, 44XX2 were approved to report surgical treatment of congenital duodenal obstruction via an open and a laparoscopic approach. A survey request was sent to a random selection of members from the American College of Surgeons self-designated as general surgeons and the American Pediatric Surgical Association.

Recommendation – 44XX2

We recommend the survey 25th percentile work RVU of 49.00.

Pre-time

Package 4 is selected with the following modifications:

Evaluation time: Add 20 minutes (total = 60 minutes) for extensive preoperative testing of the newborn and review of imaging to assist with preoperative planning. There is also extensive discussion with the parents/guardian about the planned procedure and expected postoperative recovery, with pediatric anesthesia, and with the NICU team.

Positioning time: Add 12 minutes (total time = 15 minutes) to account for additional time for positioning of the infant in relation to anesthesia lines and laparoscopic equipment, ensuring optimal access to the surgical field. Position the upper extremities in adduction or abduction of less than 90 degrees, maintain neutral alignment of the spine and cervical region, and implement measures to minimize the risk of peripheral nerve injury and preserve skin integrity.

Scrub, dress, wait time: Subtract 10 minutes (total time = 10 minutes) to be consistent with survey median.

Immediate Post-time

Package 9b: Subtract 3 minutes to be consistent with the survey median.

Key Reference Code Comparison

Survey respondents are well-acquainted with both the key reference codes and the new code 44XX2, and are therefore well-positioned to compare the services. Intensity and complexity measures clearly indicate that code 44XX2 represents a procedure significantly more demanding than the reference codes. A duodenoduodenostomy or duodenojejunostomy for congenital duodenal obstruction usually requires greater technical skill and is considered more intense and complex than a standard single resection and anastomosis of the proximal small intestine, mostly because of anatomical difficulty, risk of injury to critical structures, and the requirement for precise mobilization in a highly confined retroperitoneal space with vital nearby structures (pancreas, bile duct, ampulla of Vater). The duodenum's fixed retroperitoneal position complicates exposure and manipulation. 44XX2 is technically more challenging, especially in very small neonates due to the size and thickness of duodenal tissue and proximity to major vessels and ducts, and is often considered one of the more complex neonatal gastrointestinal procedures due to challenging anatomy and high risk for intraoperative complications.. The laparoscopic approach further increases technical intensity as it involves operating within a very limited space and requires advanced skills. Challenges include limited visualization and the need for precise suturing and tissue manipulation with long, slender instruments. Errors in precision are not forgiving and may result in conversion to an open procedure.

Other Code Comparison

The table below presents codes reviewed over the past decade that are associated with substantial total times. These findings provide compelling support for the recommendation for code 44XX2 and underscore the necessity of accounting for all components of physician work—preoperative, intraoperative, and postoperative—when establishing an appropriate relative value.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 44238 Unlisted laparoscopy procedure, intestine (except rectum)

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty general surgery How often? Rarely

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 200
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. specialty estimate

PRESENTER(S): Charles Mabry, MD, FACS; Richard Weiss, MD, FACS

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC) PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

Meeting Date: 09/2025

CPT Code	Long Descriptor	Global Period
44XX1	Duodenoduodenostomy or duodenojejunostomy for congenital duodenal obstruction	90
44XX2	Laparoscopy, surgical; duodenoduodenostomy or duodenojejunostomy for congenital duodenal obstruction	90

Vignette(s) (*vignette required even if PE only code(s)***):**

CPT Code	Vignette
44XX1	A 35-week gestation, 2 kg infant with a prenatal diagnosis of duodenal atresia that is confirmed on postnatal imaging. The infant undergoes duodenoduodenostomy for congenital duodenal obstruction.
44XX2	A 38-week gestation, 3 kg infant with a prenatal diagnosis of duodenal atresia that is confirmed on postnatal imaging. The infant undergoes laparoscopic duodenoduodenostomy for congenital duodenal obstruction.

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:
   Surgeons familiar with the procedure reviewed the PE details for a similar procedure and considered current staff, supplies, and equipment for the two new codes

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here:
   Key reference code 44126 was chosen as a PE reference, particularly as it included the same level of discharge management.
   NOTE: For services reviewed prior to the implementation of clinical activity codes in 2016-17, detail is not provided in the RUC database, please contact *Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org* for PE spreadsheets for your older reference codes.

3. Is this code(s) typically reported with an E/M service?
   no
   See the *Billed Together* tab in the RUC Database.

4. If you are requesting an increase over the aggregate current cost for clinical activities, supplies and equipment, please provide compelling evidence:
   n/a – new codes
   See the *PE compelling evidence guidelines* on the RUC Collaboration website. Be sure to explain if the increase can be entirely accounted for because of an increase in physician time.

CLINICAL STAFF ACTIVITIES

The RUC has agreed that there is a presumption of zero pre-service clinical staff time unless the specialty can provide evidence to the PE Subcommittee that any pre-service time is appropriate. The RUC agreed that with evidence some subset of codes may require either minimal or extensive use of clinical staff and

has allocated time when appropriate (for example when a service describes a major surgical procedure). If the package times are not applicable, alternate times may be presented and should be justified for consideration by the Subcommittee.

5. Are the global periods of the codes transitioning? Information about the amount of pre-service clinical staff time and a rationale for the change from a 090-day global to a 000 or 010 day global should be described below.

NO

6. If you are recommending more minutes than the PE Subcommittee standards for clinical activities, you must provide rationale to justify the time:

N/A

7. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (*please see 2nd worksheet tab in PE spreadsheet*), please explain the difference here:

N/A

8. Please provide a brief description of the clinical staff work for the following:
   a. Pre-Service period:

Activity	**Clinical Staff Work**
Complete pre-service diagnostic and referral forms	Staff ensures referral and all relevant history and diagnostic information is ported into the surgeon's office EHR in order to complete surgical authorization and establish the patient's records for insurance.
Coordinate pre-surgery services (including test results)	Staff coordinates collection and documentation of preservice imaging/lab results, patient specific information and other relevant patient information for a surgical procedure including presurgery assessment with anesthesiologist for the surgeon's office EHR and records all clinical updates in EHR.
Schedule space and equipment in facility	Staff interacts with facility to schedule space, supplies, equipment, and review checklists.
Provide pre-service education/obtain consent	Staff confirms procedure, complication risk, process of recovery and consent has been obtained and entered into the surgeon's office EHR
Complete pre-procedure phone calls and prescription	Staff answers questions from parent/guardian/family.

   a. Service period (includes pre, intra and post):

Prior to discharge, office clinical staff will assist with necessary post-discharge care coordination, such as: Responding to family/guardian questions and reviewing home supply needs. Coordinate with other physicians and QHPs involved in the care of the patient for transfer of records. Transitioning discharge information to the surgeon's office medical record, including medication list, correspondence and imaging or lab results pending at discharge

   b. Post-service period:

The clinical staff work includes the standard activities involved in office E/M visits including ensuring the appropriate supplies are available in the room, ensuring imaging and lab reports are available, updating medications, obtaining vital signs, assisting with positioning, coordination of care, cleaning of the room, and home instructions.

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

9. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (*please see 2nd worksheet tab in PE spreadsheet*):
   N/A

10. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov.
    N/A

MEDICAL SUPPLIES & EQUIPMENT/INVOICES

11. ☐ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

12. ☐ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

13. If you wish to include a supply that is not on the Direct PE Inputs Medical Supplies Listing (*please see 4th worksheet tab in PE spreadsheet*), a paid invoice is required. Identify and explain the supply input and invoice here:
    N/A

14. Are you recommending a PE supply pack for this recommendation? ☐ Yes or ☒No.
    If Yes, please indicate if the pack is an established package of supplies as defined by CMS (eg, SA047 *pack, E/M visit*) or a pack that is commercially available?
    N/A

15. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation (*please see 8-10th worksheet tabs in PE spreadsheet*). Please include the description, CMS supply code, unit, item quantity and unit price (if available).
    N/A

16. If you wish to include an equipment item that is not on the Direct PE Inputs Equipment Listing (*please see 5th worksheet tab in PE spreadsheet*), a paid invoice is required. Identify and explain the equipment input and invoice here:
    N/A

17. Please provide an estimate of the useful life of the new equipment item as required to calculate the equipment cost per minute:
    N/A

18. Have you recommended equipment minutes for a computer or equivalent laptop/integrated computer, equipment item computer, desktop, w-monitor, ED021 or notebook (Dell Latitute D600), ED038?
    ☐ Yes or ☒ No.
    a. If yes, please explain how the computer is used for this service(s).

b. Is the computer used exclusively as an integral component of the service or is it also used for other purposes not specific to the code?
c. Does the computer include code specific software that is typically used to provide the service(s)?

19. List all the equipment included in your recommendation and the equipment formula chosen *(please see 7th worksheet tab in PE spreadsheet: Equipment minute formulas)*. If you have selected "other formula" for any of the equipment please explain here:

EF023	table, exam	Office Visits	
EF017	scale, new born, digital	Other	5 minutes per office visit has been assigned for use of a scale as not every exam room will include a dedicated scale. The infant will need to be taken to the scale, undressed, and settled down to be able to obtain an accurate reading, and then taken back to the exam room.

PE-ONLY CODES ADDITIONAL INFORMATION

20. (a) Estimate the number of times this service might be provided nationally in a one-year period?
(b) Estimate the number of times this service might be provided to Medicare patients nationally in a one-year period?

N/A

21. Please select a Professional Liability Insurance (PLI) crosswalk based on a similar specialty mix:

Code 44126

ADDITIONAL INFORMATION

22. If there is any other item(s) on your spreadsheet not covered in the categories above that requires greater detail/explanation, please include here:

SB036	paper, exam table	5 ft per visit - Pediatric table is shorter than adult exam table
SB022	gloves, non-sterile	2 pair per visit – one for surgeon and one for clinical staff
SB004	cover, thermometer probe	One for each visit for rectal temperature
SB044	underpad 2ft x 3ft (Chux)	One for each visit - Placed on new born scale for weight and used for cover when diaper is off during exam
SM022	sanitizing cloth-wipe (surface, instruments, equipment)	One for each visit to clean surfaces after visit

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

ITEMIZED LIST OF CHANGES (FOLLOWING THE PE SUBCOMMITTEE MEETING)

NOTE: The PE spreadsheets will be updated and finalized in real-time at the meeting. PE SORs must be updated based on modifications made during the meeting and resubmitted asap. The PE SOR should match the updated PE spreadsheet. Please provide a list of the modifications made to the PE spreadsheet during the PE Subcommittee meeting in the space below with brief justification for the modification (e.g. Equipment item EF023 *table, exam* was changed to EF031 *table, power* as the power table is typical in the surgeon's office).

The PE SOR serves as key support for the spreadsheet and should include any important details/explanation for the inputs as these cannot be elaborated upon in the excel document itself.

Please submit the revised form electronically to Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org.

AMA/Specialty Society RVS Update Committee Summary of Recommendations

September 2025

Irreversible Electroporation of Tumor, Pancreas – Tab 12

In May 2025, the CPT Editorial Panel approved the addition of a code to report open irreversible electroporation (IRE) ablation of tumors of the pancreas and revision of a Category III code to exclude open ablation via IRE of tumors of the pancreas.

48XXX ***Ablation, irreversible electroporation of tumor(s) of the pancreas, open, including imaging guidance***
The RUC reviewed the survey results from 32 general surgeons, surgical oncologists and hepatopancreatobiliary surgeons and determined that the survey 25th percentile work RVU of 25.19 appropriately accounts for the physician work involved in this service. The RUC recommends the following physician time components: 50 minutes pre-service evaluation time, 10 minutes pre-service positioning time, 15 minutes pre-service scrub/dress/wait time, 120 minutes intra-service time, 30 minutes immediate post-service time, 1-99233, 2-99232, 3-99231 subsequent hospital inpatient or observation care visits, 1-99238 discharge visit, and 1-99214 and 2-99213 office visits for 544 minutes total time as supported by the survey.

Pre-time package 4 *Difficult patient/Difficult procedure* for the facility setting was selected with adjustments to the evaluation and positioning times. An additional 10 minutes of physician evaluation time is necessary for extensive preoperative review of angiographic studies, magnetic resonance imaging (MRI), computed tomography (CT) scans, and associated radiology reports to guide surgical planning. These imaging reviews are essential for determining vascular involvement, tumor margins, and the feasibility of resection versus ablation. In addition, additional positioning time is necessary due to the complexity of aligning the patient, anesthesia lines, intraoperative imaging guidance equipment, and IRE probe systems with associated monitoring and energy delivery devices. This positioning must allow unobstructed operative access to the pancreas while maintaining the accuracy and safety of probe placement during the procedure.

The specialty noted that the surgeon approaches the case with the primary intent of resecting the pancreatic tumor if technically feasible. However, the IRE system is prepared and available intraoperatively should the tumor be deemed unresectable upon direct visualization and assessment. In such cases, IRE serves as a critical alternative therapy for local control of the tumor. Most patients undergoing this procedure have locally advanced pancreatic cancer and have previously completed chemotherapy, resulting in tissue changes, adhesions, and increased complexity in surgical management. Postoperatively, these patients require close monitoring for postoperative complications related to both open pancreatic surgery and IRE technology, including risk of pancreatitis, vascular injury, and arrhythmias from energy delivery. Standard postoperative management includes a lengthy inpatient hospitalization to allow for vigilant observation, pain control, nutritional support, and multidisciplinary care coordination. The RUC concurred with the inpatient length of stay recommendation and with the survey median response of two 99213 and one 99214 post-operative office visits.

To justify a work RVU of 25.19, the RUC compared CPT code 48XXX to the top key reference service code 47380 *Ablation, open, of 1 or more liver tumor(s); radiofrequency* (work RVU = 24.56, 200 minutes intra-service time and 550 minutes total time) and noted that the intra-service

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

time is less for the surveyed code yet intensity is greater, justifying the higher work value. The RUC also compared the surveyed code to the second key reference service code 49189 *Excision or destruction, open, intra-abdominal (ie, peritoneal, mesenteric, retroperitoneal), primary or secondary tumor(s) or cyst(s), sum of the maximum length of tumor(s) or cyst(s); 20.1 to 30 cm* (work RVU = 40.00, 310 minutes intra-service time and 814 minutes total time) and noted that the reference service has much more intra-service and total time than the surveyed code denoting more physician work, and is therefore appropriately valued higher.

It was further noted that survey respondents who selected the top two key reference codes rated the intensity and complexity measures for the surveyed code as being significantly greater. The portal vein, superior mesenteric vein (SMV), superior mesenteric artery (SMA), celiac artery, and all its branches are within millimeters of where these probes are placed, and the anatomy is markedly distorted from the locally advanced tumor, prior chemotherapy, and often radiation treatment these patients have already received. Exposing and operating on the pancreas next to the SMA/SMV/celiac artery is far more intense in this domain than a liver ablation or excision/destruction of a large peritoneal tumor.

The RUC also agreed that the surveyed code is appropriately bracketed by the MPC codes 32669 *Thoracoscopy, surgical; with removal of a single lung segment (segmentectomy)* (work RVU = 23.53 and 150 minutes intra-service time and 502 minutes total time) and 34705 *Endovascular repair of infrarenal aorta and/or iliac artery(ies) by deployment of an aorto-bi-iliac endograft including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, all endograft extension(s) placed in the aorta from the level of the renal arteries to the iliac bifurcation, and all angioplasty/stenting performed from the level of the renal arteries to the iliac bifurcation; for other than rupture (eg, for aneurysm, pseudoaneurysm, dissection, penetrating ulcer)* (work RVU = 29.58 and 150 minutes intra-service time and 512 minutes total time). The RUC concluded that CPT code 48XXX should be valued at the 25th percentile work RVU, as supported by the survey. **The RUC recommends a work RVU of 25.19 for CPT code 48XXX.**

Practice Expense
The Practice Expense (PE) Subcommittee reviewed the direct practice expense inputs and made no modifications to the standard 090-day global inputs. **The RUC recommends the direct practice expense inputs as submitted by the specialty society.**

New Technology
CPT code 48XXX will be placed on the New Technology list and will be re-reviewed by the RUC in three years to ensure correct valuation and utilization assumptions.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:48XXX Tracking Number N1 Original Specialty Recommended RVU: **27.00**
Presented Recommended RVU: **25.19**
Global Period: 090 Current Work RVU: RUC Recommended RVU: **25.19**

CPT Descriptor: Ablation, irreversible electroporation of tumor(s) of the pancreas, open, including imaging guidance

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 58-year-old male with biopsy-proven locally advanced pancreatic ductal adenocarcinoma has completed 6 months of induction chemotherapy and has no evidence of metastatic disease, but the tumor continues to encase the celiac and superior mesenteric arteries and is deemed unresectable. He undergoes irreversible electroporation ablation of the tumor.

Percentage of Survey Respondents who found Vignette to be Typical: 97%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 100% , In the ASC 0%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 100%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 100%

Description of Pre-Service Work: Review preoperative work-up, with particular attention to understanding the vascular anatomy identified on the numerous cross-sectional imaging studies obtained during the course of chemotherapy. Particular attention is paid to CT or MRI representation of the portal venous and mesenteric arterial anatomy and common bile duct in relation to the tumor and pancreas identifying potential areas where a resection may still be possible or where electroporation is most likely needed. Review results of preoperative testing (laboratory, EKG, chest X-ray, availability of blood products). Select and order the appropriate antibiotic(s) and confirm timing and administration. Assure appropriate selection, timing, and administration of DVT prophylaxis. Write orders for preoperative medications, including beta blockers, if indicated. Meet with the patient and the patient's family to review the planned procedure and postoperative management. Review and obtain informed consent, including witness. Review the length and type of anesthesia with the anesthesiologist. Verify that all required instruments and supplies are available. Assist in the transfer of the patient from the gurney to the operating table. Monitor/assist with the supine positioning of the patient. Monitor placement of central venous and arterial lines following intubation and the induction of general anesthesia to confirm required access of electroporation and imaging equipment. Indicate areas of skin to be prepared and mark surgical incisions. Scrub and gown. Perform surgical time-out with operating surgical team.

Description of Intra-Service Work:
Make an upper midline incision. Identify and carefully divide the Linea alba. Grasp, elevate, and carefully incise the peritoneum to avoid injury to the bowel. Clear adhesions using sharp dissection in order to expose all of the abdominal viscera. Place a wound protector and set up the retractor. Perform a visual and manual complete exploration of the abdominal cavity and its contents to rule out occult metastatic disease that would preclude further exploration. Enter the lesser sac by dividing the gastrocolic ligament outside of the gastroepiploic vessels. Clear adhesions between the posterior stomach and the anterior border of the pancreas. Follow the middle colic vein down to the inferior border of the pancreas. Ligate the gastrocolic trunk using ties and clips. Identify the SMV as it courses behind the pancreas. Begin creating a retropancreatic tunnel, if feasible. Mobilize the right colon by incising the white line of Toldt. Identify the plane between the colon mesentery and the duodenum. Perform a wide Kocher maneuver of the duodenum to the level of the left renal vein. Begin the portal dissection by removing the common hepatic artery lymph node and send for frozen section. Dissect

out the hepatic artery and gastroduodenal artery, if possible. Dissect the hepatic artery back towards the celiac axis. Use intraoperative ultrasound to identify the tumor and its relationship to the SMV, portal vein, celiac, hepatic artery, and SMA.

Once the tumor is deemed unresectable, irreversible electroporation will be performed. Under continuous intraoperative imaging guidance, place five irreversible electroporation (IRE) probes to bracket the target lesion entirely for an intended ablation area including the encased celiac and superior mesenteric arteries and other impacted structures identified. Probes are placed parallel at the same depth to each other at least 1.5 to max 2.2 centimeter spacing. Confirm level of anesthesia is sufficient to suppress muscle twitch. With attention to the gated pulse delivery, electroporation is cycled between the probe pairs until the allotted 90-100 pulses per probe pair are achieved. Monitor the electrical current change between probes to assure IRE of tissue. Monitor the ablation zone via ultrasound. When IRE treatment is complete, the probes are pulled back and treatment is repeated as necessary based on the length of the tumor or removed if the intended electroporation is achieved. Irrigate the abdominal cavity copiously. Obtain hemostasis. Inspect the abdomen for injury and the presence of any instruments or lap pads (ie, conduct a count). Remove and count all the retractor components to ensure all components are accounted for. Return the abdominal organs to normal anatomical position. Drape the omentum over the abdominal contents. Place drain(s) as required. Close the fascia with running suture. Conduct a second count of the instrument, needle, sponge, and lap pad. Irrigate and approximate the subcutaneous tissues and close the skin.

Description of Post-Service Work: Apply sterile dressings. Standby as the patient undergoes reversal of anesthesia. Assist in the transfer of the patient from the operating table to the gurney. Assist in transport of the patient from the operating room to the recovery room. Discuss postoperative recovery care with anesthesia and nursing staff, including the need for patient-controlled analgesia. Discontinue prophylactic antibiotic therapy as appropriate. Review postoperative laboratory results. Discuss procedure and outcome with the patient's family in the waiting area. Write the immediate postoperative note in the patient's chart. Write orders for transferring to the general surgical floor and discuss ongoing care with nursing staff. Dictate operative report and copy referring physician(s). Call the referring physician(s). Later the same day and daily, review interval nursing/other staff chart notes. Discuss ongoing care with nursing staff. Evaluate vital signs and intake/output. Monitor fluid and electrolyte status and renal function; monitor for problems, such as ileus, pancreatic leak, or intestinal ischemia. Examine the patient, including reviewing vital signs and confirming as necessary. Auscultate the heart, lungs, and abdomen for bowel sounds. Manage dressings to wounds daily, monitor status of incision, and looking for signs of infection. Monitor drain(s) output. Continue prophylaxis for DVT and monitor daily for adequacy. Assess the need for beta-blockers and order as required. Assess the need for antibiotics and order as required. Monitor and document patient progress, such as evaluate for sepsis, bowel function, and cardiorespiratory function. Assess pain scores and adequacy of analgesia. Write orders for laboratory studies, films, and medications. Manage nasogastric tube, remove when appropriate, and advance diet. Write orders for patient activity and therapy as required. Chart patient progress notes. Answer patient and patient's family questions. Answer nursing/other provider questions. Monitor values of laboratory tests including complete blood count, liver function tests, and pancreatic enzymes assessing for potential complications of pancreatic tissue ablation causing biliary outflow obstruction or pancreatitis or a pancreatic leak. Prior to discharge, examine the patient, and assess the wounds, drains, and status of incisions. Auscultate the heart, lungs, and abdomen. Reconcile hospital medications, and in consultation with other treating providers, confirm that all orders are in place for medications needed post-discharge, including timing and need for resumption of preoperative medications. Order the continuation of prophylaxis for DVT. Discuss home restrictions (ie, diet, activity, bathing) with the patient, family members, and discharging nurse. Complete all appropriate medical records, including day-of-discharge progress notes, discharge summary, and discharge instructions, and insurance forms. At each office visit, perform and document an interval history and physical examination. Perform a review of other treating providers' documentation. Remove dressings and evaluate the wound. Remove staples when appropriate (at a single visit or over multiple visits). Remove drains when appropriate (at a single visit or over multiple visits). Reapply dressings as needed. Perform and address evaluation for postoperative problems (eg, seroma, constipation). Review the pathology report with the patient and family. Answer patient and family questions. Perform a PDMP check at every visit, review pain medications and make adjustments, including counseling on side effects and tapering instructions. Consider and continue DVT prophylaxis, as required. Review activity limitations and wound care with the patient and the patient's family. Discuss and order physical therapy, home health, and occupational therapy as required. Consider and order laboratory studies to evaluate postoperative anemia, hydration, and electrolytes as required post-review. Consider and order imaging to evaluate for healing or complications as required. Discuss dietary instructions and the need for nutritional supplements. Perform multidisciplinary discussions with other treating providers and updates to primary care physician. Complete leave-of-absence or short-term disability forms. Dictate, review, and sign medical record progress notes.

SURVEY DATA

RUC Meeting Date (mm/yyyy)	09/2025					
Presenter(s):	Don Selzer, MD, FACS; Charles Mabry, MD, FACS

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	27%	55%	18%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	36%	64%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	9%	18%	73%
Physical effort required	9%	64%	27%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician	0%	9%	91%

- Estimated risk of malpractice suit with poor outcome

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	0%	33%	67%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	33%	67%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	0%	100%
Physical effort required	17%	33%	50%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	0%	100%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

For CPT 2027, code 48XXX was approved for reporting open irreversible electroporation (IRE) ablation of tumors of the pancreas, including imaging guidance and Category III code 0601T was revised to describe open IRE ablation of tumors in organs other than the pancreas. A survey request was sent to a random selection of 500 members from the American Chapter of the International Hepato-Pancreato-Biliary Association. This society is recognized by the American College of Surgeons and includes general surgeons and surgical oncologists who would be familiar with treating pancreas tumors. A survey request was also sent to a list of surgeons that was provided by the device vendor who have been trained to use the IRE device. The Summary Spreadsheet presents survey statistics for each group separately and for all respondents.

Recommendation – 48XXX

We recommend 25.19 which is the 25th percentile work RVU**.**

Pre-time

Package 4 is selected with the following modifications:

Evaluation time: Add 10 minutes (total = 50 minutes) for extensive preoperative review of angiograms and MRI and CT imaging and reports to assist with preoperative planning.

Positioning time: Add 7 minutes (total time = 10 minutes) to account for additional time to position the patient, anesthesia lines, imaging guidance equipment, and IRE probes with connected equipment for clear access during surgery.

Scrub, dress, wait time: Subtract 5 minutes (total time = 15 minutes) to be consistent with survey median.

Immediate Post-time

Package 9b: Subtract 3 minutes to be consistent with the survey median.

Discussion of Postoperative Office Visits

At the first postoperative visit, an interval history and physical exam is performed and documented. Review of other treating providers documentation is performed. Dressings are removed and the wound is evaluated. Some or all staples/sutures are removed as appropriate. Drain(s) may be removed. Dressings are reapplied as needed. Evaluation for postoperative problems (eg, seroma, constipation) is performed and addressed. The pathology report is reviewed with the patient and family. Patient and family questions are answered. A PDMP check is performed, pain medications are reviewed and alterations made including counseling on side effects and tapering instructions. DVT prophylaxis is considered and continued unless contraindicated. Activity limitations and wound care are reviewed. Physical therapy, home health, occupational therapy are discussed and ordered as required. Labs evaluating postoperative anemia, hydration, electrolytes are considered and ordered as required with reviewed. Imaging to evaluate for healing or complications is considered and ordered as required. Dietary instructions and need for nutritional supplements are discussed. Multidisciplinary discussion with other treating providers and update to primary care physician is performed. Leave of absence or short term disability forms are completed. Medical record progress notes are dictated, reviewed, and signed. (The survey median 99214 visit level is supported based on MDM or time)

At subsequent postoperative visits, an interval history and physical exam is performed. The wounds are inspected and any remaining staples, sutures, and drain(s) are removed, with dressings applied as required. Evaluation for postoperative problems (eg, seroma, constipation) is performed and addressed. A PDMP check is performed, pain medications are reviewed and alterations made including counseling on side effects and tapering instructions. Activity limitations and wound care are reviewed. DVT prophylaxis is considered and continued unless contraindicated. Physical therapy, home health, and/or occupational therapy notes are reviewed. Continuation of therapy and home health is discussed with patient and ordered as required. Patient and family questions are answered. Discussion with other treating providers occurs as additional treatment plans may be initiated once surgical recovery is adequate (eg systemic therapy or radiation). Interval imaging and labs reviewed and care plan changed if appropriate. Medical record progress notes are dictated, reviewed, and signed. Leave of absence or short term disability forms are updated, as required. An update to other treating providers and primary care physician is provided. (The survey median 99213 visit level is supported based on MDM or time).

Comparison to Key Reference Procedures

The survey respondents would be familiar with the key reference code procedures and rated the intensity and complexity for the survey code significantly greater than reference codes. The portal vein, SMA, Celiac, and all its branches are within millimeters of where these probes are placed and the anatomy is markedly distorted from the locally advanced tumor, extensive chemotherapy, and often radiation therapy these patients have already received. Exposing and operating on the pancreas next to the SMA/SMV/celiac is far more intense in this domain than a liver ablation or excision/destruction of a large peritoneal tumor.

Comparison to Similar Procedures

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 0601T Ablation, irreversible electroporation; 1 or more tumors per organ, including fluoroscopic and ultrasound guidance, when performed, open

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty surgical oncology How often? Rarely

Specialty general surgery How often? Rarely

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 300
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Manufacturer device sales data for 2024

Specialty surgical oncology Frequency 240 Percentage 80.00 %

Specialty general surgery Frequency 60 Percentage 20.00 %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 50 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Specialty estimate based on national sales data for 2024 and reporting of prior code 0601T (open IRE of any organ).

Specialty surgical oncology Frequency 40 Percentage 80.00 %

Specialty general surgery Frequency 10 Percentage 20.00 %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? No

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 36260

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC) PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

Meeting Date: 09/2025

CPT Code	Long Descriptor	Global Period
48XXX	Ablation, irreversible electroporation of tumor(s) of the pancreas, open, including imaging guidance	90

Vignette(s) (*vignette required even if PE only code(s)***):**

CPT Code	Vignette
48XXX	A 58-year-old male with biopsy-proven locally advanced pancreatic ductal adenocarcinoma has completed 6 months of induction chemotherapy and has no evidence of metastatic disease, but the tumor continues to encase the celiac and superior mesenteric arteries and is deemed unresectable. He undergoes irreversible electroporation ablation of the tumor.

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:
   Surgeons familiar with this procedure reviewed PE direct details for recently review reference code 49189 to develop inputs for new code 48XXX.

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here:
   Reference code 49189, *Excision or destruction, open, intra-abdominal (ie, peritoneal, mesenteric, retroperitoneal), primary or secondary tumor(s) or cyst(s), sum of the maximum length of tumor(s) or cyst(s); 20.1 to 30 cm*, has been selected as a recently reviewed open abdominal procedure performed on a patient with cancer.
   NOTE: For services reviewed prior to the implementation of clinical activity codes in 2016-17, detail is not provided in the RUC database, please contact *Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org* for PE spreadsheets for your older reference codes.

3. Is this code(s) typically reported with an E/M service?
   No
   See the *Billed Together* tab in the RUC Database.

4. If you are requesting an increase over the aggregate current cost for clinical activities, supplies and equipment, please provide compelling evidence:
   N/A
   See the *PE compelling evidence guidelines* on the RUC Collaboration website. Be sure to explain if the increase can be entirely accounted for because of an increase in physician time.

CLINICAL STAFF ACTIVITIES

The RUC has agreed that there is a presumption of zero pre-service clinical staff time unless the specialty can provide evidence to the PE Subcommittee that any pre-service time is appropriate. The RUC agreed that with evidence some subset of codes may require either minimal or extensive use of clinical staff and has allocated time when appropriate (for example when a service describes a major surgical procedure).

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

If the package times are not applicable, alternate times may be presented and should be justified for consideration by the Subcommittee.

5. Are the global periods of the codes transitioning? Information about the amount of pre-service clinical staff time and a rationale for the change from a 090-day global to a 000 or 010 day global should be described below.

N/A

6. If you are recommending more minutes than the PE Subcommittee standards for clinical activities, you must provide rationale to justify the time:

N/A

7. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (*please see 2nd worksheet tab in PE spreadsheet*), please explain the difference here:

N/A

8. Please provide a brief description of the clinical staff work for the following:
   a. Pre-Service period:

Activity	**Clinical Staff Work**
Complete pre-service diagnostic and referral forms	Staff reviews all forms with patient and family to ensure all relevant history and diagnostic information is included.
Coordinate pre-surgery services (including test results)	Staff coordinates collection and documentation of preservice imaging/lab results, patient specific information and other relevant patient information for a surgical procedure including presurgery assessment with anesthesiologist. Enter and record all clinical updates in EHR.
Schedule space and equipment in facility	Staff interacts with facility to schedule space, supplies, equipment, and review checklists. Confirms that IRE equipment will be available.
Provide pre-service education/obtain consent	Staff reviews procedure, complication risk, process of recovery, and answers patient/family questions.
Complete pre-procedure phone calls and prescription	Staff reviews preoperative medication changes, preop diet restrictions, reviews patient medical status, and answers final pre-admission questions.

   b. Service period (includes pre, intra and post):

Prior to discharge, office clinical staff will assist with necessary post-discharge care coordination, such as: Responding to patient/family questions about home activity restrictions and outpatient follow-up. Coordination with other physicians and QHPs involved in the care of the patient for transfer of records. Transitioning discharge information to the surgeon's office medical record, including medication list, correspondence and imaging or lab results pending at discharge

   c. Post-service period:

The clinical staff work includes the standard activities involved in office E/M visits including ensuring the appropriate supplies are available in the room, ensuring imaging and lab reports are available, rooming and gowning the patient, reviewing current medications/allergies in EHR, obtaining vital signs, assisting with positioning, wound care, coordination of care, cleaning of the room, and home instructions.

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

9. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (*please see 2nd worksheet tab in PE spreadsheet*):

N/A

10. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov.

N/A

MEDICAL SUPPLIES & EQUIPMENT/INVOICES

11. ☐ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

12. ☐ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

13. If you wish to include a supply that is not on the Direct PE Inputs Medical Supplies Listing (*please see 4th worksheet tab in PE spreadsheet*), a paid invoice is required. Identify and explain the supply input and invoice here:

N/A

14. Are you recommending a PE supply pack for this recommendation? ☒ Yes or ☐ No.
If Yes, please indicate if the pack is an established package of supplies as defined by CMS (eg, SA047 *pack, E/M visit*) or a pack that is commercially available?

CMS established pack

15. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation (*please see 8-10th worksheet tabs in PE spreadsheet*). Please include the description, CMS supply code, unit, item quantity and unit price (if available).

DESCRIPTION	Code	Unit	Item Qty

PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

20. (a) Estimate the number of times this service might be provided nationally in a one-year period?
(b) Estimate the number of times this service might be provided to Medicare patients nationally in a one-year period?

N/A

21. Please select a Professional Liability Insurance (PLI) crosswalk based on a similar specialty mix:

36260

ADDITIONAL INFORMATION

22. If there is any other item(s) on your spreadsheet not covered in the categories above that requires greater detail/explanation, please include here:

- SM022, sanitizing cloth-wipe (surface, instruments, equipment), is needed to clean hard surfaces at each postoperative visit. This is consistent with the addition of SM022 to E/M office visit codes as this was not included in the E/M multispecialty office visit pack.
- SA054 (suture) is needed in addition to SA053 (suture and staple) as it is typical to remove the drain(s) at a visit separate from removal of wound sutures and staples. In addition, wound sutures and staples are not typically all removed at a single visit, requiring more than a single pack.
- SB044 (Chux), will be used at the visits that drains, sutures, and/or staples are removed.
- SG039 (ABD-Combine), and SG079 (tape) will be used for dressings related to the operative wound or drains.

ITEMIZED LIST OF CHANGES (FOLLOWING THE PE SUBCOMMITTEE MEETING)

NOTE: The PE spreadsheets will be updated and finalized in real-time at the meeting. PE SORs must be updated based on modifications made during the meeting and resubmitted asap. The PE SOR should match the updated PE spreadsheet. Please provide a list of the modifications made to the PE spreadsheet during the PE Subcommittee meeting in the space below with brief justification for the modification (e.g. Equipment item EF023 *table, exam* was changed to EF031 *table, power* as the power table is typical in the surgeon's office).

The PE SOR serves as key support for the spreadsheet and should include any important details/explanation for the inputs as these cannot be elaborated upon in the excel document itself.

Please submit the revised form electronically to Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org.

AMA/Specialty Society RVS Update Committee (RUC)
Vendor/Company Attestation Statement

This form needs to be completed by an authorized representative of any **Vendor or Company** that makes, markets or distributes a product or device utilized in performing the service being surveyed by the AMA/Specialty Society RVS Update Committee (RUC), as part of its CPT® code survey and valuation process, and which has supplied a list of users of such products or devices in connection with the survey and valuation process.

By submitting to the RUC a list of users of the undersigned's product or device as part of the RUC's CPT® code survey and valuation process, I attest that no employee, affiliate, or agent of the undersigned has contacted, and further covenant that they will not contact, any such user in connection with the survey. I hereby represent and warrant that I have the authority to sign this statement on behalf of the undersigned company and that the information herein is true and accurate. I understand that any false or inaccurate information will render the survey invalid, harming both the undersigned and the physicians who use the product or device.

AMA/Specialty Society RVS Update Committee Summary of Recommendations

September 2025

Percutaneous Lumbar Decompression – Tab 13

At the January 2025 RUC meeting, the surveying societies requested deletion of CPT code 62287 due to declining Medicare utilization. At the May 2025 CPT Editorial Panel meeting, additional utilization estimates were reviewed, and requests from neurosurgery and radiology were received to retain the code. It was determined that the code should be maintained within the CPT code set to report this service. Since the code was not surveyed with family codes 62330 and 62331 in January 2025, it was placed back on the LOI for survey at the September 2025 RUC meeting.

62287 ***Decompression percutaneous, of nucleus pulposus of intervertebral disc, any method utilizing needle-based technique to remove disc material under fluoroscopic imaging or other form of indirect visualization, with discography and/or epidural injection(s) at the treated level(s), when performed, single or multiple levels, lumbar***
The RUC reviewed the survey results from 38 surgeons and recommends a work RVU of 7.06 based on the survey 25th percentile, which maintains relativity within the family for this code. The RUC recommends 38 minutes pre-service evaluation time, 10 minutes positioning time, 10 minutes scrub/dress/wait time, 37 minutes intra-service time, 20 minutes immediate post-service time, 0.5-99238 discharge visit, and 2-99213 post-operative office visits, totaling 180 minutes. The RUC agreed with the specialty recommendation that a half-day discharge visit and 2-99213 office visits are typical. The post-operative office visits are necessary for the patient to confirm a successful outcome of the procedure at 7-10 days post-surgery and 6 weeks post-surgery.

For this procedure, the skin is anesthetized at the entry site, and an introducer needle is carefully advanced along a posterior lateral trajectory into the nucleus pulposus of the disc using regular fluoroscopic guidance. Meticulous care is taken to avoid structures like the exiting nerve root medially, and vascular structures, or the viscera laterally. A guide wire is then placed, the tract is dilated, and a working cannula is then placed and advanced into the disc. A discogram is then performed with contrast to confirm placement and to evaluate the structural integrity of the annulus. Through that cannula, instruments are inserted and used to remove small portions of the nucleus pulposus from the posterior third of the disc. Each pass requires regular fluoroscopic confirmation and tactile judgment to ensure that you are in the nucleus and to preserve the annular integrity. Once adequate decompression is achieved, the area is flushed, and homeostasis is confirmed, closure occurs. The goal of this procedure is to reduce intradiscal pressure and decompress the nerve root to reduce nerve irritation and related pain.

To support the recommended work RVU, the RUC compared the surveyed code to top key reference service codes 22869 *Insertion of interlaminar/interspinous process stabilization/distraction device, without open decompression or fusion, including image guidance when performed, lumbar; single level* (work RVU = 7.03, 45 minutes intra-service, 175 minutes total time) and 63662 *Removal of spinal neurostimulator electrode plate/paddle(s) placed via laminotomy or laminectomy, including fluoroscopy, when performed* (work RVU = 11.00, 60 minutes intra-service, 243 minutes total time). A majority of the survey respondents that selected one of the two top key reference codes indicated that the surveyed code is identical or somewhat more intense/complex than the key reference codes. The intra-service time is lower than the key reference services, but the post-operative work is similar, as supported by the total time. Therefore, the recommended work RVU of 7.06 is

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

appropriately bracketed by the reference codes. The top key reference code 22869 provides a strong relative comparison when compared to intra-service time, total time, and post-operative work. Therefore, the codes should be valued similarly.

For additional support, the RUC referenced MPC codes 15823 *Blepharoplasty, upper eyelid; with excessive skin weighting down lid* (work RVU = 6.81, 45 minutes intra-service, 161 minutes total time) and 14060 *Adjacent tissue transfer or rearrangement, eyelids, nose, ears and/or lips; defect 10 sq cm or less* (work RVU = 9.23, 60 minutes intra-service, 183 minutes total time). The recommended work RVU is appropriately bracketed by the MPC reference codes. The intra-service time of the surveyed code is lower than both codes; however, the total time is very close to MPC code 14060. Thus, the surveyed code recommended work RVU is appropriately supported relative to the reference MPC codes.

Further, CPT code 29881 *Arthroscopy, knee, surgical; with meniscectomy (medial OR lateral, including any meniscal shaving) including debridement/shaving of articular cartilage (chondroplasty), same or separate compartment(s), when performed* (work RVU = 7.03, 40 minutes intra-service, 194 minutes total time) has similar intra-service time and total time. Therefore, the surveyed code should be valued similarly to the reference code. **The RUC recommends a work RVU of 7.06 for CPT code 62287.**

62330 ***Decompression, percutaneous, with partial removal of the ligamentum flavum, including laminotomy for access, epidurography, and imaging guidance (ie, CT or fluoroscopy), bilateral; one interspace, lumbar***
62331 ***Decompression, percutaneous, with partial removal of the ligamentum flavum, including laminotomy for access, epidurography, and imaging guidance (ie, CT or fluoroscopy), bilateral; additional interspace(s), lumbar (List separately in addition to code for primary procedure)***
CPT codes 62330 and 62331 were surveyed for the January 2025 RUC meeting. In the CY 2026 MFS Proposed Rule, the RUC recommended work values of 8.00 for CPT code 62330 and 4.25 for CPT code 62331 were accepted. **The RUC agreed with the specialty societies and recommends affirmation of the current work RVU of 8.00 for CPT code 62330 and 4.25 for CPT code 62331.**

Practice Expense
The Practice Expense (PE) Subcommittee reviewed the direct practice expense inputs and made no modifications to the standard 090-day global inputs for CPT code 62287. The PE Subcommittee agreed to affirm the January 2025 PE recommendations for CPT codes 62330 and 62331. **The RUC recommends the direct practice expense inputs as submitted by the specialty societies.**

~~Percutaneous spinal procedures are done with indirect visualization (eg, image guidance) (eg, 62287). Endoscopic assistance during an open procedure with continuous and direct visualization (light-based) is reported using excision codes (eg, 63020-63035).~~

~~(For transforaminal epidural injection, see 64479-64484)~~

~~(Report 01996 for daily hospital management of continuous epidural or subarachnoid drug administration performed in conjunction with 62324, 62325, 62326, 62327)~~

~~**Definitions**~~

~~For purposes of CPT coding, the following definitions of approach and visualization apply. The primary approach and visualization define the service, whether another method is incidentally applied. Surgical services are presumed open, unless otherwise specified.~~

~~***Percutaneous:*** Image-guided procedures (eg, computer tomography [CT] or fluoroscopy) performed with indirect visualization of the spine without the use of any device that allows visualization through a surgical incision.~~

~~***Endoscopic:*** Spinal procedures performed with continuous direct visualization of the spine through an endoscope.~~

~~***Open:*** Spinal procedures performed with continuous direct visualization of the spine through a surgical opening.~~

~~***Indirect visualization:*** Image-guided (eg, CT or fluoroscopy), not light-based visualization.~~

~~***Direct visualization:*** Light-based visualization; can be performed by eye, or with surgical loupes, microscope, or endoscope.~~

(For the techniques of microsurgery and/or use of microscope, use 69990)

62263 *Percutaneous lysis of epidural adhesions using solution injection (eg, hypertonic saline, enzyme) or mechanical means (eg, catheter) including radiologic localization (includes contrast when administered), multiple adhesiolysis sessions; 2 or more days*

(62263 includes code 77003)

62264 *1 day*

(Do not report 62264 with 62263)

(62264 includes code 77003)

~~62287 Decompression procedure, percutaneous, of nucleus pulposus of intervertebral disc, any method utilizing needle based technique to remove disc material under fluoroscopic imaging or other form of indirect visualization, with discography and/or epidural injection(s) at the treated level(s), when performed, single or multiple levels, lumbar~~

~~(Do not report 62287 in conjunction with 62267, 62290, 62322, 77003, 77012, 72295, when performed at same level)~~

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

~~(For non-needle based technique for percutaneous decompression of nucleus pulposus of intervertebral disc, see 0274T, 0275T)~~

Percutaneous Decompression of Neural Elements (Blue Heading)

Percutaneous spinal procedures are done with indirect visualization (eg, image guidance) (eg, 62287~~),~~, 62330, 62331, 0274T). Endoscopic assistance during an open procedure with continuous and direct visualization (light-based) is reported using excision codes (eg, 63020-63035).

(For transforaminal epidural injection, see 64479-64484)

(Report 01996 for daily hospital management of continuous epidural or subarachnoid drug administration performed in conjunction with 62324, 62325, 62326, 62327)

Definitions

For purposes of CPT coding, the following definitions of approach and visualization apply. The primary approach and visualization define the service, whether another method is incidentally applied. Surgical services are presumed open, unless otherwise specified.

Percutaneous: *Image-guided procedures (eg, computer tomography [CT] or fluoroscopy) performed with indirect visualization of the spine without the use of any device that allows visualization through a surgical incision.*

Endoscopic: *Spinal procedures performed with continuous direct visualization of the spine through an endoscope.*

Open: *Spinal procedures performed with continuous direct visualization of the spine through a surgical opening.*

Indirect visualization: *Image-guided (eg, CT or fluoroscopy), not light-based visualization.*

Direct visualization: *Light-based visualization; can be performed by eye, or with surgical loupes, microscope, or endoscope.*

(f)62287	O1	Decompression ~~procedure,~~ percutaneous, of nucleus pulposus of intervertebral disc, any method utilizing needle-based technique to remove disc material under fluoroscopic imaging or other form of indirect visualization, with discography and/or epidural injection(s) at the treated level(s), when performed, single or multiple levels, lumbar (Do not report 62287 in conjunction with 62267, 62290, 62322, 77003, 77012, 72295, when performed at same level) (For non-needle based technique for percutaneous decompression of nucleus pulposus of intervertebral disc, see 0274T~~, 0275T~~) (For percutaneous lumbar decompression using non-needle-based technique, see 62330, 62331)	090	7.06 (2025 Work RVU = 9.03)

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:62287 Tracking Number O1 Original Specialty Recommended RVU: **7.06**
Presented Recommended RVU: **7.06**
Global Period: 090 Current Work RVU: **9.03** RUC Recommended RVU: **7.06**

CPT Descriptor: Decompression, percutaneous, of nucleus pulposus of intervertebral disc, any method utilizing needle-based technique to remove disc material under fluoroscopic imaging or other form of indirect visualization, with discography and/or epidural injection(s) at the treated level(s), when performed, single or multiple levels, lumbar

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 25-year-old male presents with low back pain, sciatica, an absent ankle reflex, and weakness of the posterior calf muscle. An MRI exam shows a diffuse bulging annulus and disk at L5-S1. The patient is scheduled for percutaneous diskectomy.

Percentage of Survey Respondents who found Vignette to be Typical: 84%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 37% , In the ASC 60%, In the office 3%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 79% , Overnight stay-less than 24 hours 14% , Overnight stay-more than 24 hours 7%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Review previous medical records including evaluation of previous imaging and appropriate lab and screening studies. Select and display appropriate images. Review and obtain informed consent from the patient. Verify that all required instruments and supplies are available in the operating suite. Review the type and duration of anesthesia with the anesthesiologist. IV antibiotics are administered to mitigate risk of discitis. Assist with turning the patient to the prone position and placing a ventral bolster under the lower abdomen to flex the spine forward to decrease the lumbar lordosis adequately. Adjust the patient's position, including repositioning the upper extremities as needed to allow unimpeded use of fluoroscopy. Scrub and gown, including lead apron. Prepare and drape the patient in sterile fashion. Perform a surgical time-out to confirm the patient and the procedure with the OR staff. Identify the correct level with fluoroscopic guidance.

Description of Intra-Service Work: Fluoroscopy is used to identify and mark the appropriate disc level in both anteroposterior (AP) and lateral projections. The planned entry point is anesthetized with local anesthetic. Using intermittent fluoroscopic guidance, an introducer is carefully advanced along a posterolateral trajectory toward the center of the disc, taking care to avoid exiting the nerve root in the foramen and to stay anterior to the posterior vertebral body line on lateral view. Once the disc is accessed, a guidewire is then advanced through the needle, followed by serial dilation and the placement of a working cannula into the disc space. Constant vigilance is needed to ensure the needle is within Kambin's triangle to avoid exiting nerve root or vascular structures.

The discectomy is then performed using the chosen system—whether it be manual graspers, aspiration-based devices, or radiofrequency ablation. The goal is to remove a portion of the nucleus pulposus from the posterior one-third of the disc to decompress the herniation, reduce intradiscal pressure, and alleviate nerve root irritation. Great care is taken not to remove excessive tissue or disrupt the annulus, which could predispose to instability. Once adequate decompression is achieved, the disc space is flushed as needed and the cannula is withdrawn. Hemostasis is obtained, and the skin is closed with a sterile dressing or a simple suture if necessary.

Description of Post-Service Work: Immediate postoperative work: The patient is monitored during resolution of anesthesia. The patient is assisted in transfer from the operating table to the gurney. Transport of the patient from the OR to the recovery room is monitored. Postoperative recovery care is discussed with the anesthesia and nursing staff. A brief operative note is written, and a postoperative note is written while in the recovery room. The patient's stabilization is monitored in the recovery room. Includes patient stabilization, communication with the family and referring physician (including written and/or telephone reports and orders), and monitoring for signs of bleeding. An operative report is dictated, and a copy is sent to the referring physician(s) if needed.

Discharge management: The procedure and outcome are discussed with the family and/or caregiver in the waiting area. Physical therapy for the use of crutches or walker is ordered. Questions from the patient and family and/or caregiver are answered. Orders for follow-up and post-discharge laboratory tests, X rays, prescriptions for medications and physical therapy, as needed post-discharge, are written. Home restrictions (ie, diet, activity, bathing) are discussed with the patient and family and/or caregiver, and discharge nurse. The patient is discharged after they have recovered from anesthesia and when there is return of adequate nutrition intake, adequate pain control with oral analgesics, and independent ambulation. All appropriate medical records, including day-of-discharge progress notes, discharge summary, discharge instructions, and insurance forms, are completed.

Office visits: First visit (occurs 7-10 days after procedure): The patient is examined, and discussion takes place. Questions from the patient and family and/or caregiver are answered. The wound is assessed. Sutures/staples are removed if placed. An exam is performed to assess strength, reflexes and sensation. Pain is assessed and pain medications are discontinued or prescriptions are extended. Activity restrictions are reviewed and physical therapy may be ordered or may be delayed until the second visit. Progress is discussed (verbal and/or written) with the primary care physician. Progress notes are entered into the medical record.
Second visit (6 weeks after the procedure): Patient is examined, and discussion takes place. Questions from the patient and family and/or caregiver are answered. Efficacy of the procedure is assessed. Activity restrictions are reviewed and typically lifted at this visit. Physical therapy is ordered or prior physicial therapy order is reviewed and modified. Progress is discussed (verbal and/or written) with the primary care physician. A prescription for pain management is written. Progress notes are entered into the medical record.
All post-discharge office visits for care throughout the global period are considered part of the post-operative work for this procedure

INTENSITY/COMPLEXITY MEASURES

(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	13%	13%	31%	43%	0%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	38%	31%	31%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	31%	19%	50%
Physical effort required	31%	50%	19%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	19%	19%	62%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	20%	80%	0%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	40%	60%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	10%	90%
Physical effort required	10%	20%	70%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	10%	20%	70%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background and Survey

Code 62287 for percutaneous decompression of the nucleus pulposus of intervertebral disc was identified on the January 2025 RUC LOI for newly established Category I codes for percutaneous interlaminar decompression (62XX0 and 62XX1). 62287 was not surveyed at the time and instead was submitted to CPT for deletion; a proposal which the CPT Editorial Panel rejected at their May meeting. Subsequently, it was added to the LOI for the September RUC meeting. Six societies expressed interest in surveying the code:

American Academy of Physical Medicine and Rehabilitation (AAPM&R)
American Association of Neurological Surgeons (AANS)
American College of Radiology (ACR)
Congress of Neurological Surgeons (CNS)
North American Spine Society (NASS)
Society for Interventional Radiology (SIR)

AAPM&R also obtained a list of 28 trained providers from a device company. This list of providers was compared to society distribution lists for deduplication purposes.

Recommendation and Rationale

The societies recommend the survey 25th percentile work RVU of 7.06, survey median times of 58 minutes pre-service, 37 minutes intra-service, and 20 minutes immediate post-service accompanied by a 0.5 discharge day management service 99238 and the survey median of two 99213 established patient office/outpatient E/M visits for a total time of 180 minutes.

Time Rationale

Pre-Service Time: The societies are recommending package 4 (difficult patient/difficult procedure) with the following modifications:

- Evaluation time – Subtract 2 minutes (total = 38 minutes) to be consistent with survey median
- Positioning time – Add 7 minutes to package time (total = 10 minutes). The patient is positioned prone and a ventral bolster is placed under the lower abdomen to flex the spine forward to decrease the lumbar lordosis adequately. The upper extremities are positioned as needed to allow unimpeded use of fluoroscopy.
- Scrub, dress, and wait time – Subtract 10 minutes (total = 10 minutes) to be consistent with survey median.

Immediate Post-Service Time: The societies are recommending package 8b (IV sedation/complex procedure) with a standard time of 28 minutes, reduced by 8 minutes for a recommended time of 20 minutes aligned with the survey median.

Discharge Day Management: The societies are recommending 0.5 x99238, which is the proxy established by the RUC for discharge day management when patients are typically discharged on the same day.

Post-Service Office Visits: The societies are recommending two level three established patient office/outpatient E/M visits (99213). This aligns with the survey results and reflects one fewer office visit than in the current inputs for the code. The first office visit typically takes place 10-14 days following the procedure with the second visit typically occurring a month later (6 weeks post-procedure).

Work RVU Rationale

The society recommended work RVU of 7.06 is the survey 25th percentile value. It is well supported by the key reference services, particularly code 22869, which is the first key reference service. While both the median survey value and 25th percentile are below the current value of the service, the societies felt the 25th percentile was more appropriate given the change in intra-service time and reduction in post-service office visits from 3 to 2.

Based on the small number of providers on the vendor list (28) and the limited volume of procedures in the RUC database (100 performed in 2023), the societies believe this procedure is infrequently performed. However, the societies were able to obtain a sufficient survey response rate of 38 with a median experience rate of 2 procedures performed in the last 12 months. The RVU responses were relatively consistent across responding specialties. The societies believe the survey data supports a 25th percentile work RVU recommendation.

Comparison to Key Reference Services

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 62287

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty neurosurgery How often? Rarely

Specialty pain medicine How often? Rarely

Specialty radiology How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. national data not available

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 100
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. RUC database - 2023

Specialty neurosurgery Frequency 10 Percentage 10.00 %

Specialty pain medicine Frequency 70 Percentage 70.00 %

Specialty radiology Frequency 4 Percentage 4.00 %

Do many physicians perform this service across the United States? No

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Explor/Decompr/Excis disc

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 62287

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

Meeting Date: September 2025

CPT Code	Long Descriptor	Global Period
62287	Decompression, percutaneous, of nucleus pulposus of intervertebral disc, any method utilizing needle-based technique to remove disc material under fluoroscopic imaging or other form of indirect visualization, with discography and/or epidural injection(s) at the treated level(s), when performed, single or multiple levels, lumbar	090

Vignette(s) (*vignette required even if PE only code(s)***):**

CPT Code	Vignette
62287	A 25-year-old male presents with low back pain, sciatica, an absent ankle reflex, and weakness of the posterior calf muscle. An MRI exam shows a diffuse bulging annulus and disk at L5-S1. The patient is schedule for percutaneous diskectomy.

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:
   The societies convened an expert panel of advisors via email and conference call to discuss the recommendations for 62287. The advisors agreed that this service is performed in the facility, requiring the resources either of a hospital or ambulatory surgical center. Thus the societies recommended standard facility inputs.

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here:
   The current code's existing PE inputs serve as the reference for this recommendation.
   NOTE: For services reviewed prior to the implementation of clinical activity codes in 2016-17, detail is not provided in the RUC database, please contact *Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org* for PE spreadsheets for your older reference codes.

3. Is this code(s) typically reported with an E/M service?
   No
   See the *Billed Together* tab in the RUC Database.

4. If you are requesting an increase over the aggregate current cost for clinical activities, supplies and equipment, please provide compelling evidence:
   Not applicable.
   See the *PE compelling evidence guidelines* on the RUC Collaboration website. Be sure to explain if the increase can be entirely accounted for because of an increase in physician time.

CLINICAL STAFF ACTIVITIES

The RUC has agreed that there is a presumption of zero pre-service clinical staff time unless the specialty can provide evidence to the PE Subcommittee that any pre-service time is appropriate. The RUC agreed

that with evidence some subset of codes may require either minimal or extensive use of clinical staff and has allocated time when appropriate (for example when a service describes a major surgical procedure). If the package times are not applicable, alternate times may be presented and should be justified for consideration by the Subcommittee.

5. Are the global periods of the codes transitioning? Information about the amount of pre-service clinical staff time and a rationale for the change from a 090-day global to a 000 or 010 day global should be described below.

No

6. If you are recommending more minutes than the PE Subcommittee standards for clinical activities, you must provide rationale to justify the time:

Standard inputs are used for a 090 day global code

7. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (*please see 2nd worksheet tab in PE spreadsheet*), please explain the difference here:

Pre-service time in our reference code was assigned to CA008 in the RUC database but has been distributed between CA001-CA005 as is aligned with PE subcommittee standards.

8. Please provide a brief description of the clinical staff work for the following:
   a. Pre-Service period:

Complete pre-service diagnostic and referral forms	**5 minutes (standard)** Staff reviews all forms with patient and family to ensure all relevant history and diagnostic information is included.
Coordinate pre-surgery services (including test results)	**20 minutes (standard)** Staff coordinates collection and documentation of imaging and lab results, patient specific information and other relevant patient information for the procedure, including conducting requisite pre-procedure assessment. All clinical updates are entered and recorded in the EHR.
Schedule space and equipment in facility	**8 minutes (standard)** Staff interacts with the facility to schedule space, supplies, equipment, and review checklists.
Provide pre-service education/obtain consent	**20 minutes (standard)** Staff reviews procedure, complication risk, recovery process, and answers patient and family questions.
Complete pre-procedure phone calls and prescription	**7 minutes (standard)** Staff reviews pre-operative medication changes and patient medical status, and answers final pre-admission questions.

   b. Service period (includes pre, intra and post):

6 minutes (standard)
Prior to discharge, clinical staff assist with necessary post-discharge care coordination, including:
- Respond to patient and family questions about home activity restrictions
- Confirm discharge medications, if needed
- Coordinate with other physicians and QHPs involved in the patient's care for records transfer

- Transition discharge information to the physician's office medical record, including medication list, correspondence, and imaging and lab results pending at discharge

c. Post-service period:

72 minutes – standard clinical staff time for office/outpatient E/M visits (two 99213 visits)
The clinical staff work includes the standard activities involved in any E/M visit, such as:

- Greet the patient and provide gowning
- Ensure all appropriate medical records are available including interval imaging and labs, physical therapy reports, and chart notes from other physicians
- Review current medications and allergies in the EHR
- Obtain vital signs
- Prepare room, including all necessary equipment and supplies
- Assist with patient positioning for exam
- Assist with wound care, as needed
- Clean room and equipment
- Answer patient and family questions about home care, including activity limitations and reinforcement of physical therapy activities
- Assist physician with orders for medication and physical therapy changes

Assist with answering patient, family/caregiver, therapist, other clinician questions and processing changes in care

9. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (*please see 2nd worksheet tab in PE spreadsheet*):

Not applicable

10. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov.

Not applicable

MEDICAL SUPPLIES & EQUIPMENT/INVOICES

11. ☐ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

12. ☐ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

13. If you wish to include a supply that is not on the Direct PE Inputs Medical Supplies Listing (*please see 4th worksheet tab in PE spreadsheet*), a paid invoice is required. Identify and explain the supply input and invoice here:

Not applicable.

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

14. Are you recommending a PE supply pack for this recommendation? **Yes** or No.
If Yes, please indicate if the pack is an established package of supplies as defined by CMS (eg, SA047 *pack, E/M visit*) or a pack that is commercially available?

Yes, standard packs for minimum multi-specialty visit (SA048) and post-op incision care (SA054)

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

15. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation (*please see 8-10th worksheet tabs in PE spreadsheet*). Please include the description, CMS supply code, unit, item quantity and unit price (if available).

DESCRIPTION	**Code**	**Unit**	**Item Qty**
pack, minimum multi-specialty visit	**SA048**	**pack**	
paper, exam table		foot	7
gloves, non-sterile		pair	2
gown, patient		item	1
pillow case		item	1
cover, thermometer probe		item	1

DESCRIPTION	**Code**	**Unit**	**Item Qty**
pack, post-op incision care (suture)	**SA054**	**pack**	
kit, suture removal		kit	1
povidone soln (Betadine)		ml	10
gauze, sterile 4in x 4in		item	2
gloves, sterile		pair	1
steri-strip (6 strip uou)		item	2
swab-pad, alcohol		item	2
tape, surgical paper 1in (Micropore)		inch	12
tincture of benzoin, swab		item	1

16. If you wish to include an equipment item that is not on the Direct PE Inputs Equipment Listing (*please see 5th worksheet tab in PE spreadsheet*), a paid invoice is required. Identify and explain the equipment input and invoice here:

N/A

17. Please provide an estimate of the useful life of the new equipment item as required to calculate the equipment cost per minute:

N/A

18. Have you recommended equipment minutes for a computer or equivalent laptop/integrated computer, equipment item computer, desktop, w-monitor, ED021 or notebook (Dell Latitute D600), ED038?
    a. If yes, please explain how the computer is used for this service(s).
    b. Is the computer used exclusively as an integral component of the service or is it also used for other purposes not specific to the code?
    c. Does the computer include code specific software that is typically used to provide the service(s)?

No

19. List all the equipment included in your recommendation and the equipment formula chosen *(please see 7th worksheet tab in PE spreadsheet: Equipment minute formulas).* If you have selected "other formula" for any of the equipment please explain here:

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

Equipment Code	Equipment	Equipment Formula	Facility Minutes
EF031	table, power	Office visits	72
EQ168	light, exam	Office visits	72

PE-ONLY CODES ADDITIONAL INFORMATION

20. (a) Estimate the number of times this service might be provided nationally in a one-year period?
(b) Estimate the number of times this service might be provided to Medicare patients nationally in a one-year period?

21. Please select a Professional Liability Insurance (PLI) crosswalk based on a similar specialty mix:

ADDITIONAL INFORMATION

22. If there is any other item(s) on your spreadsheet not covered in the categories above that requires greater detail/explanation, please include here:

Two units of supply item SM022 are included to clean surfaces, instruments and equipment at each post-operative visit. This is consistent with the addition of SM022 to E/M office visit codes as this was not included in the E/M multispecialty office visit pack.

The societies are recommending a power table (EF031) in place of the current exam table input (EF023) as well as an exam light (EQ168). Since this code was last reviewed, there have been updates to the appropriate equipment for office visits following this procedure. The power table and exam light are standard in the surgical office for this specialty. These inputs align with the equipment inputs for 62XX0, which was presented in January 2025.

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

ITEMIZED LIST OF CHANGES (FOLLOWING THE PE SUBCOMMITTEE MEETING)

NOTE: The PE spreadsheets will be updated and finalized in real-time at the meeting. PE SORs must be updated based on modifications made during the meeting and resubmitted asap. The PE SOR should match the updated PE spreadsheet. Please provide a list of the modifications made to the PE spreadsheet during the PE Subcommittee meeting in the space below with brief justification for the modification (e.g. Equipment item EF023 *table, exam* was changed to EF031 *table, power* as the power table is typical in the surgeon's office).

The PE SOR serves as key support for the spreadsheet and should include any important details/explanation for the inputs as these cannot be elaborated upon in the excel document itself.

Please submit the revised form electronically to Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org.

AMA/Specialty Society RVS Update Committee (RUC)
Vendor/Company Attestation Statement

This form needs to be completed by an authorized representative of any **Vendor or Company** that makes, markets or distributes a product or device utilized in performing the service being surveyed by the AMA/Specialty Society RVS Update Committee (RUC), as part of its CPT® code survey and valuation process, and which has supplied a list of users of such products or devices in connection with the survey and valuation process.

By submitting to the RUC a list of users of the undersigned's product or device as part of the RUC's CPT® code survey and valuation process, I attest that no employee, affiliate, or agent of the undersigned has contacted, and further covenant that they will not contact, any such user in connection with the survey. I hereby represent and warrant that I have the authority to sign this statement on behalf of the undersigned company and that the information herein is true and accurate. I understand that any false or inaccurate information will render the survey invalid, harming both the undersigned and the physicians who use the product or device.

AMA/Specialty Society RVS Update Committee Summary of Recommendations

January 2025

Percutaneous Interlaminar Lumbar Decompression – Tab 10

At the September 2024 CPT Editorial Panel meeting two new Category I codes, 62330 and 62331, were created to report percutaneous interlaminar lumbar decompression with partial removal of the ligamentum flavum. These two new codes replace the existing Category III code, 0275T, to report this service. The code family was surveyed for the January 2025 RUC meeting.

62287 ***Decompression percutaneous, of nucleus pulposus of intervertebral disc, any method utilizing needle-based technique to remove disc material under fluoroscopic imaging or other form of indirect visualization, with discography and/or epidural injection(s) at the treated level(s), when performed, single or multiple levels, lumbar***
The specialty societies noted that the utilization of CPT code 62287 has always been low and continues to decline, with only 100 claims in the 2023 Medicare data. Given the low volume of 62287, the code could not be surveyed and properly valued within the code family. **Therefore, the specialty societies will submit a CPT code change application (CCA) requesting the deletion of CPT code 62287 for the CPT 2026 cycle.**

62330 ***Decompression, percutaneous, with partial removal of the ligamentum flavum, including laminotomy for access, epidurography, and imaging guidance (ie, CT or fluoroscopy), bilateral; one interspace, lumbar***
The RUC reviewed the survey results from 106 anesthesiologists and pain medicine specialists and recommends a work RVU of 8.00 based on the survey 25th percentile, which maintains relativity within the family for this code. The RUC recommends 40 minutes of pre-service evaluation time, 10 minutes positioning time, 10 minutes scrub/dress/wait time, 45 minutes intra-service time, 15 minutes immediate post-service time, 0.5-99238, 3-99213, and 208 minutes total time. The RUC concurred that the 0.5-day discharge is appropriate given that this service is primarily performed in the facility setting.

It is important to note that for the initial interspace, all imaging guidance is included, and the procedure is performed on one side and then the contralateral side; this code describes a bilateral procedure.

To support the recommended work RVU, the RUC compared the surveyed code to key reference codes 22869 *Insertion of interlaminar/interspinous process stabilization/distraction device, without open decompression or fusion, including image guidance when performed, lumbar; single level* (work RVU = 7.03, 45 minutes intra-service, 175 minutes total time) and 22867 *Insertion of interlaminar/interspinous process stabilization/distraction device, without fusion, including image guidance when performed, with open decompression, lumbar; single level* (work RVU = 15.00, 90 minutes intra-service, 271 minutes total time). The surveyed code is performed directly within the vertebral canal, however, in comparison the interspinous spacer procedure (code 22869) is not. The work of code 22869 is performed between the spinous processes of vertebrae rather than in proximity to the spinal cord like the surveyed code. The proximity to the spinal cord and vertebral canal increases the intensity and complexity of the surveyed code given that there are additional risks. This is due to the ligamentum flavum's intimate position relative to the spinal cord, nerve roots, and subarachnoid space. The space between spinous processes, as

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

described by code 22869, is generally more removed from sensitive neurological tissues. Reference code 22867 describes the insert of an interspinous spacer between the spinous processes of vertebrae in the spine, however, different from code 22869 the procedure includes an open decompression. A procedure with an open decompression typically takes more time compared to a procedure without. The surveyed code does not include open decompression and has the same intra-service time as reference code 22869, albeit a higher total time supported the RUC recommended work RVU.

For additional support, the RUC reference MPC code 21556 *Excision, tumor, soft tissue of neck or anterior thorax, subfascial (eg, intramuscular); less than 5 cm* (work RVU = 7.66, 60 minutes intra-service, and 234 minutes total time) and 15823 *Blepharoplasty, upper eyelid; with excessive skin weighting down lid* (work RVU = 6.81, 45 minutes intra-service, and 161 minutes total time). The surveyed code work RVU is appropriately bracketed by the MPC codes. **The RUC recommends a work RVU of 8.00 for CPT code 62330.**

62331 ***Decompression, percutaneous, with partial removal of the ligamentum flavum, including laminotomy for access, epidurography, and imaging guidance (ie, CT or fluoroscopy), bilateral; additional interspace(s), lumbar (List separately in addition to code for primary procedure)***
The RUC reviewed the survey results from 105 anesthesiologists and pain medicine specialists and recommends a work RVU of 4.25 based on a direct crosswalk to CPT code 60661 *Ablation of 1 or more thyroid nodule(s), additional lobe, percutaneous, including imaging guidance, radiofrequency (List separately in addition to code for primary procedure)* (work RVU = 4.25, 45 minutes intra-service and total time), which maintains relativity within the family for this code. The RUC recommends 43 minutes of intra-service and total time for this add-on code.

It is important to note that for the add-on service, the initial interspace is complete, and then a new incision is made for an additional interspace. For the additional interspace, all imaging guidance is done again, and the procedure is performed on one side and then the contralateral side; this code describes a bilateral procedure. It is typical for only one additional interspace to be performed.

To support the recommended work RVU, the RUC compared the surveyed code to key reference codes 22634 *Arthrodesis, combined posterior or posterolateral technique with posterior interbody technique including laminectomy and/or discectomy sufficient to prepare interspace (other than for decompression), single interspace, lumbar; each additional interspace (List separately in addition to code for primary procedure)* (work RVU = 7.96, 65 minutes intra-service and total time) and 22552 *Arthrodesis, anterior interbody, including disc space preparation, discectomy, osteophytectomy and decompression of spinal cord and/or nerve roots; cervical below C2, each additional interspace (List separately in addition to code for primary procedure)* (work RVU = 6.50, 45 minutes intra-service and total time). Reference code 22634 describes the work to treat each additional interspace during spinal fusion surgery using a posterolateral technique with a posterior interbody technique. Code 22634 is a procedure that involves the vertebral canal similar to the surveyed code. Survey respondents who selected 22643 as their key reference indicated that the surveyed code was identical (42%) or more intense/complex (26%) overall when compared to reference code 22643. Survey respondents who selected 22552 as their key reference indicated that the surveyed code was identical (42%) or more intense/complex (19%) when compared to the second reference code 22552. The surveyed code recommended work RVU is appropriately relative to the key reference services.

For additional support, the RUC reference MPC code 34812 *Open femoral artery exposure for delivery of endovascular prosthesis, by groin incision, unilateral (List separately in addition to code for primary procedure)* (work RVU = 4.13, 40 minutes intra-service and total time) and

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

22632 *Arthrodesis, posterior interbody technique, including laminectomy and/or discectomy to prepare interspace (other than for decompression), single interspace, lumbar; each additional interspace (List separately in addition to code for primary procedure)* (work RVU = 5.22, 60 minutes intra-service and total time). The surveyed code work RVU is appropriately bracketed by the MPC codes. **The RUC recommends a work RVU of 4.25 for CPT code 62331.**

Practice Expense
The Practice Expense (PE) Subcommittee reviewed the direct practice expense inputs and made no modifications to the standard 090-day global inputs. **The RUC recommends the direct practice expense inputs as submitted by the specialty societies.**

New Technology
CPT codes 62330 and 62331 will be placed on the New Technology/New Services list and be re-reviewed by the RUC in three years.

~~**Definitions**~~

~~For purposes of CPT coding, the following definitions of approach and visualization apply. The primary approach and visualization define the service, whether another method is incidentally applied. Surgical services are presumed open, unless otherwise specified.~~

~~***Percutaneous:*** Image-guided procedures (eg, computer tomography [CT] or fluoroscopy) performed with indirect visualization of the spine without the use of any device that allows visualization through a surgical incision.~~

~~***Endoscopic:*** Spinal procedures performed with continuous direct visualization of the spine through an endoscope.~~

~~***Open:*** Spinal procedures performed with continuous direct visualization of the spine through a surgical opening.~~

~~***Indirect visualization:*** Image-guided (eg, CT or fluoroscopy), not light-based visualization.~~

~~***Direct visualization:*** Light-based visualization; can be performed by eye, or with surgical loupes, microscope, or endoscope.~~

(For the techniques of microsurgery and/or use of microscope, use 69990)

62263 *Percutaneous lysis of epidural adhesions using solution injection (eg, hypertonic saline, enzyme) or mechanical means (eg, catheter) including radiologic localization (includes contrast when administered), multiple adhesiolysis sessions; 2 or more days*

(62263 includes code 77003)

62264 *1 day*

(Do not report 62264 with 62263)

(62264 includes code 77003)

…

62284 *Injection procedure for myelography and/or computed tomography, lumbar*

(Do not report 62284 in conjunction with 62302, 62303, 62304, 62305, 72240, 72255, 72265, 72270)

(When both 62284 and 72240, 72255, 72265, 72270 are performed by the same physician or other qualified health care professional for myelography, see 62302, 62303, 62304, 62305)

(For injection procedure at C1-C2, use 61055)

*(For radiological supervision and interpretation, see **Radiology**)*

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

~~62287 Decompression procedure, percutaneous, of nucleus pulposus of intervertebral disc, any method utilizing needle based technique to remove disc material under fluoroscopic imaging or other form of indirect visualization, with discography and/or epidural injection(s) at the treated level(s), when performed, single or multiple levels, lumbar~~

~~(Do not report 62287 in conjunction with 62267, 62290, 62322, 77003, 77012, 72295, when performed at same level)~~

~~(For non-needle based technique for percutaneous decompression of nucleus pulposus of intervertebral disc, see 0274T, 0275T)~~

62290 Injection procedure for discography, each level; lumbar

62291 cervical or thoracic

(For radiological supervision and interpretation, see 72285, 72295)

62326 Injection(s), including indwelling catheter placement, continuous infusion or intermittent bolus, of diagnostic or therapeutic substance(s) (eg, anesthetic, antispasmodic, opioid, steroid, other solution), not including neurolytic substances, interlaminar epidural or subarachnoid, lumbar or sacral (caudal); without imaging guidance

62327 with imaging guidance (ie, fluoroscopy or CT)

(Do not report 62327 in conjunction with 77003, 77012, 76942)

(Report 01996 for daily hospital management of continuous epidural or subarachnoid drug administration performed in conjunction with 62324, 62325, 62326, 62327)

Percutaneous Decompression of Neural Elements (Blue Heading)

Percutaneous spinal procedures are done with indirect visualization (eg, image guidance) (eg, 62287~~.~~, 62330, 62331, 0274T). Endoscopic assistance during an open procedure with continuous and direct visualization (light-based) is reported using excision codes (eg, 63020-63035).

(For transforaminal epidural injection, see 64479-64484)

(Report 01996 for daily hospital management of continuous epidural or subarachnoid drug administration performed in conjunction with 62324, 62325, 62326, 62327)

Definitions

For purposes of CPT coding, the following definitions of approach and visualization apply. The primary approach and visualization define the service, whether another method is incidentally applied. Surgical services are presumed open, unless otherwise specified.

Percutaneous: *Image-guided procedures (eg, computer tomography [CT] or fluoroscopy) performed with indirect visualization of the spine without the use of any device that allows visualization through a surgical incision.*

Endoscopic: *Spinal procedures performed with continuous direct visualization of the spine through an endoscope.*

Open: *Spinal procedures performed with continuous direct visualization of the spine through a surgical opening.*

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Indirect visualization: *Image-guided (eg, CT or fluoroscopy), not light-based visualization.* ***Direct visualization:*** *Light-based visualization; can be performed by eye, or with surgical loupes, microscope, or endoscope.*				
#▲62287	T1	Decompression ~~procedure,~~ percutaneous, of nucleus pulposus of intervertebral disc, any method utilizing needle-based technique to remove disc material under fluoroscopic imaging or other form of indirect visualization, with discography and/or epidural injection(s) at the treated level(s), when performed, single or multiple levels, lumbar (Do not report 62287 in conjunction with 62267, 62290, 62322, 77003, 77012, 72295, when performed at same level) (For non-needle based technique for percutaneous decompression of nucleus pulposus of intervertebral disc, see 0274T~~, 0275T~~) <u>(For percutaneous lumbar decompression using non-needle-based technique, see 62330, 62331)</u>	090	Request to Delete for CPT 2026 (2025 Work RVU = 9.03)

Chicago, IL 60611

Subject: Percutaneous Interlaminar Lumbar Decompression

Dear Dr. Silva:

The American Society of Anesthesiologists (ASA) and American Society of Regional Anesthesia and Pain Medicine (ASRA) are preparing survey recommendations for Percutaneous Interlaminar Lumbar Decompression, including CPT codes 62XX0, 62XX1 and 62287, for consideration at the January 2025 RUC meeting. When preparing for the survey, the societies realized that utilization for CPT code 62287 was very low. The current RUC database shows low and steadily decreasing usage of CPT code 62287 over the last ten years from a high of 487 services in 2012 to only 103 services in 2022 – a nearly 80 percent decrease. An analysis of the Medicare Physician & Other Practitioners by Geography and Service analytic files shows only a limited number of unique providers reporting this service annually over the last five years from a high of 92 in 2018 to a low of 76 in 2022. Utilization and rendering provider data for CPT code 62287 is summarized below in Table/Graph 1 and Table/Graph 2, respectively.

Given the low and declining utilization of CPT code 62287 and the limited number of providers reporting this service, the societies do not believe it will be possible to obtain an adequate survey and properly value CPT code 62287 within the code family for the January 2025 RUC meeting. In addition, the societies will be submitting a code change application requesting the deletion of CPT code 62287 for consideration at the February 2025 CPT meeting. Therefore, the societies recommend that CPT code 62287 not be surveyed for the January 2025 RUC meeting and that it be sent to CPT for deletion in CY 2027.

Should you have any questions, please contact Helen Olkaba at h.olkaba@asahq.org. Thank you for your consideration of this matter.

Sincerely,

Richard W. Rosenquist, M.D., FASRA
ASA RUC Advisor

Trent Emerick, MD, MBA
ASRA RUC Advisor

Ezequiel Silva III, MD
Chair, AMA/Specialty Society RVS Update Committee
Relative Value Systems, American Medical Association
330 N. Wabash Ave., Suite 39300
Chicago, IL 60611

Dear Dr. Silva,

The American Academy of Pain Medicine (AAPM) appreciates the opportunity to comment on the relative value recommendations for Tab 10: Percutaneous Interlaminar Lumbar Decompression (62287, 62XX0, 62XX1).

This is a service performed by a subset of our members and the recommendations have been reviewed by our Coding and Reimbursement Committee. Our committee concludes that the survey data is robust in the number of responses and the types of respondents. The survey was sent to a targeted vendor list and a random sample of members of the five specialty societies involved with the survey. The survey results at the 25th percentile are consistent between the two groups and when the results are combined. Further, the key reference services used in the survey are familiar to physicians performing the procedure and are reasonable comparisons that support an appropriate rank order.

In conclusion, AAPM supports the specialty societies' recommendations for the 25th percentile survey data for 62XX0 and 62XX1.

Sincerely,

Gregory Polston

Gregory Polston, MD
AAPM RUC Advisor

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:62330 Tracking Number T2 Original Specialty Recommended RVU: **8.00**
Presented Recommended RVU: **8.00**
Global Period: 090 Current Work RVU: **N/A** RUC Recommended RVU: **8.00**

CPT Descriptor: Decompression, percutaneous, with partial removal of the ligamentum flavum, including laminotomy for access, epidurography, and imaging guidance (ie, CT or fluoroscopy), bilateral; one interspace, lumbar

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 67-year-old male is diagnosed with symptomatic lumbar spinal stenosis with neurogenic claudication unresponsive to conservative therapy. Imaging demonstrates thickened ligamentum flavum with resultant stenosis of the spinal canal at L3-L4. The patient does not require immediate open decompression. The patient undergoes a percutaneous thinning of the ligamentum flavum.

Percentage of Survey Respondents who found Vignette to be Typical: 99%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they typically perform the procedure; In the hospital 27% , In the ASC 67%, In the office 6%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 97% , Overnight stay-less than 24 hours 3% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Perform a targeted history and physical examination. Review the patient's medical record. Pay particular attention to any evidence of infection, anticoagulation and bleeding disorders as these increase the risk of severe complications from the procedure. Meet with patient and family and/or caregiver to review planned procedure and postoperative management. Review and obtain informed consent from patient. Verify that all required instruments and supplies are available in the operating suite. Review imaging and select and display appropriate images. Review the type and duration of anesthesia with the anesthesiologist. Assist with turning the patient to the prone position and placing a ventral bolster under the lower abdomen to flex the spine forward to adequately decrease the lumbar lordosis. Adjust the patient's position, including repositioning the upper extremities as needed to allow unimpeded use of fluoroscopy. Scrub and gown, including lead apron. Prepare and drape the patient in sterile fashion. Perform a surgical time-out to confirm the patient and the procedure with the OR staff. Identify the correct level with fluoroscopic guidance.

Description of Intra-Service Work: An access point to the interlaminar epidural space of the appropriate level (eg, L3-L4) is identified as close as possible to the midline and marked. The overlying skin and subcutaneous tissues are anesthetized with a local anesthetic. An 18G Touhy needle is directed under fluoroscopic guidance into the epidural space, contrast dye is injected to confirm epidural spread, and baseline epidurogram images are taken. An 1 cm incision is made at the medial pedicular line approximately 1.5 vertebral levels below the target treatment level. The trocar and portal are inserted and advanced under fluoroscopic guidance to the interlaminar space. Local anesthesia is injected to anesthetize the track and treatment area. The trocar is advanced to the interlaminar space under fluoroscopic guidance, and a portal stabilizer device is locked into the device. The trocar is removed, and the depth guide is attached to the portal. A small bone rongeur is used to remove small bony fragments of the superior and inferior laminae under fluoroscopic guidance to allow further advancement of the working portal. A tissue sculptor is used to remove small sections of ligamentum flavum under fluoroscopic guidance with insertion and removal of the tissue sculptor as each section is removed. In a typical case, the instruments are used to resect between 20 and 50 fragments of bone and ligamentous tissue per single hemilaminar segment, with each tissue fragment measuring between 0.5 and 3.0 mm in greatest. Under fluoroscopic guidance repeat refreshing of the epidural contrast is performed and epidurogram views are obtained to confirm decompression of the

spinal canal. The portal is removed from the first side. The exact same procedure is then repeated on the contralateral side. After completing the contralateral side, images are taken and compared to baseline images. The portal and epidural needle are removed, hemostasis is achieved, and the skin incision(s) are closed.

Description of Post-Service Work: Facility: Sterile dressings are applied. The patient is monitored during resolution of anesthesia. The patient is assisted in transfer from the operating table to the gurney. Transport of the patient from the OR to the recovery room is monitored. Postoperative recovery care is discussed with the anesthesia and nursing staff. A brief operative note is written, and a postoperative note is written while in the recovery room. The patient's stabilization is monitored in the recovery room. An operative report is dictated, and a copy is sent to the referring physician(s) if needed. The procedure and outcome are discussed with the family and/or caregiver in the waiting area. Physical therapy for the use of crutches or walker is ordered. Questions from the patient and family and/or caregiver are answered. Orders for follow-up and post-discharge laboratory tests, X rays, prescriptions for medications and physical therapy, as needed post-discharge, are written. Home restrictions (ie, diet, activity, bathing) are discussed with the patient and family and/or caregiver, and discharge nurse. Completed forms for handicap parking are provided. The patient is discharged after they have recovered from anesthesia and when there is return of adequate nutrition intake, adequate pain control with oral analgesics, and independent ambulation. All appropriate medical records, including day-of-discharge progress notes, discharge summary, discharge instructions, and insurance forms, are completed. All hospital visits and post-discharge office visits for care throughout the global period are considered part of the post-operative work for this procedure.

Office visits: The patient is examined, and discussion takes place. Questions from the patient and family and/or caregiver are answered. The wound is assessed. Sutures/staples are removed if placed. An exam is performed to confirm normal strength, reflexes and sensation. Activity and/or restrictions are reviewed. Questions from the patient and family and/or caregiver are answered. Physical therapy is ordered, rehabilitation is supervised, and physical therapy is monitored. Progress is discussed (verbal and written) with the primary care physician. A prescription for pain management is written. Progress notes are entered into the medical record. All post-discharge office visits for care throughout the global period are considered part of the post-operative work for this procedure.

SURVEY DATA

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Survey: Five societies (ASA, ASRA-PM, AAPM&R, IPSIS, NANS) surveyed both codes 62330 and 62331 using a single survey instrument. Each society sent the survey instrument to a random sample of their membership. The survey was also sent to a targeted vendor list ("vendor list"), which was approved by the Research Subcommittee. The societies obtained the vendor list from the sole vendor of the FDA-cleared devices that are used for the percutaneous interlaminar lumbar decompression (PILD) procedure. The vendor list included active contact information for 1,720 physician who have performed at least one PILD procedure since January 1, 2023.

For this January 2025 RUC meeting, only work was surveyed. An expert panel of RUC advisors from each of the five surveying societies was convened to review the survey data and inform the work recommendations. The expert panel also developed the practice expense (PE) recommendations.

Recommendations: For code 62330, the societies recommend the survey 25th percentile RVW of 8.00, and the survey median times of 60 minutes total pre-service, 45 minutes intra-service, and 15 minutes immediate post-service for a total time of 208 minutes. The societies offer the following rationale for these recommendations.

Pre-time: Package 4 (difficult patient / difficult procedure), with the following modifications:

- *Positioning:* Add 7 minutes to the standard package time of 3 minutes, consistent with the survey median. The additional 7 minutes is spent (1) turning the patient to the prone position, (2) placing a ventral bolster under the lower abdomen to flex the spine forward to adequately decrease the lumbar lordosis, and (3) further adjusting the patient's position, including repositioning the upper extremities, as needed, to allow unimpeded use of fluoroscopy.
- *Scrub, dress, wait (SDW):* Subtract 10 minutes from the standard package time of 20 minutes, consistent with the survey median.
- *Total pre-service time:* Subtract 3 minutes from the standard package time of 63 minutes to reflect the adjusted positioning (+7 minutes) and SDW (-10 minutes) times, and consistent with the survey median.

	Package 4 Standard Time	62330 Survey Median Time	62330 Recommended Time
EVAL	40	40	40
POSIT	3	10	10
SDW	20	10	10
TOTAL	63	60	60

Immediate post-time: Package 8b (IV sedation / complex procedure) adjusted to subtract 13 minutes from the standard package time of 28 minutes, for a total of 15 minutes, consistent with the survey median.

Post-op visits – DISCHARGE: One half-day (0.5) discharge day management visit code 99238. The survey median number of discharge day management visits is zero. However, the societies recommend one half-day (0.5) discharge day management visit code 99238, which is typical for this service and consistent with other similar 90-day global services, including both key reference service (KRS) codes. Most (97%) survey respondents said the typical patient for this procedure is discharged on the same day as the procedure. A discharge day management visit is appropriate and

necessary to perform a final evaluation, discuss the procedure, provide instructions for post-operative care, and prepare discharge paperwork. Most (86%) 90-day global services include at least one discharge day management visit (either code 99238 or code 99239). The top KRS codes for code 62330 (codes 22869 and 22867) each include the same half-day (0.5) discharge day management visit code 99238 that the societies recommend for code 62330.

Post-op visits – OFFICE: Survey median of three (3) level two office/outpatient E/M visits for an established patient (code 99213).

RVW: Survey 25th percentile RVW of 8.00.

IST: Survey median IST of 45 minutes.

The 25th percentile RVW and median IST are well supported by the strong survey data, which reflect a robust response rate (n=106) that exceeds the 30-response minimum for codes with annual Medicare utilization less than 100,000. The 25th percentile RVW and median IST values were the same when respondents were stratified by vendor list (n=30), society affiliation (n=76), and respondents with experience (n=94).

IWPUT: 0.065 based on the recommended survey 25th percentile RVW of 8.00 and survey median pre-, intra-, and post-service times. An IWPUT of 0.065 is conservative relative to top KRS codes 22869 and 22867, which have IWPUTs of 0.077 and 0.106, respectively.

Reference service list (RSL): Anesthesiology and pain medicine specialists furnish a relatively small number of 90-day global services. Because our members do not report many 90-day global services, we were limited when selecting RSL codes that would be both (1) appropriate and consistent with RUC guidelines / requirements, and (2) familiar enough to survey respondents for the purposes of rating code 62330. The final RSL for code 62330 included 22 90-day global services. Three of these services (codes 22867, 22869, 63655) describe spine procedures that anesthesiology and pain medicine specialist commonly furnish; the other 19 RSL codes are rarely, if ever, reported by anesthesiology and pain medicine specialists. RVWs for the 22 RSL codes were well-distributed and ranged from 6.68 to 15.00. The RSL included six (6) MPC codes, and most codes were RUC reviewed in the last 10 (n=12) or 15 (n=9) years; one code (code 53445, an MPC code) was RUC reviewed in 2008.

Key Reference Service (KRS) Comparison: Nearly all survey respondents (87%) chose the three spine procedures that anesthesiology and pain medicine specialists commonly furnish as the KRS codes for rating code 62330, including when respondents were stratified by vendor list (83%), society affiliation (88%), and with (88%) and without (75%) experience. Code 22869 was the 1st KRS code for all survey respondents (42%), and when respondents were stratified by vendor list (40%), society affiliation (43%), and respondents with (44%) and without (33%) experience. Code 22867 was the 2nd KRS code for all survey respondents (24%), and when respondents were stratified by vendor list (33%), and respondents with experience (24%). Code 63655 was the 2nd KRS code when respondents were stratified by society affiliation (25%) and those without experience (25%). Although the RVW range for the selected KRS codes is somewhat wide (7.03; 10.92; 15.00), it appropriately bounds the recommended survey 25th percentile RVW of 8.00 and is consistent with how respondents rated code 62330 relative to the KRS codes for each intensity / complexity sub-measure.

TOP KEY REFERENCE SERVICE SELECTION – 62330

CODE	RVW	ALL	VENDOR LIST	SOCIETY AFFILIATION	WITH EXPERIENCE	WITHOUT EXPERIENCE
22869	7.03	42%	40%	43%	44%	33%
22867	15.00	24%	33%	20%	24%	17%
63655	10.92	21%	10%	25%	20%	25%
TOTAL		*87%*	*83%*	*88%*	*88%*	*75%*

1st KRS: Code 22869 was most recently reviewed at the April 2021 RUC meeting. The RUC reviewed the survey results from 75 physicians and determined that a value between the survey 25th percentile of 6.75 and survey median of 8.00 would most accurately reflect the typical physician work necessary to perform this service. The RUC recommended a RVW of 7.03 and times of 55 / 45 / 17 / 175 for code 22869. The survey 25th percentile RVW of 8.00 for code 62330 is appropriate relative to code 22869 and well-supported by the survey data.

The PILD procedure (code 62330) is performed directly within the vertebral canal; the interspinous spacer procedure (code 22869) is not – the work is performed between the spinous processes of vertebrae rather than in proximity to the spinal cord for code 62330. This is a key distinction for the purposes of assessing the relative intensity / complexity because procedures within the vertebral canal, like code 62330, can carry additional risks compared to procedures performed between spinous processes, like code 22869. This is due to the ligamentum flavum's intimate position relative to the spinal cord, nerve roots, and subarachnoid space. The space between spinous processes is generally more removed from sensitive neurological tissues.

The increased intensity / complexity of a procedure within the vertebral canal (code 62330) relative to a procedure where the work is performed between the vertebrae (code 22869) is well supported by the survey data. While the median IST for the two procedures is the same (45 minutes), survey respondents rated code 62330 as identical or more intense for each intensity / complexity sub-measure, including:

- overall intensity and complexity (44% identical; 47% more)
- mental effort and judgement (62% identical; 27% more)
- technical skill (49% identical; 42% more)
- physical effort (51% identical; 38% more)
- psychological stress (42% identical; 40% more)

The increased intensity / complexity of code 62330 relative to other spine procedures, like code 22869 can also be explained by differences in patient population. Patients who undergo the PILD procedure (code 62330) tend to be older and more medically complex compared to patients who undergo other lumbar decompression procedures, like interspinous spacers (code 22869) or laminectomy. This is supported by the literature. In a prospective longitudinal study comparing outcomes between Medicare beneficiaries who underwent the PILD procedure (n=2,229) and a control group of patients receiving interspinous spacers (code 22869; n = 3,401) for the treatment of LSS with neurogenic claudication, patients in the PILD group were significantly older than patients in the interspinous spacer cohort. (Staats, 2024) Symptomatic LSS patients frequently suffer from multiple medical comorbidities that make them unattractive candidates for more invasive decompression procedures that carry a higher risk of significant procedural morbidity, including due to the need for general anesthesia and longer hospital stays. In one retrospective observational cohort study of 50 patients (mean age = 73 years) who underwent the PILD procedure, most were overweight (36%) or obese (40%) with medical comorbidities that included, among others, hypertension (78%), diabetes type 1 and 2 (34%), depression (20%), coronary artery disease (30%), hypercholesterolemia (54%), rheumatoid arthritis (12%), peripheral vascular disease (8%); 68% were documented as class 3 according to the physical status classification system of the American Society of Anesthesiologists (ASA); 24% and 8% were graded ASA class 2 and 4, respectively. (Durkin, 2013) The survey data support the increased intensity and complexity of the PILD procedure (code 62330), which requires the same IST (45 minutes) as the interspinous spacer procedure (code 22869) but has a higher survey 25th percentile (8.00) and median (10.00) RVW compared to the survey 25th percentile (6.75) and median (8.00) RVW for code 22869 when surveyed for the April 2021 RUC meeting where the RUC ultimately recommended an RVW of 7.03.

For code 62330, the recommended survey 25th percentile RVW of 8.00 and median IST of 45 minutes results in an IWPUT of 0.065, which is lower than the IWPUT of 0.077 for code 22869.

2nd KRS: Code 22867 was most recently reviewed at the January 2016 RUC meeting. The RUC reviewed the survey results from 58 physicians and recommends a RVW of 15.00, based on a direct crosswalk to code 29915 *Arthroscopy, hip, surgical; with acetabuloplasty (ie, treatment of pincer lesion).* The RUC recommended a RVW of 15.00 and times of 63 / 90 / 30 / 271 for code 22867. The survey 25th percentile RVW of 8.00 for code 62330 is appropriate relative to code 22867 and well-supported by the survey data.

Like code 22869 (1st KRS), code 22867 describes a procedure to insert an interspinous spacer between the spinous processes of vertebrae in the spine. They key difference between these services is that code 22867 includes an open decompression whereas code 22869 does not. A procedure with an open decompression takes more time compared to a procedure without, which is reflected in the higher IST for code 22867 (90 minutes) than code 22869 (45 minutes). Code 62330 does not include an open decompression (as stated in the vignette) and has the same survey median IST as code 22869 (45 minutes), which also does not include an open decompression. The recommended survey median IST of 45 minutes for code 62330 is appropriate relative to the survey median IST of 90 minutes for code 22867 due to the difference in intra-service work for a procedure that includes open decompression compared to one that does not. In addition to requiring more IST, open decompression procedures can be more intense compared to procedures without open decompression. This is reflected in the slightly higher IWPUT for code 22867 (0.106) compared to code 22869 (0.077).

The increased intensity / complexity of a percutaneous procedure in the vertebral canal relative to a procedure where the work is performed between the vertebrae is well supported by the survey data. Respondents rated code 62330 as identical or more intense compared to code 22867 for each intensity / complexity sub-measure, including:

- overall intensity and complexity (44% identical; 56% more)
- mental effort and judgement (56% identical; 32% more)
- technical skill (52% identical; 40% more)
- physical effort (52% identical; 36% more)
- psychological stress (40% identical; 52% more)

For code 62330, the recommended survey 25th percentile RVW of 8.00 and median IST of 45 minutes results in an IWPUT of 0.065, which is lower than the IWPUT of 0.106 for code 22867.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 0275T

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pain Management How often? Sometimes

Specialty Anesthesiology How often? Sometimes

Specialty Interventional Pain Management How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 18200
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. We estimate national, one-year utilization of approximately 18,200 for code 62330. This estimate is based on 2022 sales data provided by the sole vendor of the FDA-cleared devices for this procedure (previously reported with Category III code 0275T) and reflects combined utilization for both Medicare and non-Medicare patients. The vendor sales data does not include the frequency and percentage data for each specialty. We used the 2022 Medicare specialty mix for code 0275T (as shown in the RUC database) to estimate the frequnecy and percentage for each specialty nationally in a one-year period for both Medicare and non-Medicare patients. [Note: The societies obtained the 2022 sales data from the sole vendor of the FDA-cleared devices for this procedure as part of the CPT code change application submission process; this same vendor also provided the societies with a targeted vendor list for the purposes of this survey.]

Specialty Pain Management Frequency 5533 Percentage 30.40 %

Specialty Anesthesiology Frequency 5460 Percentage 30.00 %

Specialty Interventional Pain Management Frequency 3986 Percentage 21.90 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 10,052 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. We estimate national, one-year utilization for Medicare patients of

approximately 10,052 for code 62330. This estimate is based on 2022 Medicare claims data for Category III code 0275T, as shown in the RUC database. To estimate the frequency for each specialty, we extrapolated based on the RUC database 2022 specialty percentages for all sites.

Specialty Pain Management Frequency 3056 Percentage 30.40 %

Specialty Anesthesiology Frequency 3019 Percentage 30.00 %

Specialty Interventional Pain Management Frequency 2201 Percentage 21.90 %

Do many physicians perform this service across the United States? Yes

SUMMARY OF RECOMMENDATION

CPT Code:62331 Tracking Number T3 Original Specialty Recommended RVU: **5.00**
Presented Recommended RVU: **5.00**
Global Period: ZZZ Current Work RVU: **N/A** RUC Recommended RVU: **4.25**

CPT Descriptor: Decompression, percutaneous, with partial removal of the ligamentum flavum, including laminotomy for access, epidurography, and imaging guidance (ie, CT or fluoroscopy), bilateral; additional interspace(s), lumbar (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 70-year-old female is diagnosed with symptomatic lumbar spinal stenosis with neurogenic claudication unresponsive to conservative therapy. Imaging demonstrates thickened ligamentum flavum with resultant stenosis of the spinal canal at L3-L4 and L4-L5. The patient does not require immediate open decompression. After performing thinning of the L3-L4 ligamentum flavum (separately reported), an additional thinning of the L4-5 ligamentum flavum is performed. [Note: This is an add-on service. Only consider the additional work related to treatment of one additional interspace.]

Percentage of Survey Respondents who found Vignette to be Typical: 98%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they typically perform the procedure; In the hospital , In the ASC , In the office

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day , Overnight stay-less than 24 hours , Overnight stay-more than 24 hours

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day

Description of Pre-Service Work:

Description of Intra-Service Work: The patient has undergone a percutaneous interlaminar decompressive procedure at one level (eg, L3-L4). Immediately following this decompression, the exact same procedure is repeated at an additional symptomatic level.

Description of Post-Service Work:

CPT Descriptor

RELATIONSHIP OF CODE BEING REVIEWED TO TOP TWO KEY REFERENCE SERVICES:
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by percent distribution) of the service you are rating to the top two chosen key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Top Key Reference Code: 31 **% of respondents:** 30.0 **%**

Number of respondents who choose 2nd Key Reference Code: 27 **% of respondents:** 26.0 **%**

TIME ESTIMATES (Median)

	CPT Code: 62331	**Top Key Reference CPT Code:** 22634	**2nd Key Reference CPT Code:** **22552**
Median Pre-Service Time	0.00	0.00	5.00
Median Intra-Service Time	43.00	65.00	45.00

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**

Overall intensity/complexity	0%	32%	42%	19%	6%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	29%	52%	20%

Technical Skill/Physical Effort	**Less**	**Identical**	**More**
Technical skill required	26%	52%	23%
Physical effort required	16%	58%	26%

Psychological Stress	**Less**	**Identical**	**More**
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	23%	52%	26%

Survey Code Compared to 2nd Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	4%	33%	41%	15%	7%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	30%	59%	11%

Technical Skill/Physical Effort	**Less**	**Identical**	**More**
Technical skill required	37%	48%	15%
Physical effort required	33%	48%	19%

Psychological Stress	**Less**	**Identical**	**More**
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician	37%	37%	26%

- Estimated risk of malpractice suit with poor outcome

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Recommendations: For code 62331, the societies recommend the survey 25th percentile RVW of 5.00, and the survey median times of 0 minutes total pre-service, 43 minutes intra-service, and 0 minutes immediate post-service for a total time of 43 minutes. The societies offer the following rationale for these recommendations.

RVW: Survey 25th percentile RVW of 5.00.

IST: Survey median IST of 43 minutes.

The survey 25th percentile RVW and median IST are well supported by the survey data, which reflect a robust response rate (n=105) that exceed the 30-response minimum for codes with annual Medicare utilization less than 100,000. The survey 25th percentile RVW is similar when respondents are stratified by vendor list (5.05), society affiliation (5.16), and respondents with experience (5.00). The survey median IST is also similar when respondents are stratified by society affiliation (45 minutes) and respondents with and without experience (both 43 minutes). The median IST for vendor list respondents is slightly lower at 33 minutes, however this is due to the relatively small number of vendor list responses (n=30), which are distributed bi-modally. There are several more vendor list responses at the lower end of the IST range, which results in a median IST for vendor list respondents that is not representative of the overall distribution. The survey mean IST is more consistent, including when stratified by vendor list and society affiliation. Specifically, for all 105 respondents for code 62331 the mean IST is 51 minutes versus 48 minutes for the 30 vendor list respondents and 52 minutes for the 75 society affiliation respondents. While using a vendor list can help collect survey data from physicians who have firsthand experience furnishing a procedure—particularly for newer services that have not been as widely adopted—nearly all (85%) of the 105 survey respondents for code 62331 reported some experience with the PILD procedure. Accordingly, we believe it is most appropriate to consider the survey data for all 105 respondents for code 62331 versus only one subset of respondents, as these data provide greater statistical power and more adequately represent data from the physicians who are currently furnishing the procedure.

The recommended survey median IST of 43 minutes for code 62331 is appropriate relative recommended survey median IST of 45 minutes for code 62330 because the intra-service work for the two procedures is identical and therefore requires the identical amount of IST. This is well-supported by the survey data which show similar median IST for codes 62330 and 62331, including when the survey data are stratified by each type of respondent. This is also well-supported by other base service and add-on service code pairs, including for other percutaneous spine procedures and injection procedures commonly furnished by anesthesiology and pain medicine specialists.

Reference service list (RSL): The RSL for code 62331 included 19 codes. RSL code RVWs were well-distributed and ranged from 4.25 to 14.14. The RSL included four spine procedure services (codes 22552, 22634, 22858, 22840) that are commonly furnished by anesthesiology and pain medicine specialists. Two of these services (codes 22634, 22552) were selected as KRS codes by most (55%) respondents, including when respondents were stratified by vendor list (47%), society affiliation (59%), and with (57%) and without (42%) experience. Both KRS codes were well-distributed in terms of RVW (6.50 and 7.96) and IST (45 and 65) and appropriately bound the recommended survey 25th percentile RVW of 5.00 and survey median IST of 43 minutes for code 62331, which is well-supported by the survey data from 105 respondents.

Key Reference Service (KRS) Comparison: All respondents selected the same two services as either 1st or 2nd KRS codes, including when the survey data were stratified by each type of respondent.

TOP KEY REFERENCE SERVICE SELECTION – 62331

CODE	RVW	ALL	VENDOR LIST	SOCIETY AFFILIATION	WITH EXPERIENCE	WITHOUT EXPERIENCE
22552	6.50	26%	39%	24%	28%	8%
22634	7.96	30%	17%	35%	29%	33%
TOTAL		*55%*	*47%*	*59%*	*57%*	*42%*

1st KRS: Code 22634 was most recently reviewed at the April 2021 RUC meeting; it is also an MPC code. The RUC reviewed the survey results from 111 physicians and determined that the survey 25th percentile RVW of 7.96 appropriately accounts for the physician work involved in this add-on service. The RUC recommended a RVW of 7.96 and times of 0 / 65 / 0 / 65 for code 22634.

Code 22634 describes the work to treat each additional interspace(s) during spinal fusion surgery using a posterolateral technique with posterior interbody technique. Code 22634 is a procedure which involves the vertebral canal, like code 62331. For each intensity / complexity sub-measure, approximately half of respondents rated code 62331 as identical to code 22634; the other half were generally split between those who said code 62331 is more versus less intense, including:

- overall intensity and complexity (42% identical; 26% more; 32% less)
- mental effort and judgement (52% identical; 19% more; 29% less)
- technical skill (52% identical; 23% more; 26% less)
- physical effort (58% identical; 36% more; 16% less)
- psychological stress (52% identical; 26% more; 23% less)

For code 62331, the recommended survey 25th percentile RVW of 5.00 and median IST of 43 minutes results in an IWPUT of 0.116, which is lower than the IWPUT of 0.122 for code 22634.

2nd KRS: Code 22552 was most recently reviewed at the February 2010 RUC meeting. The RUC reviewed survey results from 109 physicians and determined that the survey 25th percentile RVW of 6.50 appropriately valued this service. The RUC recommended a RVW of 6.50 and times of 5 / 45 / 0 / 50 for code 22552. For each intensity / complexity sub-measure most respondents rated code 62331 as identical or less intense compared to code 22552, including:

- overall intensity and complexity (41% identical; 22% more; 37% less)
- mental effort and judgement (59% identical; 11% more; 30% less)
- technical skill (48% identical; 15% more; 37% less)
- physical effort (48% identical; 19% more; 33% less)
- psychological stress (37% identical; 26% more; 37% less)

For code 62331, the recommended survey 25th percentile RVW of 5.00 and median IST of 43 minutes results in an IWPUT of 0.116, which is lower than the IWPUT of 0.142 for code 22552.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 0275T

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pain Management How often? Sometimes

Specialty Anesthesiology How often? Sometimes

Specialty Interventional Pain Management How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 7280
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. We estimate national, one-year utilization of approximately 7,280 for code 62331. This estimate reflects approximately 40% of the 2022 sales data provided by the sole vendor of the FDA-cleared devices for this procedure (previously reported with Category III code 0275T) and reflects combined utilization for both Medicare and non-Medicare patients. We estimate that approximately 40% of patients who undergo the PILD procedure will be treated at more than one level. This estimate is based a review of the relevant literature.The vendor sales data does not include the frequency and percentage data for each specialty. We used the 2022 Medicare specialty mix for code 0275T (as shown in the RUC database) to estimate the frequnecy and percentage for each specialty nationally in a one-year period for both Medicare and non-Medicare patients. [Note: The societies obtained the 2022 sales data from the sole vendor of the FDA-cleared devices for this procedure as part of the CPT code change application submission process; this same vendor also provided the societies with a targeted vendor list for the purposes of this survey.]

Specialty Pain Management Frequency 2213 Percentage 30.40 %

Specialty Anesthesiology Frequency 2184 Percentage 30.00 %

Specialty Interventional Pain Management Frequency 1594 Percentage 21.90 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 4021
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please

explain the rationale for this estimate. We estimate national, one-year utilization for Medicare patients of approximately 4,021 for code 62331. This estimate reflects approximately 40% of the 2022 Medicare fee-for-service claims for CPT code 0275T (n=10,052), as shown in the RUC database. We estimate that approximately 40% of patients who undergo the PILD procedure will be treated at more than one level. This estimate is based a review of the relevant literature.

Specialty Pain Management Frequency 1222 Percentage 30.40 %

Specialty Anesthesiology Frequency 1206 Percentage 30.00 %

Specialty Interventional Pain Management Frequency 881 Percentage 21.90 %

Do many physicians perform this service across the United States? Yes

62330	A 67-year-old male is diagnosed with symptomatic lumbar spinal stenosis with neurogenic claudication unresponsive to conservative therapy. Imaging demonstrates thickened ligamentum flavum with resultant stenosis of the spinal canal at L3-L4. The patient does not require immediate open decompression. The patient undergoes a percutaneous thinning of the ligamentum flavum.
62331	A 70-year-old female is diagnosed with symptomatic lumbar spinal stenosis with neurogenic claudication unresponsive to conservative therapy. Imaging demonstrates thickened ligamentum flavum with resultant stenosis of the spinal canal at L3-L4 and L4-L5. The patient does not require immediate open decompression. After performing thinning of the L3-L4 ligamentum flavum (separately reported), an additional thinning of the L4-5 ligamentum flavum is performed. [Note: This is an add-on service. Only consider the additional work related to treatment of one additional interspace.]

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

   An Expert Panel consisting of RUC advisors and subject matter experts from each of the surveying societies communicated via email and zoom to develop PE recommendations. The expert panel reviewed (1) survey times, (2) existing inputs for key reference service codes, and (3) PE standards.

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here:

   The societies recommend the following PE reference codes:

   <u>62330</u>
   PE Reference code #1: Code 22869 was the 1st KRS selected by 42% of survey respondents (n=45). Codes 22869 and 62330 both describe surgical procedures of the lumbar spine without open decompression or fusion and including imaging guidance when performed. Codes 22869 and 62330 are 90-global services with similar facility PE inputs for clinical staff activities, supplies, equipment.

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

PE Reference code #2: Code 22867 was the 2nd KRS selected by 24% of survey respondents (n=25). Codes 22867 and 62330 both describe surgical procedures of the lumbar spine including imaging guidance when performed. Codes 22867 and 62330 are 90-global services with similar facility PE inputs for clinical staff activities, supplies, equipment.

62331
PE Reference code #1: Code 22634 was the 1st KRS selected by 30% of survey respondents (n=31). Codes 22634 and 62331 both describe each additional interspace treated during a primary surgical procedure of the lumbar spine. Codes 22634 and 62331 are ZZZ global services with no facility PE inputs for clinical staff activities, supplies, equipment.

PE Reference code #2: Code 22552 was the 2nd KRS selected by 26% of survey respondents (n=27). Codes 22552 and 62331 both describe each additional interspace treated during a primary surgical procedure of the spine (cervical for code 22552, lumbar for code 62331). Codes 22552 and 62331 are ZZZ global services with no facility PE inputs for clinical staff activities, supplies, equipment.

NOTE: For services reviewed prior to the implementation of clinical activity codes in 2016-17, detail is not provided in the RUC database, please contact *Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org* for PE spreadsheets for your older reference codes.

3. Is this code(s) typically reported with an E/M service?

No

See the *Billed Together* tab in the RUC Database.

4. If you are requesting an increase over the aggregate current cost for clinical activities, supplies and equipment, please provide compelling evidence:

N/A

See the *PE compelling evidence guidelines* on the RUC Collaboration website. Be sure to explain if the increase can be entirely accounted for because of an increase in physician time.

CLINICAL STAFF ACTIVITIES

The RUC has agreed that there is a presumption of zero pre-service clinical staff time unless the specialty can provide evidence to the PE Subcommittee that any pre-service time is appropriate. The RUC agreed that with evidence some subset of codes may require either minimal or extensive use of clinical staff and has allocated time when appropriate (for example when a service describes a major surgical procedure). If the package times are not applicable, alternate times may be presented and should be justified for consideration by the Subcommittee.

5. Are the global periods of the codes transitioning? Information about the amount of pre-service clinical staff time and a rationale for the change from a 090-day global to a 000 or 010 day global should be described below.

Codes 62330 and 62331 are new Category I codes. The procedures described by codes 62330 and 62331 were previously reported with Category III code 0275T. Since both codes 62330 and 62331 are new, the global periods have not transitioned.

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

6. If you are recommending more minutes than the PE Subcommittee standards for clinical activities, you must provide rationale to justify the time:

N/A

7. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (*please see 2nd worksheet tab in PE spreadsheet*), please explain the difference here:

N/A

8. Please provide a brief description of the clinical staff work for the following:
   a. Pre-Service period:

Pre-service clinical staff activities for code 62330 include the following:

Complete pre-service diagnostic and referral forms	**5 minutes (standard)** Staff reviews all forms with patient and family to ensure all relevant history and diagnostic information is included.
Coordinate pre-surgery services (including test results)	**20 minutes (standard)** Staff coordinates collection and documentation of imaging and lab results, patient specific information and other relevant patient information for the procedure, including conducting requisite pre-procedure assessment. All clinical updates are entered and recorded in the EHR.
Schedule space and equipment in facility	**8 minutes (standard)** Staff interacts with the facility to schedule space, supplies, equipment, and review checklists.
Provide pre-service education/obtain consent	**20 minutes (standard)** Staff reviews procedure, complication risk, recovery process, and answers patient and family questions.
Complete pre-procedure phone calls and prescription	**7 minutes (standard)** Staff reviews pre-operative medication changes and patient medical status, and answers final pre-admission questions.

   b. Service period (includes pre, intra and post):

Service period clinical staff activities for code 62330 include the following:

6 minutes (standard)
Prior to discharge, clinical staff assist with necessary post-discharge care coordination, including:

- Respond to patient and family questions about home activity restrictions
- Confirm discharge medications, if needed
- Coordinate with other physicians and QHPs involved in the patient's care for records transfer
- Transition discharge information to the physician's office medical record, including medication list, correspondence, and imaging and lab results pending at discharge

c. Post-service period:

Post-service period clinical staff activities for code 62330 include the following:

108 minutes – standard clinical staff time for current office E/M visits (three 99213 visits)
The clinical staff work includes the standard activities involved in any E/M visit, such as:

- Greet the patient and provide gowning
- Ensure all appropriate medical records are available including interval imaging and labs, physical therapy reports, and chart notes from other physicians
- Review current medications and allergies in the EHR
- Obtain vital signs
- Prepare room, including all necessary equipment and supplies
- Assist with patient positioning for exam
- Assist with wound care, as needed
- Clean room and equipment
- Answer patient and family questions about home care, including activity limitations and reinforcement of physical therapy activities
- Assist physician with orders for medication and physical therapy changes
- Assist with answering patient, family/caregiver, therapist, other clinician questions and processing changes in care

9. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (*please see 2nd worksheet tab in PE spreadsheet*):

N/A

10. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov.

N/A

MEDICAL SUPPLIES & EQUIPMENT/INVOICES

11. ☐ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

12. ☐ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

13. If you wish to include a supply that is not on the Direct PE Inputs Medical Supplies Listing (*please see 4th worksheet tab in PE spreadsheet*), a paid invoice is required. Identify and explain the supply input and invoice here:

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

N/A

14. Are you recommending a PE supply pack for this recommendation? Yes or No.
If Yes, please indicate if the pack is an established package of supplies as defined by CMS (eg, SA047 *pack, E/M visit*) or a pack that is commercially available?

Yes, we recommend two supply packs: SA048 and SA054.
These supply packs are both established packs as defined by CMS.

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

15. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation (*please see 8-10th worksheet tabs in PE spreadsheet*). Please include the description, CMS supply code, unit, item quantity and unit price (if available).

DESCRIPTION	Code	Unit	Item Qty
pack, minimum multi-specialty visit	**SA048**	**pack**	
paper, exam table		foot	7
gloves, non-sterile		pair	2
gown, patient		item	1
pillow case		item	1
cover, thermometer probe		item	1

DESCRIPTION	Code	Unit	Item Qty
pack, post-op incision care (suture)	**SA054**	**pack**	
kit, suture removal		kit	1
povidone soln (Betadine)		ml	10
gauze, sterile 4in x 4in		item	2
gloves, sterile		pair	1
steri-strip (6 strip uou)		item	2
swab-pad, alcohol		item	2
tape, surgical paper 1in (Micropore)		inch	12
tincture of benzoin, swab		item	1

16. If you wish to include an equipment item that is not on the Direct PE Inputs Equipment Listing (*please see 5th worksheet tab in PE spreadsheet*), a paid invoice is required. Identify and explain the equipment input and invoice here:

N/A

17. Please provide an estimate of the useful life of the new equipment item as required to calculate the equipment cost per minute:

N/A

18. Have you recommended equipment minutes for a computer or equivalent laptop/integrated computer, equipment item computer, desktop, w-monitor, ED021 or notebook (Dell Latitute D600), ED038?
    a. If yes, please explain how the computer is used for this service(s).
    b. Is the computer used exclusively as an integral component of the service or is it also used for other purposes not specific to the code?
    c. Does the computer include code specific software that is typically used to provide the service(s)?

N/A

19. List all the equipment included in your recommendation and the equipment formula chosen *(please see 7th worksheet tab in PE spreadsheet: Equipment minute formulas).* If you have selected "other formula" for any of the equipment please explain here:

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

Equipment Code	Equipment	Equipment Formula	Facility Minutes
EF031	table, power	Office visits	108
EQ168	light, exam	Office visits	108

PE-ONLY CODES ADDITIONAL INFORMATION

20. (a) Estimate the number of times this service might be provided nationally in a one-year period?
(b) Estimate the number of times this service might be provided to Medicare patients nationally in a one-year period?

N/A

21. Please select a Professional Liability Insurance (PLI) crosswalk based on a similar specialty mix:

The societies recommend a PLI crosswalk to code 22869 for code 62330 and code 22870 for code 62331 based on a similar specialty mix. The societies reviewed 2023 utilization data (published with the calendar year 2025 Physician Fee Schedule final rule) for all CPT codes to identify appropriate PLI crosswalks for codes 62330 and 62331. Our analysis focused on codes that (1) are predominantly provided in the facility setting, and (2) have a similar specialty mix to code 0275T. codes 22869 and 22870 are furnished in a facility setting 99% of the time by a similar mix of specialties as code 0275T.

Code	Crosswalk	Descriptor	PLI RVU
62330	22869	Insertion of interlaminar/interspinous process stabilization/distraction device, without open decompression or fusion, including image guidance when performed, lumbar; single level	0.70
62331	22870	Insertion of interlaminar/interspinous process stabilization/distraction device, without open decompression or fusion, including image guidance when performed, lumbar; second level (List separately in addition to code for primary procedure)	0.23

	2022 Medicare Percentages for Global Medicare Specialty (All Sites), Specialty %		
Specialty	**0275T**	**22869**	**22870**
Pain Management	30.4%	30.3%	31.0%
Anesthesiology	30.0%	31.5%	31.9%
Interventional Pain Management	21.9%	22.1%	23.6%
Physical Medicine and Rehabilitation	15.8%	11.8%	10.3%
Neurology	0.4%	0.6%	0.3%
Diagnostic Radiology	0.4%	0.8%	0.6%

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC) PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

ITEMIZED LIST OF CHANGES (FOLLOWING THE PE SUBCOMMITTEE MEETING)

NOTE: The PE spreadsheets will be updated and finalized in real-time at the meeting. PE SORs must be updated based on modifications made during the meeting and resubmitted asap. The PE SOR should match the updated PE spreadsheet. Please provide a list of the modifications made to the PE spreadsheet during the PE Subcommittee meeting in the space below with brief justification for the modification (e.g. Equipment item EF023 *table, exam* was changed to EF031 *table, power* as the power table is typical in the surgeon's office).

The PE SOR serves as key support for the spreadsheet and should include any important details/explanation for the inputs as these cannot be elaborated upon in the excel document itself.

Please submit the revised form electronically to Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org.

AMA/Specialty Society RVS Update Committee Summary of Recommendations
Screen: Codes Reported Together 75% or More

September 2025

Rotational Vestibular Assessment – Tab 14

In April 2024, the Relativity Assessment Workgroup (RAW) identified code 92546 as reported with 92540 by the same physician or qualified health care professional on the same date of service 84% of the time based on 2022 Medicare Utilization data. However, code 92540 is reported with 92546 less than 50% of the time. In September 2024, the RAW reviewed the action plan and recommended referral to the CPT Editorial Panel to revise the descriptor for code 92546 to clarify the service so that it is no longer typically reported with code 92540 more than 75% of the time. Specifically, CPT code 92546 is a separate and distinct service from CPT code 92540, in that 92546 utilizes the use of a calibrated, computer controlled rotary chair and requires different work and equipment than CPT code 92540. The specialties noted that the codes can still be reported together, although it is strongly anticipated that it will be far less frequent (<50%). At the September 2025 CPT Editorial Panel Meeting, CPT code 92546 was deleted, and two new codes were added to report rotational vestibular assessment. The two new codes were surveyed for the September 2025 RUC meeting.

Compelling Evidence

The specialty societies presented compelling evidence to support a change in physician work due to a change in specialty. According to Medicare utilization data, the plurality of the billing is from audiology (31%), followed by neurology (29.8%), and otolaryngology (12.8%). Further, Audiology time is currently captured as clinical labor in practice expense. However, since 2009, audiologists may bill Medicare independently. As such, audiologists' time should not be captured under practice expense. Rather, audiology time should be accounted for in professional work. **The RUC accepted compelling evidence based on a change in specialty.**

92XX5 ***Rotational vestibular assessment by sinusoidal harmonic acceleration (SHA) testing with calibrated, computer-controlled chair, with interpretation and report;***

The RUC reviewed the survey results from 92 audiologists and neurologists and recommends a work RVU of 0.92 based on the survey median, which maintains relativity within the family for this code. The RUC recommends 10 minutes of pre-service evaluation time, 25 minutes intra-service time, 10 minutes immediate post-service time, totaling 45 minutes.

For this procedure, the patient is strapped into the chair, goggles are placed, and their visual awareness is compromised. The chair is being moved in different directions, with varying intensities of movement. It is important to remember that these patients are also undergoing this service because they have had a long-standing vestibular history and are often frightened and anxious about the procedure. The service requires the skill of the physician/qualified healthcare professional (QHP) to make clinical decisions and interpret the results continuously throughout the entirety of the test. Further, monitoring the patient for symptom provocation so that real-time decision-making can be made is essential to the procedure.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

To support the recommended work RVU, compared the surveyed code to the top key reference service codes 92519 *Vestibular evoked myogenic potential (VEMP) testing, with interpretation and report; cervical (cVEMP) and ocular (oVEMP)* (work RVU = 1.20, 35 minutes intra-service, 50 minutes total time) and 92537 *Caloric vestibular test with recording, bilateral; bithermal (ie, one warm and one cool irrigation in each ear for a total of four irrigations)* (work RVU = 0.60, 30 minutes intra-service, 40 minutes total time). A majority of the survey respondents that selected the top key reference codes indicated that the surveyed code is more intense/complex. A majority of the survey respondents that selected the second key reference code indicated that the surveyed code and reference code have identical intensity. The surveyed code intra-service time is lower when compared to the key reference services; however, the total time and related intensity and complexity of the surveyed code are relative to the reference services. Therefore, the recommended work RVU is appropriately bracketed by the key reference services.

For additional support, the RUC referenced MPC codes 92517 *Vestibular evoked myogenic potential (VEMP) testing, with interpretation and report; cervical (cVEMP)* (work RVU = 0.80, 20 minutes intra-service, 32 minutes total time) and 92653 *Auditory evoked potentials; neurodiagnostic, with interpretation and report* (work RVU = 1.05, 30 minutes intra-service, 50 minutes total time). The MPC reference codes appropriately bracket the survey code work RVU, intra-service time, and total time, supporting the recommended work RVU and relativity within the MFS. **The RUC recommends a work RVU of 0.92 for CPT code 92XX5.**

92XX6 ***Rotational vestibular assessment by sinusoidal harmonic acceleration (SHA) testing with calibrated, computer-controlled chair, with interpretation and report; with velocity step testing (VST) (List separately in addition to code for primary procedure)***
The RUC reviewed the survey results from 80 audiologists and neurologists and recommends a work RVU of 0.48 based on the survey median, which maintains relativity within the family for this code. The RUC recommends 12 minutes intra-service and total time.

For this add-on procedure, vestibular step testing (VST) provides additional diagnostic information about central vestibular function and helps to distinguish lateralization of peripheral vestibular dysfunction. The equipment used is the same as it is for the base code 92XX5. The additional test allows for rotation of the chair at lower and higher velocities than the sinusoidal harmonic acceleration (SHA) testing in the base code and requires additional time for the testing. Specifically, the computer-controlled chair is abruptly accelerated in a clockwise direction to a designated velocity for 60 seconds before a rapid deceleration is immediately applied back to baseline velocity for an additional 60 seconds. The process is then repeated in a counterclockwise direction. The assessment consists of four low-velocity and four high-velocity targets, each involving 60 seconds of rotational movement. For maximizing the test findings, the physician/qualified health care professional (QHP) must be engaged with the patient throughout the test to secure valid results and will make real-time decisions to adjust the protocol.

To support the recommended work RVU, the RUC compared the surveyed code to the top key reference service codes 92621 *Evaluation of central auditory function, with report; each additional 15 minutes (List separately in addition to code for primary procedure)* (work RVU = 0.35, 15 minutes intra-service and total time) and 92627 *Evaluation of auditory function for surgically implanted device(s) candidacy or postoperative status of a surgically implanted device(s); each additional 15 minutes (List separately in addition to code for primary procedure)* (work RVU = 0.33, 15 minutes intra-service and total time). A majority of the survey respondents that selected the key reference codes indicated that the surveyed code is identical or more intense/complex. Although the intra-service and total time are slightly lower than the key reference service, the surveyed code is overall more intense and complex to perform and should be valued slightly higher.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

For additional support, the RUC referenced MPC codes 77001 *Fluoroscopic guidance for central venous access device placement, replacement (catheter only or complete), or removal (includes fluoroscopic guidance for vascular access and catheter manipulation, any necessary contrast injections through access site or catheter with related venography radiologic supervision and interpretation, and radiographic documentation of final catheter position) (List separately in addition to code for primary procedure)* (work RVU = 0.38, 15 minutes intra-service, 17 minutes total time) and 96168 *Health behavior intervention, family (with the patient present), face-to-face; each additional 15 minutes (List separately in addition to code for primary service)* (work RVU = 0.60, 15 minutes intra-service and total time). The surveyed code intra-service time is lower when compared to the MPC codes; however, the surveyed code is more intense and complex to perform when compared to code 77001 and is identical to the intensity and complexity to perform MPC code 96168. Therefore, the recommended work RVU is appropriately supported by the MPC codes. **The RUC recommends a work RVU of 0.48 for CPT code 92XX6.**

Practice Expense
The Practice Expense (PE) Subcommittee reviewed the direct practice expense inputs and made minor modifications. The PE Subcommittee removed the supply input SJ010 *Basin, emesis* which was deemed to be not typically used for every patient. Further, equipment item ED021 *Computer, desktop, w-monitor* was removed as this input is considered an indirect expense in accord with CMS policy. The PE Subcommittee agreed with the specialty societies and is recommending a new equipment item for the *VNG Open Chair System*. This new system includes goggles. The "Other" equipment formula is used because the physician/audiologist time required to perform the rotational chair testing is accounted for in the work component rather than in the PE. The specialties clarified that the equipment is a fixed installation, bolted to the floor in a specialized room for this test, and cannot be moved. Further, the procedure is not typically performed with another procedure on the same day. The patient is sent specifically for the rotational vestibular assessment with the chair. **The RUC recommends the direct practice expense inputs as modified by the PE Subcommittee.**

New Technology
CPT code 92XX5 and 92XX6 will be placed on the New Technology list and be re-reviewed by the RUC in three years to ensure correct valuation, patient population, and utilization assumptions.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:92XX5 Tracking Number P1 Original Specialty Recommended RVU: **0.92**
Presented Recommended RVU: **0.92**
Global Period: XXX Current Work RVU: **0.29** RUC Recommended RVU: **0.92**

CPT Descriptor: Rotational vestibular assessment by sinusoidal harmonic acceleration (SHA) testing with calibrated, computer-controlled chair, with interpretation and report (do not report 92XX5 in conjunction with 92270)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 53-year-old female presented with dizziness and vertigo of unknown origin. Rotational vestibular assessment by sinusoidal harmonic acceleration testing with calibrated, computer-controlled chair is performed to evaluate status of the vestibulo-ocular reflex and to determine the degree of functional compensation.

Percentage of Survey Respondents who found Vignette to be Typical: 93%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 0% , In the ASC 0%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 0%

Description of Pre-Service Work: The QHP reviews the patient's medical record, including any communications and/or treatments from the referring QHP, previous diagnostic testing, relevant comorbidities, and history of taking vestibular suppressants and other centrally acting medications. The QHP prepares the equipment prior to patient arrival (e.g., goggle/equipment calibration). The QHP confirms the patient history with the patient, evaluates standardized questionnaires, and reviews current medications, explains the purpose, procedure, and safety of the test. The patient is instructed about the nature of the procedure in relation to their medical history and their expectations.

Description of Intra-Service Work: The patient is instructed about what is required before and during testing. For example, the patient should remain attentive during testing, keep eyes open, avoid looking away, and keep the head stable. Some components of testing, such as chair rotation movements, may be physically unsettling to patients. Attentional tasks will be completed between test runs to maintain arousal. The QHP removes any residual makeup or facial lotions due to interference with the infrared pupil tracking. The QHP confirms patient understanding of instructions before proceeding.
The patient is seated upright in the rotational chair and is secured via a seatbelt to ensure safety and diminish extraneous movements. Video-oculography goggles are fitted over the eyes of the patient to record pupil movement as a measure of eye motion. The goggles must be snug, contain infrared cameras to record eye movements, dichroic glass to allow the patient to see in front of them while reflecting the eye image to the cameras, and a removeable cover to transition the patient from light to dark. The QHP accurately places the goggles to avoid introducing light artifact which impacts effective tracking and compromises the ability to visually fixate, thus artificially suppressing the vestibulo-ocular reflex (VOR). To ensure accurate pupil tracking, the QHP adjusts video goggle settings for contrast and sensitivity. Good positioning of the eye in the camera's recording area, focusing of the eyes so they do not look blurry, and pupillary focusing is confirmed before proceeding with testing.
The QHP adjusts the patient's head to be pitched downward at a 30-degree angle to align the patient's horizontal semicircular canals in the same plane with the chair's horizontal axis of rotation. The patient's head is securely strapped in this downward position so that the patient's head moves in sync with the chair. VOR gain, the primary metric of this test, is defined as the ratio of eye velocity to head velocity. Chair velocity serves as a substitute for head velocity. After securing the patient in the chair, the chair lock is disengaged to allow free rotation. The room is darkened for testing and the goggle cover removed. The QHP initiates test calibration which involves the patient tracking a light stimulus on a TV monitor

moving across a defined path (sinusoidal or eccentric gaze hold), and establishes a known range of motion for accurate eye movement measurement.
The QHP places the goggle cover on the patient to ensure complete darkness, eliminating the opportunity to suppress the VOR . The chair is then oscillated at fixed frequencies. The rotational chair is accelerated to each target frequency, decelerated, switches direction, then accelerated and decelerated completing one cycle of rotation. Each frequency has 3-6 cycles for repeatability. Testing is routinely done at least one low, medium, and high frequency, ranging from 0.01 to Hz to 1.28 Hz. Intermediate frequencies may be repeated or added if the QHP sees recordings that indicate VOR abnormalities at a specific frequency range or if there is a recording error or artifact, such as excessive blinking. Intermediate frequencies may be added by QHP in real-time based on the findings. Throughout testing, the QHP provides attentional tasking to the patient to maintain consistent VOR responses.
During the procedure, the QHP actively monitors test quality, patient comfort, compliance, safety, and the integrity of sinusoidal harmonic acceleration (SHA) recordings. For each frequency, the presence or absence of a VOR response is determined, and if present, the gain, phase, and symmetry are calculated. The QHP interprets raw data to assess brainstem-cerebellar function. SHA results are integrated with results from other vestibular test findings. Age-appropriate normative data are used to aid in interpretation. Based on the findings, the QHP formulates a diagnostic assessment including localization, severity of the vestibular system dysfunction, if present, and to determine if velocity step testing is required. The QHP reviews test results and develops a report of impressions and recommendations.

Description of Post-Service Work: The QHP discusses results, clinical implications, prognosis and recommendations on follow-up evaluation or therapy (e.g., vestibular rehab) with the patient/family/caregivers. The QHP prepares a report of the diagnostic results and provides recommendations documenting the encounter in the medical record and prints a summary of recordings for storage in the patient’s electronic health record.

• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	16%	66%	16%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

CPT code 92546 was identified by the AMA RUC Relativity Assessment Workgroup (RAW) as being reported together with CPT code 92540 (Basic Vestibular Evaluation) in 75% or more of cases, based on 2022 Medicare claims data. Recognizing the need for updates, organizations representing audiology, neurology, and otolaryngology (AAA, ASHA, AAN, and AAO-HNS) collaborated to develop an action plan recommending that CPT code 92546 be referred to the CPT Editorial Panel for the creation of a detailed code descriptor, vignette, and description of service to appropriately define this procedure. This code, created prior to 1992, currently lacks a detailed descriptor, description of service, or vignette, and its utilization may not align with its intended use. The proposed revisions aim to clarify the intended purpose of the code and accurately reflect both clinical work and practice expenses. The action plan was presented to and accepted by the RAW at its September 2024 meeting.

Current CPT 92546 is performed to obtain a dynamic, quantitative assessment of vestibular function—specifically the vestibulo-ocular reflex (VOR) at mid-to-high stimulus frequencies and the degree of central compensation after peripheral loss. These data are pivotal for diagnosing and differentiating vestibular disorders (especially bilateral

vestibular hypofunction), adjudicating equivocal or conflicting results from other tests, and guiding management and rehabilitation. CPT 92546 is a separate and distinct service from CPT 92540: it requires a computerized rotational chair, specialized software, and continuous monitoring, and it measures physiologic domains not captured by the 92540 battery. The rotary-chair methodology, equipment, technical setup, and professional interpretation are different from—and not duplicative of—those used for 92540.

During the September AMA RUC RAW review, the societies recommended that newly created CPT codes 92XX5 and 92XX6, together with CPT 92540, remain on the RAW "billed together" screen for three years. A defined three-year window will allow CMS and the RUC to assess real-world utilization and case-mix, capturing substitution, add-on, and referral patterns. Historically, rotational chair testing (92546) has often been billed in combination with other vestibular services (e.g., 92540) or referred externally when not available in-office, obscuring the standalone time, intensity, and resource needs of the service. Maintaining these codes on the screen will enable a focused, data-driven review to ensure accurate valuation, reduce distortions from billing combinations, and clarify the true clinical intensity of the procedure.

CPT Code 92XX5 is the base code describing rotational vestibular assessment with sinusoidal harmonic acceleration (SHA), which is the most commonly performed rotational vestibular assessment. This procedure evaluates the vestibular system by delivering sinusoidal rotational stimulation via a computer-controlled, motor-driven chair. Oscillations are delivered at precise accelerations and velocities, ranging in frequency from 0.01 Hz to 1.28 Hz, and are typically completed at low, medium, and high frequencies. SHA testing isolates and assesses the functional integrity of the horizontal vestibulo-ocular reflex (VOR) and evaluates whether the central vestibular system has compensated for any peripheral impairments.

Compelling evidence

The expert panel believes there is compelling evidence for an increase in the current **work RVU from 0.29 to 0.92** for the following reasons:

- CPT code 92546, which is currently used to capture these services, has never been surveyed, and does not have a clinical vignette or a detailed description of the procedure. This omission likely skewed perceptions of provider involvement and failed to convey the actual cognitive complexity, clinical judgment, and interpretive workload required. Additionally, utilizing inappropriate crosswalks to simpler tests underestimated complexity, greater diagnostic depth, and the need for interpretation across a broader frequency range in the rotational vestibular assessment.

- According to Medicare utilization data, the plurality of the billing is from audiology (31%) followed by neurology (29.8%) and otolaryngology (12.8%). Audiology time is currently captured as clinical labor in practice expense. However, audiologists now bill Medicare independently and audiology time should not be captured under practice expense. As such, audiology time should be accounted for in professional work.

Survey Sample

The survey data and recommendations are based upon a random sample of AAA, AAN, and ASHA memberships. Specifically, AAA sent 1781 surveys to a random sample of the general membership; ASHA sent 1794 surveys to a random sample of a subset of audiologists indicating experience in vestibular disorders; AAN sent 396 surveys to a random sample of members of established AAN sections. Additionally, a targeted survey was sent to 108 members of the American Balance Society (ABS), at the approval of the Research Subcommittee. Duplicate survey distributions were identified and eliminated. The total sample size was 4079, with 92 completed responses. Of those 92 responses, 67 came from the random sample of audiologists, 17 came from the targeted survey of audiologists, and 8 came from neurologists.

Expert Panel Recommendations

An expert panel of audiologists and neurologists was convened to consider the survey data and provide recommendations regarding appropriate times and professional work values, as outlined below.

We recommend the median work RVU of 0.92 and the total time of 45 minutes.

Time

The expert panel validated the median survey times of 10 minutes (pre-service), 25 minutes (intra-service), and 10 minutes (post-service), concluding that these values accurately reflect the clinical intensity and workflow associated with rotational chair testing. The 10 minutes of pre-service time are essential for the qualified health professional (QHP) to conduct a comprehensive review of the patient's medical history and medications, select and customize the test protocol, correlate prior diagnostic findings (e.g., caloric testing, VEMP), and perform precise calibration of the rotational chair and associated equipment.

The 25 minutes of intra-service time is critical to perform the test, actively monitor the patient in real time, and make continuous clinical judgments. The QHP must assess test fidelity, monitor patient responses, ensure patient safety, and determine whether to adjust or expand testing frequencies based on the patient's evolving clinical presentation. This phase is highly dynamic and demands constant engagement and decision-making by the provider. Based on the findings, the QHP formulates a diagnostic assessment impression, including localization, and potential severity of the vestibular system dysfunction, if present, and to determine if velocity step testing is required. The QHP synthesizes the complex multi-frequency data, integrates the results with clinical findings, and develops a report of impressions and recommendations.

Post-service, the 10 minutes are required for the QHP to discuss results, clinical implications, prognosis and recommendations for follow-up evaluation or therapy (e.g., vestibular rehab) with the patient/family/caregivers. The QHP shares results with referring provider(s) and prints a summary of rotational chair test data for storage in the patient's electronic health record.

Rotational chair testing is a highly specialized, active, clinician-directed procedure. It demands sustained QHP oversight to ensure diagnostic accuracy, patient safety, and meaningful interpretation. This testing is most often completed on medically complex populations such as older adults with balance impairment, individuals with neurologic comorbidities, or patients experiencing chronic dizziness.

In summary, the expert panel strongly supports the allocation of 10 minutes for pre-service, 25 minutes for intra-service, and 10 minutes for post-service activities, for a total of 45 minutes. These times are supported by the clinical complexity, cognitive workload, and high level of professional engagement required to perform this advanced vestibular assessment safely and effectively to maximize patient comfort and compliance necessary to achieve optimal results.

Work RVU

The expert panel validated the median surveyed work RVU of 0.92 and affirmed that it is appropriate, accurately capturing the clinical intensity and professional effort involved in rotational chair testing. This valuation also supports appropriate rank order within the broader family of vestibular diagnostic codes. Historically, CPT code 92546 (Sinusoidal Vertical Axis Rotational Testing) was not formally surveyed to establish physician time values or work RVUs. It also did not account for the role of audiologists as independently billing qualified health professionals (QHPs) who directly perform and interpret the service. The original valuation relied on flawed crosswalk methodology, lacked a clinical vignette, and was based on outdated assumptions that bundled audiologist work under clinical staff time within the practice expense (PE) component. As a result, the true professional workload and cognitive complexity were substantially underestimated.

Under the prior structure, CPT code 92546 was assigned a total intra-service work time of just 8 minutes, with no time allocated for pre- or post-service work. Meanwhile, practice expense included 64 minutes of clinical staff time—50 minutes of which was intended to reflect the testing component performed by audiologists. However, with the transition to audiologists independently performing and billing for this service as QHPs, it is no longer appropriate to classify their time under PE. Instead, the time must be reassigned as intra-service professional time, consistent with AMA RUC valuation principles and reflective of the direct clinical involvement and decision-making required of the billing provider.

The current survey identified a median intra-service time of 25 minutes—more than triple the prior total time allocated to QHP work. Reassigning this time from PE to professional intra-service time represents a substantial shift in how the service is valued and, in turn, warrants a corresponding increase in the work RVU. Based on standard RUC valuation principles, the increase in intra-service time alone supports the median surveyed work RVU of 0.92.

It is important to note that during rotational chair testing, a audiologist/QHP must remain present and actively engaged for the entire procedure. Continuous attendance is necessary to manage sudden symptoms (e.g., vertigo, emesis,

syncope), adjust stimulus parameters in real time, and prevent data loss by correcting artifacts in ocular recordings. The audiologist's ongoing clinical judgment guides sequence, repetitions, and protocol changes based on evolving responses and comorbidities. This uninterrupted oversight ensures patient safety, preserves diagnostic validity, and reflects the service's time intensity and clinical complexity.

To further support the median value of 0.92 wRVU, we applied the 92546 WPUT to calculate work RVUs for XX5 and XX6 using their intra-service times. Code 92546 carries 8 minutes of intra-service time valued at 0.29 wRVU, yielding a WPUT of 0.29 ÷ 8 ≈ ***0.036 wRVU/min****. Applying this rate:* ***XX5 (25 min) ≈ 0.90 wRVU*** *and* ***XX6 (12 min) ≈ 0.43 wRVU****, which aligns closely with the recommended median values. The 50 minutes of total clinical time for 92546 is also consistent with the cumulative time for XX5 plus XX6. Because audiologist/QHP work has transitioned to the wRVU, WPUT is an appropriate comparator supporting selection of the median; defaulting to the 25th percentile fails to account for the PE-to-work shift in clinical labor and would systematically undervalue these services.*

In light of these factors—including updated billing structures, the reclassification of clinical time from practice expense to professional work, and the need for continuous, hands-on involvement from performers of the service - both audiology and neurology—the expert panel concludes that the proposed work RVU of 0.92 is appropriate.

To illustrate the impact of these changes, the table below compares the estimated changes to wRVU and practice expense and resulting values.

Scenario	Work RVU	CY2025 National Payment Rate*	PE Inputs (Non-facility)	PE Clinical Labor
Current 92546 – including Audiology in PE	0.29	$ 9.38	$ 82.28	$ 49.69
Proposed 92XX5 – estimates based on moving Audiology from PE to work	0.92	$ 29.76	$ 36.18	$ 5.40
Variance	0.63	$ 20.38	$ (46.10)	$ (44.29)

CF CY2025 - $32.35*

Comparison to Other Codes

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.

☐ Historical precedents.
☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. We anticipate this code will be reported with the other vestibular codes. However, the selection of other codes will depend largely on the reason for testing and the patient's history. We anticipate that this code will be billed typically together with CPT code 92XX6 when supplemental testing is required. A typical scenario would be when rotational vestibular assessment by sinusoidal harmonic acceleration testing with calibrated, computer-controlled chair, was completed and patient requires supplemental testing with velocity step testing to determine laterality of the disorder.

CPT Code: 92XX6 Global Period: ZZZ Work RVU: 0.48 Time: Pre:0 Intra: 12 Post:0

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 92546

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Audiology How often? Commonly

Specialty Neurology How often? Sometimes

Specialty Otolaryngology How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 120042
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. The national estimate is the product of the estimated Medicare patient utilization (seen below) multiplied by three.

Specialty Audiology Frequency 37213 Percentage 30.99 %

Specialty Neurology Frequency 35868 Percentage 29.87 %

Specialty Otolaryngology Frequency 15485 Percentage 12.89 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 40,014 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. These estimates are based on 2023 Medicare Utilization data for CPT codes 92546 from the AMA RUC database.

Specialty Audiology Frequency 12404 Percentage 30.99 %

Specialty Neurology Frequency 11924 Percentage 29.79 %

Specialty Otolaryngology Frequency 5161 Percentage 12.89 %

Do many physicians perform this service across the United States? Yes

CPT Descriptor: Rotational vestibular assessment by sinusoidal harmonic acceleration (SHA) testing with calibrated, computer-controlled chair, with interpretation and report; with velocity step testing (VST) (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 63-year-old male presents with persistent dizziness and vertigo of unknown origin. Rotational vestibular assessment by sinusoidal harmonic acceleration testing with calibrated, computer-controlled chair, was completed. Supplemental testing is performed using velocity step testing to determine laterality of the disorder.

Percentage of Survey Respondents who found Vignette to be Typical: 90%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 0% , In the ASC 0%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 0%

Description of Pre-Service Work: None

Description of Intra-Service Work: Sinusoidal harmonic acceleration (SHA) testing was inconclusive, necessitating the performance of velocity step testing (VST). VST provides additional diagnostic information about central vestibular function and helps to distinguish lateralization of peripheral vestibular dysfunction. The QHP removes the goggle cover and the patient is instructed about the additional testing including patient safety and requisite compliance. Specifically, the patient is instructed that the computer-controlled chair is abruptly accelerated in a clockwise direction to a target rotational velocity for 60 seconds before a rapid deceleration is immediately applied back to baseline velocity for an additional 60 seconds. The process is then repeated in a counterclockwise direction. The assessment consists of four low-velocity and four high-velocity targets, each involving 60 seconds of rotational movement. To initiate the test, the goggle cover is reapplied by the QHP placing the patient in complete darkness eliminating the opportunity to suppress the VOR. The QHP provides real-time monitoring to ensure patient safety and optimize test findings. For each VST recording, the direction and amplitude of nystagmus and the rate of nystagmus decay (time constant and phase lead) are measured. Additionally, for each VST recording, the direction, gain (amplitude of nystagmus), symmetry, and the rate of nystagmus decay (time constant) are measured. Responses are compared against age-appropriate normative data. These findings are interpreted and captured as part of the patient report.

Description of Post-Service Work: None

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	28%	48%	37%	11%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	5%	48%	45%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	2%	54%	42%
Physical effort required	17%	65%	17%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician	0%	45%	54%

• Estimated risk of malpractice suit with poor outcome

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	4%	52%	23%	19%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	19%	38%	42%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	14%	47%	38%
Physical effort required	23%	57%	19%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	9%	28%	61%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

CPT code 92546 was identified by the AMA RUC Relativity Assessment Workgroup (RAW) as being reported together with CPT code 92540 (Basic Vestibular Evaluation) in 75% or more of cases, based on 2022 Medicare claims data. Recognizing the need for updates, organizations representing audiology, neurology, and otolaryngology (AAA, ASHA, AAN, and AAO-HNS) collaborated to develop an action plan recommending that CPT code 92546 be referred to the CPT Editorial Panel for the creation of a detailed code descriptor, vignette, and description of service to appropriately define this procedure. This code, created prior to 1992, currently lacks a detailed descriptor, description of service, or vignette, and its utilization may not align with its intended use. The proposed revisions aim to clarify the intended purpose of the code and accurately reflect both clinical work and practice expenses. The action plan was presented to and accepted by the RAW at its September 2024 meeting.

Current CPT 92546 is performed to obtain a dynamic, quantitative assessment of vestibular function—specifically the vestibulo-ocular reflex (VOR) at mid-to-high stimulus frequencies and the degree of central compensation after peripheral loss. These data are pivotal for diagnosing and differentiating vestibular disorders (especially bilateral vestibular hypofunction), adjudicating equivocal or conflicting results from other tests, and guiding management and rehabilitation. CPT 92546 is a separate and distinct service from CPT 92540: it requires a computerized rotational chair, specialized software, and continuous monitoring, and it measures physiologic domains not captured by the 92540 battery. The rotary-chair methodology, equipment, technical setup, and professional interpretation are different from—and not duplicative of—those used for 92540.

During the September AMA RUC RAW review, the societies recommended that newly created CPT codes 92XX5 and 92XX6, together with CPT 92540, remain on the RAW "billed together" screen for three years. A defined three-year window will allow CMS and the RUC to assess real-world utilization and case-mix, capturing substitution, add-on, and referral patterns. Historically, rotational chair testing (92546) has often been billed in combination with other vestibular services (e.g., 92540) or referred externally when not available in-office, obscuring the standalone time, intensity, and resource needs of the service. Maintaining these codes on the screen will enable a focused, data-driven review to ensure accurate valuation, reduce distortions from billing combinations, and clarify the true clinical intensity of the procedure.

CPT Code 92XX6 is the add-on code describing rotational vestibular assessment with velocity step testing (VST) in addition to sinusoidal harmonic acceleration (SHA). VST assesses VOR function at higher frequencies of rotation and uses rapid acceleration and deceleration of the motor-driven chair. The chair accelerates to low and high target rotational velocities and abruptly decelerates back to baseline, in both clockwise and counterclockwise directions. This provides additional diagnostic information about central vestibular function and helps to distinguish lateralization of peripheral vestibular dysfunction. CPT code 92XX6 was presented to the CPT Editorial Panel during the May 2025 meeting as a standalone code. However, the Editorial Panel finalized edits to designate 92XX6 as an add-on code to base code 92XX5 as subject matter experts reported this procedure would not be done in isolation, but rather, would be added to the base rotational chair code when diagnostically indicated.

Compelling evidence
The expert panel believes there is compelling evidence for **work RVU of 0.48** for the following reasons:

- Currently, there is no designated CPT code to capture this service. It may have vaguely been captured under the CPT code 92546, however, there is no evidence. Additionally, CPT code 92546 has never been surveyed, and does not have a clinical vignette or a detailed description of the procedure. This omission likely skewed perceptions of provider involvement and failed to convey the actual cognitive complexity, clinical judgment, and interpretive workload required. Furthermore, utilizing inappropriate crosswalks to simpler tests underestimated the patient and procedure complexity, and greater diagnostic depth of this procedure.

- According to Medicare utilization data, the plurality of billing is by audiology (31%) followed by neurology (29.8%) and otolaryngology (12.8%). Audiology time is currently captured as clinical labor in practice expense. However, audiologists now bill Medicare independently and audiology time should not be captured under practice expense. As such, audiology time should be accounted for in professional work.

Survey Sample
The survey data and recommendations are based upon a random sample of AAA, AAN, and ASHA memberships. Specifically, AAA sent 1781 surveys to a random sample of the general membership; ASHA sent 1794 surveys to a random sample of a subset of audiologists indicating experience in vestibular disorders; AAN sent 396 surveys to a random sample of members of established AAN sections. Additionally, a targeted survey was sent to 108 members of the American Balance Society (ABS), at the approval of the Research Subcommittee. The total sample size was 4079, with 80 completed responses. Of those 80 responses, 59 came from the random sample of audiologists, 14 came from the targeted survey of audiologists, and 7 came from neurologists.

Expert Panel Recommendations
An expert panel of audiologists and neurologists was convened to consider the survey data and provide recommendations regarding appropriate times and professional work values, as outlined below.

We recommend the median for work RVU of 0.48 and the median time of 12 minutes.

Time

The expert panel reviewed the survey data and supported the median times of 0 minutes for pre-service, 12 minutes for intra-service, and 0 minutes for post-service work. As 92XX6 is an add-on code to the base procedure (92XX5), pre- and post-service activities are captured under the primary code and do not require duplication here. The 12 minutes of intra-service time is essential to conduct the velocity step test (VST), which includes real-time monitoring and clinical decision-making related to test fidelity, supervising patient safety, and securing the patient's physiological response.

During VST, the patient is seated in a computer-controlled rotational chair, which is rapidly accelerated in a clockwise direction to a target velocity for 60 seconds, followed by immediate deceleration back to baseline for an additional 60 seconds. This same protocol is repeated in a counterclockwise direction across both low and high target velocities. In addition to required time for acceleration and deceleration, time is required to confirm setup, safety monitoring, and patient instruction to ensure compliance necessary. In summary, the expert panel affirms the appropriateness of the reported times—0 minutes pre-, 12 minutes intra-, and 0 minutes post-service—for a total of 12 minutes. These times accurately reflect the procedural complexity and clinical engagement required to perform this advanced vestibular assessment.

Work RVU

The expert panel validated the median surveyed work RVU of 0.48 and agreed that it accurately reflects the clinical intensity of the service and maintains appropriate rank order within the family of vestibular testing codes. Previous valuations of rotational chair testing failed to capture the true provider work due to the absence of a clinical vignette, inappropriate crosswalks to simpler tests, and outdated assumptions about billing practices—specifically, when audiology services were billed under the physician's NPI. At that time, the interpretive work of the QHP was indirectly accounted for through practice expense and the non-physician work pool. However, with audiologists now independently billing for these services, that construct is no longer valid.

Patients requiring additional evaluation with velocity step testing (VST) are typically more complex, often presenting with unresolved symptoms, multiple comorbidities, and diagnostic uncertainty following initial testing (e.g., SHA). These cases demand greater clinical oversight and interpretive effort, as the QHP must guide testing in real time, ensure patient safety, and analyze nuanced findings to advance the diagnostic process. The complexity of both the patient and the procedure is substantial, particularly when VST is used to address persistent diagnostic dilemmas. *This sequencing increases complexity: laterality is typically unknown until X6 is performed, the clinician must determine the affected ear during X6, interpret and document the care plan pathway.*

As noted above, rotational chair testing is an active, clinician-directed diagnostic procedure that demands continuous engagement from a QHP throughout its performance. The QHP plays a critical role in monitoring the patient's physiological responses, ensuring the fidelity and accuracy of test parameters, and making real-time clinical decisions to adjust the assessment based on the patient's tolerance and presentation. This level of oversight is particularly essential in higher-risk populations, such as older adults with impaired balance or fall risk, individuals with underlying neurological disorders (e.g., Parkinson's disease, multiple sclerosis), and patients with persistent, unexplained dizziness. These patients often exhibit unpredictable or heightened sensitivity to vestibular stimuli, requiring careful titration of test intensity and duration to avoid adverse effects and to optimize diagnostic yield. As such, the complexity of patient management during rotational chair testing extends well beyond the technical operation of the equipment and underscores the importance of QHP involvement in delivering a safe and clinically meaningful assessment.

To further support the median value of 0.92 wRVU, we applied the 92546 WPUT to calculate work RVUs for XX5 and XX6 using their intra-service times. Code 92546 carries 8 minutes of intra-service time valued at 0.29 wRVU, yielding a WPUT of 0.29 ÷ 8 ≈ ***0.036 wRVU/min****. Applying this rate:* ***XX5 (25 min) ≈ 0.90 wRVU*** *and* ***XX6 (12 min) ≈ 0.43 wRVU****, which aligns closely with the recommended median values. The 50 minutes of total clinical time for 92546 is also consistent with the cumulative time for XX5 plus XX6. Because audiologist/QHP work has transitioned to the wRVU, WPUT is an appropriate comparator supporting selection of the median; defaulting to the 25th percentile fails to account for the PE-to-work shift in clinical labor and would systematically undervalue these services.*

Comparison to Other Codes

The following table outlines the key reference service, MPC, and other comparison codes to illustrate relativity and support the requested values for time and professional work for 92XX6.

CPT Code	Descriptor	RVW	IWPUT	Total Time	PRE	INTRA	POST	Note

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. We anticipate this code will often be reported with the other vestibular codes. However, the selection of other codes will depend largely on the reason for testing and the patient's history. We anticipate that this code when billed, will be billed together 100% of the time with 92XX5, as 92XX5 is the base code to this add-on code, when supplemental testing is required. A typical scenario would be when rotational vestibular assessment by sinusoidal harmonic acceleration testing with calibrated, computer-controlled chair, was completed and patient requires supplemental testing with velocity step testing to determine laterality of the disorder.

   CPT Code: 92XX5 Global Period: XXX Work RVU:0.92 Time: Pre 10 Intra:25 Post:10

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 92546

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Audiology How often? Sometimes

Specialty Neurology How often? Sometimes

Specialty Otolayrngology How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 12003
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. The estimates are based on 2023 Medicare utilization data for CPT code 92546 from the AMA RUC database. The societies estimate 10% of the 2023 Medicare utilization for 92546 will be reported as 92XX6. The national estimate is the product of the estimate Medicare patient utilization (seen below) multiplied by three..

Specialty Audiology Frequency 3721 Percentage 31.00 %

Specialty Neurology Frequency 3577 Percentage 29.80 %

Specialty Otolaryngology Frequency 1548 Percentage 12.89 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 4,001
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. These estimates are based on 2023 Medicare utilization data for CPT code 92546 from the AMA RUC database. Based on subject matter experts, approximately 10% of the individuals who receive rotational vestibular assessment undergo velocity step testing. Therefore, the societies estimate 10% of the 2023 Medicare utilization for 92546 will be reported as 92XX6. The following numbers represent the estimates for velocity step testing.

Specialty Audiology Frequency 1241 Percentage 31.01 %

Specialty Neurology Frequency 1192 Percentage 29.79 %

Specialty Otolaryngology Frequency 516 Percentage 12.89 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Tests

BETOS Sub-classification:
Other tests

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 92546

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

SS Rec Summary

NON-FACILITY DIRECT PE INPUTS

CPT CODE(S):92XX5, 92XX6 - Rotational Vestibular Assessment
SPECIALTY SOCIETY(IES): AAA, ASHA, AAN
PRESENTER(S): Deborah Carlson, PhD (ASHA), Patricia Gaffney, AuD (AAA), Erin L. Miller, AuD (AAA), Marianna Spanaki, MD (AAN), Terry Fife, MD (AAN),

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

Meeting Date: September 2025

CPT Code	Long Descriptor	Global Period
92XX5	Rotational vestibular assessment by sinusoidal harmonic acceleration (SHA) testing with calibrated, computer-controlled chair, with interpretation and report (do not report 92XX5 in conjunction with 92270)	XXX
+92XX6	Rotational vestibular assessment by sinusoidal harmonic acceleration (SHA) testing with calibrated, computer-controlled chair, with interpretation and report; with velocity step testing (VST) (List separately in addition to code for primary procedure)	ZZZ

Vignette(s) (*vignette required even if PE only code(s)***):**

CPT Code	Vignette
92XX5	A 53-year-old female presents with persistent dizziness and vertigo of unknown origin. Rotational vestibular assessment by sinusoidal harmonic acceleration testing with calibrated, computer-controlled chair is performed to evaluate the status of the vestibulo-ocular reflex and to determine the degree of functional compensation.
+92XX6	A 63-year-old male presents with persistent dizziness and vertigo of unknown origin. Rotational vestibular assessment by sinusoidal harmonic acceleration testing with calibrated, computer-controlled chair, was completed. Supplemental testing is performed using velocity step testing to determine laterality of the disorder. [Note: This is an add-on service. Only consider the additional work related to the velocity step testing]

If there is a significantly different patient population in the non-facility setting, a vignette should be provided for the non-facility setting in the PE SOR.

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

   The American Academy of Audiology, American Speech-Language-Hearing Association, and the American Academy of Neurology convened a consensus panel of neurologists and audiologists that included experts familiar with these services to evaluate the direct practice expense inputs for rotational vestibular assessment. The experts come from different practice settings (eg, private practice, clinic, hospital-based) and geographic regions of the country.

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here:

   The societies are providing the current code, 92546, as reference for 92XX5 as well as CPT code 92548 as an additional reference because it has similar inputs to 92XX5.

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

The societies are providing CPT code 92627 as the reference code for 92XX6 because it is an add-on code and has similar equipment inputs to 92XX6.

NOTE: For services reviewed prior to the implementation of clinical activity codes in 2016-17, detail is not provided in the RUC database, please contact *Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org* for PE spreadsheets for your older reference codes.

3. Is this code(s) typically reported with an E/M service?
Is this code(s) typically reported with the E/M service in the non-facility?

No

See the *Billed Together* tab in the RUC Database.

4. A. What specialty is the dominant provider *in the non-facility?* What percent of the time does the dominant provider provide the service(s) in the non-facility? Is the dominant provider in the non-facility different than for the global? Note: When discussing specialties that perform the code, they must perform 51% to be called the "typical" physicians. If no one specialty meets the 51% but is the top specialty with 27% (for example), then they are referred as the top or dominant specialty.

According to the RUC database in the non-facility the dominant providers of 92546 are: -Audiology – 31.0% -Neurology – 29.8% -Otolaryngology – 12.9%

See the *Claims Data* tab in the RUC Database. Use the *Medicare Specialty (Non-Facility Only)* table.

5. If you are requesting an increase over the aggregate current cost for clinical activities, supplies and equipment, please provide compelling evidence:

The overall aggregate current cost for clinical activities, supplies and equipment is expected to decrease due to the shift of 56 minutes of audiology time from PE to physician work. However, we have provided updated invoices for equipment and anticipate a slight increase for equipment cost only due to that updated data.

See the *PE compelling evidence guidelines* under PE Reference Materials on the RUC Collaboration website. Be sure to explain if the increase can be entirely accounted for because of an increase in physician time.

CLINICAL STAFF ACTIVITIES

The RUC has agreed that there is a presumption of zero pre-service clinical staff time unless the specialty can provide evidence to the PE Subcommittee that any pre-service time is appropriate. The RUC agreed that with evidence some subset of codes may require minimal or extensive use of clinical staff and has allocated time when appropriate (for example when a service describes a major surgical procedure). If the package times are not applicable, alternate times may be presented and should be justified for consideration by the Subcommittee.

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

6. Are the global periods of the codes transitioning? Information about the amount of pre-service clinical staff time and a rationale for the change from a 090-day global to a 000 or 010 day global should be described below.

No

7. If you are recommending more minutes than the PE Subcommittee standards for clinical activities, you must provide rationale to justify the time:

N/A

8. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (*please see 2nd worksheet tab in PE spreadsheet*), please explain the difference here:

N/A

9. How much time was allocated to clinical activity, *obtain vital signs* (CA010) prior to CMS increasing the clinical activity to 5 minutes for calendar year 2018? The standard for clinical activity, obtains vital signs remains 0, 3 and 5 based on the number of vital signs taken. Please provide a rationale for the clinical staff time that you are requesting for obtain vital signs here:

3 minutes was previously included but we are not recommending time for this activity.

10. Please provide a brief description of the clinical staff work for the following:
    a. Pre-Service period:

• Complete pre-procedure phone calls and prescription (CA005) - Patient phone call with instructions for testing visit: guidance on food, caffeine and alcohol intake, smoking cessation, avoid any constrictive/compression clothing, review of medication list and counsel on which should be withheld prior to testing, plan for driving as test may cause dizziness or fainting. Perform medical screening for pacemakers or anything that may contraindicate test**. 3 minutes**

    b. Service period (includes pre, intra and post):

• Greet patient, provide gowning, ensure appropriate medical records are available (CA009) – greet patient, review medical records – 1 minute removed as patient does not receive gowning. **2 minutes** • Prepare room, equipment and supplies (CA013) - Set up the equipment, including all attachments, ensure that it has been properly cleaned, and adjusted for the patient, including entry of basic clinical information into testing software. **2 minutes**

    c. Post-service period:

• Clean room/equipment by clinical staff (CA024) - Any disposable items are discarded, and reusable equipment is thoroughly sanitized and repackaged. **3 minutes**

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

11. Please provide granular detail regarding what the clinical staff is doing during the intra-service (of service period) clinical activity, *assist physician or other qualified healthcare professional---directly related to physician work time* or *Perform procedure/service---NOT directly related to physician work time:*

N/A

12. If you have used a percentage of the physician intra-service work time other then 100 or 67 percent for the intra-service (of service period) clinical activity, please indicate the percentage and explain why the alternate percentage is needed and how it was derived.

N/A

13. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (*please see 2nd worksheet tab in PE spreadsheet*):

N/A

14. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov.

N/A

MEDICAL SUPPLIES & EQUIPMENT/INVOICES

15. ☒ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

16. ☒ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

17. If you wish to include a supply that is not on the Direct PE Inputs Medical Supplies Listing (*please see 4th worksheet tab in PE spreadsheet*), a paid invoice is required. Identify and explain the supply input and invoice here:

N/A.

18. Are you recommending a PE supply pack for this recommendation? Yes or No.
If Yes, please indicate if the pack is an established package of supplies as defined by CMS (eg, SA047 *pack, E/M visit*) or a pack that is commercially available?

N/A

19. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation (*please see 8-10th worksheet tabs in PE spreadsheet*). Please include the description, CMS supply code, unit, item quantity and unit price (if available).

N/A

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

20. If you wish to include an equipment item that is not on the Direct PE Inputs Equipment Listing (*please see 5th worksheet tab in PE spreadsheet*), a paid invoice is required. Identify and explain the equipment input and invoice here:

VNG open chair and goggles are requested to be added. This is the specialized equipment required to complete this procedure. This item is not listed on the Direct Input Medical Supplies Listing. We are including a paid invoice for the VNG Open Rotational Chair system, **which includes goggles.**

21. Please provide an estimate of the useful life of the new equipment item as required to calculate the equipment cost per minute:

The estimated useful life for the VNG Open Rotational Chair system is 7 years

22. Have you recommended equipment minutes for a computer or equivalent laptop/integrated computer, equipment item computer, desktop, w-monitor, ED021 or notebook (Dell Latitude D600), ED038?
    a. If yes, please explain how the computer is used for this service(s).
    b. Is the computer used exclusively as an integral component of the service or is it also used for other purposes not specific to the code?
    c. Does the computer include code specific software that is typically used to provide the service(s)?

N/A - **Removed**

23. List all the equipment included in your recommendation and the equipment formula chosen *(please see 7th worksheet tab in PE spreadsheet: Equipment minute formulas).* If you have selected "other formula" for any of the equipment, please explain here:

The equipment formula is classified as "Other" because the physician/audiologist time required to perform the rotational chair testing is accounted for in the work component rather than in the PE. Additionally, no ancillary clinical staff are involved in the procedure. To appropriately account for equipment time, we proposed 2 minutes for room preparation (CA013) and 3 minutes for room cleaning (CA024) in addition to the 25 minutes intraservice time = 30 minutes for 92XX5; and 12 minutes intraservice time for 92XX6. The equipment is a fixed installation, bolted to the floor in a specialized room for this test, and cannot be moved.

PE-ONLY CODES ADDITIONAL INFORMATION

24. (a) Estimate the number of times this service might be provided nationally in a one-year period?
    (b) Estimate the number of times this service might be provided to Medicare patients nationally in a one-year period?

N/A

25. Please select a Professional Liability Insurance (PLI) crosswalk based on a similar specialty mix:

N/A

ADDITIONAL INFORMATION

26. If there is any other item(s) on your spreadsheet not covered in the categories above that requires greater detail/explanation, please include here:

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC) PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

None

ITEMIZED LIST OF CHANGES (FOLLOWING THE PE SUBCOMMITTEE MEETING)

NOTE: The PE spreadsheets will be updated and finalized in real-time at the meeting. PE SORs must be updated based on modifications made during the meeting and resubmitted asap. The PE SOR should match the updated PE spreadsheet. Please provide a list of the modifications made to the PE spreadsheet during the PE Subcommittee meeting in the space below with brief justification for the modification (e.g. Equipment item EF023 *table, exam* was changed to EF031 *table, power* as the power table is typical in the surgeon's office).

The PE SOR serves as key support for the spreadsheet and should include any important details/explanation for the inputs as these cannot be elaborated upon in the excel document itself.

Remove all clinical L052A activities – review chart, prepare room / electrodes, perform service, collate and prepare data, clean room – **56 minutes**
Update supplies – removing electrodes and related supplies
Update supplies – add sanitizing wipes for patient and equipment and three additional pieces of paper for printing
Update equipment – including desktop computer, goggles and open rotational chair system

Recommendations for 92XX5

ROW	CODE	92XX5	current	REC	Rationale
CLINICAL ACTIVITIES					
19	**CA005**	Complete pre-procedure phone calls and prescription	3	3	**Retain** – Recommended standard 3 minutes for clinical staff to provide pre-test instructions covering dietary and lifestyle guidance (food, caffeine, alcohol, smoking), avoidance of constrictive or compression clothing, medication review with guidance on which to withhold, and driving precautions due to possible dizziness or fainting. Conduct a medical screening for pacemakers or other conditions that may contraindicate the test.

	33	**CA009**	Greet patient, provide gowning, ensure appropriate medical records are available (L037D – RN/LPN/MTA)	3	2	**Decrease** – Recommend below the standard of 3 minutes, as gowning is not required. Clinical staff prepare medical records for QHP review and provide a brief explanation of the testing procedure.
	34	**CA010**	Obtain vital signs (L037D – RN/LPN/MTA)	3	0	**Remove** – this activity is not required.
	37	**CA013**	Prepare room, equipment and supplies (L037D – RN/LPN/MTA)	0	2	**Add** – Recommend the standard of 2 minutes. Clinical staff prepares the equipment for testing, including all attachments, and ensures that it has been properly cleaned and adjusted for the patient, including entry of basic clinical information into testing software.
	45		Review Charts (L052A – Audiologist)	3	0	**Remove –** Captured in Line 33
	46		Prepare Room / Electrodes (L052A – Audiologist)	7	0	**Remove-** removing electrodes and all related activities
	52	**CA021**	Perform procedure/service--- NOT directly related to physician work time (L052A – Audiologist)	30	0	**Remove –** Audiologists now bill independently and should not be included in clinical labor time
	62	**CA024**	Clean room/equipment by clinical staff (L037D – RN/LPN/MTA)	0	3	**Add –** Recommend the standard of 3 minutes. Clinical staff discard any disposable items, and reusable equipment is thoroughly sanitized and repackaged. .
	78		Clean Room / equipment (L052A – Audiologist)	5	0	**Remove –** Audiologists now bill independently and should not be included in clinical labor time
	79		Collate and prepare extensive amount of recording paper (L052A – Audiologist)	5	0	**Remove –** reports are computerized and printed on standard paper

85	**CA038**	Coordinate post procedure services (L052A – Audiologist)	3	0	**Remove -** Audiologists now bill independently and should not be included in clinical labor time
MEDICAL SUPPLIES					
102	**SK059**	paper, recording (per sheet)	6	3	**Decrease –** From 6 sheets to 3 sheets, used to document and review each of the required tests. **This is for printing out the test results/source data. Rotary chair equipment is operated outside of medical record systems. Summary results need to be printed and scanned into the medical record system.**
103	**SM022**	sanitizing cloth-wipe (surface, instruments, equipment)	0	2	**Add-** requesting 2 cloth-wipes for cleaning of chair and restraints before and after the procedure
104	**SB022**	Gloves, non-sterile	1	1	**Retain-** required when QHP is physically touching the patient during the assessment to maintain hygiene.
105	**SM025**	specula tips, otoscope	1	0	**Remove –** this item is no longer required to perform this procedure
106	**SJ053**	swab-pad, alcohol	2	2	**Retain-** requesting 2 alcohol swab pads for cleaning of goggles before and after the procedure
107	**SF021**	cautery, patient ground pad w-cord	1	0	**Remove-** removing electrodes and all related supplies
108	**SD053**	electrode, ECG single	1	**0**	**Remove-** removing electrodes and all related supplies
109	**SG008**	applicator, cotton-tipped, non-sterile 6in	2	0	**Remove –** removing electrodes and all related supplies
110	**SG079**	tape, surgical paper 1in (Micropore)	12	0	**Remove-** removing electrodes and all related supplies
111	**SJ021**	electrode conductive paste	1	**0**	**Remove-** removing electrodes and all related supplies
112	**SJ010**	basin, emesis	1	**0**	**Remove –** removed emesis basin

113	**SM021**	sanitizing cloth-wipe (patient)	0	2	**Add:** required to clean eye debris/makeup. Recommending one for each eye
114	**SK008**	audiology scoring forms	1	1	**Retain –** required to score and document service
EQUIPMENT					
118	**EQ002**	CDP-computerized dynamic posturography system	56	0	**Remove-** This equipment is no longer used.
119	**EQ025**	ENG recording system	56	30	**Decrease -** Equipment needed for duration of clinical staff time for preparation and clean up (CA013 and CA024) and QHP intraservice time.
123	**ED021**	Computer, desk-top w-monitor	0	**0**	**Remove -** Remove desk-top computer as this is an indirect expense.
125	**NEW**	*VNG* open chair system **and goggles**	0	30	**Add-** requesting to add as this is the specialized equipment to perform the test. This equipment is needed for duration of procedure performance (QHP intraservice time) plus clinical staff time for preparation and clean up (CA013 and CA024). **Goggles are included as a part of the chair system**

Recommendations for 92XX6

ROW	CODE	92XX6	REF	REC	Rationale
CLINICAL ACTIVITIES: No clinical activities. This is an add-on code.					
MEDICAL SUPPLIES					
102	**SK059**	paper, recording (per sheet)	3	3	**Add-** Used to document and review each of the required tests. **This is required for printing additional test results/source data under 92XX6. Rotary chair equipment is operated outside of medical record systems. Summary results need to be printed and scanned into the medical record system.**
EQUIPMENT					

119	**EQ025**	ENG recording system	0	12	**Add-** this is the specialized equipment required to perform this procedure. This equipment is needed for duration of procedure performance (QHP intraservice time).
123	**ED021**	Computer, desktop w-monitor	0	**0**	**Remove –** remove desktop computer as this is an indirect expense.
125	**NEW**	*VNG* open chair and goggles	0	12	**Add-** this is the specialized equipment required to perform this procedure. This equipment is needed for duration of QHP intraservice time. **Goggles are included as a part of the chair system.**

Please submit the revised form electronically to Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org.

AMA/Specialty Society RVS Update Committee Summary of Recommendations

September 2025

Intracoronary Drug Delivery Balloon Services – Tab 15

In May 2025, the CPT Editorial Panel created two new Category I CPT codes to describe percutaneous transcatheter therapeutic drug delivery by intracoronary drug-delivery balloons (CPT codes 9XX04 and 9XX07). These two new codes join the percutaneous coronary intervention (PCI) code family, which was last reviewed by the RUC in April 2024. For the September 2025 RUC meeting, it was noted that in the CY2026 Medicare Physician Payment Schedule Proposed Rule, CMS proposed to accept the RUC recommended work RVU for all twelve codes in the family previously reviewed at the April 2024 RUC meeting.

9XX04 ***Percutaneous transcatheter therapeutic drug delivery by intracoronary drug-delivery balloon (eg, drug-coated, drug-eluting), including mechanical dilation by nondrug-delivery balloon angioplasty, single major coronary artery and/or its branch(es)***
The RUC reviewed the survey results from 99 interventional cardiologists and determined that the survey median work RVU of 10.00 appropriately accounts for the physician work required to perform this service. The RUC recommends 35 minutes pre-service evaluation time, 3 minutes pre-service positioning time, 10 minutes pre-service scrub/dress/wait time, 60 minutes intra-service time, and 21 minutes immediate post-service time.

The RUC agreed to align the pre-service times to be consistent for 9XX04 with the pre-service time for the other 000-day global codes included in the percutaneous coronary intervention code family to reflect the time typically required to perform the pre-service evaluation and other work to prepare for the procedure. The additional time is necessary to evaluate and prepare the access site(s) (one or both radial arteries and/or one or both femoral arteries). The myriad of techniques that are now available for percutaneous coronary intervention has expanded, and that requires a full discussion with the patient because each one carries separate risks. Left and right radial pulses are also evaluated using an Allen test to determine which are available for access and which of the two offers preferable access. It is typical for the physician to prepare at least two access sites. Many operators routinely provide an anti-vasospastic cocktail, which also takes additional time to prepare. As part of the evaluation, the operator discusses the results of Heart Team consultations (if performed) and describes various PCI techniques, and the possibility of conversion to emergency surgery, among other typical scenarios. The Heart Team for coronary revascularizations is a multidisciplinary team convened to evaluate complex patients and help allow patient-centered, evidence-based clinical decisions for patients who are considered for coronary revascularization.

The specialty societies noted that CPT code 9XX04 is inclusive of all of the work included in CPT code 92920 *Percutaneous transluminal coronary angioplasty; single major coronary artery and/or its branch(es)* (CY2026 NRPM work RVU= 8.35, CY2026 NPRM intra-service time of 48 minutes, CY2026 NPRM total time of 123 minutes) and also the additional work to provide percutaneous transcatheter therapeutic drug delivery by intracoronary drug-delivery balloon. Therefore, the specialty societies noted, and the RUC concurred that a proposed value of 10.00 maintains the appropriate rank order with CPT code 92920.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The specialty society noted that the typical patient has in-stent restenosis, where a blockage or narrowing reoccurs in the portion of the coronary artery and/or its branches previously treated with a stent. When the surgeon encounters in-stent restenosis, they must perform extensive analysis to figure out the mode of failure of the stent and then address that mode of failure. Often, that mode of failure is calcium restriction of expansion of the stent, which requires multiple steps to further dilate the vessel and further reanalyze, iteratively. The vessel needs to be completely optimized for the effective drug-coated balloon delivery to ensure a durable result; this takes a significant amount of extra work beyond what would be involved in a regular balloon angioplasty. The specialty also noted that this service is not typically performed with intravascular ultrasound or any other imaging modality.

To support the recommended work RVU of 10.00, the RUC compared the surveyed code to CPT code 33991 *Insertion of ventricular assist device, percutaneous, including radiological supervision and interpretation; left heart, both arterial and venous access, with transseptal puncture* (work RVU=8.84, intra-service time of 60 minutes, total time of 113 minutes) and noted that both services involve the same amount of intra-service time though the surveyed code typically involves 16 more minutes of total time. The specialty noted and the RUC concurred that the reference code is less intense than the surveyed code, as it is transvenous, as opposed to being an arterial entry for engagement of the coronary artery. For additional support, the RUC compared the surveyed code to CPT code 33530 *Reoperation, coronary artery bypass procedure or valve procedure, more than 1 month after original operation (List separately in addition to code for primary procedure)* (work RVU= 10.13, 70 minutes intra-service time and 112 minutes total time) and noted that although the surveyed code involves less intra-service time, it involves more total time. Both procedures typically involve a similar amount of physician work. **The RUC recommends a work RVU of 10.00 for CPT code 9XX04.**

9XX07 ***Percutaneous transcatheter therapeutic drug-delivery by intracoronary drug-delivery balloon (eg, drug-coated, drug-eluting), single major artery and/or its branches (List separately in addition to code for primary procedure)***
The RUC reviewed the survey results from 95 interventional cardiologists and determined that the survey 25th percentile work RVU of 4.38 appropriately accounts for the physician work required to perform this service. The RUC recommends 48 minutes intra-service and total time for this add-on procedure.

The specialty society noted that this add-on service is to be used when a drug-coated balloon is used in addition to another intervention in the same coronary artery. The specialty society indicated that the typical patient would undergo atherectomy (separately reported), and if the vessel is felt to be too small caliber for stenting. Therefore, the atherectomy is followed by drug-coated balloon treatment.

In general, the specialty society noted that this add-on service would be performed when the artery is either too small or too diffusely diseased for a stent to be an option. There is a high degree of restenosis with the standard non-drug balloon angioplasty, therefore a drug-coated balloon is used instead. The specialty societies also estimated that this service will likely be very infrequently performed, as the surgeon would always opt to use a stent if that were a viable option.

The RUC compared the surveyed code to second key reference code 37186 *Secondary percutaneous transluminal thrombectomy (eg, nonprimary mechanical, snare basket, suction technique), noncoronary, non-intracranial, arterial or arterial bypass graft, including fluoroscopic guidance and intraprocedural pharmacological thrombolytic injections, provided in conjunction with another percutaneous intervention other than primary mechanical thrombectomy (List separately in addition to code for primary procedure)* (work RVU= 4.92, intra-service and total time of 60

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

minutes) and noted that the key reference code typically involves 12 more minutes of time and more physician work. The RUC concluded that these two services maintain appropriate relativity. For additional support, the RUC compared the surveyed code to MPC code 34812 *Open femoral artery exposure for delivery of endovascular prosthesis, by groin incision, unilateral (List separately in addition to code for primary procedure)* (work RVU= 4.13, intra-service and total time of 40 minutes) and noted that the surveyed code involves more intra-service and total time; both services would have appropriate relativity to each other. **The RUC recommends a work RVU of 4.38 for CPT code 9XX07.**

Affirm RUC Recommendations
The RUC affirms its April 2024 work RVU recommendations of 8.35 for CPT code 92920, a work RVU of 10.13 for CPT code 92924, a work RVU of 10.00 for CPT code 92928, a work RVU of 11.94 for CPT code 92933, a work RVU of 11.30 for CPT code 92937, a work RVU of 12.72 for CPT code 92941, a work RVU of 13.69 for CPT code 92943, a work RVU of 2.97 for 92972, a work RVU of 1.75 for CPT code 92973, a work RVU of 12.00 for CPT code 92930, a work RVU of 15.00 for CPT code 92945, a work RVU of 1.80 for CPT code 93571, and a work RVU of 1.44 for CPT code 93572. CMS proposed to accept these RUC recommendations in the CY2026 Medicare Physician Fee Schedule Proposed Rule.

Practice Expense
The RUC recommends no direct practice expense inputs for CPT codes 9XX04 and 9XX07 as they are facility-only services.

New Technology/New Services List
CPT codes 9XX04 and 9XX07 will be placed on the New Technology/New Services list and be re-reviewed by the RUC in three years to ensure correct valuation, patient population, and utilization assumptions.

CPT Code	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
Surgery **Cardiovascular System** **Transcatheter Procedures** *Codes for catheter placement and the radiologic supervision and interpretation should also be reported, in addition to the code(s) for the therapeutic aspect of the procedure.* ***Mechanical Thrombectomy*** *Code(s) for catheter placement(s), diagnostic studies, and other percutaneous interventions (eg, transluminal balloon angioplasty, stent placement) provided are separately reportable.*				

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Codes [37184]-[37188] specifically include intraprocedural fluoroscopic radiological supervision and interpretation services for guidance of the procedure.

Intraprocedural injection(s) of a thrombolytic agent is an included service and not separately reportable in conjunction with mechanical thrombectomy. However, subsequent or prior continuous infusion of a thrombolytic is not an included service and is separately reportable (see [37211]-[37214]).

For coronary mechanical aspiration thrombectomy, use [92973].

For intracranial arterial mechanical thrombectomy, use [61645].

Endovascular Revascularization, Transluminal Balloon Angioplasty (Other Than Central Nervous System, Coronary, Pulmonary, Lower Extremity for Occlusive Disease, and Dialysis Circuit When Approached through Ipsilateral Dialysis Access)

Codes [37246], [37247], [37248], [37249] describe open or percutaneous transluminal balloon angioplasty (eg, conventional, low profile, cutting, drug-coated balloon). Codes [37246], [37247] describe transluminal balloon angioplasty in an artery, excluding the central nervous system ([61630], [61635]), coronary ([92920]~~*[92944],* [0913T]~~*92945*), pulmonary ([92997], [92998]), and lower extremities for occlusive disease (*37XX1-37X46~~[37220] [37235]~~*). Codes [37248] and [37249] describe transluminal balloon angioplasty in a vein excluding the dialysis circuit ([36902], [36905], [36907]) when approached through the ipsilateral dialysis access. Transluminal balloon angioplasty is inherent to stenting in the extracranial carotid and innominate arteries ([37215], [37216], [37217], [37218]), peripheral arteries (*37XX1-37X46~~[37220]-[37237]~~*), and in peripheral veins ([37238], [37239]) and, therefore, is not separately reportable. Multiple angioplasties performed in a single vessel, including treatment of separate and distinct lesions within a single vessel, are reported with a single code. If a lesion extends across the margins of one vessel into another, but can be treated with a single therapy, the intervention should be reported only once. When additional, separate and distinct ipsilateral or contralateral vessels are treated in the same session, [37247] and/or [37249] may be reported as appropriate.

…

Non-selective and/or selective catheterization…

#[37248] *Transluminal balloon angioplasty (except dialysis circuit), open or percutaneous, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty within the same vein; initial vein*

Medicine
Cardiovascular
Coronary Therapeutic Services and Procedures

Codes [92920]-~~*[92944]*~~92945 describe percutaneous revascularization services performed for occlusive disease of the coronary vessels (major coronary arteries, coronary artery branches, or coronary artery bypass grafts). These percutaneous coronary intervention (PCI) codes are built on progressive hierarchies with more intensive services inclusive of lesser intensive services. These PCI codes all include the work of accessing and selectively catheterizing the vessel, traversing the lesion, radiological supervision and interpretation directly related to the intervention(s) performed, closure of the arteriotomy when performed through the access sheath, and imaging performed to document completion of the intervention in addition to the intervention(s) performed. These codes include angioplasty (eg, *conventional* balloon*s*, cutting balloon*s*, wired balloons, cryoplasty *balloons*), atherectomy (eg, directional *atherectomy*, rotational *atherectomy, orbital atherectomy*, laser *atherectomy*), therapeutic drug delivery balloon (eg, drug-coated, drug-eluting) and stenting (eg, balloon expandable *stents*, self-expanding *stents*, bare metal *stents*, drug eluting *stents*, covered *stents*). Each code in this family includes balloon angioplasty, when performed. Diagnostic coronary angiography may be reported separately under specific circumstances *as outlined below*. Codes 9XX04, 9XX07 include mechanical dilation by non-drug delivery balloon angioplasty followed by therapeutic drug-delivery by drug delivery balloon. Percutaneous transluminal coronary

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

lithotripsy may be reported using [92972] in conjunction with [92920], 9XX04, [92924], [92928], *92930,* [92933], [92937], [92941], [92943], *92945, ~~[92975]~~*, as appropriate.

Diagnostic coronary angiography codes ([93454]-[93461]) and injection procedure codes ([93563]-[93564]) should not be used with percutaneous coronary revascularization services ([92920]-~~[92944]~~92945) to report:

1. *Contrast injections, angiography, roadmapping, and/or fluoroscopic guidance for the coronary intervention,*
2. *Vessel measurement for the coronary intervention,* ***or***
3. *Post-coronary angioplasty/stent/atherectomy angiography, as this work is captured in the percutaneous coronary revascularization services codes ([92920]-~~[92944]~~92945).*

Diagnostic angiography performed at the time of a coronary interventional procedure may be separately reportable if:

1. *No prior catheter-based coronary angiography study is available, and a full diagnostic study is performed, and a decision to intervene is based on the diagnostic angiography,* ***or***
2. *A prior study is available, but as documented in the medical record:*
   a. *The patient's condition with respect to the clinical indication has changed since the prior study,* ***or***
   b. ~~*There is*~~ *The prior study provides inadequate visualization of the anatomy and/or pathology,* ***or***
   c. *There is a clinical change during the procedure that requires new evaluation outside the target area of intervention.*

Diagnostic coronary angiography performed at a separate session from an interventional procedure is separately reportable.

Coronary Lesion: *For purposes of reporting, a single distinct coronary lesion starts at the proximal end of the target lesion and ends at the distal end of the target lesion. A single distinct coronary lesion may involve multiple coronary segments and may extend from a major coronary artery into one of its branches or from a bypass graft into the subtended vessel. For the purposes or reporting, two distinct coronary lesions within one major coronary artery are considered present when the first lesion is geographically separated from the second lesion. For example, a diffuse single coronary lesion extending from the mid to distal right coronary artery (RCA) treated with two stents constitutes a single distinct coronary lesion. A coronary lesion in the proximal RCA treated with a single stent and a separate coronary lesion in the distal RCA treated with two stents would be considered two distinct coronary lesions for the purposes of reporting.*

Major coronary arteries: *The major coronary arteries are the left main, left anterior descending, left circumflex, right, and ramus intermedius arteries. ~~All PCI procedures performed in all segments (proximal, mid, distal) of a single major coronary artery through the native coronary circulation are reported with one code.~~ When one segment of a major coronary artery is treated through the native circulation and treatment of another segment of the same artery requires access through a coronary artery bypass graft, the intervention through the bypass graft is reported separately.*

Coronary artery branches: *Up to two coronary artery branches of the left anterior descending (diagonals), left circumflex (marginals), and right (posterior descending, posterolaterals) coronary arteries are recognized. The left main and ramus intermedius coronary arteries do not*

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

have recognized branches for reporting purposes. ~~All PCI(s) performed in any segment (proximal, mid, distal) of a coronary artery branch is reported with one code. PCI is reported for up to two branches of a major coronary artery. Additional PCI in a third branch of the same major coronary artery is not separately reportable.~~

Coronary Segments: *Coronary segments are recognized portions of each major coronary artery and its branches. For the purpose of coding, coronary segments are defined using the established paradigm used in the National Cardiovascular Data Registry (NCDR) CathPCI database.*

Coronary artery bypass grafts: *Each coronary artery bypass graft represents a major coronary artery ~~vessel~~. A sequential or branching bypass graft (eg, Y graft) with more than one distal anastomosis represents only one graft. ~~A branching bypass graft (eg, Y graft) represents a coronary vessel for the main graft, and each branch off the main graft constitutes an additional coronary vessel.~~ PCI performed on a major coronary artery~~ies~~ or major coronary artery branch~~es~~ by access through a bypass graft is reported using the bypass graft PCI codes. ~~All b~~Bypass graft PCI codes include the use of coronary artery embolic protection devices when performed.*

Only one *base* code from ~~*this*~~ *the PCI* family may be reported for revascularization of a major ~~*coronary*~~ artery and its ~~*recognized*~~ branches. Only one ~~*base*~~ code should be reported for revascularization of a coronary artery bypass graft, its subtended coronary artery, and ~~*recognized*~~ branches of the subtended coronary artery. If one segment of a major coronary artery and its ~~*recognized*~~ branches is treated through the native circulation, and treatment of another segment of the same vessel requires access through a coronary artery bypass graft, an additional base code ~~*is*~~ *may be* reported to describe the intervention performed through the bypass graft. The PCI base codes are [92920], 9XX04, [92924], [92928], *92930,* [92933], [92937], [92941], ~~and~~ [92943]*, and 92945*. ~~*The PCI base code that includes the most intensive service provided for the target vessel should be reported. The hierarchy of these services is built on an intensity of service ranked from highest to lowest as [92943] = [92941] = [92933] > [92924] > [92937] = [92928] > [92920].*~~

~~*PCI performed during the same session in additional recognized branches of the target vessel should be reported using the applicable add-on code(s). The add-on codes are [92921], [92925], [92929], [92934], [92938], and [92944] and follow the same principle in regard to reporting the most intensive service provided. The intensity of service is ranked from highest to lowest as [92944] = [92938] > [92934] > [92925] > [92929] > [92921].*~~

PCI performed during the same session in additional major coronary artery(ies) or in/through an additional coronary artery bypass grafts ~~should~~may be reported using the applicable major coronary artery base code(s). ~~additional base code(s). PCI performed during the same session in additional coronary artery branches should be reported using the applicable additional add-on code(s).~~

If a single lesion extends from one target vessel (major coronary artery, coronary artery bypass graft, or coronary artery branch) into another target vessel, but can be revascularized with a single intervention bridging the two vessels, this PCI should be reported with a single code despite treating more than one vessel. For example, if a left main coronary lesion extends into the proximal left circumflex coronary artery and a single stent is placed to treat the entire lesion, this PCI should be reported as a single vessel stent ([92928]). ~~In this example, a code for additional vessel treatment ([92929]) would not be additionally reported.~~

When bifurcation lesions are treated with at least one stent, 92930 is reported. ~~PCI is reported for both vessels treated.~~ For example, when both ~~vessels~~ branches of a bifurcation lesion involving the left anterior descending artery and the first diagonal artery are treated and at least one stent is used, report 92930.~~is treated by stenting both vessels, [92928] and [92929] are both reported.~~

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Code [92941] is intended for situations where PCI for acute MI (AMI), usually ST-elevation MI ~~(~~NSTEMI~~)~~*, is performed emergently.* ~~*Target vessel*~~ PCI ~~*for*~~ *of the culprit major coronary artery lesion(s) causing an* ~~*myocardial infarction*~~ *AMI* ~~*is inclusive of all*~~ *includes* balloon angioplasty, atherectomy, stenting, *nonmechanical* manual aspiration thrombectomy, distal protection, and intracoronary rheolytic agent administration *when* performed. Mechanical *aspiration coronary* thrombectomy *([92973])* ~~*is*~~ *may be* reported separately.

PCI for a non-emergent acute coronary syndrome (eg, late-presenting, or non-ST-elevation MI ~~NSTEMI~~ *without ongoing chest pain) should not be reported with [92941].*

PCI of chronic total occlusions is reported using [99243], 92945. Chronic total occlusion of a coronary vessel is present when there is no antegrade flow through the true lumen, accompanied by suggestive angiographic and clinical criteria (eg, antegrade "bridging" collaterals present, calcification at the occlusion site, no current presentation with ST elevation or Q wave acute myocardial infarction attributable to the occluded target lesion). Current clinical presentation with ST elevation or Q wave acute myocardial infarction attributable to the occluded target lesion, subtotal occlusion, ~~*and*~~ *or occlusion with dye staining at the site consistent with fresh thrombus are not considered chronic total occlusion. Some chronic total occlusions may be treated with antegrade advancement of a wire through the occluding calcified plaque or around this plaque in the subintimal space ([92943]). Some chronic total occlusion lesions must be traversed in a combined antegrade retrograde fashion (92945). In such cases, in addition to the antegrade approach, a wire is advanced via a non-occluded coronary artery and through collateral vessels to cross the occlusion in a retrograde fashion from its distal cap.*

Codes [92972] (percutaneous transluminal coronary lithotripsy), [92973] (percutaneous transluminal coronary thrombectomy, mechanical *aspiration*), [92974] (coronary brachytherapy), [92978] and [92979] (intravascular ultrasound/optical coherence tomography), [93571] and [93572] (intravascular Doppler velocity and/or pressure [~~*fractional flow*~~ reserve *measurement* ~~*(FFR) or coronary flow reserve (CFR)*~~]), and ~~[92972] (percutaneous transluminal coronary lithotripsy)~~, are add-on codes for reporting procedures performed in addition to coronary and bypass graft diagnostic and *PCI procedures* ~~*interventional services, unless included in the base code*~~. Non-mechanical, *manual* aspiration thrombectomy is not reported with [92973], and is included in the PCI code for ~~AMI~~ acute myocardial infarction ([92941]), when performed. *For nonmechanical, manual aspiration thrombectomy performed during PCI for indications other than* acute myocardial infarction ~~AMI~~, *use [93799].*

For purposes of reporting stent placement, there are two codes for stent PCI. Code [92928] is reported when one lesion is treated with one or more stents in a major coronary artery, whether the lesion is confined to one segment or extends across multiple coronary segments. When two or more separate coronary lesions are treated with two or more stents in two or more coronary segments in a major coronary artery and/or its branch(es), use 92930. Example #1: placement of stents to treat a single lesion that overlaps the mid and distal right coronary artery segments ~~*is*~~ *may be reported with [92928]. Example #2: Treatment of two separate lesions by placement of stents in the 1st diagonal artery and the distal LAD may be reported with 92930.*

Category III Codes

~~**Transcatheter Therapeutic Drug Delivery by Intracoronary Drug-Delivery Balloon**~~

~~Codes [0913T], [0914T] describe percutaneous coronary revascularization services by intracoronary antiproliferative drug delivery, performed for occlusive disease of the coronary vessels (major coronary arteries, coronary artery branches) using drug-delivery balloon (eg, drug-coated, drug-eluting) for~~

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

~~intracoronary antiproliferative drug delivery. Code [0913T] includes the work of accessing and selectively catheterizing the vessel, coronary angiography and intracoronary imaging (eg, intracoronary ultrasound, intracoronary optical coherence tomography) to guide the intervention, traversing the lesion, radiological supervision and interpretation directly related to the intervention(s) performed, closure of the arteriotomy when performed through the access sheath, and imaging performed to document completion of the intervention in addition to the intervention(s) performed. Code [0914T] is an add-on code and includes only the coronary angiography and intracoronary imaging (eg, intracoronary ultrasound, intracoronary optical coherence tomography) to guide the additional intervention, traversing the additional lesion, and radiological supervision and interpretation directly related to the intervention(s) performed on the additional lesion. Codes [0913T], [0914T] include mechanical dilation by nondrug-delivery balloon angioplasty followed by therapeutic drug delivery by drug-delivery balloon. Code [0913T] may not be reported with [92920], [92924], [92928], [92933], [92937], [92941], [92943], [92973], [92978] for percutaneous coronary interventions (PCI) on the same target lesion in the same major coronary artery or graft as the drug-delivery balloon intervention. For drug delivery by intracoronary drug-delivery balloon (eg, drug-coated, drug-eluting) performed on a separate target lesion in the same major coronary artery or graft, [0914T] may be reported for the separate target lesion in conjunction with [92920], [92924], [92928], [92933], [92937], [92941], [92943] for the first target lesion. For PCI in other major coronary arteries, see the appropriate PCI codes ([92920], [92924], [92928], [92933], [92937], [92941], [92943], [0913T]).~~

~~Diagnostic coronary angiography codes ([93454], [93455], [93456], [93457], [93458], [93459], [93460], [93461]) andinjection procedure codes ([93563], [93564]) should not be used with percutaneous coronary revascularization services by intracoronary antiproliferative drug-delivery balloon services ([0913T], [0914T]) to report:~~

~~Contrast injections, angiography, roadmapping, and/or fluoroscopic guidance for the coronary intervention,~~

~~1. Vessel measurement for the coronary intervention, or~~

~~2. Postcoronary intervention angiography, as this work is captured in the percutaneous coronary revascularization services by intracoronary antiproliferative drug-delivery balloon codes ([0913T], [0914T]).~~

~~Diagnostic angiography performed at the time of a coronary interventional procedure may be separately~~

~~reportable, if:~~

~~1. No prior catheter-based coronary angiography study is available, and a full diagnostic study is performed, and a decision to intervene is based on the diagnostic angiography, or~~

~~2. A prior study is available, but as documented in the medical record:~~

~~a. The patient's condition with respect to the clinical indication has changed since the prior study,~~

~~or~~

~~b. The prior study provides inadequate visualization of the anatomy and/or pathology, or~~

~~c. There is a clinical change during the procedure that requires new evaluation outside the target area of intervention.~~

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

~~Diagnostic coronary angiography performed at a separate session from an interventional procedure is~~

~~Separately reportable.~~

~~●[0913T]~~ ~~Percutaneous transcatheter therapeutic drug delivery by intracoronary drug-delivery balloon (eg, drug-coated, drug-eluting), including mechanical dilation by nondrug-delivery balloon angioplasty, endoluminal imaging using intravascular ultrasound (IVUS) or optical coherence tomography (OCT) when performed, imaging supervision, interpretation, and report, single major coronary artery or branch~~

~~(Do not report [0913T] in conjunction with [92920], [92924], [92928], [92933], [92937], [92941], [92943], [92973], [92978], for interventions on the same target lesion in the same major coronary artery or graft as the target lesion treated with drug-delivery balloon intervention)~~

([0913T] has been deleted)

(For percutaneous transcatheter therapeutic drug delivery by intracoronary drug-delivery balloon, use 9XX04)

~~+●[0914T]~~ ~~Percutaneous transcatheter therapeutic drug delivery by intracoronary drug-delivery balloon (eg, drug-coated, drug-eluting) performed on a separate target lesion from the target lesion treated with balloon angioplasty, coronary stent placement or coronary atherectomy, including mechanical dilation by nondrug-delivery balloon angioplasty, endoluminal imaging using intravascular ultrasound (IVUS) or optical coherence tomography (OCT) when performed, imaging supervision, interpretation, and report, single major coronary artery or branch (List separately in addition to code for percutaneous coronary stent or atherectomy intervention)~~

~~(Use [0914T] in conjunction with [92920], [92924], [92928], [92933], [92937], [92941], [92943])~~

([0914T] has been deleted)

(For percutaneous transcatheter therapeutic drug delivery by intracoronary drug-delivery in conjunction with percutaneous coronary interventions [PCI] performed on a separate target lesion, use 9XX07)

Re: Tab 15 Intracoronary Drug Delivery Balloon Services

Dear Dr. Silva:

Tab 15 of the September 2025 RUC agenda addresses 2 new category I codes for intracoronary drug coated balloon services as well as 13 existing percutaneous coronary intervention (PCI) codes as part of the family.

The intravascular lithotripsy code (92972) was valued by the RUC at the January 2023 meeting and finalized by CMS in the CY2025 MPFS Final Rule. The remaining 12 codes in this family had RUC recommended values established at the April 2024 meeting. These values, as recommended by the RUC, were proposed by CMS in the CY2026 MPFS proposed rule. The AMA RUC and the surveying societies of the PCI codes have all submitted comment letters supporting the CMS proposal to accept the RUC recommended values for all 12 PCI codes.

Being that CMS proposes to accept the RUC recommended values for all of the established PCI codes in this family, they have all been surveyed within the last two years, and neither the RUC nor the surveying societies have raised any concerns with these values, we recommend reaffirmation of the existing value of 92972 and the RUC recommended/CMS proposed values of 92920, 92924, 92928, 92X01, 92933, 92937, 92941, 92943, 92X02, 92973, 93571, and 93572.

Thank you for your consideration of this information as you prepare for the upcoming meeting. Please contact Matt Minnella at mminnella@acc.org if you have any questions.

Sincerely,

Afnan Tariq, MD
SCAI RUC Advisor

Richard Wright, MD
ACC RUC Advisor

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:9XX04 Tracking Number Q2 Original Specialty Recommended RVU: **8.05**
Presented Recommended RVU: **10.00**
Global Period: 000 Current Work RVU: **NA** RUC Recommended RVU: **10.00**

CPT Descriptor: Percutaneous transcatheter therapeutic drug delivery by intracoronary drug-delivery balloon (eg, drug-coated, drug-eluting), including mechanical dilation by nondrug-delivery balloon angioplasty, single major coronary artery and/or its branch(es)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 67-year-old man with history of diabetes who underwent DES of the LAD six months ago now presents with escalating angina. Coronary angiography demonstrates focal 80% in-stent stenosis at the DES site. Drug-coated balloon treatment is recommended.

Percentage of Survey Respondents who found Vignette to be Typical: 98%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 100% , In the ASC 0%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 49% , Overnight stay-less than 24 hours 44% , Overnight stay-more than 24 hours 7%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 100%

Description of Pre-Service Work: The patient's history, records, laboratory, and diagnostic tests are reviewed. A physical examination is conducted. Previous catheterization films are reviewed. In addition to the decision that an intervention is appropriate, additional consideration is given to different strategies for revascularization including repeat stenting, intra-coronary lithotripsy, atherectomy (rotational, orbital, or laser) or high pressure (40 atm) balloon dilatation. Appropriate communication is conducted with the patient and the patient's family as well as with other medical professionals as needed. The procedure is reviewed with the patient. The risks and benefits of the procedure are presented, as well as the alternatives. Informed consent is obtained. Hair is removed from the potential access sites. Necessary equipment, instruments, and supplies for the procedure are confirmed to be available and operational. Instruments and supplies for the procedure are pulled. The patient is transported to the procedure suite, positioned on the procedural table, and attached to cardiac electrodes and an oxygen saturation monitor. A sterile table is prepared. The potential access sites are scrubbed in sterile fashion. A sterile drape is placed over the patient. The patient's information is loaded in the hemodynamic monitoring equipment to retain the data from the upcoming study.

Description of Intra-Service Work: A "time out" occurs during which confirmation of critical information is ensured, such as the patient's identity, planned procedure, access route, allergies, completion of the consent process, availability of proper equipment, and any unusual circumstances that might influence the procedure. Conscious sedation is administered and adequate conscious sedation monitoring is verified. Percutaneous arterial access is obtained, typically through the femoral artery or radial artery. A thin-walled needle is inserted percutaneously into the peripheral artery through which a flexible guidewire is inserted. The needle is removed over the guidewire, a sheath/dilator system is inserted over the guidewire, the dilator is removed, and the sidearm of the sheath is flushed to remove any clot or air. Intraarterial vasodilators are administered to prevent arterial spasm for radial artery access. An appropriate guiding catheter is inserted over the guidewire through the sheath into the arterial system under fluoroscopic guidance throughout the procedure. The catheter is advanced retrograde through the arterial system to the ascending aorta. The guidewire is removed and the catheter is attached to the pressure manifold. The guide is aspirated to remove any air, atheroma, or thrombus. Pressure is measured in the aortic root. The catheter is then manipulated using fluoroscopic guidance into the ostium of a coronary artery. Typically the guide must be manipulated to avoid aortic atheroma and adjusted substantially to engage the artery based on the

anatomy of the aorta. The arterial pressure and waveform are then checked to be sure there is no evidence of catheter malposition or impairment of coronary flow due to an ostial stenosis. Frequently several guide catheters are required to achieve a safe catheter engagement of the artery. Test contrast injections under fluoroscopy are performed to check catheter position.
Appropriate antiplatelet therapy pretreatment is confirmed, and additional antiplatelet therapy is administered as needed. Direct thrombin inhibitors or heparin is administered for anticoagulation. Therapeutic anticoagulation is confirmed by drawing blood from the guide and testing an activated clotting time (ACT). Additional anticoagulation is administered as needed to achieve a therapeutic ACT. Intracoronary vasodilators are administered. Multiple coronary injections are performed, each with the imaging system aligned in a different orientation, with simultaneous panning (moving the table) to assess the stenoses. A coronary guidewire is then manipulated through the guide and down the coronary artery and carefully used to cross the target lesion. Typically, this requires manipulation of the guidewire in several angiographic views and often requires additional guidewires if the first guidewire is not successful. Guidewire position across the lesion is confirmed angiographically. The guidewire is adjusted as needed to ensure it is not lodged in a small distal vessel that might result in perforation or dissection. Multiple coronary injections are performed, each with the imaging system aligned in a different orientation, with simultaneous panning (moving the table) to assess the stenoses.
Lesion preparation is initially performed using traditional balloon angioplasty to gain maximal lumen area prior to therapeutic drug-delivery by drug-coated balloon (DCB). An appropriate-sized non-compliant balloon is selected and advanced over the guidewire to the lesion. Balloon position within the stent is confirmed by angiography. The balloon is inflated gradually to reduce slippage while observing for clinical and angiographic signs of ischemia. The balloon is deflated and reinflated several times to progressively higher pressures. The balloon is withdrawn over the guidewire and removed from the guide catheter.
Precise measurement of the area to be treated by DCB is calculated by identifying the proximal and distal landing zones 2 mm beyond the edges of the lesion and measuring the vessel diameter post-dilation. An appropriate-sized DCB is selected to ensure contact with the vessel wall. The DCB is carefully delivered to the stenotic lesion preventing delamination of the drug-coating. The radiopaque marker bands on the DCB visualized by angiography are used to position the drug-coating precisely across the lesion treatment site. Pressure is gradually applied to the DCB until nominal pressure is achieved watching for balloon slippage or deformation, appropriate balloon expansion, and drug-coating apposition to the vessel lumen initiating the drug transfer process. During the drug transfer process, the inflated DCB is held in place continuously occluding blood flow while total inflation time is monitored according to manufacturer specifications and patient vitals including chest pain, EKG, hemodynamics, and blood pressure are assessed for signs of ischemia or arrhythmia, which may occur during the purposeful prolonged continuous occlusion of the vessel by the inflated DCB. Following completion of the drug transfer process, negative pressure is applied deflating the DCB, vessel patency is confirmed, and the DCB is withdrawn over the guidewire and removed from the guide catheter.
The guidewire is withdrawn back into the guide catheter. The guide catheter is disengaged and removed. The arterial access site is closed, and the patient is sent to recovery. Additional time in recovery may be necessary given that the lesion has not been stented.

Description of Post-Service Work: Films and hemodynamics are reviewed and a formal report is generated. The patient, the patient's family, and the referring physician are notified of the results. A plan of management is developed and discussed with the patient and the patient's family. Additional antiplatelet and antithrombin therapy is administered as necessary. The patient is observed to ensure no bleeding, to monitor for abrupt vessel closure, and for continued therapy of ischemic heart disease.

SURVEY DATA

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	6%	26%	55%	13%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	6%	42%	52%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	6%	55%	39%
Physical effort required	3%	77%	20%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	6%	39%	55%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	11%	61%	22%	6%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	6%	55%	39%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	17%	61%	22%
Physical effort required	22%	56%	22%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	22%	56%	22%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Drug coated balloon was brought to the May 2025 CPT meeting to convert the existing category III codes to category I. It was surveyed by ACC and SCAI for the September 2025 RUC meeting. The survey used an industry list of 765 known interventional cardiologists familiar with the procedure along with 2893 random interventional cardiologist members of ACC and SCAI.

ACC and SCAI convened a panel of physicians familiar with the services to review the survey data. The survey was robust and was completed by physicians who have experience with the service.

The key reference service is 37242, a vascular embolization code that was selected by 29 respondents. While the median intraservice time was 40 minutes less than the key reference service, 68% of respondents selecting this key reference felt DCB was more or much more intense than the key reference service with 26% indicating the intensity was identical. The second most selected key reference service was 37184 mechanical thrombectomy selected by 17 respondents. While the median intraservice time was 30 minutes less than the key reference service, 28% of respondents selecting this key reference felt DCB was more or much more intense than the key reference service with 61% indicating the intensity was identical.

Preservice Time

For each of the 000 global PCI codes, we recommend additions to preservice package 2 (Difficult patient/straightforward procedure without anesthesia care) that are supported by the survey. While these are 000 codes provided to patients with short or no hospital stay, there are certain elements of preservice time that are more akin to that of a service which utilizes general anesthesia. The elements below regarding the entire PCI family were approved by the RUC after facilitation discussion in April 2024 and we recommend replicating them for 9X004.

		FACILITY			**PCI**	**Notes**
		2	**3**	**4**	**2+**	
	Total Pre-Service Time	**25**	**51**	**63**	**48**	
	CATEGORY SUBTOTALS					
A	Pre-Service Evaluation (IWPUT =0.0224)	18	33	40	35	
B	Pre-Service Positioning (IWPUT = 0.0224)	1	3	3	3	
C	Pre-Service Scrub, Dress and Wait (IWPUT =0.0081)	6	15	20	10	
	DETAILS					
A	History and Exam (Performance and review of appropriate Pre-Tests)	10	10	15	10	Standard
A	Prepare for Procedure (Check labs, plan, assess risks, review procedure)	2	2	4	2	Standard
A	Communicate with patient and/or family (Discuss procedure/ obtain consent)	3	5	5	11	+8 for detailed consenting using multi-page or electronic form. Discuss results of Heart Team consultations (if performed); access site options; pros and cons of various PCI techniques including intra-coronary lithotripsy, drug-coated balloon, atherectomy

						angioplasty, stenting; and possibility of conversion to emergency surgery. Discuss alternatives to PCI (surgery or medical therapy.) Discuss risks of all 3 approaches. Obtain separate consents for transfusion and moderate sedation.
A	Communicate with other professionals	0	5	5	0	Standard
A	Check/set-up room, supplies and equipment	1	5	5	5	+4 Utilize time similar to procedures with anesthesia to assess complex array of catheter, stents, and other supplies/equipment
A	Check/ prepare patient readiness (Gown, drape, prep, mark)	1	5	5	6	+5 Left and right radial pulses are evaluated to determine which are available for access (eg not harvested for prior CABG) and which of the two offers better access. Evaluate whether femoral artery is available for access and determine if left, right, or both femoral access sites should be prepped. Time out is performed.
A	Prepare/ review/ confirm procedure	1	1	1	1	Standard
B	Perform/ supervise patient positioning	1	3	3	3	+2 Utilize time similar to procedures with anesthesia to position patient comfortably on the table with arm in uncomfortable position, usually on a special pad. Arm used for radial access must be positioned and supinated with ventral surface oriented up and secured with tape to keep it there for entire procedure. Ultra-sound probe is inserted into sterile sleeve; console is programmed and turned on. Anti-spasm cocktail is prepared for intra-arterial injection.
C	Administer local/topical anesthesia	1	0	0	1	Standard

C	Observe (wait anesthesia care)	0	10	15	0	+4 Additional management of complex moderate sedation
C	Dress and scrub for procedure	5	5	5	5	Standard

The societies recommend a wRVU of 10.00 with times of 48/60/21. Preservice Package 2 was selected with the adjustments described above. Post-service package 8B for a complex procedure with IV sedation was selected with adjustment to match the survey 21 minutes. The intra-service time of 60 minutes is the survey median time. The societies are recommending the median survey wRVU of 10.00. We are recommending the median to avoid a rank order anomaly within this code family. The April 2024 RUC recommended work RVU for 92920 was 8.35. CMS proposed this value in the CY2026 proposed MPFS rule with the RUC and surveying societies supporting the value. As 9X004 includes the same work as 92920 plus additional steps it would not be appropriate to have 9X004 valued lower than 92920. It is also logical from a relativity sense for it to have the same/similar value as 92928 for straightforward stenting with the same intraservice time of 60 minutes. The median value of 10.00 with recommended times produces an IWPUT of 0.143. This aligns with the IWPUT of 92920 at 0.142 and the next code in the family hierarchy of 92924 which is also 0.142.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 0913T

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Interventional Cardiologists How often? Commonly

Specialty Cardiologists How often? Commonly

Specialty Internal Medicine How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 15000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimate approximately matches manufacturers use-contingent sales of products required for the procedure over the 12 months prior to CPT Cat I code approval plus 50% more for growth of the new technology.

Specialty Interventional Cardiology Frequency 7800 Percentage 52.00 %

Specialty Cardiologists Frequency 6800 Percentage 45.33 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 7,500
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimate reflects half of the total estimated performance as the average age of patient is expected to be approximatelyl 65 years old and in Medicare FFS. This would lead to approximately half of the patients to be Medicare beneficiaries.

Specialty Interventional Cardiologist Frequency 3900 Percentage 52.00 %

Specialty Cardiologists Frequency 3400 Percentage 45.33 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Cardiovascular-Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 92920

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:9XX07 Tracking Number Q12 Original Specialty Recommended RVU: **4.38**
Presented Recommended RVU: **4.38**
Global Period: 000 Current Work RVU: RUC Recommended RVU: **4.38**

CPT Descriptor: Percutaneous transcatheter therapeutic drug-delivery by intracoronary drug-delivery balloon (eg, drug-coated, drug-eluting), single major artery and/or its branches (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: a 65-year-old female undergoing atherectomy for a 90% calcified lesion in the distal parts of the left anterior descending artery. the vessel is felt to be too small-caliber for stenting so the atherectomy is followed by drug coated balloon treatment is undertaken. (note: this is an add-on service. only consider the additional work related to the drug coated balloon treatment)

Percentage of Survey Respondents who found Vignette to be Typical: 91%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 0% , In the ASC 0%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 0%

Description of Pre-Service Work:

Description of Intra-Service Work: Once the percutaneous coronary intervention (PCI) is complete, lesion preparation is initially performed using traditional balloon angioplasty (performed as part of the primary procedure) to gain maximal lumen area prior to therapeutic drug-delivery by drug-coated balloon (DCB). An appropriate-sized non-compliant balloon is selected and advanced over the guidewire to the lesion. Balloon position is confirmed by angiography. The balloon is inflated gradually to reduce slippage while observing for clinical and angiographic signs of ischemia. The balloon is deflated and reinflated several times to progressively higher pressures. The balloon is withdrawn over the guidewire and removed from the guide catheter.

Description of Post-Service Work:

CPT Descriptor

RELATIONSHIP OF CODE BEING REVIEWED TO TOP TWO KEY REFERENCE SERVICES:

Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by percent distribution) of the service you are rating to the top two chosen key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Top Key Reference Code: 34 **% of respondents:** 35.7 **%**

Number of respondents who choose 2nd Key Reference Code: 12 **% of respondents:** 12.6 **%**

TIME ESTIMATES (Median)

	CPT Code: 9XX07	**Top Key Reference CPT Code:** 92974	**2nd Key Reference CPT Code:** **37186**
Median Pre-Service Time	0.00	0.00	0.00
Median Intra-Service Time	48.00	42.50	60.00
Median Immediate Post-service Time	0.00	0.00	0.00
Median Critical Care Time	0.0	0.00	0.00
Median Other Hospital Visit Time	0.0	0.00	0.00
Median Discharge Day Management Time	0.0	0.00	0.00
Median Office Visit Time	0.0	0.00	0.00
Median Total Time	**48.00**	**42.50**	**60.00**
Other time if appropriate			

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	0%	65%	30%	5%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	6%	71%	23%

Technical Skill/Physical Effort	**Less**	**Identical**	**More**
Technical skill required	6%	71%	23%
Physical effort required	6%	71%	23%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	71%	29%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	7%	0%	7%	50%	36%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	7%	7%	86%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	7%	14%	79%
Physical effort required	7%	28%	65%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	7%	22%	71%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Drug coated balloon was brought to the May 2025 CPT meeting to convert the existing category III codes to category I. It was surveyed by ACC and SCAI for the September 2025 RUC meeting. The survey used an industry list of 765 known interventional cardiologists familiar with the procedure along with 2893 random interventional cardiologist members of ACC and SCAI.

ACC and SCAI convened a panel of physicians familiar with the services to review the survey data. The survey was robust and was completed by physicians who have experience with the service. The panel reviewed this ZZZ code and recommends the survey median intra-service time with no preservice or post-service time.

The key reference service is 92974 a transcatheter placement of radiation delivery device with a wRVU of 3.0 and an intraservice time of 42.5. This reference service was selected by 34 respondents. The median intraservice time was 5.5 minutes more than the key reference service and 35% of respondents selecting this key reference felt DCB was more or much more intense with 65% indicating the intensity was identical. The second most selected key reference service was 37186 noncoronary transluminal thrombectomy with a wRVU of 4.92 and an intraservice time of 60 selected by 12 respondents. While the median intraservice time was 12 minutes less than the second key reference service, 86% of respondents selecting this key reference felt DCB was more or much more intense than the key reference service with 7% indicating the intensity was identical.

The societies recommend a wRVU of 4.38 with times of 0/48/0. This is a ZZZ add on code with no pre and no post time. The societies are recommending the 25th percentile survey wRVU of 4.38. This is higher than the key reference service 92974 as the survey shows 9X007 has both longer time and higher intensity and less than reference service 37186 which has more time, but is considered less intense by the vast majority of respondents.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 0914T

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Interventional Cardiology How often? Sometimes

Specialty Cardiologist How often? Sometimes

Specialty Internal Medicine How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 450
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Service was perfomred approximatelyl 3% of the time as base code in 2024 data. Maintaining that percentage as projection of 9X007 estimate.

Specialty Interventonal Cardiologist Frequency 230 Percentage 51.11 %

Specialty Cardiologist Frequency 220 Percentage 48.88 %

Specialty Frequency 0 Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 225
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimating half of services will be perfomed on Medicare beneficiaries

Specialty Interventional Cardiologist Frequency 115 Percentage 51.11 %

Specialty Cardiologist Frequency 110 Percentage 48.88 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Cardiovascular-Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 92974

Re: Tab 15 Intracoronary Drug Delivery Balloon Services

Dear Dr. Silva:

Tab 15 of the September 2025 RUC agenda addresses 2 new category I codes for intracoronary drug coated balloon services as well as 13 existing percutaneous coronary intervention (PCI) codes as part of the family.

The intravascular lithotripsy code (92972) was valued by the RUC at the January 2023 meeting and finalized by CMS in the CY2025 MPFS Final Rule. The remaining 12 codes in this family had RUC recommended values established at the April 2024 meeting. These values, as recommended by the RUC, were proposed by CMS in the CY2026 MPFS proposed rule. The AMA RUC and the surveying societies of the PCI codes have all submitted comment letters supporting the CMS proposal to accept the RUC recommended values for all 12 PCI codes.

Being that CMS proposes to accept the RUC recommended values for all of the established PCI codes in this family, they have all been surveyed within the last two years, and neither the RUC nor the surveying societies have raised any concerns with these values, we recommend reaffirmation of the existing value of 92972 and the RUC recommended/CMS proposed values of 92920, 92924, 92928, 92X01, 92933, 92937, 92941, 92943, 92X02, 92973, 93571, and 93572.

Thank you for your consideration of this information as you prepare for the upcoming meeting. Please contact Matt Minnella at mminnella@acc.org if you have any questions.

Sincerely,

Afnan Tariq, MD
SCAI RUC Advisor

Richard Wright, MD

AMA/Specialty Society RVS Update Committee (RUC)
Vendor/Company Attestation Statement

This form needs to be completed by an authorized representative of any **Vendor or Company** that makes, markets or distributes a product or device utilized in performing the service being surveyed by the AMA/Specialty Society RVS Update Committee (RUC), as part of its CPT® code survey and valuation process, and which has supplied a list of users of such products or devices in connection with the survey and valuation process.

By submitting to the RUC a list of users of the undersigned's product or device as part of the RUC's CPT® code survey and valuation process, I attest that no employee, affiliate, or agent of the undersigned has contacted, and further covenant that they will not contact, any such user in connection with the survey. I hereby represent and warrant that I have the authority to sign this statement on behalf of the undersigned company and that the information herein is true and accurate. I understand that any false or inaccurate information will render the survey invalid, harming both the undersigned and the physicians who use the product or device.

AMA/Specialty Society RVS Update Committee Summary of Recommendations

April 2024

Coronary Therapeutic Services and Procedures – Tab 06

In October 2010, CPT code 92980 *Transcatheter placement of an intracoronary stent(s), percutaneous, with or without other therapeutic intervention, any method; single vessel* was identified by the Relativity Assessment Workgroup (RAW) via the MPC List screen. The RAW requested that the specialty societies survey this code for RUC review. Subsequently, the specialty societies referred the code to the CPT Editorial Panel to revise the family of procedures to more accurately describe the current physician work involved in percutaneous coronary intervention (PCI). At the October 2011 CPT meeting, the Panel approved 13 new codes to describe PCI services. The societies surveyed the family and the RUC submitted recommendations to the Centers for Medicare & Medicaid Services (CMS) in January 2012. Instead of accepting the RUC recommendations, CMS opted to assign bundled status to all the add-on codes for the additional branches off the major coronary arteries (codes 92921, 92929, 92934, 92938, 92944). In addition, CMS increased values and intra-times of all the base codes using a mathematical formula to include a fraction of the time and value of the add-on codes, based on the billed together data available at the time. For example, using 2011 Medicare claims data, CMS anticipated that the service described by add-on code 92921 would be performed with the procedure described by base code 92920 27.4% of the time. To bundle the work value of the add-on code into base code 92920, CMS multiplied the RUC recommendation for the add-on code of 4.00 by 27.4% (or 1.10) and added that fractional value to the RUC recommendation for the base code (9.00+1.10=10.10). The value of moderate sedation, which was bundled into the base codes, was systematically removed when separate moderate sedation CPT codes were created for CPT 2017.

In September 2022, the CPT Editorial Panel created one new Category I CPT code for percutaneous coronary lithotripsy. Sixteen other PCI codes were considered part of the code family. For the January 2023 RUC meeting, the specialty societies opted to survey nine of the sixteen codes. The specialty societies opted to not survey the add-on codes in the family that describe the intervention in additional branches off major coronary arteries. As described above, CMS and payers have never recognized these add-on codes as separately payable services, therefore they have no Medicare utilization. After reviewing the survey results in preparation for the January 2023 RUC meeting, the surveying specialty societies requested, and the RUC agreed, to submit a recommendation only for the new add-on code 92972 for CPT 2024 and referred the entire PCI code family to the CPT Editorial Panel for restructuring for the CPT 2025 cycle. The code family was revised at the February 2024 CPT Editorial Panel meeting for the CPT 2026 cycle and the family was surveyed for the April 2024 RUC meeting.

The new/revised PCI code family is built on progressive hierarchies with more intensive services being inclusive of lesser intensive services. The base PCI codes include the work of accessing and selectively catheterizing the vessel, traversing the lesion, radiological supervision and interpretation directly related to the intervention(s) performed, closure of the arteriotomy when performed through the access sheath, and imaging performed to document completion of the intervention in addition to the intervention(s) performed. These codes include angioplasty (eg, conventional balloons, cutting balloons, wired balloons, cryoplasty balloons), atherectomy (eg, directional atherectomy, rotational atherectomy, orbital atherectomy, laser atherectomy), and stenting (eg, balloon expandable stents, self-expanding stents, bare metal stents, drug-eluting stents, covered stents). Each base code in this family also includes balloon angioplasty, when performed.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Compelling Evidence
The RUC reviewed compelling evidence based on a change in technique. At the time of the 2012 survey, PCI was typically performed via the femoral artery, whereas fewer than 5 percent of PCI were performed via the radial artery at the time. Due to improvements in technique and catheter technology, PCI is now typically performed through the radial artery (more than 60 percent of the time nationally). This approach requires different skills and techniques that are more difficult to perform than access through the femoral artery. Research has shown the radial approach to be safer for patients and involves a significant reduction in the risk of patient bleeding. The specialties noted that the average radial artery is about 2 mm compared to femoral arteries which average about 9 mm. While safer for the patient, the service is technically more challenging for the operator. Unlike the femoral artery, not only does the operator give local anesthesia, but they also must administer additional medications intra-arterially because of the tendency for the radial and brachial arteries to go into spasms. Procedures that involve the radial artery involve injections by the physician into the artery once the artery has been canulated. **The RUC accepted compelling evidence based on a change in technique.**

Pre-service and Post-service Time
The RUC agreed to make the times consistent with the survey pre-service time for each 000-day global code to reflect the time typically required to perform the pre-service evaluation and other work to prepare for the procedure, as well as additional post-service time for several of the codes. The pre-service evaluation was adjusted to 35 minutes for every 000-day code, except for emergent code 92941, which was instead adjusted to 22 minutes. Also, pre-service scrub, dress, wait time was adjusted to 10 minutes for every 000-day procedure code. Similarly, the post-service time for each 000-day service was adjusted to 30 minutes or the surveyed post-service time (if surveyed time was less than 30).

These changes were in part based on the additional time needed to evaluate and prepare access site(s) (one or both radial arteries and/or one or both femoral arteries). The myriad of techniques that are now available for percutaneous coronary intervention has expanded and that requires a full discussion with the patient because each one carries separate risks. Left and right radial pulses are also evaluated using an Allen test to determine which are available for access and which of the two offers preferable access. It is typical for the physician to prepare at least two access sites. Many operators give an anti-vasospastic cocktail routinely which also takes additional time to prepare for during the pre-service period. As part of the evaluation, the operator discusses the results of Heart Team consultations (if performed) and describes various PCI techniques, and the possibility of conversion to emergency surgery, among other typical tasks. The Heart Team for coronary revascularizations is a multidisciplinary team convened to evaluate complex patients and helps make patient-centered, evidence-based clinical decisions for patients considered for coronary revascularization.

92920 ***Percutaneous transluminal coronary angioplasty, single major coronary artery and/or its branch(es)***
The RUC reviewed the survey results from 140 interventional cardiologists and determined a direct work RVU crosswalk to CPT code 49013 *Preperitoneal pelvic packing for hemorrhage associated with pelvic trauma, including local exploration* (work RVU = 8.35, 45 minutes intra-service time and 155 minutes total time) appropriately accounts for the work required to perform this service. Both services typically involve a similar amount of intra-service time and the same overall amount of physician work. The RUC acknowledged the dearth of potential reference codes that are major surgical procedures with the 000-day global period and involved similar times, so the pool of potential reference codes was limited for most survey codes in this code family. The RUC recommends 35 minutes pre-service evaluation time, 3 minutes pre-service positioning time, 10 minutes pre-service scrub/dress/wait time, 48 minutes intra-service time, and 27 minutes immediate post-service time.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The specialties noted that operators now see patients undergoing PCI who have more comorbidities than when the PCI code family was last reviewed in 2012. Attention to stricter adherence to statins and other medicines in revascularization and chest pain guidelines has excluded many patients who otherwise may have been treated with lower acuity PCI. The remaining patients are more complex than they were a dozen years ago. This is true for the patient population for each of the new/revised codes in this code family. The specialty also noted that typically, to close the radial artery access site (which is now typical), the operator uses a radial artery occluder band and this work takes much less time relative to what femoral closure used to involve when this service was last valued in 2012. The femoral artery closure work was a low-intensity portion of the intra-service work back in 2012, though took up a fair amount of time. With the replacement of this work with the usage of occluder bands, the typical intra-service work has a higher average intensity as a lower proportion of the time is dedicated to the closure.

For additional support, The RUC also referenced CPT code 31601 *Tracheostomy, planned (separate procedure); younger than 2 years* (work RVU = 8.00, 45 minutes intra-service time and 135 minutes total time) and CPT code 33952 *Extracorporeal membrane oxygenation (ECMO)/extracorporeal life support (ECLS) provided by physician; insertion of peripheral (arterial and/or venous) cannula(e), percutaneous, 6 years and older (includes fluoroscopic guidance, when performed)* (work RVU = 8.15, 60 minutes intra-service time and 158 minutes total time). **The RUC recommends a work RVU of 8.35 for CPT code 92920.**

92924 ***Percutaneous transluminal coronary atherectomy, with coronary angioplasty when performed, single major coronary artery and/or its branch(es)***

The RUC reviewed the survey results from 137 interventional cardiologists and determined a direct work RVU crosswalk to CPT code 33530 *Reoperation, coronary artery bypass procedure or valve procedure, more than 1 month after original operation (List separately in addition to code for primary procedure)* (work RVU= 10.13, 70 minutes intra-service time and 112 minutes total time) appropriately accounts for the work required to perform this service. The RUC acknowledged that this direct crosswalk has a different global period, though also noted the relative dearth of available reference codes that are 000-day global major surgical procedures that have similar times and involve a similar amount of physician work in general. The RUC recommends 35 minutes pre-service evaluation time, 3 minutes pre-service positioning time, 10 minutes pre-service scrub/dress/wait time, 60 minutes intra-service time, and 30 minutes immediate post-service time. This service includes the entire physician work of CPT code 92920 when performed, plus the additional work of performing percutaneous transluminal coronary atherectomy. This places the recommendation for 92924 with appropriate relativity to the recommendation for 92920.

For additional support, the RUC referenced CPT code 33986 *Extracorporeal membrane oxygenation (ECMO)/extracorporeal life support (ECLS) provided by physician; removal of central cannula(e) by sternotomy or thoracotomy, 6 years and older* (work RVU = 10.00, 60 minutes intra-service time and 205 minutes total time.) and CPT code 33964 *Extracorporeal membrane oxygenation (ECMO)/extracorporeal life support (ECLS) provided by physician; reposition central cannula by sternotomy or thoracotomy, 6 years and older (includes fluoroscopic guidance, when performed)* (work RVU = 9.50, 60 minutes intra-service time and 195 minutes total time).**The RUC recommends a work RVU of 10.13 for CPT code 92924.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

92928 ***Percutaneous transcatheter placement of intracoronary stent(s), with coronary angioplasty when performed, single major coronary artery and/or its branch(es); one lesion involving one or more coronary segments***
The RUC reviewed the survey results from 140 interventional cardiologists and determined a direct work RVU crosswalk to CPT code 33986 *Extracorporeal membrane oxygenation (ECMO)/extracorporeal life support (ECLS) provided by physician; removal of central cannula(e) by sternotomy or thoracotomy, 6 years and older* (work RVU= 10.00, 60 minutes intra-service time and 205 minutes total time) appropriately accounts for the work required to perform this service. The RUC acknowledged the dearth of potential reference codes that are major surgical procedures with the 000-day global period and involved a similar amount of physician work and similar times, so the pool of potential reference codes was limited. The RUC recommends 35 minutes pre-service evaluation time, 3 minutes pre-service positioning time, 10 minutes pre-service scrub/dress/wait time, 60 minutes intra-service time, and 28 minutes immediate post-service time. This service includes the entire physician work of CPT code 92920 when performed, plus the additional placement of intracoronary stent(s). The RUC noted that the recommendation for this service is slightly lower than that of 92924, as this service involves two minutes less total time.

The specialties noted that the former intra-service time for CPT 92928 was based on the survey 75th percentile intra-service time from the prior survey conducted for the January 2012 meeting, whereas their recommendation based on the 2024 survey for this revised service is based on the survey median intra-service time.

For additional support, the RUC referenced CPT code 33530 *Reoperation, coronary artery bypass procedure or valve procedure, more than 1 month after original operation (List separately in addition to code for primary procedure)* (work RVU= 10.13, 70 minutes intra-service time and 112 minutes total time). **The RUC recommends a work RVU of 10.00 for CPT code 92928.**

92930 ***Percutaneous transcatheter placement of intracoronary stent(s), with coronary angioplasty when performed, single major coronary artery and/or its branch(es); two or more distinct coronary lesions with two or more coronary stents deployed in two or more coronary segments, or a bifurcation lesion requiring angioplasty and/or stenting in both the main artery and the side branch***
The RUC reviewed the survey results from 138 interventional cardiologists and determined that the survey 25th percentile work RVU of 12.00 appropriately accounts for the physician work required to perform this service. The RUC recommends 35 minutes pre-service evaluation time, 3 minutes pre-service positioning time, 10 minutes pre-service scrub/dress/wait time, 75 minutes intra-service time, and 29 minutes immediate post-service time. The specialties noted that CPT code 92930 was created to allow coding for the work involved in placement of intracoronary stent(s) (previously coded as 92928) that exceeds the typical stenting case.

The RUC acknowledged the dearth of potential reference codes that are major surgical procedures with the 000-day global period and involved a similar amount of physician work, so the pool of potential reference codes was severely limited. The RUC compared the surveyed code to key reference codes 93653 *Comprehensive electrophysiologic evaluation with insertion and repositioning of multiple electrode catheters, induction or attempted induction of an arrhythmia with right atrial pacing and recording and catheter ablation of arrhythmogenic focus, including intracardiac electrophysiologic 3-dimensional mapping, right ventricular pacing and recording, left atrial pacing and recording from coronary sinus or left atrium, and His bundle recording, when performed; with treatment of supraventricular tachycardia by ablation of fast or slow atrioventricular pathway, accessory atrioventricular connection, cavo-tricuspid isthmus or other single atrial focus or source of atrial re-entry*

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

(work RVU = 15.00, 120 minutes intra-service time and 199 minutes total time) and 37225 *Revascularization, endovascular, open or percutaneous, femoral, popliteal artery(s), unilateral; with atherectomy, includes angioplasty within the same vessel, when performed* (work RVU = 11.75, 118 minutes intra-service time and 186 minutes total time) and determined that although the surveyed code involves less intra-service time and total time, it is a much more intense service to perform than both of these reference codes. The RUC concurred that the total amount of physician work for the surveyed code is slightly more than the 2nd key reference code, CPT code 37225. The RUC concluded that CPT code 92930 should be valued at the 25th percentile work RVU as supported by the survey. **The RUC recommends a work RVU of 12.00 for CPT code 92930.**

92933 ***Percutaneous transluminal coronary atherectomy, with intracoronary stent, with coronary angioplasty when performed, single major coronary artery and/or its branch(es)***
The RUC reviewed the survey results from 140 interventional cardiologists and determined that the survey 25th percentile work RVU of 11.94 appropriately accounts for the physician work required to perform this service. The RUC recommends 35 minutes pre-service evaluation time, 3 minutes pre-service positioning time, 10 minutes pre-service scrub/dress/wait time, 75 minutes intra-service time, and 30 minutes immediate post-service time. The RUC noted that this service typically involves the same intra-service time as 92930 and a very similar total time, and should be valued similarly,.

The RUC acknowledged the dearth of potential reference codes that are major surgical procedures with the 000-day global period and involved a similar amount of physician work, so the pool of potential reference codes was severely limited. The RUC compared the surveyed code to key reference codes 37225 *Revascularization, endovascular, open or percutaneous, femoral, popliteal artery(s), unilateral; with atherectomy, includes angioplasty within the same vessel, when performed* (work RVU = 11.75, 118 minutes intra-service time and 186 minutes total time) and 93583 *Percutaneous transcatheter septal reduction therapy (eg, alcohol septal ablation) including temporary pacemaker insertion when performed* (work RVU = 13.75, 90 minutes intra-service time and 178 minutes total time) and determined that the surveyed code involves much more intensity than both reference codes. 86 percent of the survey respondents who selected top key reference code 37225 had rated the surveyed code as more intense/complex to perform. 60 percent of the survey respondents that selected second key reference code 93583 had indicated the surveyed code is more intense/complex to perform. The RUC concluded that CPT code 92933 should be valued at the 25th percentile work RVU as supported by the survey. **The RUC recommends a work RVU of 11.94 for CPT code 92933.**

92937 ***Percutaneous transluminal revascularization of or through coronary artery bypass graft (internal mammary, free arterial, venous), any combination of intracoronary stent, atherectomy and angioplasty, including distal protection when performed, single vessel major coronary artery and/its branches***
The RUC reviewed the survey results from 141 interventional cardiologists and determined that the survey 25th percentile work RVU of 11.30 appropriately accounts for the physician work required to perform this service. The RUC recommends 35 minutes pre-service evaluation time, 3 minutes pre-service positioning time, 10 minutes pre-service scrub/dress/wait time, 65 minutes intra-service time, and 30 minutes immediate post-service time. The RUC noted that, relative to the currently assigned CMS from 2012, this recommendation involves 2 minutes less of intra-service time though 17 more minutes of total time. Also, as described in the introductory section, these services are more intense relative to when this service was previously reviewed.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The RUC acknowledged the dearth of potential reference codes that are major surgical procedures with the 000-day global period and involved a similar amount of physician work, so the pool of potential reference codes was severely limited. The RUC compared the surveyed code to key reference codes 37225 *Revascularization, endovascular, open or percutaneous, femoral, popliteal artery(s), unilateral; with atherectomy, includes angioplasty within the same vessel, when performed* (work RVU = 11.75, 118 minutes intra-service time and 186 minutes total time) and 93583 *Percutaneous transcatheter septal reduction therapy (eg, alcohol septal ablation) including temporary pacemaker insertion when performed* (work RVU = 13.75, 90 minutes intra-service time and 178 minutes total time) and determined that the surveyed code involves much more intensity than both reference codes. 84 percent of the survey respondents who selected top key reference code 37225 had rated the surveyed code as more intense/complex to perform. 68 percent of the survey respondents who selected second key reference code 93583 had indicated the surveyed code is more intense/complex to perform. The RUC concluded that CPT code 92937 should be valued at the 25th percentile work RVU as supported by the survey. **The RUC recommends a work RVU of 11.30 for CPT code 92937.**

92941 ***Percutaneous transluminal revascularization of acute total/subtotal occlusion during acute myocardial infarction, any combination of intracoronary stent, atherectomy and angioplasty, including aspiration thrombectomy when performed, single major coronary artery and/or its branches or single bypass graft and/or its subtended branches***
The RUC reviewed the survey results from 139 interventional cardiologists and determined that the survey 25th percentile work RVU of 12.72 appropriately accounts for the work required to perform this service. The RUC recommends 22 minutes pre-service evaluation time, 3 minutes pre-service positioning time, 10 minutes pre-service scrub/dress/wait time, 65 minutes intra-service time, and 30 minutes immediate post-service time. The specialties noted and the RUC concurred that this service is the most intense service to perform in the code family as it is emergent and involves a patient undergoing acute myocardial infarction. Since it is emergent, the pre-service evaluation time is typically shorter than all the planned 000-day global procedures in the code family. Also, this service is the most intense procedure to perform in the code family.

The RUC acknowledged the dearth of potential reference codes that are major surgical procedures with the 000-day global period and involved a similar amount of physician work, so the pool of potential reference codes was severely limited. The RUC compared the surveyed code to key reference codes 93583 *Percutaneous transcatheter septal reduction therapy (eg, alcohol septal ablation) including temporary pacemaker insertion when performed* (work RVU = 13.75, 90 minutes intra-service time and 178 minutes total time) and 37225 *Revascularization, endovascular, open or percutaneous, femoral, popliteal artery(s), unilateral; with atherectomy, includes angioplasty within the same vessel, when performed* (work RVU = 11.75, 118 minutes intra-service time and 186 minutes total time) and determined that the surveyed code involves much more intensity than both reference codes. 83 percent of the survey respondents who selected top key reference code 93583 had rated the surveyed code as more intense/complex to perform. 91 percent of the survey respondents that selected second key reference code 37225 had indicated the surveyed code is more intense/complex to perform. The RUC concluded that CPT code 92941 should be valued at the 25th percentile work RVU as supported by the survey. **The RUC recommends a work RVU of 12.72 for CPT code 92941.**

92943 ***Percutaneous transluminal revascularization of chronic total occlusion, single coronary artery, coronary artery branch, or coronary artery bypass graft, and/or subtended major coronary artery branches of the bypass graft any combination of intracoronary stent, atherectomy and angioplasty; antegrade approach***
The RUC reviewed the survey results from 132 interventional cardiologists and determined that the survey 25th percentile work RVU of 13.69 appropriately accounts for the physician work required to perform this service. The RUC recommends 35 minutes pre-service evaluation time, 3

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

minutes pre-service positioning time, 10 minutes pre-service scrub/dress/wait time, 120 minutes intra-service time, and 30 minutes immediate post-service time. The specialty noted that this is one of the longest services to perform in the code family, as it involves multiple catheter changes and multiple techniques being attempted.

The RUC compared the surveyed code to key reference codes 93653 *Comprehensive electrophysiologic evaluation with insertion and repositioning of multiple electrode catheters, induction or attempted induction of an arrhythmia with right atrial pacing and recording and catheter ablation of arrhythmogenic focus, including intracardiac electrophysiologic 3-dimensional mapping, right ventricular pacing and recording, left atrial pacing and recording from coronary sinus or left atrium, and His bundle recording, when performed; with treatment of supraventricular tachycardia by ablation of fast or slow atrioventricular pathway, accessory atrioventricular connection, cavo-tricuspid isthmus or other single atrial focus or source of atrial re-entry* (work RVU = 15.00, 120 minutes intra-service time and 199 minutes total time) and 93591 *Percutaneous transcatheter closure of paravalvular leak; initial occlusion device, aortic valve* (work RVU = 17.97, 120 minutes intra-service time and 208 minutes total time) and determined that the surveyed code typically involves an identical amount of intra-service time as these two reference codes, though somewhat less total time. The RUC concurred that the recommended times and values fit appropriately with both reference services, as the surveyed code involves less total work. The RUC concluded that CPT code 92943 should be valued at the 25th percentile work RVU as supported by the survey. **The RUC recommends a work RVU of 13.69 for CPT code 92943.**

92945 *Percutaneous transluminal revascularization of chronic total occlusion, single coronary artery, coronary artery branch, or coronary artery bypass graft, and/or subtended major coronary artery branches of the bypass graft any combination of intracoronary stent, atherectomy and angioplasty; combined antegrade and retrograde approaches*

The RUC reviewed the survey results from 118 interventional cardiologists and determined that the survey 25th percentile work RVU of 15.00 appropriately accounts for the physician work required to perform this service. The RUC recommends 35 minutes pre-service evaluation time, 3 minutes pre-service positioning time, 10 minutes pre-service scrub/dress/wait time, 130 minutes intra-service time, and 30 minutes immediate post-service time. The specialties noted that CPT code 92945 was created to allow coding for revascularization of a chronic total occlusion when both antegrade and retrograde approaches are employed. The specialty noted that this is one of the longest services to perform in the code family, as it involves multiple catheter changes and multiple techniques being attempted.

The RUC compared the surveyed code to key reference codes 93591 *Percutaneous transcatheter closure of paravalvular leak; initial occlusion device, aortic valve* (work RVU = 17.97, 120 minutes intra-service time and 208 minutes total time) and 93653 *Comprehensive electrophysiologic evaluation with insertion and repositioning of multiple electrode catheters, induction or attempted induction of an arrhythmia with right atrial pacing and recording and catheter ablation of arrhythmogenic focus, including intracardiac electrophysiologic 3-dimensional mapping, right ventricular pacing and recording, left atrial pacing and recording from coronary sinus or left atrium, and His bundle recording, when performed; with treatment of supraventricular tachycardia by ablation of fast or slow atrioventricular pathway, accessory atrioventricular connection, cavo-tricuspid isthmus or other single atrial focus or source of atrial re-entry* (work RVU = 15.00, 120 minutes intra-service time and 199 minutes total time). The RUC noted that the surveyed code involves 10 minutes more of total time and either identical or similar total time to both reference codes. The RUC concluded that CPT code 92945 should be valued at the 25th percentile work RVU as supported by the survey. **The RUC recommends a work RVU of 15.00 for CPT code 92945.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

92972 ***Percutaneous transluminal coronary lithotripsy (List separately in addition to code for primary procedure)***
The RUC concurred with the societies that this add-on service should be affirmed, as it was most recently surveyed in January 2023 and the current time and value remain appropriate. The RUC affirms 30 minutes of intra-service and total time. **The RUC recommends affirming a work RVU of 2.97 for CPT code 92972.**

92973 ***Percutaneous transluminal coronary thrombectomy aspiration mechanical (List separately in addition to code for primary procedure)***
The RUC reviewed the survey results from 140 interventional cardiologists and determined that a direct work RVU crosswalk to CPT code 36483 *Endovenous ablation therapy of incompetent vein, extremity, by transcatheter delivery of a chemical adhesive (eg, cyanoacrylate) remote from the access site, inclusive of all imaging guidance and monitoring, percutaneous; subsequent vein(s) treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)* (work RVU= 1.75 and 20 minutes of intra-service time) appropriately accounts for the work required to perform this service. The RUC noted that both add-on services typically involve the same amount of time to perform and the same average physician work intensity. The RUC recommends 20 minutes of intra-service time and total time.

The RUC compared the surveyed code to key reference codes 37186 *Secondary percutaneous transluminal thrombectomy (eg, nonprimary mechanical, snare basket, suction technique), noncoronary, non-intracranial, arterial or arterial bypass graft, including fluoroscopic guidance and intraprocedural pharmacological thrombolytic injections, provided in conjunction with another percutaneous intervention other than primary mechanical thrombectomy (List separately in addition to code for primary procedure)* (work RVU = 4.92, 60 minutes intra-service time and total time) and 92974 *Transcatheter placement of radiation delivery device for subsequent coronary intravascular brachytherapy (List separately in addition to code for primary procedure)* (work RVU = 3.00, 42.5 minutes intra-service time and total time) and noted that both key reference codes involve more than twice as much time to perform as this add-on survey code, though the surveyed code typically involves more work intensity. **The RUC recommends a work RVU of 1.75 for CPT code 92973.**

93571 ***Intravascular Doppler velocity and/or pressure derived coronary flow reserve measurement (coronary vessel or graft) during coronary angiography including pharmacologically induced stress, when performed; initial vessel (List separately in addition to code for primary procedure)***
The RUC reviewed the survey results from 138 interventional cardiologists and determined that a direct work RVU crosswalk to CPT code 37252 *Intravascular ultrasound (non-coronary vessel) during diagnostic evaluation and/or therapeutic intervention; initial vessel (List separately in addition to code for primary procedure)* (work RVU= 1.80, 20 minutes intra-service time and 22 minutes total time) appropriately accounts for the work required to perform this service. The RUC noted that both services typically involve an identical intra-service time, similar total time, and the same amount of physician work. The RUC recommends 20 minutes of intra-service time and total time.

The RUC compared the surveyed code to key reference code 92974 *Transcatheter placement of radiation delivery device for subsequent coronary intravascular brachytherapy (List separately in addition to code for primary procedure)* (work RVU = 3.00, 42.5 minutes intra-service and total time) and noted that although the surveyed code involves roughly half as much time, the surveyed code is more intense to perform. The RUC concurred that this justifies a work value that is 60 percent of the value of the reference code. **The RUC recommends a work RVU of 1.80 for CPT code 93571.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

93572 ***Intravascular Doppler velocity and/or pressure derived coronary flow reserve measurement (coronary vessel or graft) during coronary angiography including pharmacologically induced stress, when performed; each additional vessel (List separately in addition to code for primary procedure)***
The RUC reviewed the survey results from 138 interventional cardiologists and determined that a direct work RVU crosswalk to CPT code 37253 *Intravascular ultrasound (noncoronary vessel) during diagnostic evaluation and/or therapeutic intervention, including radiological supervision and interpretation; each additional noncoronary vessel (List separately in addition to code for primary procedure)* (work RVU= 1.44, 20 minutes intra-service time and 21 minutes total time) appropriately accounts for the work required to perform this service. Although the reference code involves more time, the surveyed code is a more intense service to perform. The RUC concurred that both services are comparable in terms of the total amount of physician work typically required ot perform each service. The RUC recommends 16 minutes of intra-service time and total time. The RUC noted that this is an increase of 5 minutes relative to the currently assigned CMS Time, a 45 percent increase.

To support the recommended work RVU, the RUC compared the surveyed code to key reference code 37252 *Intravascular ultrasound (noncoronary vessel) during diagnostic evaluation and/or therapeutic intervention, including radiological supervision and interpretation; initial noncoronary vessel (List separately in addition to code for primary procedure)* (work RVU = 1.80, 20 minutes intra-service and 22 minutes total time) and determined that it is appropriate to assign the surveyed code a lower work value than this key reference code. **The RUC recommends a work RVU of 1.44 for CPT code 93572.**

Practice Expense
The RUC recommends no direct practice expense inputs for the PCI code family as they are facility-only services.

RUC Flag
The RUC recommends that CPT code 92924 should be flagged as **Do Not Use to Validate for Physician Work**. The direct work RVU crosswalk for this survey code was a different global period, ZZZ.

New Technology/New Services List
CPT code 92972 will be placed on the New Technology/New Services list and be re-reviewed by the RUC in three years to ensure correct valuation, patient population, and utilization assumptions.

Work Neutrality
The RUC's recommendation for these codes will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Surgery
Cardiovascular System
Arteries and Veins
Transcatheter Procedures

Codes for catheter placement and the radiologic supervision and interpretation should also be reported, in addition to the code(s) for the therapeutic aspect of the procedure.

Mechanical Thrombectomy

Code(s) for catheter placement(s)…

Codes 37184-37188 specifically…

Intraprocedural injection(s) of a thrombolytic…

For coronary mechanical aspiration thrombectomy, use 92973.

For intracranial arterial mechanical thrombectomy, use 61645.

Transcatheter Thrombolytic Infusion

Codes 37211 or 37212 are used to report…

Endovascular Revascularization (Open or Percutaneous, Transcatheter)

Codes 37220-37235 are to be used…

These lower extremity endovascular…

…

✚*37235* *with transluminal stent placement(s) and atherectomy, includes angioplasty within the same vessel, when performed (List separately in addition to code for primary procedure)*

(Use 37235 in conjunction with 37231)

Codes 37246, 37247, 37248, 37249 describe open or percutaneous transluminal balloon angioplasty (eg, conventional, low profile, cutting, drug-coated balloon). Codes 37246, 37247 describe transluminal balloon angioplasty in an artery excluding the central nervous system (61630, 61635), coronary (92920-~~9294~~92945, *0913T*), pulmonary (92997, 92998), and lower extremities for occlusive disease (37220-37235). Codes

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

37248 and 37249 describe transluminal balloon angioplasty in a vein excluding the dialysis circuit (36902, 36905, 36907) when approached through the ipsilateral dialysis access. Transluminal balloon angioplasty is inherent to stenting in the extracranial carotid and innominate arteries (37215, 37216, 37217, 37218), peripheral arteries (37220-37237), and in peripheral veins (37238, 37239) and, therefore, is not separately reportable. Multiple angioplasties performed in a single vessel, including treatment of separate and distinct lesions within a single vessel, are reported with a single code. If a lesion extends across the margins of one vessel into another, but can be treated with a single therapy, the intervention should be reported only once. When additional, separate, and distinct ipsilateral or contralateral vessels are treated in the same session, 37247 and/or 37249 may be reported as appropriate.

Non-selective and/or selective catheterization ...

#37248 Transluminal balloon angioplasty (except dialysis circuit), open or percutaneous, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty within the same vein; initial vein

#✚37249 each additional vein (List separately in addition to code for primary procedure)

(Use 37249 in conjunction with 37248)

(Do not report 37248, 37249 in conjunction with 36836, 36837)

(Do not report 37248, 37249 in conjunction with 37238, 37239 when performed in the same vein during the same operative session)

(Do not report 37248, 37249 in conjunction with 0505T, within the femoral-popliteal segment)

(Do not report 37248, 37249 in conjunction with 0620T within the tibial-peroneal segment)

(For transluminal balloon angioplasty in aorta/visceral artery[ies] in conjunction with fenestrated endovascular repair, see 34841, 34842, 34843, 34844, 34845, 34846, 34847, 34848)

(For transluminal balloon angioplasty in iliac, femoral, popliteal, or tibial/peroneal artery[ies] for occlusive disease, see 37220-37235)

(For transluminal balloon angioplasty in a dialysis circuit performed through the circuit, see 36902, 36903, 36904, 36905, 36906, 36907, 36908)

(For transluminal balloon angioplasty in an intracranial artery, see 61630, 61635)

(For transluminal balloon angioplasty in a coronary artery, see 92920-~~92944~~ 92945)

(For transluminal balloon angioplasty in a pulmonary artery, see 92997, 92998)

Codes 37236-37239 are used to report endovascular revascularization for vessels other than lower extremity artery(ies) for occlusive disease (ie, 37221, 37223, 37226, 37227, 37230, 37231, 37234, 37235), cervical carotid (ie, 37215, 37216), intracranial (ie, 61635), intracoronary (ie, 92920, 92924, 92928,~~92929,~~ 92933, ~~92934,~~92937, ~~92938,~~92941, 92943, ~~92944~~, 92930, 92945), innominate and/or intrathoracic carotid artery through an antegrade approach (37218), extracranial vertebral (ie, 0075T, 0076T) performed percutaneously and/or through an open surgical

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

exposure, open retrograde intrathoracic common carotid or innominate (37217), or dialysis circuit when performed through the dialysis circuit (36903, 36905, 36908).

…

Intravascular stents, both covered and uncovered, are a class of devices that may be used as part of an embolization procedure.

37236 *Transcatheter placement of an intravascular stent(s) (except lower extremity artery(s) for occlusive disease, cervical carotid, extracranial vertebral or intrathoracic carotid, intracranial, or coronary), open or percutaneous, including radiological supervision and interpretation and including all angioplasty within the same vessel, when performed; initial artery*

✚*37237* *each additional artery (List separately in addition to code for primary procedure)*

(Use 37237 in conjunction with 37236)

(Do not report 37236, 37237 in conjunction with 36836, 36837)

(Do not report 37236, 37237 in conjunction with 34841- 34848 for bare metal or covered stents placed into the visceral branches within the endoprosthesis target zone)

(For stent placement~~([s])~~ in iliac, femoral, popliteal, or tibial/peroneal artery~~([s])~~ for occlusive disease, see 37221, 37223, 37226, 37227, 37230, 37231, 37234, 37235)

(For transcatheter placement of intravascular cervical carotid artery stent~~([s])~~ see 37215, 37216)

(For transcatheter placement of intracranial stent~~([s])~~, use 61635)

(For transcatheter placement of intracoronary stent~~([s])~~, see 92928, ~~92929~~92933, ~~92934,~~ 92937, ~~92938,~~ 92941, 92943, ~~92944~~ 92930, 92945)

(For stenting of visceral arteries in conjunction with fenestrated endovascular repair, see 34841-34848)

(For open or percutaneous antegrade transcatheter placement of intrathoracic carotid/innominate artery stent(s), use 37218)

(For open or percutaneous transcatheter placement of extracranial vertebral artery stent~~([s])~~, see Category III codes 0075T, 0076T)

(For open retrograde transcatheter placement of intrathoracic common carotid/innominate artery stent~~([s])~~, use 37217)

(For placement of a stent at the arterial anastomosis of a dialysis circuit with or without transluminal mechanical thrombectomy and/or infusion for thrombolysis, see 36903, 36906)

Medicine
Cardiovascular
Therapeutic Services and Procedures
Coronary Therapeutic Services and Procedures

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Codes 92920-~~92944~~ 92945 describe percutaneous revascularization services performed for occlusive disease of the coronary vessels (major coronary arteries, coronary artery branches, or coronary artery bypass grafts). These percutaneous coronary intervention (PCI) codes are built on progressive hierarchies with more intensive services inclusive of lesser intensive services. These PCI codes all include the work of accessing and selectively catheterizing the vessel, traversing the lesion, radiological supervision and interpretation directly related to the intervention(s) performed, closure of the arteriotomy when performed through the access sheath, and imaging performed to document completion of the intervention in addition to the intervention(s) performed. These codes include angioplasty (eg, conventional balloons, cutting balloons, wired balloons, cryoplasty balloons), atherectomy (eg, directional atherectomy, rotational atherectomy, orbital atherectomy, laser atherectomy), and stenting (eg, balloon expandable stents, self-expanding stents, bare metal stents, drug eluting stents, covered stents). Each code in this family includes balloon angioplasty, when performed. Diagnostic coronary angiography may be reported separately under specific circumstances as outlined below. Percutaneous transluminal coronary lithotripsy may be reported using 92972 in conjunction with 92920, 92924, 92928, 92933, 92937, 92941, 92943, 92975, 92930, 92945, as appropriate.

Diagnostic coronary angiography codes (93454-93461) and injection procedure codes (93563-93564) should not be used with percutaneous coronary revascularization services (92920-~~92944~~ 92945) to report:

1. *Contrast injections, angiography, roadmapping, and/or fluoroscopic guidance for the coronary intervention,*
2. *Vessel measurement for the coronary intervention,* ***or***
3. Post-coronary angioplasty/stent/atherectomy angiography, as this work is captured in the percutaneous coronary revascularization services codes (92920-~~92944~~ 92945).

Diagnostic angiography performed at the time of a coronary interventional procedure may be separately reportable if:

1. *No prior catheter-based coronary angiography study is available, and a full diagnostic study is performed, and a decision to intervene is based on the diagnostic angiography, or*
2. *A prior study is available, but as documented in the medical record:*
    1. *The patient's condition with respect to the clinical indication has changed since the prior study, or*
    2. The~~re is~~ prior study provides inadequate visualization of the anatomy and/or pathology, **or**
    3. *There is a clinical change during the procedure that requires new evaluation outside the target area of intervention.*

Diagnostic coronary angiography performed at a separate session from an interventional procedure is separately reportable.

Coronary Lesion: For the purposes of reporting, a single distinct coronary lesion starts at the proximal end of the target lesion and ends at the distal end of the target lesion. A single distinct coronary lesion may involve multiple coronary segments and may extend from a major coronary artery into one of its branches or from a bypass graft into the subtended vessel. For the purposes of reporting, two distinct coronary lesions within one major coronary artery are considered present when the first lesion is geographically separated from the second lesion. For example, a diffuse single coronary lesion extending from the mid to distal right coronary artery (RCA) treated with two stents constitutes a single distinct

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

coronary lesion. A coronary lesion in the proximal RCA treated with a single stent and a separate coronary lesion in the distal RCA treated with two stents would be considered two distinct coronary lesions for the purposes of reporting.

Major coronary arteries: The major coronary arteries are the left main, left anterior descending, left circumflex, right, and ramus intermedius arteries. ~~All PCI procedures performed in all segments (proximal, mid, distal) of a single major coronary artery through the native coronary circulation are reported with one code.~~ When one segment of a major coronary artery is treated through the native circulation and treatment of another segment of the same artery requires access through a coronary artery bypass graft, the intervention through the bypass graft is reported separately.

Coronary artery branches: Up to two coronary artery branches of the left anterior descending (diagonals), left circumflex (marginals), and right (posterior descending, posterolaterals) coronary arteries are recognized. The left main and ramus intermedius coronary arteries do not have recognized branches for reporting purposes. ~~All PCI(s) performed in any segment (proximal, mid, distal) of a coronary artery branch is reported with one code. PCI is reported for up to two branches of a major coronary artery. Additional PCI in a third branch of the same major coronary artery is not separately reportable.~~

Coronary Segments: Coronary segments are recognized portions of each major coronary artery and its branches. For the purpose of coding, coronary segments are defined using the established paradigm used in the National Cardiovascular Data Registry (NCDR) CathPCI database.

Coronary artery bypass grafts: Each coronary artery bypass graft represents a coronary major artery ~~vessel~~. A sequential or branching bypass graft (eg, Y graft) with more than one distal anastomosis represents only one graft. ~~A branching bypass graft (eg, Y graft)represents a coronary vessel for the main graft, and each branch off the main graft constitutes an additional coronary vessel~~. PCI performed on a major coronary artery~~ies~~ or major coronary artery branch~~es~~ by access through a bypass graft is reported using the bypass graft PCI codes. B~~All b~~ypass graft PCI codes include the use of coronary artery embolic protection devices when performed.

Only one base code from ~~this~~ the PCI family may be reported for revascularization of a major ~~coronary~~ artery and its ~~recognized~~ branches. Only one ~~base~~ code should be reported for revascularization of a coronary artery bypass graft, its subtended coronary artery, and ~~recognized~~ branches of the subtended coronary artery. If one segment of a major coronary artery and its ~~recognized~~ branches is treated through the native circulation, and treatment of another segment of the same vessel requires access through a coronary artery bypass graft, an additional base code ~~is~~ may be reported to describe the intervention performed through the bypass graft. The PCI base codes are 92920, 92924, 92928, 92933, 92937, 92941, 92943, 92930, and 92945. T~~he PCI base code that includes the most intensive service provided for the target vessel should be reported. The hierarchy of these services is built on an intensity of service ranked from highest to lowest as 92943 = 92941 = 92933 > 92924 > 92937 = 92928 > 92920.~~

~~PCI performed during the same session in additional recognized branches of the target vessel should be reported using the applicable add-on code(s). The add-on codes are 92921, 92925, 92928, 92934, 92938, and 92944 and follow the same principle in regard to reporting the most intensive service provided. The intensity of service is ranked from highest to lowest as 92944 = 92938 > 92934 > 92925 > 92929 > 92921.~~

PCI performed during the same session in additional major coronary artery(ies) or in/through an additional coronary artery bypass graft(s) ~~should~~ may be reported using the applicable major coronary artery base code(s). ~~additional base code(s). PCI performed during the same session in additional coronary artery branches should be reported using the applicable additional add-on code(s).~~

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

If a single lesion extends from one target vessel (major coronary artery, coronary artery bypass graft, or coronary artery branch) into another target vessel, but can be revascularized with a single intervention bridging the two vessels, this PCI should be reported with a single code despite treating more than one vessel. For example, if a left main coronary lesion extends into the proximal left circumflex coronary artery and a single stent is placed to treat the entire lesion, this PCI should be reported as a single vessel stent (92928). ~~In this example, a code for additional vessel treatment (92929) would not be additionally reported.~~

When bifurcation lesions are treated with at least one stent, 92930 is reported.~~, PCI is reported for both vessels treated.~~ For example, when both branches of a bifurcation lesion involving the left anterior descending artery and the first diagonal artery are treated and at least one stent is used, report 92930.~~is treated by stenting both vessels, 92928 and 92929 are both reported.~~

Code 92941 is intended for situations where PCI for acute MI, usually ST-elevation MI, is done emergently. ~~Target vessel~~ PCI ~~for~~ of the culprit major coronary artery lesion(s) causing an acute MI ~~myocardial infarction~~ includes ~~is inclusive of all~~ balloon angioplasty, atherectomy, stenting, non-mechanical manual aspiration thrombectomy, distal protection, and intracoronary rheolytic agent administration when performed. Mechanical aspiration coronary thrombectomy (92973) ~~is~~ may be reported separately.

PCI for a non-emergent acute coronary syndrome (eg, late-presenting, or non-ST-elevation MI without ongoing chest pain) should not be reported with 92941.

PCI of chronic total occlusions is reported using 99243, 92945. Chronic total occlusion of a coronary vessel is present when there is no antegrade flow through the true lumen, accompanied by suggestive angiographic and clinical criteria (eg, antegrade "bridging" collaterals present, calcification at the occlusion site, no current presentation with ST elevation or Q wave acute myocardial infarction attributable to the occluded target lesion). Current clinical presentation with ST elevation or Q wave acute myocardial infarction attributable to the occluded target lesion, subtotal occlusion, ~~and~~ or occlusion with dye staining at the site consistent with fresh thrombus are not considered chronic total occlusion. Some chronic total occlusions may be treated with antegrade advancement of a wire through the occluding calcified plaque or around this plaque in the subintimal space (92943). Some chronic total occlusion lesions must be traversed in a combined antegrade retrograde fashion (92945). In such cases, in addition to the antegrade approach, a wire is advanced via a non-occluded coronary artery and through collateral vessels to cross the occlusion in a retrograde fashion from its distal cap.

Codes 92973 (percutaneous transluminal coronary thrombectomy, mechanical aspiration), 92974 (coronary brachytherapy), 92978 and 92979 (intravascular ultrasound/optical coherence tomography), 93571 and 93572 (intravascular Doppler velocity and/or pressure [~~fractional flow~~ reserve measurement ~~{FFR} or coronary flow reserve {CFR}~~]), and 92972 (percutaneous transluminal coronary lithotripsy), are add-on codes for reporting procedures performed in addition to coronary and bypass graft diagnostic and PCI procedures ~~interventional services, unless included in the base code~~. Non-mechanical, manual aspiration thrombectomy is not reported with 92973, and is included in the PCI code for acute myocardial infarction (92941), when performed. For non-mechanical, manual aspiration thrombectomy performed during PCI for indications other than acute myocardial infarction, use 93799.

For purposes of reporting stent placement, there are two codes for stent PCI. Code 92928 is reported when one lesion is treated with one or more stents in a major coronary artery, whether the lesion is confined to one segment or extends across multiple coronary segments. When two or more separate coronary lesions are treated with two or more stents in two or more coronary segments in a major coronary artery and/or its branch(es), use 92930. Example #1: placement of stents to treat a single lesion that overlaps the mid and distal right coronary artery segments

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

may be reported with 92928. Example #2: Treatment of two separate lesions by placement of stents in the 1st diagonal artery and the distal LAD may be reported with 92930. *(To report transcatheter placement of radiation delivery device for coronary intravascular brachytherapy, use 92974)* *(For intravascular radioelement application, see 77770, 77771, 77772)* *(For nonsurgical septal reduction therapy [eg, alcohol ablation], use 93799)*

#✚*92978* *Endoluminal imaging of coronary vessel or graft using intravascular ultrasound (IVUS) or optical coherence tomography (OCT) during diagnostic evaluation and/or therapeutic intervention including imaging supervision, interpretation and report; initial vessel (List separately in addition to code for primary procedure)*

(Report 92978 once per session)

(Use 92978 in conjunction with ~~92975~~, 92920, 92924, 92928, 92933, 92937, 92941, 92943, 93454-93461, 93563, 93564, 92930, 92945)

(Do not report 92978 in conjunction with 0913T, 0914T for intervention in the same major coronary artery or in the same bypass graft or its subtended branches)

#✚*92979* *each additional vessel (List separately in addition to code for primary procedure)*

(Report 92979 once per additional vessel)

(Use 92979 in conjunction with 92978)

(Intravascular ultrasound and optical coherence tomography services include all transducer manipulations and repositioning within the specific vessel being examined, both before and after therapeutic intervention [eg, stent placement])

Cardiac Catheterization

Cardiac catheterization is a diagnostic medical procedure which includes introduction, positioning and repositioning, when necessary, of catheter(s), within the vascular system, recording of intracardiac and/or intravascular pressure(s), and final evaluation and report of procedure. There are two code families for cardiac catheterization: one for congenital heart disease and one for all other conditions. For cardiac catheterization for congenital heart defects (93593, 93594, 93595, 93596, 93597, 93598), see the ***Medicine/Cardiovascular/Cardiac Catheterization for Congenital Heart Defects*** *subsection. The following guidelines apply to cardiac catheterization performed for indications other than the evaluation of congenital heart defects.*

Adjunctive hemodynamic assessments: when cardiac catheterization is combined with pharmacologic agent administration with the specific purpose of repeating hemodynamic measurements to evaluate hemodynamic response, use 93463 in conjunction with 93451-93453 and 93456-93461, 93593, 93594, 93595, 93596, 93597. Do not report 93463 for intracoronary administration of pharmacologic agents during percutaneous coronary interventional procedures, during intracoronary assessment of coronary pressure, flow or resistance, or during intracoronary imaging procedures. Do not report 93463 in conjunction with 92920-~~9294~~92945 ~~92975, 92977~~.

When cardiac catheterization is combined with exercise (eg, walking or arm or leg ergometry protocol) with the specific purpose of repeating hemodynamic measurements to evaluate hemodynamic response, report 93464 in conjunction with 93451-93453, 93456-93461, 93593, 93594, 93595, 93596, 93597.

Contrast injection to image the access site(s) for the specific purpose of placing a closure device is inherent to the catheterization procedure and not separately reportable. Closure device placement at the vascular access site is inherent to the catheterization procedure and not separately reportable.

…

✚*93463*		*Pharmacologic agent administration (eg, inhaled nitric oxide, intravenous infusion of nitroprusside, dobutamine, milrinone, or other agent) including assessing hemodynamic measurements before, during, after and repeat pharmacologic agent administration, when performed (List separately in addition to code for primary procedure)* *(Use 93463 in conjunction with 33477, 93451-93453, 93456-93461, 93580, 93581, 93582, 93593, 93594, 93595, 93596, 93597)* *(Report 93463 only once per catheterization procedure)* (Do not report 93463 for pharmacologic agent administration in conjunction with coronary interventional procedure 92920-~~9294~~92945 ~~92975, 92977~~)		

...

▲✚93571	D12	Intravascular Doppler velocity and/or pressure derived coronary flow reserve measurement (coronary vessel or graft) during coronary angiography including pharmacologically induced stress, when performed; initial vessel (List separately in addition to code for primary procedure) (Use 93571 in conjunction with 92920, 92924, 92928, 92933, 92937, 92941, 92943, ~~92975,~~ 93454-93461, 93563, 93564, 93593, 93594, 93595, 93596, 93597, 92930, 92945, 0913T) (Do not report 93571 in conjunction with 0523T)	ZZZ	1.80

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:92920 Tracking Number D1 Original Specialty Recommended RVU: **9.00**
Presented Recommended RVU: **9.00**
Global Period: 000 Current Work RVU: **9.85** RUC Recommended RVU: **8.35**

CPT Descriptor: Percutaneous transluminal coronary angioplasty, single major coronary artery and/or its branch(es)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 68-year-old female presents with unstable angina. Coronary arteriography demonstrates diffusely diseased coronary arteries with 90% lesions in both the mid and distal parts of a tortuous left anterior descending artery. The vessel diameter is smaller than the smallest available stent. Percutaneous coronary intervention is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 88%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 98% , In the ASC 2%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 65% , Overnight stay-less than 24 hours 33% , Overnight stay-more than 24 hours 2%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 100%

Description of Pre-Service Work: The patient's history, records, laboratory, and diagnostic tests are reviewed. A physical examination is conducted. Appropriate communication is conducted with the patient and the patient's family as well as with other medical professionals as needed(i.e., the “Heart Team approach”). The procedure is reviewed with the patient. The risks and benefits of the procedure are presented, as well as the alternatives. Informed consent is obtained. Hair is removed from the potential access sites. Necessary equipment, instruments, and supplies for the procedure are confirmed to be available and operational. Instruments and supplies for the procedure are pulled. The patient is transported to the procedure suite, positioned on the procedural table, and attached to cardiac electrodes and an oxygen saturation monitor. A sterile table is prepared. The potential access sites are scrubbed in sterile fashion. A sterile drape is placed over the patient. The patient's information is loaded in the hemodynamic monitoring equipment to retain the data from the upcoming study.

Description of Intra-Service Work: Percutaneous arterial access is obtained, typically through the femoral artery or radial artery. Angiography of the access site is performed as needed to assess anatomy of the access vessel and appropriate location of the access site. A sheath is placed and flushed. Intraarterial vasodilators are administered. An appropriate guiding catheter is passed under fluoroscopic guidance to the ascending aorta, engaged into the coronary ostium, and re-positioned as needed to prevent pressure damping. Appropriate antiplatelet therapy treatment is confirmed and anticoagulation administered. Therapeutic anticoagulation is confirmed by testing an activated clotting time (ACT). Additional anticoagulation is administered as needed. Multiple coronary injections are performed in different views to assess the target lesion(s). A coronary guidewire is used to cross the target lesion(s) and its position distally in the artery is confirmed. A coronary dilation balloon is advanced over the guidewire to the lesion and dilation performed until adequate, then it is pulled back into the guide. Angiography is performed in multiple views. If the lesion is not fully expanded, the angioplasty procedure is repeated, using different larger or less compliant balloons as needed, and repeat angiography is performed. The entire process of coronary artery imaging, guidewire placement, and balloon inflation may be repeated at multiple stenotic sites in separate locations in the coronary artery or its branches. At the end of the procedure the guide catheter is disengaged and removed. The sheath is removed, and hemostasis is achieved by an appropriate technique. If a vascular closure device cannot be used with femoral access, the sheath is sutured in place for subsequent removal once the ACT level falls to a safe level for manual compression.

Description of Post-Service Work: Films and hemodynamics are reviewed and a formal report is generated. The patient, the patient's family, and the referring physician are notified of the results. A plan of management is developed and discussed with the patient and the patient's family. Additional antiplatelet and antithrombin therapy is administered as necessary. The patient is admitted to ensure no bleeding, to monitor for abrupt vessel closure, and for continued therapy of ischemic heart disease.

SURVEY DATA

RUC Meeting Date (mm/yyyy)	04/2024

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	9%	41%	41%	9%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	3%	59%	38%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	9%	55%	36%
Physical effort required	15%	70%	15%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	9%	41%	40%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	22%	50%	28%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	25%	75%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	38%	62%
Physical effort required	6%	55%	39%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	9%	91%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

CPT Changes

The full family of percutaneous coronary intervention (PCI) codes was last reviewed by the RUC at the January 2012 meeting, when the code family was updated to reflect bundling after CMS identified MPC codes not reviewed in the prior 5 years as potentially misvalued. The codes were surveyed for the January 2023 RUC

meeting after the CPT Editorial Panel approved creation of a single add-on code that describes the work of coronary intravascular lithotripsy (IVL), a technology to modify lesions that did not exist at the time of the prior review. That code change application was submitted by a device manufacturer. The societies had planned to make other revisions to the code family at the following CPT cycle. At the January 2023 RUC meeting the societies proposed that only the new IVL code be valued, and the remainder of the code set be sent to CPT for revision before review. The RUC approved this proposal and, after several code change applications, the revised family was approved at the February 2024 CPT Panel meeting.

The CPT updates included code deletions, revisions, and additions.

- The original code set included additional branch add-on codes for several of the procedures. CMS assigned the branch codes a value of 0 RVUs, rolling a prorated portion of their value into their base codes (more on this later). Due to this lack of RVUs neither CMS nor commercial payers reimbursed these codes from 2013 to present and they were deleted by CPT in February 2024. The deleted codes included 92921, 92925, 92929, 92934, 92938, and 92944.
- CPT amended the base codes to each of these deleted add-on codes (92920, 92924, 92928, 92933, 92937, 92941, and 92943) to include the work, when performed, of potential branch vessels which was not included in the original code definitions and descriptions of work. This essentially matches the code descriptors to CMS's approach to not pay separately for additional branch work.
- Also, in February 2024 CPT created two new codes within the family. First, 92930, was created to allow coding for the work involved in placement of intracoronary stent(s) (currently coded as 92928) that exceeds the typical stenting case. The second new code, 92945, was created to allow coding for revascularization of a chronic total occlusion when both antegrade and retrograde approaches are employed.
- Finally, CPT revised codes 93571 and 93572 to make a correction to the fractional flow reserve (FFR) codes to correct a coding issue relating to instant flow reserve (iFR).

92972 Intravascular Lithotripsy (IVL)

As noted above, the IVL code was surveyed, reviewed by the RUC and issued a value at the January 2023 RUC meeting. The IVL code survey was robust, with 139 respondents. There have been no significant technological or other changes to the IVL procedure since its initial valuation. With the recent survey of this code and in an effort to maximize survey response by keeping it a bit shorter, we did not include the code in this survey and recommend affirmation of current value and time.

Current RVUs and Times

As referenced above, CMS does not recognize the add-on branch codes as separately payable. However, the agency did bundle them into the underlying PCI codes. In doing so, it also added small amounts of work and time, proportionate to predicted utilization. Also, since the last time these codes were valued, moderate sedation was unbundled, removing commensurate work and time. The summary spreadsheet shows the original RUC recommended value, the CMS adjustments for branch code bundling, the adjustments for unbundling of moderate sedation, and finally the current values.

Background: PCI Evolution & Compelling Evidence

Change in Technique

The recommendations for this tab produce an increase in RVUs of less than one half of a percent aggregated across the family of codes. Accordingly, we submit that these services have undergone changes in technique and patient population that substantiate compelling evidence to allow an increase in the aggregate value of the code family. At the time of the 2012 survey, PCI was typically performed via the femoral artery, with a very small minority of cases performed through the radial artery. PCI is now typically performed through the radial artery, reflecting best practice recommendations from the field. https://onlinelibrary.wiley.com/doi/10.1002/ccd.28672

Radial access is safer for patients despite being technically more challenging for the operator. The main advantage is a significant reduction in bleeding risk as well as decreased mortality for some patient subsets. https://pubmed.ncbi.nlm.nih.gov/33507598/.

Radial access requires additional preservice time that is discussed further below. This approach also requires different skills and techniques that are more difficult to perform than access through the femoral artery. While safer for the patient, the service is more technically challenging for the operator in several respects.

(1) The average radial artery is about 2 mm compared to femoral arteries that average about 9 mm, so entering the artery with a needle is more difficult.
(2) The radial and brachial arteries are smaller and more prone to spasm making catheter advancement or torquing difficult or impossible; many operators give an anti-vasospastic cocktail routinely which takes additional time.
(3) Whereas femoral access requires catheters to traverse one 180-degree bend to reach the heart, radial access requires the catheter to make one-180 degree bend and usually two more 90-degree bends to reach the heart, which makes catheter advancement and torquing more difficult.
(4) Radial access provides more frequent challenging anatomic variants such as radial loop, accessory radial arteries, early take-off radial arteries, and aberrant innominate arteries (arteria lusoria); in contrast anatomy from the femoral artery to the heart has few variants. These problems lead to conversion from radial to femoral access in about 10% of cases, while conversion from femoral to radial is almost non-existent.

Positioning for radial increases the risk of radiation and precautions. More time is spent closer to the image intensifier at different angles as opposed to standing farther back when patient is in the femoral area. Now we are closer to the heart and reaching across the patient's chest.

Change in Patient Population

We also see patients undergoing PCI who generally have more comorbidities than a decade ago. Attention to stricter adherence on statins and other medicines in revascularization and chest pain guidelines has eliminated many patients who otherwise may have been treated with lower acuity PCI, something we see in the declining utilization of these services. Remaining patients are more complex than they were a dozen years ago.

All of these factors lead to services that are both more intense/complex while also successfully decreasing the intra-procedure time the patient is on the table.

Incorrect Assumptions

Finally, with the current times and valuation consisting of a mix of RUC recommendations, pro-rated bundling of time and work of PCI in branches by CMS, and reductions of work and time by CMS to apply coding changes related to unbundling moderate sedation, we submit that the current values were derived using a flawed mechanism. CMS bundled the now-deleted branch codes using a type of prorated building block methodology that casts the current values in doubt and provides compelling evidence that the best values for these services should be derived from the robust survey before us.

Recommendations Methodology

We have laid out a rationale above for the intensity/complexity of these codes rising while in some cases the performance time may have decreased. We recommend the survey 25th percentile for all the 000 codes in this family. We chose the survey 25th percentile work RVUs because this approach generally kept the recommended values in line with the trajectory of the reduction or addition of intra-service and total time for the codes while maintaining rank order. While changes to the work RVUs and times are not recommended in exactly proportional amounts, they do maintain relativity in the magnitude to which they change to the positive or the negative. That is to say, where there is a significant reduction in intra-service time there is a more modest

reduction in recommended work RVU and the same is true in the positive direction. Where there is a significant increase in intra-service time there is a more modest recommended increase in work RVU for those codes. RVU.

In developing recommendations for the family, we observed that recommendations for times and values generate WPUT (ie, intensity) values that maintain rank order relationships within the family and align with operators' estimates of work intensity. For instance, 92920 for PTCA has a lower WPUT than 92924 for PTCA with atherectomy, reflecting the higher complication rates of atherectomy and operators' perception that atherectomy is more intense. WPUT for 92941 (PCI of an acute myocardial infarction) has the highest WPUT consistent with operators' perceptions that this is the most intense interventional service. CTO codes 92943 and 92945 have lower WPUTs because they are longer services with multiple catheter changes and techniques being attempted. This consistency of WPUT with current rank order and with operators' perceptions of intensity support the recommendations at the 25th-percentile survey values.

This approach produces the following recommendations for the family that would produce budget increase of 12,342 RVUs out of a baseline of over 3.2 million RVUs (0.38%)

Preservice Time

For each of the 000 codes, we recommend additions to preservice package 2 (Difficult patient/straightforward procedure without anesthesia care) that are supported by the survey. While these are 000 codes provided to patients with short or no hospital stay, there are certain elements of preservice time that are more akin to that of a service which utilizes general anesthesia.

		FACILITY			**PCI**	**Notes**
		2	**3**	**4**	**2+**	
	Total Pre-Service Time	**25**	**51**	**63**	**43**	
	CATEGORY SUBTOTALS					
A	Pre-Service Evaluation (IWPUT =0.0224)	18	33	40	34	
B	Pre-Service Positioning (IWPUT = 0.0224)	1	3	3	3	
C	Pre-Service Scrub, Dress and Wait (IWPUT =0.0081)	6	15	20	6	
	DETAILS					
A	History and Exam (Performance and review of appropriate Pre-Tests)	10	10	15	10	Standard
A	Prepare for Procedure (Check labs, plan, assess risks, review procedure)	2	2	4	2	Standard
A	Communicate with patient and/or family (Discuss procedure/ obtain consent)	3	5	5	10	+7 for detailed consenting using multi-page or electronic form. Discuss results of Heart Team consultations (if performed); access site options; pros and cons of

						various PCI techniques including intra-coronary lithotripsy, atherectomy angioplasty, stenting; and possibility of conversion to emergency surgery. Discuss alternatives to PCI (surgery or medical therapy.) Discuss risks of all 3 approaches. Obtain separate consents for transfusion and moderate sedation.
A	Communicate with other professionals	0	5	5	0	Standard
A	Check/set-up room, supplies and equipment	1	5	5	5	+4 Utilize time similar to procedures with anesthesia to assess complex array of catheter, stents, and other supplies/equipment
A	Check/ prepare patient readiness (Gown, drape, prep, mark)	1	5	5	6	+5 Left and right radial pulses are evaluated to determine which are available for access (eg not harvested for prior CABG) and which of the two offers better access. Evaluate whether femoral artery is available for access and determine if left, right, or both femoral access sites should be prepped. Time out is performed.
A	Prepare/ review/ confirm procedure	1	1	1	1	Standard
B	Perform/ supervise patient positioning	1	3	3	3	+2 Utilize time similar to procedures with anesthesia to position patient comfortably on the table with arm in uncomfortable position, usually on a special pad. Arm used for radial access must be positioned and supinated with ventral surface oriented up and secured with tape to keep it there for entire procedure. Ultra-sound probe is inserted into sterile sleeve; console is programmed and turned on. Anti-spasm cocktail is prepared for intra-arterial

						injection.
C	Administer local/topical anesthesia	1	0	0	1	Standard
C	Observe (wait anesthesia care)	0	10	15	0	Standard
C	Dress and scrub for procedure	5	5	5	5	Standard

92920: PTCA

ACC and SCAI convened a panel of physicians familiar with the services to review the survey data. The survey was robust and was completed by physicians who have experience with the service. Code 92920 will be used to report percutaneous transluminal coronary angioplasty of a single major coronary artery and/or its branches. The panel reviewed the preservice time and selected package 2 with the modifications described above for a straightforward procedure on a difficult patient without anesthesia in a facility.

The key reference service is 37236, transcatheter placement of an intravascular stent(s). While procedurally similar, 37236 is a longer, less intense service.

The societies **recommend a wRVU of 9.00 with times of 43/48/28.** The preservice time of 43 was adjusted upward from Package 2 to reflect the enhanced steps described above: 7 additional minutes for complicated consent, 4 additional minutes to setup room similar to a procedure that utilizes anesthesia, 5 additional minutes for double and complex draping and ultrasound for vessel viability, and 2 additional minutes for complex positioning of the arm and heart imaging. The intra-service time of 48 minutes is the survey median. Post-service time is the standard 8B package for a complex procedure under sedation.

This value is slightly above the longer KRS, but also accounts for the increased intensity of working in the coronary arteries (which are always in motion and where rupture can cause immediate death) as well as the increased intensity of radial artery access as opposed to the prior typical technique using femoral artery access.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☒ Other reason (please explain) The interventional cardiologisty typically also manages moderate sedation, 99152.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 92920

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Cardiology How often? Commonly

Specialty Interventional Cardiology How often? Commonly

Specialty Internal Medicine How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 57177
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This estimate is three times the 2022 the traditional Medicare data from the RUC database to account for Medicare Advantage and commerical insurance covered performance.

Specialty Cardiology Frequency 27960 Percentage 48.90 %

Specialty Interventional Cardiology Frequency 26930 Percentage 47.09 %

Specialty Internal Medicine Frequency 1544 Percentage 2.70 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 19,059 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2022 RUC Database data. Recent trends show gradual decline, but we do not know if that will continue.

Specialty Cardiology Frequency 9320 Percentage 48.90 %

Specialty Interventional Cardiology Frequency 8977 Percentage 47.10 %

Specialty Internal Medicine Frequency 515 Percentage 2.70 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Cardiovascular-Coronary angioplasty (PTCA)

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 92920

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:92924 Tracking Number D2 Original Specialty Recommended RVU: **11.25**
Presented Recommended RVU: **11.25**
Global Period: 000 Current Work RVU: **11.74** RUC Recommended RVU: **10.13**

CPT Descriptor: Percutaneous transluminal coronary atherectomy, with coronary angioplasty when performed, single major coronary artery and/or its branch(es)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 73-year-old male presents with chronic angina refractory to medical therapy. Stress testing shows inferior ischemia. Coronary arteriography demonstrates heavily calcified coronary arteries. The proximal right coronary artery and its posterior descending branch each have long heavily calcified 80% stenotic lesions. Percutaneous coronary intervention is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 93%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 100% , In the ASC 0%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 43% , Overnight stay-less than 24 hours 52% , Overnight stay-more than 24 hours 5%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 96%

Description of Pre-Service Work: The patient's history, records, laboratory, and diagnostic tests are reviewed. A physical examination is conducted. Appropriate communication is conducted with the patient and the patient's family as well as with other medical professionals as needed(i.e., the “Heart Team approach”). The procedure is reviewed with the patient. The risks and benefits of the procedure are presented, as well as the alternatives. Informed consent is obtained. Hair is removed from the potential access sites. Necessary equipment, instruments, and supplies for the procedure are confirmed to be available and operational. Instruments and supplies for the procedure are pulled. The patient is transported to the procedure suite, positioned on the procedural table, and attached to cardiac electrodes and an oxygen saturation monitor. A sterile table is prepared. The potential access sites are scrubbed in sterile fashion. A sterile drape is placed over the patient. The patient's information is loaded in the hemodynamic monitoring equipment to retain the data from the upcoming study.

Description of Intra-Service Work: Percutaneous arterial access is obtained, typically through the femoral artery or radial artery. A sheath is placed and flushed. Angiography of the access site is performed as needed to assess anatomy of the access vessel and appropriate location of the access site. Intraarterial vasodilators are administered. An appropriate guiding catheter is passed under fluoroscopic guidance to the ascending aorta, engaged into the coronary ostium, and re-positioned as needed to prevent pressure damping. Appropriate antiplatelet therapy treatment is confirmed and anticoagulation administered. Therapeutic anticoagulation is confirmed by testing an activated clotting time (ACT). Additional anticoagulation is administered as needed. Multiple coronary injections are performed in different views to assess the target lesion(s). A coronary guidewire is used to cross the target lesion(s) and its position distally in the artery is confirmed. An appropriate-sized atherectomy device is selected, assembled, and passed through the guide into the target artery. The device is test-activated in the body and adjusted as needed. The device is activated and advanced in a gradual back and forth motion to ablate calcific plaque. Multiple runs are performed until it can progress through the lesion. If a larger device is needed to enlarge the lumen more optimally, the above steps are repeated with the larger device. The device is removed and an angioplasty balloon is passed over the guidewire to the target lesion(s) and used to further dilate the target lesion(s). Final angiography is performed. The entire process of coronary artery imaging, guidewire placement, atherectomy, and balloon inflation may be repeated at multiple stenotic sites in separate locations in the coronary artery or its branches. At the end of the procedure the guide catheter is disengaged and removed. The sheath is removed, and hemostasis is achieved

by appropriate technique. If a vascular closure device cannot be used with femoral access, the sheath is sutured in place for subsequent removal once the ACT level falls to a safe level for manual compression.

Description of Post-Service Work: Films and hemodynamics are reviewed and a formal report is generated. The patient, the patient's family, and the referring physician are notified of the results. A plan of management is developed and discussed with the patient and the patient's family. Additional antiplatelet and antithrombin therapy is administered as necessary. The patient is admitted to ensure no bleeding, to monitor for abrupt vessel closure, and for continued therapy of ischemic heart disease.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	22%	46%	32%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	3%	24%	73%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	30%	70%
Physical effort required	3%	52%	45%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	13%	87%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	8%	58%	34%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	42%	58%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	42%	58%
Physical effort required	0%	42%	58%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	25%	75%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

CPT Changes

The full family of percutaneous coronary intervention (PCI) codes was last reviewed by the RUC at the January 2012 meeting, when the code family was updated to reflect bundling after CMS identified MPC codes not reviewed in the prior 5 years as potentially misvalued. The codes were surveyed for the January 2023 RUC

meeting after the CPT Editorial Panel approved creation of a single add-on code that describes the work of coronary intravascular lithotripsy (IVL), a technology to modify lesions that did not exist at the time of the prior review. That code change application was submitted by a device manufacturer. The societies had planned to make other revisions to the code family at the following CPT cycle. At the January 2023 RUC meeting the societies proposed that only the new IVL code be valued, and the remainder of the code set be sent to CPT for revision before review. The RUC approved this proposal and, after several code change applications, the revised family was approved at the February 2024 CPT Panel meeting.

The CPT updates included code deletions, revisions, and additions.

- The original code set included additional branch add-on codes for several of the procedures. CMS assigned the branch codes a value of 0 RVUs, rolling a prorated portion of their value into their base codes (more on this later). Due to this lack of RVUs neither CMS nor commercial payers reimbursed these codes from 2013 to present and they were deleted by CPT in February 2024. The deleted codes included 92921, 92925, 92929, 92934, 92938, and 92944.
- CPT amended the base codes to each of these deleted add-on codes (92920, 92924, 92928, 92933, 92937, 92941, and 92943) to include the work, when performed, of potential branch vessels which was not included in the original code definitions and descriptions of work. This essentially matches the code descriptors to CMS's approach to not pay separately for additional branch work.
- Also, in February 2024 CPT created two new codes within the family. First, 92930, was created to allow coding for the work involved in placement of intracoronary stent(s) (currently coded as 92928) that exceeds the typical stenting case. The second new code, 92945, was created to allow coding for revascularization of a chronic total occlusion when both antegrade and retrograde approaches are employed.
- Finally, CPT revised codes 93571 and 93572 to make a correction to the fractional flow reserve (FFR) codes to correct a coding issue relating to instant flow reserve (iFR).

92972 Intravascular Lithotripsy (IVL)

As noted above, the IVL code was surveyed, reviewed by the RUC and issued a value at the January 2023 RUC meeting. The IVL code survey was robust, with 139 respondents. There have been no significant technological or other changes to the IVL procedure since its initial valuation. With the recent survey of this code and in an effort to maximize survey response by keeping it a bit shorter, we did not include the code in this survey and recommend affirmation of current value and time.

Current RVUs and Times

As referenced above, CMS does not recognize the add-on branch codes as separately payable. However, the agency did bundle them into the underlying PCI codes. In doing so, it also added small amounts of work and time, proportionate to predicted utilization. Also, since the last time these codes were valued, moderate sedation was unbundled, removing commensurate work and time. The summary spreadsheet shows the original RUC recommended value, the CMS adjustments for branch code bundling, the adjustments for unbundling of moderate sedation, and finally the current values.

Background: PCI Evolution & Compelling Evidence

Change in Technique

The recommendations for this tab produce an increase in RVUs of less than one half of a percent aggregated across the family of codes. Accordingly, we submit that these services have undergone changes in technique and patient population that substantiate compelling evidence to allow an increase in the aggregate value of the code family. At the time of the 2012 survey, PCI was typically performed via the femoral artery, with a very small minority of cases performed through the radial artery. PCI is now typically performed through the radial artery, reflecting best practice recommendations from the field. https://onlinelibrary.wiley.com/doi/10.1002/ccd.28672

Radial access is safer for patients despite being technically more challenging for the operator. The main advantage is a significant reduction in bleeding risk as well as decreased mortality for some patient subsets. https://pubmed.ncbi.nlm.nih.gov/33507598/.

Radial access requires additional preservice time that is discussed further below. This approach also requires different skills and techniques that are more difficult to perform than access through the femoral artery. While safer for the patient, the service is more technically challenging for the operator in several respects.

(1) The average radial artery is about 2 mm compared to femoral arteries that average about 9 mm, so entering the artery with a needle is more difficult.
(2) The radial and brachial arteries are smaller and more prone to spasm making catheter advancement or torquing difficult or impossible; many operators give an anti-vasospastic cocktail routinely which takes additional time.
(3) Whereas femoral access requires catheters to traverse one 180-degree bend to reach the heart, radial access requires the catheter to make one-180 degree bend and usually two more 90-degree bends to reach the heart, which makes catheter advancement and torquing more difficult.
(4) Radial access provides more frequent challenging anatomic variants such as radial loop, accessory radial arteries, early take-off radial arteries, and aberrant innominate arteries (arteria lusoria); in contrast anatomy from the femoral artery to the heart has few variants. These problems lead to conversion from radial to femoral access in about 10% of cases, while conversion from femoral to radial is almost non-existent.

Positioning for radial increases the risk of radiation and precautions. More time is spent closer to the image intensifier at different angles as opposed to standing farther back when patient is in the femoral area. Now we are closer to the heart and reaching across the patient's chest.

Change in Patient Population

We also see patients undergoing PCI who generally have more comorbidities than a decade ago. Attention to stricter adherence on statins and other medicines in revascularization and chest pain guidelines has eliminated many patients who otherwise may have been treated with lower acuity PCI, something we see in the declining utilization of these services. Remaining patients are more complex than they were a dozen years ago.

All of these factors lead to services that are both more intense/complex while also successfully decreasing the intra-procedure time the patient is on the table.

Incorrect Assumptions

Finally, with the current times and valuation consisting of a mix of RUC recommendations, pro-rated bundling of time and work of PCI in branches by CMS, and reductions of work and time by CMS to apply coding changes related to unbundling moderate sedation, we submit that the current values were derived using a flawed mechanism. CMS bundled the now-deleted branch codes using a type of prorated building block methodology that casts the current values in doubt and provides compelling evidence that the best values for these services should be derived from the robust survey before us.

Recommendations Methodology

We have laid out a rationale above for the intensity/complexity of these codes rising while in some cases the performance time may have decreased. We recommend the survey 25th percentile for all the 000 codes in this family. We chose the survey 25th percentile work RVUs because this approach generally kept the recommended values in line with the trajectory of the reduction or addition of intra-service and total time for the codes while maintaining rank order. While changes to the work RVUs and times are not recommended in exactly proportional amounts, they do maintain relativity in the magnitude to which they change to the positive or the negative. That is to say, where there is a significant reduction in intra-service time there is a more modest

reduction in recommended work RVU and the same is true in the positive direction. Where there is a significant increase in intra-service time there is a more modest recommended increase in work RVU for those codes. RVU.

In developing recommendations for the family, we observed that recommendations for times and values generate WPUT (ie, intensity) values that maintain rank order relationships within the family and align with operators' estimates of work intensity. For instance, 92920 for PTCA has a lower WPUT than 92924 for PTCA with atherectomy, reflecting the higher complication rates of atherectomy and operators' perception that atherectomy is more intense. WPUT for 92941 (PCI of an acute myocardial infarction) has the highest WPUT consistent with operators' perceptions that this is the most intense interventional service. CTO codes 92943 and 92945 have lower WPUTs because they are longer services with multiple catheter changes and techniques being attempted. This consistency of WPUT with current rank order and with operators' perceptions of intensity support the recommendations at the 25th-percentile survey values.

This approach produces the following recommendations for the family that would produce budget increase of 12,342 RVUs out of a baseline of over 3.2 million RVUs (0.38%)

Preservice Time

For each of the 000 codes, we recommend additions to preservice package 2 (Difficult patient/straightforward procedure without anesthesia care) that are supported by the survey. While these are 000 codes provided to patients with short or no hospital stay, there are certain elements of preservice time that are more akin to that of a service which utilizes general anesthesia.

		FACILITY			**PCI**	**Notes**
		2	**3**	**4**	**2+**	
	Total Pre-Service Time	**25**	**51**	**63**	**43**	
	CATEGORY SUBTOTALS					
A	Pre-Service Evaluation (IWPUT =0.0224)	18	33	40	34	
B	Pre-Service Positioning (IWPUT = 0.0224)	1	3	3	3	
C	Pre-Service Scrub, Dress and Wait (IWPUT =0.0081)	6	15	20	6	
	DETAILS					
A	History and Exam (Performance and review of appropriate Pre-Tests)	10	10	15	10	Standard
A	Prepare for Procedure (Check labs, plan, assess risks, review procedure)	2	2	4	2	Standard
A	Communicate with patient and/or family (Discuss procedure/ obtain consent)	3	5	5	10	+7 for detailed consenting using multi-page or electronic form. Discuss results of Heart Team consultations (if performed); access site options; pros and cons of

						various PCI techniques including intra-coronary lithotripsy, atherectomy angioplasty, stenting; and possibility of conversion to emergency surgery. Discuss alternatives to PCI (surgery or medical therapy.) Discuss risks of all 3 approaches. Obtain separate consents for transfusion and moderate sedation.
A	Communicate with other professionals	0	5	5	0	Standard
A	Check/set-up room, supplies and equipment	1	5	5	5	+4 Utilize time similar to procedures with anesthesia to assess complex array of catheter, stents, and other supplies/equipment
A	Check/ prepare patient readiness (Gown, drape, prep, mark)	1	5	5	6	+5 Left and right radial pulses are evaluated to determine which are available for access (eg not harvested for prior CABG) and which of the two offers better access. Evaluate whether femoral artery is available for access and determine if left, right, or both femoral access sites should be prepped. Time out is performed.
A	Prepare/ review/ confirm procedure	1	1	1	1	Standard
B	Perform/ supervise patient positioning	1	3	3	3	+2 Utilize time similar to procedures with anesthesia to position patient comfortably on the table with arm in uncomfortable position, usually on a special pad. Arm used for radial access must be positioned and supinated with ventral surface oriented up and secured with tape to keep it there for entire procedure. Ultra-sound probe is inserted into sterile sleeve; console is programmed and turned on. Anti-spasm cocktail is prepared for intra-arterial injection.
C	Administer local/topical anesthesia	1	0	0	1	Standard
C	Observe (wait anesthesia care)	0	10	15	0	Standard
C	Dress and scrub for procedure	5	5	5	5	Standard

92924: PTCA + Atherectomy

ACC and SCAI convened a panel of physicians familiar with the services to review the survey data. The survey was robust and was completed by physicians who have experience with the service. Code 92924 will be used to report percutaneous transluminal coronary angioplasty plus atherectomy of a single major coronary artery and/or its branches. The panel reviewed the preservice time and selected package 2 with the modifications described above for a straightforward procedure on a difficult patient without anesthesia in a facility.

The key reference service is 37225, femoral/popliteal revascularization with angioplasty and atherectomy. While procedurally similar, 37225 is a longer, less intense service. 78% of key reference respondents found surveyed code 92924 to be more or much more intense/complex than 37225.

The societies **recommend a wRVU of 11.25 with times of 43/60/28.** The preservice time of 43 was adjusted upward from Package 2 to reflect the enhanced steps described above: 7 additional minutes for complicated consent, 4 additional minutes to setup room similar to a procedure that utilizes anesthesia, 5 additional minutes for double and complex draping and ultrasound for vessel viability, and 2 additional minutes for complex positioning of the arm and heart imaging. The intra-service time of 60 minutes is the survey median. Post-service time is the standard 8B package for a complex procedure under sedation.

This value is below the longer KRS, but also accounts for the increased intensity of working in the coronary arteries (which are always in motion and where rupture can cause immediate death), as well as the increased intensity radial artery access as opposed to the prior typical technique using femoral artery access.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☒ Other reason (please explain) The interventional cardiologisty typically also manages moderate sedation, 99152.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 92924

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Cardiology How often? Commonly

Specialty Interventional Cardiology How often? Commonly

Specialty Internal Medicine How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 4839
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This estimate is three times the 2022 traditional Medicare data for usage to account for Medicare Advantage and commerical insurance covered performance.

Specialty Cardiology Frequency 2410 Percentage 49.80 %

Specialty Interventional Cardiology Frequency 2255 Percentage 46.60 %

Specialty Internal Medicine Frequency 121 Percentage 2.50 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 1,613
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2022 RUC Database data. Recent trends show gradual decline, but we do not know if that will continue.

Specialty Cardiology Frequency 803 Percentage 48.90 %

Specialty Interventional Cardiology Frequency 752 Percentage 46.60 %

Specialty Internal Medicine Frequency 40 Percentage 2.50 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Cardiovascular-Coronary angioplasty (PTCA)

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 92924

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:92928 Tracking Number D3 Original Specialty Recommended RVU: **10.41**
Presented Recommended RVU: **10.41**
Global Period: 000 Current Work RVU: **10.96** RUC Recommended RVU: **10.00**

CPT Descriptor: Percutaneous transcatheter placement of intracoronary stent(s), with coronary angioplasty when performed, single major coronary artery and/or its branch(es); one lesion involving one or more coronary segments

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 76-year-old obese male presents with unstable angina consistent with acute coronary syndrome. Coronary arteriography demonstrates about a 30 mm long hazy 90% lesion in the mid and distal segments of the circumflex coronary artery. Percutaneous coronary intervention is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 97%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 98% , In the ASC 2%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 68% , Overnight stay-less than 24 hours 31% , Overnight stay-more than 24 hours 1%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 98%

Description of Pre-Service Work: The patient's history, records, laboratory, and diagnostic tests are reviewed. A physical examination is conducted. Appropriate communication is conducted with the patient and the patient's family as well as with other medical professionals as needed(i.e., the “Heart Team approach”). The procedure is reviewed with the patient. The risks and benefits of the procedure are presented, as well as the alternatives. Informed consent is obtained. Hair is removed from the potential access sites. Necessary equipment, instruments, and supplies for the procedure are confirmed to be available and operational. Instruments and supplies for the procedure are pulled. The patient is transported to the procedure suite, positioned on the procedural table, and attached to cardiac electrodes and an oxygen saturation monitor. A sterile table is prepared. The potential access sites are scrubbed in sterile fashion. A sterile drape is placed over the patient. The patient's information is loaded in the hemodynamic monitoring equipment to retain the data from the upcoming study.

Description of Intra-Service Work: Percutaneous arterial access is obtained, typically through the femoral artery or radial artery. Angiography of the access site is performed as needed to assess anatomy of the access vessel and appropriate location of the access site. A sheath is placed and flushed. Intraarterial vasodilators are administered. Angiography of the access site is performed as needed to assess anatomy of the access vessel and appropriate location of the access site. An appropriate guiding catheter is passed under fluoroscopic guidance to the ascending aorta, engaged into the coronary ostium, and re-positioned as needed to prevent pressure damping. Appropriate antiplatelet therapy treatment is confirmed and anticoagulation administered. Therapeutic anticoagulation is confirmed by testing an activated clotting time (ACT). Additional anticoagulation is administered as needed. Multiple coronary injections are performed in different views to assess the target lesion(s). A coronary guidewire is used to cross the target lesion(s) and its position distally in the artery is confirmed. A coronary dilation balloon is advanced over the guidewire to the lesion(s) and dilated, using repeat dilatations as needed to be sure the lesion can be fully expanded with a stent. The angioplasty balloon is then removed. Angiography is performed in multiple views. A stent of appropriate diameter is advanced to the target lesion(s), carefully positioned, and deployed. If the stent fails to cover the entire diseased segment, additional stent(s) are then placed repeating the steps above. The entire process of coronary artery imaging, guidewire placement, and balloon inflation may be repeated at multiple stenotic sites in separate locations in the coronary artery or its branches. At the end of the procedure the guide catheter is disengaged and removed. The sheath is removed, and hemostasis is achieved by an appropriate technique. If a

vascular closure device cannot be used for femoral access, the sheath is sewn in for subsequent removal once the ACT level falls to a safe level for manual compression.

Description of Post-Service Work: Films and hemodynamics are reviewed and a formal report is generated. The patient, the patient's family, and the referring physician are notified of the results. A plan of management is developed and discussed with the patient and the patient's family. Additional antiplatelet and antithrombin therapy is administered as necessary. The patient is admitted to ensure no bleeding, to monitor for abrupt vessel closure, and for continued therapy of ischemic heart disease.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	3%	21%	49%	27%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	3%	35%	62%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	3%	33%	64%
Physical effort required	11%	61%	28%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	19%	81%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	54%	38%	8%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	4%	48%	48%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	4%	48%	48%
Physical effort required	4%	70%	26%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	54%	46%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

CPT Changes

The full family of percutaneous coronary intervention (PCI) codes was last reviewed by the RUC at the January 2012 meeting, when the code family was updated to reflect bundling after CMS identified MPC codes not reviewed in the prior 5 years as potentially misvalued. The codes were surveyed for the January 2023 RUC

meeting after the CPT Editorial Panel approved creation of a single add-on code that describes the work of coronary intravascular lithotripsy (IVL), a technology to modify lesions that did not exist at the time of the prior review. That code change application was submitted by a device manufacturer. The societies had planned to make other revisions to the code family at the following CPT cycle. At the January 2023 RUC meeting the societies proposed that only the new IVL code be valued, and the remainder of the code set be sent to CPT for revision before review. The RUC approved this proposal and, after several code change applications, the revised family was approved at the February 2024 CPT Panel meeting.

The CPT updates included code deletions, revisions, and additions.

- The original code set included additional branch add-on codes for several of the procedures. CMS assigned the branch codes a value of 0 RVUs, rolling a prorated portion of their value into their base codes (more on this later). Due to this lack of RVUs neither CMS nor commercial payers reimbursed these codes from 2013 to present and they were deleted by CPT in February 2024. The deleted codes included 92921, 92925, 92929, 92934, 92938, and 92944.
- CPT amended the base codes to each of these deleted add-on codes (92920, 92924, 92928, 92933, 92937, 92941, and 92943) to include the work, when performed, of potential branch vessels which was not included in the original code definitions and descriptions of work. This essentially matches the code descriptors to CMS's approach to not pay separately for additional branch work.
- Also, in February 2024 CPT created two new codes within the family. First, 92930, was created to allow coding for the work involved in placement of intracoronary stent(s) (currently coded as 92928) that exceeds the typical stenting case. The second new code, 92945, was created to allow coding for revascularization of a chronic total occlusion when both antegrade and retrograde approaches are employed.
- Finally, CPT revised codes 93571 and 93572 to make a correction to the fractional flow reserve (FFR) codes to correct a coding issue relating to instant flow reserve (iFR).

92972 Intravascular Lithotripsy (IVL)

As noted above, the IVL code was surveyed, reviewed by the RUC and issued a value at the January 2023 RUC meeting. The IVL code survey was robust, with 139 respondents. There have been no significant technological or other changes to the IVL procedure since its initial valuation. With the recent survey of this code and in an effort to maximize survey response by keeping it a bit shorter, we did not include the code in this survey and recommend affirmation of current value and time.

Current RVUs and Times

As referenced above, CMS does not recognize the add-on branch codes as separately payable. However, the agency did bundle them into the underlying PCI codes. In doing so, it also added small amounts of work and time, proportionate to predicted utilization. Also, since the last time these codes were valued, moderate sedation was unbundled, removing commensurate work and time. The summary spreadsheet shows the original RUC recommended value, the CMS adjustments for branch code bundling, the adjustments for unbundling of moderate sedation, and finally the current values.

Background: PCI Evolution & Compelling Evidence

Change in Technique

The recommendations for this tab produce an increase in RVUs of less than one half of a percent aggregated across the family of codes. Accordingly, we submit that these services have undergone changes in technique and patient population that substantiate compelling evidence to allow an increase in the aggregate value of the code family. At the time of the 2012 survey, PCI was typically performed via the femoral artery, with a very small minority of cases performed through the radial artery. PCI is now typically performed through the radial artery, reflecting best practice recommendations from the field. https://onlinelibrary.wiley.com/doi/10.1002/ccd.28672

Radial access is safer for patients despite being technically more challenging for the operator. The main advantage is a significant reduction in bleeding risk as well as decreased mortality for some patient subsets. https://pubmed.ncbi.nlm.nih.gov/33507598/.

Radial access requires additional preservice time that is discussed further below. This approach also requires different skills and techniques that are more difficult to perform than access through the femoral artery. While safer for the patient, the service is more technically challenging for the operator in several respects.

(1) The average radial artery is about 2 mm compared to femoral arteries that average about 9 mm, so entering the artery with a needle is more difficult.
(2) The radial and brachial arteries are smaller and more prone to spasm making catheter advancement or torquing difficult or impossible; many operators give an anti-vasospastic cocktail routinely which takes additional time.
(3) Whereas femoral access requires catheters to traverse one 180-degree bend to reach the heart, radial access requires the catheter to make one-180 degree bend and usually two more 90-degree bends to reach the heart, which makes catheter advancement and torquing more difficult.
(4) Radial access provides more frequent challenging anatomic variants such as radial loop, accessory radial arteries, early take-off radial arteries, and aberrant innominate arteries (arteria lusoria); in contrast anatomy from the femoral artery to the heart has few variants. These problems lead to conversion from radial to femoral access in about 10% of cases, while conversion from femoral to radial is almost non-existent.

Positioning for radial increases the risk of radiation and precautions. More time is spent closer to the image intensifier at different angles as opposed to standing farther back when patient is in the femoral area. Now we are closer to the heart and reaching across the patient's chest.

Change in Patient Population

We also see patients undergoing PCI who generally have more comorbidities than a decade ago. Attention to stricter adherence on statins and other medicines in revascularization and chest pain guidelines has eliminated many patients who otherwise may have been treated with lower acuity PCI, something we see in the declining utilization of these services. Remaining patients are more complex than they were a dozen years ago.

All of these factors lead to services that are both more intense/complex while also successfully decreasing the intra-procedure time the patient is on the table.

Incorrect Assumptions

Finally, with the current times and valuation consisting of a mix of RUC recommendations, pro-rated bundling of time and work of PCI in branches by CMS, and reductions of work and time by CMS to apply coding changes related to unbundling moderate sedation, we submit that the current values were derived using a flawed mechanism. CMS bundled the now-deleted branch codes using a type of prorated building block methodology that casts the current values in doubt and provides compelling evidence that the best values for these services should be derived from the robust survey before us.

Recommendations Methodology

We have laid out a rationale above for the intensity/complexity of these codes rising while in some cases the performance time may have decreased. We recommend the survey 25th percentile for all the 000 codes in this family. We chose the survey 25th percentile work RVUs because this approach generally kept the recommended values in line with the trajectory of the reduction or addition of intra-service and total time for the codes while maintaining rank order. While changes to the work RVUs and times are not recommended in exactly proportional amounts, they do maintain relativity in the magnitude to which they change to the positive or the negative. That is to say, where there is a significant reduction in intra-service time there is a more modest

reduction in recommended work RVU and the same is true in the positive direction. Where there is a significant increase in intra-service time there is a more modest recommended increase in work RVU for those codes. RVU.

In developing recommendations for the family, we observed that recommendations for times and values generate WPUT (ie, intensity) values that maintain rank order relationships within the family and align with operators' estimates of work intensity. For instance, 92920 for PTCA has a lower WPUT than 92924 for PTCA with atherectomy, reflecting the higher complication rates of atherectomy and operators' perception that atherectomy is more intense. WPUT for 92941 (PCI of an acute myocardial infarction) has the highest WPUT consistent with operators' perceptions that this is the most intense interventional service. CTO codes 92943 and 92945 have lower WPUTs because they are longer services with multiple catheter changes and techniques being attempted. This consistency of WPUT with current rank order and with operators' perceptions of intensity support the recommendations at the 25th-percentile survey values.

This approach produces the following recommendations for the family that would produce budget increase of 12,342 RVUs out of a baseline of over 3.2 million RVUs (0.38%)

Preservice Time

For each of the 000 codes, we recommend additions to preservice package 2 (Difficult patient/straightforward procedure without anesthesia care) that are supported by the survey. While these are 000 codes provided to patients with short or no hospital stay, there are certain elements of preservice time that are more akin to that of a service which utilizes general anesthesia.

		FACILITY			**PCI**	**Notes**
		2	**3**	**4**	**2+**	
	Total Pre-Service Time	**25**	**51**	**63**	**43**	
	CATEGORY SUBTOTALS					
A	Pre-Service Evaluation (IWPUT =0.0224)	18	33	40	34	
B	Pre-Service Positioning (IWPUT = 0.0224)	1	3	3	3	
C	Pre-Service Scrub, Dress and Wait (IWPUT =0.0081)	6	15	20	6	
	DETAILS					
A	History and Exam (Performance and review of appropriate Pre-Tests)	10	10	15	10	Standard
A	Prepare for Procedure (Check labs, plan, assess risks, review procedure)	2	2	4	2	Standard
A	Communicate with patient and/or family (Discuss procedure/ obtain consent)	3	5	5	10	+7 for detailed consenting using multi-page or electronic form. Discuss results of Heart Team consultations (if performed); access site options; pros and cons of various PCI techniques including

						intra-coronary lithotripsy, atherectomy angioplasty, stenting; and possibility of conversion to emergency surgery. Discuss alternatives to PCI (surgery or medical therapy.) Discuss risks of all 3 approaches. Obtain separate consents for transfusion and moderate sedation.
A	Communicate with other professionals	0	5	5	0	Standard
A	Check/set-up room, supplies and equipment	1	5	5	5	+4 Utilize time similar to procedures with anesthesia to assess complex array of catheter, stents, and other supplies/equipment
A	Check/ prepare patient readiness (Gown, drape, prep, mark)	1	5	5	6	+5 Left and right radial pulses are evaluated to determine which are available for access (eg not harvested for prior CABG) and which of the two offers better access. Evaluate whether femoral artery is available for access and determine if left, right, or both femoral access sites should be prepped. Time out is performed.
A	Prepare/ review/ confirm procedure	1	1	1	1	Standard
B	Perform/ supervise patient positioning	1	3	3	3	+2 Utilize time similar to procedures with anesthesia to position patient comfortably on the table with arm in uncomfortable position, usually on a special pad. Arm used for radial access must be positioned and supinated with ventral surface oriented up and secured with tape to keep it there for entire procedure. Ultra-sound probe is inserted into sterile sleeve; console is programmed and turned on. Anti-spasm cocktail is prepared for intra-arterial injection.
C	Administer local/topical anesthesia	1	0	0	1	Standard
C	Observe (wait anesthesia care)	0	10	15	0	Standard
C	Dress and scrub for procedure	5	5	5	5	Standard

92928: PTCA+ stent

ACC and SCAI convened a panel of physicians familiar with the services to review the survey data. The survey was robust and was completed by physicians who have experience with the service. Code 92928 will be used to report percutaneous transluminal coronary angioplasty plus stent placement in a single major

coronary artery and/or its branches, one lesion involving one or more coronary segments. The panel reviewed the preservice time and selected package 2 with the modifications described above for a straightforward procedure on a difficult patient without anesthesia in a facility.

The key reference service is 37226, femoral/popliteal revascularization with transluminal stent placement and angioplasty, when performed. While procedurally similar, 37226 is a longer, less intense service. 76% of key reference respondents found surveyed code 92928 to be more or much more intense/complex than 37226.

The societies **recommend a wRVU of 10.41 with times of 43/60/28.** The preservice time of 43 was adjusted upward from Package 2 to reflect the enhanced steps described above: 7 additional minutes for complicated consent, 4 additional minutes to setup room similar to a procedure that utilizes anesthesia, 5 additional minutes for double and complex draping and ultrasound for vessel viability, and 2 additional minutes for complex positioning of the arm and heart imaging. The intra-service time of 60 minutes is the survey median. Post-service time is the standard 8B package for a complex procedure under sedation.

This value is above the longer KRS, yet below the current 92928 value. The recommendation accounts for the increased intensity of working in the coronary arteries, (which are always in motion and where rupture can cause immediate death), as well as the increased intensity of radial artery access as opposed to the prior typical technique using femoral artery access.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☒ Other reason (please explain) The interventional cardiologisty typically also manages moderate sedation, 99152.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 92928

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Interventional Cardiology How often? Commonly

Specialty Cardiology How often? Commonly

Specialty Internal Medicine How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 421805
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on data from the CathPCI Registry the new 92930 code would apply to 27% of the stent cases currently performed. As such we anticipate 73% of the previous volume of this service to continue to be reported as 92928. We arrived at this estimate by multiplying the the 2022 traditional Medicare utilization found in the RUC database by three to account for Medicare Advantage and commerical covered performance, then applying 73% of that number.

Specialty Interventional Cardiology Frequency 211325 Percentage 50.10 %

Specialty Cardiology Frequency 195718 Percentage 46.40 %

Specialty Internal Medicine Frequency 10123 Percentage 2.39 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 140,602 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Procedure data from the CathPCI Registry predicts that 73% of the current 92928 procedures would continue to be coded as such after the 92930 code is implemented. This estimate for 92928 is 73% of the 2022 RUC Database data for 92928.

Specialty Interventional Cardiology Frequency 70442 Percentage 50.10 %

Specialty Cardiology Frequency 65239 Percentage 46.39 %

Specialty Internal Medicine Frequency 3375 Percentage 2.40 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Cardiovascular-Coronary angioplasty (PTCA)

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 92928

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

CPT Descriptor: Percutaneous transcatheter placement of intracoronary stent(s), with coronary angioplasty when performed, two or more distinct coronary lesions with two or more coronary stents deployed int wo or more coronary segments, or a bifurcation lesion requiring angioplasty and/or stenting in both the main artery and the side branch

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 77-year-old diabetic female presents with accelerated angina despite medical therapy. Coronary angiography demonstrates about a 30 mm long 90% stenosis in the mid segment of the left anterior descending coronary artery at the bifurcation with a large first diagonal artery branch which itself has a 90% focal stenosis. Percutaneous coronary intervention is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 97%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 99% , In the ASC 1%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 43% , Overnight stay-less than 24 hours 50% , Overnight stay-more than 24 hours 7%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 97%

Description of Pre-Service Work: The patient's history, records, laboratory, and diagnostic tests are reviewed. A physical examination is conducted. Appropriate communication is conducted with the patient and the patient's family as well as with other medical professionals as needed(i.e., the “Heart Team approach”). The procedure is reviewed with the patient. The risks and benefits of the procedure are presented, as well as the alternatives. Informed consent is obtained. Hair is removed from the potential access sites. Necessary equipment, instruments, and supplies for the procedure are confirmed to be available and operational. Instruments and supplies for the procedure are pulled. The patient is transported to the procedure suite, positioned on the procedural table, and attached to cardiac electrodes and an oxygen saturation monitor. A sterile table is prepared. The potential access sites are scrubbed in sterile fashion. A sterile drape is placed over the patient. The patient's information is loaded in the hemodynamic monitoring equipment to retain the data from the upcoming study.

Description of Intra-Service Work: Percutaneous arterial access is obtained, typically through the femoral artery or radial artery. Angiography of the access site is performed as needed to assess anatomy of the access vessel and appropriate location of the access site. A sheath is placed and flushed. Intra-arterial vasodilators are administered. An appropriate guiding catheter is passed under fluoroscopic guidance to the ascending aorta, engaged into the coronary ostium, and re-positioned as needed to prevent pressure damping. Appropriate antiplatelet therapy treatment is confirmed and anticoagulation administered. Therapeutic anticoagulation is confirmed by testing an activated clotting time (ACT). Additional anticoagulation is administered as needed. Multiple coronary injections are performed in different views to assess the target lesion(s). A coronary guidewire is used to cross the target lesion(s) and its position distally in the artery is confirmed. A second guidewire is manipulated across the lesion(s) into the side branch with the same cautions and confirmed angiographically. An appropriate-sized balloon is advanced into the main branch, dilates it, and is removed. Angiography is performed in multiple views. If the lesion is not fully expanded the procedure is repeated multiple times with progressively larger balloons or higher pressures. Once an adequate expansion is achieved, a balloon is passed over the sidebranch wire half-way into the side branch, and inflated until the side branch is adequately dilated. Then a stent of appropriate diameter and length is advanced half-way into the side branch. A non-compliant balloon is then placed in the main vessel adjacent to the branch stent. The sidebranch stent is deployed at high pressure, the stent delivery system is

withdrawn, and angiography is performed to verify adequate coverage of the lesion dilatation of the lesion. The balloon in the main vessel is immediately inflated to crush the portion of the stent to the side of the main vessel. The main vessel balloon is withdrawn into the guide. A new guidewire is placed through the side of the crushed stent into the side branch and the original sidebranch wire is removed. A new balloon is placed half-way into the side branch through the side of the crushed sidebranch stent. The balloon in the main artery is again advanced to the site of the lesion alongside the proximal half of the sidebranch balloon and both balloons are inflated simultaneously (1st "kissing balloon inflation"). The balloons are withdrawn and angiography is performed to assess interim results. The sidebranch guidewire is removed. A stent is advanced in the main vessel to the target lesion covering the ostium of the sidebranch and deployed at high pressure. The stent delivery balloon is removed over the guidewire. A larger balloon is advanced to the bifurcation point of the main vessel and inflated at the origin of the side branch to optimize the size of the larger proximal portion of the main vessel (1st "Proximal Optimization Technique" or "POT") and then removed. A new guidewire is advanced into the side branch stent through the side of the main vessel stent. A new balloon is passed over the sidebranch wire half-way into the sidebranch, another balloon is passed over the main branch wire to the lesion, and both balloons are inflated simultaneously ("2nd kissing balloon inflation"). These balloons are removed and another larger balloon is passed over the guidewire in the main artery to the bifurcation point. The segment of the main vessel stent just proximal to the bifurcation point is dilated (2nd POT). All guidewires are removed. Final angiography is performed to assess the result and ensure no perforation as well as adequate stent deployment and continuity of coronary flow after administration of vasodilators. The guide catheter is removed and anticoagulation infusion is stopped. The sheath is removed, and hemostasis is achieved by an appropriate technique. If a vascular closure device cannot used for femoral access, the sheath is sutured in place for subsequent removal once the ACT level falls to a safe level for manual compression.

Description of Post-Service Work: Films and hemodynamics are reviewed and a formal report is generated. The patient, the patient's family, and the referring physician are notified of the results. A plan of management is developed and discussed with the patient and the patient's family. Additional antiplatelet and antithrombin therapy is administered as necessary. The patient is admitted to ensure no bleeding, to monitor for abrupt vessel closure, and for continued therapy of ischemic heart disease.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	24%	56%	20%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	8%	40%	52%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	75%	25%
Physical effort required	4%	42%	54%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	24%	76%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	12%	32%	56%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	20%	80%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	25%	75%
Physical effort required	4%	29%	67%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	12%	88%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

CPT Changes

The full family of percutaneous coronary intervention (PCI) codes was last reviewed by the RUC at the January 2012 meeting, when the code family was updated to reflect bundling after CMS identified MPC codes not reviewed in the prior 5 years as potentially misvalued. The codes were surveyed for the January 2023 RUC

meeting after the CPT Editorial Panel approved creation of a single add-on code that describes the work of coronary intravascular lithotripsy (IVL), a technology to modify lesions that did not exist at the time of the prior review. That code change application was submitted by a device manufacturer. The societies had planned to make other revisions to the code family at the following CPT cycle. At the January 2023 RUC meeting the societies proposed that only the new IVL code be valued, and the remainder of the code set be sent to CPT for revision before review. The RUC approved this proposal and, after several code change applications, the revised family was approved at the February 2024 CPT Panel meeting.

The CPT updates included code deletions, revisions, and additions.

- The original code set included additional branch add-on codes for several of the procedures. CMS assigned the branch codes a value of 0 RVUs, rolling a prorated portion of their value into their base codes (more on this later). Due to this lack of RVUs neither CMS nor commercial payers reimbursed these codes from 2013 to present and they were deleted by CPT in February 2024. The deleted codes included 92921, 92925, 92929, 92934, 92938, and 92944.
- CPT amended the base codes to each of these deleted add-on codes (92920, 92924, 92928, 92933, 92937, 92941, and 92943) to include the work, when performed, of potential branch vessels which was not included in the original code definitions and descriptions of work. This essentially matches the code descriptors to CMS's approach to not pay separately for additional branch work.
- Also, in February 2024 CPT created two new codes within the family. First, 92930, was created to allow coding for the work involved in placement of intracoronary stent(s) (currently coded as 92928) that exceeds the typical stenting case. The second new code, 92945, was created to allow coding for revascularization of a chronic total occlusion when both antegrade and retrograde approaches are employed.
- Finally, CPT revised codes 93571 and 93572 to make a correction to the fractional flow reserve (FFR) codes to correct a coding issue relating to instant flow reserve (iFR).

92972 Intravascular Lithotripsy (IVL)

As noted above, the IVL code was surveyed, reviewed by the RUC and issued a value at the January 2023 RUC meeting. The IVL code survey was robust, with 139 respondents. There have been no significant technological or other changes to the IVL procedure since its initial valuation. With the recent survey of this code and in an effort to maximize survey response by keeping it a bit shorter, we did not include the code in this survey and recommend affirmation of current value and time.

Current RVUs and Times

As referenced above, CMS does not recognize the add-on branch codes as separately payable. However, the agency did bundle them into the underlying PCI codes. In doing so, it also added small amounts of work and time, proportionate to predicted utilization. Also, since the last time these codes were valued, moderate sedation was unbundled, removing commensurate work and time. The summary spreadsheet shows the original RUC recommended value, the CMS adjustments for branch code bundling, the adjustments for unbundling of moderate sedation, and finally the current values.

Background: PCI Evolution & Compelling Evidence

Change in Technique

The recommendations for this tab produce an increase in RVUs of less than one half of a percent aggregated across the family of codes. Accordingly, we submit that these services have undergone changes in technique and patient population that substantiate compelling evidence to allow an increase in the aggregate value of the code family. At the time of the 2012 survey, PCI was typically performed via the femoral artery, with a very small minority of cases performed through the radial artery. PCI is now typically performed through the radial artery, reflecting best practice recommendations from the field. https://onlinelibrary.wiley.com/doi/10.1002/ccd.28672

Radial access is safer for patients despite being technically more challenging for the operator. The main advantage is a significant reduction in bleeding risk as well as decreased mortality for some patient subsets. https://pubmed.ncbi.nlm.nih.gov/33507598/.

Radial access requires additional preservice time that is discussed further below. This approach also requires different skills and techniques that are more difficult to perform than access through the femoral artery. While safer for the patient, the service is more technically challenging for the operator in several respects.

(1) The average radial artery is about 2 mm compared to femoral arteries that average about 9 mm, so entering the artery with a needle is more difficult.
(2) The radial and brachial arteries are smaller and more prone to spasm making catheter advancement or torquing difficult or impossible; many operators give an anti-vasospastic cocktail routinely which takes additional time.
(3) Whereas femoral access requires catheters to traverse one 180-degree bend to reach the heart, radial access requires the catheter to make one-180 degree bend and usually two more 90-degree bends to reach the heart, which makes catheter advancement and torquing more difficult.
(4) Radial access provides more frequent challenging anatomic variants such as radial loop, accessory radial arteries, early take-off radial arteries, and aberrant innominate arteries (arteria lusoria); in contrast anatomy from the femoral artery to the heart has few variants. These problems lead to conversion from radial to femoral access in about 10% of cases, while conversion from femoral to radial is almost non-existent.

Positioning for radial increases the risk of radiation and precautions. More time is spent closer to the image intensifier at different angles as opposed to standing farther back when patient is in the femoral area. Now we are closer to the heart and reaching across the patient's chest.

Change in Patient Population

We also see patients undergoing PCI who generally have more comorbidities than a decade ago. Attention to stricter adherence on statins and other medicines in revascularization and chest pain guidelines has eliminated many patients who otherwise may have been treated with lower acuity PCI, something we see in the declining utilization of these services. Remaining patients are more complex than they were a dozen years ago.

All of these factors lead to services that are both more intense/complex while also successfully decreasing the intra-procedure time the patient is on the table.

Incorrect Assumptions

Finally, with the current times and valuation consisting of a mix of RUC recommendations, pro-rated bundling of time and work of PCI in branches by CMS, and reductions of work and time by CMS to apply coding changes related to unbundling moderate sedation, we submit that the current values were derived using a flawed mechanism. CMS bundled the now-deleted branch codes using a type of prorated building block methodology that casts the current values in doubt and provides compelling evidence that the best values for these services should be derived from the robust survey before us.

Recommendations Methodology

We have laid out a rationale above for the intensity/complexity of these codes rising while in some cases the performance time may have decreased. We recommend the survey 25th percentile for all the 000 codes in this family. We chose the survey 25th percentile work RVUs because this approach generally kept the recommended values in line with the trajectory of the reduction or addition of intra-service and total time for the codes while maintaining rank order. While changes to the work RVUs and times are not recommended in exactly proportional amounts, they do maintain relativity in the magnitude to which they change to the positive or the negative. That is to say, where there is a significant reduction in intra-service time there is a more modest

reduction in recommended work RVU and the same is true in the positive direction. Where there is a significant increase in intra-service time there is a more modest recommended increase in work RVU for those codes. RVU.

In developing recommendations for the family, we observed that recommendations for times and values generate WPUT (ie, intensity) values that maintain rank order relationships within the family and align with operators' estimates of work intensity. For instance, 92920 for PTCA has a lower WPUT than 92924 for PTCA with atherectomy, reflecting the higher complication rates of atherectomy and operators' perception that atherectomy is more intense. WPUT for 92941 (PCI of an acute myocardial infarction) has the highest WPUT consistent with operators' perceptions that this is the most intense interventional service. CTO codes 92943 and 92945 have lower WPUTs because they are longer services with multiple catheter changes and techniques being attempted. This consistency of WPUT with current rank order and with operators' perceptions of intensity support the recommendations at the 25th-percentile survey values.

This approach produces the following recommendations for the family that would produce budget increase of 12,342 RVUs out of a baseline of over 3.2 million RVUs (0.38%)

Preservice Time

For each of the 000 codes, we recommend additions to preservice package 2 (Difficult patient/straightforward procedure without anesthesia care) that are supported by the survey. While these are 000 codes provided to patients with short or no hospital stay, there are certain elements of preservice time that are more akin to that of a service which utilizes general anesthesia.

		FACILITY			**PCI**	**Notes**
		2	**3**	**4**	**2+**	
	Total Pre-Service Time	**25**	**51**	**63**	**43**	
	CATEGORY SUBTOTALS

C	Observe (wait anesthesia care)	0	10	15	0	Standard
C	Dress and scrub for procedure	5	5	5	5	Standard

92930: PTCA + Non-Straightforward Stent

ACC and SCAI convened a panel of physicians familiar with the services to review the survey data. The survey was robust and was completed by physicians who have experience with the service. Code 92930 will be used to report percutaneous transluminal coronary angioplasty plus stent placement in a single major

coronary artery and/or its branches, two or more distinct coronary lesions with two or more coronary stents deployed in two or more coronary segments, or a bifurcation lesion requiring angioplasty and/or stenting in both the main artery and the side branch. The panel reviewed the preservice time and selected package 2 with the modifications described above for a straightforward procedure on a difficult patient without anesthesia in a facility.

The key reference service is 93653, Comprehensive electrophysiologic evaluation with insertion and repositioning of multiple electrode catheters, induction or attempted induction of an arrhythmia with right atrial pacing and recording and catheter ablation of arrhythmogenic focus, including intracardiac electrophysiologic 3-dimensional mapping, right ventricular pacing and recording, left atrial pacing and recording from coronary sinus or left atrium, and His bundle recording, when performed; with treatment of supraventricular tachycardia by ablation of fast or slow atrioventricular pathway, accessory atrioventricular connection, cavo-tricuspid isthmus or other single atrial focus or source of atrial re-entry. While procedurally similar in that it is also a catheter service, 93653 is a longer and different service inside the heart. 76% of key reference respondents found surveyed code 92930 to be more or much more intense/complex than 93653.

The societies **recommend a wRVU of 12.00 with times of 43/75/28.** The preservice time of 43 was adjusted upward from Package 2 to reflect the enhanced steps described above: 7 additional minutes for complicated consent, 4 additional minutes to setup room similar to a procedure that utilizes anesthesia, 5 additional minutes for double and complex draping and ultrasound for vessel viability, and 2 additional minutes for complex positioning of the arm and heart imaging. The intra-service time of 75 minutes is the survey median. Post-service time is the standard 8B package for a complex procedure under sedation.

This value is below the longer KRS, but also accounts for the intensity of working in the coronary arteries(which are always in motion and where rupture can cause immediate death), as well as the increased intensity of radial artery access as opposed to the prior typical technique using femoral artery access.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☒ Other reason (please explain) The interventional cardiologisty typically also manages moderate sedation, 99152.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 92928

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Interventional Cardiology How often? Commonly

Specialty Cardiology How often? Commonly

Specialty Internal Medicine How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 156010
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on CathPCI Registry data we anticipate that 27% of the services reported as 92928 will be reported as 92930 when the code is implemented. This estimate is 27% of the 2022 traditional Medicare volume as reported in the RUC database multiplied by three to account for Medicare Advantage and commerical insurance covered performance.

Specialty Interventional Cardiology Frequency 78161 Percentage 50.09 %

Specialty Cardiolgoy Frequency 72389 Percentage 46.40 %

Specialty Internal Medicine Frequency 3744 Percentage 2.39 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 52,003 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. CathPCI Registry data predict that 27% of the services reported as 92928 will be reported as 92930 when the code is implemented. This estimate is 27% of the 2022 utilization of 92928 per the RUC database.

Specialty Interventional Cardiology Frequency 26054 Percentage 50.10 %

Specialty Cardiology Frequency 24129 Percentage 46.39 %

Specialty Internal Medicine Frequency 1248 Percentage 2.39 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Cardiovascular-Coronary angioplasty (PTCA)

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 92928

CPT Descriptor: Percutaneous transluminal coronary atherectomy, with intracoronary stent, with coronary angioplasty when performed, single major coronary artery and/or its branch(es)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 72-year-old male presents with progressive angina and pharmacologic stress testing showing lateral ischemia. Coronary arteriography shows 50% lesions in the left and right coronary arteries and an 80%, tubular left circumflex coronary artery lesion. The vessels are extremely heavily calcified. Percutaneous coronary intervention is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 94%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 100% , In the ASC 0%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 37% , Overnight stay-less than 24 hours 55% , Overnight stay-more than 24 hours 8%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 99%

Description of Pre-Service Work: The patient's history, records, laboratory, and diagnostic tests are reviewed. A physical examination is conducted. Appropriate communication is conducted with the patient and the patient's family as well as with other medical professionals as needed(i.e., the “Heart Team approach”). The procedure is reviewed with the patient. The risks and benefits of the procedure are presented, as well as the alternatives. Informed consent is obtained. Hair is removed from the potential access sites. Necessary equipment, instruments, and supplies for the procedure are confirmed to be available and operational. Instruments and supplies for the procedure are pulled. The patient is transported to the procedure suite, positioned on the procedural table, and attached to cardiac electrodes and an oxygen saturation monitor. A sterile table is prepared. The potential access sites are scrubbed in sterile fashion. A sterile drape is placed over the patient. The patient's information is loaded in the hemodynamic monitoring equipment to retain the data from the upcoming study.

Description of Intra-Service Work: Percutaneous arterial access is obtained, typically through the femoral artery or radial artery. A sheath is placed and flushed. Angiography of the access site is performed as needed to assess anatomy of the access vessel and appropriate location of the access site. Intraarterial vasodilators are administered. An appropriate guiding catheter is passed under fluoroscopic guidance to the ascending aorta, engaged into the coronary ostium, and re-positioned as needed to prevent pressure damping. Appropriate antiplatelet therapy treatment is confirmed and anticoagulation administered. Therapeutic anticoagulation is confirmed by testing an activated clotting time (ACT). Additional anticoagulation is administered as needed. Multiple coronary injections are performed in different views to assess the target lesion(s). A coronary guidewire is used to cross the target lesion(s) and its position distally in the artery is confirmed. An appropriate-sized atherectomy device is selected, assembled, and passed through the guide into the target artery. The device is test-activated in the body and adjusted as needed. The device is activated and advanced in a gradual back and forth motion to ablate calcific plaque. Multiple runs are performed until it can progress through the lesion. If a larger device is needed to enlarge the lumen more optimally, the above steps are repeated with the larger device. The device is removed and an angioplasty balloon is advanced over the guidewire to the lesion(s) and dilated, using repeat dilatations as needed to be sure the lesion can be fully expanded with a stent. A stent of appropriate diameter and length is selected and advanced over the guidewire to the target lesion and deployed. If the stent fails to cover the entire diseased segment, additional stent(s) are then placed using the same techniques. The stent deployment balloon is removed and a high-pressure, non-

compliant balloon is advanced over the wire into the stented segment and inflated at high pressure to ensure stent expansion. The entire process of coronary artery imaging, guidewire placement, atherectomy, stent placement, and balloon inflation may be repeated at multiple stenotic sites in separate locations in the coronary artery or its branches. At the end of the procedure the guide catheter is disengaged and removed. The sheath is removed, and hemostasis is achieved by an appropriate technique. If a vascular closure device cannot be used for femoral access, the sheath is sutured in place for subsequent removal once the ACT level falls to a safe level for manual compression.

Description of Post-Service Work: Films and hemodynamics are reviewed and a formal report is generated. The patient, the patient's family, and the referring physician are notified of the results. A plan of management is developed and discussed with the patient and the patient's family. Additional antiplatelet and antithrombin therapy is administered as necessary. The patient is admitted to ensure no bleeding, to monitor for abrupt vessel closure, and for continued therapy of ischemic heart disease.

SURVEY DATA

RUC Meeting Date (mm/yyyy)	04/2024					
Presenter(s):	Dr. Richard Wright, Dr. Ed Tuohy, Dr. Afnan Tariq, Dr. Mark Hoyer

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	19%	45%	36%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	2%	27%	71%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	4%	28%	68%
Physical effort required	2%	55%	43%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	2%	7%	91%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	16%	24%	24%	36%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	12%	42%	46%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	8%	28%	64%
Physical effort required	8%	32%	60%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	8%	44%	48%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

CPT Changes

The full family of percutaneous coronary intervention (PCI) codes was last reviewed by the RUC at the January 2012 meeting, when the code family was updated to reflect bundling after CMS identified MPC codes not reviewed in the prior 5 years as potentially misvalued. The codes were surveyed for the January 2023 RUC

meeting after the CPT Editorial Panel approved creation of a single add-on code that describes the work of coronary intravascular lithotripsy (IVL), a technology to modify lesions that did not exist at the time of the prior review. That code change application was submitted by a device manufacturer. The societies had planned to make other revisions to the code family at the following CPT cycle. At the January 2023 RUC meeting the societies proposed that only the new IVL code be valued, and the remainder of the code set be sent to CPT for revision before review. The RUC approved this proposal and, after several code change applications, the revised family was approved at the February 2024 CPT Panel meeting.

The CPT updates included code deletions, revisions, and additions.

- The original code set included additional branch add-on codes for several of the procedures. CMS assigned the branch codes a value of 0 RVUs, rolling a prorated portion of their value into their base codes (more on this later). Due to this lack of RVUs neither CMS nor commercial payers reimbursed these codes from 2013 to present and they were deleted by CPT in February 2024. The deleted codes included 92921, 92925, 92929, 92934, 92938, and 92944.
- CPT amended the base codes to each of these deleted add-on codes (92920, 92924, 92928, 92933, 92937, 92941, and 92943) to include the work, when performed, of potential branch vessels which was not included in the original code definitions and descriptions of work. This essentially matches the code descriptors to CMS's approach to not pay separately for additional branch work.
- Also, in February 2024 CPT created two new codes within the family. First, 92930, was created to allow coding for the work involved in placement of intracoronary stent(s) (currently coded as 92928) that exceeds the typical stenting case. The second new code, 92945, was created to allow coding for revascularization of a chronic total occlusion when both antegrade and retrograde approaches are employed.
- Finally, CPT revised codes 93571 and 93572 to make a correction to the fractional flow reserve (FFR) codes to correct a coding issue relating to instant flow reserve (iFR).

92972 Intravascular Lithotripsy (IVL)

As noted above, the IVL code was surveyed, reviewed by the RUC and issued a value at the January 2023 RUC meeting. The IVL code survey was robust, with 139 respondents. There have been no significant technological or other changes to the IVL procedure since its initial valuation. With the recent survey of this code and in an effort to maximize survey response by keeping it a bit shorter, we did not include the code in this survey and recommend affirmation of current value and time.

Current RVUs and Times

As referenced above, CMS does not recognize the add-on branch codes as separately payable. However, the agency did bundle them into the underlying PCI codes. In doing so, it also added small amounts of work and time, proportionate to predicted utilization. Also, since the last time these codes were valued, moderate sedation was unbundled, removing commensurate work and time. The summary spreadsheet shows the original RUC recommended value, the CMS adjustments for branch code bundling, the adjustments for unbundling of moderate sedation, and finally the current values.

Background: PCI Evolution & Compelling Evidence

Change in Technique

The recommendations for this tab produce an increase in RVUs of less than one half of a percent aggregated across the family of codes. Accordingly, we submit that these services have undergone changes in technique and patient population that substantiate compelling evidence to allow an increase in the aggregate value of the code family. At the time of the 2012 survey, PCI was typically performed via the femoral artery, with a very small minority of cases performed through the radial artery. PCI is now typically performed through the radial artery, reflecting best practice recommendations from the field. https://onlinelibrary.wiley.com/doi/10.1002/ccd.28672

Radial access is safer for patients despite being technically more challenging for the operator. The main advantage is a significant reduction in bleeding risk as well as decreased mortality for some patient subsets. https://pubmed.ncbi.nlm.nih.gov/33507598/.

Radial access requires additional preservice time that is discussed further below. This approach also requires different skills and techniques that are more difficult to perform than access through the femoral artery. While safer for the patient, the service is more technically challenging for the operator in several respects.

(1) The average radial artery is about 2 mm compared to femoral arteries that average about 9 mm, so entering the artery with a needle is more difficult.
(2) The radial and brachial arteries are smaller and more prone to spasm making catheter advancement or torquing difficult or impossible; many operators give an anti-vasospastic cocktail routinely which takes additional time.
(3) Whereas femoral access requires catheters to traverse one 180-degree bend to reach the heart, radial access requires the catheter to make one-180 degree bend and usually two more 90-degree bends to reach the heart, which makes catheter advancement and torquing more difficult.
(4) Radial access provides more frequent challenging anatomic variants such as radial loop, accessory radial arteries, early take-off radial arteries, and aberrant innominate arteries (arteria lusoria); in contrast anatomy from the femoral artery to the heart has few variants. These problems lead to conversion from radial to femoral access in about 10% of cases, while conversion from femoral to radial is almost non-existent.

Positioning for radial increases the risk of radiation and precautions. More time is spent closer to the image intensifier at different angles as opposed to standing farther back when patient is in the femoral area. Now we are closer to the heart and reaching across the patient's chest.

Change in Patient Population

We also see patients undergoing PCI who generally have more comorbidities than a decade ago. Attention to stricter adherence on statins and other medicines in revascularization and chest pain guidelines has eliminated many patients who otherwise may have been treated with lower acuity PCI, something we see in the declining utilization of these services. Remaining patients are more complex than they were a dozen years ago.

All of these factors lead to services that are both more intense/complex while also successfully decreasing the intra-procedure time the patient is on the table.

Incorrect Assumptions

Finally, with the current times and valuation consisting of a mix of RUC recommendations, pro-rated bundling of time and work of PCI in branches by CMS, and reductions of work and time by CMS to apply coding changes related to unbundling moderate sedation, we submit that the current values were derived using a flawed mechanism. CMS bundled the now-deleted branch codes using a type of prorated building block methodology that casts the current values in doubt and provides compelling evidence that the best values for these services should be derived from the robust survey before us.

Recommendations Methodology

We have laid out a rationale above for the intensity/complexity of these codes rising while in some cases the performance time may have decreased. We recommend the survey 25th percentile for all the 000 codes in this family. We chose the survey 25th percentile work RVUs because this approach generally kept the recommended values in line with the trajectory of the reduction or addition of intra-service and total time for the codes while maintaining rank order. While changes to the work RVUs and times are not recommended in exactly proportional amounts, they do maintain relativity in the magnitude to which they change to the positive or the negative. That is to say, where there is a significant reduction in intra-service time there is a more modest

reduction in recommended work RVU and the same is true in the positive direction. Where there is a significant increase in intra-service time there is a more modest recommended increase in work RVU for those codes. RVU.

In developing recommendations for the family, we observed that recommendations for times and values generate WPUT (ie, intensity) values that maintain rank order relationships within the family and align with operators' estimates of work intensity. For instance, 92920 for PTCA has a lower WPUT than 92924 for PTCA with atherectomy, reflecting the higher complication rates of atherectomy and operators' perception that atherectomy is more intense. WPUT for 92941 (PCI of an acute myocardial infarction) has the highest WPUT consistent with operators' perceptions that this is the most intense interventional service. CTO codes 92943 and 92945 have lower WPUTs because they are longer services with multiple catheter changes and techniques being attempted. This consistency of WPUT with current rank order and with operators' perceptions of intensity support the recommendations at the 25th-percentile survey values.

This approach produces the following recommendations for the family that would produce budget increase of 12,342 RVUs out of a baseline of over 3.2 million RVUs (0.38%)

Preservice Time

For each of the 000 codes, we recommend additions to preservice package 2 (Difficult patient/straightforward procedure without anesthesia care) that are supported by the survey. While these are 000 codes provided to patients with short or no hospital stay, there are certain elements of preservice time that are more akin to that of a service which utilizes general anesthesia.

		FACILITY			**PCI**	**Notes**
		2	**3**	**4**	**2+**	
	Total Pre-Service Time	**25**	**51**	**63**	**43**	
	CATEGORY SUBTOTALS					
A	Pre-Service Evaluation (IWPUT =0.0224)	18	33	40	34	
B	Pre-Service Positioning (IWPUT = 0.0224)	1	3	3	3	
C	Pre-Service Scrub, Dress and Wait (IWPUT =0.0081)	6	15	20	6	
	DETAILS					
A	History and Exam (Performance and review of appropriate Pre-Tests)	10	10	15	10	Standard
A	Prepare for Procedure (Check labs, plan, assess risks, review procedure)	2	2	4	2	Standard
A	Communicate with patient and/or family (Discuss procedure/ obtain consent)	3	5	5	10	+7 for detailed consenting using multi-page or electronic form. Discuss results of Heart Team consultations (if performed); access site options; pros and cons of various PCI techniques including

						intra-coronary lithotripsy, atherectomy angioplasty, stenting; and possibility of conversion to emergency surgery. Discuss alternatives to PCI (surgery or medical therapy.) Discuss risks of all 3 approaches. Obtain separate consents for transfusion and moderate sedation.
A	Communicate with other professionals	0	5	5	0	Standard
A	Check/set-up room, supplies and equipment	1	5	5	5	+4 Utilize time similar to procedures with anesthesia to assess complex array of catheter, stents, and other supplies/equipment
A	Check/ prepare patient readiness (Gown, drape, prep, mark)	1	5	5	6	+5 Left and right radial pulses are evaluated to determine which are available for access (eg not harvested for prior CABG) and which of the two offers better access. Evaluate whether femoral artery is available for access and determine if left, right, or both femoral access sites should be prepped. Time out is performed.
A	Prepare/ review/ confirm procedure	1	1	1	1	Standard
B	Perform/ supervise patient positioning	1	3	3	3	+2 Utilize time similar to procedures with anesthesia to position patient comfortably on the table with arm in uncomfortable position, usually on a special pad. Arm used for radial access must be positioned and supinated with ventral surface oriented up and secured with tape to keep it there for entire procedure. Ultra-sound probe is inserted into sterile sleeve; console is programmed and turned on. Anti-spasm cocktail is prepared for intra-arterial injection.

C	Observe (wait anesthesia care)	0	10	15	0	Standard
C	Dress and scrub for procedure	5	5	5	5	Standard

92933: PTCA + Atherectomy + Stent

ACC and SCAI convened a panel of physicians familiar with the services to review the survey data. The survey was robust and was completed by physicians who have experience with the service. Code 92933 will

be used to report percutaneous transluminal coronary atherectomy, with intracoronary stent, with coronary angioplasty when performed, single major coronary artery and/or its branches. The panel reviewed the preservice time and selected package 2 with the modifications described above for a straightforward procedure on a difficult patient without anesthesia in a facility.

The key reference service is 37225, femoral/popliteal revascularization with angioplasty and atherectomy. While procedurally similar, 37225 is a longer, less intense service. 81% of key reference respondents found surveyed code 92933 to be more or much more intense/complex than 37225.

The societies **recommend a wRVU of 11.94 with times of 43/75/28.** The preservice time of 43 was adjusted upward from Package 2 to reflect the enhanced steps described above: 7 additional minutes for complicated consent, 4 additional minutes to setup room similar to a procedure that utilizes anesthesia, 5 additional minutes for double and complex draping and ultrasound for vessel viability, and 2 additional minutes for complex positioning of the arm and heart imaging. The intra-service time of 77 minutes is the survey median. Post-service time is the standard 8B package for a complex procedure under sedation.

This value is below the longer KRS, but also accounts for the increased intensity of working in the coronary arteries(which are always in motion and where rupture can cause immediate death), as well as the increased intensity of radial artery access as opposed to the prior typical technique using femoral artery access.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☒ Other reason (please explain) The interventional cardiologisty typically also manages moderate sedation, 99152.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 92933

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Interventional Cardiology How often? Commonly

Specialty Cardiology How often? Commonly

Specialty Internal Medicine How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 44157
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This estimate is three times the 2022 traditional Medicare data for usage to account for Medicare Advantage and commerical insurance covered performance.

Specialty Interventional Cardiology Frequency 23050 Percentage 52.20 %

Specialty Cardiology Frequency 19562 Percentage 44.30 %

Specialty Internal Medicine Frequency 1016 Percentage 2.30 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 14,719 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2022 RUC Database data. Recent trends show gradual decline, but we do not know if that will continue.

Specialty Interventional Cardiology Frequency 7683 Percentage 52.19 %

Specialty Cardiology Frequency 6521 Percentage 44.30 %

Specialty Internal Medicine Frequency 339 Percentage 2.30 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Cardiovascular-Coronary angioplasty (PTCA)

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 92933

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:92937 Tracking Number D6 Original Specialty Recommended RVU: **11.30**
Presented Recommended RVU: **11.30**
Global Period: 000 Current Work RVU: **10.95** RUC Recommended RVU: **11.30**

CPT Descriptor: Percutaneous transluminal revascularization of or through coronary artery bypass graft (internal mammary, free arterial, venous), any combination of intracoronary stent, atherectomy and angioplasty, including distal protection when performed, single major coronary artery and/its branches

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 79-year-old female who had bypass surgery 10 years ago presents with unstable angina consistent with an acute coronary syndrome. Coronary arteriography demonstrates that the culprit is a saphenous vein graft to a large left circumflex coronary artery. The vein graft is diffusely diseased and has subtotal occlusion by a 3-mm long thrombus. Percutaneous coronary intervention is
performed.

Percentage of Survey Respondents who found Vignette to be Typical: 97%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 99% , In the ASC 1%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 31% , Overnight stay-less than 24 hours 58% , Overnight stay-more than 24 hours 11%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 98%

Description of Pre-Service Work: The patient's history, records, laboratory, and diagnostic tests are reviewed. A physical examination is conducted. Appropriate communication is conducted with the patient and the patient's family as well as with other medical professionals as needed (i.e., the “Heart Team approach”). The procedure is reviewed with the patient. The risks and benefits of the procedure are presented, as well as the alternatives. Informed consent is obtained. Hair is removed from the potential access sites. Necessary equipment, instruments, and supplies for the procedure are confirmed to be available and operational. Instruments and supplies for the procedure are pulled. The patient is transported to the procedure suite, positioned on the procedural table, and attached to cardiac electrodes and an oxygen saturation monitor. A sterile table is prepared. The potential access sites are scrubbed in sterile fashion. A sterile drape is placed over the patient. The patient's information is loaded in the hemodynamic monitoring equipment to retain the data from the upcoming study.

Description of Intra-Service Work: Percutaneous arterial access is obtained, typically through the femoral artery or radial artery. Angiography of the access site is performed as needed to assess anatomy of the access vessel and appropriate location of the access site. A sheath is placed and flushed. Intraarterial vasodilators are administered. An appropriate guiding catheter is passed under fluoroscopic guidance to the ascending aorta, engaged into the coronary or graft ostium, and re-positioned as needed to prevent pressure damping. Appropriate antiplatelet therapy treatment is confirmed and anticoagulation administered. Therapeutic anticoagulation is confirmed by testing an activated clotting time (ACT). Additional anticoagulation is administered as needed. Multiple coronary injections are performed in different views to assess the target lesion(s). A coronary guidewire is used to cross the target lesion(s) and its position distally in the artery is confirmed. A distal protection device is then advanced down the graft over the coronary guidewire to capture embolic debris and help prevent no-reflow. Microvascular vasodilators are administered through the graft to help prevent no-reflow. A stent of appropriate diameter and length is selected, advanced over the guidewire to the target lesion and carefully positioned. The stent is deployed at nominal or high pressure. If the stent fails to cover the entire diseased segment, additional stent(s) are then placed using the same techniques. If there is no-reflow (slow flow of contrast down the vessel, electrocardiography changes, and chest pain) microvascular vasodilators are administered again and if there is no resolution

an aspiration catheter is advanced down into the graft, debris is aspirated to restore flow, and coronary vasodilators are delivered into the distal vessel. Once adequate flow is restored, assessment of the need for further balloon expansion is performed. If needed, an appropriate-sized balloon is selected and the lesion dilated. Intracoronary vasodilators are again administered. If the result is acceptable, the distal protection device is then removed by advancing the recapture catheter over the guidewire. Completion angiography is again performed after repeat administration of intracoronary vasodilators. Inspection of the images is again performed for signs of vessel dissection, perforation, or impaired coronary flow. The guide catheter is disengaged from the coronary ostium and then removed over a guidewire from the body. Anticoagulation infusions are stopped. The sheath is removed, and hemostasis is achieved by an appropriate technique. If a vascular closure device cannot used for femoral access, the sheath is sutured in place for subsequent removal once the ACT level falls to a safe level for manual compression.

Description of Post-Service Work: Films and hemodynamics are reviewed and a formal report is generated. The patient, the patient's family, and the referring physician are notified of the results. A plan of management is developed and discussed with the patient and the patient's family. Additional antiplatelet and antithrombin therapy is administered as necessary. The patient is admitted to ensure no bleeding, to monitor for abrupt vessel closure, and for continued therapy of ischemic heart disease.

SURVEY DATA

RUC Meeting Date (mm/yyyy)	04/2024					
Presenter(s):	Dr. Richard Wright, Dr. Ed Tuohy, Dr. Afnan Tariq, Dr. Mark Hoyer					
Specialty Society(ies):	ACC, SCAI

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	2%	14%	40%	44%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	24%	76%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	29%	71%
Physical effort required	5%	55%	40%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	7%	93%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	18%	14%	39%	29%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	21%	32%	47%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	11%	36%	53%
Physical effort required	7%	43%	50%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	11%	36%	53%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

CPT Changes

The full family of percutaneous coronary intervention (PCI) codes was last reviewed by the RUC at the January 2012 meeting, when the code family was updated to reflect bundling after CMS identified MPC codes not reviewed in the prior 5 years as potentially misvalued. The codes were surveyed for the January 2023 RUC

meeting after the CPT Editorial Panel approved creation of a single add-on code that describes the work of coronary intravascular lithotripsy (IVL), a technology to modify lesions that did not exist at the time of the prior review. That code change application was submitted by a device manufacturer. The societies had planned to make other revisions to the code family at the following CPT cycle. At the January 2023 RUC meeting the societies proposed that only the new IVL code be valued, and the remainder of the code set be sent to CPT for revision before review. The RUC approved this proposal and, after several code change applications, the revised family was approved at the February 2024 CPT Panel meeting.

The CPT updates included code deletions, revisions, and additions.

- The original code set included additional branch add-on codes for several of the procedures. CMS assigned the branch codes a value of 0 RVUs, rolling a prorated portion of their value into their base codes (more on this later). Due to this lack of RVUs neither CMS nor commercial payers reimbursed these codes from 2013 to present and they were deleted by CPT in February 2024. The deleted codes included 92921, 92925, 92929, 92934, 92938, and 92944.
- CPT amended the base codes to each of these deleted add-on codes (92920, 92924, 92928, 92933, 92937, 92941, and 92943) to include the work, when performed, of potential branch vessels which was not included in the original code definitions and descriptions of work. This essentially matches the code descriptors to CMS's approach to not pay separately for additional branch work.
- Also, in February 2024 CPT created two new codes within the family. First, 92930, was created to allow coding for the work involved in placement of intracoronary stent(s) (currently coded as 92928) that exceeds the typical stenting case. The second new code, 92945, was created to allow coding for revascularization of a chronic total occlusion when both antegrade and retrograde approaches are employed.
- Finally, CPT revised codes 93571 and 93572 to make a correction to the fractional flow reserve (FFR) codes to correct a coding issue relating to instant flow reserve (iFR).

92972 Intravascular Lithotripsy (IVL)

As noted above, the IVL code was surveyed, reviewed by the RUC and issued a value at the January 2023 RUC meeting. The IVL code survey was robust, with 139 respondents. There have been no significant technological or other changes to the IVL procedure since its initial valuation. With the recent survey of this code and in an effort to maximize survey response by keeping it a bit shorter, we did not include the code in this survey and recommend affirmation of current value and time.

Current RVUs and Times

As referenced above, CMS does not recognize the add-on branch codes as separately payable. However, the agency did bundle them into the underlying PCI codes. In doing so, it also added small amounts of work and time, proportionate to predicted utilization. Also, since the last time these codes were valued, moderate sedation was unbundled, removing commensurate work and time. The summary spreadsheet shows the original RUC recommended value, the CMS adjustments for branch code bundling, the adjustments for unbundling of moderate sedation, and finally the current values.

Background: PCI Evolution & Compelling Evidence

Change in Technique

The recommendations for this tab produce an increase in RVUs of less than one half of a percent aggregated across the family of codes. Accordingly, we submit that these services have undergone changes in technique and patient population that substantiate compelling evidence to allow an increase in the aggregate value of the code family. At the time of the 2012 survey, PCI was typically performed via the femoral artery, with a very small minority of cases performed through the radial artery. PCI is now typically performed through the radial artery, reflecting best practice recommendations from the field. https://onlinelibrary.wiley.com/doi/10.1002/ccd.28672

Radial access is safer for patients despite being technically more challenging for the operator. The main advantage is a significant reduction in bleeding risk as well as decreased mortality for some patient subsets. https://pubmed.ncbi.nlm.nih.gov/33507598/.

Radial access requires additional preservice time that is discussed further below. This approach also requires different skills and techniques that are more difficult to perform than access through the femoral artery. While safer for the patient, the service is more technically challenging for the operator in several respects.

(1) The average radial artery is about 2 mm compared to femoral arteries that average about 9 mm, so entering the artery with a needle is more difficult.
(2) The radial and brachial arteries are smaller and more prone to spasm making catheter advancement or torquing difficult or impossible; many operators give an anti-vasospastic cocktail routinely which takes additional time.
(3) Whereas femoral access requires catheters to traverse one 180-degree bend to reach the heart, radial access requires the catheter to make one-180 degree bend and usually two more 90-degree bends to reach the heart, which makes catheter advancement and torquing more difficult.
(4) Radial access provides more frequent challenging anatomic variants such as radial loop, accessory radial arteries, early take-off radial arteries, and aberrant innominate arteries (arteria lusoria); in contrast anatomy from the femoral artery to the heart has few variants. These problems lead to conversion from radial to femoral access in about 10% of cases, while conversion from femoral to radial is almost non-existent.

Positioning for radial increases the risk of radiation and precautions. More time is spent closer to the image intensifier at different angles as opposed to standing farther back when patient is in the femoral area. Now we are closer to the heart and reaching across the patient's chest.

Change in Patient Population

We also see patients undergoing PCI who generally have more comorbidities than a decade ago. Attention to stricter adherence on statins and other medicines in revascularization and chest pain guidelines has eliminated many patients who otherwise may have been treated with lower acuity PCI, something we see in the declining utilization of these services. Remaining patients are more complex than they were a dozen years ago.

All of these factors lead to services that are both more intense/complex while also successfully decreasing the intra-procedure time the patient is on the table.

Incorrect Assumptions

Finally, with the current times and valuation consisting of a mix of RUC recommendations, pro-rated bundling of time and work of PCI in branches by CMS, and reductions of work and time by CMS to apply coding changes related to unbundling moderate sedation, we submit that the current values were derived using a flawed mechanism. CMS bundled the now-deleted branch codes using a type of prorated building block methodology that casts the current values in doubt and provides compelling evidence that the best values for these services should be derived from the robust survey before us.

Recommendations Methodology

We have laid out a rationale above for the intensity/complexity of these codes rising while in some cases the performance time may have decreased. We recommend the survey 25th percentile for all the 000 codes in this family. We chose the survey 25th percentile work RVUs because this approach generally kept the recommended values in line with the trajectory of the reduction or addition of intra-service and total time for the codes while maintaining rank order. While changes to the work RVUs and times are not recommended in exactly proportional amounts, they do maintain relativity in the magnitude to which they change to the positive or the negative. That is to say, where there is a significant reduction in intra-service time there is a more modest

reduction in recommended work RVU and the same is true in the positive direction. Where there is a significant increase in intra-service time there is a more modest recommended increase in work RVU for those codes. RVU.

In developing recommendations for the family, we observed that recommendations for times and values generate WPUT (ie, intensity) values that maintain rank order relationships within the family and align with operators' estimates of work intensity. For instance, 92920 for PTCA has a lower WPUT than 92924 for PTCA with atherectomy, reflecting the higher complication rates of atherectomy and operators' perception that atherectomy is more intense. WPUT for 92941 (PCI of an acute myocardial infarction) has the highest WPUT consistent with operators' perceptions that this is the most intense interventional service. CTO codes 92943 and 92945 have lower WPUTs because they are longer services with multiple catheter changes and techniques being attempted. This consistency of WPUT with current rank order and with operators' perceptions of intensity support the recommendations at the 25th-percentile survey values.

This approach produces the following recommendations for the family that would produce budget increase of 12,342 RVUs out of a baseline of over 3.2 million RVUs (0.38%)

Preservice Time

For each of the 000 codes, we recommend additions to preservice package 2 (Difficult patient/straightforward procedure without anesthesia care) that are supported by the survey. While these are 000 codes provided to patients with short or no hospital stay, there are certain elements of preservice time that are more akin to that of a service which utilizes general anesthesia.

		FACILITY			**PCI**	**Notes**
		2	**3**	**4**	**2+**	
	Total Pre-Service Time	**25**	**51**	**63**	**43**

C	Observe (wait anesthesia care)	0	10	15	0	Standard
C	Dress and scrub for procedure	5	5	5	5	Standard

93237: Any PCI in CABG

ACC and SCAI convened a panel of physicians familiar with the services to review the survey data. The survey was robust and was completed by physicians who have experience with the service. Code 93237 will be used to report percutaneous transluminal coronary intervention of/through a coronary artery bypass graft,

using any combination of angioplasty, atherectomy, and/or stent in a single major coronary artery and/or its branches. The panel reviewed the preservice time and selected package 2 with the modifications described above for a straightforward procedure on a difficult patient without anesthesia in a facility.

The key reference service is 37225, femoral/popliteal revascularization with angioplasty and atherectomy. While procedurally similar, 37225 is a longer, less intense service. 84% of key reference respondents found surveyed code 93237 to be more or much more intense/complex than 37225.

The societies **recommend a wRVU of 11.30 with times of 43/65/28.** The preservice time of 43 was adjusted upward from Package 2 to reflect the enhanced steps described above: 7 additional minutes for complicated consent, 4 additional minutes to setup room similar to a procedure that utilizes anesthesia, 5 additional minutes for double and complex draping and ultrasound for vessel viability, and 2 additional minutes for complex positioning of the arm and heart imaging. The intra-service time of 77 minutes relies on 70 minutes from the survey plus 7 minutes from bundling of the branch codes. Post-service time is the standard 8B package for a complex procedure under sedation.

This value is below the longer KRS yet above the current value. The change accounts for the increased intensity of working in the coronary arteries(which are always in motion and where rupture can cause immediate death), as well as the increased intensity of radial artery access as opposed to the prior typical technique using femoral artery access. Patients undergoing PCI of bypass graft have higher long term complications than conventional native artery PCI. https://www.practiceupdate.com/content/pci-innative-coronary-arteries-vs-bypassgrafts-in-patients-with-prior-cabg/38087

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☒ Other reason (please explain) The interventional cardiologisty typically also manages moderate sedation, 99152.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 92933

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Interventional Cardiology How often? Commonly

Specialty Cardiology How often? Commonly

Specialty Internal Medicine How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 37014
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This estimate is three times the 2022 traditonal Medicare data for usage to account for Medicare Advantage and commercial insurance covered performance.

Specialty Interventional Cardiology Frequency 19765 Percentage 53.39 %

Specialty Cardiology Frequency 16138 Percentage 43.59 %

Specialty Internal Medicine Frequency 777 Percentage 2.09 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 12,338 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2022 RUC Database data. Recent trends show gradual decline, but we do not know if that will continue.9

Specialty Interventional Cardiology Frequency 6588 Percentage 53.39 %

Specialty Cardiology Frequency 5379 Percentage 43.59 %

Specialty Internal Medicine Frequency 259 Percentage 2.09 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Cardiovascular-Coronary angioplasty (PTCA)

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 92933

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Descriptor: Percutaneous transluminal revascularization of acute total/subtotal occlusion during acute myocardial infarction, any combination of intracoronary stent, atherectomy and angioplasty, including aspiration thrombectomy when performed, single major coronary artery and/or its branches or single bypass graft and/or its subtended branches

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 66-year-old male calls 911 for sudden onset of crushing substernal chest pain. Prehospital electrocardiography demonstrates acute anterior myocardial infarction. The emergency medical personnel bypass the emergency department and take the patient directly to the cardiac catheterization laboratory. After rapid assessment, immediate coronary angiography (reported separately), demonstrates thrombotic 100% occlusion of the mid-left anterior descending artery. Percutaneous coronary intervention is planned immediately with the goal of first medical contact-toballoon time under 90 minutes.

Percentage of Survey Respondents who found Vignette to be Typical: 96%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 100% , In the ASC 0%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 6% , Overnight stay-less than 24 hours 22% , Overnight stay-more than 24 hours 72%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 100%

Description of Pre-Service Work: The patient's history, records, laboratory, and diagnostic tests are rapidly reviewed. A physical examination is rapidly conducted. Appropriate communication is conducted with the patient and the patient's family as well as with other medical professionals as needed (i.e., the “Heart Team approach”). The procedure is quickly reviewed with the patient. The risks and benefits of the procedure are rapidly presented, as well as the alternatives. Informed consent is obtained. In an emergent fashion, hair is removed from the potential access sites. Necessary equipment, instruments, and supplies for the procedure are confirmed to be available and operational. Instruments and supplies for the procedure are pulled. The patient is rushed to the procedure suite, positioned on the procedural table, and attached to cardiac electrodes and an oxygen saturation monitor. A sterile table is prepared. The potential access sites are scrubbed in sterile fashion. A sterile drape is placed over the patient. The patient's information is loaded in the hemodynamic monitoring equipment to retain the data from the upcoming study.

Description of Intra-Service Work: Percutaneous arterial access is obtained, typically through the femoral artery or radial artery. Angiography of the access site is performed as needed to assess anatomy of the access vessel and appropriate location of the access site. A sheath is placed and flushed. Intraarterial vasodilators are administered. An appropriate guiding catheter is passed under fluoroscopic guidance to the ascending aorta, engaged into the coronary ostium, and re-positioned as needed to prevent pressure damping. Appropriate antiplatelet therapy treatment is confirmed and anticoagulation administered. Therapeutic anticoagulation is confirmed by testing an activated clotting time (ACT). Additional anticoagulation is administered as needed. Multiple coronary injections are performed in different views to assess the target lesion(s). A coronary guidewire is used to cross the target lesion(s) and its position distally in the artery is confirmed. If there is no re-flow down the vessel or significant thrombus, an appropriate aspiration catheter is rapidly advanced to the occluded vessel and thrombus is aspirated. Multiple rounds of intracoronary microvascular vasodilators are administered. If antegrade coronary flow is restored but there is residual thrombus, intravenous and/or intracoronary antiplatelet agents may be infused to help resolve the thrombus. An appropriate-sized balloon is selected, advanced over

the coronary guidewire to the lesion, inflated as needed to open the lesion, and withdrawn. Intracoronary vasodilators are again administered. Angiography is performed in multiple views. Once an adequate expansion is achieved to allow stent deployment, a stent of appropriate diameter and length is selected and advanced to the target lesion and carefully positioned. The stent is deployed but frequently does not cover the entire diseased segment and additional stents are then placed as needed using the same techniques. Next a high-pressure, non-compliant balloon is advanced over the coronary guidewire into the stented segment, and this is inflated at high pressure to ensure stent expansion. If the result is acceptable, the coronary guidewire is then withdrawn back into the guide. The catheter and sheath are removed, and hemostasis is achieved by appropriate means. Closure devices require device/suture deployment. If a vascular closure/suture device is placed, observation of the site is performed to ensure no immediate bleeding and manual pressure is required for a short time to achieve complete hemostasis. If a vascular closure device is not used, typically the sheath is sewn in for subsequent removal once the ACT level falls to a safe level after which manual compression is held for approximately 20 minutes to achieve hemostasis. A full report is dictated or entered into the record.

Description of Post-Service Work: Films and hemodynamics are reviewed and a formal report is generated. The patient, the patient's family, and the referring physician are notified of the results. A plan of management is developed and discussed with the patient and the patient's family. Additional antiplatelet and antithrombin therapy is administered as necessary. The patient is admitted to ensure no bleeding, to monitor for abrupt vessel closure, and for continued therapy of ischemic heart disease.

SURVEY DATA

RUC Meeting Date (mm/yyyy)	04/2024					
Presenter(s):	Dr. Richard Wright, Dr. Ed Tuohy, Dr. Afnan Tariq, Dr. Mark Hoyer

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	3%	14%	30%	53%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	3%	31%	46%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	6%	28%	66%
Physical effort required	8%	42%	50%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	3%	19%	78%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	9%	33%	58%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	9%	91%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	29%	71%
Physical effort required	0%	40%	60%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	9%	91%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

CPT Changes

The full family of percutaneous coronary intervention (PCI) codes was last reviewed by the RUC at the January 2012 meeting, when the code family was updated to reflect bundling after CMS identified MPC codes not reviewed in the prior 5 years as potentially misvalued. The codes were surveyed for the January 2023 RUC

meeting after the CPT Editorial Panel approved creation of a single add-on code that describes the work of coronary intravascular lithotripsy (IVL), a technology to modify lesions that did not exist at the time of the prior review. That code change application was submitted by a device manufacturer. The societies had planned to make other revisions to the code family at the following CPT cycle. At the January 2023 RUC meeting the societies proposed that only the new IVL code be valued, and the remainder of the code set be sent to CPT for revision before review. The RUC approved this proposal and, after several code change applications, the revised family was approved at the February 2024 CPT Panel meeting.

The CPT updates included code deletions, revisions, and additions.

- The original code set included additional branch add-on codes for several of the procedures. CMS assigned the branch codes a value of 0 RVUs, rolling a prorated portion of their value into their base codes (more on this later). Due to this lack of RVUs neither CMS nor commercial payers reimbursed these codes from 2013 to present and they were deleted by CPT in February 2024. The deleted codes included 92921, 92925, 92929, 92934, 92938, and 92944.
- CPT amended the base codes to each of these deleted add-on codes (92920, 92924, 92928, 92933, 92937, 92941, and 92943) to include the work, when performed, of potential branch vessels which was not included in the original code definitions and descriptions of work. This essentially matches the code descriptors to CMS's approach to not pay separately for additional branch work.
- Also, in February 2024 CPT created two new codes within the family. First, 92930, was created to allow coding for the work involved in placement of intracoronary stent(s) (currently coded as 92928) that exceeds the typical stenting case. The second new code, 92945, was created to allow coding for revascularization of a chronic total occlusion when both antegrade and retrograde approaches are employed.
- Finally, CPT revised codes 93571 and 93572 to make a correction to the fractional flow reserve (FFR) codes to correct a coding issue relating to instant flow reserve (iFR).

92972 Intravascular Lithotripsy (IVL)

As noted above, the IVL code was surveyed, reviewed by the RUC and issued a value at the January 2023 RUC meeting. The IVL code survey was robust, with 139 respondents. There have been no significant technological or other changes to the IVL procedure since its initial valuation. With the recent survey of this code and in an effort to maximize survey response by keeping it a bit shorter, we did not include the code in this survey and recommend affirmation of current value and time.

Current RVUs and Times

As referenced above, CMS does not recognize the add-on branch codes as separately payable. However, the agency did bundle them into the underlying PCI codes. In doing so, it also added small amounts of work and time, proportionate to predicted utilization. Also, since the last time these codes were valued, moderate sedation was unbundled, removing commensurate work and time. The summary spreadsheet shows the original RUC recommended value, the CMS adjustments for branch code bundling, the adjustments for unbundling of moderate sedation, and finally the current values.

Background: PCI Evolution & Compelling Evidence

Change in Technique

The recommendations for this tab produce an increase in RVUs of less than one half of a percent aggregated across the family of codes. Accordingly, we submit that these services have undergone changes in technique and patient population that substantiate compelling evidence to allow an increase in the aggregate value of the code family. At the time of the 2012 survey, PCI was typically performed via the femoral artery, with a very small minority of cases performed through the radial artery. PCI is now typically performed through the radial artery, reflecting best practice recommendations from the field. https://onlinelibrary.wiley.com/doi/10.1002/ccd.28672

Radial access is safer for patients despite being technically more challenging for the operator. The main advantage is a significant reduction in bleeding risk as well as decreased mortality for some patient subsets. https://pubmed.ncbi.nlm.nih.gov/33507598/.

Radial access requires additional preservice time that is discussed further below. This approach also requires different skills and techniques that are more difficult to perform than access through the femoral artery. While safer for the patient, the service is more technically challenging for the operator in several respects.

(1) The average radial artery is about 2 mm compared to femoral arteries that average about 9 mm, so entering the artery with a needle is more difficult.
(2) The radial and brachial arteries are smaller and more prone to spasm making catheter advancement or torquing difficult or impossible; many operators give an anti-vasospastic cocktail routinely which takes additional time.
(3) Whereas femoral access requires catheters to traverse one 180-degree bend to reach the heart, radial access requires the catheter to make one-180 degree bend and usually two more 90-degree bends to reach the heart, which makes catheter advancement and torquing more difficult.
(4) Radial access provides more frequent challenging anatomic variants such as radial loop, accessory radial arteries, early take-off radial arteries, and aberrant innominate arteries (arteria lusoria); in contrast anatomy from the femoral artery to the heart has few variants. These problems lead to conversion from radial to femoral access in about 10% of cases, while conversion from femoral to radial is almost non-existent.

Positioning for radial increases the risk of radiation and precautions. More time is spent closer to the image intensifier at different angles as opposed to standing farther back when patient is in the femoral area. Now we are closer to the heart and reaching across the patient's chest.

Change in Patient Population

We also see patients undergoing PCI who generally have more comorbidities than a decade ago. Attention to stricter adherence on statins and other medicines in revascularization and chest pain guidelines has eliminated many patients who otherwise may have been treated with lower acuity PCI, something we see in the declining utilization of these services. Remaining patients are more complex than they were a dozen years ago.

All of these factors lead to services that are both more intense/complex while also successfully decreasing the intra-procedure time the patient is on the table.

Incorrect Assumptions

Finally, with the current times and valuation consisting of a mix of RUC recommendations, pro-rated bundling of time and work of PCI in branches by CMS, and reductions of work and time by CMS to apply coding changes related to unbundling moderate sedation, we submit that the current values were derived using a flawed mechanism. CMS bundled the now-deleted branch codes using a type of prorated building block methodology that casts the current values in doubt and provides compelling evidence that the best values for these services should be derived from the robust survey before us.

Recommendations Methodology

We have laid out a rationale above for the intensity/complexity of these codes rising while in some cases the performance time may have decreased. We recommend the survey 25th percentile for all the 000 codes in this family. We chose the survey 25th percentile work RVUs because this approach generally kept the recommended values in line with the trajectory of the reduction or addition of intra-service and total time for the codes while maintaining rank order. While changes to the work RVUs and times are not recommended in exactly proportional amounts, they do maintain relativity in the magnitude to which they change to the positive or the negative. That is to say, where there is a significant reduction in intra-service time there is a more modest

reduction in recommended work RVU and the same is true in the positive direction. Where there is a significant increase in intra-service time there is a more modest recommended increase in work RVU for those codes. RVU.

In developing recommendations for the family, we observed that recommendations for times and values generate WPUT (ie, intensity) values that maintain rank order relationships within the family and align with operators' estimates of work intensity. For instance, 92920 for PTCA has a lower WPUT than 92924 for PTCA with atherectomy, reflecting the higher complication rates of atherectomy and operators' perception that atherectomy is more intense. WPUT for 92941 (PCI of an acute myocardial infarction) has the highest WPUT consistent with operators' perceptions that this is the most intense interventional service. CTO codes 92943 and 92945 have lower WPUTs because they are longer services with multiple catheter changes and techniques being attempted. This consistency of WPUT with current rank order and with operators' perceptions of intensity support the recommendations at the 25th-percentile survey values.

This approach produces the following recommendations for the family that would produce budget increase of 12,342 RVUs out of a baseline of over 3.2 million RVUs (0.38%)

Preservice Time

For each of the 000 codes, we recommend additions to preservice package 2 (Difficult patient/straightforward procedure without anesthesia care) that are supported by the survey. While these are 000 codes provided to patients with short or no hospital stay, there are certain elements of preservice time that are more akin to that of a service which utilizes general anesthesia.

		FACILITY			**PCI**	**Notes**
		2	**3**	**4**	**2+**	
	Total Pre-Service Time	**25**	**51**	**63**	**43**

C	Observe (wait anesthesia care)	0	10	15	0	Standard
C	Dress and scrub for procedure	5	5	5	5	Standard

92941: Any PCI of Myocardial Infarction

ACC and SCAI convened a panel of physicians familiar with the services to review the survey data. The survey was robust and was completed by physicians who have experience with the service. Code 92941 will be used to report percutaneous transluminal coronary intervention of an acute occlusion during acute

myocardial infarction, using any combination of angioplasty, atherectomy, and/or stent in a single major coronary artery and/or its branches or single bypass graft and/or its subtended branches. This is a race to save as much myocardial tissue as possible during AMI minimizing door-to-balloon time. The panel reviewed the preservice time and selected package 2 with the *some* of the modifications described above for a straightforward procedure on a difficult patient without anesthesia in a facility.

The key reference service is 93583, percutaneous transcatheter septal reduction therapy. While procedurally similar, 93583 is a longer, less intense service. 83% of key reference respondents found surveyed code 92941 to be more or much more intense/complex than 93583.

The societies **recommend a wRVU of 12.72 with times of 30/65/28.** The pre-service time of 30 was adjusted upward from Package 2 to reflect the some, but not all, of the enhanced steps described above: 2 additional minutes for complicated consent of this emergent case, 1 additional minute for complex draping and ultrasound for vessel viability, and 2 additional minutes for complex positioning of the arm and heart imaging. The intra-service time of 65 minutes is the survey median. Post-service time is the standard 8B package for a complex procedure under sedation.

This value is below the longer KRS yet higher than the current value. The change accounts for the increased intensity of working in the coronary arteries(which are always in motion and where rupture can cause immediate death), as well as the increased intensity radial artery access as opposed to the prior typical technique using femoral artery access.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☒ Historical precedents.
   ☒ Other reason (please explain) The interventional cardiologisty typically also manages moderate sedation, 99152. Since these patients are seen emergently and are unknown to the operator who is focused on door to balloon time, separately reportable diagnostic catheterization codes are typically reported and reduced by multiple procedure payment reduction policy.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 92941

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Interventional Cardiology How often? Commonly

Specialty Cardiology How often? Commonly

Specialty Internal medicine How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 92289
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This estimate is three times the 2022 Medicare data for usage to account for Medicare Advantage and commerical insurance covered performance.

Specialty Interventional Cardiology Frequency 45406 Percentage 49.19 %

Specialty Cardiology Frequency 42914 Percentage 46.49 %

Specialty Internal Medicine Frequency 2861 Percentage 3.10 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 30,763 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2022 RUC Database data. Recent trends show gradual decline, but we do not know if that will continue.

Specialty Interventional Cardiology Frequency 15135 Percentage 49.19 %

Specialty Cardiology Frequency 14305 Percentage 46.50 %

Specialty Internal Medicine Frequency 954 Percentage 3.10 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Cardiovascular-Coronary angioplasty (PTCA)

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 92941

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

CPT Descriptor: Percutaneous transluminal revascularization of chronic total occlusion, single coronary artery, coronary artery branch, or coronary artery bypass graft, and/or subtended major coronary artery branches of the bypass graft any combination of intracoronary stent, atherectomy and angioplasty; antegrade approach

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 72-year-old female presents with six months of exertional angina despite guideline directed medical therapy. Coronary angiography shows 100% left circumflex coronary stenosis. The lesion is on a bend in the circumflex coronary artery with focal calcification at the site and has antegrade bridging collaterals to the distal vessel, consistent with a chronic total occlusion. The patient is referred for percutaneous coronary intervention.

Percentage of Survey Respondents who found Vignette to be Typical: 94%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 99% , In the ASC 1%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 17% , Overnight stay-less than 24 hours 64% , Overnight stay-more than 24 hours 19%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 100%

Description of Pre-Service Work: The patient's history, records, laboratory, and diagnostic tests are reviewed. A physical examination is conducted. Appropriate communication is conducted with the patient and the patient's family as well as with other medical professionals as needed (i.e., the “Heart Team approach”). The procedure is reviewed with the patient. The risks and benefits of the procedure are presented, as well as the alternatives. Informed consent is obtained. Hair is removed from the potential access sites. Necessary equipment, instruments, and supplies for the procedure are confirmed to be available and operational. Instruments and supplies for the procedure are pulled. The patient is transported to the procedure suite, positioned on the procedural table, and attached to cardiac electrodes and an oxygen saturation monitor. A sterile table is prepared. The potential access sites are scrubbed in sterile fashion. A sterile drape is placed over the patient. The patient's information is loaded in the hemodynamic monitoring equipment to retain the data from the upcoming study.

Description of Intra-Service Work: Percutaneous arterial access is obtained in two peripheral arteries, typically through the femoral arteries and/or radial artery. Angiography of the access site(s) is performed as needed to assess anatomy of the access vessel(s) and appropriate location of the access site(s). Sheaths are placed and flushed. Intraarterial vasodilators are administered as needed. An appropriate guiding catheter is advanced retrograde to the ascending aorta. The guidewire is removed and the catheter is attached to the pressure manifold and aspirated and pressure measured. The catheter is placed in the left or right coronary ostium. Using this same technique, a second catheter is placed in the other coronary ostium. Appropriate antiplatelet therapy pretreatment is confirmed and anticoagulation is administered. Therapeutic anticoagulation is confirmed by drawing blood from the guide and testing an activated clotting time (ACT). Additional anticoagulation is administered as needed. Intracoronary vasodilators are administered. Multiple coronary injections are performed simultaneously through both guide catheters to determine anatomy of the target lesion and collaterals. A coronary guidewire is then manipulated through the guide catheter in the target artery and down the coronary artery and used to attempt to cross the target lesion or lesions. Typically, the operator uses additional multiple guidewires progressing to increasingly stiff guidewires to puncture through the chronic total occlusion, or more lubricious (hydrophilic) or tapered tip guidewires are used to engage and cross a microchannel. Multiple other techniques may be employed as needed (dual guidewire, dissection f the arterial wall using microcatheters, re-entry into the true lumen using a specialized balloon

catheter). Guidewire position across the lesion is confirmed angiographically by injections through the guide catheter in the artery providing collaterals to the occluded artery. An appropriate-sized balloon is selected and advanced to the lesion. Often, no balloon will cross and guide extension catheters or special microcatheters may be employed to corkscrew through the total occlusion. Plaque modification (atherectomy) may be needed to ablate calcium at the total occlusion site. If balloon crossing is eventually achieved, the angioplasty balloon is inflated then pulled back. Intracoronary vasodilators are administered. Angiography is performed in multiple views. Repeat balloon inflations are performed as needed to allow a stent to pass. An appropriately sized stent is passed across the lesion and deployed at high pressure. If the stent fails to cover the entire diseased segment, additional stent(s) are then placed repeating the steps above. A high-pressure, non-compliant balloon is advanced over the coronary guidewire into the stented segment, inflated at high pressure to ensure stent expansion, and pulled back. The balloon is then exchanged back over the guidewire into the guide. Intracoronary vasodilators are administered. Angiography is performed in multiple views. The artery used for the retrograde technique is carefully imaged to rule out trauma or thrombus. Final angiogram of the target artery and lesion are taken. If the result is acceptable, the guidewire is then withdrawn back into the guide. Completion angiography is again performed after repeat administration of intracoronary vasodilators. Both catheters and sheaths are removed, and hemostasis at both access sites is achieved by appropriate techniques. If a vascular closure device cannot be used for femoral access, the sheath is sutured in place for subsequent removal once the ACT level falls to a safe level for manual compression.

Description of Post-Service Work: Films and hemodynamics are reviewed and a formal report is generated. The patient, the patient's family, and the referring physician are notified of the results. A plan of management is developed and discussed with the patient and the patient's family. Additional antiplatelet and antithrombin therapy is administered as necessary. The patient is admitted to ensure no bleeding, to monitor for abrupt vessel closure, and for continued therapy of ischemic heart disease.

SURVEY DATA

RUC Meeting Date (mm/yyyy)	04/2024					
Presenter(s):	Dr. Richard Wright, Dr. Ed Tuohy, Dr. Afnan Tariq, Dr. Mark Hoyer

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	6%	17%	19%	58%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	6%	14%	80%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	17%	83%
Physical effort required	6%	20%	74%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	19%	81%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	10%	29%	61%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	10%	23%	67%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	13%	87%
Physical effort required	7%	20%	73%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	10%	90%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

CPT Changes

The full family of percutaneous coronary intervention (PCI) codes was last reviewed by the RUC at the January 2012 meeting, when the code family was updated to reflect bundling after CMS identified MPC codes not reviewed in the prior 5 years as potentially misvalued. The codes were surveyed for the January 2023 RUC

meeting after the CPT Editorial Panel approved creation of a single add-on code that describes the work of coronary intravascular lithotripsy (IVL), a technology to modify lesions that did not exist at the time of the prior review. That code change application was submitted by a device manufacturer. The societies had planned to make other revisions to the code family at the following CPT cycle. At the January 2023 RUC meeting the societies proposed that only the new IVL code be valued, and the remainder of the code set be sent to CPT for revision before review. The RUC approved this proposal and, after several code change applications, the revised family was approved at the February 2024 CPT Panel meeting.

The CPT updates included code deletions, revisions, and additions.

- The original code set included additional branch add-on codes for several of the procedures. CMS assigned the branch codes a value of 0 RVUs, rolling a prorated portion of their value into their base codes (more on this later). Due to this lack of RVUs neither CMS nor commercial payers reimbursed these codes from 2013 to present and they were deleted by CPT in February 2024. The deleted codes included 92921, 92925, 92929, 92934, 92938, and 92944.
- CPT amended the base codes to each of these deleted add-on codes (92920, 92924, 92928, 92933, 92937, 92941, and 92943) to include the work, when performed, of potential branch vessels which was not included in the original code definitions and descriptions of work. This essentially matches the code descriptors to CMS's approach to not pay separately for additional branch work.
- Also, in February 2024 CPT created two new codes within the family. First, 92930, was created to allow coding for the work involved in placement of intracoronary stent(s) (currently coded as 92928) that exceeds the typical stenting case. The second new code, 92945, was created to allow coding for revascularization of a chronic total occlusion when both antegrade and retrograde approaches are employed.
- Finally, CPT revised codes 93571 and 93572 to make a correction to the fractional flow reserve (FFR) codes to correct a coding issue relating to instant flow reserve (iFR).

92972 Intravascular Lithotripsy (IVL)

As noted above, the IVL code was surveyed, reviewed by the RUC and issued a value at the January 2023 RUC meeting. The IVL code survey was robust, with 139 respondents. There have been no significant technological or other changes to the IVL procedure since its initial valuation. With the recent survey of this code and in an effort to maximize survey response by keeping it a bit shorter, we did not include the code in this survey and recommend affirmation of current value and time.

Current RVUs and Times

As referenced above, CMS does not recognize the add-on branch codes as separately payable. However, the agency did bundle them into the underlying PCI codes. In doing so, it also added small amounts of work and time, proportionate to predicted utilization. Also, since the last time these codes were valued, moderate sedation was unbundled, removing commensurate work and time. The summary spreadsheet shows the original RUC recommended value, the CMS adjustments for branch code bundling, the adjustments for unbundling of moderate sedation, and finally the current values.

Background: PCI Evolution & Compelling Evidence

Change in Technique

The recommendations for this tab produce an increase in RVUs of less than one half of a percent aggregated across the family of codes. Accordingly, we submit that these services have undergone changes in technique and patient population that substantiate compelling evidence to allow an increase in the aggregate value of the code family. At the time of the 2012 survey, PCI was typically performed via the femoral artery, with a very small minority of cases performed through the radial artery. PCI is now typically performed through the radial artery, reflecting best practice recommendations from the field. https://onlinelibrary.wiley.com/doi/10.1002/ccd.28672

Radial access is safer for patients despite being technically more challenging for the operator. The main advantage is a significant reduction in bleeding risk as well as decreased mortality for some patient subsets. https://pubmed.ncbi.nlm.nih.gov/33507598/.

Radial access requires additional preservice time that is discussed further below. This approach also requires different skills and techniques that are more difficult to perform than access through the femoral artery. While safer for the patient, the service is more technically challenging for the operator in several respects.

(1) The average radial artery is about 2 mm compared to femoral arteries that average about 9 mm, so entering the artery with a needle is more difficult.
(2) The radial and brachial arteries are smaller and more prone to spasm making catheter advancement or torquing difficult or impossible; many operators give an anti-vasospastic cocktail routinely which takes additional time.
(3) Whereas femoral access requires catheters to traverse one 180-degree bend to reach the heart, radial access requires the catheter to make one-180 degree bend and usually two more 90-degree bends to reach the heart, which makes catheter advancement and torquing more difficult.
(4) Radial access provides more frequent challenging anatomic variants such as radial loop, accessory radial arteries, early take-off radial arteries, and aberrant innominate arteries (arteria lusoria); in contrast anatomy from the femoral artery to the heart has few variants. These problems lead to conversion from radial to femoral access in about 10% of cases, while conversion from femoral to radial is almost non-existent.

Positioning for radial increases the risk of radiation and precautions. More time is spent closer to the image intensifier at different angles as opposed to standing farther back when patient is in the femoral area. Now we are closer to the heart and reaching across the patient's chest.

Change in Patient Population

We also see patients undergoing PCI who generally have more comorbidities than a decade ago. Attention to stricter adherence on statins and other medicines in revascularization and chest pain guidelines has eliminated many patients who otherwise may have been treated with lower acuity PCI, something we see in the declining utilization of these services. Remaining patients are more complex than they were a dozen years ago.

All of these factors lead to services that are both more intense/complex while also successfully decreasing the intra-procedure time the patient is on the table.

Incorrect Assumptions

Finally, with the current times and valuation consisting of a mix of RUC recommendations, pro-rated bundling of time and work of PCI in branches by CMS, and reductions of work and time by CMS to apply coding changes related to unbundling moderate sedation, we submit that the current values were derived using a flawed mechanism. CMS bundled the now-deleted branch codes using a type of prorated building block methodology that casts the current values in doubt and provides compelling evidence that the best values for these services should be derived from the robust survey before us.

Recommendations Methodology

We have laid out a rationale above for the intensity/complexity of these codes rising while in some cases the performance time may have decreased. We recommend the survey 25th percentile for all the 000 codes in this family. We chose the survey 25th percentile work RVUs because this approach generally kept the recommended values in line with the trajectory of the reduction or addition of intra-service and total time for the codes while maintaining rank order. While changes to the work RVUs and times are not recommended in exactly proportional amounts, they do maintain relativity in the magnitude to which they change to the positive or the negative. That is to say, where there is a significant reduction in intra-service time there is a more modest

reduction in recommended work RVU and the same is true in the positive direction. Where there is a significant increase in intra-service time there is a more modest recommended increase in work RVU for those codes. RVU.

In developing recommendations for the family, we observed that recommendations for times and values generate WPUT (ie, intensity) values that maintain rank order relationships within the family and align with operators' estimates of work intensity. For instance, 92920 for PTCA has a lower WPUT than 92924 for PTCA with atherectomy, reflecting the higher complication rates of atherectomy and operators' perception that atherectomy is more intense. WPUT for 92941 (PCI of an acute myocardial infarction) has the highest WPUT consistent with operators' perceptions that this is the most intense interventional service. CTO codes 92943 and 92945 have lower WPUTs because they are longer services with multiple catheter changes and techniques being attempted. This consistency of WPUT with current rank order and with operators' perceptions of intensity support the recommendations at the 25th-percentile survey values.

This approach produces the following recommendations for the family that would produce budget increase of 12,342 RVUs out of a baseline of over 3.2 million RVUs (0.38%)

Preservice Time

For each of the 000 codes, we recommend additions to preservice package 2 (Difficult patient/straightforward procedure without anesthesia care) that are supported by the survey. While these are 000 codes provided to patients with short or no hospital stay, there are certain elements of preservice time that are more akin to that of a service which utilizes general anesthesia.

		FACILITY			**PCI**	**Notes**

C	Dress and scrub for procedure	5	5	5	5	Standard

92943: Any PCI of CTO, Antegrade

ACC and SCAI convened a panel of physicians familiar with the services to review the survey data. The survey was robust and was completed by physicians who have experience with the service. Code 92943 percutaneous transluminal revascularization of chronic total occlusion, single coronary artery, coronary artery

branch, or coronary artery bypass graft, and/or subtended major coronary artery branches of the bypass graft with any combination of intracoronary stent, atherectomy and angioplasty; antegrade approach. The panel reviewed the preservice time and selected package 2 with the modifications described above for a straightforward procedure on a difficult patient without anesthesia in a facility.

The key reference service is 93653, comprehensive electrophysiologic evaluation with insertion and repositioning of multiple electrode catheters, induction or attempted induction of an arrhythmia with right atrial pacing and recording and catheter ablation of arrhythmogenic focus, including intracardiac electrophysiologic 3-dimensional mapping, right ventricular pacing and recording, left atrial pacing and recording from coronary sinus or left atrium, and His bundle recording, when performed; with treatment of supraventricular tachycardia by ablation of fast or slow atrioventricular pathway, accessory atrioventricular connection, cavo-tricuspid isthmus or other single atrial focus or source of atrial re-entry. The KRS compares reasonably well with the survey times and RVUs here, though 93653 is performed under general anesthesia and represents intracardiac work rather than intracoronary work.

To appropriately reflect the notable increase in time and wRVU found in this survey the societies **recommend a wRVU of 13.69 with times of 43/120/28.** The pre-service time of 43 was adjusted upward from Package 2 to reflect the enhanced steps described above: 7 additional minutes for complicated consent, 4 additional minutes to setup room similar to a procedure that utilizes anesthesia, 5 additional minutes for double and complex draping and ultrasound for vessel viability, and 2 additional minutes for complex positioning of the arm and heart imaging. The intra-service time of 120 minutes is the survey median. Post-service time is the standard 8B package for a complex procedure under sedation.

CTO treatment has evolved since this code was first valued. CTO PCI has now become a dedicated sub-specialty of interventional cardiology, with operators who specialize in CTO PCI and spend more time and try more techniques to reach success, compared to 10 years ago when less experienced operators would often abort procedures when initial attempts failed. Additional catheter tools have been developed in the intervening decade. CTO operators spend more time and deploy more catheters to treat these lesions. The increased time and RVUs estimated from the survey are consistent with the experience of the expert panel.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☒ Other reason (please explain) The interventional cardiologisty typically also manages moderate sedation, 99152.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 92943

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Interventional Caridology How often? Commonly

Specialty Cardiology How often? Commonly

Specialty Internal Medicine How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 16814
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on CathPCI Registry data we anticipate that 25% of the services reported as 92943 will be reported as 92945 when the code is implemented. This estimate is 75% of the 2022 traditional Medicare volume of 92943 as reported in the RUC database multiplied by three to account for Medicare Advantage and commerical insurance covered performance.

Specialty Interventional Cardiology Frequency 9096 Percentage 54.09 %

Specialty Cardiology Frequency 7180 Percentage 42.70 %

Specialty Internal Medicine Frequency 370 Percentage 2.20 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 5,605
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on CathPCI Registry data we anticipate that 75% of the services reported as 92943 will continue to be reported as such when the 92945 code is implemented. This estimate is 75% of the 2022 utilization of 92943 per the RUC database.

Specialty Interventional Cardiology Frequency 3032 Percentage 54.09 %

Specialty Cardiology Frequency 2393 Percentage 42.69 %

Specialty Internal Medicine Frequency 123 Percentage 2.19 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Cardiovascular-Coronary angioplasty (PTCA)

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 92943

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:92945 Tracking Number D9 Original Specialty Recommended RVU: **15.00**
Presented Recommended RVU: **15.00**
Global Period: 000 Current Work RVU: **N/A** RUC Recommended RVU: **15.00**

CPT Descriptor: Percutaneous transluminal revascularization of chronic total occlusion, single coronary artery, coronary artery branch, or coronary artery bypass graft, and/or subtended major coronary artery branches of the bypass graft any combination of intracoronary stent, atherectomy and angioplasty; combined antegrade and retrograde approaches

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 68-year-old man is referred for treatment of chronic (greater than 3 months) totally occluded right coronary artery. Antegrade coronary intervention is unsuccessfully attempted using antegrade wire escalation and antegrade dissection re-entry techniques. Retrograde coronary intervention is undertaken via septals from the left anterior descending artery.

Percentage of Survey Respondents who found Vignette to be Typical: 92%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 100% , In the ASC 0%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 12% , Overnight stay-less than 24 hours 64% , Overnight stay-more than 24 hours 24%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 100%

Description of Pre-Service Work: The patient's history, records, laboratory, and diagnostic tests are reviewed. A physical examination is conducted. Appropriate communication is conducted with the patient and the patient's family as well as with other medical professionals as needed (i.e., the “Heart Team approach”). The procedure is reviewed with the patient. The risks and benefits of the procedure are presented, as well as the alternatives. Informed consent is obtained. Hair is removed from the potential access sites. Necessary equipment, instruments, and supplies for the procedure are confirmed to be available and operational. Instruments and supplies for the procedure are pulled. The patient is transported to the procedure suite, positioned on the procedural table, and attached to cardiac electrodes and an oxygen saturation monitor. A sterile table is prepared. The potential access sites are scrubbed in sterile fashion. A sterile drape is placed over the patient. The patient's information is loaded in the hemodynamic monitoring equipment to retain the data from the upcoming study.

Description of Intra-Service Work: Percutaneous arterial access is obtained in two peripheral arteries, typically through the femoral arteries and/or radial artery. Angiography of the access site(s) is performed as needed to assess anatomy of the access vessel(s) and appropriate location of the access site(s). Sheaths are placed and flushed. Intraarterial vasodilators are administered as needed. An appropriate guiding catheter is advanced retrograde to the ascending aorta. The guidewire is removed and the catheter is attached to the pressure manifold and aspirated and pressure measured. The catheter is placed in the left or right coronary ostium. Using this same technique, a second catheter is placed in the other coronary ostium. Appropriate antiplatelet therapy pretreatment is confirmed and anticoagulation is administered. Therapeutic anticoagulation is confirmed by drawing blood from the guide and testing an activated clotting time (ACT). Additional anticoagulation is administered as needed. Intracoronary vasodilators are administered. Multiple coronary injections are performed simultaneously through both guide catheters to determine anatomy of the target lesion and collaterals. Antegrade technique: A coronary guidewire is then manipulated down the target coronary artery to attempt to cross the target lesion. A micro-catheter is passed over the guidewire to the lesion to provide extra support to the guidewire. Typically, the operator uses additional multiple guidewires progressing to increasingly stiff guidewires to puncture through the chronic total occlusion, and/or more lubricious (hydrophilic) or tapered tip guidewires to cross a microchannel. Multiple other techniques may be employed (dual guidewire, dissection using microcatheters). Retrograde technique: If extensive efforts

to cross the lesion antegradely are unsuccessful, a retrograde approach is attempted. A guide wire in a micro-catheter is passed into the coronary artery (often the left anterior descending artery) that provides collaterals to the target artery. Various specialized guidewires are advanced into different collateral micro-vessels until one is found that connects with the target artery distal to the target lesion. The wire is passed retrogradely in the target artery to the target lesion and the micro-catheter is advanced over the guidewire to the target lesion. Typically the guidewire is passed into a dissection plane in the target arterial wall to get past the target lesion. At this point an angioplasty balloon is passed over the guidewire in the proximal target artery to the target lesion and inflated to purposefully create a dissection in the wall of the proximal target artery. The antegrade guidewire is advanced antegradely in the dissection plane of the arterial wall and the retrograde wire is advanced retrogradely in the dissection plane of the arterial wall until both connect, allowing the retrograde wire to pass along the dissection plane proximal to the lesion and thence into the true lumen and into the mouth of the target artery guide catheter. The micro-catheter is advanced into the target artery guide catheter. The guidewire is then advanced retrogradely through the target artery guide catheter to the outside of the body (ie, “externalization”). This guidewire is then used to perform balloon angioplasty and stenting of the culprit lesion(s) using standard techniques. After an adequate result is obtained, the microcatheter is again passed into the target artery guide catheter and through it the retrograde guidewire is withdrawn through the retrograde artery catheter, followed by the microcatheter. The artery used for the retrograde technique is carefully imaged to rule out trauma or thrombus. Final angiogram of the target artery and lesion are taken. If the result is acceptable, the guidewire is then withdrawn back into the guide. Completion angiography is again performed after repeat administration of intracoronary vasodilators. Both catheters and sheaths are removed, and hemostasis at both access sites is achieved by appropriate techniques. If a vascular closure device cannot used for femoral access, the sheath is sutured in place for subsequent removal once the ACT level falls to a safe level for manual compression.

Description of Post-Service Work: Films and hemodynamics are reviewed and a formal report is generated. The patient, the patient's family, and the referring physician are notified of the results. A plan of management is developed and discussed with the patient and the patient's family. Additional antiplatelet and antithrombin therapy is administered as necessary. The patient is admitted to ensure no bleeding, to monitor for abrupt vessel closure, and for continued therapy of ischemic heart disease.

SURVEY DATA

RUC Meeting Date (mm/yyyy)	04/2024					
Presenter(s):	Dr. Richard Wright, Dr. Ed Tuohy, Dr. Afnan Tariq, Dr. Mark Hoyer

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	2%	18%	23%	57%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	4%	28%	68%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	2%	26%	72%
Physical effort required	5%	36%	59%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	22%	78%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	22%	11%	67%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	28%	72%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	6%	6%	88%
Physical effort required	0%	22%	78%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	11%	89%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

CPT Changes

The full family of percutaneous coronary intervention (PCI) codes was last reviewed by the RUC at the January 2012 meeting, when the code family was updated to reflect bundling after CMS identified MPC codes not reviewed in the prior 5 years as potentially misvalued. The codes were surveyed for the January 2023 RUC

meeting after the CPT Editorial Panel approved creation of a single add-on code that describes the work of coronary intravascular lithotripsy (IVL), a technology to modify lesions that did not exist at the time of the prior review. That code change application was submitted by a device manufacturer. The societies had planned to make other revisions to the code family at the following CPT cycle. At the January 2023 RUC meeting the societies proposed that only the new IVL code be valued, and the remainder of the code set be sent to CPT for revision before review. The RUC approved this proposal and, after several code change applications, the revised family was approved at the February 2024 CPT Panel meeting.

The CPT updates included code deletions, revisions, and additions.

- The original code set included additional branch add-on codes for several of the procedures. CMS assigned the branch codes a value of 0 RVUs, rolling a prorated portion of their value into their base codes (more on this later). Due to this lack of RVUs neither CMS nor commercial payers reimbursed these codes from 2013 to present and they were deleted by CPT in February 2024. The deleted codes included 92921, 92925, 92929, 92934, 92938, and 92944.
- CPT amended the base codes to each of these deleted add-on codes (92920, 92924, 92928, 92933, 92937, 92941, and 92943) to include the work, when performed, of potential branch vessels which was not included in the original code definitions and descriptions of work. This essentially matches the code descriptors to CMS's approach to not pay separately for additional branch work.
- Also, in February 2024 CPT created two new codes within the family. First, 92930, was created to allow coding for the work involved in placement of intracoronary stent(s) (currently coded as 92928) that exceeds the typical stenting case. The second new code, 92945, was created to allow coding for revascularization of a chronic total occlusion when both antegrade and retrograde approaches are employed.
- Finally, CPT revised codes 93571 and 93572 to make a correction to the fractional flow reserve (FFR) codes to correct a coding issue relating to instant flow reserve (iFR).

92972 Intravascular Lithotripsy (IVL)

As noted above, the IVL code was surveyed, reviewed by the RUC and issued a value at the January 2023 RUC meeting. The IVL code survey was robust, with 139 respondents. There have been no significant technological or other changes to the IVL procedure since its initial valuation. With the recent survey of this code and in an effort to maximize survey response by keeping it a bit shorter, we did not include the code in this survey and recommend affirmation of current value and time.

Current RVUs and Times

As referenced above, CMS does not recognize the add-on branch codes as separately payable. However, the agency did bundle them into the underlying PCI codes. In doing so, it also added small amounts of work and time, proportionate to predicted utilization. Also, since the last time these codes were valued, moderate sedation was unbundled, removing commensurate work and time. The summary spreadsheet shows the original RUC recommended value, the CMS adjustments for branch code bundling, the adjustments for unbundling of moderate sedation, and finally the current values.

Background: PCI Evolution & Compelling Evidence

Change in Technique

The recommendations for this tab produce an increase in RVUs of less than one half of a percent aggregated across the family of codes. Accordingly, we submit that these services have undergone changes in technique and patient population that substantiate compelling evidence to allow an increase in the aggregate value of the code family. At the time of the 2012 survey, PCI was typically performed via the femoral artery, with a very small minority of cases performed through the radial artery. PCI is now typically performed through the radial artery, reflecting best practice recommendations from the field. https://onlinelibrary.wiley.com/doi/10.1002/ccd.28672

Radial access is safer for patients despite being technically more challenging for the operator. The main advantage is a significant reduction in bleeding risk as well as decreased mortality for some patient subsets. https://pubmed.ncbi.nlm.nih.gov/33507598/.

Radial access requires additional preservice time that is discussed further below. This approach also requires different skills and techniques that are more difficult to perform than access through the femoral artery. While safer for the patient, the service is more technically challenging for the operator in several respects.

(1) The average radial artery is about 2 mm compared to femoral arteries that average about 9 mm, so entering the artery with a needle is more difficult.
(2) The radial and brachial arteries are smaller and more prone to spasm making catheter advancement or torquing difficult or impossible; many operators give an anti-vasospastic cocktail routinely which takes additional time.
(3) Whereas femoral access requires catheters to traverse one 180-degree bend to reach the heart, radial access requires the catheter to make one-180 degree bend and usually two more 90-degree bends to reach the heart, which makes catheter advancement and torquing more difficult.
(4) Radial access provides more frequent challenging anatomic variants such as radial loop, accessory radial arteries, early take-off radial arteries, and aberrant innominate arteries (arteria lusoria); in contrast anatomy from the femoral artery to the heart has few variants. These problems lead to conversion from radial to femoral access in about 10% of cases, while conversion from femoral to radial is almost non-existent.

Positioning for radial increases the risk of radiation and precautions. More time is spent closer to the image intensifier at different angles as opposed to standing farther back when patient is in the femoral area. Now we are closer to the heart and reaching across the patient's chest.

Change in Patient Population

We also see patients undergoing PCI who generally have more comorbidities than a decade ago. Attention to stricter adherence on statins and other medicines in revascularization and chest pain guidelines has eliminated many patients who otherwise may have been treated with lower acuity PCI, something we see in the declining utilization of these services. Remaining patients are more complex than they were a dozen years ago.

All of these factors lead to services that are both more intense/complex while also successfully decreasing the intra-procedure time the patient is on the table.

Incorrect Assumptions

Finally, with the current times and valuation consisting of a mix of RUC recommendations, pro-rated bundling of time and work of PCI in branches by CMS, and reductions of work and time by CMS to apply coding changes related to unbundling moderate sedation, we submit that the current values were derived using a flawed mechanism. CMS bundled the now-deleted branch codes using a type of prorated building block methodology that casts the current values in doubt and provides compelling evidence that the best values for these services should be derived from the robust survey before us.

Recommendations Methodology

We have laid out a rationale above for the intensity/complexity of these codes rising while in some cases the performance time may have decreased. We recommend the survey 25th percentile for all the 000 codes in this family. We chose the survey 25th percentile work RVUs because this approach generally kept the recommended values in line with the trajectory of the reduction or addition of intra-service and total time for the codes while maintaining rank order. While changes to the work RVUs and times are not recommended in exactly proportional amounts, they do maintain relativity in the magnitude to which they change to the positive or the negative. That is to say, where there is a significant reduction in intra-service time there is a more modest

reduction in recommended work RVU and the same is true in the positive direction. Where there is a significant increase in intra-service time there is a more modest recommended increase in work RVU for those codes. RVU.

In developing recommendations for the family, we observed that recommendations for times and values generate WPUT (ie, intensity) values that maintain rank order relationships within the family and align with operators' estimates of work intensity. For instance, 92920 for PTCA has a lower WPUT than 92924 for PTCA with atherectomy, reflecting the higher complication rates of atherectomy and operators' perception that atherectomy is more intense. WPUT for 92941 (PCI of an acute myocardial infarction) has the highest WPUT consistent with operators' perceptions that this is the most intense interventional service. CTO codes 92943 and 92945 have lower WPUTs because they are longer services with multiple catheter changes and techniques being attempted. This consistency of WPUT with current rank order and with operators' perceptions of intensity support the recommendations at the 25th-percentile survey values.

This approach produces the following recommendations for the family that would produce budget increase of 12,342 RVUs out of a baseline of over 3.2 million RVUs (0.38%)

Preservice Time

For each of the 000 codes, we recommend additions to preservice package 2 (Difficult patient/straightforward procedure without anesthesia care) that are supported by the survey. While these are 000 codes provided to patients with short or no hospital stay, there are certain elements of preservice time that are more akin to that of a service which utilizes general anesthesia.

		FACILITY			**PCI**	**Notes**

92945: Any PCI of CTO, Antegrade + Retrograde

ACC and SCAI convened a panel of physicians familiar with the services to review the survey data. The survey was robust and was completed by physicians who have experience with the service. Code 92943 percutaneous transluminal revascularization of chronic total occlusion, single coronary artery, coronary artery

branch, or coronary artery bypass graft, and/or subtended major coronary artery branches of the bypass graft with any combination of intracoronary stent, atherectomy and angioplasty; combined antegrade and retrograde approaches. The panel reviewed the preservice time and selected package 2 with the modifications described above for a straightforward procedure on a difficult patient without anesthesia in a facility.

The key reference service is 93591, percutaneous transcatheter closure of paravalvular leak; initial occlusion device, aortic valve. 93591 is a longer, slightly more intense service based on its time and wRVU versus the survey 25th percentile wRVU and median time. Interestingly, 80% of key reference respondents stated that 92945 was more or much more intense/complex than 93591.

To reflect the slightly greater intra-service time over 92943 and the increased complexity of deploying both antegrade and retrograde therapies, the societies **recommend a wRVU of 15.00 with times of 43/130/28.** The pre-service time of 43 was adjusted upward from Package 2 to reflect the enhanced steps described above: 7 additional minutes for complicated consent, 4 additional minutes to setup room similar to a procedure that utilizes anesthesia, 5 additional minutes for double and complex draping and ultrasound for vessel viability, and 2 additional minutes for complex positioning of the arm and heart imaging. The intra-service time of 130 minutes is the survey median. Post-service time is the standard 8B package for a complex procedure under sedation.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☒ Other reason (please explain) The interventional cardiologisty typically also manages moderate sedation, 99152.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 92943

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Interventional Cardiology How often? Commonly

Specialty Cardiology How often? Commonly

Specialty Internal Medicine How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 5605
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on CathPCI Registry data we anticipate that 25% of the services currently reported as 92943 will be reported as 92945 when the code is implemented. This estimate is 25% of the 2022 traditional Medicare volume of 92943 as reported in the RUC database multiplied by three to account for Medicare Advantage and commerical insurance covered performance.

Specialty Interventional Cardiology Frequency 3032 Percentage 54.09 %

Specialty Cardiology Frequency 2393 Percentage 42.69 %

Specialty Internal Medicine Frequency 123 Percentage 2.19 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 1,868
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on CathPCI Registry data we anticipate that 25% of the services reported as 92943 will be reported as 92945 when the code is implemented. This estimate is 25% of the 2022 utilization of 92943 per the RUC database.

Specialty Interventional Cardiology Frequency 1011 Percentage 54.12 %

Specialty Cardiology Frequency 798 Percentage 42.71 %

Specialty Internal Medicine Frequency 41 Percentage 2.19 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Cardiovascular-Coronary angioplasty (PTCA)

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 92943

Global Period: ZZZ Current Work RVU: **3.28** RUC Recommended RVU: **1.75**

CPT Descriptor: Percutaneous transluminal coronary thrombectomy aspiration mechanical (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 70-year-old male, eight years after coronary artery bypass grafting (CABG), now presents with unstable angina and recent non-Q wave myocardial infarction (MI). Coronary angiography demonstrates a high-grade stenosis in the saphenous vein graft (SVG) to the right coronary artery (RCA) with a large filling defect consistent with fresh thrombus. A coronary mechanical aspiration thrombectomy is performed. [Note: This is an add-on service. Only consider the additional physician work related to percutaneous transluminal coronary mechanical thrombectomy.]

Percentage of Survey Respondents who found Vignette to be Typical: 97%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 0% , In the ASC 0%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 0%

Description of Pre-Service Work:

Description of Intra-Service Work: After defining the relevant anatomy by coronary angiography, introduce a guiding catheter (reported separately) to the ostium of the vessel to be treated. Through the guiding catheter, use a guidewire to cross the lesion and thrombus (reported separately) and advance the mechanical thrombus aspiration catheter over the guidewire to the thrombotic lesion. Position the catheter appropriately and activate the catheter. Pass the catheter through the thrombus one or more times. Deactivate the catheter, withdraw it, and assess the results by coronary angiography. Treat the remaining lesion as appropriate, usually with additional balloon angioplasty or stent placement (reported separately).

Description of Post-Service Work:

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	2%	0%	31%	37%	30%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	2%	49%	49%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	6%	42%	52%
Physical effort required	6%	51%	43%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	2%	35%	63%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	7%	41%	45%	7%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	7%	48%	45%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	4%	59%	37%
Physical effort required	7%	63%	30%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	7%	39%	54%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

CPT Changes

The full family of percutaneous coronary intervention (PCI) codes was last reviewed by the RUC at the January 2012 meeting, when the code family was updated to reflect bundling after CMS identified MPC codes not reviewed in the prior 5 years as potentially misvalued. The codes were surveyed for the January 2023 RUC

meeting after the CPT Editorial Panel approved creation of a single add-on code that describes the work of coronary intravascular lithotripsy (IVL), a technology to modify lesions that did not exist at the time of the prior review. That code change application was submitted by a device manufacturer. The societies had planned to make other revisions to the code family at the following CPT cycle. At the January 2023 RUC meeting the societies proposed that only the new IVL code be valued, and the remainder of the code set be sent to CPT for revision before review. The RUC approved this proposal and, after several code change applications, the revised family was approved at the February 2024 CPT Panel meeting.

The CPT updates included code deletions, revisions, and additions.

- The original code set included additional branch add-on codes for several of the procedures. CMS assigned the branch codes a value of 0 RVUs, rolling a prorated portion of their value into their base codes (more on this later). Due to this lack of RVUs neither CMS nor commercial payers reimbursed these codes from 2013 to present and they were deleted by CPT in February 2024. The deleted codes included 92921, 92925, 92929, 92934, 92938, and 92944.
- CPT amended the base codes to each of these deleted add-on codes (92920, 92924, 92928, 92933, 92937, 92941, and 92943) to include the work, when performed, of potential branch vessels which was not included in the original code definitions and descriptions of work. This essentially matches the code descriptors to CMS's approach to not pay separately for additional branch work.
- Also, in February 2024 CPT created two new codes within the family. First, 92930, was created to allow coding for the work involved in placement of intracoronary stent(s) (currently coded as 92928) that exceeds the typical stenting case. The second new code, 92945, was created to allow coding for revascularization of a chronic total occlusion when both antegrade and retrograde approaches are employed.
- Finally, CPT revised codes 93571 and 93572 to make a correction to the fractional flow reserve (FFR) codes to correct a coding issue relating to instant flow reserve (iFR).

92972 Intravascular Lithotripsy (IVL)

As noted above, the IVL code was surveyed, reviewed by the RUC and issued a value at the January 2023 RUC meeting. The IVL code survey was robust, with 139 respondents. There have been no significant technological or other changes to the IVL procedure since its initial valuation. With the recent survey of this code and in an effort to maximize survey response by keeping it a bit shorter, we did not include the code in this survey and recommend affirmation of current value and time.

Current RVUs and Times

As referenced above, CMS does not recognize the add-on branch codes as separately payable. However, the agency did bundle them into the underlying PCI codes. In doing so, it also added small amounts of work and time, proportionate to predicted utilization. Also, since the last time these codes were valued, moderate sedation was unbundled, removing commensurate work and time. The summary spreadsheet shows the original RUC recommended value, the CMS adjustments for branch code bundling, the adjustments for unbundling of moderate sedation, and finally the current values.

Background: PCI Evolution & Compelling Evidence

Change in Technique

The recommendations for this tab produce an increase in RVUs of less than one half of a percent aggregated across the family of codes. Accordingly, we submit that these services have undergone changes in technique and patient population that substantiate compelling evidence to allow an increase in the aggregate value of the code family. At the time of the 2012 survey, PCI was typically performed via the femoral artery, with a very small minority of cases performed through the radial artery. PCI is now typically performed through the radial artery, reflecting best practice recommendations from the field. https://onlinelibrary.wiley.com/doi/10.1002/ccd.28672

Radial access is safer for patients despite being technically more challenging for the operator. The main advantage is a significant reduction in bleeding risk as well as decreased mortality for some patient subsets. https://pubmed.ncbi.nlm.nih.gov/33507598/.

Radial access requires additional preservice time that is discussed further below. This approach also requires different skills and techniques that are more difficult to perform than access through the femoral artery. While safer for the patient, the service is more technically challenging for the operator in several respects.

(1) The average radial artery is about 2 mm compared to femoral arteries that average about 9 mm, so entering the artery with a needle is more difficult.
(2) The radial and brachial arteries are smaller and more prone to spasm making catheter advancement or torquing difficult or impossible; many operators give an anti-vasospastic cocktail routinely which takes additional time.
(3) Whereas femoral access requires catheters to traverse one 180-degree bend to reach the heart, radial access requires the catheter to make one-180 degree bend and usually two more 90-degree bends to reach the heart, which makes catheter advancement and torquing more difficult.
(4) Radial access provides more frequent challenging anatomic variants such as radial loop, accessory radial arteries, early take-off radial arteries, and aberrant innominate arteries (arteria lusoria); in contrast anatomy from the femoral artery to the heart has few variants. These problems lead to conversion from radial to femoral access in about 10% of cases, while conversion from femoral to radial is almost non-existent.

Positioning for radial increases the risk of radiation and precautions. More time is spent closer to the image intensifier at different angles as opposed to standing farther back when patient is in the femoral area. Now we are closer to the heart and reaching across the patient's chest.

Change in Patient Population

We also see patients undergoing PCI who generally have more comorbidities than a decade ago. Attention to stricter adherence on statins and other medicines in revascularization and chest pain guidelines has eliminated many patients who otherwise may have been treated with lower acuity PCI, something we see in the declining utilization of these services. Remaining patients are more complex than they were a dozen years ago.

All of these factors lead to services that are both more intense/complex while also successfully decreasing the intra-procedure time the patient is on the table.

Incorrect Assumptions

Finally, with the current times and valuation consisting of a mix of RUC recommendations, pro-rated bundling of time and work of PCI in branches by CMS, and reductions of work and time by CMS to apply coding changes related to unbundling moderate sedation, we submit that the current values were derived using a flawed mechanism. CMS bundled the now-deleted branch codes using a type of prorated building block methodology that casts the current values in doubt and provides compelling evidence that the best values for these services should be derived from the robust survey before us.

Recommendations Methodology

We have laid out a rationale above for the intensity/complexity of these codes rising while in some cases the performance time may have decreased. We recommend the survey 25th percentile for all the 000 codes in this family. We chose the survey 25th percentile work RVUs because this approach generally kept the recommended values in line with the trajectory of the reduction or addition of intra-service and total time for the codes while maintaining rank order. While changes to the work RVUs and times are not recommended in exactly proportional amounts, they do maintain relativity in the magnitude to which they change to the positive or the negative. That is to say, where there is a significant reduction in intra-service time there is a more modest

reduction in recommended work RVU and the same is true in the positive direction. Where there is a significant increase in intra-service time there is a more modest recommended increase in work RVU for those codes. RVU.

In developing recommendations for the family, we observed that recommendations for times and values generate WPUT (ie, intensity) values that maintain rank order relationships within the family and align with operators' estimates of work intensity. For instance, 92920 for PTCA has a lower WPUT than 92924 for PTCA with atherectomy, reflecting the higher complication rates of atherectomy and operators' perception that atherectomy is more intense. WPUT for 92941 (PCI of an acute myocardial infarction) has the highest WPUT consistent with operators' perceptions that this is the most intense interventional service. CTO codes 92943 and 92945 have lower WPUTs because they are longer services with multiple catheter changes and techniques being attempted. This consistency of WPUT with current rank order and with operators' perceptions of intensity support the recommendations at the 25th-percentile survey values.

This approach produces the following recommendations for the family that would produce budget increase of 12,342 RVUs out of a baseline of over 3.2 million RVUs (0.38%)

Preservice Time

For each of the 000 codes, we recommend additions to preservice package 2 (Difficult patient/straightforward procedure without anesthesia care) that are supported by the survey. While these are 000 codes provided to patients with short or no hospital stay, there are certain elements of preservice time that are more akin to that of a service which utilizes general anesthesia.

92973: Thrombectomy add-on

This code for mechanical transluminal coronary thrombectomy was reviewed as part of the family of PCI codes. It was not reviewed in 2012 when the rest of the PCI codes were created and last reviewed. This low-volume service was last reviewed when it was added to CPT in 2001.

ACC and SCAI convened a panel of physicians familiar with the services to review the survey data. The survey was robust and was completed by physicians who have experience with the service. The panel reviewed this ZZZ code and recommends the survey median intra-service time with no preservice or post-service time.

The key reference service is 37186, noncoronary transluminal thrombectomy. 67% of respondents found surveyed code 92973 to be of somewhat more or much more intense/complex, while 31% felt it to be identical. The second key reference service is 92974, transcatheter placement of a radiation delivery device for subsequent coronary intravascular brachytherapy.

To account for the significant reduction in time for this code while still maintaining a work intensity above the KRS **we recommend a crosswalk to 36483 for subsequent endovenous ablation of an incompetent vein with a wRVU of 1.75 and 20 minutes intra-service and total time.**

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 92973

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Interventional Cardiology How often? Commonly

Specialty Cardiology How often? Commonly

Specialty Internal Medicine How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 6627
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This estimate is three times the 2022 Medicare data for usage to account for Medicare Advantage and commerical insurance covered performance.

Specialty Interventional Cardiology Frequency 3254 Percentage 49.10 %

Specialty Cardiology Frequency 3062 Percentage 46.20 %

Specialty Internal Medicine Frequency 205 Percentage 3.09 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 2,209
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. RUC database for 2022 data. Recent trends show this service being stable between 2,000-2,500.

Specialty Interventional Cardiology Frequency 1085 Percentage 49.11 %

Specialty Cardioloyg Frequency 1021 Percentage 46.22 %

Specialty Internal Medicine Frequency 68 Percentage 3.07 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Cardiovascular-Thromboendarterectomy

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 92973

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

SUMMARY OF RECOMMENDATION

CPT Code:93571 Tracking Number D12 Original Specialty Recommended RVU: **1.80**
Presented Recommended RVU: **1.80**
Global Period: ZZZ Current Work RVU: **1.38** RUC Recommended RVU: **1.80**

CPT Descriptor: Intravascular Doppler velocity and/or pressure derived coronary flow reserve measurement (coronary vessel or graft) during coronary angiography including pharmacologically induced stress; initial vessel (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: 55-year-old female presents with a three-week history of progressive chest discomfort at rest and with mild exertion. Cardiac catheterization demonstrates a 60% stenosis in the mid left anterior descending artery. To determine the hemodynamic significance of the lesion, intracoronary fractional flow reserve (FFR) measurement testing is performed. [Note: This is an add-on service. Only consider the additional physician work related to intra-coronary FFR testing for the initial vessel.]

Percentage of Survey Respondents who found Vignette to be Typical: 99%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 0% , In the ASC 0%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 0%

Description of Pre-Service Work:

Description of Intra-Service Work: Exchange diagnostic catheter for a guide catheter and selectively cannulate the coronary artery. Prepare the physiologic testing wire by flushing on the table,
calibrating the pressure sensor outside of the body. Pass the wire through the guide catheter and into the coronary artery. Normalize (equalize) the pressure tracings from the guide catheter and the pressure sensor on the wire, readjusting the guide catheter as needed to provide undamped pressures. Pass the wire across the target lesion(s) until the pressure sensor on the wire is well beyond the lesion(s). Measure the wave free ratio first at rest. If physiologic stress will be performed, reconstitute the appropriate pharmacologic agent and inject it intra-coronary or infuse it intravenously and record pressures from the wire and guide catheter. If tracings contain artifacts, if tracings are disrupted by asystole or complete heart block caused by the drug, or if measurements are of borderline clinical significance, obtain repeat measurements by pulling the wire back proximal to the lesion, re-normalizing, passing it distal to the lesion, and re-measuring pressures. If serial lesions are being assessed, measure pressures distal to the most distal lesion, pull the wire back across the most distal lesion, repeat pressure measurements, then pull the wire proximal to all lesions and check measurements to assess for electronic drift. If electronic drift has occurred, re-normalize the pressure tracings and repeat the above process. When measurements are complete, remove the wire from the guide catheter. Perform coronary arteriography in appropriate views to be sure that the wire has not damaged the coronary artery. If coronary intervention is not undertaken, remove the guide catheter.

Description of Post-Service Work:

INTENSITY/COMPLEXITY MEASURES

(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	13%	41%	24%	22%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	15%	48%	37%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	10%	48%	42%
Physical effort required	7%	68%	25%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	10%	45%	45%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	15%	46%	23%	15%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	28%	36%	36%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	21%	50%	29%
Physical effort required	25%	55%	20%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	26%	42%	32%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

CPT Changes

The full family of percutaneous coronary intervention (PCI) codes was last reviewed by the RUC at the January 2012 meeting, when the code family was updated to reflect bundling after CMS identified MPC codes not reviewed in the prior 5 years as potentially misvalued. The codes were surveyed for the January 2023 RUC

meeting after the CPT Editorial Panel approved creation of a single add-on code that describes the work of coronary intravascular lithotripsy (IVL), a technology to modify lesions that did not exist at the time of the prior review. That code change application was submitted by a device manufacturer. The societies had planned to make other revisions to the code family at the following CPT cycle. At the January 2023 RUC meeting the societies proposed that only the new IVL code be valued, and the remainder of the code set be sent to CPT for revision before review. The RUC approved this proposal and, after several code change applications, the revised family was approved at the February 2024 CPT Panel meeting.

The CPT updates included code deletions, revisions, and additions.

- The original code set included additional branch add-on codes for several of the procedures. CMS assigned the branch codes a value of 0 RVUs, rolling a prorated portion of their value into their base codes (more on this later). Due to this lack of RVUs neither CMS nor commercial payers reimbursed these codes from 2013 to present and they were deleted by CPT in February 2024. The deleted codes included 92921, 92925, 92929, 92934, 92938, and 92944.
- CPT amended the base codes to each of these deleted add-on codes (92920, 92924, 92928, 92933, 92937, 92941, and 92943) to include the work, when performed, of potential branch vessels which was not included in the original code definitions and descriptions of work. This essentially matches the code descriptors to CMS's approach to not pay separately for additional branch work.
- Also, in February 2024 CPT created two new codes within the family. First, 92930, was created to allow coding for the work involved in placement of intracoronary stent(s) (currently coded as 92928) that exceeds the typical stenting case. The second new code, 92945, was created to allow coding for revascularization of a chronic total occlusion when both antegrade and retrograde approaches are employed.
- Finally, CPT revised codes 93571 and 93572 to make a correction to the fractional flow reserve (FFR) codes to correct a coding issue relating to instant flow reserve (iFR).

92972 Intravascular Lithotripsy (IVL)

As noted above, the IVL code was surveyed, reviewed by the RUC and issued a value at the January 2023 RUC meeting. The IVL code survey was robust, with 139 respondents. There have been no significant technological or other changes to the IVL procedure since its initial valuation. With the recent survey of this code and in an effort to maximize survey response by keeping it a bit shorter, we did not include the code in this survey and recommend affirmation of current value and time.

Current RVUs and Times

As referenced above, CMS does not recognize the add-on branch codes as separately payable. However, the agency did bundle them into the underlying PCI codes. In doing so, it also added small amounts of work and time, proportionate to predicted utilization. Also, since the last time these codes were valued, moderate sedation was unbundled, removing commensurate work and time. The summary spreadsheet shows the original RUC recommended value, the CMS adjustments for branch code bundling, the adjustments for unbundling of moderate sedation, and finally the current values.

Background: PCI Evolution & Compelling Evidence

Change in Technique

The recommendations for this tab produce an increase in RVUs of less than one half of a percent aggregated across the family of codes. Accordingly, we submit that these services have undergone changes in technique and patient population that substantiate compelling evidence to allow an increase in the aggregate value of the code family. At the time of the 2012 survey, PCI was typically performed via the femoral artery, with a very small minority of cases performed through the radial artery. PCI is now typically performed through the radial artery, reflecting best practice recommendations from the field. https://onlinelibrary.wiley.com/doi/10.1002/ccd.28672

Radial access is safer for patients despite being technically more challenging for the operator. The main advantage is a significant reduction in bleeding risk as well as decreased mortality for some patient subsets. https://pubmed.ncbi.nlm.nih.gov/33507598/.

Radial access requires additional preservice time that is discussed further below. This approach also requires different skills and techniques that are more difficult to perform than access through the femoral artery. While safer for the patient, the service is more technically challenging for the operator in several respects.

(1) The average radial artery is about 2 mm compared to femoral arteries that average about 9 mm, so entering the artery with a needle is more difficult.
(2) The radial and brachial arteries are smaller and more prone to spasm making catheter advancement or torquing difficult or impossible; many operators give an anti-vasospastic cocktail routinely which takes additional time.
(3) Whereas femoral access requires catheters to traverse one 180-degree bend to reach the heart, radial access requires the catheter to make one-180 degree bend and usually two more 90-degree bends to reach the heart, which makes catheter advancement and torquing more difficult.
(4) Radial access provides more frequent challenging anatomic variants such as radial loop, accessory radial arteries, early take-off radial arteries, and aberrant innominate arteries (arteria lusoria); in contrast anatomy from the femoral artery to the heart has few variants. These problems lead to conversion from radial to femoral access in about 10% of cases, while conversion from femoral to radial is almost non-existent.

Positioning for radial increases the risk of radiation and precautions. More time is spent closer to the image intensifier at different angles as opposed to standing farther back when patient is in the femoral area. Now we are closer to the heart and reaching across the patient's chest.

Change in Patient Population

We also see patients undergoing PCI who generally have more comorbidities than a decade ago. Attention to stricter adherence on statins and other medicines in revascularization and chest pain guidelines has eliminated many patients who otherwise may have been treated with lower acuity PCI, something we see in the declining utilization of these services. Remaining patients are more complex than they were a dozen years ago.

All of these factors lead to services that are both more intense/complex while also successfully decreasing the intra-procedure time the patient is on the table.

Incorrect Assumptions

Finally, with the current times and valuation consisting of a mix of RUC recommendations, pro-rated bundling of time and work of PCI in branches by CMS, and reductions of work and time by CMS to apply coding changes related to unbundling moderate sedation, we submit that the current values were derived using a flawed mechanism. CMS bundled the now-deleted branch codes using a type of prorated building block methodology that casts the current values in doubt and provides compelling evidence that the best values for these services should be derived from the robust survey before us.

Recommendations Methodology

We have laid out a rationale above for the intensity/complexity of these codes rising while in some cases the performance time may have decreased. We recommend the survey 25th percentile for all the 000 codes in this family. We chose the survey 25th percentile work RVUs because this approach generally kept the recommended values in line with the trajectory of the reduction or addition of intra-service and total time for the codes while maintaining rank order. While changes to the work RVUs and times are not recommended in exactly proportional amounts, they do maintain relativity in the magnitude to which they change to the positive or the negative. That is to say, where there is a significant reduction in intra-service time there is a more modest

reduction in recommended work RVU and the same is true in the positive direction. Where there is a significant increase in intra-service time there is a more modest recommended increase in work RVU for those codes. RVU.

In developing recommendations for the family, we observed that recommendations for times and values generate WPUT (ie, intensity) values that maintain rank order relationships within the family and align with operators' estimates of work intensity. For instance, 92920 for PTCA has a lower WPUT than 92924 for PTCA with atherectomy, reflecting the higher complication rates of atherectomy and operators' perception that atherectomy is more intense. WPUT for 92941 (PCI of an acute myocardial infarction) has the highest WPUT consistent with operators' perceptions that this is the most intense interventional service. CTO codes 92943 and 92945 have lower WPUTs because they are longer services with multiple catheter changes and techniques being attempted. This consistency of WPUT with current rank order and with operators' perceptions of intensity support the recommendations at the 25th-percentile survey values.

This approach produces the following recommendations for the family that would produce budget increase of 12,342 RVUs out of a baseline of over 3.2 million RVUs (0.38%)

Preservice Time

For each of the 000 codes, we recommend additions to preservice package 2 (Difficult patient/straightforward procedure without anesthesia care) that are supported by the survey. While these are 000 codes provided to patients with short or no hospital stay, there are certain elements of preservice time that are more akin to that of a service which utilizes general anesthesia.

		FACILITY			**PCI**	**Notes**
		2	**3**	**4**	**2+**	
	Total Pre-Service Time	**25**	**51**	**63**	**43**

93571: Fractional flow reserve measurement add-on

ACC and SCAI convened a panel of physicians familiar with the services to review the survey data. The survey was robust and was completed by physicians who have experience with the service. The panel

reviewed this ZZZ code and recommends the survey median intra-service time with no preservice or post-service time.

The key reference service is 37252, intravascular ultrasound, initial vessel. 46% of respondents found surveyed code 93571 to be of somewhat more or much more intense/complex, while 41% felt it to be identical.

While the time for this code greatly increased in the survey over the current time, the intensity of the code even when applying the 25th percentile survey wRVU seemed too high versus its KRS. As such, our panel felt the KRS itself would serve as an ideal crosswalk. We note that the increase in recommended RVU is almost directly in proportion to the increase in survey time. **We recommend a wRVU of 1.80 for 93571 with 20 minutes intra-service and total time via crosswalk to the survey KRS 37252.**

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 93571

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Interventional Cardiology How often? Commonly

Specialty Cardiology How often? Commonly

Specialty Internal Medicine How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 186234
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This estimate is three times the 2022 Medicare data for usage to account for Medicare Advantage and commerical insurance covered performance.

Specialty Interventional Cardiology Frequency 98332 Percentage 52.80 %

Specialty Cardiology Frequency 80826 Percentage 43.40 %

Specialty Internal Medicine Frequency 4842 Percentage 2.59 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 62,078 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. RUC Database for 2022 data. In recent years this service declined somewhat from a pre-pandemic high. Utilization could tick up in coming years as this service remains a Class I recommendation.

Specialty Interventional Cardiology Frequency 32777 Percentage 52.79 %

Specialty Cardiology Frequency 26942 Percentage 43.40 %

Specialty Internal Medicine Frequency 1614 Percentage 2.59 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:93572 Tracking Number D13 Original Specialty Recommended RVU: **1.44**
Presented Recommended RVU: **1.44**
Global Period: ZZZ Current Work RVU: **1.00** RUC Recommended RVU: **1.44**

CPT Descriptor: Intravascular Doppler velocity and/or pressure derived coronary flow reserve measurement (coronary vessel or graft) during coronary angiography including pharmacologically induced stress; each additional vessel (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 55-year-old female presents with a 3-week history of progressive chest discomfort at rest and with mild exertion. Cardiac catheterization demonstrates a 60% stenosis in two coronary arteries. After intra-coronary fractional flow reserve measurement (FFR) testing is performed to evaluate the first lesion (coded separately), FFR testing is performed to evaluate the second artery lesion. [Note: This is an add-on service. Only consider the additional physician work related to intracoronary FFR testing for one additional vessel.]

Percentage of Survey Respondents who found Vignette to be Typical: 99%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 0% , In the ASC 0%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 0%

Description of Pre-Service Work:

Description of Intra-Service Work: After analysis of lesions in the first artery is complete, wipe the wire and prepare it for re-insertion. Typically a different guide catheter is passed to the ascending aorta and positioned in the ostium of the other coronary artery. The wire is passed through the guide catheter and into the coronary artery. Normalize (equalize) the pressure tracings from the guide catheter and the pressure sensor on the wire, readjusting the guide catheter as needed to provide undamped pressures. Pass the wire across the target lesion(s) until the pressure sensor on the wire is well beyond the lesion(s). Measure the wave free ratio first at rest. If physiologic stress will be performed, reconstitute the appropriate pharmacologic agent and inject it intra-coronary or infuse it intravenously and record pressures from the wire and guide catheter. If tracings contain artifacts, if tracings are disrupted by asystole or complete heart block caused by the drug, or if measurements are of borderline clinical significance, obtain repeat measurements by pulling the wire back proximal to the lesion, re-normalizing, passing it distal to the lesion, and re-measuring pressures. If serial lesions are being assessed, measure pressures distal to the most distal lesion, pull the wire back across the most distal lesion, repeat pressure measurements, then pull the wire proximal to all lesions and check measurements to assess for electronic drift. If electronic drift has occurred, re-normalize the pressure tracings and repeat the above process. When measurements are complete, remove the wire from the guide catheter. Perform coronary arteriography in appropriate views to be sure that the wire has not damaged the coronary artery. If coronary intervention is not undertaken, remove the guide catheter.

Description of Post-Service Work:

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	6%	44%	29%	21%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	4%	53%	43%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	6%	38%	56%
Physical effort required	8%	56%	36%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	6%	44%	50%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	16%	50%	18%	16%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	21%	50%	29%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	14%	57%	29%
Physical effort required	9%	70%	21%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	14%	57%	29%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

CPT Changes

The full family of percutaneous coronary intervention (PCI) codes was last reviewed by the RUC at the January 2012 meeting, when the code family was updated to reflect bundling after CMS identified MPC codes not reviewed in the prior 5 years as potentially misvalued. The codes were surveyed for the January 2023 RUC

meeting after the CPT Editorial Panel approved creation of a single add-on code that describes the work of coronary intravascular lithotripsy (IVL), a technology to modify lesions that did not exist at the time of the prior review. That code change application was submitted by a device manufacturer. The societies had planned to make other revisions to the code family at the following CPT cycle. At the January 2023 RUC meeting the societies proposed that only the new IVL code be valued, and the remainder of the code set be sent to CPT for revision before review. The RUC approved this proposal and, after several code change applications, the revised family was approved at the February 2024 CPT Panel meeting.

The CPT updates included code deletions, revisions, and additions.

- The original code set included additional branch add-on codes for several of the procedures. CMS assigned the branch codes a value of 0 RVUs, rolling a prorated portion of their value into their base codes (more on this later). Due to this lack of RVUs neither CMS nor commercial payers reimbursed these codes from 2013 to present and they were deleted by CPT in February 2024. The deleted codes included 92921, 92925, 92929, 92934, 92938, and 92944.
- CPT amended the base codes to each of these deleted add-on codes (92920, 92924, 92928, 92933, 92937, 92941, and 92943) to include the work, when performed, of potential branch vessels which was not included in the original code definitions and descriptions of work. This essentially matches the code descriptors to CMS's approach to not pay separately for additional branch work.
- Also, in February 2024 CPT created two new codes within the family. First, 92930, was created to allow coding for the work involved in placement of intracoronary stent(s) (currently coded as 92928) that exceeds the typical stenting case. The second new code, 92945, was created to allow coding for revascularization of a chronic total occlusion when both antegrade and retrograde approaches are employed.
- Finally, CPT revised codes 93571 and 93572 to make a correction to the fractional flow reserve (FFR) codes to correct a coding issue relating to instant flow reserve (iFR).

92972 Intravascular Lithotripsy (IVL)

As noted above, the IVL code was surveyed, reviewed by the RUC and issued a value at the January 2023 RUC meeting. The IVL code survey was robust, with 139 respondents. There have been no significant technological or other changes to the IVL procedure since its initial valuation. With the recent survey of this code and in an effort to maximize survey response by keeping it a bit shorter, we did not include the code in this survey and recommend affirmation of current value and time.

Current RVUs and Times

As referenced above, CMS does not recognize the add-on branch codes as separately payable. However, the agency did bundle them into the underlying PCI codes. In doing so, it also added small amounts of work and time, proportionate to predicted utilization. Also, since the last time these codes were valued, moderate sedation was unbundled, removing commensurate work and time. The summary spreadsheet shows the original RUC recommended value, the CMS adjustments for branch code bundling, the adjustments for unbundling of moderate sedation, and finally the current values.

Background: PCI Evolution & Compelling Evidence

Change in Technique

The recommendations for this tab produce an increase in RVUs of less than one half of a percent aggregated across the family of codes. Accordingly, we submit that these services have undergone changes in technique and patient population that substantiate compelling evidence to allow an increase in the aggregate value of the code family. At the time of the 2012 survey, PCI was typically performed via the femoral artery, with a very small minority of cases performed through the radial artery. PCI is now typically performed through the radial artery, reflecting best practice recommendations from the field. https://onlinelibrary.wiley.com/doi/10.1002/ccd.28672

Radial access is safer for patients despite being technically more challenging for the operator. The main advantage is a significant reduction in bleeding risk as well as decreased mortality for some patient subsets. https://pubmed.ncbi.nlm.nih.gov/33507598/.

Radial access requires additional preservice time that is discussed further below. This approach also requires different skills and techniques that are more difficult to perform than access through the femoral artery. While safer for the patient, the service is more technically challenging for the operator in several respects.

(1) The average radial artery is about 2 mm compared to femoral arteries that average about 9 mm, so entering the artery with a needle is more difficult.
(2) The radial and brachial arteries are smaller and more prone to spasm making catheter advancement or torquing difficult or impossible; many operators give an anti-vasospastic cocktail routinely which takes additional time.
(3) Whereas femoral access requires catheters to traverse one 180-degree bend to reach the heart, radial access requires the catheter to make one-180 degree bend and usually two more 90-degree bends to reach the heart, which makes catheter advancement and torquing more difficult.
(4) Radial access provides more frequent challenging anatomic variants such as radial loop, accessory radial arteries, early take-off radial arteries, and aberrant innominate arteries (arteria lusoria); in contrast anatomy from the femoral artery to the heart has few variants. These problems lead to conversion from radial to femoral access in about 10% of cases, while conversion from femoral to radial is almost non-existent.

Positioning for radial increases the risk of radiation and precautions. More time is spent closer to the image intensifier at different angles as opposed to standing farther back when patient is in the femoral area. Now we are closer to the heart and reaching across the patient's chest.

Change in Patient Population

We also see patients undergoing PCI who generally have more comorbidities than a decade ago. Attention to stricter adherence on statins and other medicines in revascularization and chest pain guidelines has eliminated many patients who otherwise may have been treated with lower acuity PCI, something we see in the declining utilization of these services. Remaining patients are more complex than they were a dozen years ago.

All of these factors lead to services that are both more intense/complex while also successfully decreasing the intra-procedure time the patient is on the table.

Incorrect Assumptions

Finally, with the current times and valuation consisting of a mix of RUC recommendations, pro-rated bundling of time and work of PCI in branches by CMS, and reductions of work and time by CMS to apply coding changes related to unbundling moderate sedation, we submit that the current values were derived using a flawed mechanism. CMS bundled the now-deleted branch codes using a type of prorated building block methodology that casts the current values in doubt and provides compelling evidence that the best values for these services should be derived from the robust survey before us.

Recommendations Methodology

We have laid out a rationale above for the intensity/complexity of these codes rising while in some cases the performance time may have decreased. We recommend the survey 25th percentile for all the 000 codes in this family. We chose the survey 25th percentile work RVUs because this approach generally kept the recommended values in line with the trajectory of the reduction or addition of intra-service and total time for the codes while maintaining rank order. While changes to the work RVUs and times are not recommended in exactly proportional amounts, they do maintain relativity in the magnitude to which they change to the positive or the negative. That is to say, where there is a significant reduction in intra-service time there is a more modest

reduction in recommended work RVU and the same is true in the positive direction. Where there is a significant increase in intra-service time there is a more modest recommended increase in work RVU for those codes. RVU.

In developing recommendations for the family, we observed that recommendations for times and values generate WPUT (ie, intensity) values that maintain rank order relationships within the family and align with operators' estimates of work intensity. For instance, 92920 for PTCA has a lower WPUT than 92924 for PTCA with atherectomy, reflecting the higher complication rates of atherectomy and operators' perception that atherectomy is more intense. WPUT for 92941 (PCI of an acute myocardial infarction) has the highest WPUT consistent with operators' perceptions that this is the most intense interventional service. CTO codes 92943 and 92945 have lower WPUTs because they are longer services with multiple catheter changes and techniques being attempted. This consistency of WPUT with current rank order and with operators' perceptions of intensity support the recommendations at the 25th-percentile survey values.

This approach produces the following recommendations for the family that would produce budget increase of 12,342 RVUs out of a baseline of over 3.2 million RVUs (0.38%)

Preservice Time

For each of the 000 codes, we recommend additions to preservice package 2 (Difficult patient/straightforward procedure without anesthesia care) that are supported by the survey. While these are 000 codes provided to patients with short or no hospital stay, there are certain elements of preservice time that are more akin to that of a service which utilizes general anesthesia.

		FACILITY			**PCI**	**Notes**
		2	**3**	**4**	**2+**

C	Dress and scrub for procedure	5	5	5	5	Standard

93572: Additional fractional flow reserve measurement add-on

ACC and SCAI convened a panel of physicians familiar with the services to review the survey data. The survey was robust and was completed by physicians who have experience with the service. The panel

reviewed this ZZZ code and recommends the survey median intra-service time with no preservice or post-service time.

The key reference service is 37252, intravascular ultrasound, initial vessel. 50% of respondents found surveyed code 93572 to be of somewhat more or much more intense/complex, while 44% felt it to be identical. The second key reference code was 37253, intravascular ultrasound, each additional vessel. 34% of respondents found the 2nd KRS to be somewhat more or much more intense/complex than the survey code 93572 while 50% found it to be identical.

While the time for this code notably increased in the survey over the current, the intensity of the code, even when applying the 25th percentile survey wRVU, seemed too high versus its KRS and 2nd KRS. In order to address the increase in time, keep the intensity at an appropriate level and maintain rank order in relation to the 93571 code we recommend a crosswalk to the 2nd KRS code 37253. **We recommend a wRVU of 1.44 for 93571 with 16 minutes intra-service and total time via crosswalk to the survey 2nd KRS 37253.**

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 93572

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Interventional Cardiology How often? Commonly

Specialty Cardiology How often? Commonly

Specialty Internal Medicine How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 35634
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This estimate is three times the 2022 Medicare data for usage to account for Medicare Advantage and commerical insurance covered performance.

Specialty Interventional Cardiology Frequency 19706 Percentage 55.30 %

Specialty Cardiology Frequency 14503 Percentage 40.69 %

Specialty Internal Medicine Frequency 891 Percentage 2.50 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 11,878 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. RUC Database for 2022 data. In recent years this service declined somewhat from a pre-pandemic high. Utilization could tick up in coming years as this service remains a Class I recommendation.

Specialty Interventional Cardiology Frequency 6569 Percentage 55.30 %

Specialty Cardiology Frequency 4834 Percentage 40.69 %

Specialty Internal Medicine Frequency 297 Percentage 2.50 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Cardiovascular-Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 93572

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

SS Rec Summary

Chicago, IL 60611

Re: Tab 6 Coronary Therapeutic Services and Procedures

Dear Dr. Manaker:

Tab 6 on the April 2024 RUC agenda addresses 13 codes for percutaneous coronary interventions (PCIs). This family of codes was referred to the CPT Editorial Panel for modification after a new code for coronary intravascular lithotripsy (IVL), code 92972, was valued at the January 2023 RUC meeting.

All of the codes in this tab are exclusively performed in the facility setting with either a 000 or ZZZ global period. As such, the Society for Cardiovascular Angiography and Interventions and the American College of Cardiology recommend no direct practice expense inputs for these codes in Tab 6.

Thank you for your consideration of this information as you prepare for the upcoming meeting. Please contact Matt Minnella at mminnella@acc.org if you have any questions.

Sincerely,

Afnan Tariq, MD
SCAI RUC Advisor

Richard Wright, MD
ACC RUC Advisor

AMA/Specialty Society RVS Update Committee Summary of Recommendations

January 2023

Percutaneous Coronary Interventions – Tab 12

Referral to the CPT Editorial Panel

In October 2010, CPT code 92980 *Transcatheter placement of an intracoronary stent(s), percutaneous, with or without other therapeutic intervention, any method; single vessel* was identified by the Relativity Assessment Workgroup (RAW) via the MPC List screen. The RAW requested that the specialty societies survey this code for RUC review. Subsequently, the specialty society referred the code to the CPT Editorial Panel to revise the family of procedures to more accurately describe the current physician work involved in PCI. At the October 2011 CPT meeting, the Panel approved 13 new codes to describe PCI services. The societies surveyed the family and the RUC submitted recommendations to the Centers for Medicare & Medicaid Services (CMS) in January 2012. Instead of accepting the RUC recommendations, CMS opted to assign bundled status to all the add-on codes for the additional branches off the major coronary arteries (codes 92921, 92929, 92934, 92938, 92944). In addition, CMS increased values and intra-times of all the base codes using a mathematical formula to include a fraction of the time and value of the add-on codes, based on the billed together data available at the time. For example, using 2011 Medicare claims data, CMS anticipated that the service described by add-on code 92921 would be performed with the procedure described by base code 92920 27.4% of the time. To bundle the work value of the add-on code into base code 92920, CMS multiplied the RUC recommendation for the add-on code of 4.00 by 27.4% (or 1.10) and added that fractional value to the RUC recommendation for the base code (9.00+1.10=10.10). The value of moderate sedation, which was bundled into the base codes, was systematically removed when separate moderate sedation CPT codes were created for CPT 2017.

In September 2022, the CPT Editorial Panel created one new Category I CPT code for percutaneous coronary lithotripsy. Sixteen other percutaneous coronary intervention (PCI) codes were considered part of the code family.

For the January 2023 RUC meeting, the specialty societies opted to survey nine of the sixteen codes. The specialty societies opted to not survey the add-on codes in the family that describe intervention in additional branches off major coronary arteries. CMS and payers have never recognized these add-on codes as separately payable services, therefore they have no Medicare utilization. The specialty societies noted they did not want to confuse respondents by asking them to survey codes with which they are not familiar or to lengthen the survey for services that are not separately reportable. As part of the societies' plans for future updates to this family of codes, the societies noted their intention is to delete add-on codes for PCI in additional branches.

After reviewing the survey results in preparation for the January 2023 RUC meeting, the surveying specialty societies requested, and the RUC agreed, to submit a recommendation only for the new add-on code 92972 for CPT 2024 and referred the entire percutaneous coronary intervention code family to the CPT Editorial Panel for restructuring for the CPT 2025 cycle.

The specialty societies noted that their intent is to update the CPT code structure for PCI services to incorporate the bundling of the branch services and to account for modern technology and changes in the techniques used to provide these services.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The specialties also explained that PCI is now typically performed through the radial artery, reflecting best practice recommendations from the field. Research has shown the radial approach to be safer for patients despite being technically more challenging for the operator. The main advantage is a significant reduction in the risk of patient bleeding. At the time of the prior survey, PCI was typically performed via the femoral artery, with a very small minority of cases performed through the radial artery; PCI via the radial artery was just emerging in this country.

The RUC recommends that existing CPT codes 92920, 92921, 92924, 92925, 92928, 92929, 92933, 92934, 92937, 92938, 92941, 92943, 92944, 92973, 92975, 92977 and new add-on code 92972 be referred to the CPT Editorial Panel for revision in the 2025 CPT cycle. It is the expectation of the RUC that the specialties will submit their code change application for the September 2023 CPT meeting and survey new and/or revised codes within the 2025 CPT cycle.

92972 ***Percutaneous transluminal coronary lithotripsy (List separately in addition to code for primary procedure)***
The RUC reviewed the survey results from 139 interventional cardiologists and noted that the survey respondents overestimated the typical physician work required to perform this add-on code. Therefore, the RUC recommended a direct work RVU crosswalk to CPT Code 37249 *Transluminal balloon angioplasty (except dialysis circuit), open or percutaneous, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty within the same vein; each additional vein (List separately in addition to code for primary procedure)* (work RVU= 2.97, intra-service and total time of 30 minutes) and noted that both services typically involve the same amount of intra-service and total time and similar physician work intensity.

Code 92972 is a new Category I code to report intravascular lithotripsy (IVL) as an add-on to other PCI services. IVL is a new revascularization treatment option, in which pulsating sonic pressure waves pass through soft tissue and selectively interact strongly with high-density calcium, producing significant shear stresses that have the ability to fracture the calcium. Arterial calcification is associated with increased cardiovascular risks. Intimal arterial calcification (IAC), considered a representation of underlying atherosclerotic plaque burden, has long been held responsible for this association, whereas increasing interest is directed towards medial arterial calcification (MAC). IVL is designed to modify both intimal and medial calcium across a wide range of vascular applications to increase vessel compliance, restore vessel mobility and provide new versatile treatment options for patients. Coronary IVL received pre-market approval on February 12, 2021 from the FDA for lithotripsy-enabled, low-pressure balloon dilatation of severely calcified, stenotic de novo coronary arteries prior to stenting.

The RUC compared the surveyed code to reference CPT code 67335 *Placement of adjustable suture(s) during strabismus surgery, including postoperative adjustment(s) of suture(s) (List separately in addition to code for specific strabismus surgery)* (work RVU= 3.23, intra-service and total time of 30 minutes) and CPT code 32668 *Thoracoscopy, surgical; with diagnostic wedge resection followed by anatomic lung resection (List separately in addition to code for primary procedure)* (work RVU= 3.00, intra-service and total time of 30 minutes) and noted that all three services typically involve an identical amount of time and similar physician work intensities to perform. The RUC concluded that CPT code 92972 should be valued based on a direct work RVU crosswalk to CPT code 37249 and agreed the crosswalk value below the survey 25th percentile was appropriate. **The RUC recommends a work RVU of 2.97 for CPT code 92972.**

Practice Expense
No direct practice expense inputs are recommended for CPT code 92972 as it is a facility-based add-on service.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Cardiovascular
Therapeutic Services and Procedures
Coronary Therapeutic Services and Procedures

Codes 92920-92944, describe percutaneous revascularization services performed for occlusive disease of the coronary vessels (major coronary arteries, coronary artery branches, or coronary artery bypass grafts). These percutaneous coronary intervention (PCI) codes are built on progressive hierarchies with more intensive services inclusive of lesser intensive services. These PCI codes all include the work of accessing and selectively catheterizing the vessel, traversing the lesion, radiological supervision and interpretation directly related to the intervention(s) performed, closure of the arteriotomy when performed through the access sheath, and imaging performed to document completion of the intervention in addition to the intervention(s) performed. These codes include angioplasty (eg, balloon, cutting balloon, wired balloons, cryoplasty), atherectomy (eg, directional, rotational, laser), and stenting (eg, balloon expandable, self-expanding, bare metal, drug eluting, covered). Each code in this family includes balloon angioplasty, when performed. Diagnostic coronary angiography may be reported separately under specific circumstances. Percutaneous transluminal coronary lithotripsy may be reported using ~~0715T~~ 92972 in conjunction with 92920, 92924, 92928, 92933, 92937, 92941, 92943, 92975, as appropriate.

Diagnostic coronary angiography codes (93454-93461)and injection procedure codes (93563-93564) should notbe used with percutaneous coronary revascularizationservices (92920-92944) to report:

1. Contrast injections, angiography, roadmapping, and/or fluoroscopic guidance for the coronaryintervention,

2. Vessel measurement for the coronary intervention, or

3. Post-coronary angioplasty/stent/atherectomyangiography, as this work is captured in thepercutaneous coronary revascularization services codes (92920-92944).

Diagnostic angiography performed at the time of a coronary interventional procedure may be separately reportable if:

1. No prior catheter-based coronary angiography study is available, and a full diagnostic study is performed, and a decision to intervene is based on the diagnostic angiography, or

2. A prior study is available, but as documented in the medical record:

    a. The patient's condition with respect to the clinical indication has changed since the prior study, or

    b. There is inadequate visualization of the anatomy and/or pathology, or

    c. There is a clinical change during the procedure that requires new evaluation outside the target area of intervention.

Diagnostic coronary angiography performed at a separate session from an interventional procedure is separately reportable.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Major coronary arteries: The major coronary arteries are the left main, left anterior descending, left circumflex, right, and ramus intermedius arteries. All PCI procedures performed in all segments (proximal, mid, distal) of a single major coronary artery through the native coronary circulation are reported with one code. When one segment of a major coronary artery is treated through the native circulation and treatment of another segment of the same artery requires access through a coronary artery bypass graft, the intervention through the bypass graft is reported separately.

Coronary artery branches: Up to two coronary artery branches of the left anterior descending (diagonals), left circumflex (marginals), and right (posterior descending, posterolaterals) coronary arteries are recognized. The left main and ramus intermedius coronary arteries do not have recognized branches for reporting purposes. All PCI(s) performed in any segment (proximal, mid, distal) of a coronary artery branch is reported with one code. PCI is reported for up to two branches of a major coronary artery. Additional PCI in a third branch of the same major coronary artery is not separately reportable.

Coronary artery bypass grafts: Each coronary artery bypass graft represents a coronary vessel. A sequential bypass graft with more than one distal anastomosis represents only one graft. A branching bypass graft (eg, Y graft) represents a coronary vessel for the main graft, and each branch off the main graft constitutes an additional coronary vessel. PCI performed on major coronary arteries or coronary artery branches by access through a bypass graft is reported using the bypass graft PCI codes. All bypass graft PCI codes include the use of coronary artery embolic protection devices when performed.

Only one base code from this family may be reported for revascularization of a major coronary artery and its recognized branches. Only one base code should be reported for revascularization of a coronary artery bypass graft, its subtended coronary artery, and recognized branches of the subtended coronary artery. If one segment of a major coronary artery and its recognized branches is treated through the native circulation, and treatment of another segment of the same vessel requires access through a coronary artery bypass graft, an additional base code is reported to describe the intervention performed through the bypass graft. The PCI base codes are 92920, 92924, 92928, 92933, 92937, 92941, and 92943. The PCI base code that includes the most intensive service provided for the target vessel should be reported. The hierarchy of these services is built on an intensity of service ranked from highest to lowest as 92943 = 92941 = 92933 > 92924 > 92937 = 92928 > 92920.

PCI performed during the same session in additional recognized branches of the target vessel should be reported using the applicable add-on code(s). The add-on codes are 92921, 92925, 92928, 92934, 92938, and 92944 and follow the same principle in regard to reporting the most intensive service provided. The intensity of service is ranked from highest to lowest as 92944 = 92938 > 92934 > 92925 > 92929 > 92921.

PCI performed during the same session in additional major coronary or in additional coronary artery bypass grafts should be reported using the applicable additional base code(s). PCI performed during the same session in additional coronary artery branches should be reported using the applicable additional add-on code(s).

If a single lesion extends from one target vessel (major coronary artery, coronary artery bypass graft, or coronary artery branch) into another target vessel, but can be revascularized with a single intervention bridging the two vessels, this PCI should be reported with a single code despite treating more than one vessel. For example, if a left main coronary lesion extends into the proximal left circumflex coronary artery and a single stent is placed to treat the entire lesion, this PCI should be reported as a single vessel stent (92928). In this example, a code for additional vessel treatment (92929) would not be additionally reported.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

When bifurcation lesions are treated, PCI is reported for both vessels treated. For example, when a bifurcation lesion involving the left anterior descending artery and the first diagonal artery is treated by stenting both vessels, 92928 and 92929 are both reported. Target vessel PCI for acute myocardial infarction is inclusive of all balloon angioplasty, atherectomy, stenting, manual aspiration thrombectomy, distal protection, and intracoronary rheolytic agent administration performed. Mechanical thrombectomy is reported separately. Chronic total occlusion of a coronary vessel is present when there is no antegrade flow through the true lumen, accompanied by suggestive angiographic and clinical criteria (eg, antegrade "bridging" collaterals present, calcification at the occlusion site, no current presentation with ST elevation or Q wave acute myocardial infarction attributable to the occluded target lesion). Current presentation with ST elevation or Q wave acute myocardial infarction attributable to the occluded target lesion, subtotal occlusion, and occlusion with dye staining at the site consistent with fresh thrombus are not considered chronic total occlusion. Codes 92973 (percutaneous transluminal coronary thrombectomy, mechanical), 92974 (coronary brachytherapy), 92978 and 92979 (intravascular ultrasound/optical coherence tomography), 93571 and 93572 (intravascular Doppler velocity and/or pressure [fractional flow reserve (FFR) or coronary flow reserve (CFR)]), and ~~0715T~~ 92972 (percutaneous transluminal coronary lithotripsy), are add-on codes for reporting procedures performed in addition to coronary and bypass graft diagnostic and interventional services, unless included in the base code. Non-mechanical, aspiration thrombectomy is not reported with 92973, and is included in the PCI code for acute myocardial infarction (92941), when performed. (To report transcatheter placement of radiation delivery device for coronary intravascular brachytherapy, use 92974) (For intravascular radioelement application, see 77770, 77771, 77772) (For nonsurgical septal reduction therapy [eg, alcohol ablation], use 93799)

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:92972 Tracking Number Q14 Original Specialty Recommended RVU: **3.90**
Presented Recommended RVU: **3.90**
Global Period: ZZZ Current Work RVU: **NA** RUC Recommended RVU: **2.97**

CPT Descriptor: Percutaneous transluminal coronary lithotripsy (list separately in addition to code for primary procedure) (use 9x070 in conjunction with 92920, 92924, 92928, 92933, 92937, 92941, 92943, 92975)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: a 62-year-old male with a history of left anterior descending coronary stent placement presents with exertional chest pain despite appropriate medical therapy. coronary angiography (coded separately) reveals severe in-stent restenosis, and imaging shows a circumferential calcified ring in the distal portion of the stent. he is sent to an angioplasty center and the lesion is treated with intravascular lithotripsy to allow appropriate stent expansion with balloon dilation.
[note: this is an add-on service. only consider the additional physician work related to percutaneous transluminal coronary lithotripsy.]

Percentage of Survey Respondents who found Vignette to be Typical: 96%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work:

Description of Intra-Service Work: Based on separately reportable diagnostic coronary angiography, the presence of severe coronary artery calcium (CAC) is observed. The appropriate diameter coronary IVL catheter is selected. The coronary IVL catheter is inserted over the standard guidewire and advanced to the target location using fluoroscopy and marker bands. Once the coronary IVL catheter is placed, the integrated balloon is inflated to 4-atm, or enough pressure to make contact with the vessel wall. The first lithotripsy cycle of pulses is then delivered. Once the cycle is complete, the integrated balloon is then inflated to its nominal pressure of 6-atm. The balloon is then deflated. The mid LAD segment is also treated with the 3.0 mm × 20 mm balloon inflated at 8 atmosphere for 50 seconds. Final angiogram shows good angiographic results in LAD with residual stenosis of 30%, no overt dissection and TIMI 3 flow. No special patient care is needed post-op.

Description of Post-Service Work:

Technical skill required	10%	37%	53%
Physical effort required	7%	41%	52%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	3%	17%	80%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

CPT Changes

The family of percutaneous coronary intervention (PCI) codes was last reviewed by the RUC at the January 2012 meeting, when the code family was updated to reflect bundling after CMS identified MPC codes not reviewed in the prior 5 years as potentially misvalued. The codes were reviewed for this meeting after the CPT Editorial Panel approved creation of a single add-on code that describes the work of coronary intravascular lithotripsy (IVL), a technology to modify lesions that did not exist at the time of the prior review. That code change application was submitted by a device manufacturer, and the societies worked aggressively to execute a survey that was not anticipated. Work to incorporate this technology was slated by our CPT committees for the subsequent cycle.

Survey Approach

One result of the unanticipated review was a decision to streamline the survey in order to increase the likelihood of completion. In consultation with RUC staff, we opted to not survey the add-on codes in the family that describe intervention in additional branches off major coronary arteries. CMS and payers have never recognized these add-on codes as separately payable services and they have no utilization. We did not want to confuse respondents by asking them to survey codes with which they are not familiar, or to lengthen the survey for services that are not actually paid. As part of the societies' plans for future updates to this family of codes, we intended to delete those add-on codes for PCI in additional branches. Therefore, we recommend affirmation or contractor pricing or bundling for those codes, whichever is most appropriate for the circumstances.

Current RVUs

As referenced above, CMS does not recognize the add-on codes as separately payable. However, the agency did bundle them into the underlying PCI codes. In doing so, it also added small amounts of work and time, proportionate to predicted utilization. Also, since the last time these codes were valued, work and time were removed when changes were made for moderate sedation billing. The summary spreadsheet shows the original RUC recommended value, the CMS adjustments for bundling, the adjustments for moderate sedation, and finally the current values.

Background: PCI Evolution

The recommendations for this tab do not produce an increase in RVUs and do not require a compelling evidence argument. However, these services have changed in a way that merits consideration of a change in technique that informs the results of the survey. PCI is now typically performed through the radial artery, reflecting best practice recommendations from the field. https://onlinelibrary.wiley.com/doi/10.1002/ccd.28672 Research has shown the radial approach to be safer for patients despite being technically more challenging for the operator. The main advantage is a significant reduction in bleeding risk as well as some improvement in other factors. https://pubmed.ncbi.nlm.nih.gov/33507598/ At the time of the prior survey, PCI was typically performed via the femoral artery, with a very small minority of cases performed through the radial artery; PCI via the radial artery was just emerging in this country. PCI via the radial artery requires additional preservice time that is discussed further below. This approach also requires different skills and techniques that are more difficult to perform than access through the femoral artery. While safer for the patient, the service is more technically challenging for the operator. In contrast to the femoral approach, using the radial access creates more potential roadblocks in terms of procedural execution that requires additional catheter manipulations. The radial artery cannot connect directly to the heart in a straight-line fashion, having a loop in it. This can influence the catheter availability and support for doing angioplasty. In some instances, one will fall back to a femoral position. There can also be trouble getting the catheter into the aorta and then into ascending aorta, so it goes into coronaries and not the valve as opposed to into the leg. Catheters don't always have ability to support push and backup in the same way as femoral access, making those manipulations more challenging. Some catheters also can't engage anomalous coronary arteries.

There have been some changes in catheters have improved certain elements of procedures that may also explain some reduction in time, such as catheters that allow us to access things radially that we didn't have previously and others that allow for easier canulation of a vessel without as many catheter changes as in the past, reducing lower acuity procedure time. These allow access to lesions that were previously not able to be treated, such as certain grafts, anomalous coronaries, or tortuous anatomy. There has been a procedural shift to more comprehensive lesion preparation. We also see patients undergoing PCI who are generally older and have more comorbidities than a decade ago. Attention to stricter appearance on statins and other medicines has eliminated many patients who otherwise may have been treated with lower acuity PCI. Those remaining are more complex. Positioning for radial increases the risk of radiation and precautions. More time is

spent closer to the image intensifier at different angles as opposed to standing farther back when patient is in the femoral area. Now we are closer to the heart and reaching across the patient's chest.

All of these factors lead to services that are both more intense/complex while also successfully decreasing the intra-procedure time the patient is on the table.

Recommendations Methodology

We struggled with how best to incorporate the bundling of the add-on branch codes. Because of the lack of recognition of the CPT-defined and previously RUC-valued add-on codes for interventions in branch vessels, we offer work recommendations at the survey 25th-percentile values for these codes with the addition of the same work increments CMS added when it bundled the branch intervention services into the base codes in 2013. We chose the survey 25th-percentile work RVUs as the starting point because this approach generally kept the recommended values below the current values. In instances where this approach did not keep the recommendations below the current values and times were similar or lower, we recommend the current value. As we move to the codes that are based on patient characteristics with use of any intervention—of/through a CABG, during AMI, and of a chronic total occlusion—where times are similar or higher, we recommend the current values for two codes where the survey 25th would be an increase and the survey 25th with a higher value for one code that shows a significant increase in time that reflects a different patient population than a decade ago. (Though that recommendation doesn't require a compelling evidence argument since the overall recommendations are budget neutral, we'll discuss that change in patient population for the chronic total occlusion code later.) In a similar manner, we added the bundled times to our recommendations in the same manner that CMS did in 2013 to account for work in the branch codes that would otherwise go unrecognized.

This approach produces the following recommendations for the family that would produce budget neutral savings of nearly 94,000 RVUs.

Code	Description	Rec.	Curr. Value	Rec. Pre	Rec. Intra	Rec. Post	Rec. Total
92920	Angioplasty	9.60	9.85	43	53	28	124
92921	Angioplasty, additional	0.00	0.00		30		30
92924	Atherectomy w/ angioplasty	11.74	11.74	43	69	28	140
92925	Atherectomy w/ angioplasty, additional	0.00	0.00		45		45
92928	Stent w/ angioplasty	10.57	10.96	43	60	28	131
92929	Stent w/ angioplasty, additional	0.00	0.00		30		30
92933	Atherectomy w/ stent w/ angioplasty	11.97	12.29	43	77	28	148
92934	Atherectomy w/ stent w/ angioplasty, additional	0.00	0.00		45		45
92937	Any revasc of CABG w/ w/out distal protection	10.95	10.95	43	77	28	148
92938	Any revasc of CABG w/ w/out distal protection, additional	0.00	0.00		60		60
92941	Any revasc of AMI total/subtotal occlusion	12.31	12.31	43	70	28	141
92943	Any revasc of chronic total occlusion w/ w/out thrombectomy	14.24	12.31	43	122	28	193
92944	Any revasc of chronic total occlusion w/ w/out thrombectomy, additional	0.00	0.00		60		60
92973	Thrombectomy add-on	2.97	3.28		30		30

Obsolete Codes

The RUC also identified codes 92975 and 92977 for thrombolysis as part of this family. With the extremely low volume and obsolete nature of these codes (78 and 2 units, respectively), the societies did not survey these. Instead, we recommend contractor pricing until they can be updated to reflect current practice or deleted.

Preservice Time

For each of the codes, we recommend additions to preservice package 2 (Difficult patient/straightforward procedure without anesthesia care). While these are 000 codes provided to patients with short or no hospital stay, the certain elements of preservice time are more akin to that of a service that utilizes general anesthesia.

92972

This is a new Category I code to report intravascular lithotripsy (IVL) as an add-on to other PCI services. IVL is a new revascularization treatment option that pulsatile sonic pressure waves that pass through soft tissue and selectively interact strongly with high-density calcium, producing significant shear stresses that have the ability to fracture the calcium. Arterial calcification is associated with increased cardiovascular risks. Intimal arterial calcification (IAC),

considered a representation of underlying atherosclerotic plaque burden, has long been held responsible for this association, whereas increasing interest is directed towards medial arterial calcification (MAC). IVL is designed to modify both intimal and medial calcium across a wide range of vascular applications to increase vessel compliance, restore vessel mobility and provide new versatile treatment options for patients. Coronary IVL received PMA approval February 12, 2021 from the FDA for lithotripsy-enabled, low-pressure balloon dilatation of severely calcified, stenotic de novo coronary arteries prior to stenting.

ACC and SCAI convened a panel of physicians familiar with the services to review the survey data. The survey was robust and was completed by physicians who have experience with the service. The panel reviewed this ZZZ code and recommends the survey median intra-service time with no preservice or post-service time.

The key reference service is 92974, transcatheter placement of a radiation delivery device for subsequent coronary intravascular brachytherapy. 43% of key reference respondents found surveyed code 92972 to be of similar intensity/complexity, while 48% found it to be somewhat more or much more intense/complex. The second key reference service is 37233, angioplasty and atherectomy of an additional tibial/peroneal additional vessel. 68% of respondents found surveyed code 92972 to be of somewhat more or much more intense/complex, while 29% felt it to be identical.

The second KRS is helpful in valuing the new code for coronary IVL. We can determine from the survey that if 92972 is half the time of 37233, that value is 3.25. With respondents indicating 92972 to be more intense, that would comport with a higher value. The survey 25th-percentile wRVU would make sense from that perspective. We did seek and find additional 30-minute procedural add-on codes that suggest 3.90 may be about right for this new technology and newly defined service. A thoracoscopy code and stereotactic radiosurgery code that both have 30 minutes of time bracket the 25th-percentile value at 4.12 and 3.48, respectively, as shown in the summary spreadsheet.

As such, the societies **recommend the survey 25th-percentile wRVU of 3.90 with times of 0/30/0** for this add-on code**.**

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 93799

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Interventional Cardiology How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 41489
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. The IVL manufacturer reported this amount as the number of IVL procedures performed in the most recently available 12 month period (June 2021-May 2022) in their CPT Code Change Application.

Specialty Interventional Cardiology Frequency 41489 Percentage 100.00 %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 34,021 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The IVL manufacturer reported this amount as the number of IVL procedures performed on Medicare patients in the most recently available 12 month period (June 2021-May 2022) in their CPT Code Change Application.

Specialty Interventional Cardiology Frequency 34021 Percentage 100.00 %

Specialty Frequency Percentage %

Specialty Frequency 0 Percentage %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:

Chicago, IL 60611

Re: Tab 12 Percutaneous Coronary Interventions

Dear Dr. Manaker:

Tab 12 on the January 2023 RUC agenda addresses 17 codes. One of these is a new code, which describes intravascular lithotripsy, 92972. This code will be provided exclusively in the facility setting with a ZZZ global period. As such, the Society for Cardiovascular Angiography and Interventions and the American College of Cardiology recommend no direct practice expense inputs for this code in Tab 12.

The RUC also identified 16 established codes as part of this family. These include 92920, 92921, 92924, 92925, 92928, 92929, 92933, 92934, 92937, 92938, 92941, 92943, 92973, 92975 and 92977. All of these codes are exclusively performed in the facility setting with either a 000, XXX, or ZZZ global periods. As such, the Society for Cardiovascular Angiography and Interventions and the American College of Cardiology recommend no direct practice expense inputs for these codes in Tab 12.

Thank you for your consideration of this information as you prepare for the upcoming meeting. Please contact Matt Minnella at mminnella@acc.org if you have any questions.

Sincerely,

Afnan Tariq, MD
SCAI RUC Advisor

Richard Wright, MD
ACC RUC Advisor

AMA/Specialty Society RVS Update Committee Summary of Recommendations

September 2025

Laser Treatment for Inflammatory Skin Diseases – Tab 16

The laser therapy for inflammatory skin conditions codes 96920, 96921 and 96922 were originally identified as potentially misvalued in 2008 via the CMS high volume growth screen. In October 2015, the RUC identified these codes via the high-volume growth screen with Medicare utilization of 10,000 or more that increased by at least 100% from 2008 through 2013. More recently, the code family was surveyed for the April 2023 RUC meeting, after being flagged again for increasing utilization in January 2022. The code set subsequently underwent several CPT revisions.

Upon consideration at the April 2025 RUC meeting, the RUC concurred that the code descriptor changes since the laser codes were last reviewed in 2023 were editorial in nature (remove the word 'excimer'). However, the new code change application with expanded indications would require a RUC survey. The RUC agreed with the specialty society's request to affirm the current CMS values for CPT codes 96920, 96921 and 96922. In May 2025, the CPT Editorial Panel revised the three codes to reflect the intended use for inflammatory or auto-immune skin diseases (eg, psoriasis). Accordingly, the specialty society surveyed the code family for the September 2025 RUC meeting.

Compelling Evidence
The RUC agreed with the specialty society that there is compelling evidence to support a change in physician work for CPT codes 96920, 96921 and 96922 based on flaws in the prior valuation process and change in patient population.

Flawed Methodology
The specialty society believes, and the RUC agrees, that the methodology used by CMS in the CY2025 Medicare Physician Fee Schedule was flawed and led to incorrect assumptions and inaccurate valuation of laser codes CPT 96920, 96921 and 96922. For CY2025, CMS accepted the RUC recommended times but did not accept the RUC recommended values, resulting in anomalies. Instead, the Agency finalized lower work RVUs: 0.83 for 96920, 0.90 for 96921, and 1.15 for 96922.

Specifically, CMS finalized work RVUs based on crosswalks to CPT codes 11104 *Punch biopsy of skin (including simple closure, when performed); single lesion* and 11301 *Shaving of epidermal or dermal lesion, single lesion, trunk, arms or legs; lesion diameter 0.6 to 1.0 cm* for 96920 and 96921, respectively. For 96922, CMS used a purely formulaic approach, applying building block methodology and citing the RUC-recommended incremental difference of 0.25 work RVUs above 96921 to arrive at a final value of 1.15. CMS also calculated intra-service time ratios between the 2002 intra-service times, and the RUC recommended intra-service times for each code, multiplying that ratio by the 2002 work RVU.

In its rationale, CMS indicated that the physician times associated with these codes have fluctuated over time, while the work RVUs have remained largely unchanged. CMS expressed concern that the 2012 recommendations did not address this inconsistency and emphasized that significant

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

decreases in time should correspond with decreases in work RVUs unless a clear rationale is provided for increased intensity. The specialty society believes CMS's methodology is flawed due to the use of time ratios across different time periods to justify reductions in work RVUs, particularly when the original 2002 values were not based on survey data but were established through crosswalks. Applying time-based calculations across periods where code descriptors have since been revised is not appropriate for valuing physician work. Calculating an intra-service time ratio based on the 2002 values is not representative of the actual time, intensity, and physician work involved in performing these services today. Further, CMS did not provide a clinical rationale to support the selected crosswalks to 11104 and 11301, which do not reflect the current clinical use, service characteristics, or intensity of laser treatment for inflammatory skin disease.

Change in patient population
The second argument in support of compelling evidence relates to a change in the patient population. Laser treatment for inflammatory and autoimmune skin diseases is now typically performed only in those patients with contraindications for systemic agents, such as those with paradoxical biologic response, lack of response to systemic agents, preexisting immunosuppression or latent infections, or those patients with particularly recalcitrant disease. The code indications, previously limited to psoriasis, now encompass applicable inflammatory and autoimmune skin diseases, such as atopic dermatitis, vitiligo, and alopecia areata. Although psoriasis is anticipated to remain the typical condition treated by this modality, the patient population treated with ultraviolet laser has shifted as highly effective systemic biologics have replaced localized therapy. With biologics, the excimer laser device is used to treat patients who have not responded well to biologics or need extra treatment in hard-to-treat areas that are thick and recalcitrant to biologics. Therefore, the patient population has significantly changed since the last time the RUC recommendation was implemented by CMS.

The RUC concurred that there is compelling evidence that the physician work for these services has changed based on flawed methodology and change in patient population. The RUC agrees to consider increased times and work RVUs for CPT codes 96920, 96921 and 96922 based on the current survey data.

96920 ***Laser treatment, 308-312 nanometer wavelengths, for inflammatory or auto-immune skin diseases (eg, psoriasis); total area less than 250 sq cm***
The RUC reviewed the survey results from 37 dermatologists and determined that the survey 25th percentile work RVU of 1.00 appropriately accounts for the physician work involved in this service. The RUC recommends 7 minutes pre-service evaluation time, 2 minutes pre-service positioning time, 1-minute pre-service scrub/dress/wait time, 12 minutes intra-service time, and 5 minutes post-service time for 27 minutes total time as supported by the survey.

Pre-service time package 5 *NF Proc w minimal anes care (if no deduct 1 min)* for the non-facility setting is supported. In addition, maintaining the current 2 minutes of pre-service positioning time to account for the necessary maneuvering and manipulation of the patient to allow access to sensitive treatment areas for the application of local anesthetic (eutectic mixture of local anesthetics (EMLA) cream), as needed; draping and positioning the patient for optimal access to each treatment site.

To justify a work RVU of 1.00, the RUC compared the surveyed code to the top key reference service code 11307 *Shaving of epidermal or dermal lesion, single lesion, scalp, neck, hands, feet, genitalia; lesion diameter 1.1 to 2.0 cm* (work RVU = 1.20, 21 minutes intra-service time and 32

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

minutes total time) and noted that the reference service has more intra-service time and total time than the surveyed code and is therefore appropriately valued higher. The RUC also compared the surveyed code to the second key reference service code 96574 *Debridement of premalignant hyperkeratotic lesion(s) (ie, targeted curettage, abrasion) followed with photodynamic therapy by external application of light to destroy premalignant lesions of the skin and adjacent mucosa with application and illumination/activation of photosensitizing drug(s) provided by a physician or other qualified health care professional, per day* (work RVU = 1.01, 16 minutes intra-service time and 36 minutes total time) and noted that the reference service has a similar amount of physician work yet the surveyed code has less intra-service time and is more intense.

The RUC also compared the surveyed code to CPT code 20606 *Arthrocentesis, aspiration and/or injection, intermediate joint or bursa (eg, temporomandibular, acromioclavicular, wrist, elbow or ankle, olecranon bursa); with ultrasound guidance, with permanent recording and reporting* (work RVU = 1.00, 10 minutes intra-service time and 27 minutes total time) and noted that the comparator code has similar intra-service time, identical total time and involves the same amount of physician work. The difference in intra-service time is offset by the slightly higher intensity of CPT code 20606.

The RUC also offers strong comparisons between the surveyed code and MPC codes 12011 *Simple repair of superficial wounds of face, ears, eyelids, nose, lips and/or mucous membranes; 2.5 cm or less* (work RVU = 1.07, 12 minutes intra-service time and 24 minutes total time) and 11980 *Subcutaneous hormone pellet implantation (implantation of estradiol and/or testosterone pellets beneath the skin)* (work RVU = 1.10, 12 minutes intra-service time and 27 minutes total time) noting the identical intra-service times, yet the comparator codes involve slightly more physician work and intensity and are therefore both appropriately valued higher than the surveyed code.

For additional support, the RUC compared the surveyed code to MPC codes 12001 *Simple repair of superficial wounds of scalp, neck, axillae, external genitalia, trunk and/or extremities (including hands and feet); 2.5 cm or less* (work RVU = 0.84, 10 minutes intra-service time and 22 minutes total time) and 12002 *Simple repair of superficial wounds of scalp, neck, axillae, external genitalia, trunk and/or extremities (including hands and feet); 2.6 cm to 7.5 cm* (work RVU = 1.14, 15 minutes intra-service time and 27 minutes total time) and noted that the comparison codes appropriately bracket the recommended work RVU. The RUC concluded that CPT code 96920 should be valued at the 25th percentile work RVU as supported by the survey. **The RUC recommends a work RVU of 1.00 for CPT code 96920.**

96921 *Laser treatment, 308-312 nanometer wavelengths, for inflammatory or auto-immune skin diseases (eg, psoriasis); 250 sq cm to 500 sq cm*
The RUC reviewed the survey results from 37 dermatologists and determined that the survey 25th percentile work RVU of 1.24 appropriately accounts for the physician work involved in this service. The recommendation also provides for a stepwise progression of the procedure based on the size of the wound or lesion. The RUC recommends 7 minutes pre-service evaluation time, 2 minutes pre-service positioning time, 1 minute of pre-service scrub/dress/wait time, 17 minutes intra-service time, and 5 minutes post-service time for 32 minutes total time as supported by the survey. The RUC acknowledged that the increase in intra-service time is attributed to the more difficult typical patient and increased complexity of the cases. The specialty society believes, and the RUC agrees, that the median intra-service times from the current survey more accurately reflect the physician time and intensity associated with these services than the current values.

Pre-service time package 5 *NF Proc w minimal anes care (if no deduct 1 min)* for the non-facility setting is supported. In addition, maintaining the current 2 minutes of pre-service positioning time to account for the necessary maneuvering and manipulation of the patient to allow access to

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

sensitive treatment areas for the application of local anesthetic (EMLA cream), as needed; draping and positioning the patient for optimal access to each treatment site.

To justify a work RVU of 1.24, the RUC compared the surveyed code to the top key reference service code 12014 *Simple repair of superficial wounds of face, ears, eyelids, nose, lips and/or mucous membranes; 5.1 cm to 7.5 cm* (work RVU = 1.57, 20 minutes intra-service time and 32 minutes total time) and noted that the reference service has the same total time yet more intra-service time and is more intense, justifying a higher value than the surveyed code. The RUC also compared the surveyed code to the second key reference service code 12006 *Simple repair of superficial wounds of scalp, neck, axillae, external genitalia, trunk and/or extremities (including hands and feet); 20.1 cm to 30.0 cm* (work RVU = 2.39, 30 minutes intra-service time and 47 minutes total time) and noted that the reference service has much more intra-service and total time than the surveyed code and is therefore appropriately valued higher.

For additional support, the RUC noted that the surveyed code is closely bracketed by MPC codes 12002 *Simple repair of superficial wounds of scalp, neck, axillae, external genitalia, trunk and/or extremities (including hands and feet); 2.6 cm to 7.5 cm* (work RVU = 1.14, 15 minutes intra-service time and 27 minutes total time) and 12004 *Simple repair of superficial wounds of scalp, neck, axillae, external genitalia, trunk and/or extremities (including hands and feet); 7.6 cm to 12.5 cm* (work RVU = 1.44, 17 minutes intra-service time and 29 minutes total time). Of note, MPC code 12004 has identical intra-service time, yet the comparator code involves more physician work and intensity and is therefore appropriately valued higher than the surveyed code. The RUC concluded that CPT code 96921 should be valued at the 25th percentile work RVU as supported by the survey. **The RUC recommends a work RVU of 1.24 for CPT code 96921.**

96922 ***Laser treatment, 308-312 nanometer wavelengths, for inflammatory or auto-immune skin diseases (eg, psoriasis); over 500 sq cm***
The RUC reviewed the survey results from 37 dermatologists and determined that the survey 25th percentile work RVU of 1.50 appropriately accounts for the physician work involved in this service. The RUC recommends 7 minutes pre-service evaluation time, 2 minutes pre-service positioning time, 1-minute pre-service scrub/dress/wait time, 24 minutes intra-service time, and 5 minutes post-service time for 39 minutes total time as supported by the survey. The specialty society believes, and the RUC agrees, that the median intra-service times from the current survey more accurately reflect the physician time and intensity associated with these services than the current values. This service covers the largest area, and the physician must perform treatment sequentially to all lesions, taking care to avoid overlapping and modifying fluences as needed.

Pre-service time package 5 *NF Proc w minimal anes care (if no deduct 1 min)* for the non-facility setting is supported. In addition, maintaining the current 2 minutes of pre-service positioning time to account for the necessary maneuvering and manipulation of the patient to allow access to sensitive treatment areas for the application of local anesthetic (EMLA cream), as needed; draping and positioning the patient for optimal access to each treatment site.

To justify a work RVU of 1.50, the RUC compared CPT code 96922 to the to the top key reference service code 12006 *Simple repair of superficial wounds of scalp, neck, axillae, external genitalia, trunk and/or extremities (including hands and feet); 20.1 cm to 30.0 cm* (work RVU = 2.39, 30 minutes intra-service time and 47 minutes total time) and to the second key reference service code 12018 *Simple repair of superficial wounds of face, ears, eyelids, nose, lips and/or mucous membranes; over 30.0 cm* (work RVU = 3.61, 45 minutes intra-service time and 64 minutes total time) noting that the reference services require more intra-service and total time than the surveyed code and are appropriately valued higher.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The RUC emphasized the appropriate comparison of CPT code 96922 to MPC code 12004 *Simple repair of superficial wounds of scalp, neck, axillae, external genitalia, trunk and/or extremities (including hands and feet); 7.6 cm to 12.5 cm* (work RVU = 1.44, 17 minutes intra-service time and 29 minutes total time) noting that both involve treatment over a larger body surface area. The surveyed code requires more intra-service and total time and is therefore valued higher than the comparator code. The RUC also compared the surveyed code to MPC code 64644 *Chemodenervation of one extremity; 5 or more muscles* (work RVU = 1.82, 25 minutes intra-service time and 45 minutes total time) and noted that the survey 25th percentile value is appropriately bracketed by these comparator codes.

The RUC concluded that CPT code 96922 should be valued at the 25th percentile work RVU as supported by the survey. This recommendation provides a stepwise progression of the procedure based on the size of the wound or lesion and preserves rank order within the family. **The RUC recommends a work RVU of 1.50 for CPT code 96922.**

Practice Expense

The Practice Expense (PE) Subcommittee reviewed the direct practice expense inputs for CPT codes 96920, 96921, and 96922 and made no modifications. The specialty presented the current direct inputs with an increase in clinical staff time for the code family related to CA018 *Assist physician or other qualified healthcare professional---directly related to physician work time (100%)*. The increased time for CA018 is entirely accounted for due to an increase in physician intra-service time.

The specialty society confirmed that the excimer laser remains the typical equipment used for this code set. The RUC acknowledged that CMS did not accept the May 2023 RUC recommendation to change the business model for excimer lasers to a pay-per-use subscription-based model, since the equipment item EQ161 *laser, excimer* is available for purchase and already accounted for under its equipment methodology. A question was raised regarding equipment item ED005 *camera, digital system, 12 megapixel (medical grade)* and what is the typical method to acquire images. There has been a perceptible shift in technology from the use of cameras to cell phones (with an application that inputs directly into the electronic health record). The PE Subcommittee agreed to maintain the direct practice inputs without modification. **The RUC recommends the direct practice expense inputs as submitted by the specialty society.**

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:96920 Tracking Number G1 Original Specialty Recommended RVU: **1.00**
Presented Recommended RVU: **1.00**
Global Period: 000 Current Work RVU: **0.83** RUC Recommended RVU: **1.00**

CPT Descriptor: Laser treatment, 308-312 nanometer wavelengths, for inflammatory or auto-immune skin diseases (eg, psoriasis); total area less than 250 sq cm

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 65-year-old male presents with an inflammatory or auto-immune skin disease. The patient has less than 250 sq cm of cutaneous lesions. The decision is made to utilize a 308-312 nm laser for treatment.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 5% , In the ASC 0%, In the office 95%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 100% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Review patient's medical chart, paying particular attention to any photosensitive medications that may affect treatment, confirm the areas of treatment with the patient, and obtain informed consent, including response and reactions to therapy. For new patients, inform them of the risk of pain, blistering, and hyper- and hypopigmentation. For established patients, perform review of photographs from the prior session to evaluate the response to treatment, spread, and active inflammation and to determine if the treatment needs to be adjusted. Assess previously burned or blistered areas for healing, dyspigmentation, and scarring. Discuss additional skin care as appropriate. Identify and confirm all lesion sites, indicating areas that previously developed severe reaction as treatment settings may need to be adjusted. Direct clinical staff where to apply eutectic mixture of local anesthetics (EMLA) cream to treatment sites. Once anesthetic effect has been achieved, remove EMLA and apply mineral oil to treatment sites. Drape and appropriately position the patient for access to the first treatment site. The treating physician confirms that everyone in the room is wearing laser safety goggles. Check laser equipment.

Description of Intra-Service Work: Select treatment fluence (or energy level) for each part of each individual plaque based on the thickness of that part of the plaque and its response to previous treatment(s). Apply the laser to the first plaque and initiate treatment with pulse duration varying based on the energy delivered. Up to 2 sq cm can be treated at a time with the spot size adjusted based on clinical presentation and plaque thickness, adjusting fluence and spot size as required. Change gloves as needed to protect equipment. Perform treatment sequentially to all lesions, taking care to avoid overlapping and modifying fluences as needed. Use blocking templates to avoid treating uninvolved areas and to deal with geometric lesion configurations that would preclude overlap avoidance or treatment of uninvolved skin. Monitor for pain and skin surface reaction throughout the process. Repeat the process with needed modifications for each subsequent lesion to be treated. At the end of treatment for each lesion, reassess the site for treatment adequacy and for any signs of overlap that might need posttreatment therapy.

Description of Post-Service Work: Review pain management and skin care. Place ice packs on all erythematous, blistered, and crusted areas. Once ice packs are removed, identify and direct clinical staff where to apply topicals including triamcinolone to intact skin with heavy inflammation; mupirocin to areas of blistering, erosion, and/or impending skin breakdown; and topical emollient to all other treatment areas to minimize pain. The physician also directs the clinical staff

on which exposed lesions sunscreen should be applied to prior to leaving to prevent further unwanted ultraviolet exposure and further burn after treatment.

SURVEY DATA

RUC Meeting Date (mm/yyyy)	09/2025		
Presenter(s):	Howard Rogers, MD, PhD, FAAD Brent Moody, MD, FAAD Mark Kaufmann, MD, FAAD Ryan Hick, MD, FAAD Lawrence Green, MD, FAAD		
Specialty Society(ies):	American Academy of Dermatology Association (AADA)		
CPT Code:	96920		
Sample Size:	803	**Resp N:**	37
Description of Sample:	The AADA used a targeted sample methodology in conjunction with a random sample of American Academy of Dermatology (AAD) membership, as approved by the Research Subcommittee. The random sample consisted of 500 practicing, U.S.-based AAD members, excluding residents. The targeted sample was developed using two sources: (1) the CMS Medicare Physician & Other Practitioners Public Use File, which identified 177 dermatologists who had billed Medicare for CPT codes 96920, 96921, or 96922 (from 2021-2023); and (2) vendor-supplied lists from two manufacturers of laser devices used to treat inflammatory and auto-immune skin diseases, which included 202 and 47 dermatologists, respectively. After removing duplicate physician names across both sources, the final targeted sample included 303 dermatologists. The random and targeted samples were compared to ensure no duplicate names were included across the two groups. Each dermatologist was included only once in the final combined sample, which consisted of 803 survey recipients.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

The laser therapy for inflammatory skin conditions codes (96920-96922) were originally identified in 2008 via the CMS High Volume Growth screen. The Relativity Assessment Workgroup agreed that the codes should be re-assessed in two years. In September 2011, the RUC recommended resurvey of these services for January 2012 which was done, as well as development of a CPT Assistant article to address incorrect reporting when using handheld devices. This article was published in June 2012, followed by a brief article in May 2013 addressing the question of treating a scar using the laser codes 96920-96922, stating that their use would not be appropriate, and that 96999, *Unlisted special dermatological service or procedure*, should be used instead.

In April 2015, the code family was identified again via the high-volume growth screen with Medicare utilization of 10,000 or more. It was recommended that a CPT Assistant article be developed and that the specialty societies develop an Action Plan to address the continued increase in utilization and assess the effectiveness of the CPT Assistant article. In October 2015, the RUC recommended that the specialty society develop an additional, comprehensive CPT Assistant article, with examples, on the use of the three laser codes to ensure the code set was being billed correctly. The CPT Assistant article was published in September 2016.

In October 2017, the RUC recommended that the RAW review these services in two years (October 2019). At that time, the same recommendation was made for a subsequent review in two years (January 2022), since therapy for psoriasis had changed, and the utilization of these services may decrease. In January 2022, the Relativity Assessment Workgroup reviewed these services again noting that their utilization continued to increase, specifically CPT code 96920. Given this the Workgroup recommended, and the RUC agreed, that CPT codes 96920, 96921 and 96922 be surveyed for work and practice expense at the April 2022 RUC meeting.

In April 2022, the specialty societies indicated, and the RUC agreed, that CPT codes 96920-96922 be referred to the CPT Editorial Panel for editorial review at the September 2022 CPT meeting as the accepted indications for UV lasers had expanded beyond what is currently noted in the code descriptors to include laser treatment for other inflammatory skin disorders such as vitiligo, atopic dermatitis, alopecia areata, etc. This issue was brought forward and subsequently withdrawn from the February 2023 CPT Editorial Panel meeting agenda as it was determined that existing literature was insufficient and did not support expanded indications at this time. Thus, CPT codes 96920–96922 were surveyed for the April 2023 RUC meeting without any revisions to their descriptors, which read "Laser treatment for inflammatory skin disease (psoriasis)".

At the April 2023 meeting, the RUC noted concerns on the validity of the survey times given their wide variation from previous, as well as the specialty society's indication that survey times were insufficient to complete the procedure as currently performed, and therefore the codes were flagged as "Do Not Use to Validate for Physician Work".

Additionally during this meeting, the RUC voted to recommend an editorial change to CPT to add "(ie, excimer)" to the code descriptor for 96920-96922. At the May 2023 CPT Editorial Panel meeting, the CPT Executive Committee voted to further editorially revise the code family to reflect use of these services exclusively for psoriasis using an "Excimer" laser. The CPT Editorial Panel approved the changes in September 2023 as editorial revisions for inclusion in the CPT 2024 code set.

In June 2024, a CPT Assistant article was published to clarify what laser equipment meets the criteria for an "excimer" laser. Despite this, concern resulted from the addition of the term "excimer" to the descriptor for those using other types of appropriate ultraviolet lasers. Subsequently, at the February 2025 CPT Editorial Panel meeting, the codes were further revised to remove "Excimer" from the code descriptor and specify the wavelengths for other lasers that treat psoriasis that are not excimer lasers. The codes were subsequently presented at the April 2025 RUC meeting, with the specialty noting these changes were considered to be editorial in nature, which was affirmed by the RUC.

In parallel to this an additional code change application was brought forward to the CPT Editorial Panel, which was considered in May 2025, to expand the laser codes beyond the treatment of psoriasis to include other inflammatory skin disorders. In May 2025, the CPT Editorial Panel approved revisions to codes 96920, 96921, and 96922 to expand the indications beyond psoriasis to include inflammatory and auto-immune skin diseases.

Compelling Evidence

The specialty society's compelling evidence argument is based both on documented flaws in the prior valuation process and evidence of a change in physician work due to changing patient population.

Flawed Methodology

First, we believe that the methodology used by CMS in the CY2025 Medicare Physician Fee Schedule was flawed and led to incorrect assumptions and inaccurate valuation of laser codes CPT 96920-96922.

For CY2025, CMS accepted the RUC-recommended times but did not accept the RUC-recommended values for 96920, 96921, and 96922. Instead, the agency finalized lower work RVUs—0.83 for 96920, 0.90 for 96921, and 1.15 for 96922.

Specifically, CMS finalized wRVUs based on crosswalks to codes 11104 and 11301 for 96920 and 96921, respectively. For 96922, CMS used a purely formulaic approach, applying building block methodology and citing the RUC-recommended incremental difference of 0.25 work RVUs above 96921 to arrive at a final value of 1.15. CMS also calculated intraservice time ratios between the 2002 intraservice times and the RUC-recommended intraservice times for each code, multiplying that ratio by the 2002 work RVU in an effort to "maintain the intensity associated with the 2002 review," despite acknowledging that commenters would likely dispute the current time values.

In its rationale, CMS indicated that the physician times associated with these codes have fluctuated over time, while the work RVUs have remained largely unchanged. CMS expressed concern that the 2012 recommendations did not address this inconsistency and emphasized that significant decreases in time should correspond with decreases in work RVUs unless a clear rationale is provided for increased intensity.

The specialty society believes CMS's methodology is flawed and disagrees with CMS's valuation methodology for CPT codes 96920, 96921, and 96922. Specifically, we oppose the use of time ratios across different time periods to justify reductions in work RVUs—particularly when the original 2002 values were not based on survey data but were established through crosswalks. Applying time-based calculations across periods where code descriptors have since been clarified is not appropriate for valuing physician work. Calculating an intraservice time ratio based on the 2002 values is not representative of the actual time, intensity, and physician work involved in performing these services today. Further, CMS did not provide clinical rationale to support the selected crosswalks to 11104 and 11301, which do not reflect the current clinical use, service characteristics, or intensity of laser treatment for inflammatory skin disease.

We also want to note that these codes have been flagged in the RUC database as "Do Not Use to Validate Physician Work" (DNU) – Service Times Not Representative since April 2023, when they were last surveyed. While we are not asserting the DNU flag constitutes flawed methodology, we want to highlight this to note the factors that led to the DNU flag reflect longstanding challenges in valuing this code family, and the times associated with these services, further supporting compelling evidence.

More specifically, in 2012, the RUC accepted increased intraservice times based on survey data but maintained the 2002 work RVUs, citing a lack of compelling evidence to support an increase in wRVU. In April 2023, the survey reflected a marked decrease in intraservice time. The specialty society advised that the reported times were insufficient to complete the procedure as currently performed. The expert panel, which included psoriasis experts who had routinely performed these services, agreed and furthermore advised that both the time and work had remained stable since the codes were last surveyed in 2012. Survey respondents also indicated relative stability in work compared to the then-current values.

The RUC noted similar concern around the survey times with the RUC rationale for this family of codes noting, "The RUC expressed concern with the survey that the times have decreased and there was not a proportionate decrease in work."

Given this disproportionate change in times in the survey results, which did not align with the specialty society, physician experts and survey takers other responses, there was significant difficulty in assigning accurate valuations to this family of codes. In particular the specialty society felt that both the current values and the 25th percentile survey values would be inappropriate given the reported decrease in time. In April 2023, the RUC recommended reduced work RVUs of 1.00 for 96920 (crosswalked to CPT code 20606), 1.07 for 96921 (crosswalked to 12011), and 1.32 for 96922, based on comparator services with similar intraservice and total times, and applied the "Do Not Use to Validate Physician Work" – Service Times Not Representative flag given the concerns noted above.

CPT Code		Intraservice Time	Total Time	Work RVU
96920	2002	17	27	1.15
	2012	23	35	1.15
	April 2023 RUC Recommendation	10	23	1.00
	Current	***10***	***23***	***0.83***
96921	2002	20	30	1.17
	2012	30	42	1.30
	April 2023 RUC Recommendation	12	25	1.07
	Current	***12***	***25***	***0.90***
96922	2002	30	40	2.10
	2012	45	57	2.10
	April 2023 RUC Recommendation	18	31	1.32
	Current	***18***	***31***	***1.15***

Of note at the April 2025 RUC meeting, the specialty society recommended that the RUC affirm the current, CMS-accepted values for CPT codes 96920–96922. The specialty society felt that affirmation of the CMS-accepted values was the most appropriate course at the time, with the understanding that the codes would return to the RUC for rereview at the September 2025 meeting—either due to approval of the proposed changes at CPT or as part of continued review for codes flagged as "Do not use to validate physician work."

We believe the median intraservice times from the current survey more accurately reflect the physician time and intensity associated with these services than the current, CMS-accepted values. Given the RUC's previously stated concerns regarding relativity between time and intensity for these codes, we request that the RUC consider increased times and work RVUs for CPT codes 96920, 96921, and 96922 based on the current survey data.

Changing Patient Population
The specialty society further believes there is a change in patient population, which supports compelling evidence.

Laser treatment for inflammatory and auto-immune skin diseases is now typically performed only in those patients with contraindications for systemic agents such as those with paradoxical biologic response, lack of response to systemic agents, preexisting immunosuppression or latent infections, or those patients with particularly recalcitrant disease. This shift in patient population can be seen in the dramatic decrease in utilization for these codes in the last few years, particularly for 96920. This patient population is more difficult to treat, reflected in the increased time and intensity as indicated by the survey respondents.

We would also note that the code indications, previously limited to psoriasis, now encompass applicable inflammatory and auto-immune skin diseases. Despite this, based on utilization data, we anticipate psoriasis will remain the typical condition treated by this modality. That being said, the patient population treated with ultraviolet laser has undoubtedly shifted as highly effective systemic biologics have replaced localized therapy.

Survey Process
The AADA requested, and the Research Subcommittee approved, to use a targeted sample methodology in conjunction with a random sample of AAD membership. Laser treatment for inflammatory and auto-immune skin diseases is not widely performed across dermatology and requires use of specialized laser devices that emit ultraviolet B (UVB) light in the 308 to 312 nanometer wavelength range. This procedure is not typically taught during conventional medical training such as in medical school or dermatology residency programs. Therefore, physicians who do not own these devices or perform the procedure may be unable to accurately estimate the physician work and time involved.

The random sample included 500 practicing, U.S.-based AAD members, excluding residents.

The targeted sample was derived from two sources: CMS Medicare Physician & Other Practitioners Public Use File (2021–2023) and vendor-supplied lists from two manufacturers of laser devices used to treat inflammatory skin diseases – Strata Skin Sciences and LASEROPTEK America Inc.

177 dermatologists were identified from the CMS claims data who billed 96920, 96921, or 96922 from 2021-2023.

The names of 202 dermatologists were received from Strata Skin Sciences, who hold the vast majority of the marketplace, and the names of 47 dermatologists LASEROPTEK America Inc. After removing duplicate physician names across all sources, the final targeted sample included 303 dermatologists.

The specialty society also compared the random and targeted samples to ensure there were no duplicate names. Each dermatologist was included only once in the final combined sample, which consisted of 803 survey recipients. All were surveyed.

Work Recommendation

The expert panel, which includes psoriasis experts who have frequently performed this procedure for many years, reviewed the survey data. As noted above, the specialty society believes the current survey results more accurately reflect the physician time and intensity associated with these services than the current values.

Therefore, the expert panel recommends the 25th percentile survey value for a wRVU of 1.00 for 96920.

It was felt this wRVU would maintain relativity well when compared to other codes with similar times. On a RUC database review of 000-day global codes valued since 2010 with the same intraservice time and similar total times (between 24 and 31 minutes), the proposed value of 1.00 would fall within range of the resulting RVWs values, and would not be the most highly valued code within this grouping.

Key Reference Services

The reference codes most frequently selected by survey participants are common dermatologic procedures:

11307 Shaving of epidermal or dermal lesion, single lesion, scalp, neck, hands, feet, genitalia; lesion diameter 1.1 to 2.0 cm

96574 Debridement of premalignant hyperkeratotic lesion(s) (ie, targeted curettage, abrasion) followed with photodynamic therapy by external application of light to destroy premalignant lesions of the skin and adjacent mucosa with application and illumination/activation of photosensitizing drug(s) provided by a physician or other qualified health care professional, per day

In reviewing the intensity/complexity measures, most survey respondents indicated that 96920 was more intense/complex than the top key reference service (KRS), 11307 (wRVU 1.20), which has a higher intraservice time (21 minutes) than the time recommended by the specialty society.

Similarly, most respondents indicated that 96920 was either identical in intensity or more intense/complex than the second KRS, 96574 (wRVU 1.01), which has the same pre-service time but slightly higher intra- and post-service times than the specialty society's recommendation.

CPT Code	Descriptor	wRVU	Pre	Intra	Post	Total Time
96920*	Excimer laser treatment for psoriasis; total area less than 250 sq cm	0.83	10	10	3	23
96920**	Laser treatment, 308-312 nanometer wavelengths, for inflammatory or auto-immune skin diseases (eg, psoriasis); total area less than 250 sq cm	1.00	10	12	5	27
11307	Shaving of epidermal or dermal lesion, single lesion, scalp, neck, hands, feet, genitalia; lesion diameter 1.1 to 2.0 cm	1.20	6	21	5	32
96574	Debridement of premalignant hyperkeratotic lesion(s) (ie, targeted curettage, abrasion) followed with photodynamic therapy by external application of light to destroy premalignant lesions of the skin and adjacent mucosa with application and illumination/activation of photosensitizing drug(s) provided by a physician or other qualified health care professional, per day	1.01	10	16	10	36

**Current*

***Specialty Recommendation*

MPC Codes
The specialty society's recommendation additionally supports relativity when compared to the MPC codes noted below:

CPT Code	Descriptor	wRVU	Pre	Intra	Post	Total Time
96920*	Excimer laser treatment for psoriasis; total area less than 250 sq cm	0.83	10	10	3	23
96920**	Laser treatment, 308-312 nanometer wavelengths, for inflammatory or auto-immune skin diseases (eg, psoriasis); total area less than 250 sq cm	1.00	10	12	5	27
12001	Simple repair of superficial wounds of scalp, neck, axillae, external genitalia, trunk and/or extremities (including hands and feet); 2.5 cm or less	0.84	7	10	5	22
12002	Simple repair of superficial wounds of scalp, neck, axillae, external genitalia, trunk and/or extremities (including hands and feet); 2.6 cm to 7.5 cm	1.14	7	15	5	27

**Current*
***Specialty Recommendation*

Recommendations for Pre-and Post-Service Times
Pre-service time
The specialty society recommends pre-service package 5 (non-facility), and recommends retaining the current pre-service positioning time of 2 minutes for a total of 10 minutes pre-service time:

Pre-Service Evaluation Time: 7
Pre-Service Positioning: 2
Pre-Service Scrub, Dress, Wait Time: 1

The 2 minutes of pre-service positioning time accounts for the necessary maneuvering and manipulation of the patient to allow access to sensitive treatment areas for the application of local anesthetic (EMLA cream), as needed; draping and positioning the patient for optimal access to each treatment site.

Immediate post-service time
The expert panel reviewed the survey data and determined that the survey median of 5 minutes for immediate post-service time is representative of the typical post-service physician work. This includes evaluation of treatment areas, direction of clinical staff for skin care, and counseling related to post-treatment management. These activities are consistent with the current post-service work description, which has not changed.

Summary
In summary, our expert panel recommends a pre-service time of 10 minutes, the survey median intraservice time of 12 minutes, the survey median post-service time of 5 minutes, and the survey 25th percentile wRVU of 1.00.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 96920

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Dermatology How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 250000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. While 2023 claims data show that Medicare may allow payment for indications beyond psoriasis in some cases, private payers currently do not permit payment for this service for conditions other than psoriasis. With the expanded indications reflected in the revised descriptor for 96920, the specialty society estimates that utilization could be more than 3.5 times higher than in the Medicare population. This projected increase reflects both the anticipated shift in private payer coverage and the higher prevalence of certain inflammatory and auto-immune skin diseases—such as vitiligo and atopic dermatitis—in the non-Medicare population. Based on these factors, the specialty society estimates total utilization at around 250,000 units annually.

Specialty Dermatology Frequency 187500 Percentage 75.00 %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 70,000 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare utilization for this code has declined by approximately 10,000 units per year since 2021. In 2023, the top five diagnosis codes billed with 96920 indicate that Medicare permits payment for certain skin conditions other than psoriasis (e.g., vitiligo, atopic dermatitis), though such cases represent a smaller portion of overall use. Given that the CPT revisions to the code descriptor expands indications for this service beyond psoriasis, the specialty society anticipates a modest increase in utilization for 96920. However, with a range of other treatments available for many inflammatory and auto-immune skin diseases, including advancing topical therapies, we expect any overall increase in utilization to remain limited.

CPT Descriptor: Laser treatment, 308-312 nanometer wavelengths, for inflammatory or auto-immune skin diseases (eg, psoriasis); 250 sq cm to 500 sq cm

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 65-year-old male presents with an inflammatory or auto-immune skin disease. the patient has between 250 sq cm and 500 sq cm of cutaneous lesions. the decision is made to utilize a 308-312 nm laser for treatment.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 5% , In the ASC 0%, In the office 95%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 100% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Review patient's medical chart, paying particular attention to any photosensitive medications that may affect treatment, confirm the areas of treatment with the patient, and obtain informed consent, including response and reactions to therapy. For new patients, inform them of the risk of pain, blistering, and hyper- and hypopigmentation. For established patients, perform review of photographs from the prior session to evaluate the response to treatment, spread, and active inflammation and to determine if the treatment needs to be adjusted. Assess previously burned or blistered areas for healing, dyspigmentation, and scarring. Discuss additional skin care as appropriate. Identify and confirm all lesion sites, indicating areas that previously developed severe reaction as treatment settings may need to be adjusted. Direct clinical staff where to apply eutectic mixture of local anesthetics (EMLA) cream to treatment sites. Once anesthetic effect has been achieved, remove EMLA and apply mineral oil to treatment sites. Drape and appropriately position the patient for access to the first treatment site. The treating physician confirms that everyone in the room is wearing laser safety goggles. Check laser equipment.

Description of Intra-Service Work: Select treatment fluence (or energy level) for each part of each individual plaque based on the thickness of that part of the plaque and its response to previous treatment(s). Apply the laser to the first plaque and initiate treatment with pulse duration varying based on the energy delivered. Up to 2 sq cm can be treated at a time with the spot size adjusted based on clinical presentation and plaque thickness, adjusting fluence and spot size as required. Change gloves as needed to protect equipment. Perform treatment sequentially to all lesions, taking care to avoid overlapping and modifying fluences as needed. Use blocking templates to avoid treating uninvolved areas and to deal with geometric lesion configurations that would preclude overlap avoidance or treatment of uninvolved skin. Monitor for pain and skin surface reaction throughout the process. Repeat the process with needed modifications for each subsequent lesion to be treated. At the end of treatment for each lesion, reassess the site for treatment adequacy and for any signs of overlap that might need posttreatment therapy.

Description of Post-Service Work: Review pain management and skin care. Place ice packs on all erythematous, blistered, and crusted areas. Once ice packs are removed, identify and direct clinical staff where to apply topicals including triamcinolone to intact skin with heavy inflammation; mupirocin to areas of blistering, erosion, and/or impending skin breakdown; and topical emollient to all other treatment areas to minimize pain. The physician also directs the clinical staff

on which exposed lesions sunscreen should be applied to prior to leaving to prevent further unwanted ultraviolet exposure and further burn after treatment.

SURVEY DATA

RUC Meeting Date (mm/yyyy)	09/2025		
Presenter(s):	Howard Rogers, MD, PhD, FAAD Brent Moody, MD, FAAD Mark Kaufmann, MD, FAAD Ryan Hick, MD, FAAD Lawrence Green, MD, FAAD		
Specialty Society(ies):	American Academy of Dermatology Assocation (AADA)		
CPT Code:	96921		
Sample Size:	803	**Resp N:**	37
Description of Sample:	The AADA used a targeted sample methodology in conjunction with a random sample of American Academy of Dermatology (AAD) membership, as approved by the Research Subcommittee. The random sample consisted of 500 practicing, U.S.-based AAD members, excluding residents. The targeted sample was developed using two sources: (1) the CMS Medicare Physician & Other Practitioners Public Use File, which identified 177 dermatologists who had billed Medicare for CPT codes 96920, 96921, or 96922 (from 2021-2023); and (2) vendor-supplied lists from two manufacturers of laser devices used to treat inflammatory and auto-immune skin diseases, which included 202 and 47 dermatologists, respectively. After removing duplicate physician names across both sources, the final targeted sample included 303 dermatologists. The random and targeted samples were compared to ensure no duplicate names were included across the two groups. Each dermatologist was included only once in the final combined sample, which consisted of 803 survey recipients.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

The laser therapy for inflammatory skin conditions codes (96920-96922) were originally identified in 2008 via the CMS High Volume Growth screen. The Relativity Assessment Workgroup agreed that the codes should be re-assessed in two years. In September 2011, the RUC recommended resurvey of these services for January 2012 which was done, as well as development of a CPT Assistant article to address incorrect reporting when using handheld devices. This article was published in June 2012. followed by a brief article in May 2013 addressing the question of treating a scar using the laser codes 96920-96922, stating that their use would not be appropriate, and that 96999, *Unlisted special dermatological service or procedure*, should be used instead.

In April 2015, the code family was identified again via the high-volume growth screen with Medicare utilization of 10,000 or more. It was recommended that a CPT Assistant article be developed and that the specialty societies develop an Action Plan to address the continued increase in utilization and assess the effectiveness of the CPT Assistant article. In October 2015, the RUC recommended that the specialty society develop an additional, comprehensive CPT Assistant article, with examples, on the use of the three laser codes to ensure the code set was being billed correctly. The CPT Assistant article was published in September 2016.

In October 2017, the RUC recommended that the RAW review these services in two years (October 2019). At that time, the same recommendation was made for a subsequent review in two years (January 2022), since therapy for psoriasis had changed, and the utilization of these services may decrease. In January 2022, the Relativity Assessment Workgroup reviewed these services again noting that their utilization continued to increase, specifically CPT code 96920. Given this the Workgroup recommended, and the RUC agreed, that CPT codes 96920, 96921 and 96922 be surveyed for work and practice expense at the April 2022 RUC meeting.

In April 2022, the specialty societies indicated, and the RUC agreed, that CPT codes 96920-96922 be referred to the CPT Editorial Panel for editorial review at the September 2022 CPT meeting as the accepted indications for UV lasers had expanded beyond what is currently noted in the code descriptors to include laser treatment for other inflammatory skin disorders such as vitiligo, atopic dermatitis, alopecia areata, etc. This issue was brought forward and subsequently withdrawn from the February 2023 CPT Editorial Panel meeting agenda as it was determined that existing literature was insufficient and did not support expanded indications at this time. Thus, CPT codes 96920–96922 were surveyed for the April 2023 RUC meeting without any revisions to their descriptors, which read "Laser treatment for inflammatory skin disease (psoriasis)".

At the April 2023 meeting, the RUC noted concerns on the validity of the survey times given their wide variation from previous, as well as the specialty society's indication that survey times were insufficient to complete the procedure as currently performed, and therefore the codes were flagged as "Do Not Use to Validate for Physician Work".

Additionally during this meeting, the RUC voted to recommend an editorial change to CPT to add "(ie, excimer)" to the code descriptor for 96920-96922. At the May 2023 CPT Editorial Panel meeting, the CPT Executive Committee voted to further editorially revise the code family to reflect use of these services exclusively for psoriasis using an "Excimer" laser. The CPT Editorial Panel approved the changes in September 2023 as editorial revisions for inclusion in the CPT 2024 code set.

In June 2024, a CPT Assistant article was published to clarify what laser equipment meets the criteria for an "excimer" laser. Despite this, concern resulted from the addition of the term "excimer" to the descriptor for those using other types of appropriate ultraviolet lasers. Subsequently, at the February 2025 CPT Editorial Panel meeting, the codes were further revised to remove "Excimer" from the code descriptor and specify the wavelengths for other lasers that treat psoriasis that are not excimer lasers. The codes were subsequently presented at the April 2025 RUC meeting, with the specialty noting these changes were considered to be editorial in nature, which was affirmed by the RUC.

In parallel to this an additional code change application was brought forward to the CPT Editorial Panel, which was considered in May 2025, to expand the laser codes beyond the treatment of psoriasis to include other inflammatory skin disorders. In May 2025, the CPT Editorial Panel approved revisions to codes 96920, 96921, and 96922 to expand the indications beyond psoriasis to include inflammatory and auto-immune skin diseases.

Compelling Evidence

The specialty society's compelling evidence argument is based both on documented flaws in the prior valuation process and evidence of a change in physician work due to changing patient population.

Flawed Methodology

First, we believe that the methodology used by CMS in the CY2025 Medicare Physician Fee Schedule was flawed and led to incorrect assumptions and inaccurate valuation of laser codes CPT 96920-96922.

For CY2025, CMS accepted the RUC-recommended times but did not accept the RUC-recommended values for 96920, 96921, and 96922. Instead, the agency finalized lower work RVUs—0.83 for 96920, 0.90 for 96921, and 1.15 for 96922.

Specifically, CMS finalized wRVUs based on crosswalks to codes 11104 and 11301 for 96920 and 96921, respectively. For 96922, CMS used a purely formulaic approach, applying building block methodology and citing the RUC-recommended incremental difference of 0.25 work RVUs above 96921 to arrive at a final value of 1.15. CMS also calculated intraservice time ratios between the 2002 intraservice times and the RUC-recommended intraservice times for each code, multiplying that ratio by the 2002 work RVU in an effort to "maintain the intensity associated with the 2002 review," despite acknowledging that commenters would likely dispute the current time values.

In its rationale, CMS indicated that the physician times associated with these codes have fluctuated over time, while the work RVUs have remained largely unchanged. CMS expressed concern that the 2012 recommendations did not address this inconsistency and emphasized that significant decreases in time should correspond with decreases in work RVUs unless a clear rationale is provided for increased intensity.

The specialty society believes CMS's methodology is flawed and disagrees with CMS's valuation methodology for CPT codes 96920, 96921, and 96922. Specifically, we oppose the use of time ratios across different time periods to justify reductions in work RVUs—particularly when the original 2002 values were not based on survey data but were established through crosswalks. Applying time-based calculations across periods where code descriptors have since been clarified is not appropriate for valuing physician work. Calculating an intraservice time ratio based on the 2002 values is not representative of the actual time, intensity, and physician work involved in performing these services today. Further, CMS did not provide clinical rationale to support the selected crosswalks to 11104 and 11301, which do not reflect the current clinical use, service characteristics, or intensity of laser treatment for inflammatory skin disease.

We also want to note that these codes have been flagged in the RUC database as "Do Not Use to Validate Physician Work" (DNU) – Service Times Not Representative since April 2023, when they were last surveyed. While we are not asserting the DNU flag constitutes flawed methodology, we want to highlight this to note the factors that led to the DNU flag reflect longstanding challenges in valuing this code family, and the times associated with these services, further supporting compelling evidence.

More specifically, in 2012, the RUC accepted increased intraservice times based on survey data but maintained the 2002 work RVUs, citing a lack of compelling evidence to support an increase in wRVU. In April 2023, the survey reflected a marked decrease in intraservice time. The specialty society advised that the reported times were insufficient to complete the procedure as currently performed. The expert panel, which included psoriasis experts who had routinely performed these services, agreed and furthermore advised that both the time and work had remained stable since the codes were last surveyed in 2012. Survey respondents also indicated relative stability in work compared to the then-current values.

The RUC noted similar concern around the survey times with the RUC rationale for this family of codes noting, "The RUC expressed concern with the survey that the times have decreased and there was not a proportionate decrease in work."

Given this disproportionate change in times in the survey results, which did not align with the specialty society, physician experts and survey takers other responses, there was significant difficulty in assigning accurate valuations to this family of codes. In particular the specialty society felt that both the current values and the 25th percentile survey values would be inappropriate given the reported decrease in time. In April 2023, the RUC recommended reduced work RVUs of 1.00 for 96920 (crosswalked to CPT code 20606), 1.07 for 96921 (crosswalked to 12011), and 1.32 for 96922, based on comparator services with similar intraservice and total times, and applied the "Do Not Use to Validate Physician Work" – Service Times Not Representative flag given the concerns noted above.

CPT Code		Intraservice Time	Total Time	Work RVU
96920	2002	17	27	1.15
	2012	23	35	1.15
	April 2023 RUC Recommendation	10	23	1.00
	Current	***10***	***23***	***0.83***
96921	2002	20	30	1.17
	2012	30	42	1.30
	April 2023 RUC Recommendation	12	25	1.07
	Current	***12***	***25***	***0.90***
96922	2002	30	40	2.10
	2012	45	57	2.10
	April 2023 RUC Recommendation	18	31	1.32
	Current	***18***	***31***	***1.15***

Of note at the April 2025 RUC meeting, the specialty society recommended that the RUC affirm the current, CMS-accepted values for CPT codes 96920–96922. The specialty society felt that affirmation of the CMS-accepted values was the most appropriate course at the time, with the understanding that the codes would return to the RUC for rereview at the September 2025 meeting—either due to approval of the proposed changes at CPT or as part of continued review for codes flagged as "Do not use to validate physician work."

We believe the median intraservice times from the current survey more accurately reflect the physician time and intensity associated with these services than the current, CMS-accepted values. Given the RUC's previously stated concerns regarding relativity between time and intensity for these codes, we request that the RUC consider increased times and work RVUs for CPT codes 96920, 96921, and 96922 based on the current survey data.

Changing Patient Population
The specialty society further believes there is a change in patient population, which supports compelling evidence.

Laser treatment for inflammatory and auto-immune skin diseases is now typically performed only in those patients with contraindications for systemic agents such as those with paradoxical biologic response, lack of response to systemic agents, preexisting immunosuppression or latent infections, or those patients with particularly recalcitrant disease. This shift in patient population can be seen in the dramatic decrease in utilization for these codes in the last few years, particularly for 96920. This patient population is more difficult to treat, reflected in the increased time and intensity as indicated by the survey respondents.

We would also note that the code indications, previously limited to psoriasis, now encompass applicable inflammatory and auto-immune skin diseases. Despite this, based on utilization data, we anticipate psoriasis will remain the typical condition treated by this modality. That being said, the patient population treated with ultraviolet laser has undoubtedly shifted as highly effective systemic biologics have replaced localized therapy.

Survey Process
The AADA requested, and the Research Subcommittee approved, to use a targeted sample methodology in conjunction with a random sample of AAD membership. Laser treatment for inflammatory and auto-immune skin diseases is not widely performed across dermatology and requires use of specialized laser devices that emit ultraviolet B (UVB) light in the 308 to 312 nanometer wavelength range. This procedure is not typically taught during conventional medical training such as in medical school or dermatology residency programs. Therefore, physicians who do not own these devices or perform the procedure may be unable to accurately estimate the physician work and time involved.

The random sample included 500 practicing, U.S.-based AAD members, excluding residents.

The targeted sample was derived from two sources: CMS Medicare Physician & Other Practitioners Public Use File (2021–2023) and vendor-supplied lists from two manufacturers of laser devices used to treat inflammatory skin diseases – Strata Skin Sciences and LASEROPTEK America Inc.

177 dermatologists were identified from the CMS claims data who billed 96920, 96921, or 96922 from 2021-2023.

The names of 202 dermatologists were received from Strata Skin Sciences, who hold the vast majority of the marketplace, and the names of 47 dermatologists LASEROPTEK America Inc. After removing duplicate physician names across all sources, the final targeted sample included 303 dermatologists.

The specialty society also compared the random and targeted samples to ensure there were no duplicate names. Each dermatologist was included only once in the final combined sample, which consisted of 803 survey recipients. All were surveyed.

Work Recommendation
The expert panel, which includes psoriasis experts who have frequently performed this procedure for many years, reviewed the survey data. As noted above, the specialty society believes the current survey results more accurately reflect the physician time and intensity associated with these services than the current values.

Therefore, the expert panel recommends the 25th percentile survey value for a wRVU of 1.24 for 96921.

It was felt this wRVU would maintain relativity well when compared to other codes with similar times. On a RUC database review of 000-day global codes valued since 2010 with the same intraservice time and similar total times (between 29 and 36 minutes), the proposed value of 1.24 would fall within range of the resulting RVWs values, and would not be the most highly valued code within this grouping.

Key Reference Services
The reference codes most frequently selected by survey participants are procedures that are well understood by dermatologists:

12014 Simple repair of superficial wounds of face, ears, eyelids, nose, lips and/or mucous membranes; 5.1 cm to 7.5 cm

12006 Simple repair of superficial wounds of scalp, neck, axillae, external genitalia, trunk and/or extremities (including hands and feet); 20.1 cm to 30.0 cm

Neither KRS code was chosen by a majority of the survey takers, at approximately 14% and 11% respectively, and therefore the society was not confident these were representative for comparison.

CPT Code	Descriptor	wRVU	Pre	Intra	Post	Total Time
96921*	Excimer laser treatment for psoriasis; 250 sq cm to 500 sq cm	0.90	10	12	3	25
96921**	Laser treatment, 308-312 nanometer wavelengths, for inflammatory or auto-immune skin diseases (eg, psoriasis); 250 sq cm to 500 sq cm	1.24	10	17	5	32
12014	Simple repair of superficial wounds of face, ears, eyelids, nose, lips and/or mucous membranes; 5.1 cm to 7.5 cm	1.57	7	20	5	32
12006	Simple repair of superficial wounds of scalp, neck, axillae, external genitalia, trunk and/or extremities (including hands and feet); 20.1 cm to 30.0 cm	2.39	11	30	6	47

**Current*
***Specialty Recommendation*

MPC Codes
The specialty society's recommendation additionally supports relativity when compared to the MPC codes noted below:

CPT Code	Descriptor	wRVU	Pre	Intra	Post	Total Time
96921*	Excimer laser treatment for psoriasis; 250 sq cm to 500 sq cm	0.90	10	12	3	25
96921**	Laser treatment, 308-312 nanometer wavelengths, for inflammatory or auto-immune skin diseases (eg, psoriasis); 250 sq cm to 500 sq cm	1.24	10	17	5	32

12002	Simple repair of superficial wounds of scalp, neck, axillae, external genitalia, trunk and/or extremities (including hands and feet); 2.6 cm to 7.5 cm	1.14	7	15	5	27
12004	Simple repair of superficial wounds of scalp, neck, axillae, external genitalia, trunk and/or extremities (including hands and feet); 7.6 cm to 12.5 cm	1.44	7	17	5	29

**Current*

Recommendations for Pre-and Post-Service Times
Pre-service time
The specialty society recommends pre-service package 5 (non-facility), and recommends retaining the current pre-service positioning time of 2 minutes for a total of 10 minutes pre-service time:

Pre-Service Evaluation Time: 7
Pre-Service Positioning: 2
Pre-Service Scrub, Dress, Wait Time: 1

The 2 minutes of pre-service positioning time accounts for the necessary maneuvering and manipulation of the patient to allow access to sensitive treatment areas for the application of local anesthetic (EMLA cream), as needed; draping and positioning the patient for optimal access to each treatment site.

Immediate post-service time
The expert panel reviewed the survey data and determined that the survey median of 5 minutes for immediate post-service time is representative of the typical post-service physician work. This includes evaluation of treatment areas, direction of clinical staff for skin care, and counseling related to post-treatment management. These activities are consistent with the current post-service work description, which has not changed.

Summary
In summary, our expert panel recommends a pre-service time of 10 minutes, the survey median intraservice time of 17 minutes, the survey median post-service time of 5 minutes, and the survey 25th percentile wRVU of 1.24.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 96921

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Dermatology How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 100000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. While 2023 claims data show that Medicare may allow payment for indications beyond psoriasis in some cases, private payers currently do not permit payment for this service for conditions other than psoriasis. With the expanded indications reflected in the revised descriptor for 96921, the specialty society estimates that utilization could be approxmiately three times higher than in the Medicare population. This projected increase reflects both the anticipated shift in private payer coverage and the higher prevalence of certain inflammatory and auto-immune skin diseases, such as vitiligo, in the non-Medicare population. Based on these factors, the specialty society estimates total utilization at around 100,000 units annually.

Specialty Dermatology Frequency 81000 Percentage 81.00 %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 30000
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare utilization for this code has remained somewhat consistent since 2021. In 2023, the top five diagnosis codes billed with 96921 indicate that Medicare permits payment for certain skin conditions other than psoriasis (e.g., vitiligo, lichen simplex chronicus and prurigo), though such cases represent a smaller portion of overall use. Given that the CPT revisions to the code descriptor expands indications for this service beyond psoriasis, the specialty society anticipates an overall increase in utilization for 96921. However, with a range of other treatments available for many inflammatory and auto-immune skin diseases, including advancing topical therapies, we expect any overall increase in utilization to remain limited.

Specialty Dermatology Frequency 24300 Percentage 81.00 %

CPT Descriptor: Laser treatment, 308-312 nanometer wavelengths, for inflammatory or auto-immune skin diseases (eg, psoriasis); over 500 sq cm

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 65-year-old male presents with an inflammatory or auto-immune skin disease. the patient has over 500 sq cm of cutaneous lesions. the decision is made to utilize a 308-312 nm laser for treatment.

Percentage of Survey Respondents who found Vignette to be Typical: 95%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 5% , In the ASC 0%, In the office 95%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 100% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Review patient's medical chart, paying particular attention to any photosensitive medications that may affect treatment, confirm the areas of treatment with the patient, and obtain informed consent, including response and reactions to therapy. For new patients, inform them of the risk of pain, blistering, and hyper- and hypopigmentation. For established patients, perform review of photographs from the prior session to evaluate the response to treatment, spread, and active inflammation and to determine if the treatment needs to be adjusted. Assess previously burned or blistered areas for healing, dyspigmentation, and scarring. Discuss additional skin care as appropriate. Identify and confirm all lesion sites, indicating areas that previously developed severe reaction as treatment settings may need to be adjusted. Direct clinical staff where to apply eutectic mixture of local anesthetics (EMLA) cream to treatment sites. Once anesthetic effect has been achieved, remove EMLA and apply mineral oil to treatment sites. Drape and appropriately position the patient for access to the first treatment site. The treating physician confirms that everyone in the room is wearing laser safety goggles. Check laser equipment.

Description of Intra-Service Work: Select treatment fluence (or energy level) for each part of each individual plaque based on the thickness of that part of the plaque and its response to previous treatment(s). Apply the laser to the first plaque and initiate treatment with pulse duration varying based on the energy delivered. Up to 2 sq cm can be treated at a time with the spot size adjusted based on clinical presentation and plaque thickness, adjusting fluence and spot size as required. Change gloves as needed to protect equipment. Perform treatment sequentially to all lesions, taking care to avoid overlapping and modifying fluences as needed. Use blocking templates to avoid treating uninvolved areas and to deal with geometric lesion configurations that would preclude overlap avoidance or treatment of uninvolved skin. Monitor for pain and skin surface reaction throughout the process. Repeat the process with needed modifications for each subsequent lesion to be treated. At the end of treatment for each lesion, reassess the site for treatment adequacy and for any signs of overlap that might need posttreatment therapy.

Description of Post-Service Work: Review pain management and skin care. Place ice packs on all erythematous, blistered, and crusted areas. Once ice packs are removed, identify and direct clinical staff where to apply topicals including triamcinolone to intact skin with heavy inflammation; mupirocin to areas of blistering, erosion, and/or impending skin breakdown; and topical emollient to all other treatment areas to minimize pain. The physician also directs the clinical staff

on which exposed lesions sunscreen should be applied to prior to leaving to prevent further unwanted ultraviolet exposure and further burn after treatment.

SURVEY DATA

RUC Meeting Date (mm/yyyy)	09/2025		
Presenter(s):	Howard Rogers, MD, PhD, FAAD Brent Moody, MD, FAAD Mark Kaufmann, MD, FAAD Ryan Hick, MD, FAAD Lawrence Green, MD, FAAD		
Specialty Society(ies):	American Academy of Dermatology Assocation (AADA)		
CPT Code:	96922		
Sample Size:	803	**Resp N:**	37
Description of Sample:	The AADA used a targeted sample methodology in conjunction with a random sample of American Academy of Dermatology (AAD) membership, as approved by the Research Subcommittee. The random sample consisted of 500 practicing, U.S.-based AAD members, excluding residents. The targeted sample was developed using two sources: (1) the CMS Medicare Physician & Other Practitioners Public Use File, which identified 177 dermatologists who had billed Medicare for CPT codes 96920, 96921, or 96922 (from 2021-2023); and (2) vendor-supplied lists from two manufacturers of laser devices used to treat inflammatory and auto-immune skin diseases, which included 202 and 47 dermatologists, respectively. After removing duplicate physician names across both sources, the final targeted sample included 303 dermatologists. The random and targeted samples were compared to ensure no duplicate names were included across the two groups. Each dermatologist was included only once in the final combined sample, which consisted of 803 survey recipients.

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	60%	40%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

The laser therapy for inflammatory skin conditions codes (96920-96922) were originally identified in 2008 via the CMS High Volume Growth screen. The Relativity Assessment Workgroup agreed that the codes should be re-assessed in two years. In September 2011, the RUC recommended resurvey of these services for January 2012 which was done, as well as development of a CPT Assistant article to address incorrect reporting when using handheld devices. This article was published in June 2012. followed by a brief article in May 2013 addressing the question of treating a scar using the laser codes 96920-96922, stating that their use would not be appropriate, and that 96999, *Unlisted special dermatological service or procedure*, should be used instead.

In April 2015, the code family was identified again via the high-volume growth screen with Medicare utilization of 10,000 or more. It was recommended that a CPT Assistant article be developed and that the specialty societies develop an Action Plan to address the continued increase in utilization and assess the effectiveness of the CPT Assistant article. In October 2015, the RUC recommended that the specialty society develop an additional, comprehensive CPT Assistant article, with examples, on the use of the three laser codes to ensure the code set was being billed correctly. The CPT Assistant article was published in September 2016.

In October 2017, the RUC recommended that the RAW review these services in two years (October 2019). At that time, the same recommendation was made for a subsequent review in two years (January 2022), since therapy for psoriasis had changed, and the utilization of these services may decrease. In January 2022, the Relativity Assessment Workgroup reviewed these services again noting that their utilization continued to increase, specifically CPT code 96920. Given this the Workgroup recommended, and the RUC agreed, that CPT codes 96920, 96921 and 96922 be surveyed for work and practice expense at the April 2022 RUC meeting.

In April 2022, the specialty societies indicated, and the RUC agreed, that CPT codes 96920-96922 be referred to the CPT Editorial Panel for editorial review at the September 2022 CPT meeting as the accepted indications for UV lasers had expanded beyond what is currently noted in the code descriptors to include laser treatment for other inflammatory skin disorders such as vitiligo, atopic dermatitis, alopecia areata, etc. This issue was brought forward and subsequently withdrawn from the February 2023 CPT Editorial Panel meeting agenda as it was determined that existing literature was insufficient and did not support expanded indications at this time. Thus, CPT codes 96920–96922 were surveyed for the April 2023 RUC meeting without any revisions to their descriptors, which read "Laser treatment for inflammatory skin disease (psoriasis)".

At the April 2023 meeting, the RUC noted concerns on the validity of the survey times given their wide variation from previous, as well as the specialty society's indication that survey times were insufficient to complete the procedure as currently performed, and therefore the codes were flagged as "Do Not Use to Validate for Physician Work".

Additionally during this meeting, the RUC voted to recommend an editorial change to CPT to add "(ie, excimer)" to the code descriptor for 96920-96922. At the May 2023 CPT Editorial Panel meeting, the CPT Executive Committee voted to further editorially revise the code family to reflect use of these services exclusively for psoriasis using an "Excimer" laser. The CPT Editorial Panel approved the changes in September 2023 as editorial revisions for inclusion in the CPT 2024 code set.

In June 2024, a CPT Assistant article was published to clarify what laser equipment meets the criteria for an "excimer" laser. Despite this, concern resulted from the addition of the term "excimer" to the descriptor for those using other types of appropriate ultraviolet lasers. Subsequently, at the February 2025 CPT Editorial Panel meeting, the codes were further revised to remove "Excimer" from the code descriptor and specify the wavelengths for other lasers that treat psoriasis that are not excimer lasers. The codes were subsequently presented at the April 2025 RUC meeting, with the specialty noting these changes were considered to be editorial in nature, which was affirmed by the RUC.

In parallel to this an additional code change application was brought forward to the CPT Editorial Panel, which was considered in May 2025, to expand the laser codes beyond the treatment of psoriasis to include other inflammatory skin disorders. In May 2025, the CPT Editorial Panel approved revisions to codes 96920, 96921, and 96922 to expand the indications beyond psoriasis to include inflammatory and auto-immune skin diseases.

Compelling Evidence

The specialty society's compelling evidence argument is based both on documented flaws in the prior valuation process and evidence of a change in physician work due to changing patient population.

Flawed Methodology

First, we believe that the methodology used by CMS in the CY2025 Medicare Physician Fee Schedule was flawed and led to incorrect assumptions and inaccurate valuation of laser codes CPT 96920-96922.

For CY2025, CMS accepted the RUC-recommended times but did not accept the RUC-recommended values for 96920, 96921, and 96922. Instead, the agency finalized lower work RVUs—0.83 for 96920, 0.90 for 96921, and 1.15 for 96922.

Specifically, CMS finalized wRVUs based on crosswalks to codes 11104 and 11301 for 96920 and 96921, respectively. For 96922, CMS used a purely formulaic approach, applying building block methodology and citing the RUC-recommended incremental difference of 0.25 work RVUs above 96921 to arrive at a final value of 1.15. CMS also calculated intraservice time ratios between the 2002 intraservice times and the RUC-recommended intraservice times for each code, multiplying that ratio by the 2002 work RVU in an effort to "maintain the intensity associated with the 2002 review," despite acknowledging that commenters would likely dispute the current time values.

In its rationale, CMS indicated that the physician times associated with these codes have fluctuated over time, while the work RVUs have remained largely unchanged. CMS expressed concern that the 2012 recommendations did not address this inconsistency and emphasized that significant decreases in time should correspond with decreases in work RVUs unless a clear rationale is provided for increased intensity.

The specialty society believes CMS's methodology is flawed and disagrees with CMS's valuation methodology for CPT codes 96920, 96921, and 96922. Specifically, we oppose the use of time ratios across different time periods to justify reductions in work RVUs—particularly when the original 2002 values were not based on survey data but were established through crosswalks. Applying time-based calculations across periods where code descriptors have since been clarified is not appropriate for valuing physician work. Calculating an intraservice time ratio based on the 2002 values is not representative of the actual time, intensity, and physician work involved in performing these services today. Further, CMS did not provide clinical rationale to support the selected crosswalks to 11104 and 11301, which do not reflect the current clinical use, service characteristics, or intensity of laser treatment for inflammatory skin disease.

We also want to note that these codes have been flagged in the RUC database as "Do Not Use to Validate Physician Work" (DNU) – Service Times Not Representative since April 2023, when they were last surveyed. While we are not asserting the DNU flag constitutes flawed methodology, we want to highlight this to note the factors that led to the DNU flag reflect longstanding challenges in valuing this code family, and the times associated with these services, further supporting compelling evidence.

More specifically, in 2012, the RUC accepted increased intraservice times based on survey data but maintained the 2002 work RVUs, citing a lack of compelling evidence to support an increase in wRVU. In April 2023, the survey reflected a marked decrease in intraservice time. The specialty society advised that the reported times were insufficient to complete the procedure as currently performed. The expert panel, which included psoriasis experts who had routinely performed these services, agreed and furthermore advised that both the time and work had remained stable since the codes were last surveyed in 2012. Survey respondents also indicated relative stability in work compared to the then-current values.

The RUC noted similar concern around the survey times with the RUC rationale for this family of codes noting, "The RUC expressed concern with the survey that the times have decreased and there was not a proportionate decrease in work."

Given this disproportionate change in times in the survey results, which did not align with the specialty society, physician experts and survey takers other responses, there was significant difficulty in assigning accurate valuations to this family of codes. In particular the specialty society felt that both the current values and the 25th percentile survey values would be inappropriate given the reported decrease in time. In April 2023, the RUC recommended reduced work RVUs of 1.00 for 96920 (crosswalked to CPT code 20606), 1.07 for 96921 (crosswalked to 12011), and 1.32 for 96922, based on comparator services with similar intraservice and total times, and applied the "Do Not Use to Validate Physician Work" – Service Times Not Representative flag given the concerns noted above.

CPT Code		Intraservice Time	Total Time	Work RVU
96920	2002	17	27	1.15
	2012	23	35	1.15
	April 2023 RUC Recommendation	10	23	1.00
	Current	***10***	***23***	***0.83***
96921	2002	20	30	1.17
	2012	30	42	1.30
	April 2023 RUC Recommendation	12	25	1.07
	Current	***12***	***25***	***0.90***
96922	2002	30	40	2.10
	2012	45	57	2.10
	April 2023 RUC Recommendation	18	31	1.32
	Current	***18***	***31***	***1.15***

Of note at the April 2025 RUC meeting, the specialty society recommended that the RUC affirm the current, CMS-accepted values for CPT codes 96920–96922. The specialty society felt that affirmation of the CMS-accepted values was the most appropriate course at the time, with the understanding that the codes would return to the RUC for rereview at the September 2025 meeting—either due to approval of the proposed changes at CPT or as part of continued review for codes flagged as "Do not use to validate physician work."

We believe the median intraservice times from the current survey more accurately reflect the physician time and intensity associated with these services than the current, CMS-accepted values. Given the RUC's previously stated concerns regarding relativity between time and intensity for these codes, we request that the RUC consider increased times and work RVUs for CPT codes 96920, 96921, and 96922 based on the current survey data.

Changing Patient Population
The specialty society further believes there is a change in patient population, which supports compelling evidence.

Laser treatment for inflammatory and auto-immune skin diseases is now typically performed only in those patients with contraindications for systemic agents such as those with paradoxical biologic response, lack of response to systemic agents, preexisting immunosuppression or latent infections, or those patients with particularly recalcitrant disease. This shift in patient population can be seen in the dramatic decrease in utilization for these codes in the last few years, particularly for 96920. This patient population is more difficult to treat, reflected in the increased time and intensity as indicated by the survey respondents.

We would also note that the code indications, previously limited to psoriasis, now encompass applicable inflammatory and auto-immune skin diseases. Despite this, based on utilization data, we anticipate psoriasis will remain the typical condition treated by this modality. That being said, the patient population treated with ultraviolet laser has undoubtedly shifted as highly effective systemic biologics have replaced localized therapy.

Survey Process
The AADA requested, and the Research Subcommittee approved, to use a targeted sample methodology in conjunction with a random sample of AAD membership. Laser treatment for inflammatory and auto-immune skin diseases is not widely performed across dermatology and requires use of specialized laser devices that emit ultraviolet B (UVB) light in the 308 to 312 nanometer wavelength range. This procedure is not typically taught during conventional medical training such as in medical school or dermatology residency programs. Therefore, physicians who do not own these devices or perform the procedure may be unable to accurately estimate the physician work and time involved.

The random sample included 500 practicing, U.S.-based AAD members, excluding residents.

The targeted sample was derived from two sources: CMS Medicare Physician & Other Practitioners Public Use File (2021–2023) and vendor-supplied lists from two manufacturers of laser devices used to treat inflammatory skin diseases – Strata Skin Sciences and LASEROPTEK America Inc.

177 dermatologists were identified from the CMS claims data who billed 96920, 96921, or 96922 from 2021-2023.

The names of 202 dermatologists were received from Strata Skin Sciences, who hold the vast majority of the marketplace, and the names of 47 dermatologists LASEROPTEK America Inc. After removing duplicate physician names across all sources, the final targeted sample included 303 dermatologists.

The specialty society also compared the random and targeted samples to ensure there were no duplicate names. Each dermatologist was included only once in the final combined sample, which consisted of 803 survey recipients. All were surveyed.

Work Recommendation
The expert panel, which includes psoriasis experts who have frequently performed this procedure for many years, reviewed the survey data. As noted above, the specialty society believes the current survey results more accurately reflect the physician time and intensity associated with these services than the current values.

Therefore, the expert panel recommends the 25th percentile survey value for a wRVU of 1.50 for 96922.

It was felt this wRVU would maintain relativity well when compared to other codes with similar times. On a RUC database review of 000-day global codes valued since 2010 with intraservice times between 20 and 25 minutes and similar total times (between 36 and 45 minutes), the proposed value of 1.50 would fall within range of the resulting RVWs values, and would not be the most highly valued code within this grouping.

Key Reference Services
The reference codes most frequently selected by survey participants are procedures that are well understood by dermatologists:

12006 Simple repair of superficial wounds of scalp, neck, axillae, external genitalia, trunk and/or extremities (including hands and feet); 20.1 cm to 30.0 cm

12018 Simple repair of superficial wounds of face, ears, eyelids, nose, lips and/or mucous membranes; over 30.0 cm

Neither KRS code was chosen by a majority of the survey takers, at approximately 22% and 14% respectively, and therefore the society was not confident these were representative for comparison.

CPT Code	Descriptor	wRVU	Pre	Intra	Post	Total Time
96922*	Excimer laser treatment for psoriasis; over 500 sq cm	1.15	10	18	3	31
96922**	Laser treatment, 308-312 nanometer wavelengths, for inflammatory or auto-immune skin diseases (eg, psoriasis); over 500 sq cm	1.50	10	24	5	39
12006	Simple repair of superficial wounds of scalp, neck, axillae, external genitalia, trunk and/or extremities (including hands and feet); 20.1 cm to 30.0 cm	2.39	11	30	6	47
12018	Simple repair of superficial wounds of face, ears, eyelids, nose, lips and/or mucous membranes; over 30.0 cm	3.61	11	45	8	64

***Specialty Recommendation*

MPC Codes
The specialty society's recommendation additionally supports relativity when compared to the MPC codes noted below:

CPT Code	Descriptor	wRVU	Pre	Intra	Post	Total Time
96922*	Excimer laser treatment for psoriasis; over 500 sq cm	1.15	10	18	3	31
96922**	Laser treatment, 308-312 nanometer wavelengths, for inflammatory or auto-immune skin diseases (eg, psoriasis); over 500 sq cm	1.50	10	24	5	39

12004	Simple repair of superficial wounds of scalp, neck, axillae, external genitalia, trunk and/or extremities (including hands and feet); 7.6 cm to 12.5 cm	1.44	7	17	5	29
64644	Chemodenervation of one extremity; 5 or more muscles	1.82	15	25	5	45

**Current*
***Specialty Recommendation*

Recommendations for Pre-and Post-Service Times
Pre-service time
The specialty society recommends pre-service package 5 (non-facility), and recommends retaining the current pre-service positioning time of 2 minutes for a total of 10 minutes pre-service time:

Pre-Service Evaluation Time: 7
Pre-Service Positioning: 2
Pre-Service Scrub, Dress, Wait Time: 1

The 2 minutes of pre-service positioning time accounts for the necessary maneuvering and manipulation of the patient to allow access to sensitive treatment areas for the application of local anesthetic (EMLA cream), as needed; draping and positioning the patient for optimal access to each treatment site.

Immediate post-service time
The expert panel reviewed the survey data and determined that the survey median of 5 minutes for immediate post-service time is representative of the typical post-service physician work. This includes evaluation of treatment areas, direction of clinical staff for skin care, and counseling related to post-treatment management. These activities are consistent with the current post-service work description, which has not changed.

Summary
In summary, our expert panel recommends a pre-service time of 10 minutes, the survey median intraservice time of 24 minutes, the survey median post-service time of 5 minutes, and the survey 25th percentile wRVU of 1.50.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 96922

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Dermatology How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 70000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. While 2023 claims data show that Medicare may allow payment for indications beyond psoriasis in some cases, private payers currently do not permit payment for this service for conditions other than psoriasis. With the expanded indications reflected in the revised descriptor for 96922, the specialty society estimates that utilization could be approximately 3.5 times higher than in the Medicare population. This projected increase reflects both the anticipated shift in private payer coverage and the higher prevalence of certain inflammatory and auto-immune skin diseases, such as vitiligo, in the non-Medicare population. Based on these factors, the specialty society estimates total utilization at around 70,000 units annually.

Specialty Dermatology Frequency 59500 Percentage 85.00 %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 20000
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare utilization for this code has remained somewhat consistent since 2021. In 2023, the top five diagnosis codes billed with 96922 indicate that Medicare permits payment for certain skin conditions other than psoriasis (e.g., vitiligo), though such cases represent a smaller portion of overall use. Given that the CPT revisions to the code descriptor expands indications for this service beyond psoriasis, the specialty society anticipates an overall increase in utilization for 96922. However, with a range of other treatments available for many inflammatory and auto-immune skin diseases, including advancing topical therapies, we expect any overall increase in utilization to remain limited.

Specialty Dermatology Frequency 17000 Percentage 85.00 %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States?

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Minor procedure

BETOS Sub-classification Level II:
Skin

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 96922

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC) PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

Meeting Date: September 2025

CPT Code	Long Descriptor	Global Period
96920	Laser treatment, 308-312 nanometer wavelengths, for inflammatory or auto-immune skin diseases (eg, psoriasis); total area less than 250 sq cm	000
96921	Laser treatment, 308-312 nanometer wavelengths, for inflammatory or auto-immune skin diseases (eg, psoriasis); 250 sq cm to 500 sq cm	000
96922	Laser treatment, 308-312 nanometer wavelengths, for inflammatory or auto-immune skin diseases (eg, psoriasis); over 500 sq cm	000

Vignette(s) (*vignette required even if PE only code(s)***):**

CPT Code	Vignette
96920	A 65-year-old male presents with an inflammatory or auto-immune skin disease. The patient has less than 250 sq cm of cutaneous lesions. The decision is made to utilize a 308-312 nm laser for treatment.
96921	A 65-year-old male presents with an inflammatory or auto-immune skin disease. The patient has between 250 sq cm and 500 sq cm of cutaneous lesions. The decision is made to utilize a 308-312 nm laser for treatment.
96922	A 65-year-old male presents with an inflammatory or auto-immune skin disease. The patient has over 500 sq cm of cutaneous lesions. The decision is made to utilize a 308-312 nm laser for treatment.

If there is a significantly different patient population in the non-facility setting, a vignette should be provided for the non-facility setting in the PE SOR.

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

   The American Academy of Dermatology Association (AADA) convened a panel that included physicians who perform the procedure. The panel developed the direct practice expense recommendations for CPT codes 96920, 96921, and 96922 based on typical clinical practice and current AMA RUC/PE guidelines.

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here:

   N/A

   NOTE: For services reviewed prior to the implementation of clinical activity codes in 2016-17, detail is not provided in the RUC database, please contact *Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org* for PE spreadsheets for your older reference codes.

3. Is this code(s) typically reported with an E/M service?
   Is this code(s) typically reported with the E/M service in the non-facility?

   Codes 96920, 96921, and 96922 are not typically reported with an E/M service (in the non-facility or facility setting).

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

See the *Billed Together* tab in the RUC Database.

4. A. What specialty is the dominant provider *in the non-facility?* What percent of the time does the dominant provider provide the service(s) in the non-facility? Is the dominant provider in the non-facility different than for the global? Note: When discussing specialties that perform the code, they must perform 51% to be called the "typical" physicians. If no one specialty meets the 51% but is the top specialty with 27% (for example), then they are referred as the top or dominant specialty.

Dermatology is the dominant provider for 96920, 96921, and 96922 across all sites of care. In the non-facility setting, Dermatology accounts for 75.4% of 96920, 80.6% of 96921, and 85.2% of 96922 utilization. These services are furnished greater than 98% of the time in a physician office (non-facility) setting: 98.7% for 96920, 99.0% for 96921, and 99.8% for 96922).

See the *Claims Data* tab in the RUC Database. Use the *Medicare Specialty (Non-Facility Only)* table.

5. If you are requesting an increase over the aggregate current cost for clinical activities, supplies and equipment, please provide compelling evidence:

The specialty society is requesting an increase in aggregate cost for 96920, 96921, and 96922 due to increased clinical staff time for CA018 *Assist physician or other qualified healthcare professional---directly related to physician work time (100%),* as reflected in line 49 of the PE Spreadsheet. **The increased time for CA018 is entirely accounted for because of an increase in physician intraservice time that we are recommending for 96920, 96921, and 96922 — 12, 17, and 24 minutes, respectively.** Per the RUC Practice Expense Compelling Evidence Guidelines, compelling evidence does not apply to time associated with the line item *assist physician in performing procedure* (CA018), if this line item is directly tied to the work recommendation.

Three of the four equipment items for 96920, 96921, and 96922 — EQ168 Exam light (PE Spreadsheet line 124), EQ161 excimer laser (line 125), and EF031 power table (line 126) — are tied to the full clinical staff time for each code (40, 45, and 52 minutes, respectively) because they are used during pre-, intra-, and post-service periods. As a result, the increase in CA018 minutes also increases the total equipment time for 96920, 96921, and 96922. As indicated above, the increase in aggregate cost for all three codes can be entirely accounted for because of an increase in physician time being recommended by the specialty society. See Question 23 for a detailed breakdown of equipment minutes.

See the *PE compelling evidence guidelines* under PE Reference Materials on the RUC Collaboration website. Be sure to explain if the increase can be entirely accounted for because of an increase in physician time.

CLINICAL STAFF ACTIVITIES

The RUC has agreed that there is a presumption of zero pre-service clinical staff time unless the specialty can provide evidence to the PE Subcommittee that any pre-service time is appropriate. The RUC agreed that with evidence some subset of codes may require minimal or extensive use of clinical staff and has allocated time when appropriate (for example when a service describes a major surgical procedure). If

the package times are not applicable, alternate times may be presented and should be justified for consideration by the Subcommittee.

6. Are the global periods of the codes transitioning? Information about the amount of pre-service clinical staff time and a rationale for the change from a 090-day global to a 000 or 010 day global should be described below.

No.

7. If you are recommending more minutes than the PE Subcommittee standards for clinical activities, you must provide rationale to justify the time:

N/A

8. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (*please see 2nd worksheet tab in PE spreadsheet*), please explain the difference here:

N/A

9. How much time was allocated to clinical activity, *obtain vital signs* (CA010) prior to CMS increasing the clinical activity to 5 minutes for calendar year 2018? The standard for clinical activity, obtains vital signs remains 0, 3 and 5 based on the number of vital signs taken. Please provide a rationale for the clinical staff time that you are requesting for obtain vital signs here:

The specialty society is requesting to maintain the 2023 RUC approved 5 minutes (Level 2 [4–6 vital signs] = 5 minutes) for CA010 for CPT codes 96920, 96921, and 96922 to account for clinical staff obtaining the following vital signs: temperature, respiratory rate, blood pressure, and pulse. Ultraviolet laser treatment typically induces redness, flushing, and occasionally fever. Evaluation of these four vital signs is critical for monitoring the patient for treatment-related changes.

10. Please provide a brief description of the clinical staff work for the following:
    a. Pre-Service period:

Room preparation is completed including turning on the laser equipment as it takes time to warm up. The patient is greeted by clinical staff, brought to treatment room and provided with a gown. Clinical staff ensures appropriate medical records are available. The clinical staff obtains vital signs including temperature, respiratory rate, BP and pulse. Clinical staff reviews the treatment procedure with the patient, obtains patient consent and confirms the order. Once the patient is gowned, photos are obtained of the treatment areas. EMLA cream is applied. The patient is positioned by the clinical staff to allow for initial treatment.

    b. Service period (includes pre, intra and post):

The clinical staff is present with the physician and actively assists the physician throughout the procedure. The clinical staff ensures the patient is wearing the required UV goggles throughout the treatment. The physician and clinical staff also wear UV goggles. Face shields are worn by physician and clinical staff to prevent any splashing due to mineral oil or other ointments. Clinical staff assists the physician with patient re-positioning throughout the entire treatment, stabilizing skin and holding any body parts to allow access (including holding skin folds back), shifting or replacing and taping the fenestrated drapes, as well as applying necessary topical agents throughout the procedure. Clinical

staff applies ice packs to treated areas. During the procedure the clinical staff and physician will change gloves due to the use of mineral oil and other ointments.

c. Post-service period:

The clinical staff provides disposable towels for the patient to clean off excess mineral oil and ointments. The patient is monitored by clinical staff in the room and the treated areas are checked for any redness, burns or other reactions. Clinical staff apply topicals including triamcinolone, mupirocin 2% topical ointment, topical emollient, and sunscreen to areas as directed by the physician. Instructions are given to the patient regarding home care. The clinical staff clean the treatment room and clean the laser. The clinical staff will remind the patient when to return for the next treatment and answer patient questions.

11. Please provide granular detail regarding what the clinical staff is doing during the intra-service (of service period) clinical activity, *assist physician or other qualified healthcare professional---directly related to physician work time* or *Perform procedure/service---NOT directly related to physician work time:*

Assist physician as noted above in 10b.

12. If you have used a percentage of the physician intra-service work time other then 100 or 67 percent for the intra-service (of service period) clinical activity, please indicate the percentage and explain why the alternate percentage is needed and how it was derived.

N/A

13. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (*please see 2nd worksheet tab in PE spreadsheet*):

N/A

14. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov.

N/A

MEDICAL SUPPLIES & EQUIPMENT/INVOICES

15. ☐ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

16. ☐ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

17. If you wish to include a supply that is not on the Direct PE Inputs Medical Supplies Listing (*please see 4th worksheet tab in PE spreadsheet*), a paid invoice is required. Identify and explain the supply input and invoice here:

N/A

NON-FACILITY DIRECT PE INPUTS

CPT CODE(S): 96920, 96921, 96922
SPECIALTY SOCIETY(IES): AADA
PRESENTER(S): Howard Rogers, MD, PhD, FAAD; Brent Moody, MD, FAAD; Mark Kaufmann, MD, FAAD; Ryan Hick, MD, FAAD; Lawrence Green, MD, FAAD

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC) PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

18. Are you recommending a PE supply pack for this recommendation? Yes or No.
If Yes, please indicate if the pack is an established package of supplies as defined by CMS (eg, SA047 *pack, E/M visit*) or a pack that is commercially available?

Yes: *SA048 pack, minimum multi-specialty visit*

19. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation (*please see 8-10th worksheet tabs in PE spreadsheet*). Please include the description, CMS supply code, unit, item quantity and unit price (if available).

DESCRIPTION	Code	Unit	Item Qty	Unit Price
pack, minimum multi-specialty visit	**SA048**	**pack**		$5.02
paper, exam table		foot	7	
gloves, non-sterile		pair	2	
gown, patient		item	1	
pillow case		item	1	
cover, thermometer probe		item	1	

20. If you wish to include an equipment item that is not on the Direct PE Inputs Equipment Listing (*please see 5th worksheet tab in PE spreadsheet*), a paid invoice is required. Identify and explain the equipment input and invoice here:

N/A

21. Please provide an estimate of the useful life of the new equipment item as required to calculate the equipment cost per minute:

N/A

22. Have you recommended equipment minutes for a computer or equivalent laptop/integrated computer, equipment item computer, desktop, w-monitor, ED021 or notebook (Dell Latitute D600), ED038?
    a. If yes, please explain how the computer is used for this service(s).
    b. Is the computer used exclusively as an integral component of the service or is it also used for other purposes not specific to the code?
    c. Does the computer include code specific software that is typically used to provide the service(s)?

N/A

23. List all the equipment included in your recommendation and the equipment formula chosen *(please see 7th worksheet tab in PE spreadsheet: Equipment minute formulas).* If you have selected "other formula" for any of the equipment, please explain here:

Equipment Code	Useful Life	Price	Utilization Rate	Min/Year	Cost/Year
EQ168 light, exam	10	1232.887	0.5	150000	0.003271745
EQ161 laser, excimer	5	155580	0.5	150000	0.589495599

EF031 table, power	10	5906.76	0.5	150000	0.015674926
ED005 camera, digital system, 12 megapixel (medical grade)	5	5607.182	0.5	150000	0.022216755

The EQ168 light is used during pre-, intra and post-service time and thus tied to the entire clinical staff time (line 10 of the PE Spreadsheet). The light allows the clinical staff and physician to easily identify the plaques as well as take well-lit photos. The light is also used during the procedure to illuminate the treatment areas to allow the physician to achieve optimal results and minimize potential risks that may occur. During post-service the light is on to allow the physician and clinical staff to identify any areas of concern and allow for ease to apply any ointments.

The EQ161 excimer laser is used during pre-, intra-, and post-service time and is therefore tied to the entire clinical staff time (line 10). The laser is warmed up in the treatment room before the patient is brought in. During the procedure, it is actively used to deliver treatment to the affected areas. After treatment, the handpiece—having been in contact with oils and topicals—is cleaned when the room is cleaned, after the patient leaves the room. Throughout this service period, the laser remains in the room and is not available for use with other patients.

The EF031 table, power is used for the entirety of the procedure and tied to the entire clinical staff time (line 10 of the PE Spreadsheet).

The ED005 camera is used to capture images of the patient's lesions in pre-service time as part of the initial 2 minutes for set-up of the procedure (CA016, line 40). The photos are used by the physician to track the course of treatment and clearance of lesions over time.

"Other formula" was selected for each equipment item outlined above. CA023 *Monitor patient following procedure/service, no multitasking* – 3 minutes included for 96920, 96921, and 96922 in the associated PE Spreadsheet (line 61) is not part of the default formula.

PE-ONLY CODES ADDITIONAL INFORMATION

24. (a) Estimate the number of times this service might be provided nationally in a one-year period?
(b) Estimate the number of times this service might be provided to Medicare patients nationally in a one-year period?

N/A

25. Please select a Professional Liability Insurance (PLI) crosswalk based on a similar specialty mix:

ITEMIZED LIST OF CHANGES (FOLLOWING THE PE SUBCOMMITTEE MEETING)

NOTE: The PE spreadsheets will be updated and finalized in real-time at the meeting. PE SORs must be updated based on modifications made during the meeting and resubmitted asap. The PE SOR should match the updated PE spreadsheet. Please provide a list of the modifications made to the PE spreadsheet during the PE Subcommittee meeting in the space below with brief justification for the modification (e.g. Equipment item EF023 *table, exam* was changed to EF031 *table, power* as the power table is typical in the surgeon's office).

The PE SOR serves as key support for the spreadsheet and should include any important details/explanation for the inputs as these cannot be elaborated upon in the excel document itself.

Please submit the revised form electronically to Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org.

AMA/Specialty Society RVS Update Committee Summary of Recommendations

April 2025

Laser Treatment for Psoriasis – Tab 10

In October 2015, CPT codes 96920, 96921 and 96922 were identified via the high-volume growth screen with Medicare utilization of 10,000 or more that increased by at least 100% from 2008 through 2013. At that time, the RUC recommended that the specialty societies develop a CPT Assistant article to ensure the codes were being used correctly, which was published in September 2016. This was the third article created for this code set, with articles also published in June 2012 and May 2013.

In January 2022, the Relativity Assessment Workgroup (RAW) reviewed these services again, noting that their utilization continued to steadily increase, specifically CPT code 96920. Use of 96920 peaked at 117,256 in 2016, dropped to 79,671 in 2020, and increased to 88,673 in 2021. The specialty societies indicated that they believed the growth is appropriate due to changes in treatment and medication for psoriasis. However, due to the continued growth, the RAW recommended, and the RUC agreed, that CPT codes 96920, 96921 and 96922 be surveyed for work and practice expense at the April 2022 RUC meeting.

In April 2022, CPT codes 96920-96922 were referred to the CPT Editorial Panel for editorial review. Since the CPT descriptor was established in 2002, psoriasis was the only approved indication and use for this treatment modality. The specialty societies stated the indications had expanded beyond those noted in the code descriptors to include laser treatment for other inflammatory skin disorders. At the September 2022 CPT meeting, the tab was withdrawn when it was determined that the specialties' proposed changes were beyond editorial. This issue was deferred to the February 2023 CPT meeting and subsequently withdrawn as it was determined that existing literature was insufficient and did not support expanded indications at that time.

The presenters described the recent history of this code set and its route back to the RUC. This issue was surveyed for the April 2023 RUC meeting, without any revisions to the code descriptors, since the available 2021 Medicare data indicated that the typical patient was being treated for psoriasis (96920, psoriasis = 79.3%). At the April 2023 meeting, the RUC voted to recommend an editorial change to CPT to add "(ie, excimer)" after "Laser treatment" for clarity in codes 96920-96922. The codes were also flagged as "Do Not Use to Validate for Physician Work" as the times were not representative. At the May 2023 CPT Editorial Panel meeting, the CPT Executive Committee voted to editorially revise the code family parent code 96920 to align with the intended use of these services exclusively for psoriasis using an "Excimer" laser. These editorial revisions for the CPT 2024 code set did not involve a change in physician work. However, despite a CPT Assistant article, concern resulted from the addition of the term "excimer" to the descriptor for those using other types of appropriate ultraviolet lasers. Subsequently, at the February 2025 CPT Editorial Panel meeting, the codes were further revised to remove "Excimer" from the code descriptor and specify the wavelengths for other lasers that treat psoriasis that are not excimer lasers.

In preparation for the April 2025 RUC meeting, the specialty society submitted a letter to the RUC that detailed the revisions to the code family (removing "excimer" and specifying a wavelength range for treatment "308-312 nanometers") and stated that the specialty considers these updates

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

editorial in nature. The typical patient, typical laser equipment, typical treatment procedure, and its associated work are unchanged. The specialty explained that an excimer laser delivers UV light energy within the range specified by the revised code descriptors and, while it is not the only laser that may be used in the phototherapy treatment of psoriasis, it is still the typical device. The excimer laser is the dominant laser with about 85% share of the ultraviolet lasers currently in use.

The specialty society also acknowledged that the code family will return to the CPT Editorial Panel in May 2025 with a new code change application (CCA) proposing to expand the laser codes beyond the treatment of psoriasis to include other inflammatory skin disorders. If approved by the CPT Editorial Panel, a RUC survey will be required to evaluate physician work and practice expense for any expanded indications. For these reasons, the specialty society requested that the RUC affirm the current values and CMS inputs for CPT codes 96920-96922.

Upon consideration at the April 2025 RUC meeting, the RUC concurred that the code descriptor changes since the laser codes were last reviewed in 2023 are editorial in nature. Furthermore, a new CCA is being considered by the CPT Editorial Panel with expanded indications that will require a RUC survey. In addition, it was noted that the codes are included in the "Do not use to validate physician work" screen that will also require resurvey for the September 2025 RUC meeting.

The RUC agreed with the specialty society's request to affirm the current CMS values for CPT codes 96920, 96921 and 96922. **The RUC concurs that the current CMS values be maintained and therefore recommends a work RVU of 0.83 for CPT code 96920, 0.90 for CPT code 96921, and 1.15 for CPT code 96922.**

Practice Expense

The specialty society requested that the Practice Expense (PE) Subcommittee affirm the current CMS inputs for CPT codes 96920, 96921 and 96922 as the code descriptor revisions do not change the current work or PE inputs. The American Academy of Dermatology Association confirmed that the excimer laser remains the typical equipment used for the code family. It was acknowledged that CMS did not accept the change in business model for excimer lasers to a per-use rental (subscription model), as recommended at the April 2023 RUC meeting, since the equipment item EQ161 *laser, excimer* is available for purchase and already accounted for under its equipment methodology. The PE Subcommittee agreed to maintain the direct practice inputs without modification. **The RUC recommends the current CMS direct practice expense inputs be maintained as affirmed by the Practice Expense Subcommittee.**

RE: Tab 10 – Laser Treatment for Psoriasis AADA Recommendations

Dear Dr. Silva,

In February 2025, the CPT Editorial Panel approved minor revisions to the descriptors for CPT codes 96920, 96921, and 96922, which describe laser treatment for psoriasis. These revisions removed "excimer" and specified a wavelength range for treatment (308-312 nanometers).

The American Academy of Dermatology Association (AADA) considers these updates editorial in nature, as confirmed by AMA CPT staff. The procedure itself remains unchanged, and the revised descriptors continue to accurately reflect the typical physician work and practice expense (PE) inputs for these services. We recommend that the RUC reaffirm the current values and CMS inputs for CPT codes 96920, 96921, and 96922.

Background

These laser codes were most recently reviewed by the RUC in April 2023. At that time, the AADA received approval to conduct a targeted survey using vendor-supplied lists as this service is not typically taught in training and is only performed by a small subset of dermatologists with the proper equipment. AADA reached out to the only two manufacturers, Strata (XTRAC) and LASEROPTEK Americas (PALLAS). The XTRAC laser is an excimer laser that delivers a focused, high-intensity ultraviolet B (UVB) laser beam at 308nm. The PALLAS laser is a non-excimer solid-state UVB laser operating at 311nm.

Strata held the majority of the market, providing 225 names, while LASEROPTEK Americas provided 25 names—all were surveyed. At the April 2023 RUC meeting, AADA recommended, and the RUC approved, physician work and PE inputs based on the typical device, the excimer laser.

FAX: (202) 842-4355

After the tab passed, the RUC voted to recommend an editorial change to CPT to add a parenthetical, "(i.e., excimer)" to the code descriptors, indicating that the recommendation was made for clarity.

In May 2023, the CPT Executive Committee recommended broader editorial revisions to the code descriptors for 96920-96922, adding the term "excimer," not as a parenthetical, and removing both the term "inflammatory skin disease" and the parenthetical around the term "psoriasis." At the time, the AADA submitted a letter to the CPT Executive Committee disagreeing with the changes as they were brought forward. The CPT Editorial Panel ultimately approved these changes as a technical correction for the CPT 2024 code set.

Despite publication of a *CPT Assistant* article, the aforementioned changes to the code descriptor, particularly the inclusion of the term "excimer", created confusion. As a result, the AADA was advised by the AMA CPT leadership team to submit an editorial code change application (CCA) for the February 2025 CPT Panel meeting requesting removal of the term "excimer" from the code descriptors. AMA CPT staff indicated that:

> *"Since there are only two players in this space and the device costs are equivalent, removing the term 'Excimer' should clear up the confusion. We could then work to handle the CPT Assistant Q&A to clarify that the laser can be generated by either pulsed gas or crystal. It's unlikely that any new RUC work would need to be done since the typical patient would remain the same."*

In February 2025, the CPT Editorial Panel approved the following changes the descriptors for CPT codes 96920, 96921, and 96922, effective for CPT 2027:

▲ 96920 ~~Excimer~~ L~~l~~aser treatment, 308-312 nanometer wavelengths, for psoriasis; total area less than 250 sq cm

▲ 96921 250 sq cm to 500 sq cm

▲ 96922 over 500 sq cm

Recommendations Rationale

The AADA maintains that the February 2025 revisions to the CPT descriptors for the laser treatment of psoriasis codes are editorial and do not change the current values, physician work, or PE associated with CPT codes 96920, 96921, and 96922. The excimer UV laser—used to value these codes in April 2023—remains the typical device for these services. Excimer lasers deliver UV light energy within the range specified by the revised code descriptor and, while it is not the only laser that may be used in the phototherapy treatment of psoriasis, it is still the typical device.

Although "excimer" is not a trade name, the term refers to a specific type of laser technology. CPT codes are typically crafted to be product-agnostic and not device-specific; therefore, the February 2025 CPT

changes, specifically the removal of "excimer," appear to be consistent with AMA CPT's conventions for code descriptor language.

The AADA acknowledges that CMS did not accept the RUC-recommended work relative values for CPT codes 96920, 96921, and 96922. Further, while the RUC recommended that the typical business model for excimer lasers is a per-use rental (subscription model), CMS stated that a rental, subscription, or per-use fee for equipment that is still available for purchase and already accounted for under its equipment methodology is not appropriate, particularly given its impact on direct PE costs for these CPT codes.[1] Indeed, CMS has historically considered rental and licensing fees as indirect PE under its methodology.

That said, CMS did recognize the excimer laser as the typical device and, while the agency did not accept the subscription model, CMS did indicate that the "excimer laser is appropriately and adequately accounted for in the equipment formula, which accounts for years of useful life, utilization rate, purchase price, interest rate, maintenance, and minutes per year of use".[1]

The AADA believes that resurveying these codes now would be premature. Since the April 2023 RUC review, there have been no changes in the physician work or technology that would warrant a rereview by the RUC at this time.

Additionally, there are new efforts to broaden the scope of these codes beyond their current indications. An industry-led CCA was submitted for the May 2025 CPT Editorial Panel Meeting, proposing to expand these codes beyond psoriasis to include additional inflammatory skin conditions, such as vitiligo, atopic dermatitis, and alopecia areata. If these changes are approved by CPT, a RUC resurvey would be required to evaluate physician work and PE for any expanded indications**.**

The AADA maintains that the February 2025 revisions to the code descriptors for 96920, 96921, and 96922 are editorial and do not change the current physician work or PE inputs. Further, given the industry-led CCA under review for the May 2025 CPT Editorial Panel Meeting, the AADA believes a resurvey is premature.

For the reasons stated, the AADA respectfully requests the RUC reaffirm the current values and CMS inputs for CPT codes 96920, 96921, and 96922.

Sincerely,

Howard Rogers, MD, PhD
AADA RUC Advisor
