The reference code 27487 offers a good comparison to 28420. The survey code total time is slightly less than 27487. The consensus panel believes the difference in work RVUs for these two codes correctly reflect the additional intra-operative work for 27487 and differences in number and level of postoperative visits between the codes. Neurovascular injury may occur with this type of fracture and multiple post-operative visits are necessary. Assessment of the circulation, sensation and motor function of the involved extremity is ongoing. The first office visit would include removal

of the splint and dressing, wound evaluation, redressing, discussion of restrictions and operative findings, splinting or casting and instruction on range of motion (ROM) and weightbearing activities. X-rays would be reviewed. The second visit would be for splint or cast and dressing removal, wound evaluation, suture removal, new cast application, ROM exercises. The third visit would be for splint or cast removal and range of motion exercises and review of restrictions. X-rays would be reviewed. The fourth visit would be to check X-rays, wound healing and ROM.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No
   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FIVE YEAR REVIEW SPECIFIC QUESTIONS:

Please indicate the number of survey respondent percentages responding to each of the following questions (for example 0.05 = 5%):
Has the work of performing this service changed in the past 5 years? Yes 61% No 39%
(Use the subset of the people who responded "Yes" to answer the following questions)

A. This service represents new technology that has become more familiar (i.e., less work):
   I agree 13% I do not agree 87%
B. Patients requiring this service are now:
   more complex (more work) 100% less complex (less work) no change
C. The usual site-of-service has changed:
   from outpatient to inpatient 3% from inpatient to outpatient 6% no change 90%

Attestation Statement

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
2005 FIVE YEAR REVIEW - SUMMARY OF RECOMMENDATION

CPT Code:28445 Tracking Number F57 Specialty Society Recommended RVU: **21.50**
Global Period: 090 RUC Recommended RVU: **17.07**

CPT Descriptor: Open treatment of talus fracture, includes internal fixation, when performed

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 35-year-old man suffers a displaced talar neck fracture where the body of the talus is extruded from the ankle joint, the medial malleolus is fractured, and the lateral foot skin is stretched and tented requiring open reduction and internal fixation.

Percentage of Survey Respondents who found Vignette to be Typical: 85%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: • Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
- Verify that all required instruments and supplies are available
- Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulatio drapes
- Assess position of the extremities and head, adjust as needed
- The patient's leg is placed properly on the table and positioned with proper bolstering to aid surgical exposure.
- Indicate areas of skin to be prepped and mark surgical incisions
- A tourniquet is placed on the proximal thigh
- The leg is prepped and draped.
- The leg is elevated and exsanguinated.
- The pneumatic tourniquet is inflated.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work: A dorsomedial incision is made in the interval between the tibialis anterior and the posterior tibial tendon. The medial malleolus is mobilized and the joint inspected. Fracture debris is removed. The talar body is manually reduced in the ankle joint and at the talar neck. This may require the insertion of a calcaneal pin for traction. A counter dorsolateral incision is made to aid in reduction and prevent varus or valgus angulation of the talar neck. K-wires are used for temporary fixation and imaging confirms reduction. Final fixation is completed with two compression screws inserted in the longitudinal axis of the talus. Two parallel compression screw are used to effect reduction of the medial malleolus. The wound is irrigated and closed in layers.

Description of Post-Service Work: Post-service work: in facility
- Application of bulky dressing and short leg splint
- Monitor patient stabilization in the recovery room.
- Consultation with the family and patient regarding the surgery and postoperative regimen.
- Communication with health care professionals including written and oral reports and orders.
- Postoperative care is coordinated with recovery room nursing staff.
- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.

- The patient is discharged to the orthopaedic floor for monitoring of compartment syndrome. This requires removing and reapplying the dressings.

Discharge day:

- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Physical therapy for the uses of crutches or walker is ordered
- Write prescriptions for medications needed post-discharge.
- Dictation of an operative report
- Procedure note is written in the patient chart
- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of splint/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order occupational therapy
- Supervision of rehabilitation
- Monitor physical therapy
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions
- Dictate progress notes for medical record

COMPELLING EVIDENCE RATIONALE (Required to be Completed)

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

- ***Evidence that technology has changed physician work.***

Surgical treatment using open anatomical reduction and internal fixation has been made more complex with the introduction of new imaging methods such as CT which allow better detection of the fracture pathology and provided the basis for new surgical strategies. There are also new internal fixation devices which require more work. Beginning in the 1990s (after the Harvard study), new plates were developed for fracture repair, with most becoming available in the late 1990s and early 2000s. As an example of the complexity of the decision process in current practice, the 1990's have given the surgeon numerous options for bone fixation. The options for a bone fixation device currently include Kirschner wires, wire, staples, screws, as well as newer alternatives such as headless bone screws, T-screws, absorbable pins, cannulated screws, and a myriad of plates. The goal of all these devices remains constant: that is, to achieve stable approximation of bone fragments to facilitate healing. The various devices afford rigid fixation along with compression of the osseous fragments. This allows early range of motion and preservation of surrounding joint function, as well as primary bone healing. Selection of the most advantageous form of fixation is dependent on many factors and takes considerable time in the pre-evaluation of a patient. These include the type of fracture or osteotomy created, bone density, type of bone, and the desire for interfragmental compression. All of this has resulted in more work. The standards of care (fracture reduction, limb alignment, etc.) have also been elevated by literature that shows fracture displacements and poor alignments lead to poorer results. Additionally, women over 50 is a fast growing segment of our population. A huge percentage of these patients are osteoporotic - making fracture fixation and maintenance of fixation far more difficult than it used to be. The new plates are more complex to insert when the underlying bone is of much poorer quality.

Given this information, we believe there is compelling evidence that ORIF is more complex than 5 years ago and this is even more true in comparison to practice in the late 1980s (or more than 25 years ago).

- ***Evidence that incorrect assumptions were made in the previous valuation of the service; a misleading vignette and/or survey in a previous evaluation***

During the period of 1989-1991 (after the Harvard study), a major effort was undertaken by the AAOS and the OTA to rewrite every fracture and dislocation treatment code in the musculoskeletal Section of CPT. In 1991, 395 code changes were accepted by the AMA CPT Editorial Panel under the leadership of Dr. William Felts. At the time of the original proposal, some of the code descriptors were changed from those submitted (presumably by the CPT staff), and published in the 1992 and subsequent editions. Some of the changes in the descriptors published in CPT 1992 didn't make sense, but in those years, the CPT process was closed-door. Additionally, in 1992 and 1993 the AMA staff were deluged by the implementation of the RBRVS process and though AAOS and OTA requested that these problems be addressed then, AMA CPT staff asked that it be deferred as their "plate was full." After that time, more important issues and other opportunities consumed the resources of the AAOS and inertia (or the lack thereof) took over. This third five year review, after completion of the practice expense review, allowed AAOS a window of time to again try to correct the nomenclature for these codes, and review their work using the standard RUC survey method.

We also note, that at the time of the original CPT proposal, external fixation was considered an adjunctive procedure. CPT instructed that the codes for external fixation (20690 and 20692) be "listed in addition to the code for the treatment ...of the fracture." This concept still applies today. External fixation can be used as an adjunctive stabilization modality when treating fractures by almost any method. However, external fixation can also be used in reconstructive orthopaedics (for example, th treatment of joint contractures) and for non-musculoskeletal system treatments (for example, as a suspension device in the treatment of lower extremity burns). In 1991, there was no Modifier -51 exempt code category. Today, these same codes, 20690 and 20692 for external fixator application are modifier -51 exempt, recognizing that they can stand alone or be used adjunctively. Because of the modifier -51 exemption, the RVUs have been reduced, so payers are not paying double when either of these codes are reported with another treatment code.

In the 2005 comment letter to CMS, the AAOS recommended examining the physician work for the ORIF codes because the code descriptors lacked clarity. In particular, because the CPT descriptors include the phrase "with or without internal or external fixation," it is difficult to imagine what the Harvard survey data actually represents (ie, no typical patient was described for the survey respondents to focus on). Further, after the descriptors for these codes were changed for CPT 1993, an Abt study was performed in 1992 for RUC consideration. This study produced *percentage* relationships to key reference codes, but not surveyed time and visit data. Some of these recommendations were accepted by the RUC and CMS and others were adjusted up or down, but no changes were made to the Harvard time and visit data, if available. Therefore, we believe that there is little, if any, relationship between the Harvard database time and visit information (from the old CPT codes) and the current work RVUs.

Given this information, we believe there is compelling evidence that the current work values and/or time and visit data may be incorrect and outdated and should be reviewed.

- *Evidence that incorrect assumptions were made in the previous valuation of the service, as documented; a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data*

Harvard utilized the AMA Physician Masterfile to draw names for their surveys. While general orthopaedic surgeons can perform open reduction fracture care, it is more typical for patients to be referred to orthopaedic surgeons who specialize in orthopaedic trauma or in a given anatomical area (eg, shoulder, hand, knee, etc.). We do not believe that all specialty surgeons were surveyed for these codes, since the AMA Masterfile did not delineate orthopaedic specialties. Additionally, podiatrists were not surveyed for any of the lower extremity codes.

Given this information, we believe there is compelling evidence that not all involved specialties were involved in the review of these codes.

A consensus committee of physicians representing the American Academy of Orthopaedic Surgeons, American Shoulder and Elbow Surgeons, Society for Surgery of the Hand, Arthroscopy Association of North America, Orthopaedic Trauma Association, American Podiatric Medical Association, and American Orthopaedic Foot and Ankle Society met by conference call to discuss the survey data for the revised orthopaedic codes and data for the key reference codes and other codes on the survey reference service lists.

For revised code 28445, we recommend 21.50 work RVUs. After considering differences in time and visits, along with differences in intra-operative work, we believe this value correctly ranks code 28445 relative to other ORIF codes, relative to the key reference code, and relative to orthopaedic codes from the survey reference service list.

This fracture is slightly less complex than 28420 and a RVW of 21.50 maintains the rank order between these two procedures. In comparison to key reference code 27447, the survey code total time is almost identical with 27447 having more hospital work and 28445 having more office work. The consensus panel believes the difference in work RVUs for these two codes correctly reflect the additional post-operative work and slightly greater intensity for the key reference code. Neurovascular injury may occur with this type of fracture and multiple post-operative visits are necessary.

Assessment of the circulation, sensation and motor function of the involved extremity is ongoing. The first office visit would include removal of the splint and dressing, wound evaluation, redressing, discussion of restrictions and operative findings, splinting or casting and instruction on range of motion (ROM) and weightbearing activities. X-rays would be reviewed. The second visit would be for splint or cast and dressing removal, wound evaluation, suture removal, new cast application, ROM exercises. The third visit would be for splint or cast removal and range of motion exercises and review of restrictions. X-rays would be reviewed. The fourth visit would be to check X-rays, wound healing and ROM.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No
   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FIVE YEAR REVIEW SPECIFIC QUESTIONS:

Please indicate the number of survey respondent percentages responding to each of the following questions (for example 0.05 = 5%):
Has the work of performing this service changed in the past 5 years? Yes 59% No 41%
(Use the subset of the people who responded "Yes" to answer the following questions)

A. This service represents new technology that has become more familiar (i.e., less work):
   I agree 9% I do not agree 91%
B. Patients requiring this service are now:
   more complex (more work) 91% less complex (less work) 0% no change 9%
C. The usual site-of-service has changed:
   from outpatient to inpatient 6% from inpatient to outpatient 6% no change 88%

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
2005 FIVE YEAR REVIEW - SUMMARY OF RECOMMENDATION

CPT Code:28465 Tracking Number F58 Specialty Society Recommended RVU: **10.50**
Global Period: 090 RUC Recommended RVU: **9.50**

CPT Descriptor: Open treatment of tarsal bone fracture (except talus and calcaneus), includes internal fixation, when performed, each

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 40-year-old male sustains a displaced cuboid fracture requiring open reduction and internal fixation.

Percentage of Survey Respondents who found Vignette to be Typical: 73%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: • Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
- Verify that all required instruments and supplies are available
- Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulatic drapes
- Assess position of the extremities and head, adjust as needed
- The patient's leg is placed properly on the table and positioned with proper bolstering to aid surgical exposure.
- Indicate areas of skin to be prepped and mark surgical incisions
- A tourniquet is placed on the proximal thigh
- The leg is prepped and draped.
- The leg is elevated and exsanguinated.
- The pneumatic tourniquet is inflated.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work: A longitudinal incision is made over the dorsum of the cuboid. The fracture is revealed via blunt and sharp dissection. Depending on the fracture configuration, one or more pins or a mini-fragment plate and screws are used to achieve reduction. Anatomic reduction of the adjacent joints is confirmed. The wound is irrigated and closed in layers.

Description of Post-Service Work: Post-service work: in facility
- Application of bulky dressing and short leg splint
- Monitor patient stabilization in the recovery room.
- Consultation with the family and patient regarding the surgery and postoperative regimen.
- Communication with health care professionals including written and oral reports and orders.
- Postoperative care is coordinated with recovery room nursing staff.
- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Physical therapy for the uses of crutches or walker is ordered
- Write prescriptions for medications needed post-discharge.

- Dictation of an operative report
- Procedure note is written in the patient chart
- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of splint/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order occupational therapy
- Supervision of rehabilitation
- Monitor physical therapy
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions
- Dictate progress notes for medical record

COMPELLING EVIDENCE RATIONALE (Required to be Completed)

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

- ***Evidence that technology has changed physician work.***

Surgical treatment using open anatomical reduction and internal fixation has been made more complex with the introduction of new imaging methods such as CT which allow better detection of the fracture pathology and provided the basis for new surgical strategies. There are also new internal fixation devices which require more work. Beginning in the 1990s (after the Harvard study), new plates were developed for fracture repair, with most becoming available in the late 1990s and early 2000s. As an example of the complexity of the decision process in current practice, the 1990's have given the surgeon numerous options for bone fixation. The options for a bone fixation device currently include Kirschner wires, wire, staples, screws, as well as newer alternatives such as headless bone screws, T-screws, absorbable pins, cannulated screws, and a myriad of plates. The goal of all these devices remains constant: that is, to achieve stable approximation of bone fragments to facilitate healing. The various devices afford rigid fixation along with compression of the osseous fragments. This allows early range of motion and preservation of surrounding joint function, as well as primary bone healing. Selection of the most advantageous form of fixation is dependent on many factors and takes considerable time in the pre-evaluation of a patient. These include the type of fracture or osteotomy created, bone density, type of bone, and the desire for interfragmental compression. All of this has resulted in more work. The standards of care (fracture reduction, limb alignment, etc.) have also been elevated by literature that shows fracture displacements and poor alignments lead to poorer results. Additionally, women over 50 is a fast growing segment of our population. A huge percentage of these patients are osteoporotic - making fracture fixation and maintenance of fixation far more difficult than it used to be. The new plates are more complex to insert when the underlying bone is of much poorer quality.

Given this information, we believe there is compelling evidence that ORIF is more complex than 5 years ago and this is even more true in comparison to practice in the late 1980s (or more than 25 years ago).

- ***Evidence that incorrect assumptions were made in the previous valuation of the service; a misleading vignette and/or survey in a previous evaluation***

During the period of 1989-1991 (after the Harvard study), a major effort was undertaken by the AAOS and the OTA to rewrite every fracture and dislocation treatment code in the musculoskeletal Section of CPT. In 1991, 395 code changes were accepted by the AMA CPT Editorial Panel under the leadership of Dr. William Felts. At the time of the original proposal, some of the code descriptors were changed from those submitted (presumably by the CPT staff), and published in the 1992 and subsequent editions. Some of the changes in the descriptors published in CPT 1992 didn't make sense, but in those years, the CPT process was closed-door. Additionally, in 1992 and 1993 the AMA staff were deluged by the implementation of the RBRVS process and though AAOS and OTA requested that these problems be addressed then, AMA CPT staff asked that it be deferred as their "plate was full." After that time, more important issues and other opportunities consumed the resources of the AAOS and inertia (or the lack thereof) took over. This third five year review, after completion of the practice expense review, allowed AAOS a window of time to again try to correct the nomenclature for these codes, and review their work using the standard RUC survey method.

We also note, that at the time of the original CPT proposal, external fixation was considered an adjunctive procedure. CPT instructed that the codes for external fixation (20690 and 20692) be "listed in addition to the code for the treatment ...of the fracture." This concept still applies today. External fixation can be used as an adjunctive stabilization modality when treating fractures by almost any method. However, external fixation can also be used in reconstructive orthopaedics (for example, the treatment of joint contractures) and for non-musculoskeletal system treatments (for example, as a suspension device in the treatment of lower extremity burns). In 1991, there was no Modifier -51 exempt code category. Today, these same codes, 20690 and 20692 for external fixator application are modifier -51 exempt, recognizing that they can stand alone or be used adjunctively. Because of the modifier -51 exemption, the RVUs have been reduced, so payers are not paying double when either of these codes are reported with another treatment code.

In the 2005 comment letter to CMS, the AAOS recommended examining the physician work for the ORIF codes because the code descriptors lacked clarity. In particular, because the CPT descriptors include the phrase "with or without internal or external fixation," it is difficult to imagine what the Harvard survey data actually represents (ie, no typical patient was described for the survey respondents to focus on). Further, after the descriptors for these codes were changed for CPT 1993, an Abt study was performed in 1992 for RUC consideration. This study produced *percentage* relationships to key reference codes, but not surveyed time and visit data. Some of these recommendations were accepted by the RUC and CMS and others were adjusted up or down, but no changes were made to the Harvard time and visit data, if available. Therefore, we believe that there is little, if any, relationship between the Harvard database time and visit information (from the old CPT codes) and the current work RVUs.

Given this information, we believe there is compelling evidence that the current work values and/or time and visit data may be incorrect and outdated and should be reviewed.

- *Evidence that incorrect assumptions were made in the previous valuation of the service, as documented; a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data*

  Harvard utilized the AMA Physician Masterfile to draw names for their surveys. While general orthopaedic surgeons can perform open reduction fracture care, it is more typical for patients to be referred to orthopaedic surgeons who specialize in orthopaedic trauma or in a given anatomical area (eg, shoulder, hand, knee, etc.). We do not believe that all specialty surgeons were surveyed for these codes, since the AMA Masterfile did not delineate orthopaedic specialties. Additionally, podiatrists were not surveyed for any of the lower extremity codes.

  Given this information, we believe there is compelling evidence that not all involved specialties were involved in the review of these codes.

A consensus committee of physicians representing the American Academy of Orthopaedic Surgeons, American Shoulder and Elbow Surgeons, Society for Surgery of the Hand, Arthroscopy Association of North America, Orthopaedic Trauma Association, American Podiatric Medical Association, and American Orthopaedic Foot and Ankle Society met by conference call to discuss the survey data for the revised orthopaedic codes and data for the key reference codes and other codes on the survey reference service lists.

For revised code 28465, we recommend 10.50 work RVUs. After considering differences in time and visits, along with differences in intra-operative work, we believe this value correctly ranks code 28465 relative to other ORIF codes, relative to the key reference code, and relative to orthopaedic codes from the survey reference service list.

The consensus panel compared the key reference code 25608 and the recommendation for a similar code 28555 to develop the recommendation for 28465. Compared to 28555, the intensity of 28465 is greater. Because of the type of injury or trauma required to cause a fracture of a tarsal bone, the risk for complications, including compartment syndrome, is significant, and greater than a 2 part DRF. Because the consensus panel believes all three codes require similar total work, the 25th percentile work RVU is recommended.

Neurovascular injury and compartment syndrome may occur with this type of fracture and multiple post-operative visits are necessary. Assessment of the circulation, sensation and motor function of the involved extremity is ongoing. The first office visit would include removal of the splint and dressing, wound evaluation, redressing, discussion of restrictions and operative findings, splinting or casting and instruction on range of motion and weightbearing activities. X-rays wou be reviewed. The second visit would be for splint or cast and dressing removal, wound evaluation, suture removal, n cast application, ROM exercises. The third visit would be for cast removal and range of motion exercises and review o restrictions. X-rays would be reviewed. Physical therapy recommendations would be communicated. The fourth visit would be to check X-rays, wound healing and ROM.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No
   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FIVE YEAR REVIEW SPECIFIC QUESTIONS:

Please indicate the number of survey respondent percentages responding to each of the following questions (for example 0.05 = 5%):
Has the work of performing this service changed in the past 5 years? Yes 65% No 35%
(Use the subset of the people who responded "Yes" to answer the following questions)

A. This service represents new technology that has become more familiar (i.e., less work):
   I agree 18% I do not agree 82%
B. Patients requiring this service are now:
   more complex (more work) 90% less complex (less work) 0% no change 10%
C. The usual site-of-service has changed:
   from outpatient to inpatient 0% from inpatient to outpatient 24% no change 73%

Attestation Statement

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
2005 FIVE YEAR REVIEW - SUMMARY OF RECOMMENDATION

CPT Code:28485 Tracking Number F59 Specialty Society Recommended RVU: **8.00**
Global Period: 090 RUC Recommended RVU: **8.00**

CPT Descriptor: Open treatment of metatarsal fracture, includes internal fixation, when performed, each

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 31-year-old male slips and sustains a displaced fracture of the first metatarsal requiring open reduction and internal fixation.

Percentage of Survey Respondents who found Vignette to be Typical: 82%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: • Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
- Verify that all required instruments and supplies are available
- Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulation Irapes
- Assess position of the extremities and head, adjust as needed
- The patient's leg is placed properly on the table and positioned with proper bolstering to aid surgical exposure.
- Indicate areas of skin to be prepped and mark surgical incisions
- An ankle tourniquet is placed
- The leg is prepped and draped.
- The leg is elevated and exsanguinated.
- The pneumatic tourniquet is inflated.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work: A longitudinal incision is made over the dorsum of the metatarsal. The fracture is revealed via blunt and sharp dissection. Depending on the fracture configuration, one or more pins or a mini-fragment plate and screws are used to achieve reduction. The wound is irrigated and closed in layers..

Description of Post-Service Work: Post-service work: in facility
- Application of bulky dressing and short leg splint
- Monitor patient stabilization in the recovery room.
- Consultation with the family and patient regarding the surgery and postoperative regimen.
- Communication with health care professionals including written and oral reports and orders.
- Postoperative care is coordinated with recovery room nursing staff.
- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Physical therapy for the uses of crutches or walker is ordered
- Write prescriptions for medications needed post-discharge.
- Dictation of an operative report
- Procedure note is written in the patient chart

- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of splint/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order occupational therapy
- Supervision of rehabilitation
- Monitor physical therapy
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions
- Dictate progress notes for medical record

Post-Service intensity/complexity	3.33	2.64

COMPELLING EVIDENCE RATIONALE (Required to be Completed)

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

- ***Evidence that technology has changed physician work.***

Surgical treatment using open anatomical reduction and internal fixation has been made more complex with the introduction of new imaging methods such as CT which allow better detection of the fracture pathology and provided the basis for new surgical strategies. There are also new internal fixation devices which require more work. Beginning in the 1990s (after the Harvard study), new plates were developed for fracture repair, with most becoming available in the late 1990s and early 2000s. As an example of the complexity of the decision process in current practice, the 1990's have given the surgeon numerous options for bone fixation. The options for a bone fixation device currently include Kirschner wires, wire, staples, screws, as well as newer alternatives such as headless bone screws, T-screws, absorbable pins, cannulated screws, and a myriad of plates. The goal of all these devices remains constant: that is, to achieve stable approximation of bone fragments to facilitate healing. The various devices afford rigid fixation along with compression of the osseous fragments. This allows early range of motion and preservation of surrounding joint function, as well as primary bone healing. · Selection of the most advantageous form of fixation is dependent on many factors and takes considerable time in the pre-evaluation of a patient. These include the type of fracture or osteotomy created, bone density, type of bone, and the desire for interfragmental compression. All of this has resulted in more work. The standards of care (fracture reduction, limb alignment, etc.) have also been elevated by literature that shows fracture displacements and poor alignments lead to poorer results. Additionally, women over 50 is a fast growing segment of our population. A huge percentage of these patients are osteoporotic - making fracture fixation and maintenance of fixation far more difficult than it used to be. The new plates are more complex to insert when the underlying bone is of much poorer quality.

Given this information, we believe there is compelling evidence that ORIF is more complex than 5 years ago and this is even more true in comparison to practice in the late 1980s (or more than 25 years ago).

- ***Evidence that incorrect assumptions were made in the previous valuation of the service; a misleading vignette and/or survey in a previous evaluation***

During the period of 1989-1991 (after the Harvard study), a major effort was undertaken by the AAOS and the OTA to rewrite every fracture and dislocation treatment code in the musculoskeletal Section of CPT. In 1991, 395 code changes were accepted by the AMA CPT Editorial Panel under the leadership of Dr. William Felts. At the time of the original proposal, some of the code descriptors were changed from those submitted (presumably by the CPT staff), and published in the 1992 and subsequent editions. Some of the changes in the descriptors published in CPT 1992 didn't make sense, but in those years, the CPT process was closed-door. Additionally, in 1992 and 1993 the AMA staff were deluged by the implementation of the RBRVS process and though AAOS and OTA requested that these problems be addressed then, AMA CPT staff asked that it be deferred as their "plate was full." After that time, more important issues and other opportunities consumed the resources of the AAOS and inertia (or the lack thereof) took over. This third five year review, after completion of the practice expense review, allowed AAOS a window of time to again try to correct the nomenclature for these codes, and review their work using the standard RUC survey method.

We also note, that at the time of the original CPT proposal, external fixation was considered an adjunctive procedure. CPT instructed that the codes for external fixation (20690 and 20692) be "listed in addition to the code for the treatment ...of the fracture." This concept still applies today. External fixation can be used as an adjunctive stabilization modality when treating fractures by almost any method. However, external fixation can also be used in reconstructive orthopaedics (for example, the treatment of joint contractures) and for non-musculoskeletal system treatments (for example, as a suspension device in the treatment of lower extremity burns). In 1991, there was no Modifier -51 exempt code category. Today, these same codes, 20690 and 20692 for external fixator application are modifier -51 exempt, recognizing that they can stand alone or be used adjunctively. Because of the modifier -51 exemption, the RVUs have been reduced, so payers are not paying double when either of these codes are reported with another treatment code.

In the 2005 comment letter to CMS, the AAOS recommended examining the physician work for the ORIF codes because the code descriptors lacked clarity. In particular, because the CPT descriptors include the phrase "with or without internal or external fixation," it is difficult to imagine what the Harvard survey data actually represents (ie, no typical patient was described for the survey respondents to focus on). Further, after the descriptors for these codes were changed for CPT 1993, an Abt study was performed in 1992 for RUC consideration. This study produced *percentage* relationships to key reference codes, but not surveyed time and visit data. Some of these recommendations were accepted by the RUC and CMS and others were adjusted up or down, but no changes were made to the Harvard time and visit data, if available. Therefore, we believe that there is little, if any, relationship between the Harvard database time and visit information (from the old CPT codes) and the current work RVUs.

Given this information, we believe there is compelling evidence that the current work values and/or time and visit data may be incorrect and outdated and should be reviewed.

- *Evidence that incorrect assumptions were made in the previous valuation of the service, as documented; a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data*

  Harvard utilized the AMA Physician Masterfile to draw names for their surveys. While general orthopaedic surgeons can perform open reduction fracture care, it is more typical for patients to be referred to orthopaedic surgeons who specialize in orthopaedic trauma or in a given anatomical area (eg, shoulder, hand, knee, etc.). We do not believe that all specialty surgeons were surveyed for these codes, since the AMA Masterfile did not delineate orthopaedic specialties. Additionally, podiatrists were not surveyed for any of the lower extremity codes.

  Given this information, we believe there is compelling evidence that not all involved specialties were involved in the review of these codes.

A consensus committee of physicians representing the American Academy of Orthopaedic Surgeons, American Shoulder and Elbow Surgeons, Society for Surgery of the Hand, Arthroscopy Association of North America, Orthopaedic Trauma Association, American Podiatric Medical Association, and American Orthopaedic Foot and Ankle Society met by conference call to discuss the survey data for the revised orthopaedic codes and data for the key reference codes and other codes on the survey reference service lists.

For revised code 28485, we recommend 8.00 work RVUs. After considering differences in time and visits, along with differences in intra-operative work, we believe this value correctly ranks code 28485 relative to other ORIF codes, relative to the key reference code, and relative to orthopaedic codes from the survey reference service list.

A wide range of reference codes were selected by survey respondents. A consensus panel compared open treatment of a metatarsal fracture to open treatment of a metacarpal fracture (26615) and believes the procedures are similar. Code 28485 has 60 minutes of intra-service time compared to 45 minutes for code 26615. Additionally, the pre-service time for the survey code is 10 minutes more. Both codes have four post-operative visits recommended (99213 x 2, 99212 x 2). The consensus panel believes that code 26615 is a better comparison against the survey code and recommends an

RVW of 8.00 for the survey code, which is slightly less than the 25th percentile and equal to the recommendation for code 26615. The consensus panel believes that since the procedures are similar, the recommended RVWs should be the same.

Neurovascular injury may occur with this type of fracture and multiple post-operative visits are necessary. Assessment of the circulation, sensation and motor function of the involved extremity is ongoing. The first office visit would include removal of the splint and dressing, wound evaluation, redressing, discussion of restrictions and operative findings, splinting or casting and instruction on range of motion (ROM) and weightbearing activities. X-rays would be reviewed. The second visit would be for splint or cast and dressing removal, wound evaluation, suture removal, new cast or splint application, ROM exercises. The third visit would be for splint or cast removal and range of motion exercises and review of restrictions. X-rays would be reviewed. The fourth visit would be to check X-rays, wound healing and ROM.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No
   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FIVE YEAR REVIEW SPECIFIC QUESTIONS:

Please indicate the number of survey respondent percentages responding to each of the following questions (for example 0.05 = 5%):
Has the work of performing this service changed in the past 5 years? Yes 57% No 43%
(Use the subset of the people who responded "Yes" to answer the following questions)

A. This service represents new technology that has become more familiar (i.e., less work):
   I agree 19% I do not agree 81%
B. Patients requiring this service are now:
   more complex (more work) 97% less complex (less work) 0% no change 3%
C. The usual site-of-service has changed:
   from outpatient to inpatient 0% from inpatient to outpatient 35% no change 65%

Attestation Statement

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
2005 FIVE YEAR REVIEW - SUMMARY OF RECOMMENDATION

CPT Code:28505 Tracking Number F60 Specialty Society Recommended RVU: **8.30**
Global Period: 090 RUC Recommended RVU: **8.00**

CPT Descriptor: Open treatment of fracture great toe, phalanx or phalanges, includes internal fixation, when performed

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 30-year-old male fractures the proximal and distal phalanx of the great toe requiring open reduction and internal fixation.

Percentage of Survey Respondents who found Vignette to be Typical: 88%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: • Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
- Verify that all required instruments and supplies are available
- Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulation drapes
- Assess position of the extremities and head, adjust as needed
- The patient's leg is placed properly on the table and positioned with proper bolstering to aid surgical exposure.
- Indicate areas of skin to be prepped and mark surgical incisions
- An ankle tourniquet is placed
- The leg is prepped and draped.
- The leg is elevated and exsanguinated.
- The pneumatic tourniquet is inflated.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work: A longitudinal incision is made over the dorsum of the great toe. The fractures are revealed via blunt and sharp dissection. Depending on the fracture configuration one or more pins or a mini-fragment plate and screws are used to achieve reduction of the proximal and distal phalanx. Anatomic reduction of the joints is confirmed. The wound is irrigated and closed in layers.

Description of Post-Service Work: Post-service work: in facility
- Application of bulky dressing and short leg splint
- Monitor patient stabilization in the recovery room.
- Consultation with the family and patient regarding the surgery and postoperative regimen.
- Communication with health care professionals including written and oral reports and orders.
- Postoperative care is coordinated with recovery room nursing staff.
- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Physical therapy for the uses of crutches or walker is ordered
- Write prescriptions for medications needed post-discharge.
- Dictation of an operative report

- Procedure note is written in the patient chart
- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of splint/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order occupational therapy
- Supervision of rehabilitation
- Monitor physical therapy
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions
- Dictate progress notes for medical record

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

- ***Evidence that technology has changed physician work.***

Surgical treatment using open anatomical reduction and internal fixation has been made more complex with the introduction of new imaging methods such as CT which allow better detection of the fracture pathology and provided the basis for new surgical strategies. There are also new internal fixation devices which require more work. Beginning in the 1990s (after the Harvard study), new plates were developed for fracture repair, with most becoming available in the late 1990s and early 2000s. As an example of the complexity of the decision process in current practice, the 1990's have given the surgeon numerous options for bone fixation. The options for a bone fixation device currently include Kirschner wires, wire, staples, screws, as well as newer alternatives such as headless bone screws, T-screws, absorbable pins, cannulated screws, and a myriad of plates. The goal of all these devices remains constant: that is, to achieve stable approximation of bone fragments to facilitate healing. The various devices afford rigid fixation along with compression of the osseous fragments. This allows early range of motion and preservation of surrounding joint function, as well as primary bone healing. Selection of the most advantageous form of fixation is dependent on many factors and takes considerable time in the pre-evaluation of a patient. These include the type of fracture or osteotomy created, bone density, type of bone, and the desire for interfragmental compression. All of this has resulted in more work. The standards of care (fracture reduction, limb alignment, etc.) have also been elevated by literature that shows fracture displacements and poor alignments lead to poorer results. Additionally, women over 50 is a fast growing segment of our population. A huge percentage of these patients are osteoporotic - making fracture fixation and maintenance of fixation far more difficult than it used to be. The new plates are more complex to insert when the underlying bone is of much poorer quality.

Given this information, we believe there is compelling evidence that ORIF is more complex than 5 years ago and this is even more true in comparison to practice in the late 1980s (or more than 25 years ago).

- ***Evidence that incorrect assumptions were made in the previous valuation of the service; a misleading vignette and/or survey in a previous evaluation***

During the period of 1989-1991 (after the Harvard study), a major effort was undertaken by the AAOS and the OTA to rewrite every fracture and dislocation treatment code in the musculoskeletal Section of CPT. In 1991, 395 code changes were accepted by the AMA CPT Editorial Panel under the leadership of Dr. William Felts. At the time of the original proposal, some of the code descriptors were changed from those submitted (presumably by the CPT staff), and published in the 1992 and subsequent editions. Some of the changes in the descriptors published in CPT 1992 didn't make sense, but in those years, the CPT process was closed-door. Additionally, in 1992 and 1993 the AMA staff were deluged by the implementation of the RBRVS process and though AAOS and OTA requested that these problems be addressed then, AMA CPT staff asked that it be deferred as their "plate was full." After that time, more important issues and other opportunities consumed the resources of the AAOS and inertia (or the lack thereof) took over. This third five year review, after completion of the practice expense review, allowed AAOS a window of time to again try to correct the nomenclature for these codes, and review their work using the standard RUC survey method.

We also note, that at the time of the original CPT proposal, external fixation was considered an adjunctive procedure. CPT instructed that the codes for external fixation (20690 and 20692) be "listed in addition to the code for the treatment ...of the fracture." This concept still applies today. External fixation can be used as an adjunctive stabilization modality when treating fractures by almost any method. However, external fixation can also be used in reconstructive orthopaedics (for example, the treatment of joint contractures) and for non-musculoskeletal system treatments (for example, as a suspension device in the treatment of lower extremity burns). In 1991, there was no Modifier -51 exempt code category. Today, these same codes, 20690 and 20692 for external fixator application are modifier -51 exempt, recognizing that they can stand alone or be used adjunctively. Because of the modifier -51 exemption, the RVUs have been reduced, so payers are not paying double when either of these codes are reported with another treatment code.

In the 2005 comment letter to CMS, the AAOS recommended examining the physician work for the ORIF codes because the code descriptors lacked clarity. In particular, because the CPT descriptors include the phrase "with or without internal or external fixation," it is difficult to imagine what the Harvard survey data actually represents (ie, no typical patient was described for the survey respondents to focus on). Further, after the descriptors for these codes were changed for CPT 1993, an Abt study was performed in 1992 for RUC consideration. This study produced *percentage* relationships to key reference codes, but not surveyed time and visit data. Some of these recommendations were accepted by the RUC and CMS and others were adjusted up or down, but no changes were made to the Harvard time and visit data, if available. Therefore, we believe that there is little, if any, relationship between the Harvard database time and visit information (from the old CPT codes) and the current work RVUs.

Given this information, we believe there is compelling evidence that the current work values and/or time and visit data may be incorrect and outdated and should be reviewed.

- *Evidence that incorrect assumptions were made in the previous valuation of the service, as documented; a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data*

Harvard utilized the AMA Physician Masterfile to draw names for their surveys. While general orthopaedic surgeons can perform open reduction fracture care, it is more typical for patients to be referred to orthopaedic surgeons who specialize in orthopaedic trauma or in a given anatomical area (eg, shoulder, hand, knee, etc.). We do not believe that all specialty surgeons were surveyed for these codes, since the AMA Masterfile did not delineate orthopaedic specialties. Additionally, podiatrists were not surveyed for any of the lower extremity codes.

Given this information, we believe there is compelling evidence that not all involved specialties were involved in the review of these codes.

A consensus committee of physicians representing the American Academy of Orthopaedic Surgeons, American Shoulder and Elbow Surgeons, Society for Surgery of the Hand, Arthroscopy Association of North America, Orthopaedic Trauma Association, American Podiatric Medical Association, and American Orthopaedic Foot and Ankle Society met by conference call to discuss the survey data for the revised orthopaedic codes and data for the key reference codes and other codes on the survey reference service lists.

For revised code 28505, we recommend 8.30 work RVUs. After considering differences in time and visits, along with differences in intra-operative work, we believe this value correctly ranks code 28505 relative to other ORIF codes, relative to the key reference code, and relative to orthopaedic codes from the survey reference service list.

Survey code 28505 and key reference code 28750 both involve the great toe and both involve the use of hardware. The reference code has a work RVU that is slightly higher (8.37) than the recommended 25th percentile (8.30) for the survey code and the total time is similar (237 reference and 227 survey). The survey code has more pre-service time because of the time involved in evaluating a fracture and positioning and prepping but the intra-service time for the reference code

(75) is higher compared to that for the survey code (45). The codes include the same number of post-operative visits but two of the visits for the survey code are less intense (99213 x 2, 99212 x 2, survey vs. 99213 x 4, reference). A consensus panel agrees that the RVW for the survey code should be lower than that for the reference code and recommending the median RVW of 9.00 would result in a rank order anomaly. Therefore, the consensus panel recommends the 25th percentile RVW of 8.30.

Neurovascular injury may occur with this type of fracture and proper function must be restored so multiple post-operative visits are necessary. Assessment of the circulation, sensation and motor function of the involved extremity is ongoing. The first office visit would include removal of the splint and dressing, wound evaluation, redressing, discussion of restrictions and operative findings, splinting or casting and instruction on range of motion (ROM) and weightbearing activities. X-rays would be reviewed. The second visit would be for splint and dressing removal, wound evaluation, suture removal, new cast or splint application, and ROM exercises. The third visit would be for cast or splint removal, range of motion exercises and review of restrictions. X-rays would be reviewed. The fourth visit would be to check X-rays, wound healing and ROM.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No
   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FIVE YEAR REVIEW SPECIFIC QUESTIONS:

Please indicate the number of survey respondent percentages responding to each of the following questions (for example 0.05 = 5%):
Has the work of performing this service changed in the past 5 years? Yes 49% No 51%
(Use the subset of the people who responded "Yes" to answer the following questions)

A. This service represents new technology that has become more familiar (i.e., less work):
   I agree 18% I do not agree 82%
B. Patients requiring this service are now:
   more complex (more work) 76% less complex (less work) 0% no change 24%
C. The usual site-of-service has changed:
   from outpatient to inpatient 0% from inpatient to outpatient 37% no change 63%

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
2005 FIVE YEAR REVIEW - SUMMARY OF RECOMMENDATION

CPT Code:28525 Tracking Number F61 Specialty Society Recommended RVU: **6.00**
Global Period: 090 RUC Recommended RVU: **6.00**

CPT Descriptor: Open treatment of fracture, phalanx or phalanges, other than great toe, includes internal fixation, when performed, each

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 25-year-old female sustained a displaced lessor toe fracture requiring open reduction and internal fixation.

Percentage of Survey Respondents who found Vignette to be Typical: 95%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: • Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
- Verify that all required instruments and supplies are available
- Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulation drapes
- Assess position of the extremities and head, adjust as needed
- The patient's leg is placed properly on the table and positioned with proper bolstering to aid surgical exposure.
- Indicate areas of skin to be prepped and mark surgical incisions
- An ankle tourniquet is placed
- The leg is prepped and draped.
- The leg is elevated and exsanguinated.
- The pneumatic tourniquet is inflated.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work: A longitudinal incision is made over the dorsum of the toe. The fracture is revealed via blunt and sharp dissection. Depending on the fracture configuration one or more pins or a mini-fragment plate and screws are used to achieve reduction. The wound is irrigated and closed in layers.

Description of Post-Service Work: Post-service work: in facility
- Application of bulky dressing and short leg splint
- Monitor patient stabilization in the recovery room.
- Consultation with the family and patient regarding the surgery and postoperative regimen.
- Communication with health care professionals including written and oral reports and orders.
- Postoperative care is coordinated with recovery room nursing staff.
- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Physical therapy for the uses of crutches or walker is ordered
- Write prescriptions for medications needed post-discharge.
- Dictation of an operative report

- Procedure note is written in the patient chart
- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of splint/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order occupational therapy
- Supervision of rehabilitation
- Monitor physical therapy
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions
- Dictate progress notes for medical record

COMPELLING EVIDENCE RATIONALE (Required to be Completed)

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

- ***Evidence that technology has changed physician work.***

Surgical treatment using open anatomical reduction and internal fixation has been made more complex with the introduction of new imaging methods such as CT which allow better detection of the fracture pathology and provided the basis for new surgical strategies. There are also new internal fixation devices which require more work. Beginning in the 1990s (after the Harvard study), new plates were developed for fracture repair, with most becoming available in the late 1990s and early 2000s. As an example of the complexity of the decision process in current practice, the 1990's have given the surgeon numerous options for bone fixation. The options for a bone fixation device currently include Kirschner wires, wire, staples, screws, as well as newer alternatives such as headless bone screws, T-screws, absorbable pins, cannulated screws, and a myriad of plates. The goal of all these devices remains constant: that is, to achieve stable approximation of bone fragments to facilitate healing. The various devices afford rigid fixation along with compression of the osseous fragments. This allows early range of motion and preservation of surrounding joint function, as well as primary bone healing. Selection of the most advantageous form of fixation is dependent on many factors and takes considerable time in the pre-evaluation of a patient. These include the type of fracture or osteotomy created, bone density, type of bone, and the desire for interfragmental compression. All of this has resulted in more work. The standards of care (fracture reduction, limb alignment, etc.) have also been elevated by literature that shows fracture displacements and poor alignments lead to poorer results. Additionally, women over 50 is a fast growing segment of our population. A huge percentage of these patients are osteoporotic - making fracture fixation and maintenance of fixation far more difficult than it used to be. The new plates are more complex to insert when the underlying bone is of much poorer quality.

Given this information, we believe there is compelling evidence that ORIF is more complex than 5 years ago and this is even more true in comparison to practice in the late 1980s (or more than 25 years ago).

- ***Evidence that incorrect assumptions were made in the previous valuation of the service; a misleading vignette and/or survey in a previous evaluation***

During the period of 1989-1991 (after the Harvard study), a major effort was undertaken by the AAOS and the OTA to rewrite every fracture and dislocation treatment code in the musculoskeletal Section of CPT. In 1991, 395 code changes were accepted by the AMA CPT Editorial Panel under the leadership of Dr. William Felts. At the time of the original proposal, some of the code descriptors were changed from those submitted (presumably by the CPT staff), and published in the 1992 and subsequent editions. Some of the changes in the descriptors published in CPT 1992 didn't make sense, but in those years, the CPT process was closed-door. Additionally, in 1992 and 1993 the AMA staff were deluged by the implementation of the RBRVS process and though AAOS and OTA requested that these problems be addressed then, AMA CPT staff asked that it be deferred as their "plate was full." After that time, more important issues and other opportunities consumed the resources of the AAOS and inertia (or the lack thereof) took over. This third five year review, after completion of the practice expense review, allowed AAOS a window of time to again try to correct the nomenclature for these codes, and review their work using the standard RUC survey method.

We also note, that at the time of the original CPT proposal, external fixation was considered an adjunctive procedure. CPT instructed that the codes for external fixation (20690 and 20692) be "listed in addition to the code for the treatment ...of the fracture." This concept still applies today. External fixation can be used as an adjunctive stabilization modality when treating fractures by almost any method. However, external fixation can also be used in reconstructive orthopaedics (for example, the treatment of joint contractures) and for non-musculoskeletal system treatments (for example, as a suspension device in the treatment of lower extremity burns). In 1991, there was no Modifier -51 exempt code category. Today, these same codes, 20690 and 20692 for external fixator application are modifier -51 exempt, recognizing that they can stand alone or be used adjunctively. Because of the modifier -51 exemption, the RVUs have been reduced, so payers are not paying double when either of these codes are reported with another treatment code.

In the 2005 comment letter to CMS, the AAOS recommended examining the physician work for the ORIF codes because the code descriptors lacked clarity. In particular, because the CPT descriptors include the phrase "with or without internal or external fixation," it is difficult to imagine what the Harvard survey data actually represents (ie, no typical patient was described for the survey respondents to focus on). Further, after the descriptors for these codes were changed for CPT 1993, an Abt study was performed in 1992 for RUC consideration. This study produced *percentage* relationships to key reference codes, but not surveyed time and visit data. Some of these recommendations were accepted by the RUC and CMS and others were adjusted up or down, but no changes were made to the Harvard time and visit data, if available. Therefore, we believe that there is little, if any, relationship between the Harvard database time and visit information (from the old CPT codes) and the current work RVUs.

Given this information, we believe there is compelling evidence that the current work values and/or time and visit data may be incorrect and outdated and should be reviewed.

- *Evidence that incorrect assumptions were made in the previous valuation of the service, as documented; a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data*

Harvard utilized the AMA Physician Masterfile to draw names for their surveys. While general orthopaedic surgeons can perform open reduction fracture care, it is more typical for patients to be referred to orthopaedic surgeons who specialize in orthopaedic trauma or in a given anatomical area (eg, shoulder, hand, knee, etc.). We do not believe that all specialty surgeons were surveyed for these codes, since the AMA Masterfile did not delineate orthopaedic specialties. Additionally, podiatrists were not surveyed for any of the lower extremity codes.

Given this information, we believe there is compelling evidence that not all involved specialties were involved in the review of these codes.

A consensus committee of physicians representing the American Academy of Orthopaedic Surgeons, American Shoulder and Elbow Surgeons, Society for Surgery of the Hand, Arthroscopy Association of North America, Orthopaedic Trauma Association, American Podiatric Medical Association, and American Orthopaedic Foot and Ankle Society met by conference call to discuss the survey data for the revised orthopaedic codes and data for the key reference codes and other codes on the survey reference service lists.

For revised code 28525, we recommend 6.00 work RVUs. After considering differences in time and visits, along with differences in intra-operative work, we believe this value correctly ranks code 28525 relative to other ORIF codes, relative to the key reference code, and relative to orthopaedic codes from the survey reference service list.

The intra-service time for the reference code (28289) is 45 minutes compared to 30 minutes for the survey code. Additional pre-service time is necessary for 28525 because this procedure involves a fracture with fixation, which requires more positioning and prep time. The number of post-operative visits is the same but the survey code includes two 99213 and two 99212 visits compared to the reference code with four 99213 visits. The recommended RVW of the

survey code is lower than that of the reference code. Due to the trauma involved with fractures, the risk for post-operative complications remains and the number and type of visits are believed to be appropriate.

Neurovascular injury may occur with this type of fracture and multiple post-operative visits are necessary. Assessment of the circulation, sensation and motor function of the involved digit and extremity is ongoing. The first office visit would include removal of the splint and dressing, wound evaluation, redressing, discussion of restrictions and operative findings, splinting and instruction on weightbearing activities. X-rays would be reviewed. The second visit would be for splint and dressing removal, wound evaluation, suture removal, new splint application, and instruction on range of motion (ROM) exercises. The third visit would be for splint removal, removal of hardware, range of motion exercises and review of restrictions. X-rays would be reviewed. The fourth visit would be to check X-rays, wound healing and ROM.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No
   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FIVE YEAR REVIEW SPECIFIC QUESTIONS:

Please indicate the number of survey respondent percentages responding to each of the following questions (for example 0.05 = 5%):
Has the work of performing this service changed in the past 5 years? Yes 54% No 46%
(Use the subset of the people who responded "Yes" to answer the following questions)

A. This service represents new technology that has become more familiar (i.e., less work):
   I agree 13% I do not agree 88%

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
2005 FIVE YEAR REVIEW - SUMMARY OF RECOMMENDATION

CPT Code:28555 Tracking Number F62 Specialty Society Recommended RVU: **10.43**
Global Period: 090 RUC Recommended RVU: **10.43**

CPT Descriptor: Open treatment of tarsal bone dislocation, includes internal fixation, when performed

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 22-year-old male sustains a dislocation of the middle cuneiform requiring open reduction and internal fixation.

Percentage of Survey Respondents who found Vignette to be Typical: 81%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work:
- Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
- Verify that all required instruments and supplies are available
- Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulatio drapes
- Assess position of the extremities and head, adjust as needed
- The patient's leg is placed properly on the table and positioned with proper bolstering to aid surgical exposure.
- Indicate areas of skin to be prepped and mark surgical incisions
- An ankle tourniquet is placed
- The leg is prepped and draped.
- The leg is elevated and exsanguinated.
- The pneumatic tourniquet is inflated.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work: A dorsal longitudinal incision is made over the metatarso-cuneiform joint. Blunt dissection reveals the dislocation. The joint is manually reduced and temporarily fixated with a k-wire Two screws are placed across the joint to provide fixation. The wound is irrigated and closed in layers.

Description of Post-Service Work: Post-service work: in facility
- Application of bulky dressing and short leg splint
- Monitor patient stabilization in the recovery room.
- Consultation with the family and patient regarding the surgery and postoperative regimen.
- Communication with health care professionals including written and oral reports and orders.
- Postoperative care is coordinated with recovery room nursing staff.
- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- The patient is discharged to the orthopaedic floor for monitoring of compartment syndrome. This require removing and reapplying the dressings.

Discharge day:
- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.

- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Physical therapy for the uses of crutches or walker is ordered
- Write prescriptions for medications needed post-discharge.
- Dictation of an operative report
- Procedure note is written in the patient chart
- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of splint/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order occupational therapy
- Supervision of rehabilitation
- Monitor physical therapy
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions
- Dictate progress notes for medical record

COMPELLING EVIDENCE RATIONALE (Required to be Completed)

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

- ***Evidence that technology has changed physician work.***

Surgical treatment using open anatomical reduction and internal fixation has been made more complex with the introduction of new imaging methods such as CT which allow better detection of the fracture pathology and provided the basis for new surgical strategies. There are also new internal fixation devices which require more work. Beginning in the 1990s (after the Harvard study), new plates were developed for fracture repair, with most becoming available in the late 1990s and early 2000s. As an example of the complexity of the decision process in current practice, the 1990's have given the surgeon numerous options for bone fixation. The options for a bone fixation device currently include Kirschner wires, wire, staples, screws, as well as newer alternatives such as headless bone screws, T-screws, absorbable pins, cannulated screws, and a myriad of plates. The goal of all these devices remains constant: that is, to achieve stable approximation of bone fragments to facilitate healing. The various devices afford rigid fixation along with compression of the osseous fragments. This allows early range of motion and preservation of surrounding joint function, as well as primary bone healing. Selection of the most advantageous form of fixation is dependent on many factors and takes considerable time in the pre-evaluation of a patient. These include the type of fracture or osteotomy created, bone density, type of bone, and the desire for interfragmental compression. All of this has resulted in more work. The standards of care (fracture reduction, limb alignment, etc.) have also been elevated by literature that shows fracture displacements and poor alignments lead to poorer results. Additionally, women over 50 is a fast growing segment of our population. A huge percentage of these patients are osteoporotic - making fracture fixation and maintenance of fixation far more difficult than it used to be. The new plates are more complex to insert when the underlying bone is of much poorer quality.

Given this information, we believe there is compelling evidence that ORIF is more complex than 5 years ago and this is even more true in comparison to practice in the late 1980s (or more than 25 years ago).

- ***Evidence that incorrect assumptions were made in the previous valuation of the service; a misleading vignette and/or survey in a previous evaluation***

During the period of 1989-1991 (after the Harvard study), a major effort was undertaken by the AAOS and the OTA to rewrite every fracture and dislocation treatment code in the musculoskeletal Section of CPT. In 1991, 395 code changes were accepted by the AMA CPT Editorial Panel under the leadership of Dr. William Felts. At the time of the original proposal, some of the code descriptors were changed from those submitted (presumably by the CPT staff), and published in the 1992 and subsequent editions. Some of the changes in the descriptors published in CPT 1992 didn't make sense, but in those years, the CPT process was closed-door. Additionally, in 1992 and 1993 the AMA staff were deluged by the implementation of the RBRVS process and though AAOS and OTA requested that these problems be addressed then, AMA CPT staff asked that it be deferred as their "plate was full." After that time, more important issues and other opportunities consumed the resources of the AAOS and inertia (or the lack thereof) took over. This third five year review, after completion of the practice expense review, allowed AAOS a window of time to again try to correct the nomenclature for these codes, and review their work using the standard RUC survey method.

We also note, that at the time of the original CPT proposal, external fixation was considered an adjunctive procedure. CPT instructed that the codes for external fixation (20690 and 20692) be "listed in addition to the code for the treatment ...of the fracture." This concept still applies today. External fixation can be used as an adjunctive stabilization modality when treating fractures by almost any method. However, external fixation can also be used in reconstructive orthopaedics (for example, th treatment of joint contractures) and for non-musculoskeletal system treatments (for example, as a suspension device in the treatment of lower extremity burns). In 1991, there was no Modifier -51 exempt code category. Today, these same codes, 20690 and 20692 for external fixator application are modifier -51 exempt, recognizing that they can stand alone or be used adjunctively. Because of the modifier -51 exemption, the RVUs have been reduced, so payers are not paying double when either of these codes are reported with another treatment code.

In the 2005 comment letter to CMS, the AAOS recommended examining the physician work for the ORIF codes because the code descriptors lacked clarity. In particular, because the CPT descriptors include the phrase "with or without internal or external fixation," it is difficult to imagine what the Harvard survey data actually represents (ie, no typical patient was described for the survey respondents to focus on). Further, after the descriptors for these codes were changed for CPT 1993, an Abt study was performed in 1992 for RUC consideration. This study produced *percentage* relationships to key reference codes, but not surveyed time and visit data. Some of these recommendations were accepted by the RUC and CMS and others were adjusted up or down, but no changes were made to the Harvard time and visit data, if available. Therefore, we believe that there is little, if any, relationship between the Harvard database time and visit information (from the old CPT codes) and the current work RVUs.

Given this information, we believe there is compelling evidence that the current work values and/or time and visit data may be incorrect and outdated and should be reviewed.

- *Evidence that incorrect assumptions were made in the previous valuation of the service, as documented; a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data*

Harvard utilized the AMA Physician Masterfile to draw names for their surveys. While general orthopaedic surgeons can perform open reduction fracture care, it is more typical for patients to be referred to orthopaedic surgeons who specialize in orthopaedic trauma or in a given anatomical area (eg, shoulder, hand, knee, etc.). We do not believe that all specialty surgeons were surveyed for these codes, since the AMA Masterfile did not delineate orthopaedic specialties. Additionally, podiatrists were not surveyed for any of the lower extremity codes.

Given this information, we believe there is compelling evidence that not all involved specialties were involved in the review of these codes.

A consensus committee of physicians representing the American Academy of Orthopaedic Surgeons, American Shoulder and Elbow Surgeons, Society for Surgery of the Hand, Arthroscopy Association of North America, Orthopaedic Trauma Association, American Podiatric Medical Association, and American Orthopaedic Foot and Ankle Society met by conference call to discuss the survey data for the revised orthopaedic codes and data for the key reference codes and other codes on the survey reference service lists.

For revised code 28555, we recommend 10.43 work RVUs. After considering differences in time and visits, along with differences in intra-operative work, we believe this value correctly ranks code 28555 relative to other ORIF codes, relative to the key reference code, and relative to orthopaedic codes from the survey reference service list.

Code 28555 is more complex than one involving a metatarsophalangeal joint dislocation, but less complex than one involving a dislocation of a tarsometatarsal or talotarsal joint. The key reference code 28261 has 103 minutes of intra-service time while the survey code has 60. The survey code has 5 minutes more of pre-service time to evaluate the fracture. Both codes include an overnight hospital stay. Based on the potential post-operative complications, the consensus panel agrees that the number and type of visits are appropriate. The total time for the reference code is

higher (343) compared to the survey code (321). The median RVW of 12.00 is too high compared to the reference code and the 25th percentile of 10.43 is recommended.

Neurovascular injury and compartment syndrome may occur with this type of dislocation and multiple post-operative visits are necessary. Additionally, restoring proper functioning of the foot is essential. Assessment of the circulation, sensation and motor function of the involved extremity is ongoing. The first office visit would include removal of the splint and dressing, wound evaluation, redressing, discussion of restrictions and operative findings, splinting or casting and instruction on range of motion and weightbearing activities. X-rays would be reviewed. The second and third visits would be for splint or cast and dressing removal, wound evaluation, suture removal (2nd visit), new cast application, ROM exercises. Additionally, physical therapy recommendations would also be communicated (3rd visit). The fourth visit would be for cast removal and range of motion exercises and review of restrictions. X-rays would be reviewed. The fifth visit would be to check X-rays, wound healing and ROM.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No
   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FIVE YEAR REVIEW SPECIFIC QUESTIONS:

Please indicate the number of survey respondent percentages responding to each of the following questions (for example 0.05 = 5%):
Has the work of performing this service changed in the past 5 years? Yes 60% No 40%
(Use the subset of the people who responded "Yes" to answer the following questions)

A. This service represents new technology that has become more familiar (i.e., less work):
   I agree 16% I do not agree 84%
B. Patients requiring this service are now:
   more complex (more work) 97% less complex (less work) 0% no change 3%
C. The usual site-of-service has changed:
   from outpatient to inpatient 0% from inpatient to outpatient 13% no change 84%

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
2005 FIVE YEAR REVIEW - SUMMARY OF RECOMMENDATION

CPT Code:28585 Tracking Number F63 Specialty Society Recommended RVU: **12.00**
Global Period: 090 RUC Recommended RVU: **12.00**

CPT Descriptor: Open treatment of talotarsal joint dislocation, includes internal fixation, when performed

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 19-year-old male sustains a talo-navicular dislocation requiring open reduction and internal fixation.

Percentage of Survey Respondents who found Vignette to be Typical: 85%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: • Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
- Verify that all required instruments and supplies are available
- Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulatio drapes
- Assess position of the extremities and head, adjust as needed
- The patient's leg is placed properly on the table and positioned with proper bolstering to aid surgical exposure.
- Indicate areas of skin to be prepped and mark surgical incisions
- An ankle tourniquet is placed
- The leg is prepped and draped.
- The leg is elevated and exsanguinated.
- The pneumatic tourniquet is inflated.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work: A dorsomedial longitudinal incision is made over the talo-navicular joint. Blunt dissection reveals the dislocation. The joint is manually reduced and temporarily fixated with a k-wire. Two screws are placed across the joint to provide fixation. The wound is irrigated and closed in layers.

Description of Post-Service Work: Post-service work: in facility
- Application of bulky dressing and short leg splint
- Monitor patient stabilization in the recovery room.
- Consultation with the family and patient regarding the surgery and postoperative regimen.
- Communication with health care professionals including written and oral reports and orders.
- Postoperative care is coordinated with recovery room nursing staff.
- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- The patient is discharged to the orthopaedic floor for monitoring of compartment syndrome. This require removing and reapplying the dressings.

Discharge day:
- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.

- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Physical therapy for the uses of crutches or walker is ordered
- Write prescriptions for medications needed post-discharge.
- Dictation of an operative report
- Procedure note is written in the patient chart
- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of splint/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order occupational therapy
- Supervision of rehabilitation
- Monitor physical therapy
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions
- Dictate progress notes for medical record

COMPELLING EVIDENCE RATIONALE (Required to be Completed)

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

- ***Evidence that technology has changed physician work.***

Surgical treatment using open anatomical reduction and internal fixation has been made more complex with the introduction of new imaging methods such as CT which allow better detection of the fracture pathology and provided the basis for new surgical strategies. There are also new internal fixation devices which require more work. Beginning in the 1990s (after the Harvard study), new plates were developed for fracture repair, with most becoming available in the late 1990s and early 2000s. As an example of the complexity of the decision process in current practice, the 1990's have given the surgeon numerous options for bone fixation. The options for a bone fixation device currently include Kirschner wires, wire, staples, screws, as well as newer alternatives such as headless bone screws, T-screws, absorbable pins, cannulated screws, and a myriad of plates. The goal of all these devices remains constant: that is, to achieve stable approximation of bone fragments to facilitate healing. The various devices afford rigid fixation along with compression of the osseous fragments. This allows early range of motion and preservation of surrounding joint function, as well as primary bone healing. Selection of the most advantageous form of fixation is dependent on many factors and takes considerable time in the pre-evaluation of a patient. These include the type of fracture or osteotomy created, bone density, type of bone, and the desire for interfragmental compression. All of this has resulted in more work. The standards of care (fracture reduction, limb alignment, etc.) have also been elevated by literature that shows fracture displacements and poor alignments lead to poorer results. Additionally, women over 50 is a fast growing segment of our population. A huge percentage of these patients are osteoporotic - making fracture fixation and maintenance of fixation far more difficult than it used to be. The new plates are more complex to insert when the underlying bone is of much poorer quality.

Given this information, we believe there is compelling evidence that ORIF is more complex than 5 years ago and this is even more true in comparison to practice in the late 1980s (or more than 25 years ago).

- ***Evidence that incorrect assumptions were made in the previous valuation of the service; a misleading vignette and/or survey in a previous evaluation***

During the period of 1989-1991 (after the Harvard study), a major effort was undertaken by the AAOS and the OTA to rewrite every fracture and dislocation treatment code in the musculoskeletal Section of CPT. In 1991, 395 code changes were accepted by the AMA CPT Editorial Panel under the leadership of Dr. William Felts. At the time of the original proposal, some of the code descriptors were changed from those submitted (presumably by the CPT staff), and published in the 1992 and subsequent editions. Some of the changes in the descriptors published in CPT 1992 didn't make sense, but in those years, the CPT process was closed-door. Additionally, in 1992 and 1993 the AMA staff were deluged by the implementation of the RBRVS process and though AAOS and OTA requested that these problems be addressed then, AMA CPT staff asked that it be deferred as their "plate was full." After that time, more important issues and other opportunities consumed the resources of the AAOS and inertia (or the lack thereof) took over. This third five year review, after completion of the practice expense review, allowed AAOS a window of time to again try to correct the nomenclature for these codes, and review their work using the standard RUC survey method.

We also note, that at the time of the original CPT proposal, external fixation was considered an adjunctive procedure. CPT instructed that the codes for external fixation (20690 and 20692) be "listed in addition to the code for the treatment ...of the fracture." This concept still applies today. External fixation can be used as an adjunctive stabilization modality when treating fractures by almost any method. However, external fixation can also be used in reconstructive orthopaedics (for example, th treatment of joint contractures) and for non-musculoskeletal system treatments (for example, as a suspension device in the treatment of lower extremity burns). In 1991, there was no Modifier -51 exempt code category. Today, these same codes, 20690 and 20692 for external fixator application are modifier -51 exempt, recognizing that they can stand alone or be used adjunctively. Because of the modifier -51 exemption, the RVUs have been reduced, so payers are not paying double when either of these codes are reported with another treatment code.

In the 2005 comment letter to CMS, the AAOS recommended examining the physician work for the ORIF codes because the code descriptors lacked clarity. In particular, because the CPT descriptors include the phrase "with or without internal or external fixation," it is difficult to imagine what the Harvard survey data actually represents (ie, no typical patient was described for the survey respondents to focus on). Further, after the descriptors for these codes were changed for CPT 1993, an Abt study was performed in 1992 for RUC consideration. This study produced *percentage* relationships to key reference codes, but not surveyed time and visit data. Some of these recommendations were accepted by the RUC and CMS and others were adjusted up or down, but no changes were made to the Harvard time and visit data, if available. Therefore, we believe that there is little, if any, relationship between the Harvard database time and visit information (from the old CPT codes) and the current work RVUs.

Given this information, we believe there is compelling evidence that the current work values and/or time and visit data may be incorrect and outdated and should be reviewed.

- *Evidence that incorrect assumptions were made in the previous valuation of the service, as documented; a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data*

Harvard utilized the AMA Physician Masterfile to draw names for their surveys. While general orthopaedic surgeons can perform open reduction fracture care, it is more typical for patients to be referred to orthopaedic surgeons who specialize in orthopaedic trauma or in a given anatomical area (eg, shoulder, hand, knee, etc.). We do not believe that all specialty surgeons were surveyed for these codes, since the AMA Masterfile did not delineate orthopaedic specialties. Additionally, podiatrists were not surveyed for any of the lower extremity codes.

Given this information, we believe there is compelling evidence that not all involved specialties were involved in the review of these codes.

A consensus committee of physicians representing the American Academy of Orthopaedic Surgeons, American Shoulder and Elbow Surgeons, Society for Surgery of the Hand, Arthroscopy Association of North America, Orthopaedic Trauma Association, American Podiatric Medical Association, and American Orthopaedic Foot and Ankle Society met by conference call to discuss the survey data for the revised orthopaedic codes and data for the key reference codes and other codes on the survey reference service lists.

For revised code 28585, we recommend 12.00 work RVUs. After considering differences in time and visits, along with differences in intra-operative work, we believe this value correctly ranks code 28585 relative to other ORIF codes, relative to the key reference code, and relative to orthopaedic codes from the survey reference service list.

The foot dislocation involved in 28585 is more complex than the other foot dislocations and fractures. This joint is more proximal and involves larger bones compared to a tarsometatarsal dislocation. Two bones are involved in this type of dislocation and the risk for post-operative complications is high. The survey code has 15 minutes less of intra-service time compared to the reference code (75 vs. 90) but the survey code has an overnight stay and five post-operative visits (99214 x 1, 99213 x 2, 99212 x 2) recommended while the reference code includes four post-operative visits (99213 x 3,

99212 x 1) only. The consensus panel also compared 28585 with similar work code 28615, which has a recommended RVW of 11.50.

Neurovascular injury and compartment syndrome may occur with this type of dislocation and the risk for complications is high. Close monitoring post-operatively is required and the restoration of foot function is essential so multiple post-operative visits are necessary. Assessment of the circulation, sensation and motor function of the involved extremity is ongoing. The first office visit would include removal of the splint and dressing, wound evaluation, redressing, discussion of restrictions and operative findings, splinting or casting and instruction on range of motion (ROM) and weightbearing activities. X-rays would be reviewed. The second and third visits would be for splint or cast and dressing removal, wound evaluation, suture removal, new cast application, ROM exercises. The fourth visit would be for cast removal, range of motion exercises and review of restrictions. X-rays would be reviewed. Physical therapy recommendations would be communicated. The fifth visit would be to check X-rays, wound healing and ROM.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No
   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FIVE YEAR REVIEW SPECIFIC QUESTIONS:

Please indicate the number of survey respondent percentages responding to each of the following questions (for example 0.05 = 5%):
Has the work of performing this service changed in the past 5 years? Yes 47% No 53%
(Use the subset of the people who responded "Yes" to answer the following questions)

A. This service represents new technology that has become more familiar (i.e., less work):
   I agree 14% I do not agree 86%
B. Patients requiring this service are now:
   more complex (more work) 96% less complex (less work) 0% no change 4%
C. The usual site-of-service has changed:
   from outpatient to inpatient 0% from inpatient to outpatient 11% no change 86%

Attestation Statement

As a RUC Advisor, I attest that the integrity of the RUC survey and summary of recommendation forms are based on accurate and complete data to the best of my knowledge. As a RUC Advisor, I

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
2005 FIVE YEAR REVIEW - SUMMARY OF RECOMMENDATION

CPT Code:28615 Tracking Number F64 Specialty Society Recommended RVU: **11.50**
Global Period: 090 RUC Recommended RVU: **11.50**

CPT Descriptor: Open treatment of tarsometatarsal joint dislocation, includes internal fixation, when performed

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 30-year-old male falls sustaining a first metatarsal cuneiform dislocation requiring open reduction and internal fixation.

Percentage of Survey Respondents who found Vignette to be Typical: 84%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work:
- Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
- Verify that all required instruments and supplies are available
- Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulation drapes
- Assess position of the extremities and head, adjust as needed
- The patient's leg is placed properly on the table and positioned with proper bolstering to aid surgical exposure.
- Indicate areas of skin to be prepped and mark surgical incisions
- An ankle tourniquet is placed
- The leg is prepped and draped.
- The leg is elevated and exsanguinated.
- The pneumatic tourniquet is inflated.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work: A dorsomedial longitudinal incision is made over the first metatarso-cuneiform joint. Blunt dissection reveals the dislocation. The joint is manually reduced and temporarily fixated with a k-wire. Two screws are placed across the joint to provide fixation. The wound is irrigated and closed in layers.

Description of Post-Service Work: Post-service work: in facility
- Application of bulky dressing and short leg splint
- Monitor patient stabilization in the recovery room.
- Consultation with the family and patient regarding the surgery and postoperative regimen.
- Communication with health care professionals including written and oral reports and orders.
- Postoperative care is coordinated with recovery room nursing staff.
- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- The patient is discharged to the orthopaedic floor for monitoring of compartment syndrome. This require removing and reapplying the dressings.

Discharge day:
- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.

- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Physical therapy for the uses of crutches or walker is ordered
- Write prescriptions for medications needed post-discharge.
- Dictation of an operative report

Procedure note is written in the patient chart

- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of splint/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order occupational therapy
- Supervision of rehabilitation
- Monitor physical therapy
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions
- Dictate progress notes for medical record

COMPELLING EVIDENCE RATIONALE (Required to be Completed)

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

- ***Evidence that technology has changed physician work.***

Surgical treatment using open anatomical reduction and internal fixation has been made more complex with the introduction of new imaging methods such as CT which allow better detection of the fracture pathology and provided the basis for new surgical strategies. There are also new internal fixation devices which require more work. Beginning in the 1990s (after the Harvard study), new plates were developed for fracture repair, with most becoming available in the late 1990s and early 2000s. As an example of the complexity of the decision process in current practice, the 1990's have given the surgeon numerous options for bone fixation. The options for a bone fixation device currently include Kirschner wires, wire, staples, screws, as well as newer alternatives such as headless bone screws, T-screws, absorbable pins, cannulated screws, and a myriad of plates. The goal of all these devices remains constant: that is, to achieve stable approximation of bone fragments to facilitate healing. The various devices afford rigid fixation along with compression of the osseous fragments. This allows early range of motion and preservation of surrounding joint function, as well as primary bone healing. Selection of the most advantageous form of fixation is dependent on many factors and takes considerable time in the pre-evaluation of a patient. These include the type of fracture or osteotomy created, bone density, type of bone, and the desire for interfragmental compression. All of this has resulted in more work. The standards of care (fracture reduction, limb alignment, etc.) have also been elevated by literature that shows fracture displacements and poor alignments lead to poorer results. Additionally, women over 50 is a fast growing segment of our population. A huge percentage of these patients are osteoporotic - making fracture fixation and maintenance of fixation far more difficult than it used to be. The new plates are more complex to insert when the underlying bone is of much poorer quality.

Given this information, we believe there is compelling evidence that ORIF is more complex than 5 years ago and this is even more true in comparison to practice in the late 1980s (or more than 25 years ago).

- ***Evidence that incorrect assumptions were made in the previous valuation of the service; a misleading vignette and/or survey in a previous evaluation***

During the period of 1989-1991 (after the Harvard study), a major effort was undertaken by the AAOS and the OTA to rewrite every fracture and dislocation treatment code in the musculoskeletal Section of CPT. In 1991, 395 code changes were accepted by the AMA CPT Editorial Panel under the leadership of Dr. William Felts. At the time of the original proposal, some of the code descriptors were changed from those submitted (presumably by the CPT staff), and published in the 1992 and subsequent editions. Some of the changes in the descriptors published in CPT 1992 didn't make sense, but in those years, the CPT process was closed-door. Additionally, in 1992 and 1993 the AMA staff were deluged by the implementation of the RBRVS process and though AAOS and OTA requested that these problems be addressed then, AMA CPT staff asked that it be deferred as their "plate was full." After that time, more important issues and other opportunities consumed the resources of the AAOS and inertia (or the lack thereof) took over. This third five year review, after completion of the practice expense review, allowed AAOS a window of time to again try to correct the nomenclature for these codes, and review their work using the standard RUC survey method.

We also note, that at the time of the original CPT proposal, external fixation was considered an adjunctive procedure. CPT instructed that the codes for external fixation (20690 and 20692) be "listed in addition to the code for the treatment ...of the fracture." This concept still applies today. External fixation can be used as an adjunctive stabilization modality when treating fractures by almost any method. However, external fixation can also be used in reconstructive orthopaedics (for example, the treatment of joint contractures) and for non-musculoskeletal system treatments (for example, as a suspension device in the treatment of lower extremity burns). In 1991, there was no Modifier -51 exempt code category. Today, these same codes, 20690 and 20692 for external fixator application are modifier -51 exempt, recognizing that they can stand alone or be used adjunctively. Because of the modifier -51 exemption, the RVUs have been reduced, so payers are not paying double when either of these codes are reported with another treatment code.

In the 2005 comment letter to CMS, the AAOS recommended examining the physician work for the ORIF codes because the code descriptors lacked clarity. In particular, because the CPT descriptors include the phrase "with or without internal or external fixation," it is difficult to imagine what the Harvard survey data actually represents (ie, no typical patient was described for the survey respondents to focus on). Further, after the descriptors for these codes were changed for CPT 1993, an Abt study was performed in 1992 for RUC consideration. This study produced *percentage* relationships to key reference codes, but not surveyed time and visit data. Some of these recommendations were accepted by the RUC and CMS and others were adjusted up or down, but no changes were made to the Harvard time and visit data, if available. Therefore, we believe that there is little, if any, relationship between the Harvard database time and visit information (from the old CPT codes) and the current work RVUs.

Given this information, we believe there is compelling evidence that the current work values and/or time and visit data may be incorrect and outdated and should be reviewed.

- *Evidence that incorrect assumptions were made in the previous valuation of the service, as documented; a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data*

  Harvard utilized the AMA Physician Masterfile to draw names for their surveys. While general orthopaedic surgeons can perform open reduction fracture care, it is more typical for patients to be referred to orthopaedic surgeons who specialize in orthopaedic trauma or in a given anatomical area (eg, shoulder, hand, knee, etc.). We do not believe that all specialty surgeons were surveyed for these codes, since the AMA Masterfile did not delineate orthopaedic specialties. Additionally, podiatrists were not surveyed for any of the lower extremity codes.

  Given this information, we believe there is compelling evidence that not all involved specialties were involved in the review of these codes.

A consensus committee of physicians representing the American Academy of Orthopaedic Surgeons, American Shoulder and Elbow Surgeons, Society for Surgery of the Hand, Arthroscopy Association of North America, Orthopaedic Trauma Association, American Podiatric Medical Association, and American Orthopaedic Foot and Ankle Society met by conference call to discuss the survey data for the revised orthopaedic codes and data for the key reference codes and other codes on the survey reference service lists.

For revised code 28615, we recommend 11.50 work RVUs. After considering differences in time and visits, along with differences in intra-operative work, we believe this value correctly ranks code 28615 relative to other ORIF codes, relative to the key reference code, and relative to orthopaedic codes from the survey reference service list.

The dislocation involved in 28615 is complex because it involves two bones and the risk for complications is high. Treating this type of dislocation is more difficult than treating a dislocation involving a single bone and the recommended RVW is appropriately greater than 28555. The survey code has less intra-service time compared to the reference code (60 vs. 90) but more total time (325 vs. 299). An overnight stay is required due to the risk for complications, including compartment syndrome. Six post-operative visits are recommended (99214 x 1, 99213 x 2, 99212 x 3), compared to

four (99213 x 3, 99212 x 1) for the reference code. Restoration of foot function is essential and close monitoring of the patient post-operatively is required.

Neurovascular injury and compartment syndrome may occur with this type of dislocation and the risk for complications is high. Close monitoring post-operatively is required and the restoration of foot function is essential so multiple post-operative visits are necessary. Assessment of the circulation, sensation and motor function of the involved extremity is ongoing. The first office visit would include removal of the splint and dressing, wound evaluation, redressing, discussion of restrictions and operative findings, splinting or casting and instruction on range of motion (ROM) and weightbearing activities. X-rays would be reviewed. The second visit would be for splint or cast and dressing removal, wound evaluation, new splint or cast application, ROM exercises. The third and fourth visits would be for splint or cast and dressing removal, wound evaluation, suture removal (3rd visit), new cast application, ROM exercises. Physical therapy recommendations would be communicated. The fifth visit would be for cast removal, range of motion exercises and review of restrictions. X-rays would be reviewed. The sixth visit would be to check X-rays, wound healing and ROM.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No
   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FIVE YEAR REVIEW SPECIFIC QUESTIONS:

Please indicate the number of survey respondent percentages responding to each of the following questions (for example 0.05 = 5%):
Has the work of performing this service changed in the past 5 years? Yes 49% No 51%
(Use the subset of the people who responded "Yes" to answer the following questions)

A. This service represents new technology that has become more familiar (i.e., less work):
   I agree 22% I do not agree 78%
B. Patients requiring this service are now:
   more complex (more work) 83% less complex (less work) 6% no change 11%
C. The usual site-of-service has changed:
   from outpatient to inpatient 0% from inpatient to outpatient 22% no change 78%

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
2005 FIVE YEAR REVIEW - SUMMARY OF RECOMMENDATION

CPT Code:28645 Tracking Number F65 Specialty Society Recommended RVU: **8.00**
Global Period: 090 RUC Recommended RVU: **8.00**

CPT Descriptor: Open treatment of metatarsophalangeal joint dislocation, includes internal fixation, when performed

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 25-year-old male trips and sustains dislocation of his great toe metatarsophalangeal joint requiring an open reduction and internal fixation.

Percentage of Survey Respondents who found Vignette to be Typical: 95%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: • Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
- Verify that all required instruments and supplies are available
- Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulatior drapes
- Assess position of the extremities and head, adjust as needed
- The patient's leg is placed properly on the table and positioned with proper bolstering to aid surgical exposure.
- Indicate areas of skin to be prepped and mark surgical incisions
- An ankle tourniquet is placed
- The leg is prepped and draped.
- The leg is elevated and exsanguinated.
- The pneumatic tourniquet is inflated.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work: A longitudinal incision is made over the metarsophalangeal joint of the great toe. Sharp and blunt dissection reveals the dislocation. The joint is manually reduced. Two K-wires are inserted across the joint to secure fixation. The dorsal extensor mechanism and tendon are repaired. The wound is irrigated and closed in layers.

Description of Post-Service Work: Post-service work: in facility
- Application of bulky dressing and short leg splint
- Monitor patient stabilization in the recovery room.
- Consultation with the family and patient regarding the surgery and postoperative regimen.
- Communication with health care professionals including written and oral reports and orders.
- Postoperative care is coordinated with recovery room nursing staff.
- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Physical therapy for the uses of crutches or walker is ordered
- Write prescriptions for medications needed post-discharge.
- Dictation of an operative report

- Procedure note is written in the patient chart
- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of splint/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order occupational therapy
- Supervision of rehabilitation
- Monitor physical therapy
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions
- Dictate progress notes for medical record

- ***Evidence that technology has changed physician work.***

Surgical treatment using open anatomical reduction and internal fixation has been made more complex with the introduction of new imaging methods such as CT which allow better detection of the fracture pathology and provided the basis for new surgical strategies. There are also new internal fixation devices which require more work. Beginning in the 1990s (after the Harvard study), new plates were developed for fracture repair, with most becoming available in the late 1990s and early 2000s. As an example of the complexity of the decision process in current practice, the 1990's have given the surgeon numerous options for bone fixation. The options for a bone fixation device currently include Kirschner wires, wire, staples, screws, as well as newer alternatives such as headless bone screws, T-screws, absorbable pins, cannulated screws, and a myriad of plates. The goal of all these devices remains constant: that is, to achieve stable approximation of bone fragments to facilitate healing. The various devices afford rigid fixation along with compression of the osseous fragments. This allows early range of motion and preservation of surrounding joint function, as well as primary bone healing. Selection of the most advantageous form of fixation is dependent on many factors and takes considerable time in the pre-evaluation of a patient. These include the type of fracture or osteotomy created, bone density, type of bone, and the desire for interfragmental compression. All of this has resulted in more work. The standards of care (fracture reduction, limb alignment, etc.) have also been elevated by literature that shows fracture displacements and poor alignments lead to poorer results. Additionally, women over 50 is a fast growing segment of our population. A huge percentage of these patients are osteoporotic - making fracture fixation and maintenance of fixation far more difficult than it used to be. The new plates are more complex to insert when the underlying bone is of much poorer quality.

Given this information, we believe there is compelling evidence that ORIF is more complex than 5 years ago and this is even more true in comparison to practice in the late 1980s (or more than 25 years ago).

- ***Evidence that incorrect assumptions were made in the previous valuation of the service; a misleading vignette and/or survey in a previous evaluation***

During the period of 1989-1991 (after the Harvard study), a major effort was undertaken by the AAOS and the OTA to rewrite every fracture and dislocation treatment code in the musculoskeletal Section of CPT. In 1991, 395 code changes were accepted by the AMA CPT Editorial Panel under the leadership of Dr. William Felts. At the time of the original proposal, some of the code descriptors were changed from those submitted (presumably by the CPT staff), and published in the 1992 and subsequent editions. Some of the changes in the descriptors published in CPT 1992 didn't make sense, but in those years, the CPT process was closed-door. Additionally, in 1992 and 1993 the AMA staff were deluged by the implementation of the RBRVS process and though AAOS and OTA requested that these problems be addressed then, AMA CPT staff asked that be deferred as their "plate was full." After that time, more important issues and other opportunities consumed the resources of the AAOS and inertia (or the lack thereof) took over. This third five year review, after completion of the practice expense review, allowed AAOS a window of time to again try to correct the nomenclature for these codes, and review their work using the standard RUC survey method.

We also note, that at the time of the original CPT proposal, external fixation was considered an adjunctive procedure. CPT instructed that the codes for external fixation (20690 and 20692) be "listed in addition to the code for the treatment ...of the fracture." This concept still applies today. External fixation can be used as an adjunctive stabilization modality when treating fractures by almost any method. However, external fixation can also be used in reconstructive orthopaedics (for example, the treatment of joint contractures) and for non-musculoskeletal system treatments (for example, as a suspension device in the treatment of lower extremity burns). In 1991, there was no Modifier -51 exempt code category. Today, these same codes, 20690 and 20692 for external fixator application are modifier -51 exempt, recognizing that they can stand alone or be used adjunctively. Because of the modifier -51 exemption, the RVUs have been reduced, so payers are not paying double when either of these codes are reported with another treatment code.

In the 2005 comment letter to CMS, the AAOS recommended examining the physician work for the ORIF codes because the code descriptors lacked clarity. In particular, because the CPT descriptors include the phrase "with or without internal or external fixation," it is difficult to imagine what the Harvard survey data actually represents (ie, no typical patient was described for the survey respondents to focus on). Further, after the descriptors for these codes were changed for CPT 1993, an Abt study was performed in 1992 for RUC consideration. This study produced *percentage* relationships to key reference codes, but not surveyed time and visit data. Some of these recommendations were accepted by the RUC and CMS and others were adjusted up or down, but no changes were made to the Harvard time and visit data, if available. Therefore, we believe that there is little, if any, relationship between the Harvard database time and visit information (from the old CPT codes) and the current work RVUs.

Given this information, we believe there is compelling evidence that the current work values and/or time and visit data may be incorrect and outdated and should be reviewed.

- *Evidence that incorrect assumptions were made in the previous valuation of the service, as documented; a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data*

Harvard utilized the AMA Physician Masterfile to draw names for their surveys. While general orthopaedic surgeons can perform open reduction fracture care, it is more typical for patients to be referred to orthopaedic surgeons who specialize in orthopaedic trauma or in a given anatomical area (eg, shoulder, hand, knee, etc.). We do not believe that all specialty surgeons were surveyed for these codes, since the AMA Masterfile did not delineate orthopaedic specialties. Additionally, podiatrists were not surveyed for any of the lower extremity codes.

Given this information, we believe there is compelling evidence that not all involved specialties were involved in the review of these codes.

A consensus committee of physicians representing the American Academy of Orthopaedic Surgeons, American Shoulder and Elbow Surgeons, Society for Surgery of the Hand, Arthroscopy Association of North America, Orthopaedic Trauma Association, American Podiatric Medical Association, and American Orthopaedic Foot and Ankle Society met by conference call to discuss the survey data for the revised orthopaedic codes and data for the key reference codes and other codes on the survey reference service lists.

For revised code 28645, we recommend 8.00 work RVUs. After considering differences in time and visits, along with differences in intra-operative work, we believe this value correctly ranks code 28645 relative to other ORIF codes, relative to the key reference code, and relative to orthopaedic codes from the survey reference service list.

This dislocation is less complex than one involving a tarsal bone, but more complex than one involving an interphalangeal joint. Survey respondents selected different reference codes. A consensus panel compared the code to 26715, which describes open treatment of a metacarpophalangeal dislocation and is a procedure that is similar to the survey code. The recommended RVW for 26715 is 7.95. The survey indicated six post-operative visits (99214 x 1, 99213 x 2, 99212 x 3) for 28645. A consensus panel reviewed the recommendations, agreed that six visits is too many,

and reduced the visits to four (99213 x 2 and 99212 x 2). The modified recommended visits are identical to those for 26715. Due to the survey code's similarity to code 26715, the consensus panel recommends the 25th percentile value of 8.00.

Neurovascular injury may occur with this type of dislocation and proper function of the joint must be restored so multir post-operative visits are necessary. Assessment of the circulation, sensation and motor function of the involv extremity is ongoing. The first office visit would include removal of the splint and dressing, wound evaluation, redressing, discussion of restrictions and operative findings, splinting or casting and instruction on range of motion (ROM) and weightbearing activities. X-rays would be reviewed. The second visit would be for splint or cast and dressing removal, wound evaluation, suture removal, new cast or splint application and ROM exercises. The third visit would be for splint or cast and dressing removal, wound evaluation, hardware removal, review of restrictions and ROM exercises. X-rays would be reviewed. The fourth visit would be to check X-rays, wound healing and ROM.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No
   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FIVE YEAR REVIEW SPECIFIC QUESTIONS:

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: An 11-year-old boy trips and sustains a dislocation of the interphalangeal joint of the second toe requiring open reduction and internal fixation.

Percentage of Survey Respondents who found Vignette to be Typical: 89%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: • Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
- Verify that all required instruments and supplies are available
- Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulation drapes
- Assess position of the extremities and head, adjust as needed
- The patient's leg is placed properly on the table and positioned with proper bolstering to aid surgical exposure.
- Indicate areas of skin to be prepped and mark surgical incisions
- An ankle tourniquet is placed
- The leg is prepped and draped.
- The leg is elevated and exsanguinated.
- The pneumatic tourniquet is inflated.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work: A longitudinal incision is made over the proximal interphalangeal joint of the second toe. The joint is manually reduced. A K-wire is first passed retrograde out of the tip of the toe, then anterograde into the proximal phalanx securing the reduction. The dorsal extensor mechanism and tendon are repaired. The wound is irrigated and closed in layers.

Description of Post-Service Work: Post-service work: in facility
- Application of bulky dressing and short leg splint
- Monitor patient stabilization in the recovery room.
- Consultation with the family and patient regarding the surgery and postoperative regimen.
- Communication with health care professionals including written and oral reports and orders.
- Postoperative care is coordinated with recovery room nursing staff.
- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Physical therapy for the uses of crutches or walker is ordered
- Write prescriptions for medications needed post-discharge.
- Dictation of an operative report

- Procedure note is written in the patient chart
- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of splint/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order occupational therapy
- Supervision of rehabilitation
- Monitor physical therapy
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions
- Dictate progress notes for medical record

COMPELLING EVIDENCE RATIONALE (Required to be Completed)

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

- ***Evidence that technology has changed physician work.***

Surgical treatment using open anatomical reduction and internal fixation has been made more complex with the introduction of new imaging methods such as CT which allow better detection of the fracture pathology and provided the basis for new surgical strategies. There are also new internal fixation devices which require more work. Beginning in the 1990s (after the Harvard study), new plates were developed for fracture repair, with most becoming available in the late 1990s and early 2000s. As an example of the complexity of the decision process in current practice, the 1990's have given the surgeon numerous options for bone fixation. The options for a bone fixation device currently include Kirschner wires, wire, staples, screws, as well as newer alternatives such as headless bone screws, T-screws, absorbable pins, cannulated screws, and a myriad of plates. The goal of all these devices remains constant: that is, to achieve stable approximation of bone fragments to facilitate healing. The various devices afford rigid fixation along with compression of the osseous fragments. This allows early range of motion and preservation of surrounding joint function, as well as primary bone healing. Selection of the most advantageous form of fixation is dependent on many factors and takes considerable time in the pre-evaluation of a patient. These include the type of fracture or osteotomy created, bone density, type of bone, and the desire for interfragmental compression. All of this has resulted in more work. The standards of care (fracture reduction, limb alignment, etc.) have also been elevated by literature that shows fracture displacements and poor alignments lead to poorer results. Additionally, women over 50 is a fast growing segment of our population. A huge percentage of these patients are osteoporotic - making fracture fixation and maintenance of fixation far more difficult than it used to be. The new plates are more complex to insert when the underlying bone is of much poorer quality.

Given this information, we believe there is compelling evidence that ORIF is more complex than 5 years ago and this is even more true in comparison to practice in the late 1980s (or more than 25 years ago).

- ***Evidence that incorrect assumptions were made in the previous valuation of the service; a misleading vignette and/or survey in a previous evaluation***

During the period of 1989-1991 (after the Harvard study), a major effort was undertaken by the AAOS and the OTA to rewrite every fracture and dislocation treatment code in the musculoskeletal Section of CPT. In 1991, 395 code changes were accepted by the AMA CPT Editorial Panel under the leadership of Dr. William Felts. At the time of the original proposal, some of the code descriptors were changed from those submitted (presumably by the CPT staff), and published in the 1992 and subsequent editions. Some of the changes in the descriptors published in CPT 1992 didn't make sense, but in those years, the CPT process was closed-door. Additionally, in 1992 and 1993 the AMA staff were deluged by the implementation of the RBRVS process and though AAOS and OTA requested that these problems be addressed then, AMA CPT staff asked that it be deferred as their "plate was full." After that time, more important issues and other opportunities consumed the resources of the AAOS and inertia (or the lack thereof) took over. This third five year review, after completion of the practice expense review, allowed AAOS a window of time to again try to correct the nomenclature for these codes, and review their work using the standard RUC survey method.

We also note, that at the time of the original CPT proposal, external fixation was considered an adjunctive procedure. CPT instructed that the codes for external fixation (20690 and 20692) be "listed in addition to the code for the treatment ...of the fracture." This concept still applies today. External fixation can be used as an adjunctive stabilization modality when treating fractures by almost any method. However, external fixation can also be used in reconstructive orthopaedics (for example, th treatment of joint contractures) and for non-musculoskeletal system treatments (for example, as a suspension device in the treatment of lower extremity burns). In 1991, there was no Modifier -51 exempt code category. Today, these same codes, 20690 and 20692 for external fixator application are modifier -51 exempt, recognizing that they can stand alone or be used adjunctively. Because of the modifier -51 exemption, the RVUs have been reduced, so payers are not paying double when either of these codes are reported with another treatment code.

In the 2005 comment letter to CMS, the AAOS recommended examining the physician work for the ORIF codes because the code descriptors lacked clarity. In particular, because the CPT descriptors include the phrase "with or without internal or external fixation," it is difficult to imagine what the Harvard survey data actually represents (ie, no typical patient was described for the survey respondents to focus on). Further, after the descriptors for these codes were changed for CPT 1993, an Abt study was performed in 1992 for RUC consideration. This study produced *percentage* relationships to key reference codes, but not surveyed time and visit data. Some of these recommendations were accepted by the RUC and CMS and others were adjusted up or down, but no changes were made to the Harvard time and visit data, if available. Therefore, we believe that there is little, if any, relationship between the Harvard database time and visit information (from the old CPT codes) and the current work RVUs.

Given this information, we believe there is compelling evidence that the current work values and/or time and visit data may be incorrect and outdated and should be reviewed.

- *Evidence that incorrect assumptions were made in the previous valuation of the service, as documented; a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data*

  Harvard utilized the AMA Physician Masterfile to draw names for their surveys. While general orthopaedic surgeons can perform open reduction fracture care, it is more typical for patients to be referred to orthopaedic surgeons who specialize in orthopaedic trauma or in a given anatomical area (eg, shoulder, hand, knee, etc.). We do not believe that all specialty surgeons were surveyed for these codes, since the AMA Masterfile did not delineate orthopaedic specialties. Additionally, podiatrists were not surveyed for any of the lower extremity codes.

  Given this information, we believe there is compelling evidence that not all involved specialties were involved in the review of these codes.

A consensus committee of physicians representing the American Academy of Orthopaedic Surgeons, American Shoulder and Elbow Surgeons, Society for Surgery of the Hand, Arthroscopy Association of North America, Orthopaedic Trauma Association, American Podiatric Medical Association, and American Orthopaedic Foot and Ankle Society met by conference call to discuss the survey data for the revised orthopaedic codes and data for the key reference codes and other codes on the survey reference service lists.

For revised code 28675, we recommend 6.00 work RVUs. After considering differences in time and visits, along with differences in intra-operative work, we believe this value correctly ranks code 28675 relative to other ORIF codes, relative to the key reference code, and relative to orthopaedic codes from the survey reference service list.

This procedure is less intense and requires less work than procedures involving either a tarsal or metatarsal bone. Compared to the reference service code of 28288, the intra-service time is identical at 30 minutes but the survey code has more pre-service time since the survey code involves a dislocation requiring fixation, which requires more positioning and prep time. The reference code does not require fixation. The reference code has five post-operative visits (99213 x 4, 99211 x 1) and five post-operative visits were indicated by the survey (99214 x 1, 99213 x 2, 99212 x 2). However,

based on the recommendations of a consensus panel, the 99214 visit was removed for the final recommendations as four post-operative visits are appropriate. The total time for the survey code is higher (197) compared to the reference code (169). Due to the trauma involved with this type of dislocation, the risk for post-operative complications remains.

Neurovascular injury may occur with this type of dislocation and multiple post-operative visits are necessary. \ssessment of the circulation, sensation and motor function of the involved digit and extremity is ongoing. The first office visit would include removal of the splint and dressing, wound evaluation, redressing, discussion of restrictions and operative findings, splinting and instruction on weightbearing activities. X-rays would be reviewed. The second visit would be for splint and dressing removal, wound evaluation, suture removal, new splint application, and instruction on range of motion (ROM) exercises. The third visit would be for splint removal, removal of hardware, range of motion exercises and review of restrictions. X-rays would be reviewed. The fourth visit would be to check X-rays, wound healing and ROM.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No
   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FIVE YEAR REVIEW SPECIFIC QUESTIONS:

Please indicate the number of survey respondent percentages responding to each of the following questions (for example 0.05 = 5%):
Has the work of performing this service changed in the past 5 years? Yes 22% No 78%
(Use the subset of the people who responded "Yes" to answer the following questions)

A. This service represents new technology that has become more familiar (i.e., less work):
   I agree 33% I do not agree 67%
B. Patients requiring this service are now:
   more complex (more work) 67% less complex (less work) 0% no change 22%
C. The usual site-of-service has changed:
   from outpatient to inpatient 0% from inpatient to outpatient 33% no change 67%

Smoking Cessation	V
Alcohol, Drug Screening and Brief Intervention	W

AMA
AMERICAN
MEDICAL
ASSOCIATION

May 30, 2007

Leslie Norwalk
Acting Director
Center for Medicare Management
Centers for Medicare and Medicaid Services
7500 Security Boulevard
Baltimore, MD 21244

Dear Ms. Norwalk:

It is with pleasure that I submit to the Centers for Medicare and Medicaid Services (CMS), on behalf of the American Medical Association (AMA)/Specialty Society RVS Update Committee (RUC), work relative value and direct practice expense input recommendations for new and revised codes for CPT 2008. In addition, I submit the work relative value and direct practice expense input recommendations for codes identified in the third Five-Year Review. At this time, the RUC is also submitting physician time data corrections and updates for existing services as well as comments regarding specific payment policies for consideration in the 2008 Medicare Physician Payment Schedule *Proposed Rule*. The RUC Health Care Professionals Advisory Committee Review Board is separately forwarding its recommendations to CMS.

Cost estimates for medical supplies and equipment not listed on "CMS's Labor, Supply, and Equipment List for the Year 2007" are based on provided source(s) as noted, such as manufacturer's catalogue prices and may not reflect the wholesale prices, quantity or cash discounts, prices for used equipment or any other factors which may alter the cost estimates. The RUC shares this information with CMS without making specific recommendations on the pricing for supplies and equipment.

CPT 2008 New and Revised Codes

Enclosed are two binders of RUC recommendations for new and revised codes. The total number of coding changes for CPT 2008 is 332, including 118 additions, 186 revisions and 28 deletions. Thirty of these new and revised codes are not payable on the RBRVS (eg, laboratory services and vaccines), and accordingly, the RUC does not submit any information on these codes. In addition, seven of these new codes were reviewed by the RUC HCPAC Review Board as these codes describe services provided by non-MD/DO health professionals. Of the remaining 267 new and revised codes, the RUC submits 266 recommendations at this time. The RUC does not submit a recommendation for code 99174 *Ocular photoscreening with interpretation and report, bilateral*, due to a lack of specialty interest in developing recommendations.

The RUC is recommending that eleven codes be carrier priced in 2008. In addition, the RUC recommends interim values for 15 codes. The summary table in the attached binders and in the enclosed CD, specifically identifies the G-, J-, G-J, C-Tube Procedures (49441-49465 and 43760), Femoral Head Fracture (27267-27269) and Computer Navigation (20985-20987) to be re-reviewed at the September 2007 RUC Meeting. I will send any new information related to these services to CMS immediately following the meeting.

Also included in these binders and on the enclosed CD, are physician time data for each of the CPT codes reviewed at the September 2006, February 2007 and April 2007 RUC meetings. The RUC continues to review physician time data to ensure that the most accurate data is utilized in the CMS practice expense methodology.

2005 Five-Year Review Issues

Enclosed in a separate binder are recommendations for nine issues identified for review in the most previous Five-Year Review. These issues include:

- Partial Mastectomy (19301)
- Insertion of Heart Pacemaker (33207)
- Anoscopy and Proctosigmoidoscopy (45300, 45303, 45305, 45307, 45308, 45309, 45315, 45317, 45320, 45321, 45327, 46600, 46604, 46606, 46608, 46610, 46611, 46612, 46614, 46615)
- Eye Exams (92002-92014)
- Audiology and Speech-Language Pathology Services (92557, 92567, 92568, 92569, 92579, 92601, 92602, 92603, 92604)
- Doppler Color Flow (93325)
- Nursing Facility Care (99304-99318)
- Domiciliary Care (99326-99328, 99334-99337)
- Home Care (99343-99345, 99347-99350)

Also included with these recommendations are physician time data for each of the Five-Year Review issues discussed.

CMS Requested Review of Practice Expense Inputs

Enclosed are direct practice expense refinement recommendations for eight issues as requested by CMS and reviewed at the February and April 2007 meetings of the RUC.

The issues include:

- Transcatheter Placement of Intravascular Stent(s) (37205, 37206, 75960)
- OB/GYN Procedures – Supply Pack (All OB/GYN Procedures)
- Gynecologic Oncology (All GYN/ONC Procedures)
- Computer Aided Detection (CAD) Breast Mammography (77051, 77052)
- Dual-Energy X-Ray Absorptiometry (77080-77082)
- Proton Beam Treatment Delivery (77520-77525)
- Remote Afterloading High Intensity Brachytherapy (77781-77784)
- Cardiac Catheterization (93501-93572)

Other RUC Recommendations

As CMS develops the Proposed Rule for the 2008 Physician Payment Schedule, I ask that you consider several pending RUC recommendations.

Anesthesia Recommendations
CMS requested a RUC review of anesthesia services in the *Final Rule* published in the December 1, 2006 *Federal Register*. CMS stated that, "Although anesthesia services are paid under the Physician Fee Schedule, they are paid on the basis of an anesthesia code-specific base unit and time units that vary based on the anesthesia time of the case. Since anesthesia services do not have a work values per codes as do other medical services, a work value must be imputed for each anesthesia code. As a result of its relationship with the RUC and the past recommendations for valuing anesthesia services, which were discussed in detail in the June 29, 2006 Proposed Notice, the American Society of Anesthesiologists (ASA) requested that we address the valuation of anesthesia services reported under CPT code 00100 through 01999. The ASA furnished an analysis that builds on the methodology used in the last 5 Year Review for the valuation of work for anesthesia services. We recommend that the valuation of anesthesia services, namely the proposed valuation of the post-induction time, be referred to the AMA RUC for review and consideration."

To address this request the RUC formed the Anesthesia Workgroup which reviewed this issue at length during two conference calls and three face-to-face meetings. Based on the extensive review of all the building block components and validation of Post-Induction

Period Procedure Anesthesia (PIPPA) work by surgeons on the Workgroup familiar with anesthesia services associated with their specialty, the Workgroup reached unanimous agreement that the revised model predicts anesthesia undervaluation. **The RUC recommends to CMS that Anesthesia work is undervalued by 32%.**

The RUC also identified three anesthesia services that may be misvalued based on this analysis and recommend that CMS allow review of the base units for at an upcoming RUC meeting:

00142 ***Anesthesia for procedures on eye; lens surgery****
00210 ***Anesthesia for intracranial procedures; not otherwise specified****
00562 ***Anesthesia for procedures on heart, pericardial sac, and great vessels of chest; with pump oxygenator****

**Assumed to be overvalued, base unit too high or incorrect quintile assumption in the second Five-Year Review valuation.*

Supporting documents including the specific recommendations made by the Anesthesia Workgroup, the anesthesia quintile intensity retrofit calculations, the anesthesia regression versus quintile comparison, and the final anesthesia services calculations using the building block methodology as approved by the RUC, are enclosed in the Other RUC Recommendations Binder.

Budget Neutrality – Work Adjuster
The Omnibus Budget Reconciliation Act of 1989 requires that increases or decreases in relative value units (RVUs) for a year may not cause the amount of expenditures for the year to differ by more than $20 million from what expenditures would have been in the absence of these changes. To limit the increases in Medicare expenditures as mandated by the statute, CMS has applied a new "work adjuster" to ensure budget neutrality following the implementation of the improved work RVUs from the most recent Five-Year Review of the RBRVS. **The RUC argues that applying budget neutrality to the work RVUs to offset the improvements in E/M and other services is a step backward and strongly urges CMS to apply the necessary adjustments to the conversion factor.**

From 1998 to present, CMS has implemented all work neutrality adjustments by adjusting the Medicare conversion factor. CMS did not explain why it altered this long utilized method and moved backward to an approach that the agency itself remarked was inappropriate. The RUC requests that CMS consider the history and these additional arguments and apply budget neutrality to the conversion factor:

1.) Adjusting the conversion factor does not affect the relativity of services reflected in the recommended RVUs. Adjusting the RVUs has the potential to inappropriately affect relativity and dampen the improvements to the E/M services valuation. CMS has publicly lauded the RUC for recommending these increases to E/M and we would surmise that the agency would want to achieve the full benefit of these improvements.

2.) An adjustment in the Medicare conversion factor is preferable because it has less impact on other payers who use the Medicare RVUs. That is, an adjustment in the Medicare conversion factor will not necessarily affect the payment rates of other payers who use the Medicare RVUs and their own conversion factors. However, any adjustment in the RVUs will impact the payment rates of such payers. The payment rates of payers who peg their rates to a percentage of Medicare will be affected regardless. The RUC believes that CMS must consider such "ripple effects" as it decides how to adjust for work neutrality.

3.) The RUC believes an adjustment to the conversion factor recognizes that budget neutrality is mandated for monetary reasons. Thus, the conversion factor, as the monetary multiplier in the Medicare payment formula, is the most appropriate place to adjust for budget neutrality

4.) Applying the work neutrality adjustment to the conversion factor would coincide with CMS' current mission of making Medicare payment transparent.

Equipment Assumptions – Equipment Utilization Data
CMS currently utilizes an interest rate of 11% in pricing medical equipment. CMS has acknowledged that this rate is too high and requested comments regarding the appropriate interest rate. The RUC also discussed and agreed that the interest rate currently utilized is too high. The RUC agreed that the interest rate should fluctuate according to market conditions, rather than a fixed rate. The cost of capital is a legitimate expense of a physician's office and should be linked to prevailing rates. **CMS should adjust the 11% cost of capital rate to a market competitive rate.**

Equipment Assumptions – Cost of Capital Assumptions
CMS requested information on how it should reflect the utilization rate, particularly for high cost equipment. Currently, CMS uses a 50% utilization rate for all equipment. The RUC has discussed whether there should be a different rate for all equipment or just for the equipment set by specific cost thresholds. The RUC indicated that the cost of capital may not have a direct linear relationship with equipment utilization. Further, the RUC discussed whether consideration should be given to impacts on rural payment, as utilization rates may not be as high as in urban areas. The RUC recommends that the existing CMS standard of 50% utilization rate for all equipment is not an accurate measure. **CMS should consider using a higher rate for all equipment, providing an opportunity to specialty societies to provide data to support lower utilization rates, if appropriate, based on clinical or geographic considerations.**

Practice Expense Inputs - Supplies
The Practice Expense Subcommittee and the RUC in an effort to continually refine the RUC's process of developing practice expense recommendations agreed that some

mechanism should be in place to distinguish high priced disposables medical supplies, from the practice expense methodology so that the inequities of the scaling factors do not cause as many anomalies in the practice expense specialty pools and in practice expense relative values. The RUC recommends:

CMS set a specific reasonable threshold for the creation of J codes on high priced disposable medical supplies, and that an impact analysis be performed to find out how individual specialty's and practice expense pools would be affected. In addition, medical supplies used in the practice expense methodology, priced at or above $200, should be re-priced on an annual basis.

Members of the subcommittee believed that an initial reasonable threshold could be $250.00.

Professional Liability Insurance
In 1999, and consistently since 2004, the RUC has urged CMS to address a significant problem in the PLI RVU determinations for services with a technical component and professional component. The current CMS methodology generates a higher PLI relative value for the technical component portion than the professional component. One particularly poignant example of this inverse relationship is found in 77057, *Screening mammography, bilateral (2-view film study of each breast)* For this service, carrying a considerable amount of risk in screening for cancer, the PLI RVU for the professional component is .03, while the technical component is .07. The professional component PLI RVU includes the interpretation of results and the most significant amount of liability, but is valued less than half of the technical component PLI RVU, which accounts for only the risk posed by the equipment and the imaging process.

In the Final Rule for the 2005 Physician Payment Schedule, CMS responded to the continuing RUC comments as follows:

> *Physician work RVUs are used to adjust for risk of service. Because technical component services do not have physician work RVUs, they are still valued using charge-based RVUs instead of the resource-based malpractice RVU methodology. We look forward working with the ACR and the other interested specialty organizations to examine alternative methodologies that would allow technical component services to also reflect resource-based malpractice RVUs.*

At a minimum, CMS should appropriately reallocate PLI RVUs within the physician fee schedule by accepting the RUC interim recommendation to establish the technical component PLI RVU to be equivalent to the professional component PLI RVU for each

CPT code. **A more appropriate strategy would develop a methodology to ensure that the technical component PLI RVUs reflect resource-based professional liability costs.**

CMS Definition of Pre-time
The RUC requests that CMS consider a modification to the definition of physician pre-service time to be consistent with the pre-service definition utilized for the practice expense methodology. The current CMS definition of pre-service time for physicians is as follows:

Pre-service period
The pre-service period includes physician services provided from the day before the operative procedure until the time of the operative procedure and may include the following:

- *Hospital admission work-up.*
- *The pre-operative evaluation may include the procedural work-up, review of records, communicating with other professionals, patient and family, and obtaining consent.*
- *Other pre-operative work may include dressing, scrubbing, and waiting before the operative procedure, preparing patient and needed equipment for the operative procedure, positioning the patient and other "non-skin-to-skin" work in the OR.*

The following services are ***not included****:*

- *Consultation or evaluation at which the decision to provide the procedure was made (reported with modifier -57).*
- *Distinct evaluation and management services provided in addition to the procedure (reported with modifier -25).*
- *Mandated services (reported with modifier -32).*

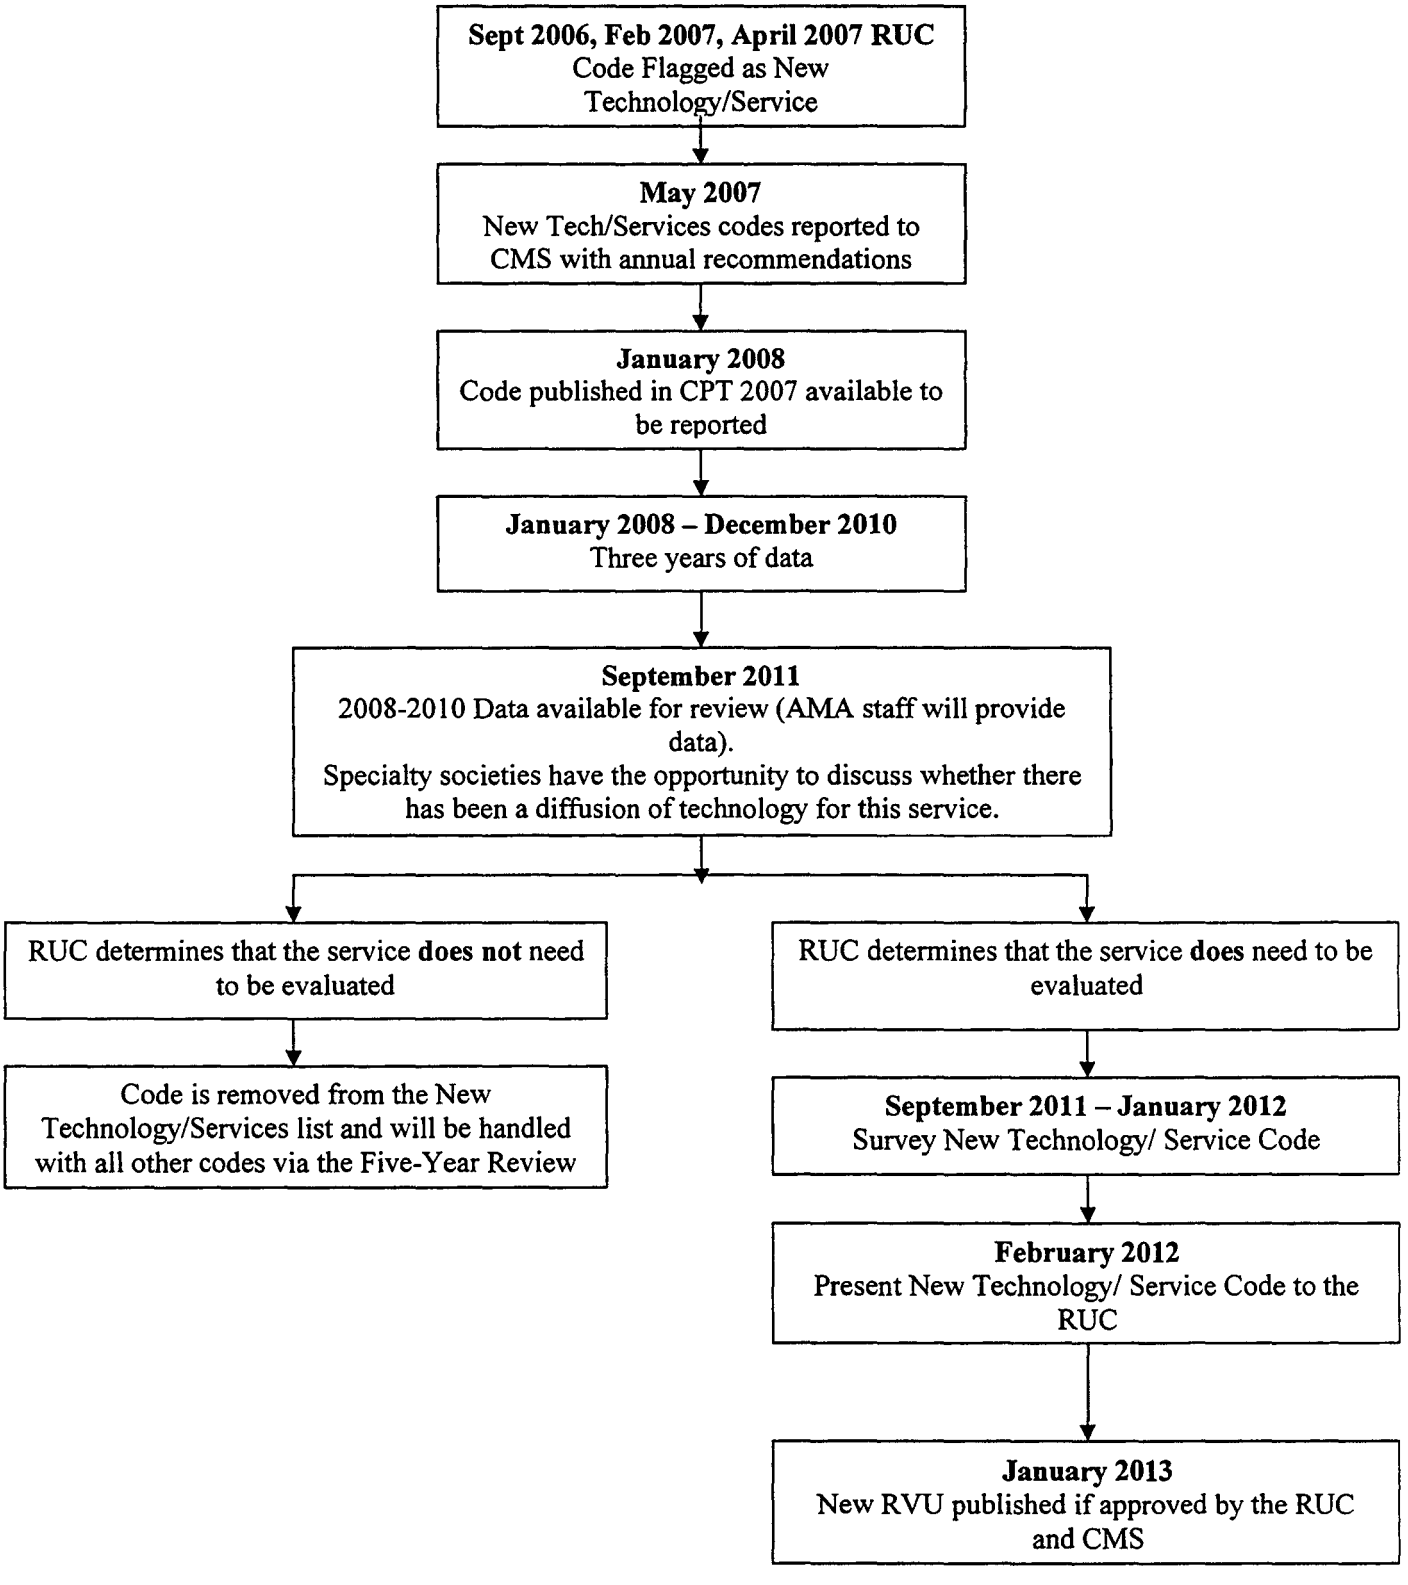
The RUC recommends that the physician pre-service period instead begin when the decision for surgery is made. Physicians may engage in many of these pre-service activities (eg, review of records, communicating with other professionals, etc) prior to the day before the operative procedure.

<u>Five Year Review Identification Workgroup and New Technology/Services Identification/Review Process</u>

Based on previous MedPAC discussions and recommendations to Congress, CMS led initiatives to identify misvalued services, and its own mission to ensure correct valuation of all codes, the RUC concurred that there should be a process to identify such codes.

This workgroup initially convened in October 2006 and February 2007. Through this process, the RUC has begun to identify services incorporating new technology, which are likely to change in value, for subsequent review in order to minimize future misvaluation. The RUC is also developing other objective measures to identify misvalued services.

At its April 2006 meeting, the RUC adopted a process to identify and review codes that represent new technology or services that have the potential to change in value. First, a code is identified as a new technology/service at the RUC meeting in which it is initially reviewed. Second, the code is identified as a new technology/service in the next version of the RUC database with the date it is to be re-reviewed. Third, the code will be reviewed according to this schedule (depending on what meeting in the CPT/RUC cycle it is initially reviewed) after at least three years of data are available. A flow chart providing a detailed description of this process is below. The RUC has already identified 78 of these procedures through its new and revised process. A table of these codes identified as new technology/services has been attached.



We appreciate your consideration of the RUC's recommendations. You may contact Sherry Smith at the AMA with any questions regarding this submission

Sincerely,

William L. Rich, III, MD, FACS

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

April 2007

Open Osteochondral Talus Graft

The CPT Editorial Panel created one new Category I CPT code in February 2007 to describe an open osteochondral autograft not presently included in CPT. Prior to this new code, the service was accounted for by using more general coding to describe only the incision of the tibia and/or fibula.

The RUC reviewed the specialty societies' survey results for CPT code 28446, *Open osteochondral autograft, talus (includes obtaining graft[s])*. The specialties commented that the service is a highly complex surgery representing only the most complex and difficult patient population. The key reference service, 29892, *Arthroscopically aided repair of large osteochondritis dissecans lesion, talar dome fracture, or tibial plafond fracture, with or without internal fixation (includes arthroscopy)* (work RVU = 10.07) which was selected by 29% of respondents, differs significantly from the procedure surveyed. Given the low service performance rate (median = 4), the specialties convened an expert consensus panel consisting of general orthopaedics, arthroscopy, trauma, hip & knee, foot & ankle, total joint, and sports medicine specialists to review the survey data compared with the reference code and other orthopaedic and podiatric services and assess more closely the complexity of the procedure. The consensus panel agreed that the surveyed median intra-service time (90 minutes) and work RVU (16.00) were both too low. Rather, the panel believed that the 75th percentile intra-service time (120 minutes) and work RVU (17.50) were an appropriate estimation of time and physician work. The specialty societies commented that the procedure involves three distinct procedures, malleolar osteotomy and repair, osteochondral transplantation of the talus, and harvesting of the osteochondral grafts from the knee. The physician work for similar codes describing each of these procedures far exceeds the 75th percentile of the survey median; code 29874, *Arthroscopy, knee, surgical; for removal of loose body or foreign body (eg, osteochondritis dissecans fragmentation, chondral fragmentation)* (work RVW = 7.10); 29866, *Arthroscopy, knee, surgical; osteochondral autograft(s) (eg, mosaicplasty) (includes harvesting of the autograft)* (work RVW = 14.48); and 27705, *Osteotomy; tibia* (work RVW= 10.74). If these three procedures are billed separately with appropriate modifier reductions, the total work RVW totals 23.40 [14.48 + (7.10 x 50%) + (10.74 x 50%)]. The RUC agreed with the consensus panel and concurred that the 75th percentile intra-service time and work RVU appropriately accounted for and appropriately valued the physician work involved. The reference service, which is not an analogous service includes only 90 minutes of intra-service time, opposed to the 120 minutes recommended by the specialties and only 10 minutes of pre-service time versus 65 minutes in the surveyed code. The

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

resulting difference in total time is 339 minutes versus 261 minutes within the reference service. The intensity and complexity measures also reveal that the survey respondents believed that 284XX was much more intense that the reference service.

The RUC did note that the single 99231 hospital visit included duplicative work accounted for in the full 99238 discharge management visit within the code's global period. The RUC removed this visit, leaving one 99238, two 99212, and three 99213 visits within the global period. The RUC recommends physician pre-service time of 65 minutes, intra-service time of 120 minutes and immediate post-service time of 15 minutes for 28446

The RUC recommends the specialty society survey 75th percentile work RVU of 17.50 for 28446.

Practice Expense
The RUC recommends the specialty societies' recommended inputs for these facility only procedures as they are standard 090 day global inputs.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
●28446	AA1	Open osteochondral autograft, talus (includes obtaining graft[s]) (Do not report 28446 in conjunction with 27705, 27707) (For arthroscopic osteochondral talus graft, use 29892) (For open osteochondral allograft or repairs with industrial grafts use 27599)	090	17.50
29892		Arthroscopically aided repair of large osteochondritis dissecans lesion, talar dome fracture, or tibial plafond fracture, with or without internal fixation (includes arthroscopy)	090	10.07 (No Change)

924

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:28446 Tracking Number AA1 Specialty Society Recommended RVU: **17.50**
Global Period: 090 RUC Recommended RVU: **17.50**

CPT Descriptor: Open osteochondral autograft, talus (includes obtaining graft[s])

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: The patient has sustained a symptomatic osteochondritis dissecans (OCD) lesion of the talus and has failed the usual arthroscopic or open debridement and drilling.

Percentage of Survey Respondents who found Vignette to be Typical: 97%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work:
- Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
- Verify that all required instruments and supplies are available
- Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulation rapes
- Assess position of the extremities and head, adjust as needed
- The patient's leg is placed properly on the table and positioned with proper bolstering to aid surgical exposure.
- Indicate areas of skin to be prepped and mark surgical incisions
- A tourniquet is placed on the proximal thigh
- The leg is prepped and draped.
- The leg is elevated and exsanguinated.
- The pneumatic tourniquet is inflated.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work: Under anesthesia, an ankle arthrotomy is performed. Depending on the location of the lesion a medial or lateral malleolar osteotomy may be performed to gain access (over 70% of the cases) to the location. The osteochondral defect is debrided and prepared for transplantation. The donor site is visualized requiring an arthroscopy or arthrotomy of the knee. The harvesting device is carefully directed into the medial or lateral femoral condyle or the intercondylar notch of the knee. Exact perpendicularity of the harvest device to the articular surface is mandatory. Once the tissue is harvested from the knee, the ankle recipient site is prepared with an appropriate sized drill to match the harvested tissue. The harvested osteochondral graft is then inserted into the articular surface defect which was "standardized" with the drill. Great care is taken to correctly orient the osteochondral autograft as it is forced into the original osteochondral defect. Once correctly placed, the procedure is repeated until the defect is filled or the available donor tissue is exhausted. The tourniquet is deflated and hemostasis is achieved. The wounds are irrigated, the knee arthrotomy or arthrosopic portals are sutured, the malleolar osteotomy is reduced and repaired with crews or a plate and screws and the ankle incisions are sutured.

Description of Post-Service Work: Post-service work: in facility
- Application of bulky dressing and short leg splint
- Monitor patient stabilization in the recovery room.
- Consultation with the family and patient regarding the surgery and postoperative regimen.

- Communication with health care professionals including written and oral reports and orders.
- Postoperative care is coordinated with recovery room nursing staff.
- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Physical therapy for the uses of crutches or walker is ordered
- Write prescriptions for medications needed post-discharge.
- Dictation of an operative report
- Procedure note is written in the patient chart
- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of splint/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order occupational therapy
- Supervision of rehabilitation
- Monitor physical therapy
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions
- Dictate progress notes for medical record

* monitor ROM and morbidity at donor site?

Time Segments (Mean)		
Pre-Service intensity/complexity	3.22	3.00
Intra-Service intensity/complexity	4.44	4.00
Post-Service intensity/complexity	3.00	3.00

Additional Rationale

Describe the process by which your specialty society reached your final recommendation: *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*
A survey was sent to orthopaedic surgeons representing foot and ankle surgeons, podiatrists, orthopaedic trauma, and general orthopaedics. A consensus panel of experts representing podiatry and orthopaedic subspecialty societies (general orthopaedics, arthroscopy, trauma, hip & knee, foot & ankle, total joint, sports medicine) reviewed the survey data compared with the reference code and other orthopaedic and podiatric services.

The panel felt the median RVW of 16.00 and intra-service time of 90 minutes were both too low for this procedure. Typically, we believe the median values represent a fair estimate, but our consensus panel, which consisted of multiple surgeons and physicians from multiple specialties all agreed the 75th percentile survey RVW of 17.50 and intra-service times of 120 were the correct values and appropriately valued the work involved in this procedure. These values, along with a hospital visit of 99231 and a discharge day, 99238 and two 99213 and two 99212 office visits, yield an appropriate approximation of the work in the procedure. The median experience of our survey respondents was 4, and given that, we felt the expert consensus panel should look more closely at the complexity of the procedure.

This code is actually three procedures in one.
1. Malleolar osteotomy and repair
2. Osteochondral transplantation of the talus
3. Harvesting of the osteochondral grafts from the knee

In looking at the work RVW for similar procedures such as 29874-Arthroscopy, knee, surgical; for removal of loose body or foreign body (eg, osteochondritis dissecans fragmentation, chondral fragmentation) Work RVW= 7.10; 28446 Similar to 29866 Arthroscopy, knee, surgical; osteochondral autograft(s) (eg, mosaicplasty) (includes harvesting of the autograft) Work RVW recommendation = 14.48; and 27705- Osteotomy; tibia Work RVW= 10.74. If these three procedures are billed separately with appropriate modifier reductions, the total work RVW equals 23.40 [14.48 + (7.10 x 50%) + (10.74 x 50%)]. Given these values, we believe a work RVW of 17.50 is an appropriate value for this procedure.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 27705, 27707

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty AAOS How often? Sometimes

Specialty APMA How often? Rarely

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 3000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. Estimate of Requestor

Specialty AAOS Frequency 2000 Percentage %

Specialty APMA Frequency 1000 Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?
1,500 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty.
Please explain the rationale for this estimate. Estimate of Requestor

Specialty AAOS Frequency 1000 Percentage %

Specialty APMA Frequency 500 Percentage %

ecialty Frequency Percentage %

Do many physicians perform this service across the United States? No

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? No

If no, please select another crosswalk and provide a brief rationale. 28445, Open treatment of talus fracture, with or without internal or external fixation (work RVU = 17.07). The key reference service requires significantly less physician intra-service time and less intensity and complexity. The RUC determined that 28445 was a more appropriate PLI crosswalk as it requires a similar amount of intra-service time and has a similar work RVU as the recommended work RVU for the surveyed service.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/Specialty Society Update Process
PERC Summary of Recommendation
010 or 090 Day Global Periods
Facility Direct Inputs

CPT Long Descriptor:

28446: Open osteochondral autograft, talus (includes obtaining graft[s])

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

A consensus panel of experts representing orthopaedic subspecialty societies (general orthopaedics, arthroscopy, trauma, shoulder and elbow, hand, hip & knee, foot & ankle, total joint, sports medicine) reviewed the practice expense details for the survey codes relative to other facility-only 90-day global orthopaedic services.

Please describe the clinical activities of your staff:

[redacted]-Service Clinical Labor Activities:

No changes were made to the standard pre-service times. A total of 35 (office) and 60 (facility) minutes has been applied for the pre-service clinical labor activities. During the pre-service period, clinical staff conducts the standard pre-service activities: An RN/LPN/MA completes pre-service diagnostic and referral forms, coordinates pre-surgery services, schedules space and equipment in facility, provides pre-service education/obtains consent, and conducts follow-up phone calls.

Intra-Service Clinical Labor Activities:

Standard times for the activities necessary in the office and 100% of physician time were applied.

The standard 6 minutes has been applied for the outpatient procedures for discharge day management services from the facility.

The standard 12 minutes has been applied for the inpatient procedure for discharge day management services from the facility.

Post-Service Clinical Labor Activities:

standard times have been applied for post-service clinical labor time.

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

April 2007

Arthroscopic Biceps Tenodesis

In February 2007, the CPT Editorial Panel created a new Category I CPT code, 29828, *Arthroscopy, shoulder, surgical; capsulorrhaphy; biceps tendonesis*, to describe a closed surgical process utilizing arthroscopic technique for biceps tendonesis. Prior to the introduction of this new coding, only open biceps tendonesis was described in CPT, despite increasing utilization of the closed arthroscopic technique.

The RUC reviewed the specialty societies' survey results describing the physician work for CPT code 29828. The RUC also reviewed the surveyed service in comparison to the key reference service, CPT code 29807, *Arthroscopy, shoulder, surgical; repair of SLAP lesion* (work RVU = 14.48). While the survey data were reliable, the specialty societies and the RUC agreed that the survey median work RVU was too high, as the surveyed service requires less time and is not more intense than the reference service. In comparison to the key reference service, the surveyed service contains slightly less intra-service and post-service time (intra = 75 and 20 minutes compared to post = 90 and 30 minutes, respectively) while the intensity and complexity measures between the two services were very similar in all categories assessed. The RUC concurred that the 25th percentile of the survey data (13.00 work RVUs) was more appropriate and accurately reflected the time and intensity involved in performing the service, especially when compared to the key reference service, code 29807.

The RUC recommends the survey's 25th percentile work RVU of 13.00 for code 29828.

Practice Expense
The RUC recommends the specialty societies' recommended inputs for these facility only procedures as they are standard 090 day global inputs.

New Technology
Because the service was developed relatively recently and at the request of the specialty society, **the RUC recommends that code 29828 be added to the New Technology list**

Global Period: 090 RUC Recommended RVU: **13.00**

CPT Descriptor: Arthroscopy, shoulder, surgical; biceps tenodesis

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: The patient is a 57-year-old man with a 5 month history of anterior shoulder pain. He has been treated with physical therapy, anti-inflammatory medications, and an injection without improvement. There is a normal contour to his biceps muscle. He has pain over of the bicipital groove and with resisted elbow flexion and supination. A diagnosis of biceps tendon degeneration and tendonitis is made. An arthroscopic biceps tenodesis is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 82%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work:
- Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
- Verify that all required instruments and supplies are available, including positioning of monitors and arthroscopic/video equipment
- Monitor/assist with patient positioning - position the patient supinely and apply a shoulder boom to support the arm and allow the appropriate amount and angle of traction. Roll the patient into the lateral decubitus position and place pads to protect areas from pressure
- Indicate areas of skin to be prepped and mark surgical incisions
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work: Under anesthesia, a posterior portal is made to gain access to the glenohumeral joint. A diagnostic arthroscopy is performed. The biceps tendon exhibits a partial tear involving 25% of its width. The rotator cuff is noted to have a one centimeter tear. An anterior portal is introduced and the cuff and biceps tears are debrided. The arthroscope is placed in the subacromial bursa through the posterior portal. The cuff tear is identified and the acromioclavicular joint is noted to be arthritic. An acromioplasty and resection of the acromioclavicular are the performed. The arthroscope is then placed in the glenohumeral joint through the posterior portal. An 18-gauge spinal needle is percutaneously passed through the biceps tendon and a monofilament stitch is placed in the needle and retrieved through the anterior portal to capture the tendon. The biceps tendon is then tenotomized at superior glenoid labrum and the tendon is delivered throughout the anterior portal. A nonabsorbable suture is then used to create a whipstitch in the terminal 20 mm of the biceps tendon stump. While viewing the subacromial space through the lateral portal, an anterolateral portal is then created and a guide wire is driven into the humerus at the bicipital groove. A bone tunnel is then created with a cannulated reamer. The end of the biceps tendon is then brought into the subacromial space and placed in the bone tunnel. An interference screw then fixes the tendon in the tunnel. The arthroscope is then placed in the posterior portal and the rotator cuff is repaired arthroscopically through the lateral portal. The arthroscope is removed and the portals are closed with sutures. The portals are injected with marcaine and a sterile dressing is applied.

Description of Post-Service Work: Post-service work: in facility

- Application of bulky dressing and a sling.
- Monitor patient stabilization in the recovery room.
- Consultation with the family and patient regarding the surgery and postoperative regimen.
- Communication with health care professionals including written and oral reports and orders.
- Postoperative care is coordinated with recovery room nursing staff.
- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Write prescriptions for medications needed post-discharge.
- Dictation of an operative report
- Procedure note is written in the patient chart
- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of sling/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order occupational therapy
- Supervision of rehabilitation
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions

Other time if appropriate			

INTENSITY/COMPLEXITY MEASURES (Mean)

Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	3.84	3.70
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	3.34	3.26
Urgency of medical decision making	2.27	2.35
Technical Skill/Physical Effort (Mean)		
Technical skill required	4.28	4.09
Physical effort required	3.44	3.28
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	2.78	2.81
Outcome depends on the skill and judgment of physician	4.03	4.04
Estimated risk of malpractice suit with poor outcome	3.03	2.94

INTENSITY/COMPLEXITY MEASURES	CPT Code	Reference Service 1
Time Segments (Mean)		
Pre-Service intensity/complexity	3.28	3.23
Intra-Service intensity/complexity	3.91	3.75
Post-Service intensity/complexity	2.88	2.87

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

A survey was sent to orthopaedic surgeons representing general orthopaedics, arthroscopy, and shoulder & elbow surgery. A consensus panel of experts representing orthopaedic subspecialty societies (general orthopaedics, arthroscopy, trauma, shoulder and elbow, hand, hip & knee, foot & ankle, total joint, sports medicine) reviewed the survey data compared with the reference code and other orthopaedic services. The panel agreed that the SLAP procedure may require slightly more intra time (90 vs 75 minutes). The panel also agreed that that the total work for the survey code would be less than the reference code. Based on this discussion, the survey 25th percentile RVW of 13.00 is recommended. This value correctly sets this new code slightly less than the reference code.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 29999 or 23430

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty AAOS How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 500
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. Estimate of Requestor

Specialty Orthopaedic Surgery Frequency 500 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 150
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimate of Requestor

Specialty Orthopaedic Surgery Frequency 150 Percentage 100.00 %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? No

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/Specialty Society Update Process
PERC Summary of Recommendation
010 or 090 Day Global Periods
Facility Direct Inputs

CPT Long Descriptor:

29828 Arthroscopy, shoulder, surgical; biceps tenodesis

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

A consensus panel of experts representing orthopaedic subspecialty societies (general orthopaedics, arthroscopy, trauma, shoulder and elbow, hand, hip & knee, foot & ankle, total joint, sports medicine) reviewed the practice expense details for the survey code relative to other facility-only 90-day global orthopaedic services.

Please describe the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

No changes were made to the standard pre-service times. A total of 60 minutes has been applied for the pre-service clinical labor activities. During the pre-service period, clinical staff conducts the standard pre-service activities: An RN/LPN/MA completes pre-service diagnostic and referral forms, coordinates pre-surgery services, schedules space and equipment in facility, provides pre-service education/obtains consent, and conducts follow-up phone calls.

Intra-Service Clinical Labor Activities:

The standard 6 minutes has been applied for this outpatient procedure for discharge day management services.

Post-Service Clinical Labor Activities:

The procedures each have 2 x 99212 and 2 x 99213 visit. The standard times have been applied for post-service clinical labor time.

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

April 2007

Subtalar Arthroscopy

In February 2007, the CPT Editorial Panel created four new Category I CPT codes to describe procedures not previously included in CPT for arthroscopy of subtalar joints.

29904

The RUC reviewed the specialty societies' survey results and presentation for 29904, *Arthroscopy, subtalar joint, surgical; with removal of loose body or foreign body*. The RUC considered the surveyed code in comparison to the key reference service selected by two-thirds of the survey respondents, 29891, *Arthroscopy, ankle, surgical, excision of osteochondral defect of talus and/or tibia, including drilling of the defect* (work RVU = 9.47). The RUC noted that the intra-service times are identical (60 minutes), however, the intensity and complexity required to perform the surveyed code is less than the reference service. Particularly, the reference service requires slightly greater mental effort and judgment as well as greater psychological stress. The RUC agreed with the specialty societies, that in light of this comparison, the survey median work RVU of 9.47 was too high. The RUC concurred that the 25th percentile work RVU of 8.50 was appropriate and was an accurate valuation of the work involved to perform the service.

The RUC recommends the 25th percentile work RVU 8.50 for code 29904.

29905

The RUC reviewed the specialty societies' survey results and presentation for 29905, *Arthroscopy, subtalar joint, surgical; with synovectomy*. The RUC considered the surveyed code in comparison to the key reference service 29891, *Arthroscopy, ankle, surgical, excision of osteochondral defect of talus and/or tibia, including drilling of the defect* (work RVU = 9.47). The RUC noted that the intra-service times are identical (60 minutes), however, the intensity and complexity required to perform the surveyed code is only slightly less than the reference service. Particularly, the reference service requires slightly greater mental effort and judgment as well as greater psychological stress. The RUC agreed with the specialty societies, that in light of this comparison, the survey median work RVU of 10.00 was too high. The RUC concurred that the 25th percentile work RVU of 9.00 was appropriate and was an accurate valuation of the work involved to perform the service and maintained proper rank order within the family of services.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The RUC recommends the 25th percentile work RVU 9.00 for code 29905.

29906

The RUC reviewed the specialty societies' survey results and presentation for 29906, *Arthroscopy, subtalar joint, surgical; with debridement.* The RUC considered the surveyed code in comparison to the key reference service 29891, *Arthroscopy, ankle, surgical, excision of osteochondral defect of talus and/or tibia, including drilling of the defect* (work RVU = 9.47). The RUC noted that the intra-service times are identical (60 minutes), however, the intensity and complexity required to perform the surveyed code is nearly identical to the reference service. As such, the RUC agreed with the specialty societies, that in light of the close comparison and relativity with the reference service, the survey median work RVU of 10.00 was too high. The RUC concurred that the 25th percentile work RVU of 9.47, identical to the reference service, was appropriate as well as an accurate valuation of the work involved to perform the service and maintained proper rank order within the family of services.

The RUC recommends the 25th percentile work RVU 9.47 for code 29906.

29907

The RUC reviewed the specialty societies' survey results and presentation for 29907, *Arthroscopy, subtalar joint, surgical; with subtalar arthrodesis.* The RUC considered the surveyed code in comparison to the key reference service 29899, *Arthroscopy Arthroscopy, ankle (tibiotalar and fibulotalar joints), surgical; with ankle arthrodesis* (work RVU = 15.21). The RUC noted that the reference service contains significantly more intra-service time than the surveyed code (120 minutes versus 90 minutes). In addition, the pre- and post-service times are slightly greater in the reference code as compared to the surveyed code (pre = 75 versus 65 minutes and post = 30 versus 15 minutes, respectively). However, the intensity and complexity required to perform the surveyed code is very comparable to the reference service. The surveyed code requires greater technical skill, physical effort, psychological stress, and greater intensity/complexity in pre-, intra-, and post-service times compared to the reference service. Given the similarities in intensity and complexity, but differences in time, the RUC agreed that the survey median of 14.00 work RVUs was too high and believed that the 25th percentile work RVU of 12.00 appropriately accounted for the physician work involved in the service. The RUC did not agree with the number of hospital visits included within the service's global period. Because the service is typically performed without an extensive hospital stay, a 99231 visit in addition to the full 99238 discharge day management visit was excessive. The specialty agreed and the RUC recommended removing the 99231 hospital visit.

The RUC recommends the 25th percentile work RVU 12.00 for code 29907.

950

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Practice Expense

The RUC recommends the specialty societies' recommended inputs for these facility-only procedures as they are standard 090 day global inputs. No practice expense is recommended in the non-facility setting. The attached PE spreadsheet reflects these issues.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
●29904	CC1	Arthroscopy, subtalar joint, surgical; with removal of loose body or foreign body	090	8.50
●29905	CC2	with synovectomy	090	9.00
●29906	CC3	with debridement	090	9.47
●29907	CC4	with subtalar arthrodesis	090	12.00

951

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:29904 Tracking Number CC1 Specialty Society Recommended RVU: **8.50**
Global Period: 090 RUC Recommended RVU: **8.50**

CPT Descriptor: Arthroscopy, subtalar joint, surgical; with removal of loose body or foreign

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 50-year-old male with rheumatoid arthritis, develops pain in the subtalar joint as a result of synovitis that has been unresponsive to medical management. He is treated with an arthroscopic subtalar synovectomy.

Percentage of Survey Respondents who found Vignette to be Typical: 98%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: • Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
- Verify that all required instruments and supplies are available, including positioning of monitors and arthroscopic/video equipment
- Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulation drapes
- Assess position of the extremities and head, adjust as needed
- The patient's leg is placed properly on the table and positioned with proper bolstering to aid surgical exposure.
- Indicate areas of skin to be prepped and mark surgical incisions
- A tourniquet is placed on the proximal thigh
- The leg is prepped and draped.
- The leg is elevated and exsanguinated.
- The pneumatic tourniquet is inflated.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work: Under anesthesia, the articular surfaces of the subtalar joint must be distracted to allow for visualization of the entire joint. Arthroscopic portals are established to access the 3 facets of the subtalar joint. The entire joint is visualized and explored identifying the loose body. The arthroscopic grasper used to remove the loose body is inserted. If the loose body is mobile, it may be immobilized by the insertion of a spinal needle, making retrieval less difficult. The loose body is removed. The joint is thoroughly irrigated to remove any remaining debris. The joint is inspected. The arthroscope is removed. The foot is positioned so that it will rest in a neutral plantigrade position with the heel in 5 to 10 degrees of valgus. It is important to assess the fact that the foot is plantigrade, and that the heel is in 5 to 10 degrees of valgus. The tourniquet is deflated, and the portals are closed in layers. A splint or ankle brace is typically applied.

Description of Post-Service Work: Post-service work: in facility
- Application of bulky dressing and short leg splint
- Monitor patient stabilization in the recovery room.
- Consultation with the family and patient regarding the surgery and postoperative regimen.
- Communication with health care professionals including written and oral reports and orders.
- Postoperative care is coordinated with recovery room nursing staff.

- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Physical therapy for the uses of crutches or walker is ordered
  Write prescriptions for medications needed post-discharge.
- Dictation of an operative report
- Procedure note is written in the patient chart
- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of splint/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order occupational therapy
- Supervision of rehabilitation
- Monitor physical therapy
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions
- Dictate progress notes for medical record

Post-Service intensity/complexity	2.43	2.80

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

A survey was sent to orthopaedic surgeons representing foot and ankle surgeons, podiatrists, orthopaedic trauma, orthopaedic sports and medicine, and general orthopaedics. A consensus panel of experts representing podiatry and orthopaedic subspecialty societies (general orthopaedics, arthroscopy, trauma, hip & knee, foot & ankle, total joint, sports medicine) reviewed the survey data compared with the reference code and other orthopaedic and podiatric services.

The consensus panel reviewed the survey data and agreed that the most commonly cited reference code, 29891 was very similar in terms of total time, but that 29904 is relatively less intense and complex. Therefore, the consensus panel recommends the 25th percentile RVW of 8.50 which maintains appropriate relativity with the reference code, as well as with the other new procedure codes within this family, all of which represent more complex procedures. The panel felt the survey recommended times for 29904 are all appropriate and accurate but the median RVW of 9.47 would be inappropriate. The panel also felt that a half day discharge day (reference code has no discharge day but this procedure will be performed initially in the facility and require a half day discharge) and four post-operative office visits are typical for this procedure.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 29999

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty AAOS How often? Sometimes

Specialty APMA How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 5000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. Estimate of Requestor

Specialty AAOS Frequency 3000 Percentage %

Specialty APMA Frequency 2000 Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 2500 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty.
Please explain the rationale for this estimate. Estimate of Requestor

Specialty AAOS Frequency 1500 Percentage %

Specialty APMA Frequency 1000 Percentage %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

f no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 50-year-old male with rheumatoid arthritis, develops pain in the subtalar joint as a result of synovitis that has been unresponsive to medical management. He is treated with an arthroscopic subtalar synovectomy.

Percentage of Survey Respondents who found Vignette to be Typical: 93%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: • Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
- Verify that all required instruments and supplies are available, including positioning of monitors and arthroscopic/video equipment
- Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulation drapes
- Assess position of the extremities and head, adjust as needed
- The patient's leg is placed properly on the table and positioned with proper bolstering to aid surgical exposure.
- Indicate areas of skin to be prepped and mark surgical incisions
- A tourniquet is placed on the proximal thigh
- The leg is prepped and draped.
- The leg is elevated and exsanguinated.
- The pneumatic tourniquet is inflated.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work: Under anesthesia, the articular surfaces of the subtalar joint must be distracted to allow for visualization of the subtalar joint, its capsule and the synovial lining. Arthroscopic portals are established to access the 3 facets of the subtalar joint and the synovial lining. The entire joint is visualized and explored identifying all diseased and hypertrophic synovium. The arthroscopic shaver is inserted and is used to excise and remove the abnormal synovium. After completion of the synovectomy, hemostasis is achieved and the joint is thoroughly irrigated to remove any remaining debris. The joint is inspected. The arthroscope is removed. The foot is positioned so that it will rest in a neutral plantigrade position with the heel in 5 to 10 degrees of valgus. It is important to assess the fact that the foot is plantigrade, and that the heel is in 5 to 10 degrees of valgus. The tourniquet is deflated, and the portals are closed in layers. A splint or ankle brace is typically applied..

Description of Post-Service Work: Post-service work: in facility
- Application of bulky dressing and short leg splint
- Monitor patient stabilization in the recovery room.
- Consultation with the family and patient regarding the surgery and postoperative regimen.
- Communication with health care professionals including written and oral reports and orders.
- Postoperative care is coordinated with recovery room nursing staff.

- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Physical therapy for the uses of crutches or walker is ordered
- Write prescriptions for medications needed post-discharge.
- Dictation of an operative report
- Procedure note is written in the patient chart
- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of splint/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order occupational therapy
- Supervision of rehabilitation
- Monitor physical therapy
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions
- Dictate progress notes for medical record

Post-Service intensity/complexity	2.42	2.73

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*
A survey was sent to orthopaedic surgeons representing foot and ankle surgeons, podiatrists, orthopaedic trauma, orthopaedic sports and medicine, and general orthopaedics. A consensus panel of experts representing podiatry and orthopaedic subspecialty societies (general orthopaedics, arthroscopy, trauma, hip & knee, foot & ankle, total joint, sports medicine) reviewed the survey data compared with the reference code and other orthopaedic and podiatric services.

The consensus panel reviewed the survey data and agreed that the most commonly cited reference code, 29891 was a good reference code and that 22905 is slightly more work and more time that 29891. Thus we recommend the survey median RVW of 10.00 as the correct value for this procedure. We believe this maintains appropriate relativity with the reference code, as well as with the other new procedure codes within this family, all of which represent more complex procedures. The panel felt the survey recommended times for 29905 are all appropriate and accurate and that a half day discharge day (reference code has no discharge day but this procedure will be performed initially in the facility and require a half day discharge) and four post-operative office visits are typical for this procedure.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 29999

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty AAOS How often? Sometimes

Specialty APMA How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 5000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. Estimate of Requestor

Specialty AAOS Frequency 3000 Percentage %

Specialty APMA Frequency 2000 Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 2500 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty.
Please explain the rationale for this estimate. Estimate of Requestor

Specialty AAOS Frequency 1500 Percentage %

Specialty APMA Frequency 1000 Percentage %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? No

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:29906 Tracking Number CC3 Specialty Society Recommended RVU: **9.47**
Global Period: 090 RUC Recommended RVU: **9.47**

CPT Descriptor: Arthroscopy, subtalar joint, surgical; with debridement

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 50-year old male develops a painful chondral lesion without associated deformity. He is treated with an arthroscopic debridement.

Percentage of Survey Respondents who found Vignette to be Typical: 97%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: • Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
- Verify that all required instruments and supplies are available, including positioning of monitors and arthroscopic/video equipment
- Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulation drapes
- Assess position of the extremities and head, adjust as needed
- The patient's leg is placed properly on the table and positioned with proper bolstering to aid surgical exposure.
- Indicate areas of skin to be prepped and mark surgical incisions
- A tourniquet is placed on the proximal thigh
- The leg is prepped and draped.
- The leg is elevated and exsanguinated.
- The pneumatic tourniquet is inflated.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work: Under anesthesia, the articular surfaces of the subtalar joint must be distracted to allow for visualization of the entire joint. Arthroscopic portals are established to access the 3 facets of the subtalar joint. The arthroscope and a high-speed arthroscopic abrader to remove the degenerative articular cartilage are inserted. After adequate visualization is established, the articular cartilage is removed from its location on the superior calcaneus or the inferior talus utilizing a high-speed burr and direct arthroscopic visualization to produce two smooth, articulating surfaces. After complete removal of the diseased articular cartilage, hemostasis is achieved and the joint is thoroughly irrigated to remove any remaining debris. The joint is inspected. The arthroscope is removed. The foot is positioned so that it will rest in a neutral plantigrade position with the heel in 5 to 10 degrees of valgus. It is important to assess the fact that the foot is plantigrade, and that the heel is in 5 to 10 degrees of valgus. The tourniquet is deflated, and the portals are closed in layers. A splint or ankle brace is typically applied.

Description of Post-Service Work: Post-service work: in facility
- Application of bulky dressing and short leg splint
- Monitor patient stabilization in the recovery room.
- Consultation with the family and patient regarding the surgery and postoperative regimen.
- Communication with health care professionals including written and oral reports and orders.

- Postoperative care is coordinated with recovery room nursing staff.
- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Physical therapy for the uses of crutches or walker is ordered
- Write prescriptions for medications needed post-discharge.
- Dictation of an operative report
- Procedure note is written in the patient chart
- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of splint/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order occupational therapy
- Supervision of rehabilitation
- Monitor physical therapy
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions
- Dictate progress notes for medical record

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

A survey was sent to orthopaedic surgeons representing foot and ankle surgeons, podiatrists, orthopaedic trauma, orthopaedic sports and medicine, and general orthopaedics. A consensus panel of experts representing podiatry and orthopaedic subspecialty societies (general orthopaedics, arthroscopy, trauma, hip & knee, foot & ankle, total joint, sports medicine) reviewed the survey data compared with the reference code and other orthopaedic and podiatric services.

The consensus panel reviewed the survey data and agreed that the most commonly cited reference code, 29891 was a good reference code and that 29906 is slightly more work and more time that 29891. Thus we recommend the survey median RVW of 10.00 as the correct value for this procedure. We believe this maintains appropriate relativity with the reference code, as well as with the other new procedure codes within this family, all of which represent more complex procedures. The panel felt the survey recommended times for 29906 are all appropriate and accurate and that a half day discharge day (reference code has no discharge day but this procedure will be performed initially in the facility and require a half day discharge) and four post-operative office visits are typical for this procedure.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

CPT Descriptor: Arthroscopy, subtalar joint, surgical; with subtalar arthrodesis

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 50-year-old male develops subtalar pain due to advanced degenerative arthritis which has failed medical management. He is treated with an arthroscopic subtalar arthrodesis.

Percentage of Survey Respondents who found Vignette to be Typical: 97%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work:
- Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
- Verify that all required instruments and supplies are available, including positioning of monitors and arthroscopic/video equipment
- Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulation drapes
- Assess position of the extremities and head, adjust as needed
- The patient's leg is placed properly on the table and positioned with proper bolstering to aid surgical exposure.
- Indicate areas of skin to be prepped and mark surgical incisions
- A tourniquet is placed on the proximal thigh
- The leg is prepped and draped.
- The leg is elevated and exsanguinated.
- The pneumatic tourniquet is inflated.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work: Under anesthesia, the articular surfaces of the subtalar joint must be distracted to allow for visualization of the entire joint. Arthroscopic portals are established to access the 3 facets of the subtalar joint. The arthroscope and a high-speed arthroscopic abrader to remove the degenerative articular cartilage are inserted. After adequate visualization is established, all of the cartilage is removed from the adjacent talar and calcaneal articular surfaces. The normal inclination and alignment of the subtalar joint must be restored by sufficient bone sculpting to allow for "mating" of the opposing surface to achieve osseous stability. Provisional stabilization is inserted, usually percutaneously and radiographs are visualized to confirm position of the implants and alignment of the foot and subtalar joint. Definitive internal fixation is inserted, usually compression screws to maintain the desired osseous alignment and the provisional fixation is removed. Allograft is added to fill any osseous voids where the joint surfaces did not oppose each other congruently. Hemostasis is achieved and the joint is thoroughly irrigated to remove any remaining debris. The joint is inspected. The arthroscope is removed. The foot is positioned so that it will rest in a neutral plantigrade position with the heel in 5 to 10 degrees of valgus. It is important to assess the fact that the foot is plantigrade, and that the heel is in 5 to 10 degrees of valgus. The tourniquet is deflated, and the portals are closed in layers. A splint or ankle brace is typically applied.

Description of Post-Service Work: Post-service work: in facility

- Application of bulky dressing and short leg splint
- Monitor patient stabilization in the recovery room.
- Consultation with the family and patient regarding the surgery and postoperative regimen.
- Communication with health care professionals including written and oral reports and orders.
- Postoperative care is coordinated with recovery room nursing staff.
- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Physical therapy for the uses of crutches or walker is ordered
- Write prescriptions for medications needed post-discharge.
- Dictation of an operative report
- Procedure note is written in the patient chart
- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of splint/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order occupational therapy
- Supervision of rehabilitation
- Monitor physical therapy
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions
- Dictate progress notes for medical record

Time Segments (Mean)		
Pre-Service intensity/complexity	3.29	3.23
Intra-Service intensity/complexity	4.50	4.31
Post-Service intensity/complexity	3.21	3.15

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

A survey was sent to orthopaedic surgeons representing foot and ankle surgeons, podiatrists, orthopaedic trauma, orthopaedic sports and medicine, and general orthopaedics. A consensus panel of experts representing podiatry and orthopaedic subspecialty societies (general orthopaedics, arthroscopy, trauma, hip & knee, foot & ankle, total joint, sports medicine) reviewed the survey data compared with the reference code and other orthopaedic and podiatric services.

The consensus panel reviewed the survey data and agreed that the most commonly cited reference code, 29899 was a good reference code and that 29907 is slightly less work and less time than 29899. Thus we recommend the survey median RVW of 14.00 as the correct value for this procedure. We believe this maintains appropriate relativity with the reference code, as well as with the other new procedure codes within this family, all of which represent more complex procedures. The panel felt the survey recommended times for 29907 are all appropriate and accurate and that an overnight facility stay along with a full discharge day and four post-operative office visits are typical for this procedure. Further, the post-operative visit package maintains relativity with our comparison code which has an additional in-facility stay visit and one higher level office visit (4-99213 for 29899 compared to 29907 which has 3-99213 and 1-99212).

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 29999

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty AAOS How often? Sometimes

Specialty APMA How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 5000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. Estimate of Requestor

Specialty AAOS Frequency 3000 Percentage %

Specialty APMA Frequency 2000 Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?
2,500 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty.
Please explain the rationale for this estimate. Estimate of Requestor

Specialty AAOS Frequency 1500 Percentage %

Specialty APMA Frequency 1000 Percentage %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/Specialty Society Update Process
PERC Summary of Recommendation
010 or 090 Day Global Periods
Facility Direct Inputs

CPT Long Descriptor:

29904: Arthroscopy, subtalar joint, surgical; with removal of loose body or foreign body

29905: Arthroscopy, subtalar joint, surgical; with synovectomy

29906: Arthroscopy, subtalar joint, surgical; with debridement

29907: Arthroscopy, subtalar joint, surgical; with subtalar arthrodesis

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:
A consensus panel of experts representing orthopaedic subspecialty societies (general orthopaedics, arthroscopy, trauma, shoulder and elbow, hand, hip & knee, foot & ankle, total joint, sports medicine) reviewed the practice expense details for the survey codes relative to other facility-only 90-day global orthopaedic services.

ease describe the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

No changes were made to the standard pre-service times. A total of 35 (office) and 60 (facility) minutes has been applied for the pre-service clinical labor activities. During the pre-service period, clinical staff conducts the standard pre-service activities: An RN/LPN/MA completes pre-service diagnostic and referral forms, coordinates pre-surgery services, schedules space and equipment in facility, provides pre-service education/obtains consent, and conducts follow-up phone calls.

Intra-Service Clinical Labor Activities:

Standard times for the activities necessary in the office and 100% of physician time were applied.

The standard 6 minutes has been applied for the outpatient procedures for discharge day management services from the facility.

The standard 12 minutes has been applied for the inpatient procedure for discharge day management services from the facility.

Post-Service Clinical Labor Activities:

The standard times have been applied for post-service clinical labor time.

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

April 2007

Insert Emergency Airway

In October 2006, the CPT Editorial Panel CPT Modifier Workgroup recommended 31500 *Intubation, endotracheal, emergency procedure* be removed from the modifier -51 exempt list. The Workgroup asked specialty societies to review the list and bring back any code they felt should be retained on the list. At the February 2007 CPT meeting the specialty societies asked to retain 31500 on the -51 Modifier exempt list. The CPT Modifier Workgroup forwarded 31500 to the RUC. Code 31500 had never been surveyed nor discussed at the RUC previously. The RUC understands that it is tasked with considering whether 31500 should be retained on the modifier -51 exempt list. If so, then support for this position is needed and the RUC must develop a work RVU recommendation consistent with the modifier -51 exempt payment policy. If not, then the RUC should determine whether there is compelling evidence for revaluation of 31500.

981

FROM THE CPT MANUAL: "Modifier -51: Multiple Procedures: When multiple procedures, other than E/M services, are performed at the same session by the same provider, the primary procedure or service listed may be reported as listed. The additional procedure(s) or service(s) may be identified by appending modifier -51 to the additional procedure or service code(s). Note: This modifier should not be appended to designated "add-on" codes."

The RUC heard a full description of the service and the history of its value. The specialty societies and the RUC understood that the service had significant time in the pre-service and post service periods which would disqualify 31500 from the -51 Modifier exempt list (according to the CPT's criteria for inclusion on the list).

FROM CPT: MODIFIER -51 EXEMPTION – INCLUSION/EXCLUSION CRITERIA
"#3 Minimal Amount of Pre-and Post-Service Time Relative to Intra-Service Time and Minimal Number of Visits. As these procedures are usually performed with other procedures, there should be a minimal amount of pre-and post-service time relative to the procedure's intra-service time and there should be a minimal number of post-operative visits associated with the valuations of the procedures on this list."

After significant discussion, the RUC determined that the specialty society recommended pre-service time did not accurately reflect the service and decreased it from 9 minutes to 4 mninutes, while retaining the post-operative time at 10 minutes. **Due to a detailed review of the pre-service and post-service time to ensure no duplication with other service performed on the same date, the RUC recommends that 31500 be retained on the Modifier -51 Exempt List.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

As the RUC works under the presumption that all services on the RBRVS are correctly valued unless evidence is produced to revalue, the specialty society provided compelling evidence to support its recommendation of 2.55 RVUs, which is an increase over the existing value of 31500, 2.33 RVUs. The RUC reviewed this compelling evidence and did not agree with the specialty that there had been changes in the techniques and methods of providing endotracheal intubation. **Therefore, the RUC recommends the new physician times, 4 minutes of pre-service time, 5 minutes of intra-service time and 10 minutes of post-service time associated with 31500 and that the existing value of 2.33 work RVUs be retained for this procedure.**

Practice Expense:
The RUC recommends that the practice expense inputs be retained for this procedure, which is no practice expense inputs in the facility or non-facility setting.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
▲⊘31500	DD2	Intubation, endotracheal, emergency procedure	000	2.33 (No Change)

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:31500 Tracking Number DD2 Specialty Society Recommended RVU: **2.55**
Global Period: 000 RUC Recommended RVU: **2.33**

CPT Descriptor: Intubation, endotracheal, emergency procedure

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 65 year old man with coronary artery disease following failure of lithotripsy to relieve ureteral obstruction from a stone develops circulatory failure. The patient requires emergency endotracheal intubation for respiratory failure

Percentage of Survey Respondents who found Vignette to be Typical: 87%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 65%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: Evaluation of the patient's clinical condition, hemodynamics and assessment of airway anatomy. Equipment needed for tracheal intubation is determined and taken to the patient's bedside. The patient's directive regarding such intervention – if previously determined – is reviewed. Drugs required to facilitate manipulation of the airway are selected and prepared. Oxygen delivery system, resuscitation bag and mask and suction device are selected and checked for proper functioning. An attempt is made to explain the situation and anticipated procedure, reason for procedure to the patient and sometimes family. The patient is informed of benefits and possible complications and risks of procedure to the degree possible in view of the emergent nature of the situation.

Description of Intra-Service Work: The patient is positioned in the sniffing position. The patient receives oxygen via resuscitation bag and mask. Cricoid pressure is applied. Following confirmation of a clear airway, the drugs are administered for patient sedation and muscle relaxation. The laryngoscope is inserted into the airway and the vocal cords are identified. The appropriate size endotracheal tube is inserted into the trachea, the cuff is inflated and confirmation of the proper position is determined by clinical examination and capnography.

Description of Post-Service Work: The position of the endotracheal tube is confirmed by clinical examination and chest X-ray. The patient receives mechanical ventilatory support as appropriate to ensure both oxygenation and ventilation based on clinical status. The patient is observed until the physician is certain that ventilation is adequate. The physician confirms that the ETT remains in proper position after resuscitation or patient transfer to gurney or bed. A procedure note is written in the patient's chart as is an order for the chest x-ray. The physician reviews the chest x-ray for proper endotracheal tube placement and adjustments are made as necessary. An attempt is made to discuss the procedure and outcome with any patient family members that may be available on site.

Modifier -51 Exempt Status

Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? Yes

New Technology/Service:

Is this new/revised procedure considered to be a new technology or service? No

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
31515	000	1.80	Harvard Time

CPT Descriptor Laryngoscopy, direct, with or without tracheoscopy; for aspiration

KEY MPC COMPARISON CODES:

Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Most Recent Medicare Utilization	Work RVU	Time Source
92950	000	87,707	3.79	Harvard Time

CPT Descriptor 1 Cardiopulmonary resuscitation (eg, in cardiac arrest)

MPC CPT Code 2	Global	Most Recent Medicare Utilization	Work RVU	Time Source
52000	000	976,556	2.23	RUC Time

CPT Descriptor 2 Cystourethroscopy (separate procedure)

Other Reference CPT Code	Global	Work RVU	Time Source
36556	000	2.50	RUC Time

CPT Descriptor Insertion of non-tunneled centrally inserted central venous catheter; age 5 years or older

---

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 32 **% of respondents:** 39.0 %

TIME ESTIMATES (Median)	CPT Code: 31500	Key Reference CPT Code: 31515	Source of Time Harvard Time
Median Pre-Service Time	4.00	14.00	
Median Intra-Service Time	5.00	26.00	
Median Immediate Post-service Time	10.00	14.00	
Median Critical Care Time	0.0	0.00	
Median Other Hospital Visit Time	0.0	0.00	
Median Discharge Day Management Time	0.0	0.00	
Median Office Visit Time	0.0	0.00	
Prolonged Services Time	0.0	0.00	
Median Total Time	**19.00**	**54.00**	
Other time if appropriate			

INTENSITY/COMPLEXITY MEASURES (Mean)

Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	3.88	3.09
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	3.53	3.00
Urgency of medical decision making	4.88	3.28
Technical Skill/Physical Effort (Mean)		
Technical skill required	4.53	3.91
Physical effort required	3.88	3.22
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	4.75	3.75
Outcome depends on the skill and judgment of physician	4.69	3.78
Estimated risk of malpractice suit with poor outcome	4.44	3.84

INTENSITY/COMPLEXITY MEASURES	CPT Code	Reference Service 1
Time Segments (Mean)		
Pre-Service intensity/complexity	3.59	2.84
Intra-Service intensity/complexity	4.34	3.63
Post-Service intensity/complexity	3.22	2.59

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

This code comes to the RUC as a result of the CPT review of codes listed in Appendix E – Summary of Codes Exempt from Modifier 51. The Panel agreed that the code met the criteria to remain in this appendix.

While 65% of our respondents indicated that moderate sedation was typical for this procedure, we maintain that it is not inherent to the procedure. We suspect that many of our respondents may have known that moderate sedation as defined by CPT was not what is actually provided in intubation, but deep sedation and temporary paralysis is necessary. This may have confused participants on how to respond to the question since that deep sedation is an important part of the service.

This was a joint survey between the two specialties that most frequently provide the service – Emergency Medicine and Anesthesia. The times from each specialty were very consistent:

	ACEP	ASA	All Responses
Pre-service time	10	8	9
Intra-service time	5	5	5
Post-service time	10	10	10

The Survey RVW was bi-modal; the ACEP median was 2.85 and the ASA median was 2.25. We are recommending a work RVU that falls between these two values – 2.55. We maintain that an increase is warranted because:

- There have been changes in practice since the code was first valued. In an emergency scenario, patients are intubated in the field. Our respondents noted that they intubate the most difficult patients that could not be successfully done in the filed. They also note that, in an emergency situation, the patient's oral airway may be filled with vomitus after a failed intubation or CPR.
- We compared the work/complexity/ intensity to that associated with code 52000 – Cystourethroscopy (separate procedure). This code is on the MPC list (status A) and has 2.23 work RVUs. An endotracheal intubation carries higher degrees of the all the components of physician work and should have a correspondingly higher value. We believe our recommended value of 2.55 is a reasonable reflection of this comparison.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☒ Other reason (please explain) The service is on the Modifier 51 exempt list as it is typically provided adjunctive to another service or procedure.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. The service could be provided to treat a patient who develops respiratory distress while undergoing another procedure. The treatment could involve other services and procedures after the airway is secure and adequate ventilation is established. These other servcies and procedures would include arterial lines (36620), pulmonary artery catheters (93503) and thoracentesis (32000).

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 31500

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Emergency Medicine	How often? Commonly
Specialty Anesthesia	How often? Commonly
Specialty Pulmonary Disease	How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 1086748
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. Using the breakdown on file for the Medicare population:

Specialty Emergency Medicine	Frequency 433396	Percentage 39.88 %
Specialty Anesthesia	Frequency 248540	Percentage 22.87 %
Specialty Pulmonary Disease	Frequency 137585	Percentage 12.66 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 271,687 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Breakdown according to RUC Database

Specialty Emergency Medicine	Frequency 108349	Percentage 39.88 %

Specialty Anesthesia	Frequency 62136	Percentage 22.87 %
Specialty Pulmonary Disease	Frequency 34396	Percentage 12.66 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? No

If no, please select another crosswalk and provide a brief rationale. The existing PLI for 31500 should be retained.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

April 2007

Add-on Maze Procedures

In 2006, the Society of Thoracic Surgeons (STS) brought forward new codes for the Maze procedures to account for the new technology and various techniques to perform Maze procedures. These codes, 33254 *Operative tissue ablation and reconstruction of atria, limited (eg, modified maze procedure)* (Work RVU=23.58), 33255 *Operative tissue ablation and reconstruction of atria, extensive (eg, maze procedure); without cardiopulmonary bypass* (Work RVU=28.91), and 33256 *Operative tissue ablation and reconstruction of atria, extensive (eg, maze procedure); with cardiopulmonary bypass* (Work RVU=34.77) were approved by CPT for the 2007 cycle and replaced code 33253 *Operative incisions and reconstruction of atria for treatment of atrial fibrillation or atrial flutter (eg, maze procedure)* (work RVU=31.01). During the valuation process at the RUC, it was determined that a significant number of these procedures were performed in conjunction with other cardiac procedures. As a result, the RUC determined that the new open codes for 2007 should not be reported with other cardiac procedures and asked CPT to add verbiage to the guidelines for the open Maze codes indicating that they should not be reported in addition to other cardiac procedures and to report this circumstance, the unlisted cardiac procedure code (33999) should be reported. The RUC suggested that add-on codes would allow appropriate valuation of these services. The CPT Editorial Panel, therefore, created three new add-on Maze codes to allow for reporting of these services with other cardiac procedures.

The specialty society utilized a standard RUC survey instrument and received survey responses from 70 thoracic surgeons. The survey data was reviewed by a consensus committee and was further supported by data from the STS Database. All of this data supported the notion made by the specialty that the patient in which these procedures are performed on, is a very intense, complicated patient with probable comorbities including congestive heart failure and cerebrovascular disease as these services would be performed in addition to other cardiac procedures including 33533 *Coronary artery bypass, using arterial graft(s); single arterial graft* (Work RVU=33.64). The specialty society explained that the complexity/severity of this patient justifies the pre-service and post-service times as well as post-operative visits not typically associated with other ZZZ global procedures and further justified that during the 2005 Five-Year Review precedents had been set that other ZZZ global codes within the cardiothoracic families received these additional times and visits. Additionally, the RUC had some concern that as these procedures are ZZZ global procedures, typically there would not be a discharge day-management procedure associated with them. The specialty society explained that the patients who would receive these procedures are very complex as they are receiving the add-on maze procedure in addition to another cardiac procedure. The additional half of the 99238 discharge day management procedure associated with these add-on maze procedures is a proxy as when a Maze procedure is performed with the base cardiac code, a level 99239 discharge day management procedure, would be typical for these patients. A RUC member did express concern regarding whether the CABG codes and other thoracic surgery services in the 2005 Five-Year Review included the Maze procedures in STS database time. The STS stated that the time in the STS database, as used in the 2005 Five-Year Review, only includes time for services where a single procedure was performed and would not reflect the additional time needed to perform the add-on Maze procedures.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

997

33257 *Operative tissue ablation and reconstruction of atria, performed at the time of other cardiac procedure(s), limited (eg, modified maze procedure), (List separately in addition to the code for the primary procedure)*

The specialty society made revisions to the pre-service and post-service time, reducing both from 30 minutes to 15 minutes to more accurately reflect the services provided during these periods of time. The RUC reviewed 33257 in comparison to its reference code 33518 *Coronary artery bypass, using venous graft(s) and arterial graft(s); two venous grafts (List separately in addition to code for arterial graft)* (Work RVU=7.93). The RUC noted that the total service time for 332570 was longer than the reference code, 180.30 minutes and 112.60 minutes. Further, the RUC noted that the surveyed code is a more complex procedure to perform in comparison to the reference code. Therefore, the RUC recommends 9.63 work RVUs, the survey's 75th percentile, as this value appropriately places this service in comparison to the reference code. The RUC further noted that under current payment policy, when 33254, the stand- alone equivalent of this code, is performed with another cardiac procedure, it would be subject to the multiple procedure reduction and would be decreased by 50 percent, resulting in a value of 11.79 work RVUs which is substantially higher in value than the proposed recommended RVU of the add-on procedure. **The RUC recommends 9.63 work RVUs for 33257.**

33258 *Operative tissue ablation and reconstruction of atria, performed at the time of other cardiac procedure(s), extensive (eg, maze procedure), without cardiopulmonary bypass, (List separately in addition to the code for the primary procedure)*

The specialty society made revisions to the pre-service and post-service time, reducing both from 30 minutes to 15 minutes to more accurately reflect the services provided during these periods of time. The RUC reviewed 33258 in comparison to its reference code 33519 *Coronary artery bypass, using venous graft(s) and arterial graft(s); three venous grafts (List separately in addition to code for arterial graft)* (Work RVU=10.49). The RUC noted that the total service time for 33258 was longer than the reference code, 190.30 minutes and 139.80 minutes. Further, the RUC noted that the surveyed code is a more complex procedure to perform in comparison to the reference code. Therefore, the RUC recommends 11.00 work RVUs, the survey's 75th percentile, as this value appropriately places this service in comparison to the reference code. The RUC further noted that under current payment policy, when 33255, the stand- alone equivalent of this code, is performed with another cardiac procedure, it would be subject to the multiple procedure reduction and would be decreased by 50 percent, resulting in a value of 14.46 work RVUs which is substantially higher in value than the proposed recommended RVU of the add-on procedure. **The RUC recommends 11.00 work RVUs for 33258.**

33259 *Operative tissue ablation and reconstruction of atria, performed at the time of other cardiac procedure(s), extensive (eg, maze procedure), with cardiopulmonary bypass, (List separately in addition to the code for the primary procedure)*

The specialty society made revisions to the pre-service and post-service time, reducing both from 30 minutes to 15 minutes to more accurately reflect the services provided during these periods of time. The RUC reviewed 33259 in comparison to its reference code 33522 *Coronary artery bypass, using venous graft(s) and arterial graft(s); five venous grafts (List separately in addition to code for arterial graft)* (Work RVU=14.14). The RUC noted that the total service time for 33259 was comparable to the reference code, 222.70 minutes and 174.45 minutes. However, the RUC noted that the surveyed code requires similar complexity in comparison to the reference code. Therefore, the RUC recommends 14.14 work RVUs, the survey's

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

75th percentile, as this value appropriately places this service in comparison to the reference code. The RUC further noted that under current payment policy, when 33256, the stand- alone equivalent of this code, is performed with another cardiac procedure, it would be subject to the multiple procedure reduction and would be decreased by 50 percent, resulting in a value of 17.39 work RVUs which is substantially higher in value than the proposed recommended RVU of the add-on procedure. **The RUC recommends 14.14 work RVUs for 33259.**

The RUC notes that its original assertion that Maze procedures performed in conjunction with other cardiac services be valued less than the 50% multiple surgery reduction is maintained with these recommendations.

Practice Expense:
The RUC recommends the standard cardiothoracic surgery 090 day global practice expense inputs package for 33257, 33258 and 33259.

New Technology:
The RUC recommends that 33257, 33258 and 33259 be added to the new technology list as this procedure utilizes new techniques.

999

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
This family of codes describes the surgical treatment of supraventricular dysrhythmias. Tissue ablation, disruption and reconstruction can be accomplished by many methods including surgical incision or through the use of a variety of energy sources (eg, radiofrequency, cryotherapy, microwave, ultrasound, laser). If excision or isolation of the left atrial appendage by any method, including stapling, oversewing, ligation, or plication, is performed in conjunction with any of the atrial tissue ablation and reconstruction (maze) procedures (33254-33256,33257, 33258, 33259, 33265-33266), it is considered part of the procedure. Codes 33254-33256 are only to be reported when there is no concurrently performed procedure that requires median sternotomy or cardiopulmonary bypass. The appropriate atrial tissue ablation add-on code, 33257, 33258, 33259 should be reported in addition to an open cardiac procedure requiring sternotomy or cardiopulmonary bypass if performed concurrently. ~~When 33254-33256 are performed with a concurrent procedure that requires a median sternotomy or cardiopulmonary bypass, report the operative (nonthoracoscopic) electrophysiologic procedure with unlisted procedure code 33999.~~ ***Definitions*** ***Limited** operative ablation...* *Surgical isolation of...* ***Extensive** operative ablation...*

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:33257 Tracking Number EE1 Specialty Society Recommended RVU: **9.63**
Global Period: ZZZ RUC Recommended RVU: **9.63**

CPT Descriptor: Operative tissue ablation and reconstruction of atria, performed at the time of other cardiac procedure(s), limited (eg, modified maze procedure), (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 65-year-old man with hypertension and hyperlipidemia presents with unstable angina, rules out for myocardial infarction, and is found to have 3 vessel coronary disease with moderate LV dysfunction. He has had multiple episodes of atrial fibrillation but presents in sinus rhythm, on antiarrhythmic medications and with a slightly enlarged left atrium on echocardiography. At the time of his cardiac procedure, a limited operative tissue ablation and reconstruction of the atria (eg, modified maze procedure) is performed.
]

Percentage of Survey Respondents who found Vignette to be Typical: 80%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: Additional physician work includes review of the echocardiogram report with attention to left atrial size to determine that a limited, modified maze procedure is appropriate. Careful review of the patients arrhythmia history, including documentation of episodes of atrial fibrillation is also required.

Description of Intra-Service Work: A series of atrial lesions were created using an ablative energy source to isolate or redirect abnormal atrial depolarization site(s). The creation of these lesions requires sharp and blunt dissection of the pulmonary veins from the pericardial reflections, to ensure that the ablation energy is directed to the body of the left atrium rather than to the pulmonary veins themselves. Special attention is paid to ablative energy delivery to avoid injury to coronary arteries or the esophagus. The left atrial appendage is excised. Temporary atrial and ventricular pacing wires are placed.

Description of Post-Service Work: - Additional postoperative visits are typically required due to the paradoxically increased incidence of atrial flutter/fibrillation related to the add-on procedure and the need for prompt conversion to sinus rhythm to mitigate against persistence of atrial fibrillation. Antiarrhytmic drugs are typically required, and oral anticoagulation frequently needed. These aspects result in increased discharge management work and additional office visits.

Time Segments (Mean)		
Pre-Service intensity/complexity	3.06	3.08
Intra-Service intensity/complexity	3.33	3.52
Post-Service intensity/complexity	3.09	3.03

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*
X0

Additional Rationale:

The STS is recommending the 75th percentile value for 33257, rather than the median value which if used would result in insufficient intraservice intensity (IWPUT) or insufficient pre- and post service elements recommended by the survey respondents. It is clear, from reviewing the survey results, that the respondents allocated substantial additional pre- and post-service work elements, but failed to consider them in estimating the overall code value. In fact, 89% of the respondents assigned more work to pre- and post-services than they did to the total code work value.

Using the median responses for total RVW, intraservice time, and additional pre- and post-service time and visits results in an IWPUT of -0.297, in that the recommended pre- and post service work exceeds the total median survey RVW. Using the 75th percentile RVW, while retaining the same pre- and post-values, still results in an IWPUT of -0.201.

It is also clear from the survey results that, despite the instructions, many respondents did not understand that ZZZ pre- and post-service time and work should be additional to that already present in the base procedure. Accordingly, STS queried its National Cardiac Database for procedures in 2004, 2005 and 2006 where this procedure was performed as the sole additional procedure, in combination with any of 55 base procedural code or code combinations. 4,587 such procedures were identified, and compared to weighted average data from 356,560 patients having matching base procedures alone. The results are illustrated in the following table:

		Base Procedure	X0 Limited Maze Add on	Absolute Delta	Relative Delta
Number of Patients			4,587		
Age(Years)	Mean	62.8	68.1	5.3	8%
Age >= 65	%Yes	48.0%	67.2%	19.2%	40%
Gender (Male)	%Yes	61.6%	63.2%	1.6%	3%
Weight(kg)	Mean	83.1	85.1	1.9	2%

Diabetes	%Yes	25.7%	26.2%	0.5%	2%
PVD	%Yes	10.1%	11.9%	1.8%	18%
CVD	%Yes	11.4%	14.6%	3.2%	28%
Previous CV Intervention	%Yes	17.2%	20.0%	2.8%	16%
Previous PCI	%Yes	52.6%	55.1%	2.5%	5%
Congestive Heart Failure	%Yes	26.1%	35.8%	9.7%	37%
Cardiogenic Shock	%Yes	1.6%	0.8%	-0.8%	-50%
Ejection Fraction Delta	Mean	52.9	51.1	-1.9	-4%
Intraop Blood Products	%Yes	39.6%	43.2%	3.6%	9%
Postop Blood Products	%Yes	40.9%	46.1%	5.2%	13%
Total Hours Ventilated	Mean	17.1	20.6	3.4	20%
Total ICU Hours	Mean	57.5	71.4	13.8	24%
Post Operative LOS	Mean	6.9	8.1	1.2	17%
Mortality	%Yes	2.1%	3.3%	1.3%	60%
Readmisson <=30 Days	%Yes	9.9%	13.3%	3.4%	35%

These data unequivocally demonstrate that the use of 33257 identifies a population of patients that are significantly older and sicker than those not undergoing 33257 or any other concomitant procedure. The 37% increase in preoperative heart failure and 28% increase in cerebrovascular disease are consistent with the presence of atrial fibrillation and more advanced age (5.3 years per patient). These patient characteristics and the impact of 33257 performance result in 13.8 additional ICU hours per patient, and an additional 1.2 days of hospital stay. The patients receive more blood products, and are more to be readmitted to the hospital, and are less likely to survive.

These data confirm in the survey results regarding pre- and post-service additional work, and STS recommends using the method approved in the 2005 5-year review to allocate post-service in-hospital E&M fractional visits from these data. It should be stressed that the add-on maze patient data were not included in the 5 year review where multiple procedure patients were appropriately excluded from the analysis. Therefore, the additional resulting physician work is not included in the base procedure code values.

We also recommend reductions in the survey recommended pre-service time, post-service time, and outpatient office visits. The latter single additional visit is consistent with the known need to manage anti-arrhythmic agents, arrhythmias, and anticoagulation and is consistent with the 35% increase in hospital readmission rate. We recommend reduction of the recommended 99238 by 50%, which in effect will provide the patient with a 99239 discharge day when combined with the base code. This is consistent with the increased work associated with drug and drug interaction management and arrhythmia counseling and discharge planning.

Using these recommendations, with the 75th percentile survey RVW results in an IWPUT of 0.110, which is well within the range of previously approved IWPUT for cardiac surgery codes. We note that this value represents 41% of the stand alone 090 global version of the ZZZ code, less than the 50% reduction that would otherwise apply.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.
3. Utilization Table for 33257 from STS Data

4. CPT code description	CPT Code	X0 Limited Maze			
5. Coronary artery bypass, using arterial and venous grafts	33533-6	33517-23	2065	45.0%	
6. Replacement, mitral valve, with cardiopulmonary bypass	33430	728	15.9%		
7. Valvuloplasty, mitral valve, with cardiopulmonary bypass; radical reconstruction	33427	574	12.5%		
8. Replacement, aortic valve, with cardiopulmonary bypass; with prosthetic valve	33405	504	11.0%		
9. Valvuloplasty, mitral valve, with cardiopulmonary bypass; with prosthetic ring	33426	295	6.4%		
10. Coronary artery bypass, vein only; three coronary venous grafts	33512	67	1.5%		
11. Coronary artery bypass, using arterial graft(s) 33533-33536	33533	64	1.4%		
12. Replacement, aortic valve, with cardiopulmonary bypass; with stentless tissue valve	33410	50	1.1%		
13. Coronary artery bypass, vein only; two coronary venous grafts	33511	46	1.0%		
14. Repair atrial septal defect, secundum, with cardiopulmonary bypass	33641	41	0.9%		
15. Coronary artery bypass, vein only; four coronary venous grafts	33513	35	0.8%		
16. Coronary artery bypass, vein only; single coronary venous graft	33510	18	0.4%		
17. Valvuloplasty, mitral valve, with cardiopulmonary bypass;	33425	17	0.4%		
18. Coronary artery bypass, vein only; five coronary venous grafts	33514	11	0.2%		
19. Ascending aorta graft with aortic root replacement and coronary reconstruction	33863	8	0.2%		
20. Replacement, tricuspid valve, with cardiopulmonary bypass	33465	7	0.2%		
21. Valvuloplasty, tricuspid valve; with ring insertion	33464	6	0.1%		
22. Valvuloplasty, tricuspid valve; with ring insertion	33464	6	0.1%		
23. Valvuloplasty, aortic valve; open, with cardiopulmonary bypass	33400	5	0.1%		
24. Coronary artery bypass, vein only; six or more coronary venous grafts	33516	4	0.1%		
25. Resection or incision of subvalvular tissue for discrete subvalvular aortic stenosis	33415	2	0.0%		
26. Replacement, pulmonary valve	33475	2	0.0%		
27. Myocardial resection (eg, ventricular aneurysmectomy)	33542	2	0.0%		
28. Repair of cardiac wound; without bypass	33300	2	0.0%		
29. Valvuloplasty, tricuspid valve; without ring insertion	33463	1	0.0%

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 33253

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty cardiothoracic surgery How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 4587

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. The frequency was taken from the STS database and accounts for procedues done over a 2.5 year period of time.

Specialty cardiothoracic surgery Frequency 4587 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 2,522 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The STS database mean age is over 65 so it is estimated that approximately 55% of these procedures are performed in the Medicare population

Specialty cardiothoracic surgery Frequency 2522 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? No

If no, please select another crosswalk and provide a brief rationale. The procedure that best reflects the PLI is the 33518 Coronary artery bypass, using venous graft(s) and arterial graft(s); two venous grafts (List separately in addition to code for arterial graft)

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:33258 Tracking Number EE2 Specialty Society Recommended RVU: **11.00**
Global Period: ZZZ RUC Recommended RVU: **11.00**

CPT Descriptor: Operative tissue ablation and reconstruction of atria, performed at the time of other cardiac procedure(s), extensive (eg, maze procedure), without cardiopulmonary bypass (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 70-year-old man with hypertension and hyperlipidemia presents with unstable angina, rules out for myocardial infarction, and is found to have 3 vessel coronary disease with moderate LV dysfunction. He also has chronic atrial fibrillation requiring anticoagulation, and an echocardiogram shows a markedly enlarged left atrium. At the time of his cardiac procedure, an extensive operative tissue ablation and reconstruction of atria (eg, maze procedure) is performed without cardiopulmonary bypass.

Percentage of Survey Respondents who found Vignette to be Typical: 68%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: - Additional physician work includes review of the echocardiogram report with attention to left atrial size to determine that a formal, extensive maze procedure is appropriate. Careful review of the patients arrhythmia history, including documentation of the duration of atrial fibrillation is also required. Attention to withdrawal of chronic anticoagulation and attendant risks of surgical bleeding is also required.

Description of Intra-Service Work: Under general anesthesia and through median sternotomy on the beating, working heart, a series of atrial lesions were created using an ablative energy source to isolate or redirect abnormal atrial depolarization site(s). An extensive lesion set was made, involving both atria or creating conduction block involving the AV annulus. Special attention is paid to ablative energy delivery to avoid injury to coronary arteries or the esophagus. The left atrial appendage is excised. Temporary atrial and ventricular pacing wires are placed.

Description of Post-Service Work: Additional postoperative visits are typically required due to the paradoxically increased incidence of atrial flutter/fibrillation related to the add-on procedure and the need for prompt conversion to sinus rhythm to mitigate against persistence of atrial fibrillation. Antiarrhythmic drugs are typically required, and oral anticoagulation frequently needed. These aspects result in increased discharge management work and additional office visits

Modifier -51 Exempt Status

Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:

Is this new/revised procedure considered to be a new technology or service? Yes

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
33519	ZZZ	10.49	**RUC Time**

CPT Descriptor Coronary artery bypass, using venous graft(s) and arterial graft(s); three venous grafts (List separately in addition to code for arterial graft)

KEY MPC COMPARISON CODES:

Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Most Recent Medicare Utilization	Work RVU	Time Source
22840	ZZZ	12.52	**RUC Time**	

CPT Descriptor 1 Posterior non-segmental instrumentation (eg, Harrington rod technique, pedicle fixation across one interspace, atlantoaxial transarticular screw fixation, sublaminar wiring at C1, facet screw fixation)

MPC CPT Code 2	Global	Most Recent Medicare Utilization	Work RVU	Time Source
22842	ZZZ	12.56	**RUC Time**	

CPT Descriptor 2 Posterior segmental instrumentation (eg, pedicle fixation, dual rods with multiple hooks and sublaminar wires); 3 to 6 vertebral segments

Other Reference CPT Code	Global	Work RVU	Time Source
33521	ZZZ	12.59	RUC Time

CPT Descriptor Coronary artery bypass, using venous graft(s) and arterial graft(s); four venous grafts (List separately in addition to code for arterial graft)

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 13 **% of respondents:** 18.5 %

Time Segments (Mean)		
Pre-Service intensity/complexity	3.38	3.37
Intra-Service intensity/complexity	4.01	3.90
Post-Service intensity/complexity	3.36	3.28

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Additional Rationale:

The STS is recommending the 75th percentile value for 33258, rather than the median value which if used would result in insufficient intraservice intensity (IWPUT) or insufficient pre- and post service elements recommended by the survey respondents. It is clear, from reviewing the survey results, that the respondents allocated substantial additional pre- and post-service work elements, but failed to consider them in estimating the overall code value. In fact, 83% of the respondents assigned more work to pre- and post-services than they did to the total code work value.

Using the median responses for total RVW, intraservice time, and additional pre- and post-service time and visits results in an IWPUT of -0.108, in that the recommended pre- and post service work exceeds the total median survey RVW. Using the 75th percentile RVW, while retaining the same pre- and post-values, still results in an IWPUT of -0.086.

It is also clear from the survey results that, despite the instructions, many respondents did not understand that ZZZ pre- and post-service time and work should be additional to that already present in the base procedure. Accordingly, STS queried its National Cardiac Database for procedures in 2004, 2005 and 2006 where this procedure was performed as the sole additional procedure, in combination with any of 35 base procedural code or code combinations. 235 such procedures were identified, and compared to weighted average data from 356,560 patients having matching base procedures alone. The results are illustrated in the following table:

	Base Procedures	33258 Extensive Maze no CPB	Absolute Delta	Relative Delta
Number of Patients		**235**		
Age(Years)	**65.3**	**72.3**	**7.0**	**11%**
Age >= 65	**54.4%**	**84.7%**	**30.3%**	**56%**
Gender (Male)	**69.4%**	**72.5%**	**3.1%**	**4%**
Weight(kg)	**85.9**	**86.0**	**0.1**	**0%**

Diabetes	35.7%	31.4%	-4.3%	-12%
PVD	15.1%	20.3%	5.2%	35%
CVD	13.7%	19.9%	6.2%	45%
Previous CV Intervention	24.5%	25.4%	0.9%	4%
Previous PCI	73.6%	59.8%	-13.9%	-19%
Congestive Heart Failure	14.4%	27.5%	13.2%	92%
Cardiogenic Shock	1.8%	0.4%	-1.4%	-77%
Ejection Fraction	51.0	48.9	-2.1	-4%
Intraop Blood Products	34.7%	29.4%	-5.3%	-15%
Postop Blood Products	39.4%	48.7%	9.2%	23%
Total Hours Ventilated	15.7	22.7	7.0	45%
Total ICU Hours	53.8	72.7	18.8	35%
Post Operative LOS	6.3	7.5	1.1	18%
Mortality	1.7%	3.5%	1.8%	106%
Readmisson <=30 Days	9.2%	11.9%	2.7%	29%

These data unequivocally demonstrate that the use of 33258 identifies a population of patients that are significantly older and sicker than those not undergoing 33258 or any other concomitant procedure. The 92% increase in preoperative heart failure and 45% increase in cerebrovascular disease are consistent with the presence of atrial fibrillation and more advanced age (7.0 years per patient). These patient characteristics and the impact of 33258 performance result in 18.8 additional ICU hours per patient, and an additional 1.1 days of hospital stay. The patients are more to be readmitted to the hospital, and are less likely to survive.

These data confirm in the survey results regarding pre- and post-service additional work, and STS recommends using the method approved in the 2005 5-year review to allocate post-service in-hospital E&M fractional visits from these data. It should be stressed that the add-on maze patient data were not included in the 5 year review where multiple procedure patients were appropriately excluded from the analysis. Therefore, the additional resulting physician work is not included in the base procedure code values.

We also recommend reductions in the survey recommended pre-service time and outpatient office visits. The latter single additional visit is consistent with the known need to manage anti-arrhythmic agents, arrhythmias, and anticoagulation and is consistent with the 29% increase in hospital readmission rate. We recommend reduction of the recommended 99238 by 50%, which in effect will provide the patient with a 99239 discharge day when combined with the base code. This is consistent with the increased work associated with drug and drug interaction management and arrhythmia counseling and discharge planning.

Using these recommendations, with the 75th percentile survey RVW results in an IWPUT of 0.094, which is well within the range of previously approved IWPUT for cardiac surgery codes. We note that this value represents 38% of the stand alone 090 global version of the ZZZ code, less than the 50% reduction that would otherwise apply.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.
3. Utilization Table for 33258 from STS database data
4. CPT code description CPT Code X1 Extensive Maze No CPB
5. Coronary artery bypass, using arterial and venous grafts 33533-6 33517-23 192 85.3%
6. Coronary artery bypass, using arterial graft(s) 33533-33536 33533 16 7.1%
7. Coronary artery bypass, vein only; two coronary venous grafts 33511 7 3.1%
8. Coronary artery bypass, vein only; three coronary venous grafts 33512 5 2.2%
9. Coronary artery bypass, vein only; four coronary venous grafts 33513 3 1.3%
10. Coronary artery bypass, vein only; single coronary venous graft 33510 1 0.4%
11. Coronary artery bypass, vein only; five coronary venous grafts 33514 1 0.4%
12.
13. Total 2.5 Years STS database 225 100.0%

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 33253

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty cardiothoracic surgery How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 225
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. Based on STS database date over a 2.5 year period

Specialty cardiothoracic surgery Frequency 225 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 123. If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty.
Please explain the rationale for this estimate. The STS database mean age is over 65 so it is estimated that approximately 55% of these procedures are performed in the Medicare population.

Specialty cardiothoracic surgery Frequency 123 Percentage 100.00 %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States?

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? No

If no, please select another crosswalk and provide a brief rationale. 33519 Coronary artery bypass, using venous graft(s) and arterial graft(s); three venous grafts (List separately in addition to code for arterial graft)

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:33259 Tracking Number EE3 Specialty Society Recommended RVU: **14.14**
Global Period: ZZZ RUC Recommended RVU: **14.14**

CPT Descriptor: Operative tissue ablation and reconstruction of atria, performed at the time of other cardiac procedure(s), extensive (eg, maze procedure), with cardiopulmonary bypass, (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 65-year-old woman presents with progressive heart failure, severe mitral regurgitation and a 5 year history of atrial fibrillation requiring anticoagulation. An echocardiogram shows biventricular and biatrial enlargement. At the time of her cardiac procedure, an extensive operative tissue ablation and reconstruction of atria (eg, maze procedure) is performed with cardiopulmonary bypass.

Percentage of Survey Respondents who found Vignette to be Typical: 90%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: Additional physician work includes review of the echocardiogram report with attention to left atrial size to determine that a formal, extensive maze procedure is appropriate. Careful review of the patients arrhythmia history, including documentation of the duration of atrial fibrillation is also required. Attention to withdrawal of chronic anticoagulation and attendant risks of surgical bleeding is also required.

Description of Intra-Service Work: Under general anesthesia and on cardiopulmonary bypass, a series of atrial lesions were created using surgical incision and/or an ablative energy source to isolate or redirect abnormal atrial depolarization site(s). An extensive lesion set was made, involving both atria or creating conduction block involving the AV annulus. Special attention is paid to ablative energy delivery to avoid injury to coronary arteries or the esophagus. The left atrial appendage is excised. Temporary atrial and ventricular pacing wires are placed.

Description of Post-Service Work: Additional postoperative visits are typically required due to the paradoxically increased incidence of atrial flutter/fibrillation related to the add-on procedure and the need for prompt conversion to sinus rhythm to mitigate against persistence of atrial fibrillation. Antiarrhythmic drugs are typically required, and oral anticoagulation frequently needed. These aspects result in increased discharge management work and additional office visits

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Additional Rationale:

The STS is recommending the 75th percentile value for 33259, rather than the median value which if used would result in insufficient intraservice intensity (IWPUT) or insufficient pre- and post service elements recommended by the survey respondents. It is clear, from reviewing the survey results, that the respondents allocated substantial additional pre- and post-service work elements, but failed to consider them in estimating the overall code value. In fact, 83% of the respondents assigned more work to pre- and post-services than they did to the total code work value.

Using the median responses for total RVW, intraservice time, and additional pre- and post-service time and visits results in an IWPUT of -0.136, in that the recommended pre- and post service work exceeds the total median survey RVW. Using the 75th percentile RVW, while retaining the same pre- and post-values, still results in an IWPUT of -0.070.

It is also clear from the survey results that, despite the instructions, many respondents did not understand that ZZZ pre- and post-service time and work should be additional to that already present in the base procedure. Accordingly, STS queried its National Cardiac Database for procedures in 2004, 2005 and 2006 where this procedure was performed as the sole additional procedure, in combination with any of 55 base procedural code or code combinations. 3,770 such procedures were identified, and compared to weighted average data from 356,560 patients having matching base procedures alone. The results are illustrated in the following table:

Cohort		Base Procedures	33259 Extensive Maze on CPB	Absolute Delta	Relative Delta
Number of Patients			3,770		
Age(Years)	Mean	62.1	67.3	5.2	8%
Age >= 65	%Yes	45.8%	64.3%	18.5%	40%
Gender (Male)	%Yes	60.2%	62.1%	2.0%	3%
Weight(kg)	Mean	82.6	84.6	2.0	2%
Diabetes	%Yes	22.7%	23.0%	0.3%	2%

PVD	%Yes	8.8%	9.6%	0.8%	9%
CVD	%Yes	10.9%	14.8%	3.9%	36%
Previous CV Intervention	%Yes	16.2%	18.7%	2.4%	15%
Previous PCI	%Yes	49.7%	50.6%	1.0%	2%
Congestive Heart Failure	%Yes	28.1%	35.2%	7.2%	25%
Cardiogenic Shock	%Yes	1.5%	0.7%	-0.7%	-51%
Ejection Fraction	Mean	53.7	51.3	-2.4	-4%
Intraop Blood Products	%Yes	36.7%	39.4%	2.7%	7%
Postop Blood Products	%Yes	38.5%	45.8%	7.3%	19%
Total Hours Ventilated	Mean	16.7	21.9	5.2	31%
Total ICU Hours	Mean	57.3	73.3	16.0	28%
Post Operative LOS	Mean	6.9	8.2	1.3	19%
Mortality	%Yes	2.1%	3.0%	0.9%	43%
Readmisson <=30 Days	%Yes	10.1%	11.5%	1.4%	14%

These data unequivocally demonstrate that the use of 33259 identifies a population of patients that are significantly older and sicker than those not undergoing 33259 or any other concomitant procedure. The 25% increase in preoperative heart failure and 36% increase in cerebrovascular disease are consistent with the presence of atrial fibrillation and more advanced age (5.2 years per patient). These patient characteristics and the impact of 33258 performance result in 16 additional ICU hours per patient, and an additional 1.3 days of hospital stay. The patients are more to be readmitted to the hospital, and are less likely to survive.

These data confirm in the survey results regarding pre- and post-service additional work, and STS recommends using the method approved in the 2005 5-year review to allocate post-service in-hospital E&M fractional visits from these data. It should be stressed that the add-on maze patient data were not included in the 5 year review where multiple procedure patients were appropriately excluded from the analysis. Therefore, the additional resulting physician work is not included in the base procedure code values.

We recommend retaining the two additional office visits as consistent with the known need to manage anti-arrhythmic agents, arrhythmias, and anticoagulation, consistent with the use of cardiopulmonary bypass, a 35.2% incidence of CHF and a 14% increase in hospital readmission rate. We recommend reduction of the recommended 99238 by 50%, which in effect will provide the patient with a 99239 discharge day when combined with the base code. This is consistent with the increased work associated with drug and drug interaction management and arrhythmia counseling and discharge planning.

Using these recommendations, with the 75th percentile survey RVW results in an IWPUT of 0.129, which is within the range of previously approved IWPUT for cardiac surgery codes. We note that this value represents 41% of the stand alone 090 global version of the ZZZ code, less than the 50% reduction that would otherwise apply.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the

provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 33253

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty cardiothoracic surgery How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 3644
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. Based on STS database data for a 2.5 year period

Specialty cardiothoracic surgery Frequency 2004 Percentage 54.99 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 2004 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The STS database mean age is over 65 so it is estimated that approximately 55% of these procedures are performed in the Medicare population

Specialty cardiothoracic surgery Frequency 3644 Percentage 100.00 %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States?

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? No

If no, please select another crosswalk and provide a brief rationale. 33522 Coronary artery bypass, using venous graft(s) and arterial graft(s); five venous grafts (List separately in addition to code for arterial graft) provides the most accurate crosswalk for this procedure.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

PEAC Summary of Recommendation
090 Day Global Period
Facility-ONLY Direct Inputs

CPT	DESCRIPTION	GLOBAL
33257 EE1	Operative tissue ablation and reconstruction of atria, performed at the time of other cardiac procedure(s), limited (eg, modified maze procedure), (List separately in addition to code for primary procedure)	ZZZ
33258 EE2	Operative tissue ablation and reconstruction of atria, performed at the time of other cardiac procedure(s), extensive (eg, maze procedure), without cardiopulmonary bypass (List separately in addition to code for primary procedure)	ZZZ
33259 EE3	Operative tissue ablation and reconstruction of atria, performed at the time of other cardiac procedure(s), extensive (eg, maze procedure), with cardiopulmonary bypass, (List separately in addition to code for primary procedure)	ZZZ

CLINICAL STAFF TIME:

Pre-service period clinical staff time: Sixty minutes has been established by a PEAC workgroup as the typical total time it takes on average across all specialties and for all categories of pre-service work to get a patient into a facility for a procedure. This time has been applied at an RN staff level which was approved by the PEAC for cardiothoracic surgery procedures.

Service period clinical staff time: The assignment of 6 minutes (12 minutes is supported by the PEAC) relative to coding of 99238 for discharge management for inpatient services has been applied. 6 minutes was applied because the procedures only contain a ½ discharge day.

Post-service period clinical staff time: Standard EM postop OFFICE visit times for clinical staff have been applied as appropriate.

SUPPLIES AND EQUIPMENT – POSTOPERATIVE OFFICE VISITS:

Standard PEAC minimum multispecialty office visit supplies and incision care have been applied.

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

April 2007

Valve Sparing Aortic Annulus Reconstruction

The CPT Editorial Panel created a new CPT code to report performance of root reconstruction in which the aortic valve is preserved and the aortic annulus is remodeled. The current codes represent different work from that involved in a valve sparing aortic annulus reconstruction. Changes in the patient population as well as changes in technology and techniques have allowed surgeons to perform a root reconstruction preserving the aortic valve and remodeling the aortic annulus, when indicated in a certain population of patients.

The RUC reviewed CPT code 33864 *Ascending aorta graft, with cardiopulmonary bypass with valve suspension; with coronary reconstruction and valve sparing aortic annulus remodeling (eg, David Procedure, Yacoub Procedure)* in comparison to its reference code, 33863 *Ascending aorta graft, with cardiopulmonary bypass, with or without valve suspension; with aortic root replacement using composite prosthesis and coronary reconstruction* (Work RVU=58.71). The RUC noted that the intra-service time associated with the surveyed code is greater than the intra-service time associated with the reference code, 300 minutes and 287 minutes, respectively. Additionally, the RUC compared the intensity/complexity measures of the surveyed code to the reference code and noted that the surveyed code requires more mental effort and judgment, technical skill and physical effort to perform than the reference code. Therefore, because the surveyed code has more intra-service time and greater intensity/complexity than the reference code, the RUC recommends the median survey value, 60.00 RVUs. **The RUC recommends 60.00 RVUs for 33864.**

Practice Expense:
The RUC recommends the standard 090 day global practice expense inputs package for 33864.

New Technology:
The RUC recommends that 33864 be added to the new technology list as this procedure utilizes new techniques.

SUMMARY OF RECOMMENDATION

CPT Code:33864 Tracking Number FF3 Specialty Society Recommended RVU: **60.00**
Global Period: 090 RUC Recommended RVU: **60.00**

CPT Descriptor: Ascending aorta graft, with cardiopulmonary bypass with valve suspension; with coronary reconstruction and valve sparing aortic annulus remodeling (eg, David Procedure, Yacoub Procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 32-year-old male with Marfan's syndrome is followed with serial echocardiograms looking for increasing aortic root dimensions. Echocardiogram shows a 5.5 cm ascending aorta with aortic annulus dilatation with mild aortic insufficiency. He is referred for a valve sparing root reconstruction.

Percentage of Survey Respondents who found Vignette to be Typical: 64%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: Physician performs a complete or interval history and physical exam, comprehensive medical decision making, writes pre-operative orders for peri-operative medications, reviews pre-operative work-up including review of information from other physicians, and relevant tests/data/labs, reviews incision and procedure, talks with pateint and family and answers any questions, obtains informed consent, confirms O.R. start time, changes into scrubs, reviews with anesthesia, dresses, waits, places bladder catheter, postitions and pads patient, scrubs, gloves, preps and drapes patient.

Description of Intra-Service Work: Performs standard median sternotomy skin incision, divides the sternum in the midline with a saw, places aortic and venous cannulas, assesses ascending aorta. Determines level of heparinization, establishes cardiopulmonary bypass, initiates systemic cooling, places antegrade and retrograde cardiplegia cannulas, adminsters cardioplegia, assesses heart for distention, cooling and cardioplegic arrest, opens ascending aorta, and evaluates aortic root and aortic valve.

The aortic valve and annulus are assessed and sized. The proximal aortic root is excised mobilizing the coronary artery ostia with cuffs of aortic tissue and leaving the native aortic valve and commissures intact. Multiple interrupted pledgetted sutures are placed beneath the aortic valve from the left ventricle to the base of the aortic root. These are passed through the proximal portion of a suitably sized Dacron graft. The graft is seated down and the sutures tied, thus fixing/remodelling the aortic annulus. The aortic valve and commissures are reattached at the appropriate height to the inside of the Dacron graft resuspending the valve using continuous sutures. Oval defects are created in the sinuses of the Dacron graft and the coronary buttons are reimplanted into the Dacron graft. The distal portion of the Dacron graft is now sewn to the normal distal ascending aorta evacuating air from the left side of the heart before tying down the last stitch.

The patient is placed in Trendelenberg, evacuate air, remove cross-clamp, vent aortic root until LV ejection present for 5-10 minutes, evaluate air in left side of heart and degree of aortic valve insuffuciency using transesophageal echocardiogram, resuscitate the heart by allowing it to beat while unloaded on cardiopulmonary bypass, ensure hemostasis, place temporary pacing wires and begin pacing if necessary, discontinue cardiopulmonary bypass, remove cannulas and close sites, place drains, re-approximate sternum and close chest.

Description of Post-Service Work: Apply sterile dressings to the incisions, remove drapes, transfer pateint to ICU, follow patient through day in ICU and provide critical care as necessary, talk to family, talk to and coordinate care with other physicians, write orders, write op note, discuss outcome with patient and family, evaluate patient post ICU, follow

patient daily while in hospital, discharge patient from hospital, follow-up with patient as necessary once discharged from hospital.

INTENSITY/COMPLEXITY MEASURES (Mean)

Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	4.47	4.00
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	4.47	4.00
Urgency of medical decision making	3.74	3.61
Technical Skill/Physical Effort (Mean)		
Technical skill required	4.89	4.36
Physical effort required	4.68	4.22
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	4.79	4.50
Outcome depends on the skill and judgment of physician	4.84	4.56

Estimated risk of malpractice suit with poor outcome	4.21	4.00

INTENSITY/COMPLEXITY MEASURES	CPT Code	Reference Service 1
Time Segments (Mean)		
Pre-Service intensity/complexity	4.32	3.89
Intra-Service intensity/complexity	4.89	4.50
Post-Service intensity/complexity	3.95	3.78

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 33861 or 33863

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty cardiothoracic surgery How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 150
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. Marfan's syndrome affects 1 in 5,000 people in the US; most people with Marfan's have some aortic root dilatation and Aortic root dilation with annuloaortic ectasia without Marfan's Syndrome affects in 1 in 10,000 people in the US. As currently reported - Approximately 5% of 33863 (90)
Approximately 10% of 33861 (26)

Specialty cardiothoracic surgery Frequency 150 Percentage 100.00 %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 5
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. This procedure is predominatley preformed in non-medicare patients.

Specialty cardiothoracic surgery Frequency 5 Percentage 100.00 %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/Specialty Society Update Process
PEAC Summary of Recommendation
090 Day Global Period
Facility-ONLY Direct Inputs

CPT	DESCRIPTION	GLOBAL
33864	**Ascending aorta graft, with cardiopulmonary bypass with valve suspension; with coronary reconstruction and valve sparing aortic annulus remodeling (eg, David Procedure, Yacoub Procedure)**	090

CLINICAL STAFF TIME:

Pre-service period clinical staff time: Sixty minutes has been established by a PEAC workgroup as the typical total time it takes on average across all specialties and for all categories of pre-service work to get a patient into a facility for a procedure. This time has been applied at an RN staff level which was approved by the PEAC for cardiothoracic surgery procedures.

Service period clinical staff time: The assignment of 12 minutes (as supported by the PEAC) relative to coding of 99238 for discharge management for inpatient services has been applied.

Post-service period clinical staff time: Standard EM postop OFFICE visit times for clinical staff have been applied as appropriate.

SUPPLIES AND EQUIPMENT – POSTOPERATIVE OFFICE VISITS:

Standard PEAC minimum multispecialty office visit supplies and incision care supplies have been applied. Standard power table and light exam have been applied

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

April 2007

Wireless Pressure Sensor Implantation

The CPT Editorial Panel replaced two Category III codes with two new Category I codes to describe the placement and subsequent monitoring of an implanted wireless pressure sensor located inside the body, within an aneurysm sac, but outside an endovascular graft as the service is currently performed 1,000 times per year and is likely to increase in utilization rapidly.

34806

The RUC reviewed the survey data for code 34806 *Transcatheter placement of wireless physiologic sensor in aneurysmal sac during endovascular repair, including radiological supervision and interpretation, instrument calibration and collection of pressure data.* The RUC compared 34806 to the key reference code indicated by the survey respondents, 34808 *Endovascular placement of iliac artery occlusion device* (Work RVU=4.12). The specialty societies indicated and the RUC agreed that the key reference service requires two times more physician work than 34806. The reference service has a total physician time of 60 minutes, however the new service requires a total of 35 minutes to complete (10 minutes pre-service time and 25 minutes intra-service time). The add-on reference service has zero pre- and post-time, however, the new service requires 10 minutes of pre-service evaluation time because sensor implantation is an independent and separate service that requires discussion with the patient and family during final preparations on the date of surgery as the physician reviews issues surrounding informed consent. Additionally, the surgeon/intervetionalist needs to ensure that the appropriate devices are present in the operating room and that the "Interrogator" (instrument that excites the sensor and records data from implanted device) is present and available. The RUC agreed that pre-service time of 10 minutes, intra-service time of 25 minutes is appropriate for code 34806.

The RUC recommends a work RVU of 2.06 for code 34806.

93982

The RUC discussed CPT code 93982 *Non-invasive physiologic study of implanted wireless pressure sensor in aneurismal sac following endovascular repair, complete study including recording, analysis of pressure and waveform tracings, interpretation and report*, and clarified that the service would have both a professional component (PC) and technical component (TC). The RUC then reviewed the specialty society survey results regarding physician work involved in the service. The RUC agreed with the specialty society recommendations to reduce the pre- and post-service times to two minutes each, because based on the associated work the pre- and post-service time is minimal. Further, the RUC agreed with the specialty society and determined that the 25th percentile survey work RVU, 0.30, was appropriate and maintained proper rank order in relation to the key reference service, CPT code 93731 *Electronic analysis of dual-chamber pacemaker system (includes evaluation of programmable*

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

parameters at rest and during activity where applicable, using electrocardiographic recording and interpretation of recordings at rest and during exercise, analysis of event markers and device response); without reprogramming, (Work RVU = 0.45). Additionally, the reference service has slightly higher pre-, intra-, and post-service times (pre = 5 minutes, intra = 15 minutes, post = 5 minutes) and nearly identical intensity/complexity measures. The RUC agreed that pre-service time of 2 minutes, intra-service time of 10 minutes, and post-service time of 2 minutes is appropriate for code 93982.

The RUC recommends a work RVU of 0.30 for code 93982.

Practice Expense
34806
The RUC determined and recommends that no direct practice expense inputs are required for code 34806.

93982
The RUC discussed the practice expenses involved in the technical component of this service performed in the non-facility setting. The RUC determined that the pre-service clinical activity of retrieving and reviewing patient records and previous studies was more appropriately accounted for in the intra-service period and performed by the technologist. Therefore, the pre-service time was reduced from three minutes to zero. The RUC also noted that the study takes place in a room that does not require preparation of the room, equipment or supplies and removed the two minutes allotted. The assist physician time denoted as 15 minutes was verified by the specialty societies and the RUC agreed that the time was appropriate. The intra-service time is not specifically spent assisting the physician, but rather includes the time for the technologist to perform the test. The specialty societies also discussed the other service period time and the RUC determined that time was appropriately allotted to greet the patient, obtain vitals, obtain consent, set-up equipment, and position the patient. **The RUC recommends the direct practice expense inputs as amended for code 93982.**

1044

New Technology
As these codes were previously reported using the Category III codes, the RUC recommends that codes 34806 and 93982 be added to the New Technology List so that these services can be closely monitored for any changes in utilization.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:34806 Tracking Number GG1 Specialty Society Recommended RVU: **2.06**
Global Period: ZZZ RUC Recommended RVU: **2.06**

CPT Descriptor: Transcatheter placement of wireless physiologic sensor in aneurysmal sac during endovascular repair, including radiological supervision and interpretation, instrument calibration and collection of pressure data

(Report 348XX with 34800, 34802, 34803, 34804, 34805, 34825, 34900, 33880, 33881, 33886)

(Do not report 939XX with 348XX)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 71-year-old male has been diagnosed with a 7.3 cm abdominal aortic aneurysm. He has elected to have the aneurysm treated using an endovascular repair. An implantable wireless pressure sensor is placed during the endovascular repair procedure.

[Note: This is an add-on code. When completing this survey, please only consider the additional work related to 348XX.]

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work:
Review CT to ensure sufficient thrombus-free space within aneurysm sac to allow safe placement of Wireless Physiologic Sensor (WPS). Discuss indications, risks and benefits of WPS with patient and family. Ensure all components present and ready in OR. Ensure device that reads sensor output is present in OR.

Description of Intra-Service Work:
- Prepare WPS introducer catheter by flushing guidewire lumen.
- Supervise technologists to position fluoroscopy unit appropriately
- Manipulate guidewire system to a position outside main body of endograft
- Advance sensor delivery system over the guidewire into correction position in the aneurysm.
- Position sensor at top of aneurysmal sac using fluoroscopic imaging.
- Use multiple projections, as required, to ensure exact placement
- Retract delivery system while maintaining position of the sensor on the tether.
- Using antenna and electronic system, calibrate sensor and take pre-exclusion measurement (measurement #1)
- Complete stent graft placement including all limbs/extensions and ballooning to achieve EVAR seal. (Note: this step is not IWPS work. It is part of endograft deployment.)
- Release sensor from tether and take post-exclusion measurement (measurement #2).
- Document final position of sensor with hard-copy imaging.

Description of Post-Service Work: N/A

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

All three specialty societies (ACR, SIR, SVS) reviewed the survey data in detail and reached the following recommendations.

PRE-TIME: There is valid pre-time for this ZZZ service. Sensor implantation is an independent and separate service that requires discussion with patient and family during final preparations on the day of surgery as the issues surrounding informed consent are reviewed. In addition, surgeon/interventionalist needs to ensure that the appropriate devices are present in OR, and that the "Interrogator" (instrument that excites the sensor and records data from the implanted device) is present and available in the OR. Median survey Pre-time for these two activities was 15 minutes. We believe 15 minutes cannot be justified, and we recommended reduction of pre-time to 10 minutes.

INTRA- and IMMEDIATE POST-TIME: There is an issue with the survey data in that all physician work involved with implantation and baseline data recording from the aneurysm sac occur in the OR before the patient's skin is closed. Therefore, all of the work is intra-work, and there is no immediate post-work. Only a minority of survey respondents entered "0" for post-service work on the RUC survey, and in fact, the median post-service survey value was 5 minutes. The RVS committees believe that survey respondents made the erroneous assumption that initial calibration and measurement of the sensor should be considered post-service work, and therefore recorded it as such on their surveys. In reality, this initial calibration and measurement takes place before the patient's skin is closed, and is therefore intra-service work based on RUC standards. To correct for this misunderstanding by survey respondents, we recommend shifting the 5 minutes of immediate post-work to intra-service work. This adjustment results in 25 minutes of intra-service work and 0 minutes of immediate post-work.

RVW: Key Reference 34808 (Endovascular placement of iliac artery occlusion device, ZZZ add-on code) was chosen by 50% of survey respondents, so it would appear to be an excellent clinical choice. The Key Reference has an RVW of 4.12, and the median survey RVW for the new service is 4.35. This appears to be a decent RVW choice, but for the fact that new service has 35 minutes total time by survey, while Key Reference has 60 minutes total time. Of course, the survey respondents are not made aware of the intra-time of the reference services, therefore, they base their responses on magnitude estimation. As noted in the intensity/complexity comparison, the new service and Key Reference have nearly identical values. This presents an unsolvable conundrum. In view of equal intensity/complexity,

but 50% less time than the Key Reference, we recommend that the RVW of new service be 50% that of the Key Reference, or 0.5 x 4.12 = 2.06.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

Coding Example: Endovascular AAA repair is the primary procedure (e.g. 34802). Open femoral artery exposure (if performed) is reported separately, as is introduction of catheter in aorta. All routine radiological supervision and interpretation is reported with 75952. Payment reduction rules for multiple procedures apply (indicated by "x1/2"). Procedure is typically performed to 2 providers, the example used here is one vascular surgeon (VS) and one interventional radiologist (IR).

CPT 34802: Endovascular repair of infrarenal abdominal aortic aneurysm or dissection; using modular bifurcated device with one docking limb. VS and IR are co-surgeons for primary code, which is a 90-day global. Both report 34802-62, each is paid ½ of 1.25 x RVW, which is 23.71 VS=14.81 RVUs, IR=14.81 RVUs

CPT 34812: Open femoral artery exposure for delivery of aortic endovascular prosthesis 0-day global, RVW=6.74 x ½ (for multiple procedure rule), so VS = 3.37 RVUs

CPT 75952: Radiological S&I for endovascular AAA repair XXX 4.49 with no multiple procedure reduction, so IR=4.49

36200: Introduce catheter in aorta XXX global. RVW=3.02 x 1/2 for multiple procedure reduction =1.51 RVUs for VS and 1.51 for IR since procedure requires one catheter be placed into aorta from each exposed femoral artery.

TOTAL RVW by Specialty VS total is 19.69 RVUs and IR total is 20.81 RVUs

The RVUs for the ZZZ add-on would be superimposed on these totals.

Pre-Service Time

Pre-service time with multiple service payment reduction rules
A portion of this will be done by each of two physicians

	VS	IR
34802	68	68
34812	38	00

75952	00	20
36200	00	00
Total	106	88

The pre-time of new service, i.e. 10 minutes would be added to one of these providers, presumably the VS in this example.

Intra-Service Time

Intra-service time with multiple service payment reduction rules. A portion of this will be done by each of two physicians

	VS	IR
34802	75	75
34812	22	00
75952	00	60
36200	39	39
Total	136	174

The Intra-time of new service, i.e. 25 minutes, would be added to one of these providers.

Post-Service Time

Post-service time with multiple service payment reduction rules. A portion of this will be done by each of two physicians

	VS	IR
34802	87	87
34812	30	0
75952	15	15
36200	0	0
Total	132	102

We propose no post-time for new service, so there would be no impact on post-service time.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 0153T

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty SVS How often? Rarely

Specialty SVS How often? Rarely

Specialty SVS How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 30000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. Used parent code 34802 to break out frequency

Specialty SVS Frequency 18000 Percentage 60.00 %

Specialty SIR Frequency 6000 Percentage 20.00 %

Specialty ACR Frequency 6000 Percentage 20.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 20,000 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Used freqency percentatges from parent code 34802 in order to develop an estimate.

Specialty SVS Frequency 12000 Percentage 60.00 %

Specialty SIR Frequency 4000 Percentage 20.00 %

Specialty ACR Frequency 4000 Percentage 20.00 %

Do many physicians perform this service across the United States? No

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? No

If no, please select another crosswalk and provide a brief rationale. 37250

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Non-Surgical

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:93982 Tracking Number GG2 Specialty Society Recommended RVU: **0.30**
Global Period: XXX RUC Recommended RVU: **0.30**

CPT Descriptor: Non-invasive physiologic study of implanted wireless pressure sensor in aneurysmal sac following endovascular repair, complete study including recording, analysis of pressure and waveform tracings, interpretation and report

(Do not report 939XX in conjunction with 348XX)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 71-year-old male underwent endovascular AAA repair with implantation of a wireless physiologic sensor one year ago. During a surveillance visit to the treating physician, sensor is used for noninvasive assessment of aneurysm pressure.

[Note: This CPT code will have a technical component (performed by a technologist) and a professional component. In responding to this survey, please consider and estimate ONLY the physician work associated with the professional component: interpretation and report writing.]

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: Review requisition to ensure appropriate test performed on correct patient. Review prior studies.

Description of Intra-Service Work: Review data provided by technologist including aneurysm sac waveform tracings obtained from excited implanted sensor, plus aneurysm sac pressure measurements taken from different positions of external sensor, and compare for pulsatility. Compare current waveform tracings to those obtained on all prior studies including the exam performed during surgery. Plot and compare raw pressures from aneurysm sac as well as sac pressures normalized to brachial systolic pressure. Draw conclusion based on all waveform reviews and pressure analyses regarding whether or not a clinically significant change has taken place in the physiologic status of the aneurysm sac. Dictate a report and identify those waveforms and pressure measurements that should be included in the final report.

Description of Post-Service Work: Review final report for accuracy of report transcription plus inclusion of appropriate waveforms, pressure measurements and pressure ratios

Time Segments (Mean)		
Pre-Service intensity/complexity	2.55	2.55
Intra-Service intensity/complexity	3.82	3.82
Post-Service intensity/complexity	2.64	2.64

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

A Multispecialty Consensus Committee (MCC) with members from ACR, SIR and SVS reviewed the survey data and determined that the pre-time of 5 minutes was difficult to justify based on the associated work, and therefore the pre-time has been reduced from the 5-minute median survey value to 2 minutes.

The MCC reviewed the survey data and determined that the post-time of 10 minutes was difficult to justify based on the associated work, and therefore the post-time has been reduced from the 10-minute median survey value to 2 minutes.

The MCC reviewed the survey intra-time and the associated work and determined that the survey median of 10 minutes is accurate and appropriate.

The recommended physician time for this service is therefore 2 minutes pre-time, 10 minutes intra-time and 2 minutes post-time for a total of 14 minutes.

The MCC compared the work of this new service, 93982 / GG2 to the most commonly cited reference service, 93731 which has an RVW of 0.45 and RUC time of 5/15/5 for a total of 25 minutes. The Committee felt that based on intensity, complexity and time comparisons, this new service 939XX must have an RVW less than the Key Reference service. Therefore, we determined the median survey RVW of 0.50 for this new service does not provide appropriate relativity.

The MCC then looked at MPC List XXX services with RVW < 0.50. CPT 71010 Chest X-ray two views has an RVW of 0.22 and a total time of 5 minutes. CPT 99212 Level 2 Established Patient Visit has an RVW of 0.45 with a total time of 16 minutes. The 25% percentile survey value for our new service is 0.30. This fits appropriately between MPC reference services 71010 and 99121.

Our MCC recommends the 25th percentile survey value of 0.30 for this service.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 0154T

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty SVS	How often? Rarely
Specialty SIR	How often? Rarely
Specialty ACR	How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 60000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. Used parent code 34802 to estimate percentages

Specialty SVS	Frequency 36000	Percentage 60.00 %
Specialty SIR	Frequency 12000	Percentage 20.00 %
Specialty ACR	Frequency 12000	Percentage 20.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 45,000 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Approx 66% of AAA repair patients are Medicare beneficiaries, used parent code 34802 to estimate percentages.

Specialty SVS	Frequency 27000	Percentage 60.00 %
Specialty SIR	Frequency 9000	Percentage 20.00 %
Specialty ACR	Frequency 9000	Percentage 20.00 %

Do many physicians perform this service across the United States? No

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Non-Surgical

Sample Size:_____ Response Rate: (%):_____ Global Period: XXX

Geographic Practice Setting %: Rural____ Suburban_____ Urban_____

Type of Practice %: _____Solo Practice
_____Single Specialty Group
_____Multispecialty Group
_____Medical School Faculty Practice Plan

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The American College of Radiology, Society for Interventional Radiology, and the Society for Vascular Surgery convened a Multispecialty Expert Consensus Panel to develop recommended direct inputs.

Please describe the clinical activities of your staff:

Pre-Service Clinical Labor Activities: Retrieve previous studies for the physician to review in concert with current exam.

Intra-Service Clinical Labor Activities: Greet patient and provide gowning. Briefly explain purpose, indications and conduct of test. Reassure patient regarding noninvasive nature, no ionizing radiation, etc. Obtain verbal consent to proceed. Prepare the room and wireless pressure sensor equipment. Position the patient. Take bilateral brachial blood pressures. Position the sensor over abdomen and search for sensor output signal. Move sensor in lateral and vertical axes to optimize AAA sac sensor output signal. Record output waveforms and pressure measurements from a variety of positions based on established protocol. Help patient from stretcher and assist as needed with clothing and transport back to waiting room. Clean room and equipment.

Post-Service Clinical Labor Activities: Post-process raw output waveforms and pressure measurements into final format. Calculate sac/brachial systolic pressure ratios. Develop hardcopy package of all waveforms, pressure measurements and pressure ratios for review by the interpreting physician. Archive information, complete service sheet.

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

April 2007

Brachial-Ulnar Bypass Graft

The CPT Editorial Panel created a new code to describe upper extremity bypass grafts performed to prevent arm amputation in a patient with very advanced arterial occlusive disease and gangrene of the digits.

The RUC reviewed the survey results for code 35523 *Bypass graft, with vein; common carotid-ipsilateral internal carotid brachial-ulnar or –radial* compared to the key reference service, 35512 *Bypass graft, with vein; subclavian-brachial* (Work RVU=23.79, 68 minutes pre-service, 180 minutes intra-service and 30 minutes immediate post-service time). The specialty society indicated that this reference service is a similar procedure performed in the shoulder/upper arm region. The RUC agreed that the mental effort, technical skill and psychological stress involved when performing 35523 were comparable to 35512. The RUC determined that the survey median work RVU of 24.00 placed 35523 in the proper rank order compared to 35512. The RUC then compared the pre-, intra- and immediate post service times (75 minutes, 180 minutes and 30 minutes) for 35523 to the reference service and determined that the specialty society recommended intra-service and immediate post-service physician times were the same. The specialty society recommended pre-service time for 35523 is 7 more minutes than the reference code. The RUC determined that additional positioning time is needed to accurately position the arm and gangrenous fingertips and well as extend the shoulder without compromising neurovascular structures.

The RUC reviewed the post-operative visits and determined that code 35523 requires an additional 99212 visit than reference code 35512. The RUC determined that the additional 99212 visit is necessary because of the required attention to wound healing, patency of the bypass graft, reperfusion of the hand, return to outpatient medical balance and the care of the reperfused fingers with gangrenous fingertips. The RUC agreed that 75 minutes pre-service, 180 minutes intra-service and 30 minutes immediate post-service physician time is appropriate for 35523. The RUC recommends the following post-operative visits for code 355X2: two 99232, one 99231, one 99238, two 99212 and two 99213 visits.

The RUC recommends the survey median work RVU of 24.00 for 35523.

1067

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Practice Expense
The RUC recommends the standard 090 day global direct practice expense inputs as attached.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
33501		Bypass graft, with vein; common carotid-ipsilateral internal carotid	090	19.43 (No Change)

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:35523 Tracking Number HH-1 Specialty Society Recommended RVU: **24.00**
Global Period: 090 RUC Recommended RVU: **24.00**

CPT Descriptor: Bypass graft, with vein; brachial-ulnar or -radial

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 70-year-old female smoker with a failed renal transplant presents with severe ischemic finger pain and digital gangrene on the left hand. Noninvasive studies confirm markedly diminished finger blood pressures. Arteriogram reveals occlusion of the distal brachial, proximal radial and proximal ulnar arteries with reconstitution of the radial and ulnar vessels near the wrist. She has not undergone prior hemodialysis access or other surgery in the symptomatic extremity. An arterial bypass graft using autogenous vein conduit is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work:

Pre-service work begins after the decision to operate, from the day before the operation until the skin incision. This activity includes obtaining and reviewing the previous work-up, with special attention to potential cardiovascular risk factors. The peripheral vascular exam and the preoperative noninvasive and arteriographic studies are reviewed. Informed consent is obtained from the patient following a review of surgical risks and benefits. Discussion is held with the anesthesiologist to determine the anesthetic of choice. Duplex vein mapping studies are reviewed to ensure patient has adequate length and caliber conduit, and discussions are held with OR nurses regarding appropriate draping to expose vein donor site. Other preoperative work includes marking the operative site, dressing, scrubbing, supervising patient positioning, moment of truth, waiting for the anesthetic to become effective, prepping, and draping the patient.

Description of Intra-Service Work:

- Proximal Dissection: Incise skin of upper arm overlying proximal brachial artery
- Dissect soft tissue to expose brachial artery, avoid injury to multiple nearby nerves & veins
- Clear soft tissue from brachial artery for 6 cm length
- Pass soft rubber loops around artery for control
- Distal Dissection: Incise skin overlying distal ulnar or radial artery, usually at the wrist
- Dissect soft tissue from around ulnar or radial artery, avoid nerve/vein injury
- Pass soft rubber loops around artery for control
- Create a tunnel from proximal to distal dissection sites in subcutaneous tissue of the forearm
- Harvest Vein Conduit: Incise skin of thigh/calf over saphenous vein
- Dissect soft tissue to identify saphenous vein
- Clear soft tissue from around saphenous vein for adequate length
- Ligate and divide all saphenous vein branches
- Ligate and divide ends of saphenous vein and remove from lower extremity
- Test saphenous vein conduit for leaks & repair same with 7-0 vascular suture
- Proximal Anastomosis: Anticoagulate patient with IV heparin
- Apply vascular clamps to proximal anastomosis site on brachial artery
- Perform arteriotomy
- Perform most of vein conduit to brachial artery anastomosis with fine vascular suture
- Open clamps transiently to flush system, remove air & debris

- Complete anastomosis, remove arterial clamps
- Apply additional sutures as needed to control hemorrhage
- Pass vein conduit through tunnel to ulnar or radial artery with care to avoid twists/kinks
- Distal Anastomosis: Stretch vein to full length
- Perform the ulnar or radial arteriotomy
- Cut vein conduit to match length and size of arteriotomy
- Perform most of vein conduit to ulnar or radial artery anastomosis with fine vascular suture
- Open clamps briefly to flush out air & debris
- Complete anastomosis
- Remove vascular clamps
- Apply additional sutures as required to achieve hemostasis
- Listen with Doppler and palpate distal pulses to assure bypass patency
- Irrigate all three incisions
- Achieve wound hemostasis
- Close all three incisions in multiple layers
- Recheck pulses to assure patency prior to application of sterile dressings

Description of Post-Service Work:

Post-service work begins after skin closure. Tasks include apply dressings, transfer patient to stretcher, accompany patient to recovery area, write orders, dictate operative note, communicate with the patient's family, communicate with referring and consulting physicians, and participate with the anesthesiologist in the recovery area to ensure smooth emergence from anesthesia. Depending on the preexisting comorbidities and operative course the patient may require admission to the intensive care unit. Results of the procedure are discussed with the patient once he or she is fully awake. The patient is transferred to the acute care ward when criteria are met. The physician makes daily visits, takes interval history, performs physical exam, makes assessment and plan, writes orders & notes, communicates with patient, family, nurses, and other care givers. Discharge day management includes communicating with all support services including visiting nurses, meals on wheels, physical therapy, etc., communicating with referring physician, providing activity advice and warnings to patient and family, and arranging office follow up for wound checks, suture/staple removal, etc. All related post-discharge care for 90-days is included in this service.

Pre-Service intensity/complexity	4.00	4.00
Intra-Service intensity/complexity	4.05	4.05
Post-Service intensity/complexity	3.55	3.60

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The new service under evaluation is a complex upper extremity bypass graft performed to prevent arm amputation in a patient with very advanced arterial occlusive disease and gangrene of the digits. The reconstruction is more challenging than the majority of bypass grafts because the distal target arteries - either the ulnar or the radial at the wrist, is very small in diameter and always heavily calcified due to underlying renal disease.

The survey results exhibit a tight distribution with 25th percentile at 23.00, the median survey value at 24.00 RVUs, and the 75th percentile is very close at 26.00 RVUs. The Key Reference Service 35512 (Bypass graft with vein; subclavian-brachial) is a similar operation performed in the shoulder/upper arm region. RVW of this Key Reference Service is 23.79, so the median survey for the new service is only 0.21 RVUs different at 24.00.

Does the new service deserve 0.21 more RVUs than the Key Reference? The SVS RVS Consensus Panel felt this was actually a conservative increment. Justification is provided herein.

PRE-TIME: By survey, the new service has 85 pre-service minutes, 17 more than the key reference. Our RVS committee compared the typical patient undergoing this service with the guidelines set out by the Pre-service Time Workgroup. The vignette patient has renal failure and a failed transplant. She's a lifelong smoker and virtually guaranteed to have underlying CAD and COPD. Her fingers are dying. This is about as sick as a patient can get in terms of medical co-morbidities. Her distal forearm arteries are all occluded. Successful revascularization without major complication will require marked attention to detail and collaboration with all other caregivers. This patient easily qualifies for Package 4-Difficult Patient/Difficult Procedure according to Pre-service Time Workgroup proposed guidelines. Finally, there is no way that a patient with gangrenous fingertips undergoing an arm revascularization can be positioned in 3 minutes. The arm-board needs to be located and attached to the table. Nurses and anesthesiologists need to extend the shoulder without compromising neurovascular structures. The elbow needs sufficient padding to avoid ulnar nerve compression. SVS respectfully recommends 10 minutes for pre-service positioning, therefore a total of 75 minutes, which is 10 minutes less than the survey median and 7 minutes more than Pre-Time Package 4.

INTRA-TIME: Both operations are 180 minutes in duration with identical complexity and intensity measures.

POST-TIME: Both services have the same hospital visit pattern (99232x2, 99231x1, 99238). Given the multiple advanced co-morbidities of the typical patient, and the attention to detail required, this is a conservative pattern. Both services have two 99213 office visits, while the new service has one additional 99212 visit, the number and levels

justified by requirements of attention to wound healing, patency of the bypass graft, reperfusion of the hand, return to outpatient medical balance, and care of the reperfused fingers with gangrenous fingertips.

In summary, with all elements of time and intensity nearly identical save for 7 additional pre-service minutes and one extra 99212 in the new service compared to the Key Reference, we believe the increment of 0.21 additional RVUs for the new service above that of the Reference is appropriate and easily justified.

With an RVW of 24.00, this new code will fit appropriately within the family of upper extremity bypass grafts performed using autogenous vein conduit:

CPT	Descriptor	RVW	RUC survey	Date
35511	subclavian-subclavian	22.12	YES	2000

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 37799 unlisted vascular surgery procedure

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty VS	How often? Rarely
Specialty	How often?
Specialty	How often?

Estimate the number of times this service might be provided nationally in a one-year period? 100
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate.

Specialty VS	Frequency 100	Percentage 100.00 %
Specialty	Frequency 0	Percentage 0.00 %
Specialty	Frequency 0	Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 100
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate.

Specialty VS	Frequency 100	Percentage 100.00 %
Specialty	Frequency 0	Percentage 0.00 %
Specialty	Frequency 0	Percentage 0.00 %

Do many physicians perform this service across the United States?

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/Specialty Society Update Process
PERC Summary of Recommendation
090 Day Global Period
Facility Direct Inputs

CPT Long Descriptor: 35523 Bypass graft with vein; brachial-ulnar or -radial

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee: All standard 90-day global values

Please describe the clinical activities of your staff:

Pre-Service Clinical Labor Activities: Sixty minutes has been established by a PEAC workgroup as the typical total time it takes on average across all specialties for all categories of pre-service work to get a patient into a facility for a procedure. This time has been applied to 35523.

Intra-Service Clinical Labor Activities: The assignment of 12 minutes (as supported by the PEAC) relative to coding 99238 for discharge management for inpatient services has been applied to 35523.

Post-Service Clinical Labor Activities: Standard EM post-op office visit times for clinical staff have been applied to 35523.

Supplies and Equipment – Postoperative Office Visits: Standard EM post-op supplies and equipment have been applied to 35523.

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

October 2006

Non-implantable Venous Access Device Blood Draws

The CPT Editorial Panel agreed that Non-implantable Venous Access Device Blood Draws is a unique new procedure, which involves specialized equipment and intense monitoring and assessment by non-physician health care professionals. This new service differs from existing codes, 36415, *Collection of venous blood by venipuncture* (work RVU = 0.00) and 36540, *Collection of blood specimen from a completely implantable venous access device* (work RVU = 0.00). There are not currently codes to describe blood draw via other routes such as Percutaneous Inserted Central Catheter (PICC) lines and peripheral IVs. To do so, CPT created three new codes, 36591, *Collection of blood specimen from a completely implantable venous access device*, 36592, *Collection of blood specimen using established central or peripheral catheter, venous, not otherwise specified*, and 36593, *Declotting by thrombolytic agent of implanted vascular access device or catheter.*

1081

The RUC reviewed the non-facility practice expense inputs carefully focusing on the typical patient encounter. The RUC believed, and the specialty agreed, that the clinical labor times initially presented to the RUC were too high for the typical patient encounter. The RUC reduced specific clinical labor activity line items to recommend a total clinical labor time of 19 minutes for code 36591, 15 minutes for 36592, and 37 minutes for 36593. The RUC established a detailed allocation of the clinical labor time in the non-facility setting and no direct practice expense inputs in the facility setting.

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The American Society of Clinical Oncology (ASCO) convened a consensus panel to develop direct practice expense inputs for 36592. The consensus panel included two oncology certified nurses who are active volunteers with the Oncology Nursing Society (ONS) and two medical oncologists. The composition of the panel was geographically diverse, with panel members hailing from California, Tennessee, Texas, and Massachusetts.

As this procedure is typically performed by nurses, the ONS participants were asked to conduct the preliminary analysis of the clinical staff times and supplies associated with this service. The full consensus panel then convened by conference call to review and finalize the recommendations for each of the inputs.

Please describe the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

There are no pre-service clinical labor activities related to this service.

Intra-Service Clinical Labor Activities:

The RN reviews the patient charts for orders and obtains medical history (e.g., chemotherapy-related history). Patient is greeted, gowned, and positioned for blood draw. The physician is typically not involved with performing the actual procedure of the blood draw. Rather, this is completed by the RN so 4 minutes of nursing time has been included for the intra-service period under "Assist physician in performing procedure". This 4 minutes of time includes the following components: 1) drawing a 10 cc syringe full to discard, 2) drawing a second syringe to collect blood specimen, and 3) flushing the line. Following the procedure, the RN completes requisite clinical forms and cleans the room. The RN labels the blood specimen and places it in the appropriate container for transport to the clinical laboratory.

Post-Service Clinical Labor Activities:

There are no post-service clinical labor activities associated with this service.

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

April 2007

Arterial Catheterization

In October 2006, the CPT Editorial Panel CPT Modifier Workgroup recommended 36620 *Arterial catheterization or cannulation for sampling, monitoring or transfusion (separate procedure); percutaneous* be removed from the modifier -51 exempt list. The Workgroup asked specialty societies to review the list and bring back any code they determined should be retained on the list. At the February 2007 CPT meeting the specialty societies asked to retain 36620 on the -51 Modifier exempt list. The CPT Modifier Workgroup forwarded 36620 to the RUC. Code 36620 had never been surveyed nor discussed at the RUC previously. The RUC understands that it is tasked with considering whether 36620 should be retained on the modifier -51 exempt list. If so, then support for this position is needed and the RUC must develop a work RVU recommendation consistent with the modifier -51 exempt payment policy. If not, then the RUC should determine whether there is compelling evidence for revaluation of 36620.

1091

FROM THE CPT MANUAL: "Modifier -51: Multiple Procedures: When multiple procedures, other than E/M services, are performed at the same session by the same provider, the primary procedure or service listed may be reported as listed. The additional procedure(s) or service(s) may be identified by appending modifier -51 to the additional procedure or service code(s). Note: This modifier should not be appended to designated "add-on" codes."

The RUC heard a full description of the service and the history of its value. The specialty societies and the RUC understood that the service did have significant time in the pre-service and post service periods which would disqualify 36620 from the -51 Modifier exempt list (according to the CPT's criteria for inclusion on the list).

FROM CPT: MODIFIER -51 EXEMPTION – INCLUSION/EXCLUSION CRITERIA
"#3 Minimal Amount of Pre-and Post-Service Time Relative to Intra-Service Time and Minimal Number of Visits. As these procedures are usually performed with other procedures, there should be a minimal amount of pre-and post-service time relative to the procedure's intra-service time and there should be a minimal number of post-operative visits associated with the valuations of the procedures on this list."

After significant discussion, the RUC determined that the specialty society recommended pre-service time did not accurately reflect the service and decreased it from 13 minutes to 7 minutes, while retaining the post-operative time at 5 minutes. **Due to this detailed review of the pre-service and post-service time to ensure no dupliction with other services reported on the same date, the RUC recommends that 36620 be retained on the Modifier -51 Exempt List.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

As the RUC works under the presumption that all services on the RBRVS are correctly valued unless evidence is produced to re-value, the specialty society provided compelling evidence to support its recommendation of 1.50 work RVUs, which is an increase over the existing value of 36620, 1.15 work RVUs. The RUC reviewed this compelling evidence and did not agree with the specialty that there was evidence that incorrect assumptions were made in the previous evaluation of this service. **Therefore, the RUC recommends that the new times, 7 minutes of pre-service time, 10 minutes of intra-service time and 5 minutes of post-service time be associated with 36620 and that the existing value of 1.15 work RVUs be retained for this procedure.**

Practice Expense:
The RUC recommends that the practice expense inputs be retained for this procedure, which is zero direct PE inputs.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:36620 Tracking Number DD3 Specialty Society Recommended RVU: **1.50**
Global Period: 000 RUC Recommended RVU: **1.15**

CPT Descriptor: Arterial catheterization or cannulation for sampling, monitoring or transfusion (separate procedure); percutaneous

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 65 year old woman is admitted to the hospital because of pneumonia, fever, septic shock, hypoxemia and agitation. An arterial catheter is inserted, both to monitor blood pressure and to obtain frequent arterial blood samples

Percentage of Survey Respondents who found Vignette to be Typical: 90%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 33%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: Pre-service includes: reason for procedure explained to patient and sometimes family; patient informed of benefits and possible complications and risks of procedure and potential access sites examined.

Description of Intra-Service Work: The puncture site is prepared with appropriate antiseptic, the artery is located and fixed and a needle with intracatheter is inserted into the target artery. The catheter is threaded into the artery and the needle is withdrawn. A blood sample is taken for Arterial Blood Gas analysis and the catheter is irrigated with saline and an obturator is inserted into the catheter which is then fixed to the skin. Depending upon hospital protocol this fixation may include sutures. If the arterial catheter is to be used for monitoring, an arterial monitoring line is connected and functionality is assessed.

Description of Post-Service Work: The catheter and puncture site are inspected and the radial pulse is palpated. The patient is then given detailed follow-up instructions regarding the care, future monitoring and withdrawal of blood samples. Note that as long as the catheter is in place, daily monitoring and withdrawal of blood samples will take place. A procedure note is written in the medical chart and appropriate orders are written for care of the catheter site.

Modifier -51 Exempt Status

the recommended value for the new/revised procedure based on its modifier -51 exempt status? Yes

New Technology/Service:

Is this new/revised procedure considered to be a new technology or service? No

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
36625	000	2.11	Harvard Time

CPT Descriptor Arterial catheterization or cannulation for samplling, monitoring or transfusion (separate procedure); cutdown

KEY MPC COMPARISON CODES:

Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Most Recent Medicare Utilization	Work RVU	Time Source
36556	000	654,136	2.50	RUC Time

CPT Descriptor 1 Insertion of non-tunneled centrally inserted central venous catheter:; age 5 years or older

MPC CPT Code 2	Global	Most Recent Medicare Utilization	Work RVU	Time Source
11755	000	22,576	1.31	RUC Time

CPT Descriptor 2 Biopsy of nail unit (eg, plate, bed, matrix, hyponychium, proximal and lateral nail folds) (separate procedure)

Other Reference CPT Code	Global	Work RVU	Time Source
64447	000	1.50	RUC Time

CPT Descriptor Injection, anesthetic agent; femoral nerve, single

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 24 **% of respondents:** 57.1 %

TIME ESTIMATES (Median)

Pre-Service intensity/complexity	2.88	2.96
Intra-Service intensity/complexity	3.25	3.67
Post-Service intensity/complexity	2.67	2.96

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The code comes to the RUC as a result of the CPT review of codes listed in Appendix E—Summary of Codes Exempt ›m Modifier 51. The Panel agreed that the code met the criteria to remain in this appendix.

While 33% of our respondents indicated that moderate sedation was typical for this procedure, we maintain that it is not inherent to the procedure. Patients may receive "light sedation" and our respondents may have been confused about all the elements inherent in moderate sedation.

Code 36620 was last reviewed by the RUC during the second Five Year Review. In its recommendation to CMS (per the June 8, 2001 Federal Register, p 31062) the RUC stated, ***"With respect to 36620, the RUC compared this procedure to the reference service (code 36140) and agreed that this service appeared to be undervalued. However, the RUC was concerned that anesthesiologists who perform this procedure over 80 percent of the time did not comment or participate in the survey conducted by the specialty groups".***

Pulmonary Disease surveyed this code for the second Five Year Review. Their survey median was 2.01 work RVUs - a value that is essentially equal to the 75th percentile in our survey. Their survey times were higher than those reported by our respondents. Our survey confirms the RUC's opinion that the code is undervalued and we recommend that the code be assigned 1.50 work RVUs - our survey's 25th percentile.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.

☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
☐ Multiple codes are used to maintain consistency with similar codes.
☐ Historical precedents.
☒ Other reason (please explain) This code is listed in CPT Appendix E - Summary of CPT Codes Exempt from Modifier 51. It describes a service/procedure that is sometimes a stand alone procedure, but it is typicall adjunctive. Anesthesia (by far the predominant specialty) performs this as a stand alone procedure approximately 40% of the time.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.
Anesthesioloigsts perform this most frequently in conjunction with an anesthesia service (00100-01999) Per CMS and CPT, placement of invasive monitoring devices is separate and distinct from an anesthesia service. Critical care physicians may report other procedures such a insertion of a pulmonary artery catheter (93503) and intubation (31500) along with this service.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 36620

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Anesthesia	How often? Commonly
Specialty Pulmonary Disease	How often? Rarely
Specialty Critical Care	How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 2487576
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. We expect that anesthesiologists would perform a higher precentage of arterial lines in younger (non-Medicare) patients, as art lines are more commonly associated with surgery in younger age groups

Specialty Anesthesia	Frequency 2363198	Percentage 95.00 %
Specialty Pulmonary Disease	Frequency 49752	Percentage 2.00 %
Specialty Critical Care	Frequency 24876	Percentage 1.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 621,894 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. This Medicare frequency information is taken from the RUC Database

Specialty Anesthesia	Frequency 559704	Percentage 89.99 %
Specialty Pulmonary Disease	Frequency 14492	Percentage 2.33 %
Specialty Critical Care	Frequency 8706	Percentage 1.39 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? No

If no, please select another crosswalk and provide a brief rationale. The RUC recommends that the current PLI be utilized for 36620.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

April 2007

Head and Neck Interstitial Brachytherapy Needle or Catheter Placement

In February 2007, the CPT Editorial Panel created a new CPT code to describe surgical placement of brachytherapy needles or catheters in the head and/or neck region.

The RUC reviewed the survey results from 50 radiation oncologists for new CPT code 41019 *Placement of needles, catheters, or other device(s) into the head and/or neck region (percutaneous, transoral, or transnasal) for subsequent interstitial radioelement application* and the specialty's key reference code 55875 *Transperineal placement of needles or catheters into prostate for interstitial radioelement application, with or without cystoscopy* (work RVU 13.31, 090 day global). The RUC concurred that the survey respondents over estimated the physician work for this new 000 day global procedure, and the physician time appeared to be overstated in the pre-service time period.

1105

The RUC determined that new code 41019 requires the same physician work, time, and intensity as code 31276 *Nasal/sinus endoscopy, surgical with frontal sinus exploration, with or without removal of tissue from frontal sinus* (work RVU = 8.84). In addition, the RUC believed that the pre-service physician time should be reduced by a total of 25 minutes, to reflect the typical patient evaluation and positioning time. The RUC determined that the typical patient would require pre-service evaluation time of 30 minutes, positioning of 10 minutes, and 15 minutes for scrub, dress, and wait, intra-service time of 90 minutes and an immediate post service time of 30 minutes, for code 41019.

The RUC recommends a physician work relative value of 8.84 for CPT code 41019.

Practice Expense

The RUC recommends no direct practice expense inputs in the non-facility setting for this facility only service. A practice expense spreadsheet is attached with recommendations for clinical labor staff time associated with typical facility service.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Source of Current Work RVU*	Work RVU Recommendation
●41019	II1	Placement of needles, catheters, or other device(s) into the head and/or neck region (percutaneous, transoral, or transnasal) for subsequent interstitial radioelement application (Report supply of device separately) (For imaging guidance, see 76942, 77002, 77012, 77021) (For stereotactic insertion of intracranial brachytherapy radiation sources, see 61770) (For interstitial radioelement application, see 77776-77784)	000	N/A	8.84

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:41019 Tracking Number II1 Specialty Society Recommended RVU: **11.00**
Global Period: 000 RUC Recommended RVU: **8.84**

CPT Descriptor: Placement of needles, catheters, or other device(s) into the head and/or neck region (percutaneous, transoral or transnasal) for subsequent interstitial radioelement application.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 60-year old man, with a history of cigarette and alcohol abuse presents with weight loss, dysphagia, and pain. A 3 cm tumor is identified in the base of tongue adjacent to the faucial arch of tonsil. Neck nodes are clinically negative and PET scan shows no metastasis. Following external beam irradiation with concurrent chemotherapy, a brachytherapy boost procedure is scheduled.

Percentage of Survey Respondents who found Vignette to be Typical: 88%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 32%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: Review of initial exams, radiation and chemotherapy records including related toxicities and labs. Obtain consent and educate patient and family about procedure. Review preoperative imaging and plan catheter placement. Discuss implant volume, placement and spacing with the brachytherapy team. Select, assemble, and if necessary order requisite brachytherapy catheters and supplies. Dress, scrub and wait. Discuss airway management with anesthesiologist.

Description of Intra-Service Work: After induction of general anesthesia with nasotracheal intubation, the patient is positioned and stabilized affording comfortable intraoral access and exposure of the neck and face. Visual and bimanual examination is performed to assess residual tumor volume and residual chemo/radiation reactions. Wax protection is fashioned for the remaining teeth. Shave, scrub, and drape are performed. The relationship of the tumor to normal structures including the hyoid bone, mandible, and carotid arteries is determined, and the are projections drawn on the skin. The proposed catheter entrance sites are marked, and an appropriate number of catheters, fixing buttons and silk ties are selected and assembled.

The oral cavity and oropharynx are suctioned and rinsed. Initial skin punctures are made according to the locations drawn submentally, with 17 gauge 30 degree bevel needles, and advanced along a trajectory aiming for the selected exit point within the oropharynx, through the muscle. A double gloved finger monitors the position of the tumor, the target position for the catheter, and the needle tip. An alternate series of advances and palpations are performed until the needle tip is in the desired position just beneath the mucosa of the base of tongue. The finger is withdrawn and the needle advanced until it exits from the tongue into the oropharnynx. A 26-gauge surgical steel wire is inserted into the external portion of the needle and advanced until it can be palpated internally. Its tip is then brought out through the oral cavity with the proximal end clamped to prevent it from being lost into the needle. The leader portion of the catheter tube, button, and silk tie is then threaded over the wire. A tonsil clamp is applied to the leader and wire. The assembly is then pulled from the submental region until the leader portion of the catheter is visible, and the button end of the tube pulled into the oral cavity and down onto the dorsal surface of the tongue. The silk tie is brought out through the oral cavity and set aside. The external portion of the catheter is held in position by placing a hemispherical color coded button on the leader and bringing the rounded end snugly to the skin.

This process is repeated for each of the 25 needles according to the implant volume. Strict spacing is assessed visually on the skin and by palpation within the oropharynx and oral cavity. Catheters are removed and replaced as necessary to ensure the geometry. Frequent irrigation and suctioning is performed to maintain a clean dry field. The excess catheter and leader projecting beyond the fixing buttons are cut to the desired length and discarded. The inner catheter ribbons

(for stabilizing the catheter during insertion) are individually removed with wire strippers and discarded. The silk ties are gathered outside the oral cavity, and tied together with another silk tie. The group is then pulled through a Penrose type drain, and externally secured with tape. The face and neck are cleansed and the exit sites of the catheter are painted with triple antibiotic ointment.

Description of Post-Service Work: The physician diagrams the implant in the patient's medical record; dictates the procedure report and writes orders. The patient is examined, paying close attention to the patient's airway and catheter wounds. The physician communicates with physics/dosimetry staff regarding subsequent radioelement application. Answers patient and family questions. Coordinates post operative imaging. Answers nursing and other staff questions.

Pre-Service intensity/complexity	4.20	3.84
Intra-Service intensity/complexity	4.82	4.03
Post-Service intensity/complexity	4.40	3.68

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Fifty physician work surveys were completed by our membership for this new CPT code. The data from those surveys were collected, reviewed and analyzed by a consensus panel, consisting of members of ASTRO's Health Policy and Code Development and Valuation Committee, as well as brachytherapy experts in the field of radiation oncology. The group reviewed the survey data and recommends a work RVU of 11.0 for this new procedure code, a value less then the 25th percentile.

The panel reviewed the data for this new CPT code, along with the reference service code and the two other new CPT codes for similar procedures, being presented at this RUC meeting. And although the panel agreed with the survey respondents that the RVU should be established at a rate higher then the panel is recommending, the survey response times, along with the surveyed RVU recommendations, create an IWPUT that would create a rank order anomaly. The panel has reviewed the family of these codes and feels that following is an appropriate rank order:

Surveyed Code:*(this survey)*	**41019**	**IWPUT 0.09723**
Reference Service Code:	55876	IWPUT 0.09482
Surveyed Code:	55920	IWPUT 0.09167
Surveyed Code:	20555	IWPUT 0.083

The panel feels the procedure described by this new CPT code is more intense then the work described in the reference service code.

The panel recommends the median survey times for this procedure (*one exception) and recommends they be entered into the RUC database: 20 minutes of pre-service evaluation time, 15 minutes for pre-service positioning, 15 minutes for pre-service scrub, dress and wait , 90 minutes of intra-service time, and 30 minutes of immediate post-service time. The society recommends 30 minutes day preceding procedure be entered into the RUC database, instead of the median of 42.5 minutes.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

CPT Code: 77014; Computed tomography guidance for placement of radiation therapy fields
Global Period: XXX
Work RVUs: TC-Only
Total Time: 17 minutes

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed)
41599; Unlisted procedure, tongue, floor of mouth
42999; Unlisted procedure, pharynx, adenoids, or tonsils

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Radiation Oncology How often? Sometimes

Specialty Head and Neck Surgery How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 400
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This type of procedure will most likely be performed by a radiation oncologist, but occassionally could be performed by a surgeon and therefore we have indicated that below.

Specialty Radiation Oncology Frequency 360 Percentage 90.00 %

Specialty Head and Neck Surgery Frequency 40 Percentage 10.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 265
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Approximately 2/3 of the total number of times this service us provided annually, the recipient is an elderly patient, and as stated above, will most likely be performed by a radiation oncologist.

Specialty Radiation Oncology Frequency 240 Percentage 90.56 %

Specialty Head and Neck Surgery Frequency 25 Percentage 9.43 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? No

If no, please select another crosswalk and provide a brief rationale. 77763

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

CPT Long Descriptor: Placement of needles, catheters, or other device(s) into the head and/or neck region (percutaneous, transoral or transnasal) for subsequent interstitial radioelement application.

Sample Size: N/A **Response Rate: (%):** N/A **Global Period:** 000

EXPERT PANEL USED TO DEVELOP RECOMMENDATION

Geographic Practice Setting %: **All geographic practice settings represented.**

Type of Practice %: **All practice types represented.**

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The American Society of Therapeutic Radiology and Oncology (ASTRO) prepared these practice expense reccommendations using a consensus panel of physicians comprised of members from ASTRO's Health Policy Committee, Code Development and Valuation Committee (CDVC), as well as those physicians that perform brachytherapy implant placement procedures. The consensus panel included physician representatives from states in various regions of the United States and all demographic areas.
The consensus panel members held several conference calls to evaluate the non-physician clinical labor times, medical supplies, and equipment, based upon the panel members' experience with the procedure under consideration. Preliminary recommendations for direct inputs were drafted and distributed for discussion by the panel during these conference calls, which led to the final formulated practice expense recommendations for CPT® Code 41019; *Placement of needles, catheters, or other device(s) into the head and/or neck region (percutaneous, transoral or transnasal) for subsequent interstitial radioelement application.*. Although ASTRO was also scheduled to make non-facility practice expense recommendations for this procedure, we felt that it was appropriate to only make recommendations for the facility setting at this time.

Please describe the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

Schedule procedure, confirm all applicable supplies and devices are available.

Retrieve and compile all relevant clinical information, including all preoperative imaging studies, and patient's medical record for review by the physician. Verify orders, and confirm procedure protocol with physician.

Contact patient on the day before the procedure to provide educational information regarding the procedure and provide them with any additional information they may request. Obtain informed consent and confirm adherence to pre procedure protocol.

Intra-Service Clinical Labor Activities:

N/A

Post-Service Clinical Labor Activities:

Initiate phone calls for physician and call in prescriptions as applicable.

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

April 2007

Peritoneal Tumor Ablation

In April 2006, the RUC reviewed new codes 58957 *Resection (tumor debulking) of recurrent ovarian, tubal, primary peritoneal, uterine malignancy (intra-abdominal, retroperitoneal tumors), with omentectomy, if performed;* (work RVU = 26.06) and 58958 *Resection (tumor debulking) of recurrent ovarian, tubal, primary peritoneal, uterine malignancy (intra-abdominal, retroperitoneal tumors), with omentectomy, if performed; with pelvic lymphadenectomy and limited para-aortic lymphadenectomy* (work RVU = 29.06). Codes 58957 and 58958 had been split out from CPT codes 49200 *Excision or destruction, open, intra-abdominal or retroperitoneal tumors or cysts or endometriomas;*(work RVU = 10.94) and 49201 *Excision or destruction, open, intra-abdominal or retroperitoneal tumors or cysts or endometriomas; extensive* (work RVU = 15.67). The RUC determined that 49200 and 49201 should be reviewed for potential work neutrality, but first requested a review by general surgery. The RUC asked general surgery to survey code 49200 and 49201 for presentation in October 2006.

1119

General surgery attempted to survey the codes for the October 2006 RUC meeting, however it was determined that the vignettes and CPT descriptors were confusing to the survey participants. The specialty indicated that they needed to first address new coding for these services, resulting in the replacement of 49200 and 49201 with three new codes. When these codes were initially created and valued, during the Harvard review, the typical patient was described as on one who had three lymphatic cysts removed. Today lymphatic cysts are treated by less evasive means. The typical patient today has a tumor which is removed openly. The specialty indicated that they needed to accurately describe the codes in CPT. The RUC agreed that coding changes were needed prior to the survey, and in February 2007 the CPT Editorial Panel deleted codes 49200 and 49201 and replaced them with three new codes to report resection and debulking of specific recurrent malignancies. The RUC agreed with the specialty that the typical patient had changed so that the current codes could not describe the procedures being performed. The RUC determined that there was compelling evidence that these services were never described or valued properly.

For the April 2007 RUC meeting, the ACS independently surveyed the three new codes (49203, 49204, 49205) while the ACOG independently surveyed 49203 and 49204. The RUC determined that the vignette used by the American College of Obstetricians and Gynecologists (ACOG) would not be used as it was not vetted through the standard CPT Editorial Panel Process.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

49203
The committee reviewed the ACS survey data for 49203 *Excision or destruction, open, intra-abdominal tumors, cysts or endometriomas, one or more peritoneal, mesenteric, or retroperitoneal primary or secondary tumors; largest tumor 5 cm diameter or less* and compared it to the reference code as selected by the ACS survey respondents, 44140 *Colectomy, partial; with anastomosis* (Work RVU=22.46). The surveyed code has significantly less intra-service time as compared to the reference code, 120 minutes and 150 minutes, respectively. Additionally, the RUC determined that the surveyed code is a less intensive procedure to perform than its reference code. Therefore, because the surveyed code has less intra-service time and is a less intensive procedure to perform in comparison to the reference code, the RUC recommends the 25th percentile of the survey data, 20.00 work RVUs.

The RUC recommends a physician work relative value of 20.00 RVUs for CPT code 49203.

49204
The committee reviewed the ACS survey data for 49204 *Excision or destruction, open, intra-abdominal tumors, cysts or endometriomas, one or more peritoneal, mesenteric, or retroperitoneal primary or secondary tumors; largest tumor 5 cm diameter or less; largest tumor 5.1 to 10.0 cm diameter* and compared it to multi-specialty points of comparison reference code, 44140 *Colectomy, partial; with anastomosis* (Work RVU=22.46). The committee reviewed all of the surveyed times for this procedure and determined that the post-operative visits of the surveyed code should mirror the post-operative visits of the reference code, as the distribution of the reference code's post-operative visits seemed to better reflect the post-operative care of the surveyed code. Therefore, the committee recommends that one 99232 hospital visit be transitioned to a 99231 hospital visit, resulting in one 99232 hospital visit and five 99231 hospital visits for the surveyed code. Further, the committee reviewed the other service times associated with this code and noted that the surveyed code has more intra-service time associated with it than the reference code (160 minutes and 150 minutes, respectively) and that the surveyed code has more pre-service time than the reference code (81 minutes and 60 minutes, respectively). Additionally, the RUC determined that the surveyed code is a more intensive procedure to perform than the reference code. Therefore, because the surveyed code has more pre-service and intra-service time and is a more intensive procedure to perform than the reference code, the RUC recommends the median of the survey data, 26.00 work RVUs.

The RUC recommends a physician work relative value of 26.00 RVUs for CPT code 49204.

49205
The committee reviewed the ACS survey data for 49205 *Excision or destruction, open, intra-abdominal tumors, cysts or endometriomas, one or more peritoneal, mesenteric, or retroperitoneal primary or secondary tumors; largest tumor 5 cm diameter or less; largest tumor greater than 10.0 cm diameter* and compared it to two reference codes as selected by the ACS respondents, 43633 *Gastrectomy, partial, distal; with Roux-en-Y reconstruction* (Work RVU=33.01) and 58957 *Resection (tumor debulking) of recurrent*

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

ovarian, tubal, primary peritoneal, uterine malignancy (intra-abdominal, retroperitoneal tumors), with omentectomy, if performed; (Work RVU=26.06). The committee used these two codes as anchors to develop work RVU recommendations for 49205. The committee compared the total service times of all three codes and noted that the total service time for the surveyed code fell between the two reference codes (Total Time, 43633: 740 minutes; 49205: 645 minutes and 58957: 552 minutes). Further, the committee noted that the intensity of performing the surveyed code fell between the two reference codes. Therefore, because the surveyed code fell between the two reference codes in times and intensities, the RUC recommends the median survey value, 30.00 work RVUs for code 49205.

The RUC recommends a physician work relative value of 30.00 RVUs for CPT code 49205.

Practice Expense

The RUC recommends no direct practice expense inputs in the non-facility setting for these facility only services. A practice expense spreadsheet is attached with recommendations for clinical labor staff time associated with typical facility service based on the 90 day global RUC standards.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:49203 Tracking Number JJ1 Specialty Society Recommended RVU: **19.69**
Global Period: 090 RUC Recommended RVU: **20.00**

CPT Descriptor: Excision or destruction, open, intra-abdominal tumors, cysts or endometriomas, one or more peritoneal, mesenteric, or retroperitoneal primary or secondary tumors; largest tumor 5 cm diameter or less

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:
A 42-year-old male had a prior abdominal resection for peritoneal mesothelioma. Two years after that, he presents with at least three 2-cm. masses in the right retroperitoneum and at exploration has four other 1-2 cm. nodules.

Percentage of Survey Respondents who found Vignette to be Typical:

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work:
- Select and order the appropriate antibiotic(s) and confirm timing and administration.
- Assure appropriate selection, timing, and administration of DVT prophylaxis.
- Write orders for preoperative medications including beta blockers, if indicated.
- Review pre-operative work-up, with particular attention to imaging information and reports.
- Review results of preoperative testing (lab, EKG, chest x-ray, availability of blood products).
- Meet with patient and family to review planned procedure and post-operative management.
- Confirm with nurses and patient that this will be done with an abdominal midline incision and there is no sidedness.
- Review and obtain informed consent, including witness.
- Review length and type of anesthesia with anesthesiologist.
- Verify that all required instruments and supplies are available.
- Assist in transfer of patient from gurney to operating table.
- Monitor/assist with positioning of patient.
- Assist anesthesia team with line placement and induction of anesthesia and intubation.
- Indicate areas of skin to be prepped and mark surgical incisions.
- Scrub and gown.
- Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work:
Skin incision is made using sharp dissection. Hemostasis is achieved using electrocautery and small ligatures, as necessary. The linea alba is identified and carefully divided. The peritoneum is grasped, elevated, and carefully incised to avoid injury to bowel. The peritoneal cavity is entered under direct vision. Adhesions are cleared by sharp dissection in order to expose all of the abdominal viscera. A visual and manual complete exploration of the abdominal cavity and its contents is carried out. The NG tube is placed and its position is confirmed. The stomach is inspected and palpated for pathology. The duodenum is visualized and palpated. The gallbladder is inspected and palpated for the presence of stones. The liver is palpated bimanually, as is the porta hepatis. The pancreas is inspected through the hepaticogastric ligament and palpated for possible masses. The tail of the pancreas is palpated for possible lymphadenopathy. The small bowel is inspected and palpated from the ligament of Treitz to the ileocecal valve. The small bowel mesentery is inspected and palpated for the presence of lymphadenopathy. The cecum and appendix, ascending, transverse, and descending colon are inspected and palpated. The cul-de-sac and pelvic contents are inspected and palpated. A self-retaining retractor is carefully inserted, while avoiding injury or entrapment of abdominal contents. A self-retaining retractor is carefully inserted, while avoiding injury or entrapment of abdominal contents. The location and extent of

the primary lesions are confirmed. The abdominal contents, to the exclusion of the right colon, are packed away using laparotomy pads and additional retractors are placed for optimal exposure. The right colon is mobilized lateral to medial by incising the line of Toldt. Three 2-3 cm. implanted masses are each individually resected using cautery. During this dissection, the right ureter is identified and a vessel loop is placed for continual identification and protection of the ureter. Additionally, four other 1 cm. nodules are identified in the paracolic gutter. They are each individually resected using the electrocautery. The abdominal cavity is irrigated copiously with antibiotic solution. Hemostasis is obtained. The abdomen is inspected for injury and the presence of any instruments or lap-pads (ie, count is made). The retractor components are removed and accounted for. The abdominal organs are returned to normal anatomical position. The omentum is draped over the abdominal contents. The fascia is closed with running suture. A second instrument, needle, sponge, and lap-pad count is conducted. The subcutaneous tissues are irrigated and approximated and the skin is closed.

Description of Post-Service Work:
Post-service Hospital Work

- Apply Steristrips and sterile dressings. Monitor patient during reversal of anesthesia, protecting the wound with a hand so that wound disruption does not occur with an unrestrained cough. Assist in transfer of patient from operating table to gurney. Monitor transport of patient from operating room to recovery room. Discuss postoperative recovery care with anesthesia and nursing staff. Instruct nursing staff in care of drains, tubes and other devices. Review post-operative labs. Check chest x-ray to confirm location of NG tube and assess pulmonary status. Discuss procedure and outcome with family in waiting area. Write brief operative note. Write postoperative note in the recovery room. Dictate operative report and copy referring physician(s). Call referring physician(s). Patient is discharged from recovery room.
- Write patient care orders and discuss floor care with nursing staff.
- Examine patient, including reviewing vital signs and confirming as necessary.
- Auscultate heart, lungs, and abdomen for bowel sounds.
- Manage dressings to wounds daily, monitoring status of incision, looking for signs of infection.
- Continue prophylaxis for DVT. Monitor daily for adequacy.
- Assess need for beta-blockers, order as required.
- Assess need for antibiotics, order as required. Discontinue as required.
- Monitor and document patient progress: evaluate for sepsis, bowel function; cardiorespiratory function.
- Assess pain scores and adequacy of analgesia.
- Monitor fluid and electrolyte status and renal function.
- Review nursing/other staff patient chart notes.
- Write orders for labs, films, medications, diet, and patient activity.
- Chart patient progress notes, daily.
- Answer patient and family questions. Answer nursing/other staff questions.
- Prior to discharge, the pathology is reviewed with the patient.
- Manage nasogastric tube, remove when appropriate and advance diet.
- Obtain oncology consultations.
- Write prescriptions for medications needed post-discharge.
- Home restrictions (ie, diet, activity, bathing) are discussed with the patient, family members, and discharging nurse.
- The patient is discharged when there is return of bowel function, adequate nutrition intake, and adequate pain control with oral analgesics.
- All appropriate medical records are completed, including day of discharge progress notes, discharge summary and discharge instructions, and insurance forms.

Post-service Office Work

- Examine and talk with patient.
- Monitor healing of incision with appropriate physical examination, including answering questions from patient and family.
- Remove sutures and staples, when appropriate.
- Monitor diet caloric intake by weight. Arrange for dietary consultation as needed.
- Review pathology report in response to family/patient questions.
- Answer patient/family questions.

- Write medication prescriptions.
- Post discharge labs/films are ordered and reviewed, as necessary.
- Begin routine surveillance for recurrent tumor. Discuss schedule of patient examination and imaging surveillance.
- Discuss the need for postoperative chemotherapy with patient.
- Discuss the need for postoperative radiotherapy with patient.
- Offer referral to cancer support groups.
- Discuss progress with referring physician(s) (verbal and written).
- Discuss case with oncologist and prepare documents for transmission to that office.
- Dictate progress notes for medical record.

Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	4.21	4.29
Outcome depends on the skill and judgment of physician	4.45	4.43

Estimated risk of malpractice suit with poor outcome	4.24	3.57

INTENSITY/COMPLEXITY MEASURES	CPT Code	Reference Service 1
Time Segments (Mean)		
Pre-Service intensity/complexity	3.76	3.86
Intra-Service intensity/complexity	4.17	4.25
Post-Service intensity/complexity	3.45	3.75

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

A CPT review of codes 49200 and 49201 arose from a discussion at both the 2nd and 3rd 5-year review processes. As presented in the CPT proposal, the existing codes used to report these services, are amorphous codes that describe a wide group of unrelated procedures. There are no clinical vignettes for 49200 and 49201, since they were Harvard valued and have never been surveyed. An attempt was made to survey these codes for both the 2nd and 3rd 5-year reviews, but difficulties arose in developing clinical vignettes that span procedures common to general surgery, surgical oncology, gynecology, and gynecologic oncology. After two different CPT proposals were reviewed an accepted by CPT, the two codes 49200 and 49201 were deleted and five new codes that describe current practice were developed which require RUC surveys.

For new code 49203, a survey was sent to general surgeons, surgical oncology specialists, and obstetricians/gynecologists. A consensus panel of these specialties reviewed the survey data compared with the reference code and other services performed by these specialties. The median intra-time and length of stay was identical for general surgery compared with all other specialties. The median RVW was also similar. After discussion of the new code and reference codes, the panel noted that the new code requires less total work than the key reference code 58957. The panel also discussed a second key reference, 44140 (Colectomy, partial; with anastomosis), and agreed that the new code was less total work than this code. Given the differences in intra-time and total work, the panel recommends the 25th percentile RVW of 19.69 for the new code (IWPUT=0.087). This value correctly sets this new code slightly less than the reference codes as discussed.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.

- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 49200 or 49201

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty General surgery How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 8610
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. To determine national frequency, we used the NCDB yearly average from 2000-2004 for 49200 and 49201 (25,000) and subtracted the national estimates for the new gynecology codes (58957 and 58958) created last year (9250 and 1400 (10,650 total) for a total frequency of 14,350 (25000-10650)). We used the surveyees' performance rate for 49203, 49204 and 49205 to determine the frequency allocation between the three new codes. Using this data, we determine 49203 would be billed 60 percent of the time (14,500 x .60 = 8610), 49204 30 percent of the time (14350 x .30=4305) and 49205 10 percent of the time (14350 x .10= 1435). Because 58957 and 58958 are new codes, we do not have frequency data available. The majority of the gynecology work originally included in 49200 and 49201 will be billed to 58957 and 58958, but some gynecology cases will be billed using 49203 and 49204. Ob-gyn billed 49200 and 48201 12 and 23 percent of the time, respectively. Based on this, our best estimate is that general surgery will bill 49203 80 percent of the time and ob-gyn will bill 49203 20 percent of the time.

Specialty General surgery Frequency 6888 Percentage %

Specialty Ob-Gyn Frequency 1722 Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 2,700 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. To determineMedicare frequency, we used the 2005 Medicare frequency data for 49200 and 49201 (5501) and subtracted the national estimates for the new gynecology codes (58957 and 58958) created last year (750 and 250 (1000 total) for a total frequency of 4501 (5501-1000)). We used the surveyees' performance rate for 49203, 49204 and 49205 to determine the frequency allocation between the three new codes. Using this data, we determine 49203 would be billed 60 percent of the time (4501 x .60 = 2700), 49204 30 percent of the time (4501 x .30=1350) and 49205 10 percent of the time (4501 x .10= 450). Because 58957 and 58958 are new codes, we do not have frequency data available. The majority of the gynecology work originally included in 49200 and 49201 will be billed to 58957 and 58958, but some gynecology cases will be billed using 49203 and 49204. Ob-gyn billed 49200

and 48201 12 and 23 percent of the time, respectively. Based on this, our best estimate is that general surgery will bill 49203 80 percent of the time and ob-gyn will bill 49203 20 percent of the time.

Specialty General surgery Frequency 2160 Percentage %

Specialty Ob-Gyn Frequency 540 Percentage %

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:49204 Tracking Number JJ2 Specialty Society Recommended RVU: **26.00**
Global Period: 090 RUC Recommended RVU: **26.00**

CPT Descriptor: Excision or destruction, open, intra-abdominal tumors, cysts or endometriomas, one or more peritoneal, mesenteric, or retroperitoneal primary or secondary tumors; largest tumor 5.1 to 10.0 cm diameter

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:
A 45-year-old female has diarrhea. A CT scan reveals a 7 cm. mesenteric mass adjacent to the mid ileum. The work-up suggests the mass is a neuroendocrine tumor (carcinoid). Two small bowel lesions are seen on an octreotide scan.

Percentage of Survey Respondents who found Vignette to be Typical:

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work:
- Select and order the appropriate antibiotic(s) and confirm timing and administration.
- Assure appropriate selection, timing, and administration of DVT prophylaxis.
- Write orders for preoperative medications including beta blockers, if indicated.
- Review pre-operative work-up, with particular attention to imaging information and reports.
- Review results of preoperative testing (lab, EKG, chest x-ray, availability of blood products).
- Meet with patient and family to review planned procedure and post-operative management.
- Confirm with nurses and patient that this will be done with an abdominal midline incision and there is no sidedness.
- Review and obtain informed consent, including witness.
- Review length and type of anesthesia with anesthesiologist.
- Verify that all required instruments and supplies are available.
- Assist in transfer of patient from gurney to operating table.
- Monitor/assist with positioning of patient.
- Assist anesthesia team with line placement and induction of anesthesia and intubation.
- Indicate areas of skin to be prepped and mark surgical incisions.
- Scrub and gown.
- Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work:
Skin incision is made using sharp dissection. Hemostasis is achieved using electrocautery and small ligatures, as necessary. The linea alba is identified and carefully divided. The peritoneum is grasped, elevated, and carefully incised to avoid injury to bowel. The peritoneal cavity is entered under direct vision. Adhesions are cleared by sharp dissection in order to expose all of the abdominal viscera. A visual and manual complete exploration of the abdominal cavity and its contents is carried out. The NG tube is placed and its position is confirmed. The stomach is inspected and palpated for pathology. The duodenum is visualized and palpated. The gallbladder is inspected and palpated for the presence of stones. The liver is palpated bimanually, as is the porta hepatis. The pancreas is inspected through the hepaticogastric ligament and palpated for possible masses. The tail of the pancreas is palpated for possible lymphadenopathy. The small bowel is inspected and palpated from the ligament of Treitz to the ileocecal valve. Two small bowel masses are palpated adjacent to the mass. The small bowel mesentery is inspected and palpated for the presence of lymphadenopathy. The cecum and appendix, ascending, transverse, and descending colon are inspected and palpated. The cul-de-sac and pelvic contents are inspected and palpated. A self-retaining retractor is carefully inserted, while avoiding injury or entrapment of abdominal contents. A self-retaining retractor is carefully inserted, while avoiding injury or entrapment of abdominal

contents. The location and extent of the primary lesion is confirmed. The abdominal contents, to the exclusion of the right colon, are packed away using laparotomy pads and additional retractors are placed for optimal exposure. The right colon is mobilized lateral to medial by incising the line of Toldt. A seven cm. mass is identified in the mesentery adjacent to above mentioned small bowel lesions. It is carefully dissected from the retroperitoneal tissues. The superior mesenteric artery is identified and isolated with vessel loops. Additionally, during this dissection, the right ureter is identified and a vessel loop is placed for continual identification and protection of the ureter. The mass is completely dissected away from the duodenum and mesenteric vessels as well as the ureter. The two small bowel lesions are resected en bloc from the mesentery of the small bowel. The abdominal cavity is irrigated copiously with antibiotic solution. Hemostasis is obtained. The abdomen is inspected for injury and the presence of any instruments or lap-pads (ie, count is made). The retractor components are removed and accounted for. The abdominal organs are returned to normal anatomical position. The omentum is draped over the abdominal contents. The fascia is closed with running suture. A second instrument, needle, sponge, and lap-pad count is conducted. The subcutaneous tissues are irrigated and approximated and the skin is closed.

Description of Post-Service Work:
Post-service Hospital Work

- Apply Steristrips and sterile dressings. Monitor patient during reversal of anesthesia, protecting the wound with a hand so that wound disruption does not occur with an unrestrained cough. Assist in transfer of patient from operating table to gurney. Monitor transport of patient from operating room to recovery room. Discuss postoperative recovery care with anesthesia and nursing staff. Instruct nursing staff in care of drains, tubes and other devices. Review post-operative labs. Check chest x-ray to confirm location of NG tube and assess pulmonary status. Discuss procedure and outcome with family in waiting area. Write brief operative note. Write postoperative note in the recovery room. Dictate operative report and copy referring physician(s). Call referring physician(s). Patient is discharged from recovery room.
- Write patient care orders and discuss floor care with nursing staff.
- Examine patient, including reviewing vital signs and confirming as necessary.
- Auscultate heart, lungs, and abdomen for bowel sounds.
- Manage dressings to wounds daily, monitoring status of incision, looking for signs of infection.
- Continue prophylaxis for DVT. Monitor daily for adequacy.
- Assess need for beta-blockers, order as required.
- Assess need for antibiotics, order as required. Discontinue as required.
- Monitor and document patient progress: evaluate for sepsis, bowel function; cardiorespiratory function.
- Assess pain scores and adequacy of analgesia.
- Monitor fluid and electrolyte status and renal function.
- Review nursing/other staff patient chart notes.
- Write orders for labs, films, medications, diet, and patient activity.
- Chart patient progress notes, daily.
- Answer patient and family questions. Answer nursing/other staff questions.
- Prior to discharge, the pathology is reviewed with the patient.
- Manage nasogastric tube, remove when appropriate and advance diet.
- Obtain oncology consultations.
- Write prescriptions for medications needed post-discharge.
- Home restrictions (ie, diet, activity, bathing) are discussed with the patient, family members, and discharging nurse.
- The patient is discharged when there is return of bowel function, adequate nutrition intake, and adequate pain control with oral analgesics.
- All appropriate medical records are completed, including day of discharge progress notes, discharge summary and discharge instructions, and insurance forms.

Post-service Office Work

- Examine and talk with patient.
- Monitor healing of incision with appropriate physical examination, including answering questions from patient and family.
- Remove sutures and staples, when appropriate.

- Monitor diet caloric intake by weight. Arrange for dietary consultation as needed.
- Review pathology report in response to family/patient questions.
- Answer patient/family questions.
- Write medication prescriptions.
- Post discharge labs/films are ordered and reviewed, as necessary.
- Begin routine surveillance for recurrent tumor. Discuss schedule of patient examination and imaging surveillance.
- Discuss the need for postoperative chemotherapy with patient.
- Discuss the need for postoperative radiotherapy with patient.
- Offer referral to cancer support groups.
- Discuss progress with referring physician(s) (verbal and written).
- Discuss case with oncologist and prepare documents for transmission to that office.
- Dictate progress notes for medical record.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

A CPT review of codes 49200 and 49201 arose from a discussion at both the 2nd and 3rd 5-year review processes. As presented in the CPT proposal, the existing codes used to report these services, are amorphous codes that describe a wide group of unrelated procedures. There are no clinical vignettes for 49200 and 49201, since they were Harvard valued and have never been surveyed. An attempt was made to survey these codes for both the 2nd and 3rd 5-year reviews, but difficulties arose in developing clinical vignettes that span procedures common to general surgery, surgical oncology, gynecology, and gynecologic oncology. After two different CPT proposals were reviewed an accepted by CPT, the two codes 49200 and 49201 were deleted and five new codes that describe current practice were developed which require RUC surveys.

For new code 49204, a survey was sent to general surgeons, surgical oncology specialists, and obstetricians/gynecologists. A consensus panel of these specialties reviewed the survey data compared with the reference code and other services performed by these specialties. The median intra-time was 5 minutes less for general surgery compared with all other specialties. The median RVW was slightly greater for general surgery compared with all other specialties. After discussion of the new code and reference codes, the panel noted that the new code was very similar in total work to the key reference code 58957, with slightly less intra-operative time, but greater length of stay. The panel also discussed a second key reference, 44140 (Colectomy, partial; with anastomosis), and agreed that the new code was greater total work than this code. Given this discussion, the panel recommends the median RVW of 26.00 for the new code (IWPUT=0.088). This value is correctly similar to the key reference code 58957 and greater than 44140.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.

- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 49200 or 49201

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty General surgery How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 4305
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. To determine national frequency, we used the NCDB yearly average from 2000-2004 for 49200 and 49201 (25,000) and subtracted the national estimates for the new gynecology codes (58957 and 58958) created last year (9250 and 1400 (10,650 total) for a total frequency of 14,350 (25000-10650)). We used the surveyees' performance rate for 49203, 49204 and 49205 to determine the frequency allocation between the three new codes. Using this data, we determine 49203 would be billed 60 percent of the time (14,500 x .60 = 8610), 49204 30 percent of the time (14350 x .30=4305) and 49205 10 percent of the time (14350 x .10= 1435). Because 58957 and 58958 are new codes, we do not have frequency data available. The majority of the gynecology work originally included in 49200 and 49201 will be billed to 58957 and 58958, but some gynecology cases will be billed using 49203 and 49204. Ob-gyn billed 49200 and 48201 12 and 23 percent of the time, respectively. Based on this, our best estimate is that general surgery will bill 49203 90 percent of the time and ob-gyn will bill 49203 10 percent of the time.

Specialty General surgery Frequency 3874 Percentage %

Specialty Ob-Gyn Frequency 430 Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 1,350 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty.
Please explain the rationale for this estimate. To determineMedicare frequency, we used the 2005 Medicare frequency data for 49200 and 49201 (5501) and subtracted the national estimates for the new gynecology codes (58957 and 58958) created last year (750 and 250 (1000 total) for a total frequency of 4501 (5501-1000)). We used the surveyees' performance rate for 49203, 49204 and 49205 to determine the frequency allocation between the three new codes. Using this data, we determine 49203 would be billed 60 percent of the time (4501 x .60 = 2700), 49204 30 percent of the time (4501 x .30=1350) and 49205 10 percent of the time (4501 x .10= 450). Because 58957 and 58958 are new codes, we

do not have frequency data available. The majority of the gynecology work originally included in 49200 and 49201 will be billed to 58957 and 58958, but some gynecology cases will be billed using 49203 and 49204. Ob-gyn billed 49200 and 48201 12 and 23 percent of the time, respectively. Based on this, our best estimate is that general surgery will bill 49203 90 percent of the time and ob-gyn will bill 49203 10 percent of the time.

SUMMARY OF RECOMMENDATION

CPT Code:49205 Tracking Number JJ3 Specialty Society Recommended RVU: **30.00**
Global Period: 090 RUC Recommended RVU: **30.00**

CPT Descriptor: Excision or destruction, open, intra-abdominal tumors, cysts or endometriomas, one or more peritoneal, mesenteric, or retroperitoneal primary or secondary tumors; largest tumor greater than 10.0 cm diameter

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:
A 55-year-old male is evaluated for four months of vague abdominal pain. A CT scan reveals a 25 cm left retroperitoneal mass. Biopsy reveals a liposarcoma. The mass has displaced the left colon, left kidney, and the pancreas superiorly. There is no metastatic disease.

Percentage of Survey Respondents who found Vignette to be Typical:

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work:
- Select and order the appropriate antibiotic(s) and confirm timing and administration.
- Assure appropriate selection, timing, and administration of DVT prophylaxis.
- Write orders for preoperative medications including beta blockers, if indicated.
- Review pre-operative work-up, with particular attention to imaging information and reports.
- Review results of preoperative testing (lab, EKG, chest x-ray, availability of blood products).
- Meet with patient and family to review planned procedure and post-operative management.
- Mark site and side of proposed skin incision and confirm with patient.
- Review and obtain informed consent, including witness.
- Review length and type of anesthesia with anesthesiologist.
- Verify that all required instruments and supplies are available.
- Assist in transfer of patient from gurney to operating table.
- Monitor/assist with positioning of patient.
- Assist anesthesia team with line placement and induction of anesthesia and intubation.
- Indicate areas of skin to be prepped and mark surgical incisions.
- Scrub and gown.
- Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work:
Skin incision is made using sharp dissection. Hemostasis is achieved using electrocautery and small ligatures, as necessary. The linea alba is identified and carefully divided. The peritoneum is grasped, elevated, and carefully incised to avoid injury to bowel. The peritoneal cavity is entered under direct vision. Adhesions are cleared by sharp dissection in order to expose all of the abdominal viscera. A visual and manual complete exploration of the abdominal cavity and its contents is carried out. The NG tube is placed and its position is confirmed. The stomach is inspected and palpated for pathology. The duodenum is visualized and palpated. The gallbladder is inspected and palpated for the presence of stones. The liver is palpated bimanually, as is the porta hepatis. The pancreas is inspected through the hepaticogastric ligament and palpated for possible masses. The tail of the pancreas is palpated for possible lymphadenopathy. The small bowel is inspected and palpated from the ligament of Treitz to the ileocecal valve. The small bowel mesentery is inspected and palpated for the presence of lymphadenopathy. The cecum and appendix, ascending, transverse, and descending colon are inspected and palpated. The cul-de-sac and pelvic contents are inspected and palpated. A self-retaining retractor is carefully inserted, while avoiding injury or entrapment of abdominal contents. A self-retaining retractor is carefully inserted, while avoiding injury or entrapment of abdominal contents. Examination reveals a

massive 25 cm. tumor emanating from the left retroperitoneum. The left colon is mobilized as is the splenic flexure of the colon. The pancreas must be elevated anteriorly and superiorly off of the upper portion of the mass. Additionally, the left kidney is dissected from the mass with care taken to avoid injury to the renal vessels. The mass encroaches upon the aorta for a length of 10 cm. the mass is carefully dissected away from the aorta, carefully ligating bridging tumor vessels and lumbar vessels. The left ureter is isolated and protected with vessel loops. It is protected throughout the procedure and is not resected. The final dense attachments between the mass and the retroperitoneal muscles are carefully divided with electrocautery and ultrasonic or harmonic dissectors. The mass is completely resected. The abdominal cavity is irrigated copiously with antibiotic solution. Hemostasis is obtained. The abdomen is inspected for injury and the presence of any instruments or lap-pads (ie, count is made). The retractor components are removed and accounted for. The abdominal organs are returned to normal anatomical position. The omentum is draped over the abdominal contents. The fascia is closed with running suture. A second instrument, needle, sponge, and lap-pad count is conducted. The subcutaneous tissues are irrigated and approximated and the skin is closed.

Description of Post-Service Work:
Post-service Hospital Work

- Apply Steristrips and sterile dressings. Monitor patient during reversal of anesthesia, protecting the wound with a hand so that wound disruption does not occur with an unrestrained cough. Assist in transfer of patient from operating table to gurney. Monitor transport of patient from operating room to recovery room. Discuss postoperative recovery care with anesthesia and nursing staff. Instruct nursing staff in care of drains, tubes and other devices. Review post-operative labs. Check chest x-ray to confirm location of NG tube and assess pulmonary status. Discuss procedure and outcome with family in waiting area. Write brief operative note. Write postoperative note in the recovery room. Dictate operative report and copy referring physician(s). Call referring physician(s). Patient is discharged from recovery room.
- Write patient care orders and discuss floor care with nursing staff.
- Examine patient, including reviewing vital signs and confirming as necessary.
- Auscultate heart, lungs, and abdomen for bowel sounds.
- Manage dressings to wounds daily, monitoring status of incision, looking for signs of infection.
- Continue prophylaxis for DVT. Monitor daily for adequacy.
- Assess need for beta-blockers, order as required.
- Assess need for antibiotics, order as required. Discontinue as required.
- Monitor and document patient progress: evaluate for sepsis, bowel function; cardiorespiratory function.
- Assess pain scores and adequacy of analgesia.
- Monitor fluid and electrolyte status and renal function.
- Review nursing/other staff patient chart notes.
- Write orders for labs, films, medications, diet, and patient activity.
- Chart patient progress notes, daily.
- Answer patient and family questions. Answer nursing/other staff questions.
- Prior to discharge, the pathology is reviewed with the patient.
- Manage nasogastric tube, remove when appropriate and advance diet.
- Obtain oncology consultations.
- Write prescriptions for medications needed post-discharge.
- Home restrictions (ie, diet, activity, bathing) are discussed with the patient, family members, and discharging nurse.
- The patient is discharged when there is return of bowel function, adequate nutrition intake, and adequate pain control with oral analgesics.
- All appropriate medical records are completed, including day of discharge progress notes, discharge summary and discharge instructions, and insurance forms.

Post-service Office Work

- Examine and talk with patient.
- Monitor healing of incision with appropriate physical examination, including answering questions from patient and family.
- Remove sutures and staples, when appropriate.
- Monitor diet caloric intake by weight. Arrange for dietary consultation as needed.
- Review pathology report in response to family/patient questions.

- Answer patient/family questions.
- Write medication prescriptions.
- Post discharge labs/films are ordered and reviewed, as necessary.
- Begin routine surveillance for recurrent tumor. Discuss schedule of patient examination and imaging surveillance.
- Discuss the need for postoperative chemotherapy with patient.
- Discuss the need for postoperative radiotherapy with patient.
- Offer referral to cancer support groups.
- Discuss progress with referring physician(s) (verbal and written).
- Discuss case with oncologist and prepare documents for transmission to that office.
- Dictate progress notes for medical record.

SURVEY DATA

RUC Meeting Date (mm/yyyy)	04/2007

INTENSITY/COMPLEXITY MEASURES (Mean)

Mental Effort and Judgment (Mean)

The number of possible diagnosis and/or the number of management options that must be considered	4.50	4.25
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	4.25	4.25
Urgency of medical decision making	4.75	4.00

Technical Skill/Physical Effort (Mean)

Technical skill required	4.50	4.50
Physical effort required	5.00	4.50

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	4.75	4.75
Outcome depends on the skill and judgment of physician	4.50	4.50
Estimated risk of malpractice suit with poor outcome	4.00	3.75

INTENSITY/COMPLEXITY MEASURES	CPT Code	Reference Service 1
Time Segments (Mean)		
Pre-Service intensity/complexity	5.00	3.75
Intra-Service intensity/complexity	5.00	4.50
Post-Service intensity/complexity	4.00	3.75

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

A CPT review of codes 49200 and 49201 arose from a discussion at both the 2nd and 3rd 5-year review processes. As presented in the CPT proposal, the existing codes used to report these services, are amorphous codes that describe a wide group of unrelated procedures. There are no clinical vignettes for 49200 and 49201, since they were Harvard valued and have never been surveyed. An attempt was made to survey these codes for both the 2nd and 3rd 5-year reviews, but difficulties arose in developing clinical vignettes that span procedures common to general surgery, surgical oncology, gynecology, and gynecologic oncology. After two different CPT proposals were reviewed an accepted by CPT, the two codes 49200 and 49201 were deleted and five new codes that describe current practice were developed which require RUC surveys.

For new code 49205, a survey was sent to general surgeons and surgical oncology specialists. A consensus panel of these specialties reviewed the survey data compared with the reference code and other services performed by these specialties. The survey response was low, but this code is not expected to be performed frequently. The median 12 month experience of the responders was one. After discussion of the new code and reference codes, the panel noted that the new code requires less total work than the key reference code 43633 (Gastrectomy, partial, distal; with Roux-en-Y reconstruction). The panel also discussed a second key reference, 58957 (Resection (tumor debulking) of recurrent ovarian, tubal, primary peritoneal, uterine malignancy (intra-abdominal, retroperitoneal tumors), with omentectomy, if performed;), and agreed that the new code required significantly more work than this code. Given the differences relative to these two codes, the panel recommends the median RVW of 30.00 for the new code (IWPUT=0.073). This value correctly sets this new code between the reference codes as discussed.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.

☐ Historical precedents.
☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 49200 or 49201

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty General surgery How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 1435
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. To determine national frequency, we used the NCDB yearly average from 2000-2004 for 49200 and 49201 (25,000) and subtracted the national estimates for the new gynecology codes (58957 and 58958) created last year (9250 and 1400 (10,650 total) for a total frequency of 14,350 (25000-10650)). We used the surveyees' performance rate for 49203, 49204 and 49205 to determine the frequency allocation between the three new codes. Using this data, we determine 49203 would be billed 60 percent of the time (14,500 x .60 = 8610), 49204 30 percent of the time (14350 x .30=4305) and 49205 10 percent of the time (14350 x .10= 1435). Because 58957 and 58958 are new codes, we do not have frequency data available. The majority of the gynecology work originally included in 49200 and 49201 will be billed to 58957 and 58958, but some gynecology cases will be billed using 49203 and 49204. Ob-gyn billed 49200 and 48201 12 and 23 percent of the time, respectively. Based on this, our best estimate is that general surgery will bill 49203 95 percent of the time and ob-gyn will bill 49203 5 percent of the time.

Specialty General surgery Frequency 1363 Percentage %

Specialty Ob-gyn Frequency 71 Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 450
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. To determineMedicare frequency, we used the 2005 Medicare frequency data for 49200 and 49201 (5501) and subtracted the national estimates for the new gynecology codes (58957 and 58958) created last year (750 and 250 (1000 total) for a total frequency of 4501 (5501-1000)). We used the surveyees' performance rate for 49203, 49204 and 49205 to determine the frequency allocation between the three new codes. Using this data, we determine 49203 would be billed 60 percent of the time (4501 x .60 = 2700), 49204 30 percent of the time (4501 x .30=1350) and 49205 10 percent of the time (4501 x .10= 450). Because 58957 and 58958 are new codes, we do not have frequency data available. The majority of the gynecology work originally included in 49200 and 49201 will be billed to 58957 and 58958, but some gynecology cases will be billed using 49203 and 49204. Ob-gyn billed 49200 and 48201 12 and 23 percent of the time, respectively. Based on this, our best estimate is that general surgery will bill 49203 95 percent of the time and ob-gyn will bill 49203 5 percent of the time.

Specialty General surgery	Frequency 427	Percentage		%
Specialty Ob-gyn	Frequency 22	Percentage	%	
Specialty	Frequency	Percentage		%

Do many physicians perform this service across the United States?

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/Specialty Society Update Process
PERC Summary of Recommendation
010 or 090 Day Global Periods
Facility Direct Inputs

CPT Long Descriptor:

49203 Excision or destruction, open, intra-abdominal tumors, cysts or endometriomas, one or more peritoneal, mesenteric, or retroperitoneal primary or secondary tumors; largest tumor 5 cm diameter or less

49204 Excision or destruction, open, intra-abdominal tumors, cysts or endometriomas, one or more peritoneal, mesenteric, or retroperitoneal primary or secondary tumors; largest tumor 5.1 to 10.0 cm diameter

49205 Excision or destruction, open, intra-abdominal tumors, cysts or endometriomas, one or more peritoneal, mesenteric, or retroperitoneal primary or secondary tumors; largest tumor greater than 10.0 cm diameter

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

A consensus panel of surgeons representing general surgery and obstetrics/gynocology reviewed the practice expense details for the survey codes relative to other facility-only 90-day global services.

Please describe the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

No changes were made to the standard pre-service times. A total of 60 minutes has been applied for the pre-service clinical labor activities. During the pre-service period, clinical staff conducts the standard pre-service activities: An RN/LPN/MA completes pre-service diagnostic and referral forms, coordinates pre-surgery services, schedules space and equipment in facility, provides pre-service education/obtains consent, and conducts follow-up phone calls.

Intra-Service Clinical Labor Activities:

The standard 12 minutes has been applied for these inpatient procedures for discharge day management services.

Post-Service Clinical Labor Activities:

The standard times have been applied for post-service clinical labor time.

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

April 2007

G-, J-, G-J and C-Tube Procedures

The CPT Editorial Panel created nine new codes and revised one current code to describe the array of percutaneous gastrostomy, jejunostomy, gastro-jejunostomy or cecostomy tube procedures and services including initial placement, conversion, replacement and removal, as well as mechanical removal of obstructive material and injection of contrast for radiological evaluation of a tube.

The RUC reviewed 49440-49465 and 43760. The RUC recognized that the survey response rates were low, ranging from 15-20 respondents for 49440-49465. The RUC noted that these procedures are frequently performed and the small number of respondents did not adequately represent these services as performed. **The RUC recommends that the following work RVUs as interim values until the RUC next meeting after the specialty societies have resurveyed and are able to present representative recommendations.** Additionally, code 43760 had a sufficient response rate of 40 respondents, however, since the recommended value is linked to 49450 and the specialty society determined that it should be resurveyed as well.

1151

49440 *Insertion of gastrostomy tube, percutaneous under fluoroscopic guidance including contrast injection(s), image documentation and report*
The RUC reviewed the survey data for 49440 and compared this service to the key reference code 36558 *Insertion of tunneled centrally inserted central venous catheter, without subcutaneous port or pump; age 5 years or older* (Work RVU=4.81). The RUC determined that the physician time required to perform 49440 was similar to the reference service. However, the RUC determined that a discharge day management visit was not performed and the associated work RVUs should be extracted. The RUC determined that extracting 1.28 RVUs of the discharge day management (99238) from the survey median RVU of 4.60, would place this service in the proper rank order among other services within this family and across specialties (4.60-1.28=3.32 Work RVU). The RUC also compared this service to codes 44365 *Small intestinal endoscopy, enteroscopy beyond second portion of duodenum, not including ileum; with removal of tumor(s), polyp(s), or other lesion(s) by hot biopsy forceps or bipolar cautery* (Work RVU=3.31) and 45915 *Removal of fecal impaction or foreign body (separate procedure) under anesthesia* (Work RVU=3.16) and determined that the recommended work RVU places code 49440 in the proper rank order. **The RUC recommends an interim work relative value of 3.32 for code 49440.**

49441 *Insertion of duodenostomy or jejunostomy tube, percutaneous under fluoroscopic guidance including contrast injection(s), image documentation and report*
The RUC reviewed the survey data for 49441 and determined that the survey respondents overestimated the pre-service scrub, dress, and wait time, therefore the RUC reduced this time to 10 minutes. The RUC also determined that a discharge day management visit was not performed and the associated work RVUs should be extracted. The RUC determined that extracting 1.28 RVUs of the discharge day management (99238) from the survey median RVU of 7.00 would place this service in the proper rank order among other services within this family and across specialties

* CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association

(7.00-1.28=5.72 Work RVU). The RUC also compared this service to codes 45382 *Colonoscopy, flexible, proximal to splenic flexure; with control of bleeding (eg, injection, bipolar cautery, unipolar cautery, laser, heater probe, stapler, plasma coagulator)* (Work RVU=5.68) and 49421 *Insertion of intraperitoneal cannula or catheter for drainage or dialysis; permanent* (Work RVU=5.87) and determined that the recommended work RVU places code 49441 in the proper rank order. **The RUC recommends an interim work relative value of 5.72 for code 49441.**

49442 *Insertion of cecostomy or other colonic tube, percutaneous under fluoroscopic guidance including contrast injection(s), image documentation and report*
The RUC reviewed the survey data for 49442 and determined that the specialty recommendation of the 75% percentile survey work RVU supported by a building block methodology was not representative of this procedure. The median survey work RVU of 5.15 was used as a starting point for valuing 49442. The RUC determined that a discharge day management visit was not performed and the associated work RVUs should be extracted. In addition, the RUC and specialty societies agreed only one hospital post-operative visit (99231) was typical rather than two, as indicated from the survey results. The RUC determined that extracting 1.28 RVUs of the discharge day management (99238) from the survey median RVU of 5.15, would place this service in the proper rank order among other services within this family and across specialties (5.15-1.28=3.87 Work RVU). The RUC also compared this service to code 49041 *Drainage of subdiaphragmatic or subphrenic abscess; percutaneous* (Work RVU = 3.99) and determined that in relation to this service, code 49442 would be properly valued at 3.87 RVUs. **The RUC recommends an interim work relative value of 3.87 for code 49442.**

1152

49446 *Conversion of gastrostomy tube to gastro-jejunostomy tube, percutaneous under fluoroscopic guidance including contrast injection(s), image documentation and report*
The RUC reviewed the survey data for 49446 and agreed with the specialty societies that the survey results in the pre-service and post-service times did not reflect the typical patient. The RUC determined that the survey respondents overestimated some of the physician's time. The RUC recommends adjusting the pre-service and post-service and subtracting the work RVUs associated per unit of time adjusted. Shown on the attached table, are all elements of pre-service time and the immediate post times. The RUC adjusted the physician time and work RVUs based on a building block methodology and comparing the result across specialties. The RUC reviewed the following services to ensure proper rank order placement of 49446:
45345 *Sigmoidoscopy, flexible; with transendoscopic stent placement (includes predilation)* (Work RVU = 2.92)
31623 *Bronchoscopy, rigid or flexible, with or without fluoroscopic guidance; with brushing or protected brushings* (Work RVU = 2.88)
52007 *Cystourethroscopy, with ureteral catheterization, with or without irrigation, instillation, or ureteropyelography, exclusive of radiologic service; with brush biopsy of ureter and/or renal pelvis* (Work RVU = 3.02)

The RUC recommends an interim relative work value of 2.94 for code 484X4.

* CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association

49450 *Replacement gastrostomy or cecostomy (or other colonic) tube, percutaneous under fluoroscopic guidance including contrast injection(s), image documentation and report*

The RUC reviewed the survey data for 49450 and agreed with the specialty societies that the survey results in the pre-service and post-service times did not reflect the typical patient. The RUC determined that the survey respondents overestimated some of the physician's time. The RUC recommends adjusting the pre-service and post-service and subtracting the work RVUs associated per unit of time adjusted. Shown on the attached table, are all elements of pre-service time and the immediate post times. The RUC adjusted the physician time and work RVUs based on a building block methodology and comparing the result across specialties. The RUC reviewed the following services to ensure proper rank order placement of 49450:

36584 *Replacement, complete, of a peripherally inserted central venous catheter (PICC), without subcutaneous port or pump, through same venous access* (Work RVU = 1.20)

The RUC recommends an interim relative work value of 1.14 for code 49450.

49451 *Replacement duodenostomy or jejunostomy tube, percutaneous under fluoroscopic guidance including contrast injection(s), image documentation and report*

The RUC reviewed the survey data for 49451 and agreed with the specialty societies that the survey results in the pre-service and post-service times did not reflect the typical patient. The RUC determined that the survey respondents overestimated some of the physician's time. The RUC recommends adjusting the pre-service and post-service and subtracting the work RVUs associated per unit of time adjusted. Shown on the attached table, are all elements of pre-service time and the immediate post times. The RUC adjusted the physician time and work RVUs based on a building block methodology and comparing the result across specialties The RUC reviewed the following services to ensure proper rank order placement of 49451:

91122 *Anorectal manometry* (Work RVU = 1.77)

57456 *Colposcopy of the cervix including upper/adjacent vagina; with endocervical* curettage (Work RVU = 1.85)

The RUC recommends an interim relative work value of 1.82 for code 49451.

49452 *Replacement gastro-jejunostomy tube, percutaneous under fluoroscopic guidance including contrast injection(s), image documentation and report*

The RUC reviewed the survey data for 49452 and agreed with the specialty societies that the survey results in the pre-service and post-service times did not reflect the typical patient. The RUC determined that the survey respondents overestimated some of the physician's time. The RUC recommends adjusting the pre-service and post-service and subtracting the work RVUs associated per unit of time adjusted. Shown on the attached table, are all elements of pre-service time and the immediate post times. The RUC adjusted the physician time and work RVUs based on

1153

* CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association

a building block methodology and comparing the result across specialties. The RUC reviewed the following services to ensure proper rank order placement of 49452:
57460 *Colposcopy of the cervix including upper/adjacent vagina; with loop electrode biopsy(s) of the cervix* (Work RVU = 2.83)

The RUC recommends an interim relative work value of 2.81 for code 49452.

49460 *Mechanical removal of obstructive material from gastrostomy, duodenostomy, jejunostomy, gastro-jejunostomy or cecostomy (or other colonic) tube, any method, under fluoroscopic guidance including contrast injection(s) if performed, image documentation and report*
The RUC reviewed the survey data for 49460 and agreed with the specialty societies that the survey results in the pre-service and post-service times did not reflect the typical patient. The RUC determined that the survey respondents overestimated some of the physician's time. The RUC recommends adjusting the pre-service and post-service and subtracting the work RVUs associated per unit of time adjusted. Shown on the attached table, are all elements of pre-service time and the immediate post times. The RUC adjusted the physician time and work RVUs based on the building block methodology and comparing the result across specialties. The RUC reviewed the following services to ensure proper rank order placement of 49460:
46608 *Anoscopy; with removal of foreign body* (Work RVU = 1.51)
62311 *Injection, single (not via indwelling catheter), not including neurolytic substances, with or without contrast (for either localization or epidurography), of diagnostic or therapeutic substance(s) (including anesthetic, antispasmodic, opioid, steroid, other solution), epidural or subarachnoid; lumbar, sacral (caudal)* (Work RVU = 1.54)

1154

The RUC recommends an interim relative work value of 1.51 for code 49460.

49465 *Contrast injection(s) for radiological evaluation of existing gastrostomy, duodenostomy, jejunostomy, gastro-jejunostomy, or cecostomy (or other colonic) tube, from a percutaneous approach including image documentation and report*
The RUC reviewed the survey data for 49465 and agreed with the specialty societies that the survey results in the pre-service and post-service times did not reflect the typical patient. The RUC determined that the survey respondents overestimated some of the physician's time. The RUC recommends adjusting the pre-service and post-service and subtracting the work RVUs associated per unit of time adjusted. Shown on the attached table, are all elements of pre-service time and the immediate post times. The RUC adjusted the physician time and work RVUs based on the building block methodology and comparing the result across specialties. The RUC reviewed the following services to ensure proper rank order placement of 49465:
36598 *Contrast injection(s) for radiologic evaluation of existing central venous access device, including fluoroscopy, image documentation and report* (Work RVU = 0.74)

The RUC recommends an interim relative work value of 0.62 for code 49465.

* CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association

43760 *Change of gastrostomy tube, percutaneous, without imaging or endoscopic guidance*
The RUC reviewed the survey results for 43760 and agreed with the specialty societies the pre-service time did not reflect that this service is typically performed in the outpatient emergency room setting. The RUC decreased the pre-service physician time to reflect the typical site of service. The physician work involved in 43760 was compared to new code 49450 with the revised recommended work RVU of 1.14, which includes fluoroscopic guidance and image documentation. The RUC determined that the surveyed median of 1.15 RVUs should be reduced to reflect the lack of fluoroscopic guidance and image documentation, but also that the service be relative to other cross specialty services. The RUC reviewed the following codes and believed the overall physician work was similar in intensity and complexity, but required less physician time.
99282 *Emergency department visit for the evaluation and management of a patient* (Work RVU = 0.88)
99213 *Office or other outpatient visit for the evaluation and management of an established patient* (Work RVU = 0.92)

The RUC determined that a reduction of 0.24 work RVUs from the survey median of 1.14 reflects the lack of fluoroscopic guidance and documentation and places the service in the correct rank order with other services on the physician payment schedule (1.14-0.24=0.90). In addition, the specialty survey 25th percentile results indicated a work RVU of 0.95. **The RUC recommends an interim work RVU of 0.90 for code 43760.**

1155

Conscious Sedation
The RUC determined that conscious sedation was only inherent in codes 49440, 49441, 49442 and 49446 but not for any other code in this family. The facilitation committee recommends no conscious sedation components in the practice expense of codes 49450, 49451, 49452, 49460, and 49465.

Practice Expense
The RUC reviewed and accepted the direct practice expense inputs as modified (eg, remove discharge day management).

* CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:49440 Tracking Number KK1 Specialty Society Recommended RVU: **4.60**
Global Period: 010 RUC Recommended RVU: **3.32**

CPT Descriptor: Insertion of gastrostomy tube, percutaneous under fluoroscopic guidance including contrast injection(s), image documentation and report
(For conversion to a gastro-jejunostomy tube at the time of initial gastrostomy tube placement, report code 494X4 in addition to 494X1)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: 76 year old male has suffered a recent cerebral vascular accident (CVA) with ongoing issues of dysphagia and risk of aspiration pneumonia. A gastrostomy tube is required to provide adequate enteral nutrition.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Is conscious sedation inherent to this procedure? Yes Percent of survey respondents who stated it is typical? 100%

Is conscious sedation inherent in your reference code? Yes

Description of Pre-Service Work: The physician,
-Discusses procedure details, including alternatives and risks with the patient (or more commonly with the power of attorney (POA) overseeing care of the patient) and family and informed consent is reviewed with patient and family.
-Estimates the range of guiding catheters/sheaths, guidewires, and other devices that may be required and ensures all are available for use.
-Reviews recent CT or US of the abdomen (separately reportable) is performed to confirm an acceptable percutenous window.
-Optimizes anticoagulent status and platelet count prior to performance of the procedure.
-Checks the interventional suite to ensure proper function and configuration of the imaging equipment including compliance with all radiation safty issues.
-Ensures all technical personnel have been familiarized with the procedure and are fully familiar with all required devices.
-Supervises selection of all equipment, incuding catheters, wires, sheaths, contrast material and other devices.
-Re-reviews applicable, available prior films.
-Dons radiation protection device.

Description of Intra-Service Work: The physician,
-Confirms clinical status has not changed.
-Checks IV set up.
-Directs administration of intravenous antibiotics.
-Brings the patient into the angiography suite and positions the patient (or supervises the postioning of the patient) in a supine position.
-Ensures patient is properly protected from radiation.
-Moderate sedation is administered.
-Ensures EKG amd hemodynamic monitors are in place and functioning.
-Imaging of the epigastrium is performed to identify interposed bowel.
-Applies topical anesthesia to the selected entry site and a naso-/oro-gastric tube is placed.with position confirmed by imaging.
-Adminstered Glucagon and the stomach is insufflated with air.
-Performs sterile prep of the stomach wall and then percutaneously punctures the wall using fluoroscopic guidance.
-Performs gastropexy with 1-3 fastners; securing the stomach to the abdominal wall.
-Introduces a Seldinger needle into the stomach and passes a wire, allowing serial dilatation.

-Introduces a peel-away sheath through which a 12-22 Fr. gastrostomy tube is placed.
-Secures the retention device internally with the tube secured to the skin externally.
-Uses continuous imaging guidance and contrast injections at each step to insure proper position of devices and patency of the stomach..
-Places the system to ensure gravity drainage and applies a sterile dressing.

Description of Post-Service Work: The physician,
-Writes orders for pain control, management of outputs and surveillance for abdominal complications.
-Commuicates to the family, POA, and managing service (if other than operator).
-Perscribes care of G-tube, graduated feeding amounts, and acceptable residual levels
-Dictates, reviews, and signs report of the procedure including review and reporting on related archived images.

Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	3.14	3.00
Outcome depends on the skill and judgment of physician	3.00	2.80

Estimated risk of malpractice suit with poor outcome	3.14	2.80

INTENSITY/COMPLEXITY MEASURES	CPT Code	Reference Service 1
Time Segments (Mean)		
Pre-Service intensity/complexity	2.14	2.20
Intra-Service intensity/complexity	3.43	3.00
Post-Service intensity/complexity	2.57	2.40

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The Society RUC workgroup was convened to review survey results. IWPUT was calculated, as follows:

Pre-service RVU = 1.089 = 0.0224*(35+10) + (0.0081*10)

Post-service RVU = 2.826 = (0.0224*15) + 0.76 + 1.28 + 0.45

MEDIAN RECOMMENDED RVU = 4.60

Intra-service RVU = 0.685

IWPUT = .022833 = 0.685/30

Per survey, typical E&M Visits:

In patient	99231 – 1	Physician Work RVUs	0.76
Discharge Day Mgmt	99238 – 1	Physician Work RVUs	1.28
Office Visit	99212 – 1	Physician Work RVUs	0.45

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.

☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43750 and 74350

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Diagnostic Radiology & Interventional Radiology How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 20790
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. Code 43750 was previously used to report G and J tube services (X1, X2, X5, X6, X7), which will now be reported using more specific codes. Medicare utilization for code 43750 for 2004 was 32754. An estimate of 60% of services reported using code 43750 are believed to be G-tube placement services that will now be reported using 494X1. Medicare patients are believed to be the preponderance of those receiving these service. A reasonable estimate of non-Medicare patients receiving these services is believed to be about 5% above that of Medicare. Per 2004 Medicare data, Diagnostic Radiology & Intervenitonal Radiology provide 32.63% of these services, General Surgery provides 40% and Gastroenterology provides 15%, the balance is provided by various other specialties.

Specialty Diagnostic Radiology & Interventional Radiology Frequency 6784 Percentage 32.63 %

Specialty General Surgery Frequency 8316 Percentage 40.00 %

Specialty Gatroenterology Frequency 3119 Percentage 15.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 19,800 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Code 43750 was previously used to report G and J tube services (X1, X2, X5, X6, X7), which will now be reported using more specific codes. Medicare utilization for code 43750 for 2004 was 32754. An estimate of 60% of services reported using code 43750 are believed to be G-tube placement services that will now be reported using 494X1. Per 2004 Medicare data, Diagnostic Radiology & Intervenitonal Radiology provide 32.63% of these services, General Surgery provides 40% and Gastroenterology provides 15%, the balance is provided by various other specialties.

Specialty Diagnostic Radiology & Interventional Radiology Frequency 6461 Percentage 32.63 %

Specialty General Surgery Frequency 7920 Percentage 40.00 %

Specialty Gastroenterology Frequency 2970 Percentage 15.00 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? No

If no, please select another crosswalk and provide a brief rationale. 45915 similar work RVU and physician time involved.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:49441 Tracking Number KK2 Specialty Society Recommended RVU: **7.00**
Global Period: 010 RUC Recommended RVU: **5.52**

CPT Descriptor: Insertion of duodenostomy or jejunostomy tube, percutaneous under fluoroscopic guidance including contrast injection(s), image documentation and report
(For conversion of gastrostomy tube to gastro-jejunostomy tube, use 494X4)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: The patient is a 38 year old quadriplegic female needing enteral nutrition. The patient has a history of aspiration pneumonia and gastro-esophageal reflux. Consultation is made for percutaneous placement of a jejunal feeding tube, which will provide longer-term access than the currently indwelling naso-duodenal feeding tube.

Percentage of Survey Respondents who found Vignette to be Typical: 85%

Is conscious sedation inherent to this procedure? Yes Percent of survey respondents who stated it is typical? 100%

Is conscious sedation inherent in your reference code? Yes

Description of Pre-Service Work: The physician,
-Discusses procedure details, including alternatives and risks with the patient (or more commonly with the power of attorney (POA) overseeing care of the patient) and family and informed consent is reviewed with patient and family.
-Estimates the range of guiding catheters/sheaths, guidewires, and other devices that may be required and ensures all are available for use.
-Reviews recent CT or US of the abdomen (separately reportable) is performed to confirm an acceptable percutenous window.
-Optimizes anticoagulent status and platelet count prior to performance of the procedure.
-Checks the interventional suite to ensure proper function and configuration of the imaging equipment including compliance with all radiation safty issues.
-Ensures all technical personnel have been familiarized with the procedure and are fully familiar with all required devices.
-Supervises selection of all equipment, incuding catheters, wires, sheaths, contrast material and other devices.
-Re-reviews applicable, available prior films.
-Dons radiation protection device.

Description of Intra-Service Work: The physician,
-Confirms clinical status has not changed.
-Checks IV set up.
-Directs administration of intravenous antibiotics.
-Brings the patient into the angiography suite and positions the patient (or supervises the postioning of the patient) in a supine position.
-Ensures patient is properly protected from radiation.
-Moderate sedation is administered.
-Ensures EKG amd hemodynamic monitors are in place and functioning.
-Performs sterile prep and drapes the left upper quadrant of the abdomen.
-Inflates the small intestine using medical grade air through the existing duodenal feeding tube.
-Injects contrast into the duodenal feeding tube.
-Applies topical anesthesia to the selected entry site.
-Uses fluoroscopic guidance to localize and directly puncture the jejunum.
-Performs jejunopexy with 2 fastners; securing the jejunum to the anterior abdominal wall.
-Uses fluoroscopic guidance and co-axial technique to access the jejunal segmant and sequentially dilate the track.

-Introduces a peel-away sheath through which a 18 Fr. jejunostomy tube is placed.
-Removes the peel away sheath and secures the retention device and cutaneous cuff.
-Uses continuous imaging guidance and contrast injections at each step to insure proper position of devices and patency of the small intestine.
-Injects contrast to confirm final tube placement and applies a sterile dressing.

Description of Post-Service Work: The physician,
-Writes orders for pain control, management of outputs and surveillance for intra-abdominal complications.
-Commuicates to the family, POA, and managing service (if other than operator).
-Perscribes care of J-tube, graduated feeding amounts, and acceptable residual levels
-Dictates, reviews, and signs report of the procedure including review and reporting on related archived images.

Pre-Service intensity/complexity	3.50	3.33
Intra-Service intensity/complexity	4.75	3.00
Post-Service intensity/complexity	3.00	2.67

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The Society RUC workgroup was convened to review survey results. The workgroup supports the survey median recommended physician RVU of 7.00, which results in an IWPUT of 0.0474; calculated, as follows:

Pre-service RVU = 1.3292 = 0.0224*(45+10) + (0.0081*12)

Post-service RVU = 2.826 = (0.0224*15) + 0.76 + 1.28 + 0.45

MEDIAN RECOMMENDED RVU = 7.00

Intra-service RVU = 2.8448

IWPUT = 0.0474 = 2.8448/60

Per survey, typical E&M visits:

In patient	99231 – 1	Physician Work RVUs	0.76
Discharge Day Mgmt	99238 – 1	Physician Work RVUs	1.28
Office Visit	99212 – 1	Physician Work RVUs	0.45

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.

☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43750, 43761 and 74355 (74350 if dual lumen)

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Diagnostic Radiology & Interventional Radiology How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 8663
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. Code 43750 was previously used to report G and J tube services (X1, X2, X5, X6, X7), which will now be reported using more specific codes. Mediare utilization for code 43750 for 2004 was 32754. An estimate of 25% of services reported using code 43750 are believed to be J-tube placement services that will now be reported using 494X2. Medicare patients are believed to be the preponderance of those receiving these service. A reasonable estimate of non-Medicare patients receiveing these services is believed to be about 5% above that of Medicare. Medicare 204 utilization data finds that Diagnostic Radiology & Interventional Radiology provide 32.63% of these services, General Surgery provides 40% and Gastroenterology provides 15%, the balance is provided by various other specialties.

Specialty Diagnostic Radiology & Interventional Radiology Frequency 2827 Percentage 32.63 %

Specialty General Surgery Frequency 3465 Percentage 39.99 %

Specialty Gatroenterology Frequency 1299 Percentage 14.99 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 8,250 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty.
Please explain the rationale for this estimate. Code 43750 was previously used to report G and J tube services (X1, X2, X5, X6, X7), which will now be reported using more specific codes. Mediare utilization for code 43750 for 2004 was 32754. An estimate of 25% of services reported using code 43750 are believed to be J-tube placement services that will now be reported using 494X2. Medicare 204 utilization data finds that Diagnostic Radiology & Interventional Radiology provide 32.63% of these services, General Surgery provides 40% and Gastroenterology provides 15%, the balance is provided by various other specialties.

Specialty Diagnostic Radiology & Interventional Radiology Frequency 2692 Percentage 32.63 %

Specialty General Surgery Frequency 3300 Percentage 40.00 %

Specialty Gastroenterology Frequency 1238 Percentage 15.00 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? No

If no, please select another crosswalk and provide a brief rationale. 49322 has a similar work RVU and physican times involved.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:49442 Tracking Number KK3 Specialty Society Recommended RVU: **6.58**
Global Period: 010 RUC Recommended RVU: **3.87**

CPT Descriptor: Insertion of cecostomy or other colonic tube, percutaneous under fluoroscopic guidance including contrast injection(s), image documentation and report

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 66 year old Caucasian male with history of sigmoid cancer that is non-resectable presents with megacolon, abdominal pain and vomiting. The colon is markedly dilated throughout. A rectal tube was placed, but did not reach the area of obstruction, so the patient is referred for cecostomy tube placement to allow decompression of the colon long-term.

Percentage of Survey Respondents who found Vignette to be Typical: 92%

Is conscious sedation inherent to this procedure? Yes Percent of survey respondents who stated it is typical? 100%

Is conscious sedation inherent in your reference code? Yes

Description of Pre-Service Work: The physician,
-Discusses procedure details, including alternatives and risks with the patient (or more commonly with the power of attorney (POA) overseeing care of the patient) and family and informed consent is reviewed with patient and family.
-Estimates the range of guiding catheters/sheaths, guidewires, and other devices that may be required and ensures all are available for use.
-Reviews recent CT or US of the abdomen (separately reportable) is performed to confirm an acceptable percutenous window.
-Optimizes anticoagulent status and platelet count prior to performance of the procedure.
-Checks the interventional suite to ensure proper function and configuration of the imaging equipment including compliance with all radiation safty issues.
-Ensures all technical personnel have been familiarized with the procedure and are fully familiar with all required devices.
-Supervises selection of all equipment, incuding catheters, wires, sheaths, contrast material and other devices.
-Re-reviews applicable, available prior films.
-Dons radiation protection device.

Description of Intra-Service Work: The physician,
-Confirms clinical status has not changed.
-Checks IV set up.
-Directs administration of intravenous antibiotics.
-Brings the patient into the angiography suite and positions the patient (or supervises the postioning of the patient) in a supine position.
-Ensures patient is properly protected from radiation.
-Moderate sedation is administered.
-Ensures EKG amd hemodynamic monitors are in place and functioning.
-Performs sterile prep and drapes the right lower quadrant of the abdomen.
-Applies topical anesthesia to the selected entry site.
-Uses fluoroscopic guidance to localize and directly puncture the cecal wall.
-Performs colonic pexy with 1-3 fastners; securing the colon to the abdominal wall.
-Uses fluoroscopic guidance to introduce a percutaenous needle into the cecum and passes a wire allowing serial dilatation.
-Introduces a peel-away sheath through which a 12-22 Fr. cecostomy tube is placed.

-Removes the peel away sheath and secures the retention device internally and secures the tube.
-Uses continuous imaging guidance and contrast injections at each step to insure proper position of devices and patency of the cecum.
-Injects contrast to confirm final tube placement.
-Places the system to ensure gravity drainage and applies a sterile dressing.

Description of Post-Service Work: The physician,
-Writes orders for pain control, management of outputs and surveillance for abdominal complications.
-Commuicates to the family, POA, and managing service (if other than operator).
-Perscribes care of tube, graduated feeding amounts, and acceptable residual levels
-Dictates, reviews, and signs report of the procedure including review and reporting on related archived images.

INTENSITY/COMPLEXITY MEASURES (Mean)

Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	3.00	3.00
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	3.00	3.00
Urgency of medical decision making	3.00	2.67
Technical Skill/Physical Effort (Mean)		
Technical skill required	3.67	3.33
Physical effort required	3.67	3.33
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	3.33	3.00
Outcome depends on the skill and judgment of physician	4.00	3.33
Estimated risk of malpractice suit with poor outcome	3.67	3.00

INTENSITY/COMPLEXITY MEASURES	CPT Code	Reference Service 1
Time Segments (Mean)		
Pre-Service intensity/complexity	3.67	3.33
Intra-Service intensity/complexity	3.67	3.00
Post-Service intensity/complexity	3.00	2.33

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The Society RUC workgroup was convened to review survey results. IWPUT was calculated using the median recommended RVU value, which resulted in a negative IWPUT of -0.3024. Therefore, the survey 75th percentile recommended RVU value was believed to be more accurate; IWPUT was calculated, as follows:

Pre-service RVU = 1.3964 = 0.0224*(43+15) + (0.0081*12)

Post-service RVU = 4.056 = (0.0224*15) + 0.76 + 0.76 + 1.28 + 0.92

RECOMMENDED RVU = 6.58

Intra-service RVU = 1.1276

IWPUT = 0.037587 = 1.1276/30

Per survey, typical E&M visits:

In patient	99231 – 2	Physician Work RVUs	0.76
Discharge Day Mgmt	99238 – 1	Physician Work RVUs	1.28
Office visit	99213 – 1	Physician Work RVUs	0.92

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.

☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 44300 and 74355

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Diagnostic Radiology & Interventional Radiology How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 70
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Code 44300 was previously used to report percutaneous C- tube placement, which will now be reported using 494X3. Medicare utilization for code 44300 for 2004 was 3444. Those services reported by Diagnostic Radiology and Interventional Radiology using code 44300 will now be reported with code 494X3. Medicare patients are believed to be the preponderance of those receiving these service. A reasonable estimate of non-Medicare patients receiveng these services is believed to be about 5% above that of Medicare. Per 2004 Medicare data, Diagnostic Radiology and Interventional Radiology represented only 1.91% of those reporting 44300.

Specialty Diagnostic Radiology & Interventional Radiology Frequency 70 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 65
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Code 44300 was previously used to report percutaneous C- tube placement, which will now be reported using 494X3. Medicare utilization for code 44300 for 2004 was 3444. Those services reported by Diagnostic Radiology and Interventional Radiology using code 44300 will now be reported with code 494X3. Per 2004 Medicare data, Diagnostic Radiology and Interventional Radiology represented only 1.91% of those reporting 44300.

Specialty Diagnostic Radiology & Interventional Radiology Frequency 65 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? No

If no, please select another crosswalk and provide a brief rationale. 38500 has a similar work RVU and physician times involved.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:49446 Tracking Number KK4 Specialty Society Recommended RVU: **3.50**
Global Period: 000 RUC Recommended RVU: **2.94**

CPT Descriptor: Conversion of gastrostomy tube to gastro-jejunostomy tube, percutaneous under fluoroscopic guidance including contrast injection(s), image documentation and report
(For conversion to a gastro-jejunostomy tube at the time of initial gastrostomy tube placement, report code 494X1 in addition to 494X4)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 66 year old male with paralysis secondary to cerebrovascular accident has suffered multiple episodes of aspiration pneumonia while on enteral feedings via gastrostomy tube. Gastroesophageal reflux is diagnosed and a conversion of the gastrostomy tube to gastro-jejunostomy has been requested.

Percentage of Survey Respondents who found Vignette to be Typical: 95%

Is conscious sedation inherent to this procedure? Yes Percent of survey respondents who stated it is typical? 78%

Is conscious sedation inherent in your reference code? Yes

Description of Pre-Service Work: The physician,
-Discusses procedure details, including alternatives and risks with the patient (or more commonly with the power of attorney (POA) overseeing care of the patient) and family and informed consent is reviewed with patient and family.
-Estimates the range of guiding catheters/sheaths, guidewires, and other devices that may be required and ensures all are available for use.
-Reviews recent CT or US of the abdomen (separately reportable) is performed to confirm an acceptable percutenous window.
-Optimizes anticoagulent status and platelet count prior to performance of the procedure.
-Checks the interventional suite to ensure proper function and configuration of the imaging equipment including compliance with all radiation safty issues.
-Ensures all technical personnel have been familiarized with the procedure and are fully familiar with all required devices.
-Supervises selection of all equipment, incuding catheters, wires, sheaths, contrast material and other devices.
-Re-reviews applicable, available prior films.
-Dons radiation protection device.

Description of Intra-Service Work: The physician,
-Confirms clinical status has not changed.
-Checks IV set up.
-Directs administration of intravenous antibiotics.
-Brings the patient into the angiography suite and positions the patient (or supervises the postioning of the patient) in a supine position.
-Ensures patient is properly protected from radiation.
-Moderate sedation is administered.
-Ensures EKG amd hemodynamic monitors are in place and functioning.
-Performs sterile prep of the gastrostomy tube site.
-Applies topical anesthesia to the selected entry site.
-Uses fluoroscopic guidance to place a guidewire over which the gastrostomy tube is removed.
-Advances a catheter through the existing tract which is then introduced across the pyloric channel into the jejunum.
-Exchanges the guidewire for a stiffwire over which the gastro-jejunostomy tube is advanced with the jejunal tip beyond the ligament of Treitz and te gastrostomy lumen positioned in the stomach.

-Removes guidewires and secures the retention balloon.
-Uses continuous imaging guidance and contrast injections at each step to insure proper position of devices and patency.

-Injects contrast through both lumens to confirm final tube positioning in both the jejunum and stomach.

Description of Post-Service Work: The physician,
-Writes orders for pain control, management of outputs and surveillance for abdominal complications.
-Commuicates to the family, POA, and managing service (if other than operator).
-Perscribes care of tube, graduated feeding amounts, and acceptable residual levels
-Dictates, reviews, and signs report of the procedure including review and reporting on related archived images.

Intra-Service intensity/complexity	3.20	3.00
Post-Service intensity/complexity	2.20	2.20

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The Society RUC workgroup was convened to review survey results. The workgroup supports the survey median recommended physician RVU of 3.50, which results in an IWPUT of 0.0759; calculated, as follows:

Pre-service RVU = 0.8874 = (0.0224*36) + (0.0081*10)

Post-service RVU = 0.336 = (0.0224*15)

MEDIAN RECOMMENDED RVU = 3.50

Intra-service RVU = 2.2766

IWPUT = 0.0759 = 2.2766 /30

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43761 and 74355

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Diagnostic Radiology & Interventional Radiology How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 8555
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. Code 43761 was previously used to report percutaneous conversion to a -J tube, which will now be reported using 494X4. Medicare utilization for code 43761 for 2004 was 8148. Those services reported by Diagnostic Radiology and Intervenitonal Radiology using code 43761 will now be reported with code 494X4. Medicare patients are believed to be the preponderance of those receiving these service. A reasonable estimate of non-Medicare patients receiveing these services is believed to be about 5% above that of Medicare. Per Medicare 2004 data, Diagnostic Radiology and Interventional Radiology represented 74.32% of those reporting 43761.

Specialty Diagnostic Radiology & Interventional Radiology Frequency 6358 Percentage 74.31 %

-Checks IV set up.
-Directs administration of intravenous antibiotics.
-Brings the patient into the angiography suite and positions the patient (or supervises the postioning of the patient) in a supine position.
-Ensures patient is properly protected from radiation.
-Moderate sedation is administered.
-Probes site with catheter.
-Injects contrast into the tract for assessment.
-Maneuveres a wire through the tract into the stomach under fluoroscopic guidance.
-Advances the gastrostomy tube over the wire into position.
-Secures the retention device internally with the tube secured to the skin externally.
-Uses continuous imaging guidance and contrast injections at each step to insure proper position of devices and patency of the stomach.
-Places the system to ensure gravity drainage and applies a sterile dressing.

Description of Post-Service Work: The physician,
-Writes orders for pain control, management of outputs and surveillance for abdominal complications.

-Commuicates to the family, POA, and managing service (if other than operator).
-Perscribes care of tube, graduated feeding amounts, and acceptable residual levels
-Dictates, reviews, and signs report of the procedure including review and reporting on related archived images.

SURVEY DATA

RUC Meeting Date (mm/yyyy)	04/2007					
Presenter(s):	Robert L. Vogelzang, MD, Sean Tutton, MD, Geraldine McGinty, MD, Jonathan W. Berlin, MD

INTENSITY/COMPLEXITY MEASURES (Mean)

Mental Effort and Judgment (Mean)

The number of possible diagnosis and/or the number of management options that must be considered	2.17	2.17
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	2.17	2.33
Urgency of medical decision making	2.50	2.50

Technical Skill/Physical Effort (Mean)

Technical skill required	2.67	2.67
Physical effort required	2.50	2.50

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	1.83	1.83
Outcome depends on the skill and judgment of physician	2.33	2.17

Estimated risk of malpractice suit with poor outcome	2.33	2.33

INTENSITY/COMPLEXITY MEASURES	CPT Code	Reference Service 1
Time Segments (Mean)		
Pre-Service intensity/complexity	2.33	2.33
Intra-Service intensity/complexity	2.83	2.67
Post-Service intensity/complexity	2.33	2.17

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The Society RUC workgroup was convened to review survey results. IWPUT was calculated using the median recommended RVU value, which resulted in an IWPUT of 0.10442, which is believed to be exceedingly high. The survey 25th percentile recommended RVU value was believed to be more accurate; IWPUT was calculated, as follows:

Pre-service RVU = 0.6097 = (0.0224*25) + (0.0081*7)

Post-service RVU = 0.224 = (0.0224*20)

25th PERCENTILE RECOMMENDED RVU = 1.50

Intra-service RVU = 0.6663

IWPUT = 0.04442 = 0.6663/15

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43760 and 74350

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Diagnostic Radiology & Interventional Radiology How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 11751
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Code 43760 was previously used to report percutaneous replacement of a gastrostomy tube through an existing tract, which will now be reported using 494X5. Medicare utilization for code 43760 for 2004 was 72532. Those services reported by Diagnostic Radiology and Interventional Radiology using code 43760 will now be reported with code 494X5. Medicare patients are believed to be the preponderance of those receiving these service. A reasonable estimate of non-Medicare patients receiving these services is believed to be about 5% above that of Medicare. Per Medicare 2004 data, Diagnostic Radiology and Interventional Radiology represented 15.43% of those reporting 43760.

Specialty Diagnostic Radiology & Interventional Radiology Frequency 11751 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 11,192 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Code 43760 was previously used to report percutaneous replacement of a gastrostomy tube through an existing tract, which will now be reported using 494X5. Medicare utilization for code 43760 for 2004 was 72532. Those services reported by Diagnostic Radiology and Interventional Radiology using code 43760 will now be reported with code 494X5. Per Medicare 2004 data, Diagnostic Radiology and Interventional Radiology represented 15.43% of those reporting 43760.

Specialty Diagnostic Radiology & Interventional Radiology Frequency 11192 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? No

If no, please select another crosswalk and provide a brief rationale. Code 36584 has a similar work RVU and physician time involved.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:49451 Tracking Number KK6 Specialty Society Recommended RVU: **2.20**
Global Period: 000 RUC Recommended RVU: **1.82**

CPT Descriptor: Replacement duodenostomy or jejunostomy tube, percutaneous under fluoroscopic guidance including contrast injection(s), image documentation and report

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 13-year-old child with permanent brain injury has a permanent indwelling jejunostomy tube that was inadvertently pulled out.

Percentage of Survey Respondents who found Vignette to be Typical: 95%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 61%

Is conscious sedation inherent in your reference code? Yes

Description of Pre-Service Work: The physician,
-Discusses procedure details, including alternatives and risks with the patient (or more commonly with the power of attorney (POA) overseeing care of the patient) and family and informed consent is reviewed with patient and family.
-Estimates the range of guiding catheters/sheaths, guidewires, and other devices that may be required and ensures all are available for use.
-Optimizes anticoagulent status and platelet count prior to performance of the procedure.
-Checks the interventional suite to ensure proper function and configuration of the imaging equipment including compliance with all radiation safty issues.
-Ensures all technical personnel have been familiarized with the procedure and are fully familiar with all required devices.
-Supervises selection of all equipment, incuding catheters, wires, sheaths, contrast material and other devices.
-Re-reviews applicable, available prior films.
-Dons radiation protection device.

Description of Intra-Service Work: The physician,
-Confirms clinical status has not changed.
-Checks IV set up.
-Directs administration of intravenous antibiotics.
-Brings the patient into the angiography suite and positions the patient (or supervises the postioning of the patient) in a supine position.
-Ensures patient is properly protected from radiation.
-Moderate sedation is administered.
-Probes site with catheter.
-Injects contrast into the tract for assessment.
-Maneuveres a wire through the tract into the jejunum under fluoroscopic guidance.
-Advances the jejunostomy tube over the wire into position.
-Secures the retention device.
-Uses continuous imaging guidance and contrast injections at each step to insure proper position of devices.
-injects contrast to confirm final feeding tube placement.

Description of Post-Service Work: The physician,
-Writes orders for pain control, management of outputs and surveillance for intra-abdominal complications.
-Commuicates to the family, POA, and managing service (if other than operator).
-Perscribes care of tube, graduated feeding amounts, and acceptable residual levels

-Dictates, reviews, and signs report of the procedure including review and reporting on related archived images.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The Society RUC workgroup was convened to review survey results. The workgroup supports the survey median recommended physician RVU of 2.20, which results in an IWPUT of 0.06613; calculated, as follows:

Pre-service RVU = 0.6086 = (0.0224*25) + (0.0081*6)

Post-service RVU = 0.2688 = (0.0224*12)

MEDIAN RECOMMENDED RVU = 2.20

Intra-service RVU = 1.3226

IWPUT = 0.06613 =1.3226/20

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:49452 Tracking Number KK7 Specialty Society Recommended RVU: **3.30**
Global Period: 000 RUC Recommended RVU: **2.81**

CPT Descriptor: Replacement gastro-jejunostomy tube, percutaneous under fluoroscopic guidance including contrast injection(s), image documentation and report

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 72-year-old patient with a chronically indwelling gastro-jejunostomy tube is seen in the interventional suite the day after the tube was accidentally pulled out. The site is inspected and the tract remains open and without infection.

Percentage of Survey Respondents who found Vignette to be Typical: 95%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 74%

Is conscious sedation inherent in your reference code? Yes

Description of Pre-Service Work: The physician,
-Discusses procedure details, including alternatives and risks with the patient (or more commonly with the power of attorney (POA) overseeing care of the patient) and family and informed consent is reviewed with patient and family.
-Estimates the range of guiding catheters/sheaths, guidewires, and other devices that may be required and ensures all are available for use.
-Optimizes anticoagulent status and platelet count prior to performance of the procedure.
-Checks the interventional suite to ensure proper function and configuration of the imaging equipment including compliance with all radiation safty issues.
-Ensures all technical personnel have been familiarized with the procedure and are fully familiar with all required devices.
-Supervises selection of all equipment, incuding catheters, wires, sheaths, contrast material and other devices.
-Re-reviews applicable, available prior films.
-Dons radiation protection device.

Description of Intra-Service Work: The physician,
-Confirms clinical status has not changed.
-Checks IV set up.
-Directs administration of intravenous antibiotics.
-Brings the patient into the angiography suite and positions the patient (or supervises the postioning of the patient) in a supine position.
-Ensures patient is properly protected from radiation.
-Moderate sedation is administered.
-Probes site with catheter.
-Injects contrast into the tract for assessment.
-Maneuveres a wire through the tract into the stomach and negotiates a catheter and wire through the pylorus, through the duodenum, into the jejunum under fluoroscopic guidance.
-Advances the gastro-jejunostomy tube over the wire into position.
-Secures the retention device.
-Uses continuous imaging guidance and contrast injections at each step to insure proper position of devices.
-Injects contrast to confirm final feeding tube placement.

Description of Post-Service Work: The physician,
-Writes orders for pain control, management of outputs and surveillance for abdominal complications.

-Commuicates to the family, POA, and managing service (if other than operator).
-Perscribes care of tube, graduated feeding amounts, and acceptable residual levels
-Dictates, reviews, and signs report of the procedure including review and reporting on related archived images.

Outcome depends on the skill and judgment of physician	2.33	1.67	

Estimated risk of malpractice suit with poor outcome	1.67	1.67

INTENSITY/COMPLEXITY MEASURES	CPT Code	Reference Service 1
Time Segments (Mean)		
Pre-Service intensity/complexity	2.00	2.00
Intra-Service intensity/complexity	2.67	1.67
Post-Service intensity/complexity	2.00	1.67

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The Society RUC workgroup was convened to review survey results. The workgroup supports the survey median recommended physician RVU of 3.30, which results in an IWPUT of 0.0766; calculated, as follows:

Pre-service RVU = 0.9098 = (0.0224*37) + (0.0081*10)

Post-service RVU = 0.2464 = (0.0224*11)

MEDIAN RECOMMENDED RVU = 3.30

Intra-service RVU = 2.1438

IWPUT = 0.0766 = 2.1438 /28

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43761, 74355 and 74350

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Diagnostic Radiology & Interventional Radiology How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 3422
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. Code 43761 was previously used to report percutaneous replacement of jejunosotomy and gastro-jejunostomy tubes, which will now be reported using 494X6 and 494X7. Medicare utilization for code 43761 for 2004 was 8148. It is believed that 40% of the services previously reported by Diagnostic Radiology and Interventional Radiology using code 43761 will now be reported using code 494X7. Medicare patients are believed to be the preponderance of those receiving these service. A reasonable estimate of non-Medicare patients receiving these services is believed to be about 5% above that of Medicare. Per Medicare 2004 data, Diagnostic Radiology and Interventional Radiology represented 74.32% of those reporting 43761.

Specialty Diagnostic Radiology & Interventional Radiology Frequency 3422 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 3,259 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty.
Please explain the rationale for this estimate. Code 43761 was previously used to report percutaneous replacement of jejunosotomy and gastro-jejunostomy tubes, which will now be reported using 494X6 and 494X7. Medicare utilization for code 43761 for 2004 was 8148. It is believed that 60% of the services previously reported by Diagnostic Radiology and Interventional Radiology using code 43761 will now be reported using code 494X6. Per Medicare 2004 data, Diagnostic Radiology and Interventional Radiology represented 74.32% of those reporting 43761.

Specialty Diagnostic Radiology & Interventional Radiology Frequency 3259 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? No

If no, please select another crosswalk and provide a brief rationale. Code 57460 has a similar work RVU and physician time.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:49460 Tracking Number KK8 Specialty Society Recommended RVU: **2.00**
Global Period: 000 RUC Recommended RVU: **1.51**

CPT Descriptor: Mechanical removal of obstructive material from gastrostomy, duodenostomy, jejunostomy, gastro-jejunostomy or cecostomy (or other colonic) tube, any method, under fluoroscopic guidance including contrast injection(s) if performed, image documentation and report
(Do not report code 494X9 in conjunction with codes 494X5-494X7, 494X10)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 76-year-old female with history of stroke and dysphagia has a chronically indwelling gastrostomy tube for enteral nutrition. Her meds are crushed and administered through the G-tube also. Interventional radiology is consulted because the gastrostomy tube is plugged and cannot be flushed. The patient has not received fluids, nutrition or medication for 24 hours.

Percentage of Survey Respondents who found Vignette to be Typical: 89%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 65%

Is conscious sedation inherent in your reference code? Yes

Description of Pre-Service Work: The physician,
-Discusses procedure details, including alternatives and risks with the patient (or more commonly with the power of attorney (POA) overseeing care of the patient) and family and informed consent is reviewed with patient and family.
-Estimates the range of guiding catheters/sheaths, guidewires, and other devices that may be required and ensures all are available for use.
-Checks the interventional suite to ensure proper function and configuration of the imaging equipment including compliance with all radiation safty issues.
-Ensures all technical personnel have been familiarized with the procedure and are fully familiar with all required devices.
-Supervises selection of all equipment, incuding catheters, wires, sheaths, contrast material and other devices.
-Dons radiation protection device.

Description of Intra-Service Work: The physician,
-Assesses current clinical status.
-Examines the catheter to ensure it is still in place.
-Attempts to vigorously flush the catheter and reasseses finding the catheter cannot be flushed.
-Checks IV set up.
-Directs administration of intravenous antibiotics.
-Brings the patient into the angiography suite and positions the patient (or supervises the postioning of the patient) in a supine position.
-Ensures patient is properly protected from radiation.
-Moderate sedation is administered.
-Verifies proper positioning of catheter under fluoroscopic imaging.
-Drapes the catheter and skin site and attempts to advance a wire through the catheter to dislodge impacted material.
-Tries numerous types of guidewires attempting to dislodge imapacted material.
-Uses a mechanical device ot break up the material.
-Advances a wire through the softened material.
-Repeatidly passes the wire to break up all impacted material; pushing it back into the stomach.
-Flushes the catheter and applies new dressing.
-Uses continuous imaging guidance and contrast injections at each step to insure proper position of devices.

-Injects contrast to confirm feeding tube is fully functioning.

Description of Post-Service Work: The physician,
-Writes orders for pain control, management of outputs and surveillance for abdominal complications.
-Commuicates to the family, POA, and managing service (if other than operator).
-Perscribes care of tube, graduated feeding amounts, and acceptable residual levels
-Dictates, reviews, and signs report of the procedure including review and reporting on related archived images.

Pre-Service intensity/complexity	1.67	1.67
Intra-Service intensity/complexity	2.67	2.33
Post-Service intensity/complexity	1.67	2.00

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The Society RUC workgroup was convened to review survey results. The workgroup supports the survey median recommended physician RVU of 2.00, which results in an IWPUT of 0.0563; calculated, as follows:

Pre-service RVU = 0.865 = (0.0224*35) + (0.0081*10)

Post-service RVU = 0.2912 = (0.0224*13)

MEDIAN RECOMMENDED RVU = 2.00

Intra-service RVU = 0.8438

IWPUT = 0.0563 = 0.8438/15

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

-Assesses current clinical status.
-Examines the catheter to ensure it is still in place.
-Brings the patient into the angiography suite and positions the patient (or supervises the postioning of the patient) in a supine position.
-Ensures patient is properly protected from radiation.
-Injects contrast through the catheter and verifies proper positioning of catheter under fluoroscopic imaging.

Description of Post-Service Work: The physician,
-Writes orders to resume feedings.
-Commuicates to the family, POA, and managing service (if other than operator)
-Dictates, reviews, and signs report of the procedure including review and reporting on related archived images.

SURVEY DATA

RUC Meeting Date (mm/yyyy)	04/2007				
Presenter(s):	Robert L. Vogelzang, MD, Sean Tutton, MD, Geraldine McGinty, MD, Jonathan W. Berlin, MD				
Specialty(s):	Interventional Radiology & Radiology				
CPT Code:	49465				
Sample Size:	375	**Resp N:**	19	**Response:** 5.0 %	

Sample Type: Panel						
		Low	25th pctl	Median*	75th pctl	High
Service Performance Rate		5.00	10.00	**10.00**	20.00	50.00
Survey RVW:		0.70	0.75	**0.76**	1.19	2.25

Post-Service intensity/complexity	1.67	1.56

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The Society RUC workgroup was convened to review survey results. The workgroup supports the survey median recommended physician RVU of 0.76, which results in an IWPUT of 0.01893; calculated, as follows:

Pre-service RVU = 0.3846 = (0.0224*15) + (0.0081*6)

Post-service RVU = 0.224 = (0.0224*10)

MEDIAN RECOMMENDED RVU = 0.76

Intra-service RVU = 0.1514

IWPUT = 0.01893 = 0.1514 /8

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 20501 and 76080

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Diagnostic Radiology & Interventional Radiology How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 8141
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. Code 20501 was previously used to report contrast injetions performed for the radiological evaluation of feeding tubes, which will now be reported using 494X10. Medicare utilization for code 20501 for 2004 was 7753. It is believed that 50% of the services previously reported by Diagnostic Radiology and Interventional Radiology using code 20501 will now be reported using code 494X10. Medicare patients are believed to be the preponderance of those receiving these service. A reasonable estimate of non-Medicare patients receiving these services is believed to be about 5% above that of Medicare. Per Medicare 2004 data, Diagnostic Radiology and Interventional Radiology represented 95.42% of those reporting 20501.

Specialty Diagnostic Radiology & Interventional Radiology Frequency 7768 Percentage 95.41 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 7,753 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty.
Please explain the rationale for this estimate. Code 20501 was previously used to report contrast injetions performed for the radiological evaluation of feeding tubes, which will now be reported using 494X10. Medicare utilization for code 20501 for 2004 was 7753. It is believed that 50% of the services previously reported by Diagnostic Radiology and Interventional Radiology using code 20501 will now be reported using code 494X10. Per Medicare 2004 data, Diagnostic Radiology and Interventional Radiology represented 95.42% of those reporting 20501.

Specialty Diagnostic Radiology & Interventional Radiology Frequency 7398 Percentage 95.42 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? No

If no, please select another crosswalk and provide a brief rationale. Code 36598 has a similar work RVU and physician time.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Non-Surgical

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:43760 Tracking Number KK11 Specialty Society Recommended RVU: **1.10**
Global Period: 000 RUC Recommended RVU: **0.90**

CPT Descriptor: Change of gastrostomy tube, percutaneous, without imaging or endoscopic guidance

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 76 year old female suffering from significant malnutrition previously required placement of a percutaneous gastrostomy tube. The gastrostomy has become clogged; attempts to establish luminal patency have been unsuccessful. The physician is requested to remove the obstructed gastrostomy catheter and replace it.

Percentage of Survey Respondents who found Vignette to be Typical: 95%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 18%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work:
- The patient's chart is reviewed and the order confirmed
- Discussion with staff about difficulties encountered with current tube
- Pertinent lab reviewed
- The procedure is discussed with the patient or family

Description of Intra-Service Work:
- The existing tube site is examined.
- Balloon deflated as appropriate
- The existing gastrostomy tube is removed by traction
- New balloon tube is tested, inserted, and balloon filled to specification
-Tube pulled back and secured, and checked for patency
- Dressing applied and patient tolerance assessed

Description of Post-Service Work:
- The procedure is documented in the patient's chart
- The referring physician and nursing staff are notified of the result of the procedure
- The report of the procedure is recorded in the medical record
- Replacement supplies are ordered (physician office)

Post-Service intensity/complexity	2.50	2.23

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The American Gastroenterological Association (AGA) and the American Society for Gastrointestinal Endoscopy (ASGE) conducted a survey of code 43760, Change of gastrostomy tube, percutaneous, without imaging or guidance. Code 43760, an existing code, was revised during the February 2007 CPT Editorial Panel meeting. *After reviewing the survey data, the societies recommend maintaining the current work relative value unit (WRVU) of the code: 1.10 WRVUs. The recommended value of 1.10 WRVU is less than the survey median of 1.15.*

Survey Process

The survey was disseminated to a randomly generated list of 250 members of AGA and ASGE. A total of 40 responses (16% response rate) were received.

Data Evaluation

RUC Advisors from both AGA and ASGE reviewed the survey data. The advisors assessed the adequacy of the survey data and the recommendation of 1.10 WRVUs by comparing the surveyed code to reference codes: 45330 *Sigmoidoscopy, flexible; diagnostic, with or without collection of specimen(s) by brushing or washing (separate procedure)* and 99214 *Office or other outpatient visit for the evaluation and management of an established patient.* Additionally, the data currently existing in the RUC database for 43760 was also considered.

An equal number of survey respondents (7) chose codes 45330 and 99214 as their reference service. No other reference service was chosen with as high a frequency. Based on these codes' inclusion on the MPC list and the comparability of existing time and WRVU values, the advisors determined that these codes were appropriate comparisons.

The chart below summarizes the data that was considered.

Analysis of Survey Data for 43760: Physician Time and WRVU Data for Reference Services						
CPT Code	**Pre Time**	**Intra Time**	**Post Time**	**Total Time**	**WRVU**	**IWPUT**
43760 (2007 survey)	30	10	5	45	1.10	.039

43760 (currently in database)	24	16	9	49	1.10	.036
45330 *	7	17	8	32	0.96	.037
99214*	5	25	10	40	1.42	.043

* Survey reference service

After comparing the time data and IWPUT values of the surveyed code to the reference codes and the values currently in the RUC database for 43760, the advisors concluded that the survey data supported the recommended value of 1.10 WRVUs.

43760 versus 45330
The 0.14 higher WRVU value for surveyed code 43760 to reference service 45330 was felt to be justified given the greater time and intensity of code 43760. This higher intensity is also reflected when comparing the typical patient for these two procedures. The majority of patients undergoing code 45330 are seen on a scheduled basis. Code 43760 is typically performed on patients with malnutrition who are no longer able to maintain adequate enteral intake due to blockage / leakage / malfunction of the gastrostomy tube requiring physician expertise for removal and replacement.

43760 versus 99214
When comparing surveyed code 43760 to code 99214, advisors agreed that a lower WRVU for code 43760 was appropriate. The lower value recommended for code 43760 reflects the less intra-service time and roughly the similar intensity. This similarity in intensity is reflected in the survey responses to questions related to intensity of service time segments.

43760 2007 Survey Value versus 43760 Current Value
The societies and their advisors compared the surveyed code 43760 with the current value of 43760. The advisors agreed that the time and intensity of the two procedures reflected the reality that the overall work of the procedure had stayed the same and validated their recommendation that the value of 1.10 WRVUs should be maintained.

The advisors considered the actions of the CPT Editorial Panel whose revision of the code removed language in the code related to radiological services. The question of how this revision should impact the value of the code was raised. The societies reviewed the survey data from when this code went through the 2005 Five-Year review, as well as the recently completed survey of Gastroenterologists. Typically, when a GI physician performs this procedure, radiological services are not performed. Therefore the advisors concluded that the overall work of this procedure has not changed. This conclusion is supported by the minor differences in time between the 2007 surveyed time for code 43760 and the time that is currently in the RUC database.

In view of the above, the AGA and ASGE recommend 1.10 WRVUs for surveyed code 43760.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and

accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43760, Change of gastrostomy tube

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gastroenterology	How often? Commonly
Specialty Emergency Medicine	How often? Sometimes
Specialty General Surgery	How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 64900
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. The majority of these procedures are performed on Medicare beneficiaries. We estimate that commercial patients expand the patient volume by 10%. We believe this would not materially affect the relative frequency and percentages for those specialties that perform this procedure.

Specialty Gastroenterology	Frequency 24000	Percentage 36.97 %
Specialty Emergency Medicine	Frequency 16000	Percentage 24.65 %
Specialty General Surgery	Frequency 12300	Percentage 18.95 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 59,000 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2005 utilization for code 43760 was 71,619. Of this, 17.77% of procedures were reported by radiology, which will now be reported by new codes specific for placement of gastrostomy under radiological guidance.

Specialty Gastroenterology	Frequency 21800	Percentage 36.94 %
Specialty Emergency Medicine	Frequency 14500	Percentage 24.57 %
Specialty General Surgery	Frequency 11150	Percentage 18.89 %

Do many physicians perform this service across the United States? Yes

---

CPT Long Descriptor:

49440- Insertion of gastrostomy tube, percutaneous under fluoroscopic guidance including contrast injection(s), image documentation and report

(For conversion to a gastro-jejunostomy tube at the time of initial gastrostomy tube placement, report code 494X4 in addition to 49440)

49441- Insertion of duodenostomy or jejunostomy tube, percutaneous under fluoroscopic guidance including contrast injection(s), image documentation and report

(For conversion of gastrostomy tube to gastro-jejunostomy tube, use 494X4)

49442- Insertion of cecostomy or other colonic tube, percutaneous under fluoroscopic guidance including contrast injection(s), image documentation and report

Sample Size N/A Response Rate: (%): N/A Global Period: 010

Expert Panel Used to Develop Recommendation

Geographic Practice Setting %: **All geographical practice settings represented**

Type of Practice %: **All practice types represented**

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

Members known to provide the service for which practice expense inputs are being developed in an in-facility setting were contacted to provide inputs. Like inputs were identified. Society RUC workgroup members evaluated unique inputs for inclusion as appropriate within the context of established standard inputs for like and/or related procedures/services.

Please describe the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

- **Schedule procedure and confirm applicable supplies and devices are in inventory**
- **Retrieve and compile all relevant clinical information for patient record for review by physician including incorporation of all relevant clinical information, verify orders, confirm procedure protocol with physician**
- **Contact patient the day before procedure to confirm adherence to pre-procedure protocol**

Intra-Service Clinical Labor Activities:

N/A

Post-Service Clinical Labor Activities:

- **Initiate phone calls for physician and call in prescriptions as applicable**
- **Support physician in providing follow-up E&M services**

Geographic Practice Setting %: **All geographical practice settings represented**

Type of Practice %: **All practice types represented**

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

Members known to provide the service for which practice expense inputs are being developed in a non-facility setting were contacted to provide inputs. Industry was contacted as applicable regarding current pricing for new devices and/or existing devices for which there has been a known price increase. Like inputs were identified. Society RUC workgroup members evaluated unique inputs for inclusion as appropriate within the context of established standard inputs for like and/or related procedures/services.

Please describe the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

- **Schedule procedure and confirm applicable supplies and devices are in inventory**
- **Retrieve and compile all relevant clinical information for patient record for review by physician including incorporation of all relevant clinical information, verify orders, confirm procedure protocol with physician**
- **Contact patient the day before procedure to confirm adherence to pre-procedure protocol.**

Intra-Service Clinical Labor Activities:

- **Review and prepare chart to insure completeness in preparation for physician review**
- **Greet patient and provide gowning**
- **Reaffirm informed consent and obtain vital signs**
- **Prepare room including locating and preparation of all applicable devices and supplies**
- **Prepare patient for procedure and set up IV**
- **Assist physician in performing procedure**
- **Assist physician in monitoring moderate (conscious) sedation**

Post-Service Clinical Labor Activities:

- **Monitor patient post procedurally, checking vital signs every 20 minutes**
- **Clean room in accordance with OSHA regulations**
- **Check wound and review post procedure instructions with patient**
- **Review x-ray and lab results for physician review and interpretation with incorporation in patients medical record**
- **Initiate phone calls for physician and call in prescriptions as applicable**
- **Support physician in providing follow up E&M services**

Please see corresponding PERC spreadsheet for additional detail.

AMA/Specialty Society Update Process
PERC Summary of Recommendation
000 Day Global Period
Facility Direct Inputs

CPT Long Descriptor:

Sample Size:_____ Response Rate: (%):_____ Global Period: 000

Geographic Practice Setting %: Rural____ Suburban_____ Urban_____

Type of Practice %: _____Solo Practice
_____Single Specialty Group
_____Multispecialty Group
_____Medical School Faculty Practice Plan

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The American Gastroenterological Association (AGA) and American Society for Gastrointestinal Endoscopy (ASGE) RUC Advisors reviewed the practice expense data for code 43760 using the approved inputs from the February 2005 PEAC meeting as a starting point. The practice expenses have been updated to reflect the changes in the CPT descriptor for 43760 for 2008, specifically removing inputs and clinical staff functions related to imaging or guidance.

Please describe the clinical activities of your staff:

Pre-Service Clinical Labor Activities:
- Complete pre-service diagnostic and referral forms
- Coordinate pre-surgery services
- Schedule space and equipment in facility
- Provide pre-service education/obtain consent
- Conduct follow-up phone calls & prescriptions

Intra-Service Clinical Labor Activities:
- None

Post-Service Clinical Labor Activities:
- Conduct phone calls/ call in prescriptions

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

February 2007

Transurethral Ureteral Stent Tube Exchange and Removal

The CPT Editorial Panel created two new codes to accurately describe the removal or removal and exchange of a ureteral stent, using radiological guidance methods.

50385

1255

The RUC reviewed the specialty society survey median RVU and physician time for code 50385 *Removal (via snare/capture) and replacement of internally dwelling ureteral stent via transurethral approach, without use of cystoscopy, including radiological supervision and interpretation.* The specialty society indicated that the key reference service, code 50382 *Removal (via snare/capture) and replacement of internally dwelling ureteral stent via percutaneous approach, including radiological supervision and interpretation* (work RVU=5.50, 50 minutes pre-, 60 minutes intra-, and 15 minutes post-service time), has more physician time involved, however the intensity of the two procedures is very similar. The specialty society indicated that the survey median RVU for 50385 was too high and recommend a building block approach to develop an RVU of 4.44.

The building block RVU is calculated by taking the reference service code's intra-service intensity measure of 0.06978, multiplied to the intra-service time of 45 minutes for code 50385 (0.07 x 45 = 3.15). Then add the pre-service (29 minutes evaluation, 10 minutes positioning and 10 minutes scrub, dress, wait = 49 minutes) and post-service (15 minutes) RVUs (0.95+0.34) to intra service RVU (3.15) to establish a total work RVU of 4.44 for 50385.

Additional reference service codes with comparable physician intra-service time and work RVUs are 52315 *Cystourethroscopy, with removal of foreign body, calculus, or ureteral stent from urethra or bladder (separate procedure); complicated* (RVU=5.20, 43 minutes intra-service) and 36360 *Insertion of tunneled centrally inserted central venous access device, with subcutaneous port; younger than 5 years of age* (RVU=6.26, intra-service time 45 minutes). The RUC determined this aforementioned building block approach along with the additional reference services supported a work RVU of 4.44, which is below the survey 25th percentile. **The RUC recommends a work RVU of 4.44 for code 50385.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

50386
The RUC reviewed the survey median RVU and physician time for code 50386 *Removal (via snare/capture) of internally dwelling ureteral stent via transurethral approach, without use of cystoscopy, including radiological supervision and interpretation.* The specialty society indicated that the key reference service, code 50384 *Removal (via snare/capture) of internally dwelling ureteral stent via percutaneous approach, including radiological supervision and interpretation* (work RVU=5.00, 55 minutes intra-service) has more physician time and intensity than 50386. The specialty society indicated that the survey median RVU of 5.00 for 50386 was too high and recommend a building block approach to develop a recommended work RVU of 3.30.

The building block RVU is calculated by taking the reference service code's intra-service intensity measure of 0.07029, multiplied to the intra-service time of 30 minutes for 50386 (0.07 x 30 = 2.10). Then add the pre-service (25 minutes evaluation, 10 minutes positioning and 10 minutes scrub, dress, wait = 45 minutes) and post-service (15 minutes) RVUs (0.87+0.33) to intra service RVU (2.10) to establish a total work RVU of 3.30 for 50386.

Additional reference service codes with comparable physician intra-service time and work RVUs are 36581 *Replacement, complete, of a tunneled centrally inserted central venous catheter, without subcutaneous port or pump, through same venous access* (RVU=3.45, 30 minutes intra-service) and 36590 *Removal of tunneled central venous access device, with subcutaneous port or pump, central or peripheral insertion* (RVU=3.32, 30 minutes intra-service). The RUC determined the aforementioned building block approach along with the additional reference services supported a work RVU of 3.30. **The RUC recommends a work RVU of 3.30 for code 50386.**

1256

Practice Expense
The PERC and RUC reviewed and refined the joint specialty recommendation for the direct inputs for codes 50385 and 50386 during its February 2007 meeting. **The RUC recommends the attached direct practice expense inputs.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation

SUMMARY OF RECOMMENDATION

CPT Code:50385 Tracking Number G1 Specialty Society Recommended RVU: **4.44**
Global Period: 000 RUC Recommended RVU: **4.44**

CPT Descriptor: Removal (via snare/capture) and replacement of internally dwelling ureteral stent via transurethral approach, without use of cystoscopy, including radiological supervision and interpretation

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 75-year-old female has an indwelling nephroureteral double-J stent tube in place, treating a ureteral obstruction caused by a stricture from post-operative and post-radiation scarring as a result of treatment of transitional cell cancer. The stent tube requires exchange every three months to prevent occlusion of the stent and subsequent urinary tract infection and loss of function of the ipsilateral kidney.

Percentage of Survey Respondents who found Vignette to be Typical: 90%

Is conscious sedation inherent to this procedure? Yes Percent of survey respondents who stated it is typical? 100%

Is conscious sedation inherent in your reference code? Yes

Description of Pre-Service Work:
The physician:
- Sees the patient in the interventional suite and briefly examines
- Reviews prior imaging studies and other test results
- Obtains a brief history assuring that there has been no intercurrent changes or complaints
- Discusses the procedure with the patient and family and informed consent is obtained for retrieval and replacement of the ureteral stent
- Supervises staff establishing an intravenous site and places the patient in a supine position on the table
- Confirms proper room set up including sterile preps and drapes and selects appropriate devices such as catheters, sheaths, guidewires, and ureteral stents
- Proper positioning of the patient on the radiologic table is confirmed with sterile prep and drape of the urethra performed

Description of Intra-Service Work:
The physician:
- Orders medication for conscious sedation
- A 4-Fr diagnostic catheter is advanced into the bladder, and contrast is injected to opacify the bladder and to identify relevant anatomy
- A guidewire is advanced into the bladder, and the diagnostic catheter is exchanged for a larger catheter, which allows introduction of a snare device
- Under fluoroscopic guidance, a snare device is negotiated into the bladder through the sheath and used to grasp the pigtail portion of the double-J ureteral stent tube within the bladder, and the indwelling stent tube is pulled out of the bladder and urethra far enough to allow retrograde introduction of a guidewire through the stent, directed into the renal pelvis
- Fluoroscopic guidance is used to negotiate the wire through the inner lumen of the ureteral stent tube rather than through the sideholes
-The indwelling double-J stent is removed via the urethra over the guidewire
- A diagnostic catheter is positioned over the wire into the renal pelvis, allowing opacification of the renal pelvis if the renal pelvis was not opacified by the bladder injection
-The guidewire is then re-positioned into the renal pelvis, and the diagnostic catheter removed

- A new double-J ureteral stent tube is then introduced over the wire, placed and positioned with the proximal pigtail in the renal pelvis and the distal pigtail in the bladder, and the wire is removed (If balloon dilation of the ureter is necessary for stent passage this is separately reportable)
- Appropriate position is confirmed with fluoroscopy, and permanent image(s) are obtained for the medical record
- The guide/sheath/safety wire are removed
- Images are obtained documenting final stent position

Description of Post-Service Work:
- A note is made in the patient record and orders are written
- Oversees the transfer of the patient to the recovery unit
- Notifies the referring physician of the outcome of the procedure, and of subsequent procedures to be done
- Discusses the outcome of the procedure with the patient and family and instructions are given
- Dictates a report for the permanent record

INTENSITY/COMPLEXITY MEASURES	CPT Code	Reference Service 1
Time Segments (Mean)		
Pre-Service intensity/complexity	2.77	2.67
Intra-Service intensity/complexity	3.56	3.54
Post-Service intensity/complexity	2.58	2.50

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The Societies' recommended work RVU value was calculated based on the reference service intensity measure of 0.07, which was previously deliberated and assigned by the RUC in development of a work RVU value for the reference service code 50382.

Applying an intensity of 0.07 to the intra-service time of 45 minutes, yields an intra-service RVU value of 3.15. Adding pre- (0.9434) and post- (0.336) RVU values, calculated using standard RUC formulas, supports a total work RVU recommendation of 4.43 RVUs.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☒ Other reason (please explain) Same day preceding diagnostic studies may indicate a need for intervention earlier than typically scheduled resulting in immediate conversion to this therapuetic procedure.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. A common diagnostic study that may precede the performance of a transuretheral ureteral stent

exchange is a cystogram which is reported using codes 51600 and 74430. The diagnostic study may be performed by the same or a different provider from the interventionalist performing the ureteral stent exchange procedure. Code 51600- global period 000, work RVUs 0.88, pre-service time 20 minutes, intra-service time 20 minutes, post-service time 15 minutes (RUC times). Code 74430- global period XXX with 8 minutes total time (Harvard).

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed)

If the removal/exchange of the stent is transurethral and performed without cystoscopy, the following cystourethroscopy codes have been used:

53899, unlisted urologic procedure

Additionally, the radiological supervision and interpretation (S&I) code 75984 is used to report the imaging services provided in conjunction with the removal and placement of the ureteral stent:
75984 Change of percutaneous tube or drainage catheter with contrast monitoring (eg, gastrointestinal system, genitourinary system, abscess), radiological supervision and interpretation

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Radiology, Interventional Radiology How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 500
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.

Specialty Radiology, Interventiona Radiology Frequency 500 Percentage 100.00 %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 350
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty.

Specialty Radiology, Interventional Radiology Frequency 350 Percentage 100.00 %

Specialty Frequency Percentage %

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The Societies' recommended work RVU value was calculated based on the reference service intensity measure of 0.07, which was previously deliberated and assigned by the RUC in development of a work RVU value for the reference service code 50384.

Applying an intensity of 0.07 to the intra-service time of 30 minutes, yields an intra-service RVU value of 2.1. Adding pre- (0.865) and post- (0.336) RVU values, calculated using standard RUC formulas, supports a total work RVU recommendation of 3.30 RVUs.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☒ Other reason (please explain) Same day preceding diagnostic studies may indicate a need for intervention earlier than typically scheduled resulting in immediate conversion to this therapuetic procedure.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. A common diagnostic study that may precede the performance of a transuretheral ureteral stent exchange is a cystogram which is reported using codes 51600 and 74430. The diagnostic study may be

performed by the same or a different provider from the interventionalist performing the ureteral stent removal procedure. Code 51600- global period 000, work RVUs 0.88, pre-service time 20 minutes, intra-service time 20

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) If the removal of the stent is transurethral and performed without cystoscopy, the following cystourethroscopy codes have been used:

53899, unlisted urologic procedure

Additionally, the radiological supervision and interpretation (S&I) code 75984 is used to report the imaging services provided in conjunction with the removal and placement of the ureteral stent:
75984 Change of percutaneous tube or drainage catheter with contrast monitoring (eg, gastrointestinal system, genitourinary system, abscess), radiological supervision and interpretatio

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Radiology, Interventional Radiology How often? Sometimes

Specialty Radiology, Interventional Radiology How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 400
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.

Specialty Radiology, Interventional Radiology Frequency 400 Percentage 100.00 %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 325
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty.

Specialty Radiology, Interventional Radiology Frequency 325 Percentage 100.00 %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States?

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

April 2007

Intra-Abdominal Voiding Pressure - Update

The CPT Editorial Panel changed CPT code, 51797, *Voiding pressure studies (VP); intra-abdominal voiding pressure (AP) (rectal, gastric, intraperitoneal)*, from a stand-alone service to an add-on service. The Panel agreed that the service should be an add-on service as it is virtually always performed with CPT code, 51795, *Voiding pressure studies (VP); bladder voiding pressure, any technique*, (work RVU = 1.53). The intra-abdominal voiding pressure is performed after the bladder study during the same session and involves inserting a rectal catheter and performing an additional calculation.

1275

February 2007
The RUC considered the specialty society's recommendations for code 51797. While this service is currently valued at 1.60 work RVUs, when it is performed in combination with code 51795, the service is subject to the multiple procedure reduction of 50% and valued appropriately at 0.80 work RVUs (1.60 x 50% = 0.80). The specialty society has recommended a work RVU of 1.00 based on a survey of 32 urologists. The RUC informed the specialty society that if it wishes to recommend a work RVU different than 0.80, it must provide compelling evidence to do so. The RUC requested that the specialty provide its recommendation and rationale, including compelling evidence for a change, if warranted, at the April 2007 RUC meeting. The RUC did, however, provide a direct practice expense input in February 2007.

April 2007
At the April 2007 RUC meeting, the specialty society accepted the RUC's recommendation to maintain the appropriate value of 0.80 work RVUs for 51797. The society agreed that there was not compelling evidence to review the work and agreed that the service should be valued at 0.80 work RVUs to maintain its present value of 1.60 work RVU x 50% multiple procedure reduction (0.80). **The RUC recommends a work RVU of 0.80 for code 51797 consistent with its current valuation accounting for the multiple procedure reduction.**

Practice Expense
The RUC recommends the non-facility practice inputs as amended for this ZZZ procedure.

RE: Request for Reconsideration of Work RVU Recommendation for 51797 (Intra-abdominal Voiding Pressure)

Dear Dr. Rich:

In follow-up to the February 2007 RUC meeting where we presented to the RUC our median RUC survey RVW of 1.00, we understand that as this is an add-on procedure to 51795, compelling evidence would need to be presented in order to justify a work RVU above 0.80.

We concur with the RUC's recommendation on this issue per the RUC minutes and will accept the RUC's recommended work RVU of 0.80.

Thank you for your understanding on this issue.

Sincerely,

James Giblin, MD
AUA RUC Advisor

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:51797 Tracking Number 2807PA Specialty Society Recommended RVU: **0.80**
Global Period: ZZZ RUC Recommended RVU: **0.80**

CPT Descriptor: Voiding pressure studies (VP); intra-abdominal voiding pressure (AP) (rectal, gastric, intraperitoneal)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 59 year-old female with multiple sclerosis complains of three year history of urinary frequency, urgency and incontinence and the sensation of incomplete emptying. She is currently wearing two pads a day. She is currently taking Ditropan for her voiding complaints. A post void residual measured in the office was 250 mls, a urine culture was negative.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: N/A

Description of Intra-Service Work: After standard detrusor pressure is documented (reported separately using 51795), the physician inserts a rectal transducer into the rectum to record intra-abdominal pressure. The inflow tubing is connected, flushed and secured and all electronic equipment recalibrated. Pressure transduction testing is necessary prior to onset of the examination (usually with serial coughing). This is an interactive examination between patient and examiner. Multiple fills are usually necessary to accurately assess and record intra-abdominal pressure. The physician calculates and interprets the abdominal pressure recorded versus the total intravesical pressure and records the true intravesical pressure during voiding.

Description of Post-Service Work: N/A

Post-Service intensity/complexity	2.75	2.75

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

An expert panel of urologists with representation from both academic and private practice reviewed the survey data and concurred that the proposed RVW of 1.00 was appropriate. The panel also concurred that both the pre-service and post-service survey times should not be included in 51797 as pre and post time is adequately captured in the base code 51795.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 51797

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Urology How often? Commonly

Specialty OB-GYN How often? Sometimes

Specialty Family Practitioners How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 170000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 103,063 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty.

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States?

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Non-Surgical

Attestation Statement

As a RUC Advisor, I attest that the integrity of the RUC survey and summary of recommendation forms are based on accurate and complete data to the best of my knowledge. As a RUC Advisor, I acknowledge that violations would be addressed by the executive committee (i.e., RUC Chair, AMA Representative and Alternate AMA Representative).

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

April 2007

Pelvic Interstitial Brachytherapy Needle or Catheter Placement

In February 2007 the CPT Editorial Panel created a new CPT code to describe surgical placement of brachytherapy needles or catheters in the pelvis (other than for prostate).

The RUC reviewed the survey results of 57 radiation oncologists considering the physician time, effort, intensity and complexity of the new procedure 55920 *Placement of needles or catheters into pelvic organs and/or genitalia (except prostate) for subsequent interstitial radioelement application.* The RUC compared the new service to code 52345 *Cystourethroscopy with ureteroscopy; with treatment of ureteropelvic junction stricture (eg, balloon dilation, laser, electrocautery, and incision)* (work RVU = 8.31), and believed that new code 55920 was similar in physician work, time, and intensity. In addition, the RUC believed that the pre-service physician time should be reduced by a total of 25 minutes to reflect the typical patient evaluation and positioning time. The RUC also reviewed a building block methodology using the specialty's reference service 55875 *Transperineal placement of needles or catheters into prostate for interstitial radioelement application, with or without cystoscopy* (work RVU = 13.31) (090 day global). As an additional approach, the RUC took the reference service code value of 13.31 RVUs and extracted the physician work of code 52000 *Cystourethroscopy (separate procedure)* (work RVU = 2.23), and its three level 3 evaluation and management office visit (99213) RVUs (2.76 RVUs), resulting in a similar value of 8.32 RVUs. The RUC also determined that for this service the typical patient service would require a pre-service evaluation time of 30 minutes, positioning of 10 minutes, 15 minutes for scrub, dress, and wait, an intra-service time of 90 minutes, and an immediate post service time of 30 minutes, for code 55920.

The RUC recommends a physician work relative value of 8.31 for CPT code 55920.

Practice Expense

The RUC recommends no direct practice expense inputs in the non-facility setting for this facility only service. A practice expense spreadsheet is attached with recommendations for clinical labor staff time associated with typical facility service.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:55920 Tracking Number LL1 Specialty Society Recommended RVU: **10.50**
Global Period: 000 RUC Recommended RVU: **8.31**

CPT Descriptor: Placement of needles or catheters into pelvic organs and/or genitalia (except prostate) for subsequent interstitial radioelement application.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 58-year old woman presents with pelvic pain and vaginal bleeding. Pelvic exam reveals the cervix is replaced by tumor and bimanual examination reveals that the tumor extends to one pelvic sidewall. A biopsy shows squamous cell carcinoma of the cervix. The staging work-up is negative for metastasis. External beam irradiation with concomitant chemotherapy is administered and the patient is scheduled for interstitial brachytherapy.

Percentage of Survey Respondents who found Vignette to be Typical: 93%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 35%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: Review initial exams, radiation and chemotherapy records including related toxicities and labs. Obtain consent and educate patient and family about procedure. Review preoperative imaging and plan catheter placement. Discuss implant volume, placement and spacing with the brachytherapy team. Select, assemble, and if necessary order requisite brachytherapy catheters and supplies. Dress, scrub, and wait.

Description of Intra-Service Work: After anesthesia, the patient is placed in the lithotomy position and sequential compression devices are fitted. Perineum and pelvis are examined for effects of chemotherapy and radiation on normal tissue. A speculum examination and bimanual recto-vaginal examination is performed to determine the extent and distribution of disease.

The perineum and vagina are prepared and draped. A radio-opaque bladder catheter with a surgical steel ring to mark the urethral meatus is inserted into the bladder. Counter-traction sutures are placed in the cervix or adjacent vaginal wall. A template device and vaginal cylinder are selected and prepared for orienting the brachytherapy needles or catheters through the vagina directly into the cervical cancer, through the perineum, directly into the parivaginal tissue and perimetria and into the pelvic side wall. Template modification is performed as needed to fit the perineum for patient comfort. The number of brachytherapy catheters selected and the depth of insertion are adjusted according to the extent and distribution of the disease, but typically 32 flexiguide needles, with a length of 25cm, are inserted during this procedure.

The cervical os is identified and uterus is sounded if possible. A guide probe and wire are inserted into the uterus to orient the direction and depth of brachytherapy catheter placement. The vaginal cylinder is inserted over the probe and the template is fitted over the cylinder to create a probe, cylinder, and template assembly. The template and cylinder are locked together, and the counter-traction sutures are threaded through the template with a pull wire and attached to hemostats.The template guide ports are selected so that the disease is fully encompassed by the implant catheters in the anterior-posterior and transverse planes.

The brachytherapy needle or catheter insertion begins around the vaginal cylinder. Catheters are advanced along the length of the vaginal cylinder until the cervical lesion is encounters. Counter-traction is applied as the brachytherapy needles/catheters are then inserted to a depth consistent with the known extent of the disease (usually about 4-6cm). Subsequent needles/catheters are inserted directly through the perineum using counter-traction. Beginning anterior and working posterior they are advanced parallel to the initial guides into the paravaginal and parametrial targets to a depth consistent with the guides. A double-gloved digital rectal palpation of the pelvic structures is utilized to guide the

posterior aspect of the applicator placement. Typically 32 catheters are utilized to encompass the disease involving parametria with extension to the pelvic sidewall. The template is secured to the perineum in by wrapping and tying the counter-traction sutures around the base of the template. Four additional bolster sutures are placed in the perineum to hold template firmly in place and to protect normal tissue from pressure injury. A 22-gauge 30cc Foley catheter is inserted into the rectum for delivery of rectal contrast. Catheter relationships, final adjustments, and total counts are performed to complete the procedure.

Description of Post-Service Work: The physician diagrams the implant in the patient's medical record. Dictates the procedure report and writes orders. The patient is examined with carful attention paid to the airway and catheter wounds. The physician communicates with physics/dosimetry staff regarding subsequent radioelement application. Answers patient and family questions. Coordinates post operative imaging. Answers nursing and other staff questions.

Pre-Service intensity/complexity	4.25	3.84
Intra-Service intensity/complexity	4.65	4.13
Post-Service intensity/complexity	4.02	3.71

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Almost 60 physician work surveys were completed by our membership for this new CPT code. The data from those surveys were collected, reviewed and analyzed by a consensus panel, consisting of members of ASTRO's Health Policy and Code Development and Valuation Committee, as well as brachytherapy experts in the field of radiation oncology. The group reviewed the survey data and recommends a work RVU of 10.5 for this new procedure code, a value less then the 25th percentile.

The panel reviewed the data for this new CPT code, along with the reference service code and the two other new CPT codes for similar procedures, being presented at this RUC meeting. And although the panel agreed with the survey respondents that the RVU should be established at a rate higher then the panel is recommending, the survey response times, along with the surveyed RVU recommendations, create an IWPUT that would create a rank order anomaly. The panel has reviewed the family of these codes and feels that following is an appropriate rank order:

Surveyed Code:	41019	IWPUT 0.09723
Reference Service Code:	55876	IWPUT 0.09482
Surveyed Code:*(this survey)*	**55920**	**IWPUT 0.09167**
Surveyed Code:	20555	IWPUT 0.083

The panel feels the procedure described by this new CPT code is a little less intense then the work described in the reference service code.

The panel recommends the median survey times for this procedure (*one exception) and recommends they be entered into the RUC database: 20 minutes of pre-service evaluation time, 15 minutes for pre-service positioning, 15 minutes for pre-service scrub, dress and wait , 90 minutes of intra-service time, and 30 minutes of immediate post-service time. The society recommends 30 minutes day preceding procedure be entered into the RUC database, instead of the median of 35 minutes.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☒ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.
   CPT Code: 77014; Computed tomography guidance for placement of radiation therapy fields
   Global Period: XXX
   Work RVUs: TC-Only
   Total Time: 17 minutes

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed)
-57155; Insertion of uterine tandem and/or ovoids for clinical brachytherapy
58346; Insertion of Heyman capsules for clinical brachytherapy
58999; unlisted procedure, female genital system (nonobstetrical)
53899; unlisted procedure, urinary system
55899; unlisted procedure, male genital system
45999; unlisted procedure, rectum
46999; unlisted procedure, anus

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Radiation Oncology How often? Sometimes

Specialty Gynecologic Oncology How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 800
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. This type of procedure will most likely be performed by a radiation oncologist, but occassionally could be performed by a gynecologic oncologist and therefore we have indicated that below.

Specialty Radiation Oncology Frequency 720 Percentage 90.00 %

Specialty Gynecologic Oncology Frequency 80 Percentage 10.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 540
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Approximately 2/3 of the total number of times this service us provided annually, the recipient is an elderly patient.

Specialty Radiation Oncology Frequency 486 Percentage 90.00 %

Specialty Gynecologic Oncology Frequency 54 Percentage 10.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? No

If no, please select another crosswalk and provide a brief rationale. 52345

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

EXPERT PANEL USED TO DEVELOP RECOMMENDATION

Geographic Practice Setting %: **All geographic practice settings represented.**

Type of Practice %: **All practice types represented.**

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The American Society of Therapeutic Radiology and Oncology (ASTRO) prepared these practice expense reccommendations using a consensus panel of physicians comprised of members from ASTRO's Health Policy Committee, Code Development and Valuation Committee (CDVC), as well as those physicians that perform brachytherapy implant placement procedures. The consensus panel included physician representatives from states in various regions of the United States and all demographic areas.

The consensus panel members held several conference calls to evaluate the non-physician clinical labor times, medical supplies, and equipment, based upon the panel members' experience with the procedure under consideration. Preliminary recommendations for direct inputs were drafted and distributed for discussion by the panel during these conference calls, which led to the final formulated practice expense recommendations for CPT® Code 55920; *Placement of needles or catheters into pelvic organs and/or genitalia (except prostate) for subsequent interstitial radioelement application.* Although ASTRO was also scheduled to make non-facility practice expense recommendations for this procedure, we felt that it was appropriate to only make recommendations for the facility setting at this time.

Please describe the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

Schedule procedure, confirm all applicable supplies and devices are available.

Retrieve and compile all relevant clinical information, including all preoperative imaging studies, and patient's medical record for review by the physician. Verify orders, and confirm procedure protocol with physician.

Contact patient on the day before the procedure to provide educational information regarding the procedure and provide them with any additional information they may request. Obtain informed consent and confirm adherence to pre procedure protocol.

Intra-Service Clinical Labor Activities:

N/A

Post-Service Clinical Labor Activities:

Initiate phone calls for physician and call in prescriptions as applicable.

****Please see corresponding PERC spreadsheet for additional details.**

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

April 2007

Percutaneous Renal Tumor Cryotherapy

In November 2006, the CPT Editorial Panel converted category III code 0135T *Ablation, renal tumor(s), unilateral, percutaneous, cryotherapy* to a category I code as it determined the service was now performed across the country in multiple locations and the device had FDA approval.

The RUC reviewed two services that were similar in physician time and intensity across specialties to arrive at value for new code 50593. The RUC reviewed code 50592 *Ablation, one or more renal tumor(s), percutaneous, unilateral, radiofrequency* (work RVU = 6.77, 010 day global) and believed 50593 required more physician time due to the complexity of the procedure, but had similar intra-work intensity. The RUC and the specialty determined that the survey respondents overestimated the pre-service time and that pre-service positioning and pre-service scrub, dress, and wait time each should be reduced to 10 minutes to be consistent with code 50592. The RUC recommends 45 minutes of pre-service evaluation time, less than the survey but significantly more than for 50592 due to the complexity of the typical patient for 50593.

1303

Using code 50592 as an anchor for a building block methodology, the Committee developed a work relative value of 9.08 for 50593. The RUC concurred that the intensity of code 50592 was quite similar to this new service, however 50592 requires one probe and new service 50593 requires four 12 gauge cryoablation probes that results in an additional 30 minutes of intra-service physician time. The intensity of 50592 was utilized, as well as the typical patient pre, intra, and post service physician time components were used in the following building block methodology, that results in the RUC's recommended physician work RVU of 9.08.

The RUC also reviewed code 31239 *Nasal/sinus endoscopy, surgical; with dacryocystorhinostomy* (work RVU = 9.23, 010 day global), as a cross specialty comparison and agreed that while its intra-work was less intense, its total work was similar to 50593.

The RUC recommends a relative work value of 9.08 for code 50593.

New Technology: The RUC recommends code 50593 to be added to the new technology list.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association

Physician Time Components	Intensity	Time	Associated RVUs
Pre-Service Eval	0.0224	45	1.01
Pre-Service Position	0.0224	10	0.22
Pre-Service Scrub, dress, wait	0.0081	10	0.08
Immediate Post	0.0224	20	0.45
Intra-service IWPUT of code 50592	0.0640	90	5.76
	Post Operative Visit		
	99238	0.5	0.64
	99213	1	0.92
		Work Value	**9.08**

Practice Expense

The RUC reviewed the specialty recommended direct practice expense inputs for the non-facility and facility settings and made minor modifications to the clinical labor time to reflect the typical patient scenario. **The RUC recommends the attached direct practice expense inputs for code 50593.**

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:50593 Tracking Number MM1 Specialty Society Recommended RVU: **13.00**
Global Period: 010 RUC Recommended RVU: **9.08**

CPT Descriptor: Ablation, renal tumor(s), unilateral, percutaneous, cryotherapy
(505XX is a unilateral procedure. For bilateral procedure, report 505XX with modifier 50)
(For imaging guidance and monitoring, see codes 76940, 77013, 77022)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 76-year-old man with poor cardiac function and history of previous open-heart surgery has a 3.0 cm enhancing solid renal mass that was incidentally found as result of a CT scan performed due to patient's complaint of abdominal pain. The patient's comorbidities rule out open total or partial nephrectomy as too risky. The patient is referred for percutaneous renal tumor ablation.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Is conscious sedation inherent to this procedure? Yes Percent of survey respondents who stated it is typical? 64%

Is conscious sedation inherent in your reference code? Yes

Description of Pre-Service Work: The physician,
The physician:
-Obtains and reviews pertinent imaging studies and lab results
-Discusses procedure and alternatives with patient and family; answers questions and informed consent is reviewed with patient and family
-Orders blood work including a coagulation profile
-Instructs patient and/or relative to pre-procedural diet and alterations in medication
-Calls patient to ensure compliance with dietary and medication instructions and to answer any remaining questions
-Estimates the range of devices that may be required and ensures all are available for use
-Ensures all technical personnel have been familiarized with the procedure and are fully familiar with all required devices
-Supervises selection of all equipment, incuding catheters, wires, sheaths, contrast material and other devices
-Re-reviews applicable, available prior films

Description of Intra-Service Work: The physician,
-Confirms clinical status has not changed
-Supervises the start of an IV
-Oversees the equiping of the room, the positioning of the patient, and the dispersement skin temperature sensors
-Obtains and interprets initial localization image (included in 77013, 77022 or 76940 -- separately reportable) for selection of the entry site for initial probe placement
-Supervises nurse's administration of a dose (or doses) of i.v. conscious sedation which typically is 50ugs fentanyl and 1mg midazolam
-Makes small incisions to facilitate placement of multiple probes (4-6 probes). This is done to assure complete tumor necrosis and satisfactory margins
-Introduces 12 gauge, cryoablation probes into the center of the lesion under imaging guidance (imaging included in 77013, 77022 or 76940) to avoid organs and major blood vessels
-Confirms location of probe tips using imaging guidance (imaging included in 77013, 77022 or 76940)
-Activates cryoablation unit until satisfactory creation of cryoablation sphere (iceball) is achieved. Typically two freeze cycles required
-Monitors and assesses tumor necrosis to confirm the completion of treatment
-Withdraws the probes, after satisfactory necrosis
-Cleans incision sites and applies sterile adhesive dressings

Description of Post-Service Work: The physician,
-Follows patient to recovery
-Writes orders for additional pain medication
-Discusses procedure and the planned subsequent course of therapy with the patient and the patient's family
-Checks on patient in recovery for complications and comfort
-Discharges patient with post-procedure instructions
-Dictates, review, and sign report of the procedure
-Discusses outcome with primary care physician
-Follows patient with telephone calls
-Sees patient in office for follow-up

SURVEY DATA

Prolonged Services Time	0.0	0.00	
Median Total Time	**217.00**	**449.00**	
Other time if appropriate			

INTENSITY/COMPLEXITY MEASURES (Mean)

Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	4.29	4.29
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	4.43	4.21
Urgency of medical decision making	3.50	3.50
Technical Skill/Physical Effort (Mean)		
Technical skill required	4.57	3.86
Physical effort required	4.71	4.07
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	4.21	4.14
Outcome depends on the skill and judgment of physician	4.64	4.31

Estimated risk of malpractice suit with poor outcome	4.29	4.07

INTENSITY/COMPLEXITY MEASURES	CPT Code	Reference Service 1
Time Segments (Mean)		
Pre-Service intensity/complexity	3.50	4.07
Intra-Service intensity/complexity	4.43	4.46
Post-Service intensity/complexity	3.07	3.29

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The Society RUC workgroup was convened to review survey results. The survey median recommended RVU was believed to be excessively high compared to other ablative therapies. The survey 25th percentile recommended RVU is believed to be relative to other clinically similar ablative therapies. IWPUT was calculated, as follows:

Pre-service RVU = 2.2495 = 0.0224*(75 +20) + (0.0081*15)

Post-service RVU = 3.296 = (0.0224*20) + 0.76 + 1.28 + 0.92

25th PERCENTILE RECOMMENDED RVU = 13.00

Intra-service RVU = 7.3425

IWPUT = 0.08158 = 7.3425 /90

Per survey, typical E&M Visits:

In patient	99231 – 1	Physician Work RVUs	0.76
Discharge Day Mgmt	99238 – 1	Physician Work RVUs	1.28
Office Visit	99213 – 1	Physician Work RVUs	0.92

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.

☒ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
☐ Multiple codes are used to maintain consistency with similar codes.
☐ Historical precedents.
☒ Other reason (please explain) Depending on the patients clinical circumstances and operator preference, different imaging modalities may be used to guide and monitor the ablation procedure.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

3.		50593 plus	76940 or	77013 or	77022	Total
4.	Global Period	010	XXX	XXX	XXX	
5.	RVW	13	2.00	3.99	4.24	15.00 to 17.24
6.	Pre-time (minutes)	110	20	20	20	130 minutes
7.	Intra-time (minutes)	90	120	120	165	210 to 255 minutes
8.	Post-time (minutes)	15	15	15	15	30 minutes
9.	Total time (minutes)	215	155	155	200	370 to 415 minutes

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) CPT codes 49999 (Unlisted procedure, abdomen, peritoneum, and omentum) or code 53899 (Unlisted uninary system) plus 77013, 77022 or 76940 depending on imaging modality used for guidance and ablation monitoring.

The Medicare 2005 frequencies for code 49999 and 53899 were 1570 and 3179, respectively. We are unable to determine the number of renal tumor(s) cryoablation procedures that may be included in these figures. For renal tumors, surgery is the primary therapy. Ablation would be reserved for patients who are poor candidates for surgery due to multiple comorbidities or who oppose surgery. Therefore, the number of renal tumo(s) cryoablations being performed today should be relatively small.

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Diagnostic Radiology & Interventional Radiology How often? Rarely

Specialty Urology How often? Rarely

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 2341
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. Assumes that approximately 50% of the unlisted procedures reported using unlisted codes 49999 and 53899 in 2005 were renal cyotherapy procedures. For code 49999, 14.14% of the services reported were reported by diagnostic and interventional radiology represent, 71.08% by general surgery and 1.97% by urology. For code 53899, 35.51% of the services reported were reported by diagnostic and interventional radiology, 0.5% by general surgery and 61.19% by urology.Medicare patients are believed to be the preponderance of those receiving these service. A reasonable estimate of non-Medicare patients receiveing these services is believed to be about 5% above that of Medicare.

Specialty Diagnostic Radiology & Interventional Radiology Frequency 709 Percentage 28.83 %

Specialty Urology Frequency 1037 Percentage 44.29 %

Specialty General Surgery Frequency 594 Percentage 25.37 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 2229 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Assumes that approximately 50% of the unlisted procedures reported using unlisted codes 49999 and 53899 in 2005 were renal cyotherapy procedures. For code 49999, 14.14% of the services reported were reported by diagnostic and interventional radiology represent, 71.08% by general surgery and 1.97% by urology. For code 53899, 35.51% of the services reported were reported by diagnostic and interventional radiology, 0.5% by general surgery and 61.19% by urology.

Specialty Diagnostic Radiology & Interventional Radiology Frequency 675 Percentage 30.28 %

Specialty Urology Frequency 988 Percentage 44.32 %

Specialty General Surgery Frequency 566 Percentage 25.39 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? No

If no, please select another crosswalk and provide a brief rationale. Code 50592 is believed to be a better PLI crosswalk; similar to 505XX, 50592 represents a percutenous procedure for the ablation of renal tumor(s) with imaging separately reportable.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

Type of Practice %: **All practice types represented**

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

Members known to provide the service for which practice expense inputs are being developed in a non-facility setting were contacted to provide inputs. Industry was contacted as applicable regarding current pricing for new devices and/or existing devices for which there has been a known price increase. Like inputs were identified. Society RUC workgroup members evaluated unique inputs for inclusion as appropriate within the context of established standard inputs for like and/or related procedures/services.

Please describe the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

- **Schedule procedure and confirm applicable supplies and devices are in inventory**
- **Retrieve and compile all relevant clinical information for patient record for review by physician including incorporation of all relevant clinical information, verify orders, confirm procedure protocol with physician**
- **Contact patient the day before procedure to confirm adherence to pre-procedure protocol.**

Intra-Service Clinical Labor Activities:

- **Review and prepare chart to insure completeness in preparation for physician**

review
- **Greet patient and provide gowning**
- **Reaffirm informed consent and obtain vital signs**
- **Prepare room including locating and preparation of all applicable devices and supplies**
- **Prepare patient for procedure and set up IV**
- **Assist physician in performing procedure**
- **Assist physician in monitoring moderate (conscious) sedation**

Post-Service Clinical Labor Activities:
- **Monitor patient post procedurally, checking vital signs every 20 minutes**
- **Clean room in accordance with OSHA regulations**
- **Check wound and review post procedure instructions with patient**
- **Review x-ray and lab results for physician review and interpretation with incorporation in patients medical record**
- **Initiate phone calls for physician and call in prescriptions as applicable**
- **Support physician in providing follow up E&M services**

Please see corresponding PERC spreadsheet for additional detail.

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

April 2007

Prostate Laser Enucleation

The CPT Editorial Panel created a new CPT code to provide greater specificity to other prostate procedures currently in CPT. Current CPT code 52648 *Laser vaporization of prostate, including control of postoperative bleeding, complete (vasectomy, meatotomy, cystourethroscopy, urethral calibration and/or dilation, internal urethrotomy and transurethral resection of prostate are included if performed)* (Work RVU = 12.00) describes the vaporization of prostate tissue with subsequent prostatic fossa cavitation. This is accomplished by contacting a bare tip laser fiber (under high energy) to the prostate surface and painting the tissue. Tissue underneath the fiber immediately vaporizes. This new code describes the use of the laser fiber to undermine and dissect away large pieces of prostate tissue which migrate into the bladder and are subsequently extracted at the end of the procedure.

1319

The RUC reviewed the specialty society's survey results for new code 52649 *Laser enucleation of the prostate with morcellation, including control of postoperative bleeding, complete (vasectomy, meatotomy, cystourethroscopy, urethral calibration and/or dilation, internal urethrotomy and transurethral resection of prostate are included if performed)* and discussed the typical patient regarding this new service. The survey results were tight from the 33 respondents who had performed the service a median of 20 times. The service is only safely performed in the facility setting, and typically is for patients who have an enlarged prostate that results in obstructive voiding symptoms. In relation to this new code the RUC also reviewed the specialty's key reference service code 55831 *Prostatectomy (including control of postoperative bleeding, vasectomy, meatotomy, urethral calibration and/or dilation, and internal urethrotomy); retropubic, subtotal* (Work RVU = 17.06), and agreed the physician work, time, and complexity was similar to the new service. The RUC concurred that the survey results median work relative value of 17.16 was appropriate for this new procedure. **The RUC recommends a relative work value of 17.16 for new code 52649.**

Practice Expense

The RUC recommends no direct practice expense inputs in the non-facility setting for this facility only service. A practice expense spreadsheet is attached with recommendations for clinical labor staff time reflecting the PERC's 090 day global standard direct practice expense inputs.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
52601		Transurethral electrosurgical resection of prostate, including control of postoperative bleeding, complete (vasectomy, meatotomy, cystourethroscopy, urethral calibration and/or dilation, and internal urethrotomy are included)	090	15.13 (No Change)
52647	NN1	Laser coagulation of prostate, including control of postoperative bleeding, complete (vasectomy, meatotomy, cystourethroscopy, urethral calibration and/or dilation, and internal urethrotomy are included if performed)	090	11.15 (No Change)
52648	NN2	Laser vaporization of prostate, including control of postoperative bleeding, complete (vasectomy, meatotomy, cystourethroscopy, urethral calibration and/or dilation, internal urethrotomy and transurethral resection of prostate are included if performed)	090	12.00 (No Change)
●52649	NN3	Laser enucleation of the prostate with morcellation, including control of postoperative bleeding, complete (vasectomy, meatotomy, cystourethroscopy, urethral calibration and/or dilation, internal urethrotomy and transurethral resection of prostate are included if performed) (Do not report 52649 in conjunction with 52000, 52276, 52281, 52601, 52647, 52648, 53020, 55250)	090	17.16

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:52649 Tracking Number 2941PA Specialty Society Recommended RVU: **17.16**
Global Period: 090 RUC Recommended RVU: **17.16**

CPT Descriptor: Laser enucleation of the prostate with morcellation, including control of postoperative bleeding, complete (vasectomy, meatotomy, cystourethroscopy, urethral calibration and/or dilation, internal urethrotomy and transurethral resection of prostate are included if performed) (Do not report 5264X in conjunction with 52000, 52276, 52281, 52601, 52647, 52648, 53020, 55250)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 63 year-old male with a long history of obstructive voiding symptoms experiences nocturia 5 to 6 times and a poor stream. His AUA symptom score is 32. On rectal examination, he is noted to have a markedly enlarged prostate which is smooth and symmetrical. A PSA is 3.9 and a transrectal ultrasound reveals a 262 gm prostate. After discussion of the treatment options, he elects holmium laser Enucleation as a definitive treatment for his BPH.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 6%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: Pre-service Work- Day before surgery: Review pre-op lab results. Review medical record. Write pre-op orders (to be faxed to hospital). Pre-service work- Day of surgery: Change into scrub clothes. Review surgical procedure, post-op recovery in and out of hospital with patient and family. Answer patient and family questions, be sure informed consent is in record. Speak to anesthesiologist about expected length of procedure and any special concerns about this particular patient (teeth, positioning, unusual medical problems). Position patient on endoscopic table. Verify that all necessary instruments are available. Take "time out" for patient identification. Wait for anesthesiologist to give the anesthetic (general or spinal).

Description of Intra-Service Work: Under appropriate anesthesia, the patient is placed in the lithotomy position and prepped and draped. Cystoscopy (of the bladder prior to the enucleation to make sure there are no tumors or masses in the bladder. Urethral calibration and dilatation (passing sounds in the urethra to make sure it can accommodate the scope. Possible meatotomy if there is narrowing at the meatus (preventing the passage of the scope). A 28 French continuous flow resectoscope sheath is passed into the bladder. The laser bridge, a 7 French laser stabilizing catheter and a 550 micron end firing holmium laser fiber are utilized. The holmium laser is set at 100 watts for dissection. Inspection of the prostatic urethra reveals a very large prostate with tri-lobar enlargement. Enucleation is begun by making an incision at the 5 o'clock location between the median lobe and left lateral lobe. Dissection is carried down to the capsule and from the bladder neck to the veru montanum. Once the groove has been cut, it is undermined on each side, thereby enucleating each lateral lobe of the prostate, as well as the median lobe. The anterior commissure is then divided at the 12 o'clock location and the anterior lobe dissected free. Hemostasis is achieved by defocusing the laser fiber. The large pieces of prostate tissue are then morcellated and extracted with an Ellik evacuator. Reinspection of the bladder shows no residual chips and excellent prostatic hemostasis. A 22 French 3-way catheter is the placed and the patient is taken to the recovery room.

Description of Post-Service Work: Post-op Same day work through discharge from recovery. Wait for anesthesiologist to awaken patient. Transfer patient off of operating table. Attach irrigation to 3-way Foley catheter. Hand irrigate Foley catheter in operating room before transfer to recovery room. Go with patient and anesthesiologist to recovery room. Assist in transfer of patient to recovery area bed. Review recovery area care and medications with staff . Meet with patient's family and discuss the procedure, expected outcome, planned post-operative care in hospital and out of hospital. Discuss procedure with patient as necessary in recovery area when awake. Conduct post-op pain

assessment. Write post-operative orders. Dictate operative report. Call referring physician regarding outcome of procedure and any unusual aspects of post-operative care (cardiac disease, diabetic management. Post-op Same day work after discharge from recovery - Examine patient, check bladder and patient progress. Conduct post-op pain assessment. Hand irrigate clots out of catheter. Review patient hospital medical record notes (nursing, pharmacy, dietary, discharge planner). Answer patient and family questions. Answer nursing and other staff questions. Write any further necessary orders. Write note in progress note section of medical record. Post-op Other Hospital Work - Beginning on post op-day 1, until discharge day - Examine and talk to patient. Conduct post-op pain assessment. Check lab values. Check catheter and irrigation, and irrigate as necessary. Discuss patient progress with patient and family. Review all patient hospital medical record notes. Discuss post operative care of catheter at home with patient and family. Answer nursing and other staff questions. Answer patient and family questions. Write any further necessary orders in medical record. Write note in progress note section of medical record Discharge day work: Examine patient and talk with patient and family. Conduct post-op pain assessment. Check catheter and patient progress. Review all patient hospital medical records. Answer patient and family questions. Write orders for post-discharge care. Write prescriptions for post-op medications. Discuss post-op care of catheter with patient and family. Dictate hospital discharge summary Post-op Office work- After discharge from hospital: Examine patient, check vital signs. Conduct post-op pain assessment oRemove Foley catheter in office . Talk with patient and family. Patient to return to office next day to see if voiding satisfactorily. Reinsert Foley catheter if unable to void. In subsequent visits, examine patient, assess voiding pattern, check residual urine volume, check urinalysis and urine culture. Write necessary prescriptions. Schedule next office visit. Dictate patient progress notes for office medical record o Dictate letter to referring physician.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 52601

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty	How often?
Specialty	How often?
Specialty	How often?

Estimate the number of times this service might be provided nationally in a one-year period? 450
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate.

Specialty Urology	Frequency 450	Percentage 100.00 %
Specialty	Frequency 0	Percentage 0.00 %
Specialty	Frequency 0	Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 350
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate.

Specialty Urology	Frequency 350	Percentage 100.00 %
Specialty	Frequency 0	Percentage 0.00 %
Specialty	Frequency 0	Percentage 0.00 %

Do many physicians perform this service across the United States? No

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

CPT Code: 52649

Type of Practice %:

12.12	Solo Practice
42.42	Single Specialty Group
18.18	Multispecialty Group
27.28	Medical School Faculty Practice Plan

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee: Our practice expense recommendations are based on the deliberation of a panel of urologists from various geographic and practice settings, including from private and academic practices.

Please describe the clinical activities of your staff:

Pre-Service Clinical Labor Activities
Pre-operative work-up scheduling, which includes scheduling of history and physical exam, performance of vitals, exam, lab draw, chest x-ray, and EKG. Pre-admission testing scheduling and assessment by anesthesia. Scheduling of surgery with the operating room. Complete pre-service diagnostic & referral forms, provide pre-service education and consent and provide follow-up phone calls and prescriptions.

Intra-Service Clinical Labor Activities: N/A

Post-Service Clinical Labor Activities:
Admission to the hospital and all required paperwork and assessments. Discharge paperwork, provide home care instructions and teaching. Scheduling of post-operative clinic visits. Prepare and deliver prescriptions.

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

April 2007

Laparoscopic Paravaginal Defect Repair

The CPT Editorial Panel revised one code and created two new codes to describe the three approaches to a paravaginal defect repair.

57284 and 57285
Code 57284 *Paravaginal defect repair (including repair of cystocele, stress urinary incontinence, and/or incomplete vaginal prolapse if performed); open abdominal approach* had been the code typically used for both the vaginal and abdominal approaches prior to its revision and the creation of new code 57285 *Paravaginal defect repair (including repair of cystocele, if performed), vaginal approach*. The physician work of code 57284 was valued at 13.51 for the 2007 Medicare Physician Payment Schedule. The RUC agreed that the vaginal approach was less work than the abdominal approach, and with the estimated Medicare utilization from the specialty, the recommended work values result in a work neutral recommendation.

1331

The low of the specialty's survey results for code 57284 of 14.25 was compared by the RUC, to its key reference code 57280 *Colpopexy, abdominal approach* (work RVU = 16.62) and was found to be similar in physician intensity, complexity, and physician time. However, the survey respondents indicated that the physician work value for 57284 was clearly lower than 57280 as its median survey value was 15.50. The specialty society recommended, and the RUC agreed, that the low of the survey results reflects the difference in the value from the reference code and accommodates for work neutrality. The RUC also confirmed that revised 57284, is similar in intra-service time and work RVU of CPT code 57260 *Combined anteroposterior colporrhaphy*. 57284 has 100 minutes of intra-service time and a recommended work RVU of 14.25, while 57260 has 90 minutes, and an RVW of 14.36. Code 57260 was revalued during the RUC's Third Five Year Review. **The RUC recommends a physician work relative value of 14.25 for CPT code 57284.**

The low of the specialty's survey results for code 57285 of 11.52 was compared by the RUC, to its key reference code 57240 *Anterior colporrhaphy, repair of cystocele with or without repair of urethrocele* (work RVU = 11.42), and was found to be physician work based on intensity, complexity, skill, and stress levels between the two services. The specialty's survey median indicated a physician work value of 13.25, however considering the physician time overall was less than the key reference code and work neutrality considerations, the RUC and the specialty concurred that the low of the specialty survey results reflects the physician work value for CPT code 57285 of 11.52. **The RUC recommends physician work relative value of 11.52 for CPT code 57285.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association

57423

The RUC reviewed the specialty society's survey results for this new technology laparoscopic approach to paravaginal defect repair, CPT code 57423 *Paravaginal defect repair (including repair of cystocele, if performed), laparoscopic approach* (previously reported with an unlisted code) and agreed the survey results from the 35 obstetrics and gynecology physicians represented the appropriate physician work involved in this new service and showed a strong argument for accepting the survey median of 16.00 work RVUs for the service. The survey results were well distributed with the median and the physician time, complexity, and intensity measures indicated this new service was similar to its key reference service code 58543 Laparoscopy, surgical, supracervical hysterectomy, for uterus greater than 250 g; (work RVU = 16.74). **The RUC recommends a specialty society's median survey physician work relative value of 16.00 for new code 57423.**

The specialty also standardized the physician time components from its survey results similar to other Obstetrics and Gynecological surgical procedures. The specialty standardized the pre-service time for evaluation to be 45 minutes, positioning to be 10 minutes, and pre-service scrub dress and wait to be 5 minutes. In addition, the procedures each were standardized to have one level three (99213) and one level two (99212) post operative evaluation and management office visits. The RUC agreed with these reductions in physician time from the survey results.

1332

Practice Expense

The RUC recommends no direct practice expense inputs in the non-facility setting for these facility only services. A practice expense spreadsheet is attached with recommendations for clinical labor staff time reflecting the PERC's 090 day global standard direct practice expense inputs.

The RUC recommends code 57423 be placed on the new technology list.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
▲57284	OO1	Paravaginal defect repair (including repair of cystocele, ~~stress urinary incontinence, and/or incomplete vaginal prolapse~~ if performed); open abdominal approach (Do not report with 51840, 51841, 51990, 57240, 57260,57265, 58152, 58267)	090	14.25
●57285	OO2	Paravaginal defect repair (including repair of cystocele, if performed), vaginal approach (Do not report 57285 in conjunction with 51990, 57240, 57260, 57265, 58267)	090	11.52

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:57284 Tracking Number OO1 Specialty Society Recommended RVU: **14.25**
Global Period: 090 RUC Recommended RVU: **14.25**

CPT Descriptor: Paravaginal defect repair (including repair of cystocele, if performed); open abdominal approach

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 54-year-old G5P5 female patient presents with complaints of vaginal pressure and heaviness associated with prolonged standing. Her past history is significant for prior hysterectomy. Pertinent physical exam reveals no rectocele, enterocele, or perineal defect. Inspection of the anterior vaginal wall relaxation reveals a cystocele arising from paravaginal defects. An abdominal paravaginal defect repair is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 87%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 4%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: Pre-service work includes: taking a comprehensive history and performing a comprehensive examination to determine the patient's current medical status; indications for the procedure and its appropriateness are reviewed; informed consent is obtained; the physician will admit the patient to the hospital; prepare the hospital records and chart in accordance with hospital policy; will check on the patient, and will review labs, x-rays and records prior to the surgery. The physician then scrubs for the procedure, and waits for anesthesia induction and the preparation of the patient.

Description of Intra-Service Work: An incision in made in the abdominal wall and access to the space of Retzius is obtained transperitoneally. The dissection is extended to expose the arcus tendineus fascia pelvis (ATFP) bilaterally. Several permanent sutures are passed along the anterior lateral vaginal sulcus (on each side) through the pubocervical fascia. These sutures are then brought through the obturator internus muscle, just above the ATFP, along its full length from the underside of the pubic symphysis down to the ischial spine. This is performed bilaterally. Then, guided by a retractor or instrument placed within the vaginal cavity, all sutures are tied sequentially to obliterate the defect. Fascia is closed and skin wounds are reapproximated.

Description of Post-Service Work: Following the procedure, the physician writes orders for post-operative care, accompanies the patient to the recovery room, and talks with the patient's family. The patient is then evaluated in the recovery room. The physician dictates the operative procedure and makes periodic checks on the patient's condition. Any drainage catheters are normally removed when the patient is ambulatory and she is monitored for normal voiding. The physician visits the patient in the hospital for 3 days. The patient is discharged on post op day 4 with instructions for follow-up care. The patient is reevaluated twice post operatively.

Post-Service intensity/complexity	3.75	3.70

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The American College of Obstetricians and Gynecologists (ACOG), in collaboration with the American Urogynecologic Society (AUGS), disseminated the RUC survey to a targeted mailing list of 1000 members. Thirty-eight surveys were submitted electronically. ACOG staff summarized the data. A panel of physicians from ACOG and AUGS reviewed the results and drafted final recommendations.

The panel recommends acceptance of 14.25 RVWs .

The panel took these steps in reaching their conclusion:

1) Reviewed the results of the survery
2) Determined an IWPUT based on the recommended RVW
3) Compared the recommended RVW and IWPUT to the reference service code and other laparoscopic hysterectomy codes.

Review of Survey Results

The panel felt the survey respondents fairly estimated the intra-service time at 100 minutes. Pre-service positioning and scrub time may have been slightly overestimated by 5and 10 minutes respectively. The pre-services have been standardized throughout the new/revised codes to provide consistency among them. Additionally, the panel is of the opinion that the hospital visits were overstated by (1) 99231 and (1) 99212 post-operative office visit. Fifty-six minutes were deducted from the total survey time.

	Surveyed time	Consensus panel recommendation
Pre-service position	15	10
Pre-service scrub	20	5
Other Hospital Visits	80	60
Office Visits	62	46
TTL	177	121

It was the consensus of the panel that the median RVW value of 15.5 for this code appears to be high. Therefore, an RVW of 14.25, the 25 percentile was agreed upon. Though this value is higher than the current RVW for 57284 of 13.51, it must be noted that the current code encompasses both the vaginal and the abdominal approaches. The surveys

were consistent in describing lower work for the vaginal approach, and higher work for the abdominal approach. The values as proposed, will be budget neutral in that the lower valued service (the vaginal approach) will be removed from the original 57284, leaving only the higher work service in that code. It is estimated that the vaginal approach will be performed 25% of the time, while the remainder of the procedures currently being coded 57284, will be performed abdominally.

Also it should be noted that revised 57284, is similar in intra-service time and RVW of CPT code 57260 *Combined anteroposterior colporrhaphy*. The revised code has 100 minutes of intra-service time and a recommended RVW of 14.25, while 57260 has 90 minutes, and an RVW of 14.36. Code 57260 was revalued during the most recent 5-Year Review.

IWPUT Calculation – *ACOG/AUGS used the standard RUC method for calculation the IWPUT*

Hospital visit 99231x 1 (0.64)		0.64
Hospital visit 99232x1 (1.06)		1.06
Discharge 99238		1.28
Office visit 99213 x 2 (.92)		1.84
Pre-service, day prior (0.0224 x 30 min)		0.672
Pre-service, same day (0.0224 x 25 min)		0.56
Scrub, dress, wait (0.0081 x 5 min)		0.0405
Post service (0.0224 x 30 min)	+	0.672
Total pre- & post- RVW		6.7645
Recommended RVW		14.25
Intra-RVW		7.4855
Intra-service time		100 minutes
IWPUT		**0.075**

A comparison of the paravaginal defect repair and reference service codes has been provided in Addendum A Excel spreadsheet.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☒ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 57284

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Ob/Gyn, Urogynecologists, Gynocologist Oncologists How often? Sometimes

Specialty Urologists How often? Rarely

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate.

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? No

If no, please select another crosswalk and provide a brief rationale. The same PLI crosswalk should be used for the revised 57284 code, as the current code.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:57285 Tracking Number OO2 Specialty Society Recommended RVU: **11.52**
Global Period: 090 RUC Recommended RVU: **11.52**

CPT Descriptor: Paravaginal defect repair (including repair of cystocele, if performed); vaginal approach

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 54-year-old G5P5 female patient presents with complaints of vaginal pressure and heaviness associated with prolonged standing. Her past history is significant for prior hysterectomy. Pertinent physical exam reveals no rectocele, enterocele, or perineal defect. Inspection of the anterior vaginal wall relaxation reveals a cystocele arising from paravaginal defects. A vaginal paravaginal defect repair is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 84%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 5%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: Pre-service work includes: taking a comprehensive history and performing a comprehensive examination to determine the patient's current medical status; indications for the procedure and its appropriateness are reviewed; informed consent is obtained; the physician will admit the patient to the hospital; prepare the hospital records and chart in accordance with hospital policy; will check on the patient, and will review labs, x-rays and records prior to the surgery. The physician then scrubs for the procedure, and waits for anesthesia induction and the preparation of the patient.

Description of Intra-Service Work: Vaginal access to the space of Retzius is obtained by opening the anterior vaginal wall and dissecting the bladder from the vaginal epithelium. The dissection is extended to expose the arcus tendineus fascia pelvis (ATFP) bilaterally. Several permanent sutures are passed along the anterior lateral vaginal sulcus (on each side) through the pubocervical fascia. These sutures are then brought through the obturator internus muscle, just above the ATFP, along its full length from the underside of the pubic symphysis down to the ischial spine. This is performed bilaterally. All sutures are tied sequentially to obliterate the defect. Vaginal incisions are reapproximated.

Description of Post-Service Work: Following the procedure, the physician writes orders for post-operative care, accompanies the patient to the recovery room, and talks with the patient's family. The patient is then evaluated in the recovery room. The physician dictates the operative procedure and makes periodic checks on the patient's condition. Any drainage catheters are normally removed when the patient is ambulatory and she is monitored for normal voiding. The physician visits the patient in the hospital for 2-3 days. The patient is most often discharged on post op day 2 or 3 with instructions for follow-up care. The patient is reevaluated four times post operatively.

Pre-Service intensity/complexity	3.58	3.37
Intra-Service intensity/complexity	4.21	3.47
Post-Service intensity/complexity	3.26	3.16

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The American College of Obstetricians and Gynecologists (ACOG), in collaboration with the American Urogynecologic Society (AUGS), disseminated the RUC survey to a targeted mailing list of 1000 members. Sixty-six surveys were submitted electronically. ACOG staff summarized the data. A panel of physicians from ACOG and AUGS reviewed the results and drafted final recommendations.

The panel recommends acceptance of 11.52 RVWs .

The panel took these steps in reaching their conclusion:

1) Reviewed the results of the survery
2) Determined an IWPUT based on the recommended RVW
3) Compared the recommended RVW and IWPUT to the reference service code and other laparoscopic hysterectomy codes.

Review of Survey Results

The panel felt the survey respondents fairly estimated the intra-service time at 60 minutes. Pre-service evaluation the day proceeding the procedure, pre-service positioning and scrub time may have been overestimated by 15, 5and 10 minutes respectively. The pre-services have been standardized throughout the new/revised codes to provide consistency among them. Additionally, the panel is of the opinion that the hospital visits are understated by (1) 99231, and the postoperative office visits are overstated by (2) 99212 visits. Forty-two minutes were deducted from the total survey time.

	Surveyed time	Consensus panel recommendation
Pre-service evaluation day proceeding procedure	45	30
Pre-service evaluation day of procedure	15	15
Pre-service positioning	15	10
Pre-service scrub	15	5
Other Hospital Visits	60	80
Office Visits	71	39
TTL	221	179

It was the consensus of the panel that the median RVW value of 13.25 for this code appears to be high. Therefore, the 25% with an RVW of 11.52 was agreed upon. Though this value is lower than the current RVW for 57284 of 13.51, it must be noted that the current code encompasses both the vaginal and the abdominal approaches. The surveys were consistent in describing lower work for the vaginal approach, and higher work for the abdominal approach. The values as proposed, will be budget neutral in that the lower valued service (the vaginal approach) will be removed from the original 57284, leaving only the higher work service in that code. It is estimated that the vaginal approach will be performed 25% of the time, while the remainder of the procedures currently being coded 57284, will be performed abdominally.

Additionally, code 5728X1 has the same intra-service time as reference service code 57240, and an RVW of 11.52.

IWPUT Calculation – *ACOG/AUGS used the standard RUC method for calculation the IWPUT*

Hospital visit 99231x 2 (0.64)		1.28
Hospital visit 99232x1 (1.06)		1.06
Discharge 99238		1.28
Office visit 99212x1 (0.45)		0.42
Office visit 99213 x 1 (.92)		0.92
Pre-service, day prior (0.0224 x 30 min)		0.672
Pre-service, same day (0.0224 x 25 min)		0.56
Scrub, dress, wait (0.0081 x 5 min)		0.0405
Post service (0.0224 x 30 min)	+	0.672
Total pre- & post- RVW		6.9045
Recommended RVW		11.52
Intra-RVW		4.6155
Intra-service time		60 minutes
IWPUT		**0.076**

A comparison of the paravaginal defect repair and reference service codes has been provided in Addendum A Excel spreadsheet.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☒ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

SUMMARY OF RECOMMENDATION

CPT Code:57423 Tracking Number OO3 Specialty Society Recommended RVU: **16.0**
Global Period: 090 RUC Recommended RVU: **16.0**

CPT Descriptor: Paravaginal defect repair (including repair of cystocele, if performed); laparoscopic approach

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 54-year-old G5P5 female patient presents with complaints of vaginal pressure and heaviness associated with prolonged standing. Her past history is significant for prior hysterectomy. Pertinent physical exam reveals no rectocele, enterocele, or perineal defect. Inspection of the anterior vaginal wall relaxation reveals a cystocele arising from paravaginal defects. A laparoscopic paravaginal defect repair is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 91%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: Pre-service work includes: taking a comprehensive history and performing a comprehensive examination to determine the patient's current medical status; indications for the procedure and its appropriateness are reviewed; informed consent is obtained; the physician will admit the patient to the hospital; prepare the hospital records and chart in accordance with hospital policy; will check on the patient, and will review labs, x-rays and records prior to the surgery. The physician then scrubs for the procedure, and waits for anesthesia induction and the preparation of the patient.

Description of Intra-Service Work: Laparoscopic access to the space of Retzius is obtained transperitoneally. Multiple ancillary trocars are placed. The dissection is extended to expose the arcus tendineus fascia pelvis (ATFP) bilaterally. Several permanent sutures are passed along the anterior lateral vaginal sulcus (on each side) through the pubocervical fascia. These sutures are then brought through the obturator internus muscle, just above the ATFP, along its full length from the underside of the pubic symphysis down to the ischial spine. This is performed bilaterally. Then, guided by a retractor or instrument placed within the vaginal cavity, all sutures are tied sequentially with intra corporeal or extra corporeal knot tying techniques to obliterate the defect. Trocars are removed under direct vision and fascia closed. Skin wounds are reapproximated.

Description of Post-Service Work: Following the procedure, the physician writes orders for post-operative care, accompanies the patient to the recovery room, and talks with the patient's family. The patient is then evaluated in the recovery room. The physician dictates the operative procedure and makes periodic checks on the patient's condition. Any drainage catheters are normally removed when the patient is ambulatory and she is monitored for normal voiding. The physician visits the patient in the hospital for 2 days. The patient is discharged on post op day 3 with instructions for follow-up care. The patient is reevaluated twice post operatively.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The American College of Obstetricians and Gynecologists (ACOG), in collaboration with the American Urogynecologic Society (AUGS) and the American Association of Gynecologic Laparoscopists (AAGL), disseminated the RUC survey to a targeted mailing list of 1200 members. Thirty-five surveys were submitted electronically. ACOG staff summarized the data. A panel of physicians from ACOG, AUGS and AAGL reviewed the results and drafted final recommendations.

The panel recommends acceptance of 16.00 RVWs .

The panel took these steps in reaching their conclusion:

1) Reviewed the results of the survery
2) Determined an IWPUT based on the recommended RVW
3) Compared the recommended RVW and IWPUT to the reference service code and other laparoscopic hysterectomy codes.

Review of Survey Results

The panel felt the survey respondents fairly estimated the intra-service time at 150 minutes. Pre-service positioning and scrub time may have been slightly overestimated by 5and 10 minutes respectively. The pre-services have been standardized throughout the new/revised codes to provide consistency among them. Additionally, the panel is of the opinion that the post-operative office visits were overstated by the respondents by (1) level two visit. Sixty-one minutes were deducted from the total survey time.

	Surveyed time	Consensus panel recommendation
Pre-service position	15	10
Pre-service scrub	15	5
Office Visits	62	46
TTL	92	31

It was the consensus of the panel that the median RVW value of 16.0 was in line with the other laparoscopic gynecology codes. The new code 5742X has 30 additional intra-service minutes than the reference service code 58543, *Laparoscopy, surgical, supracervical hysterectomy, for uterus greater than 250 g*; which has a RVW of 16.74.

IWPUT Calculation – *ACOG/AUGS/AAGL used the standard RUC method for calculation the IWPUT*

Hospital visit 99231x 1 (0.64)		0.64
Hospital visit 99232x1 (1.06)		1.06

Total pre- & post- RVW		6.7645
Recommended RVW		16.0
Intra-RVW		9.2355
Intra-service time		150 minutes
IWPUT		**0.062**

A comparison of the paravaginal defect repair and reference service codes has been provided in Addendum A Excel spreadsheet.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☒ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☒ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) Unlisted

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Ob/Gyn, Urogynecologists, Gynecologic laparoscopists How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 1000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate.

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 600
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States?

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/Specialty Society Update Process
PERC Summary of Recommendation
010 or 090 Day Global Periods
Facility Direct Inputs

CPT Long Descriptor:
▲**57284**, Paravaginal defect repair (including repair of cystocele, if performed); open abdominal approach

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

ACOG developed practiced expense recommendations for ▲57284 using a consensus panel format. ACOG's members familiar with practice expense participated in this process through emails. Members of ACOG's Committee on Coding and Nomenclature finalized the recommendations through emails.

Please describe the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

No changes were made to the standard pre-service times. A total of 60 minutes has been applied for the pre-service clinical labor activities. During the pre-service period, clinical staff conducts the standard pre-service activities: An RN/LPN/MA (CMS Labor Supply code L037D) completes pre-service diagnostic and referral forms, coordinates pre-surgery services schedules space and equipment in facility, provides pre-service education/obtains consent, and conducts follow-up phone calls.

Intra-Service Clinical Labor Activities:

The standard 12 minutes are applied for this inpatient procedure for discharge day management services.

Post-Service Clinical Labor Activities:

The procedure has (1) level two and (1) level three office visits. The standard times for a level two and level three office visits were used; 27 and 36 minutes respectively. A total of 63 minutes has been applied for post-service clinical labor activities time.

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

April 2007

Laparoscopic Total Hysterectomy

The CPT Editorial Panel created four new procedure codes to accurately reflect a total hysterectomy in which both the uterine cervix and body are completely detached from their surrounding support structures via a laparoscopic approach, and in which the vaginal cuff is sutured via a laparoscopic approach. Thus, with the exception of simply retrieving the specimen through the vagina, the entire procedure is performed laparoscopically.

Current codes reflect a procedure in which the attachments of the uterine body are secured laparoscopically and then the cervical attachments are secured via a vaginal route; both a laparoscopic and vaginal surgical approach are required for these procedures. The proposed codes describe accomplishing the complete detachment of the entire uterus and cervix via a laparoscopic approach. A vaginal approach is used only to retrieve the specimen. The vagina is closed via laparoscopic suturing techniques.

1361

In February 2007, the RUC's Research Subcommittee had agreed that the two proposed base codes, 58570 *Laparoscopy, surgical, with total hysterectomy for uterus 250 grams or less* and 58572 *Laparoscopy, surgical, with total hysterectomy for uterus greater than 250 grams* be surveyed utilizing a standard RUC survey instrument and an incremental add-on approach be used to develop RVU recommendations for the subsequent two codes in the family which both include the removal of tube(s) and/or ovary(s). These two subsequent codes are: 58571 *Laparoscopy, surgical, with total hysterectomy for uterus 250 grams or less; with removal of tubes and/or ovary(s)*, 58573 *Laparoscopy, surgical, with total hysterectomy for uterus greater than 250 grams; with removal of tubes and/or ovary(s)*

58570 and 58572
The RUC reviewed the specialty society's survey results and key reference codes in order to provide proper rank order among the hysterectomy procedures. The RUC believed the survey results for new codes 58570 and 58572, of over 60 obstetrics and gynecologic physicians, represented the typical physician work involved with these new procedures. The RUC reviewed the specialty's key reference codes; 58550 *Laparoscopy, surgical, with vaginal hysterectomy, for uterus 250 g or less;* (work RVU = 14.97)
58552 *Laparoscopy, surgical, with vaginal hysterectomy, for uterus 250 g or less; with removal of tube(s) and/or ovary(s)* (work RVU = 16.78), and concurred that the specialty survey results provided the proper relative physician work value for codes 58570 and 58572. The agreed that the incremental difference between a vaginal approach and a total hysterectomy for a large uterus was less apparent than

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association

that with a smaller uterus. The RUC considered the vaginal approach for a smaller uterus less overall work than the abdominal laproscopic approach.. The survey results in the intra-service period supported this relationship, where code 58570 has 20 additional minutes of intra-service time than 58550 and code 58571 has 15 more minutes of intra-service time than 58552. **The RUC recommends a relative physician work value of 15.75 for 58570 and 17.56 for 58572.**

58571 and 58573

Based on the agreed RUC Research Subcommittee methodology, the RUC added the incremental difference between 58550 and 58552 of 1.81 to arrive at a recommendation of (14.97 +1.81) 17.56 for 58571. In addition, the RUC added the incremental difference between codes; 58553 *Laparoscopy, surgical, with vaginal hysterectomy, for uterus greater than 250 g;* (work RVU = 19.96) 58554 *Laparoscopy, surgical, with vaginal hysterectomy, for uterus greater than 250 g; with removal of tube(s) and/or ovary(s)* (work RVU = 22.98) of 3.02 to 58572 (19.96 + 3.02) to arrive at 22.98 work RVUs for code 58573. The RUC and specialty concurred on that the physician work for codes 58571 and 58573 was identical codes 58553 and 58554 respectively. **The RUC recommends a physician work relative value for CPT code 58571 of 19.96 and 22.98 for 58573.**

Physician Time Components

Physician time components for codes 58571 and 58572 where derived by maintaining the same pre and post service work throughout the new family of codes and by adding an additional 15 minutes of intra-service work time for codes 58571 and 58573 above the surveyed time of 58570 and 58572 respectively.

1362

The specialty also standardized the physician time components from its survey results similar to other Obstetrics and Gynecological surgical procedures. The specialty standardized the pre-service time for evaluation to be 45 minutes, positioning 10 minutes, and scrub dress and wait 5 minutes. In addition, the procedures each were standardized to have two level three and one level two post operative office visits. The RUC agreed with these reductions in physician time from the survey results. **The RUC recommends the following physician time components for 58570-58573.**

CPT Code	Pre-Evaluation	Pre Position	Pre-Srub, Dress, wait	Intra-Service	Immediate Post Time	99232	99231	99238	99212	99213	Total Time
58570	45	10	5	120	30	1	1	38	1	2	370
58571	45	10	5	135	30	1	1	38	1	2	385
58572	45	10	5	150	30	1	1	38	1	2	400
58573	45	10	5	165	30	1	1	38	1	2	415

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association

New Technology: The RUC recommends this family of codes to be added to the new technology list. (Codes 58570, 58571, 58572, 58573)

Practice Expense

The RUC recommends no direct practice expense inputs in the non-facility setting for these facility only services. A practice expense spreadsheet is attached with recommendations for clinical labor staff time associated with typical facility service based on the 90 day global RUC standards.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
●58570	PP1	Laparoscopy, surgical, with total hysterectomy, for uterus 250 g or less;	090	15.75

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:58570 Tracking Number PP1 Specialty Society Recommended RVU: **15.75**
Global Period: 090 RUC Recommended RVU: **15.75**

CPT Descriptor: Laparoscopy, surgical, with total hysterectomy, for uterus 250 grams or less;

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 35 year-old G3P0 female has persistent cervical dysplasia. On physical examination she has an immobile, normal-sized uterus, and desires definitive therapy. She wishes to retain her ovaries. A total laparoscopic hysterectomy (TLH) is recommended without removal of the adnexae.

Percentage of Survey Respondents who found Vignette to be Typical: 92%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? .08%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: Pre-service work includes taking a comprehensive history and performing a comprehensive examination to determine the patient's current medical status; reviewing indications for the procedure and its appropriateness; obtain Informed consent; admit the patient to the hospital; prepare the hospital records and chart in accordance with hospital policy; check on the patient, and review labs, x-rays and records prior to the surgery; physician scrubs for procedure, and waits for anesthesia induction and the preparation of the patient.

Description of Intra-Service Work: General anesthesia is induced, the patient is placed in the dorsal lithotomy position, and a surgical prep of the vagina and abdomen is performed. A foley catheter is placed transurethrally and a uterine manipulator is placed transcervically. Laparoscopy is performed through an umbilical camera port and second, third, and sometimes fourth incisions for accessory ports. The course of the ureters are identified transperitoneally or retroperitoneally, if needed. The bladder peritoneum is opened and the bladder is dissected off of the lower uterine segment. The utero-ovarian ligament and attachments of the uterus are then sequentially coagulated or ligated and then transected. The uterine arteries are skeletonized and control of this vasculature is obtained. An occluding device is placed within the vagina in order to preclude the escape of pneumoperitoneum, and anterior and posterior colpotomy incisions are performed. The uterus and cervix are removed through the vagina. Once the specimen has been completely removed, the occluding device is re-inserted, and the abdominal cavity is then re-inflated. Laparoscopic suture closure of the vaginal cuff is performed. Hemostasis is confirmed, the abdomen is deflated, and the instruments and trocars are removed. The trocar sites are closed with suture at the level of both the fascia and the skin.

Description of Post-Service Work: Post-service work includes monitoring the patient's stability in the recovery room; writing orders and dictating an operative report; communicating with the patient, family and other health care professionals (including wirtten and oral reports and orders); hospital visits to assees patient's status; removal of packs, drains, catheters, sutures, staples. Discharge management includes the physician's final examination of the patient, review of laboratory reports, instructions for continuing care, and preparation of the discharge records. In addition, three office visits are included in the global period.

Pre-Service intensity/complexity	3.56	3.36
Intra-Service intensity/complexity	4.64	3.84
Post-Service intensity/complexity	3.16	3.08

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The American College of Obstetricians and Gynecologists (ACOG), in collaboration with the American Association of Gynecologic Laparoscopists (AAGL), disseminated the RUC survey to a targeted list of 500 members. Sixty-one surveys were submitted electronically. ACOG staff summarized the data. A panel of physicians from ACOG and AAGL reviewed the results and drafted final recommendations.

The panel recommends acceptance of 15.75 RVWs .

The panel took these steps in reaching their conclusion:

1) Reviewed the results of the survery
2) Determined an IWPUT based on the recommended RVW
3) Compared the recommended RVW and IWPUT to the reference service code and other laparoscopic hysterectomy codes.

Review of Survey Results

The panel felt the survey respondents fairly estimated the intra-service time at 120 minutes. Pre-service positioning and scrub time may have been slightly overestimated by 5 minutes each. The pre-service times have been standardized throughout the new codes to provide consistency among them. Ten minutes were deducted from the total survey time.

	Surveyed time	Consensus panel recommendation
Pre-service position	15	10
Pre-service scrub	10	5
TTL	25	15

It was the consensus of the panel that the median RVW value of 15.75 was in line with the other laparoscopic hysterectomy codes. Code 58570 has 20 additional intra-service minutes than 58550, *Laparoscopy, surgical, with vaginal hysterectomy, for uterus 250 g or less*; which has an RVW of 14.97. Code 58570 has 25 additional intra-service minutes compared to 58541, *Laparoscopy, surgical, supracervical hysterectomy, for uterus 250 g or less;* which has an RVW of 14.57. A comparison of the laparoscopic hysterectomy codes has been provided in Addendum A Excel spreadsheet.

IWPUT Calculation – *ACOG/AAGL used the standard RUC method for calculation the IWPUT*

Hospital visit 99231x 1 (.64)		0.64
Hospital visit 99232x1 (1.06)		1.06
Discharge 99238		1.28

Office visit 99213 x 2 (.92)		1.84
Pre-service, day prior (0.0224 x 30 min)		0.672
Pre-service, same day (0.0224 x 25 min)		0.56
Scrub, dress, wait (0.0081 x 5 min)		0.0405
Post service (0.0224 x 30 min)	+	0.672
Total pre- & post- RVW		7.2145
Recommended RVW		15.75
Intra-RVW		8.5355
Intra-service time		120 minutes
IWPUT		**0.071**

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 58550

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Ob/Gyn & Gynecologic Laparoscopist, Gynecologists — How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 3000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate.

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:58571 Tracking Number PP2 Specialty Society Recommended RVU: **17.56**
Global Period: 090 RUC Recommended RVU: **17.56**

CPT Descriptor: Laparoscopy, surgical, with total hysterectomy, for uterus 250 grams or less; with removal of tube(s) and/or ovary(s)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 45 year-old G3P3 female with chronic, anovulatory bleeding is evaluated for profound menorrhagia with anemia despite medical therapies. On physical examination she has a mobile, normal-sized uterus. The patient has a strong family history for malignancy and elects to have both her cervix and ovaries removed. A total laparoscopic hysterectomy (TLH) with bilateral salpingo-oophorectomy is recommended.

Percentage of Survey Respondents who found Vignette to be Typical: 0%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: Pre-service work includes taking a comprehensive history and performing a comprehensive examination to determine the patient's current medical status; reviewing indications for the procedure and its appropriateness; obtain Informed consent; admit the patient to the hospital; prepare the hospital records and chart in accordance with hospital policy; check on the patient, and review labs, x-rays and records prior to the surgery; physician scrubs for procedure, and waits for anesthesia induction and the preparation of the patient.

Description of Intra-Service Work: General anesthesia is induced, the patient is placed in the dorsal lithotomy position, and a surgical prep of the vagina and abdomen is performed. A foley catheter is placed transurethrally and a uterine manipulator is placed transcervically. Laparoscopy is performed through an umbilical camera port and second, third, and sometimes fourth incisions for accessory ports. The course of the ureters are identified transperitoneally or retroperitoneally, if needed. The bladder peritoneum is opened and the bladder is dissected off of the lower uterine segment. The location and course of the ureters are identified and the leaves of the broad ligament opened. The vasculature of the infundibulopelvic ligament is isolated, secured, and transected. The attachments of the uterus are then sequentially coagulated or ligated and then transected. An occluding device is placed within the vagina in order to preclude the escape of pneumoperitoneum, and anterior and posterior colpotomy incisions are performed. The patient is placed in the high lithotomy position and the surgeon removes the occluding device from the vagina, the pneumoperitoneum is allowed to escape, and the uterus and cervix are removed through the vagina. Once the specimen has been completely removed, the occluding device is re-inserted, and the abdominal cavity is then re-inflated. Laparoscopic suture closure of the vaginal cuff is performed. Hemostasis is confirmed, the abdomen is deflated, and the instruments and trocars are removed. The trocar sites are closed with suture at the level of both the fascia and the skin.

Description of Post-Service Work: Post-service work includes monitoring the patient's stability in the recovery room; writing orders and dictating an operative report; communicating with the patient, family and other health care professionals (including wirtten and oral reports and orders); hospital visits to assees patient's status; removal of packs, drains, catheters, sutures, staples. Discharge management includes the physician's final examination of the patient, review of laboratory reports, instructions for continuing care, and preparation of the discharge records. In addition, three office visits are included in the global period.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The American College of Obstetricians and Gynecologists (ACOG), in collaboration with the American Association of Gynecologic Laparoscopists (AAGL), reviewed the survey data of 58570 and developed a recommendation for 58571 based off of those data. As requested and agreed upon at the February 2007 RUC Research Subcommittee, the building block method was utilized using an incremental add-on approach in the valuation of this code. This method was utilized because of inconsistencies experienced in RVW values previously, when surveying the laparoscopic vaginal hysterectomy codes (LAVH) and the laparoscopic supracervical hysterectomy codes (LSH). The inconsistencies existed in the survey respondents recommended RVW values between the procedures with the *removal of tube(s) and/or ovary(s)* and those procedures where the tube(s) and/or ovary(s) were not removed.

The panel recommends acceptance of 17.56 RVWs .

The panel took these steps in reaching their conclusion:

1) Calculated the differences in RVW values between the LAVH codes (58550-58554) and the LSH codes (58541-58554) valued with and without the removal of tube(s) and/or ovary(s.
2) Calculated the differences between the intra-service times between the codes with and without the removal tube(s) and/or ovary(s).
3) Reviewed the relationship between the IWPUT in both families of laparoscopic hysterectomy codes (LAVH, LSH).
4) Developed a recommended RVW for 58571.

Review of Survey Results

After reviewing the differences in RVW values between the LAVH and LSH hysterectomy codes, the panel agreed on an increment of 1.81 RVW for the removal of tube(s) and ovary(s) for 58571. This value is the RVW increase between 58550 and 58552 (1.81RVW), and very close in value to 58541 and 58542 (1.86RVW). Therefore, based on the recommended median RVW for 58571 of 15.75, the panel recommends an RVW of 17.54 for code 58571 (15.75 + 1.81 = 17.56).

After calculating the differences in the intra-service times between the two established families of laparoscopic hysterectomy codes (LAVH and LSH), a conservative increment of 15 minutes was agreed upon by the panel.

Therefore, based on the intra-service time of 120 minutes for 58570, the panel recommends an intra-service time of 135 minutes for 58571.

The IWPUTs were reviewed between the new codes 58570, 58571, 58572 and 58573 after the valuation of these codes. The incremental increase of 1.81RVW and 15 additional minutes followed similar increases in IWPUTs between the LAVH and the LSH codes. Please refer to Addendum A Excel spreadsheet "Comparison of Laparoscopic Hysterectomy Procedures".

IWPUT Calculation – *ACOG/AAGL used the standard RUC method for calculation the IWPUT*

Hospital visit 99231x 1 (.64)		0.64

Global Period: 090 RUC Recommended RVU: **19.96**

CPT Descriptor: Laparoscopy, surgical, with total hysterectomy, for uterus greater than 250g;

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 32 year-old G32P2 female is evaluated for symptoms of dyspareunia and dysmenorrhea. On physical examination, she has an enlarged, but mobile, 14-week sized, enlarged uterus which is tender and consistent with an adenomyotic uterus. The patient elects a hysterectomy but wishes to retain her ovaries. A total laparoscopic hysterectomy (TLH) without removal of the adnexae is recommended.

Percentage of Survey Respondents who found Vignette to be Typical: 94%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 4%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: Pre-service work includes taking a comprehensive history and performing a comprehensive examination to determine the patient's current medical status; reviewing indications for the procedure and its appropriateness; obtain Informed consent; admit the patient to the hospital; prepare the hospital records and chart in accordance with hospital policy; check on the patient, and review labs, x-rays and records prior to the surgery; physician scrubs for procedure, and waits for anesthesia induction and the preparation of the patient.

Description of Intra-Service Work: General anesthesia is induced, the patient is placed in the dorsal lithotomy position, and a surgical prep of the vagina and abdomen is performed. A foley catheter is placed transurethrally and a uterine manipulator is placed transcervically. Laparoscopy is performed through an umbilical camera port and second, third, and sometimes fourth incisions for accessory ports. The course of the ureters are identified transperitoneally or retroperitoneally, if needed. The bladder peritoneum is opened and the bladder is dissected off of the lower uterine segment. The utero-ovarian ligament and attachments of the uterus are then sequentially coagulated or ligated and then transected. If necessary, the uterine fundus may be debulked using a laparoscopic morcellator for benign disease, and, at times, the retroperitoneal spaces must be opened in order to identify the ureter. The uterine arteries are skeletonized and control of this vasculature is obtained. An occluding device is placed within the vagina in order to preclude the escape of pneumoperitoneum, and anterior and posterior colpotomy incisions are performed. The uterus and cervix are removed through the vagina. At times, vaginal morcellation of the specimen is necessary in order to accomplish removal. Once the specimen has been completely removed, the occluding device is re-inserted, and the abdominal cavity is then re-inflated. Laparoscopic suture closure of the vaginal cuff is performed. Hemostasis is confirmed, the abdomen is deflated, and the instruments and trocars are removed. The trocar sites are closed with suture at the level of both the fascia and the skin.

Description of Post-Service Work: Post-service work includes monitoring the patient's stability in the recovery room; writing orders and dictating an operative report; communicating with the patient, family and other health care professionals (including wirtten and oral reports and orders); hospital visits to assees patient's status; removal of packs, drains, catheters, sutures, staples. Discharge management includes the physician's final examination of the patient, review of laboratory reports, instructions for continuing care, and preparation of the discharge records. In addition, two office visits are included in the global period.

Pre-Service intensity/complexity	3.71	3.39
Intra-Service intensity/complexity	4.57	4.02
Post-Service intensity/complexity	3.18	3.10

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The American College of Obstetricians and Gynecologists (ACOG), in collaboration with the American Association of Gynecologic Laparoscopists (AAGL), disseminated the RUC survey to a targeted mailing list of 500 members. One hundred and one surveys were submitted electronically. ACOG staff summarized the data. A panel of physicians from ACOG and AAGL reviewed the results and drafted final recommendations.

The panel recommends acceptance of 19.96 RVWs .

The panel took these steps in reaching their conclusion:

1) Reviewed the results of the survery
2) Determined an IWPUT based on the recommended RVW
3) Compared the recommended RVW and IWPUT to the reference service code and other laparoscopic hysterectomy codes.

Review of Survey Results

The panel felt the survey respondents fairly estimated the intra-service time at 150 minutes. Pre-service positioning and scrub time may have been slightly overestimated by 5 minutes and 10 minutes respectively. The pre-services have been standardized throughout the new codes to provide consistency among them. Fifteen minutes were deducted from the total survey time.

	Surveyed time	Consensus panel recommendation
Pre-service position	15	10
Pre-service scrub	15	5
TTL	30	15

It was the consensus of the panel that the RVW value of 19.96 was consistent with 58553. The new code 58572 has the same intra-service time as 58553, *Laparoscopy, surgical, with vaginal hysterectomy, for uterus greater than 250*, which has an RVW of 19.96. Therefore, the panel agreed on the same RVW value as 58553, instead of the median RVW of 20.02. A comparison of the laparoscopic hysterectomy codes has been provided in Addendum A Excel spreadsheet.

IWPUT Calculation – *ACOG/AAGL used the standard RUC method for calculation the IWPUT*

Hospital visit 99231x 1 (.64)		0.64
Hospital visit 99232x 1 (1.06)		1.06
Discharge 99238		1.28
Office visit 99212x1 (.45)		0.45
Office visit 99213 x 2 (.92)		1.84
Pre-service, day prior (0.0224 x 30 min)		0.672
Pre-service, same day (0.0224 x 25 min)		0.56
Scrub, dress, wait (0.0081 x 5 min)		0.0405
Post service (0.0224 x 30 min)	+	0.672
Total pre- & post- RVW		7.214
Recommended RVW		19.96
Intra-RVW		12.746
Intra-service time		150 minutes
IWPUT		**0.085**

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 58553

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Ob/Gyn & Gynecologic Laparoscopists How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 750

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate.

Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 75
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate.

Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%

Do many physicians perform this service across the United States?

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:58573 Tracking Number PP4 Specialty Society Recommended RVU: **22.98**
Global Period: 090 RUC Recommended RVU: **22.98**

CPT Descriptor: Laparoscopy, surgical, with total hysterectomy, for uterus greater than 250 grams; with removal of tube(s) and/or ovary(s)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 46 year-old G32P2 female is evaluated for profound menorrhagia with anemia despite daily medical therapy. On physical examination, she has an irregular, mobile, 14-week sized, leiomyomatous uterus. The patient elects a hysterectomy and wishes to have her ovaries removed. A total laparoscopic hysterectomy (TLH) with bilateral salpingo-oophorectomy is recommended.

Percentage of Survey Respondents who found Vignette to be Typical: 0%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: Pre-service work includes taking a comprehensive history and performing a comprehensive examination to determine the patient's current medical status; reviewing indications for the procedure and its appropriateness; obtain Informed consent; admit the patient to the hospital; prepare the hospital records and chart in accordance with hospital policy; check on the patient, and review labs, x-rays and records prior to the surgery; physician scrubs for procedure, and waits for anesthesia induction and the preparation of the patient.

Description of Intra-Service Work: General anesthesia is induced, the patient is placed in the dorsal lithotomy position, and a surgical prep of the vagina and abdomen is performed. A foley catheter is placed transurethrally and a uterine manipulator is placed transcervically. Laparoscopy is performed through an umbilical camera port and second, third, and sometimes fourth incisions for accessory ports. The course of the ureters are identified transperitoneally or retroperitoneally, if needed. The bladder peritoneum is opened and the bladder is dissected off of the lower uterine segment. If necessary, the uterine fundus may be debulked using a laparoscopic morcellator for benign disease, and, at times, the retroperitoneal spaces must be opened in order to identify the ureter. The vasculature of the infundibulopelvic ligament is isolated, secured, and transected. The attachments of the uterus are then sequentially coagulated or ligated and then transected. If necessary, steps may be taken to debulk the size of the uterus in order to safely continue to dissect the uterine attachments. The uterine arteries are skeletonized and control of this vasculature is obtained. An occluding device is placed within the vagina in order to preclude the escape of pneumoperitoneum, and anterior and posterior colpotomy incisions are performed. The uterus and cervix are removed through the vagina. At times, vaginal morcellation of the specimen is necessary in order to accomplish removal. Once the specimen has been completely removed, the occluding device is re-inserted, and the abdominal cavity is then re-inflated. Laparoscopic suture closure of the vaginal cuff is performed. Hemostasis is confirmed, the abdomen is deflated, and the instruments and trocars are removed. The trocar sites are closed with suture at the level of both the fascia and the skin.

Description of Post-Service Work: Post-service work includes monitoring the patient's stability in the recovery room; writing orders and dictating an operative report; communicating with the patient, family and other health care professionals (including wirtten and oral reports and orders); hospital visits to assees patient's status; removal of packs, drains, catheters, sutures, staples. Discharge management includes the physician's final examination of the patient, review of laboratory reports, instructions for continuing care, and preparation of the discharge records. In addition, two office visits are included in the global period.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The American College of Obstetricians and Gynecologists (ACOG), in collaboration with the American Association of Gynecologic Laparoscopists (AAGL), reviewed the survey data of 58573 and developed a recommendation for 58573 based off of those data. As requested and agreed upon at the February 2007 RUC Research Subcommittee, the building block method was utilized using an incremental add-on approach in the valuation of this code. This method was utilized because of inconsistencies experienced in RVW values previously when surveying the laparoscopic vaginal hysterectomy codes (LAVH) and the laparoscopic supracervical hysterectomy codes (LSH). The inconsistencies existed in the survey respondents recommended RVW values between the procedures with the *removal of tube(s) and/or ovary(s)* and those procedures where the tube(s) and/or ovary(s) were not removed.

The panel recommends acceptance of 22.98 RVWs .

The panel took these steps in reaching their conclusion:

1) Calculated the differences in RVW values between the LAVH codes (58550-58554) and the LSH codes (58541-58554) valued with and without the removal of tube(s) and/or ovary(s).
2) Calculated the differences between the intra-service times between the codes with and without the removal tube(s) and/or ovary(s).
3) Reviewed the relationship between the IWPUT in both families of laparoscopic hysterectomy codes (LAVH, LSH).
4) Developed a recommended RVW for 585XX4.

Review of Survey Results

After reviewing the differences in RVW values between the LAVH, LSH and the vaginal hysterectomy codes, the panel agreed on an increment of 3.02 RVW for the removal of tube(s) and ovary(s). This is the RVW increase between 58553 and 58554. Therefore, based on the recommended median RVW for 58573 of 19.96, the panel recommends an RVW of 22.98 for code 58572 (19.96 + 3.02 = 22.98).

After calculating the differences between the intra-service times between the two established families of laparoscopic hysterectomy codes (LAVH and LSH), a conservative increment of 15 minutes was agreed upon by the panel. Therefore, based on the intra-service time of 150 minutes for 58572, the panel recommends an intra-service time of 165 minutes for 58573.

The IWPUTs were reviewed between the new codes 58570, 58571, 58572 and 58573 after the valuation of these codes. The incremental increases of 3.02RVW and 15 additional minutes followed similar increases in IWPUTs between the LAVH and the LSH codes. Please refer to the Addendum A Excel spreadsheet "Comparison of Laparoscopic Hysterectomy Procedures".

IWPUT Calculation – *ACOG/AAGL used the standard RUC method for calculation the IWPUT*

Hospital visit 99231x 1 (.64)		0.64

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 58554

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Ob/Gyn, Gynecologic Laparoscopists, Gynecologists How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 1250
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate.

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 100
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate.

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States?

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

Addendum A (Additional Rationale)
585XX1, 585XX2, 585XX3, 585XX4

AMA/Specialty Society Update Process
PERC Summary of Recommendation
010 or 090 Day Global Periods
Facility Direct Inputs

CPT Long Descriptor:
58570, Laparoscopy, surgical, with total hysterectomy, for uterus 250 grams or less;

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

ACOG developed practiced expense recommendations for 58570 using a consensus panel format. ACOG's members familiar with practice expense participated in this process through emails. Members of ACOG's Committee on Coding and Nomenclature finalized the recommendations through emails.

Please describe the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

No changes were made to the standard pre-service times. A total of 60 minutes has been applied for the pre-service clinical labor activities. During the pre-service period, clinical staff conducts the standard pre-service activities: An RN/LPN/MA (CMS Labor Supply code L037D) completes pre-service diagnostic and referral forms, coordinates pre-surgery services schedules space and equipment in facility, provides pre-service education/obtains consent, and conducts follow-up phone calls.

Intra-Service Clinical Labor Activities:

The standard 12 minutes are applied for this inpatient procedure for discharge day management services.

Post-Service Clinical Labor Activities:

The procedure has (1) level two and (2) level three office visits. The standard times for a level two and level three office visit were used, 27 and 36 minutes respectively. A total of 99 minutes has been applied for post-service clinical labor activities time.

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

February 2007

Vitrectomy with Epiretinal Membrane Stripping

CPT code 67038, *Vitrectomy, mechanical, pars plana approach; with epiretinal membrane stripping*, was identified by CMS in 2005 as a potentially mis-valued service and placed in the Five-Year Review. The code was referred to CPT for refinement because the code was being used to report several dinstinct procedures which had evolved over the past decade for treatment of retinal-vitreal disease. The CPT Editorial Panel deleted code 67038 and created four new codes to describe the work performed in code 67038. The new codes are:

1401

- Code 67041, V*itrectomy, mechanical, pars plana approach; with removal of preretinal cellular membrane (eg, macular pucker)*, which describes vitrectomy surgery to remove a cellular membrane from the anterior surface of the macula (center of the retina), e.g. macular pucker.
- Code 67042, *Vitrectomy, mechanical, pars plana approach; with removal of internal limiting membrane of retina (eg, for repair of macular hole, diabetic macular edema), includes, if performed, intraocular tamponade (ie, air, gas or silicone oil)*, which describes vitrectomy with removal of the internal limiting membrane (non-cellular, very adherent and microscopically thin) from the surface of the macula requiring greater time and skill and with considerable risk of damaging the macula. This procedure is performed for the repair of macular holes and for treatment of diabetic macular edema. This service may include the injection of therapeutic intraocular gas for macular hole repair.
- Code 67043, V*itrectomy, mechanical, pars plana approach; with removal of subretinal membrane (eg, choroidal neovascularization), includes, if performed, intraocular tamponade (ie, air, gas or silicone oil) and laser photocoagulation*, which describes vitrectomy for the repair of complex retinal detachment combined with code 67108. The typical patient has proliferative vitreoretinopathy or diabetic traction producing a retinal detachment, which may be performed for management of a giant retinal tear.
- Code 67113 *Repair of complex retinal detachment (eg, proliferative vitreoretinopathy, stage C-1 or greater, diabetic traction retinal detachment, retinopathy of prematurity, retinal tear of > 90 degrees), with vitrectomy and membrane peeling, may include air, gas or silicone oil tamponade, cryotherapy, endolaser photocoagulation, drainage of subretinal fluid, scleral buckling, and/or removal of lens*, which describes vitrectomy with the removal of a neovascular membrane from the subretinal space. The procedure requires a vitrectomy and a retinotomy. Currently no single CPT procedure accurately describes the

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

surgical repair of complex retinal detachment using this technique, so surgeons used codes 67038, (work RVU = 23.30) and 67108, *Repair of retinal detachment; with vitrectomy, any method, with or without air or gas tamponade, focal endolaser photocoagulation, cryotherapy, drainage of subretinal fluid, scleral buckling, and/or removal of lens by same technique* (work RVU = 22.49). CMS has expressed concern that the combination of the retinal detachment repair and vitrectomy codes resulted, even with a multiple procedure modifier, in a total work RVU that was overvalued.

The RUC considered new code 67041 and discussed the survey results in comparison with the key reference service code, 67108, *Repair of retinal detachment; with vitrectomy, any method, with or without air or gas tamponade, focal endolaser photocoagulation, cryotherapy, drainage of subretinal fluid, scleral buckling, and/or removal of lens by same technique*, (work RVU = 22.49, pre-service time = 65, intra-service time = 191, post-service time = 34). The reference service code has a significantly higher intra-service time as compared to the surveyed code, 191 minutes and 62.50 minutes, respectively. While the physician time differed, the RUC agreed that although the reference code has more time than the surveyed code, both codes have similar mental effort and judgment, identical psychological stress and increased technical skill and physical effort of the surveyed code made it a suitable reference service. Due to the difference in total time, the RUC agreed with the specialty society recommendation of 19.00 work RVUs. The RUC considered an additional reference service, 67218, *Destruction of localized lesion of retina (eg, macular edema, tumors), one or more sessions; radiation by implantation of source (includes removal of source)* (work RVU = 20.22, intra-service time = 60 minutes). Additionally, the recommendation maintains appropriate rank order within the family of services. **The RUC recommends a work RVU of 19.00 pre-service time of 35 minutes, intra-service time of 62.50 minutes, and post-service time of 17.50 minutes for code 67041.**

1402

The RUC discussed new code 67042 and reviewed the survey results in comparison with the key reference service code, 67108 *Repair of retinal detachment; with vitrectomy, any method, with or without air or gas tamponade, focal endolaser photocoagulation, cryotherapy, drainage of subretinal fluid, scleral buckling, and/or removal of lens by same technique*, (work RVU = 22.49, pre-service time = 65, intra-service time = 191, post-service time = 34). The key reference service has significantly higher intra-service time than 67042 survey results, 191 minutes and 85 minutes, respectively. However, the reference service code requires less technical skill, physical effort, and psychological stress. The RUC also noted that the use of vitreous substitute results in a 30 to 40 percent incidence of post-operative elevated intraocular pressure requiring treatment with topical and systemic medications, and in some instances code 65805, *Paracentesis of anterior chamber of eye (separate procedure); with therapeutic release of aqueous* (work RVU = 1.91) or code 67015, *Aspiration or release of vitreous, subretinal or choroidal fluid, pars plana approach (posterior sclerotomy)* (work RVU = 7.00) are required. Neither of these procedures related to the initial surgery, which are performed in the office and would be billable during the global period, but both have significant physician work associated with them. The reference service work RVU of 22.49 is significantly higher than the surveyed median, therefore the RUC agreed that the 25th percentile of the survey results was appropriate. **The RUC recommends a work RVU of 22.13, pre-service time of 35, intra-service time of 85, and post-service time of 15 for code 67042.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The RUC considered new code 67043 and discussed the survey results in comparison with the key reference service code, 67108 *Repair of retinal detachment; with vitrectomy, any method, with or without air or gas tamponade, focal endolaser photocoagulation, cryotherapy, drainage of subretinal fluid, scleral buckling, and/or removal of lens by same technique*, (work RVU = 22.49, pre-service time = 65, intra-service time = 191, post-service time = 34). The key reference service has contains more intra-service time than the surveyed code, 191 minutes and 90 minutes, respectively. However, because of the patient expectation of perfect vision, the surveyed code requires greater mental effort and judgment, technical skill, psychological stress, and intensity and complexity. The RUC agreed that the 25th percentile of the survey results was too low. Because the service is more complex and contains one additional post-operative visit than 67042, which also relied on 67108 as the key reference service, the RUC added 0.94 RVUs to the survey median, commensurate with one 99213, to account for additional work and to maintain rank order within the family. **The RUC recommends a work RVU of 22.94, pre-service time of 35, intra-service time of 90, and post-service time of 20 for code 67043.**

The RUC discussed new code 67113 and reviewed the survey results in comparison with the key reference service code, 67108 *Repair of retinal detachment; with vitrectomy, any method, with or without air or gas tamponade, focal endolaser photocoagulation, cryotherapy, drainage of subretinal fluid, scleral buckling, and/or removal of lens by same technique*, (work RVU = 22.49, pre-service time = 65, intra-service time = 191, post-service time = 34). This service is the most complex of the four codes in the series of vitrectomy procedures and is performed only by fellowship trained retina surgeons. Code 67113 combines pars plana vitrectomy with a number of other surgical procedures that may include scleral buckling, dissection of periretinal scar tissue, retinal repositioning, retinopexy with laser or cryopexy, cataract extraction and installation of a vitreous substitute, either an expansible gas or silicon oil. The survey found a median wRVU of 27.00 and a 25th percentile of 25.00. The median intra-service time was 130 minutes. All of the intensity complexity measures were higher than to perform this procedure than the surveyed reference code. The need for retinal tamponade with a vitreous substitute results in a 30% incidence of elevated intraocular pressure requiring treatment with topical and systemic medications or in some cases the in-office removal of fluid from the eye by paracentesis (65805) or by vitreous tap (67015). Neither of these procedures, would be billable during the global period, but both have significant physician work associated with them. Based on survey responses, seven 99213 post-operative visits are required. The surveyed code requires greater mental effort, judgment, technical skill, physical effort, and psychological stress than reference code 67108, which has a value of 22.49. As such, the RUC agreed that the 25th percentile of the survey results was appropriate. **The RUC recommends a work RVU of 25.00, pre-service time of 35, intra-service time of 130, and post-service time of 20 for code 67113.**

The coding changes do not represent new work and the RUC sought to maintain work neutrality within the family. Therefore, the RUC reviewed an analysis of its recommended work RVUs and projected Medicare utilization to assure that the changes are work neutral.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:67041 Tracking Number Specialty Society Recommended RVU: **19.00**
Global Period: 090 RUC Recommended RVU: **19.00**

CPT Descriptor: Vitrectomy, mechanical, pars plana approach; with removal of preretinal cellular membrane (eg, macular pucker)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 67-year old woman with reduced vision and metamorphopsia due to macular pucker

Percentage of Survey Respondents who found Vignette to be Typical: 91%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 33%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: Review patient record. Review diagnostic testing (fundus photography, extended ophthalmoscopy, fluorescein angiography, and optical coherence tomography). Obtain consent. Write preoperative orders for medications, pupillary dilation, and antibiotic prophylaxis. Select appropriate anesthesia. Discuss surgery again with patient and family. Scrub and gown. Perform surgical 'time out' with the OR team. After appropriate anesthesia is administered, the eye is prepped and draped.

Description of Intra-Service Work: The conjunctiva is opened both nasally and temporally. The sclera is entered with a microvitreoretinal (MVR) blade inferotemporally and an infusion cannula is sutured to the sclera . A balanced salt infusion fluid is used to maintain intraocular pressure. The sclera is entered with a MVR blade both superonasally and superotemporally to allow passage of the vitrector and the fiber optic light source through separate incisions. The central vitreous is removed, and vitreous shaved as close as is safe to the vitreous base. Then an MVR blade is barbed, and under high magnification of the operating microscope, en edge of the cellular membrane is gently elevated. When sufficient tissue is mobilized, an intraocular micro forceps is introduced and used to further elevate and then permanently remove the cellular membrane. The peripheral fundus is examined for possible retinal tears. The wounds are inspected and the conjunctival approximated over the scleral incisions. Antibiotics and cycloplegics are applied to the operated eye.

Description of Post-Service Work: Apply sterile dressing. Instruct recovery room staff on correct positioning of patient. Write post-operative orders. Chart progress note. Discuss surgical procedure and post op instructions with patient and family. Dictate operative note. Communicate with referring physician.The patient is typically seen post-operatively at one day, one week, 3 weeks, 6 weeks and 10 weeks. At each exam the visual acuity is measured, a complete eye exam performed including assessment of the anterior segment, the crystalline lens (or implant), the intraocular pressure, and a full dilated fundus exam is performed.. Activity and restrictions are reviewed. Medications are tapered or changed as appropriate. Progress is discussed with referring physician. Progress notes placed in the medical record..

Post-Service intensity/complexity	4.08	4.38

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

CPT code 67038 was originally submitted by CMS for the third Five Year review because it had never been RUC valued. Survey data were collected last year. The expert consensus panel of the AAO Health Policy Committee reviewed the data for the service and determined that it would be difficult to value because the code was being used to report several distinct procedures which had evolved over the last decade for the treatment of retinal-vitreal disease. This resulted in confusion regarding the code during the original survey. AAO requested that the RUC refer the code to CPT and the RUC agreed. CPT created a new family of codes and this family is being surveyed. All of the procedures require complex surgical technology to perform. Although in some cases improved technology may result in the work being easier, in this instance the new technology has raised expectations significantly as the patients believe that restoration of "perfect" vision is now possible.

Code 67041 describes a vitrectomy with removal of a preretinal cellular membrane. It is the least complex code in the family, but still represents a high skill, high intensity intraocular procedure because the area of the retina being treated (the macula) is responsible for central vision. The median work RVU was 23.3 and the 25th percentile 19.75. The median intraservice time was 62.5, shorter than the Harvard time for this procedure. This is typical of most ophthalmology codes (as well as those of other specialties) recently surveyed. Five 99213 post-op visits are required. These visits are at a higher level because all require a dilated retinal exam.

When the consensus panel reviewed the survey results, it felt that the 25th percentile was too high and that an RVU of 19.00 would be appropriate. This results in a code which still has a relatively high IWPUT, typical for ophthalmologic procedures with high intensity but relatively short intraservice times. As we discussed when 66984 (cataract surgery) was reviewed during the Third Five Year review, modern eye surgery is characterized by improvements in technology which significantly reduce the time needed to enter the eye and close the incisions at the end of the procedure. For vitrectomy surgery, surgeons are using sutureless self-sealing incisions which require more technical skill to create, but much less intraservice time overall. This raises the IWPUT significantly.

The RVU of 19.0 compares well with *67218 destruction of localized lesion of the retina, one or more sessions; radiation by implantation of source* which is a RUC reviewed extraocular procedure with less morbidity and chance of complications. For that reason, the specialty recommends **RVU=19.0.**

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 67038

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

CPT code 67038 was originally submitted by CMS for the Third Five Year review because it had never been RUC valued. Survey data were collected last year. The expert consensus panel of the AAO Health Policy Committee reviewed the data for the service and determined that it would be difficult to value because the code was being used to report several distinct procedures which had evolved over the last decade for the treatment of retinal-vitreal disease. This resulted in confusion regarding the code during the original survey. AAO requested that the RUC refer the code to CPT and the RUC agreed. CPT created a new family of codes and this family is being surveyed. All of the procedures require complex surgical technology to perform. Although in some cases improved technology may result in the work being easier, in this instance the new technology has raised expectations significantly as the patients believe that restoration of "perfect" vision is now possible.

CPT 67042 describes the treatment of a macular hole or chronic macular edema. The code defines a new procedure to treat previously untreatable macular diseases that almost always resulted in permanent loss of central vision. The procedure involves pars plana vitrectomy, removal of the internal limiting membrane of the retina and intraocular tamponade with the installation of a vitreous substitute composed of silicon oil or gas. For these reasons, it is a more sophisticated surgical procedure with additional surgical maneuvers than 67041.

The median survey WRVU was 24.0 and the 25th percentile 22.13. The use of vitreous substitute results in a 30 to 40 per cent incidence of post operative elevated intraocular pressure requiring treatment with topical and systemic medications, and in some instances the in-office removal of fluid from the eye by paracentesis (65805) or by vitreous tap (67015). Neither of these procedures related to the initial surgery, which are performed in the office, would be billable during the global period, but both have significant physician work associated with them. Survey respondents indicated five 99213 visits are required for the typical patient. The respondents indicated that this code was technically more difficult and had higher psychological stress than the reference code which has an WRVU of 22.49, but slightly lower mental effort and judgment regarding medical decision making.

The expert consensus panel of the AAH Health Policy committee reviewed the survey data and recommends the 25th percentile value of **WRVU=22.13.**

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:67043 Tracking Number Specialty Society Recommended RVU: **22.94**
Global Period: 090 RUC Recommended RVU: **22.94**

CPT Descriptor: Vitrectomy, with removal of subretinal membrane (eg, choraoidal neovascularizaiton), includes if performed, intraocular tamponade (ie, air gas or silicone oil) and laser photocoagulation

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 66 year old patient with reduced vision to 20/100 with subretinal fluid and a choroidal neovascular membrane.

Percentage of Survey Respondents who found Vignette to be Typical: 86%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 34%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: Review patient record. Review diagnostic testing (fundus photography, extended ophthalmoscopy, fluorescein angiography, and optical coherence tomography). Obtain consent. Write preoperative orders for medications, papillary dilation, and antibiotic prophylaxis. Select appropriate anesthesia. Discuss surgery again with patient and family. Scrub and gown. Perform surgical 'time out' with the OR team After appropriate anesthesia is administered, the eye is prepped and draped.

Description of Intra-Service Work: The conjunctiva is opened both nasally and temporally. The sclera is entered with a microvitreoretinal (MVR) blade inferotemporally and an infusion cannula is sutured to the sclera. A balanced salt infusion fluid is used to maintain intraocular pressure. The sclera is entered with a MVR blade both superonasally and superotemporally to allow passage of the vitrector and the fiber optic light source. The central vitreous is removed. The posterior hyaloid is elevated and peeled peripherally and then the vitreous is shaved off as close as is safe to the vitreous base. Under high magnification of the operating microscope, a small gauge cannula is inserted under the retina adjacent to the macula. A minute quantity of fluid is injected into the sub-retinal space to detach the central retina. The infusion bottle height is elevated to tamponade possible massive bleeding. A sub retinal forceps is placed in the eye and through the retinotomy and into the sub retinal space. The forceps blades are placed one above and one under the neovascular membrane. The membrane is removed carefully from the sub retinal space and then from the eye. Air-fluid exchange is performed to reattach the retina. Endolaser photocoagulation may be placed around the posterior retinotomy. The air within the eye is exchanged for a long acting gas for internal tamponade The sclerotomies are closed with sutures. The conjunctiva is closed with interrupted sutures. Antibiotics and cycloplegics are applied to the operated eye.

Description of Post-Service Work: Apply sterile dressing. Instruct recovery room staff on correct positioning of patient. Write post operative orders. Chart progress notes. Discuss surgical procedure and post op instructions with patient and family. Dictate operative note. Communicate with referring physician

Post-service Office work: The patient is typically seen post-operatively at one day, one week, 3 weeks, 5 weeks and 10 weeks. At each exam the visual acuity is measured, a complete eye exam performed including assessment of the anterior segment, the lens (or implant), the intraocular pressure, and a full dilated fundus exam is performed. The status of the gas bubble is assessed and post operative positioning is altered as a function of the bubble size and value of positioning.. Activity and restrictions are reviewed. Medications are tapered or changed as appropriate. Progress is discussed with referring physician.. Progress notes placed in the medical record.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

CPT code 67038 was originally submitted by CMS for the third Five Year review because it had never been RUC valued. Survey data were collected last year. The expert consensus panel of the AAO Health Policy Committee reviewed the data for the service and determined that it would be difficult to value because the code was being used to report several distinct procedures which had evolved over the last decade for the treatment of retinal-vitreal disease. This resulted in confusion regarding the code during the original survey. AAO requested that the RUC refer the code to CPT and the RUC agreed. CPT created a new family of codes and this family is being surveyed. All of the procedures require complex surgical technology to perform. Although in some cases improved technology may result in the work being easier, in this instance the new technology has raised expectations significantly as the patients believe that restoration of "perfect" vision is now possible.

CPT 67043 describes the surgical treatment of subretinal neovascularization with vitrectomy. Currently there is no CPT code that describes this procedure which involves pars plana vitrectomy, incising the retina, creation of a retinal detachment by subretinal injection, subretinal dissection and removal of the neovascular tissue and retinal reattachment with a vitreous substitute. This a low volume procedure expected to account for less than 5 % of vitrectomy procedures previously reported with 67038.

The median WRVU was 24.5 and the 25th percentile 22. The median intraservice time was 90 minutes. The majority of this time is spent inside the eye operating at or under the retinal surface. This procedure ranks in physician work between 67042 and 67113 within this new family of services. The service takes longer than 67042 because subretinal dissection takes longer than preretinal dissection and additional time is necessary to assure subretinal hemostasis after removal of the neovascular tissue. Also, this procedure is typically performed in patients with an attached posterior vitreous which must be dissected from the retinal surface.

The expert consensus panel considered the data and recommends a **WRVU=23.0** which is slightly above the 25th percentile of the survey and just above our proposed value for 67042.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:67113 Tracking Number Specialty Society Recommended RVU: **25.00**
Global Period: 090 RUC Recommended RVU: **25.00**

CPT Descriptor: Repair of complex retinal detachment (eg, proliferative vitreoretinopthy, stageC-1 or greater, diabetic traction retinal detachment, retinopathy of prematureity, retinal tear of greater than 90 degrees), with vitrectomy and membrane peeling, may include air, gas or silicone oil tampanade, cryotherapy, endolaser photocoagulation, drainage of subretinal fluid, scleral buckling, and/or removal of lens

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 58 year old patient with a total retinal detachment and proliferative vitreoretinopathy consisting of extensive intravitreal membranes.

Percentage of Survey Respondents who found Vignette to be Typical: 94%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 29%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: The decision that a pars plana vitrectomy is made in order to remove the vitreous. Dissection of the membranes and their attachment is required as well as a relaxing retinopathy with a gas-fluid exchange to allow the retina to reattach. Review patient record. Review diagnostic testing (fundus photography, extended ophthalmoscopy, fluorescein angiography, and optical coherence tomography). Obtain consent. Write preoperative orders for medications, papillary dilation, and antibiotic prophylaxis. Select appropriate anesthesia. Discuss surgery again with patient and family. Scrub and gown. Perform surgical 'time out' with the OR team. After appropriate anesthesia is administered, the eye is prepped and draped.

Description of Intra-Service Work: A complete conjunctival peritomy is performed. Tenon's capsule is peeled back and the rectus muscles are isolated. The sclera is entered with a microvitreoretinal (MVR) blade inferotemporally and an infusion cannula is sutured to the sclera. A balanced salt infusion fluid is used to maintain intraocular pressure. The sclera is entered with a MVR blade both superonasally and superotemporally to allow passage of the vitrector and the fiber optic light source. The central vitreous is removed, and vitreous shaved as close as is safe to the vitreous base. Then a MVR blade is barbed, and under high magnification of the operating microscope, the extensive cellular membranes are meticulously removed from the retinal surface to relieve traction. The peripheral fundus is examined for retinal tears which are marked with endodiathermy. A posterior retinotomy is created with endodiathermy. Fluid is removed from the eye and replaced with gas to create pneumatic retinal reattachment. Extensive endolaser photocoagulation is placed about the peripheral breaks and around the retinotomy. Plugs are placed in the sclerotomy sites.
The surgeon then begins the extraocular portion of the procedure. Mattress sutures are placed in each quadrant to support an encircling buckle of solid silicone which is placed 360 degrees around the equator of the eye. The ends of the buckling material are the connected with a silicone sleeve. The mattress sutures are tied and trimmed after the indentation of the sclera is felt to be appropriate.
The air within the eye is exchanged for a long acting gas. The sclerotomies are closed with sutures, and the conjunctiva is closed with sutures. Antibiotics and cycloplegics are applied to the operated eye.

Description of Post-Service Work: Apply sterile dressing. Instruct recovery room staff on correct positioning of patient. Write post operative orders. Chart progress notes. Discuss surgical procedure and post op instructions with patient and family. Dictate operative note. Communicate with refereeing physician

Post-service Office work: The patient is typically seen post-operatively at one day, one week, 3 weeks, 4 weeks, 8 weeks and 12 weeks. . At each exam the visual acuity is measured, a complete eye exam performed including

assessment of the anterior segment, the lens (or implant), the intraocular pressure, and a full dilated fundus exam is performed. The status of the gas bubble is assessed and post operative positioning is altered as a function of the bubble size and value of positioning. Activity and restrictions are reviewed. Medications are tapered or changed as appropriate. Progress is discussed with referring physician. Progress notes are placed in the medical record.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

CPT code 67038 was originally submitted by CMS for the third Five Year review because it had never been RUC valued. Survey data were collected last year. The expert consensus panel of the AAO Health Policy Committee reviewed the data for the service and determined that it would be difficult to value because the code was being used to report several distinct procedures which had evolved over the last decade for the treatment of retinal-vitreal disease. This resulted in confusion regarding the code during the original survey. AAO requested that the RUC refer the code to CPT and the RUC agreed. CPT created a new family of codes and this family is being surveyed. All of the procedures require complex surgical technology to perform. Although in some cases improved technology may result in the work being easier, in this instance the new technology has raised expectations significantly as the patients believe that restoration of "perfect" vision is now possible.

CPT 67113 describes the repair of a complex retinal detachment described in detail in the new descriptor which includes vitrectomy as part of the procedure. Currently no single CPT procedure accurately describes the surgical repair of complex retinal detachment using this technique, so surgeons used 67038 and 67108.CMS has expressed concern that the combination of the retinal detachment repair and vitrectomy codes resulted, even with a multiple procedure modifier, in a total WRVU that was overvalued.

The service represented by this code is the most complex of the four codes in the series of vitrectomy procedures. In fact, it is likely the most complex ocular surgical procedure performed currently. This surgery is performed only by fellowship trained retina surgeons. CPT 67113 combines pars plana vitrectomy with a number of other surgical procedures that may include scleral buckling, dissection of periretinal scar tissue, retinal repositioning, retinopexy with laser or cryopexy, cataract extraction and installation of a vitreous substitute, either an expansible gas or silicon oil.

The survey found a median WRVU of 27.00 and a 25th percentile of 25.00. The median intraservice time was 130 minutes. All of the intensity complexity measures were higher than the reference code, the majority significantly so. The need for retinal tamponade with a vitreous substitute results in a 30% incidence of elevated intraocular pressure requiring treatment with topical and systemic medications or in some cases the in-office removal of fluid from the eye by paracentesis (65805) or by vitreous tap (67015). Neither of these procedures, would be billable during the global period, but both have significant physician work associated with them. Based on survey responses, seven 99213 post-operative visits are required.

This service is much more complex than the reference code 67108 chosen by most respondents which has a value of 22.49. As we discussed when 66984 (cataract surgery) was submitted to the Five Year review, modern eye surgery is

characterized by improvements in technology which significantly reduce the time needed to enter the eye and close the incisions at the end of the procedure. For vitrectomy, physician are using unsutured, self-sealing incisions which require more technical skill to create but much less intraservice time overall. **The consensus committee reviewed the survey findings and recommends the 25th percentile of 25.00 RVUs.**

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 67038/67108

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Ophth	How often? Sometimes
Specialty	How often?
Specialty	How often?

Estimate the number of times this service might be provided nationally in a one-year period? 11000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.

Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 5,785 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty.

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

February 2007

Retinopathy Treatment

CPT code 67228, *Treatment of extensive or progressive retinopathy; (eg, diabetic retinopathy), photocoagulation; single session*, was originally referred to the third Five-Year Review by CMS. At that time, the RUC referred the code to the CPT Editorial Panel for revisions because there were difficulties in reviewing the physician work due to a lack of uniformity between the vignette and the descriptor. It was unclear whether or not the work being described was for a single session or the typical number of treatments during the global period (between 2 and 3). The Panel removed the "one or more sessions" language, replaced it with "single session," and the specialty society recommended that the code be changed from a 90 day global to a 10 day global period. CMS did not approve a change in the global period. This action created difficulty in assessing whether the work within the code should include a single session or the typical multiple sessions. In addition to these changes, the Panel created one new code in the family, 67229, *Prophylaxis of retinal detachment (eg, retinal break, lattice degeneration) without drainage, one or more sessions; photocoagulation (laser or xenon arc); preterm infant (less than 37 weeks gestation at birth), performed from birth up to 1 year of age (eg, retinopathy of prematurity), photocoagulation or cryotherapy, one or more sessions*, to describe retinopathy treatment in pre-term infants performed in the first year of life.

1437

The specialty society noted that the changes to the global period were assumed within the vignette and description for the edits approved by the CPT Editorial Panel. However, they were not approved by CMS and the service remains a 90 global and accounts for only one procedure. The procedure is typically performed between two and three times, as reflected in the specialty society survey, with an average of 2.4. The survey respondents assumed the inclusion of multiple treatments when the code was surveyed and the recommended values are based on this assumption.

The RUC recommends that the CPT Editorial Panel remove "single session" from the CPT descriptor for code 67228. [Staff note: The CPT Editorial Panel accepted this recommendation at its February 2007 meeting.]

The RUC discussed the survey data for 67228 in comparison with the reference service code, 67145, *Prophylaxis of retinal detachment (eg, retinal break, lattice degeneration) without drainage, one or more sessions; photocoagulation (laser or xenon arc)*,

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

(work RVU = 6.17, pre-service time = 24, intra-service time = 25, post-service time = 11). The reference service is considerably lower in nearly every measure of intensity and complexity for the pre-, intra-, and post-service periods. The surveyed code requires greater mental effort, complexity, technical skill, physical effort, and risk than the reference service. The reference service which has a work RVU of 6.17, when multiplied by 2.4 is 14.81, which is very similar to the current work RVU of 13.76. Based on the similarity to the reference service and the average of 2.4 treatments within the global period, the RUC recommends maintaining the current work RVU of 13.76, which includes the updates to the E/M services inherent in the global period of the procedure. Further the RUC recommends adjusting the mean pre-, intra-, and post-service physician times by 2.4 times the median survey times to appropriately account for the performing the procedure 2.4 times. **The RUC recommends a work RVU of 13.67, pre-service time of 48 minutes, intra-service time of 60 minutes, and post-service time of 12 minutes for 67228.**

The RUC considered the specialty society survey data for code 67229, *Prophylaxis of retinal detachment (eg, retinal break, lattice degeneration) without drainage, one or more sessions; photocoagulation (laser or xenon arc); preterm infant (less than 37 weeks gestation at birth), performed from birth up to 1 year of age (eg, retinopathy of prematurity), photocoagulation or cryotherapy, one or more sessions* and agreed that the median work RVU was appropriate when compared to the reference service code 67145, *Prophylaxis of retinal detachment (eg, retinal break, lattice degeneration) without drainage, one or more sessions; photocoagulation (laser or xenon arc)*, (work RVU = 6.17). The RUC agreed that the work involved in code 67229 is far more intense and complex than the reference service. The intra-service time is exactly three times that of 67145, and the RUC concurred that the median work RVU of 16.00 is appropriate as it is slightly less than three times the reference service work RVU of 6.17. The RUC also discussed the service in comparison with 67107, *Repair of retinal detachment; scleral buckling (such as lamellar scleral dissection, imbrication or encircling procedure), with or without implant, with or without cryotherapy, photocoagulation, and drainage of subretinal fluid* (work RVU = 16.35), which was the second most commonly selected reference service from the survey results. The intra-service time is slightly greater in the reference service than the surveyed code, 107 minutes and 75 minutes, respectively. However, the surveyed code is more extensive and carries a greater risk of unfavorable visual outcome. The RUC considered one additional reference service, code 65782, Ocular surface reconstruction; limbal conjunctival autograft (includes obtaining graft) (work RVU = 15.16), but has a far more similar intraservice time, 83 minutes. **The RUC recommends a work RVU of 16.00, pre-service time of 45 minutes, intra-service time of 75 minutes, and post-service time of 17.50 minutes for code 67229.**

1438

Practice Expense

The RUC accepted the practice expense inputs as amended by the PERC and as adjusted for the change in intra-service time for 67228.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:67228 Tracking Number Specialty Society Recommended RVU: **13.67**
Global Period: 090 RUC Recommended RVU: **13.67**

CPT Descriptor: Treatment of extensive or progressive retinopathy; (eg, diabetic retinopathy), photocoagulation, single session

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 47 year old male with a 15-year history of insulin dependent diabetes mellitus with proliferative diabetic retinopathy who meets high risk characteristics

Percentage of Survey Respondents who found Vignette to be Typical: 96%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: The patient has previously been evaluated and scheduled for therapy. The medical record is reviewed. An interim history is obtained. Diagnostic testing (e.g. fundus photography, fluorescein angiography and possible optical coherence tomography) is reviewed. A full discussion of risks and benefits of the procedure is carried out with the patient. Consent is obtained.

Description of Intra-Service Work: The visual acuity is measured and the pupil is dilated. The fundus is examined to ensure that laser therapy is still appropriate (as opposed to vitreous surgery). A topical anesthetic is applied to the cornea. Laser photocoagulation is administered by either one of two techniques: 1. slit lamp delivery system or 2. indirect ophthalmoscopic delivery system. With the slit lamp laser system a fundus contact lens is applied to the globe using a liquid methylcellulose cushion. Laser ablation is applied to the mid-peripheral and peripheral retina. With indirect ophthalmoscopic delivery, an anesthetic is applied topically to the cornea. The laser ablation is applied to the mid-peripheral and peripheral retina

Description of Post-Service Work: The eye is irrigated. The patient is apprised of the progress of the treatment, any complications, and is told of what to expect post-operatively. Post operative orders are written. The operative note is prepared. Follow up appointment is scheduled. Referring physician is notified of treatment

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

This code was originally submitted by CMS for the Five Year Review because if had never previously been reviewed. When the code was surveyed, it was felt that difficulties with the vignette and the CPT descriptor language prevented an accurate assessment of the physician work because it was not clear whether the work being described was for a single session or the usual number of treatments during the global period (2 to3). When the problem and survey findings were presented to the RUC, there was agreement that the code should be referred to CPT for refinement in the descriptor to clarify the issue. At CPT, we recommended changing the code to a 10-day global, describing each individual treatment session and removing "one or more sessions" from the CPT descriptor. That change was approved by CPT. However CMS did not agree to a 10-day global for this procedure and insisted that the survey be performed for a 90-day global period. However "one or more sessions" was appropriately deleted from the descriptor in the new code.

Unfortunately this decision by CMS recreated the initial problem that the referral to CPT had been designed to alleviate: lack of clarity as to whether the survey respondents were evaluating the work of the single session or the entire course of treatment. Not surprisingly, the new survey generated the same ambiguous responses as the prior one. This confusion is clearly demonstrated by looking at the intraservice time data from the survey. It is impossible to complete 2 to 3 treatment sessions in the median time of 25 minutes. In fact, that time is closer to the typical intraservice time for a single session. Therefore, the consensus panel of the AAO believes most respondents indicated service times for a single session. This is supported by the fact that the most common reference code chosen (67145) is typically administered in a single session.

Given the issues with the survey using a 90-day global, the consensus panel discussed the issue of how to better determine the number of treatments during the global period with RUC staff and they allowed us to ask the respondents an additional question via the survey:

> "The Academy is surveying this revised CPT code for panretinal photocoagulation with a format we are required to use for RUC Surveys.
>
> The form is designed for procedures assigned a 90-day global period by CMS (Medicare). However, the new descriptor was intended to represent the services provided within a 10-day global period.
>
> The typical treatment of this type of patient often requires more than one treatment session. In order for us to

provide information to CMS and the AMA Relative Value Update Committee (RUC) on the best timeframe and valuation for this procedure it is important for the Academy to establish the number of treatment sessions for proliferative diabetic retinopathy (PDR) as described in the patient vignette that would be provided in a 90-day time period. Please indicate here the number of treatments that would be required for one eye with PDR in the typical patient within a 90-day time period: _____."

The respondents indicated that on average about 2.4 treatments were required within 90 days. This is consistent with two NIH clinical trials of the treatment of proliferative diabetic retinopathy as well as the current standard of practice which indicate that the treatments should be performed in a minimum of 2 sessions, but more commonly in 3 sessions (see references below).

The reference code chosen has a RVU of 5.36, and multiplying that by 2.4 gives a calculated RVU of 12.86, very close to the current value (12.72 RVU). In addition, those surveyed felt that the new code had higher intensity and complexity than the reference code. The AAO expert consensus panel composed of members of the Health Policy Committee reviewed these findings and feels that there is no compelling evidence to support the conclusion that the code is overvalued at the present time. In addition, there is no clear method to better determine a value given the issues discussed previously. **The committee therefore recommends that the present value (RVU=12.72) be reaffirmed.** This value is consistent with other RUC evaluated codes. For instance *49085 Removal of peritoneal foreign body from peritoneal cavity* has an RVU =12.12, and an intraservice time of 60 minutes. *43605 biopsy of stomach by laparotomy* has a similar intraservice time with an RVU=11.96.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 67228

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:67229 Tracking Number Specialty Society Recommended RVU: **16.00**
Global Period: 090 RUC Recommended RVU: **16.00**

CPT Descriptor: Treatment of extensive or progressive retinopathy; preterm infant (less than 37 weeks gestation at birth), performed from birth up to 1 year of age (eg, retinopathy of prematurity), photocoagulation or cryotherapy, one or more sessions

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 10 week old infant born at 25 weeks post-menstrual age with threshold retinopathy of prematurity.

Percentage of Survey Respondents who found Vignette to be Typical: 91%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 33%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: Once the decision for treatment is made consultation is completed with the consulting neonatologist as to the advisability of surgery, the location of the surgery (OR versus NICU), type of anesthetic to be used (conscious sedation versus general aneshtesia) and airway management. The family is contacted and the nature of the proposed surgery including the risks and liklihood of benefit discussed. Orders for pupillary dilation are placed in the record. The family is counseled in the waiting area. An interval history and ophthalmological exam are documented.

Description of Intra-Service Work: The correct surgical eye is confirmed. Topical anesthesia is adminstered along with supplemental mydriatic drops as needed. A eyelid speculum is placed. The eye is positioned with scleral depression. The regions of normal vascularization and absent vascularization are recorded. Retinal ablation is performed with the application of laser burns to the avascular retina with an indirect ophthalmoscopic laser delivery system. Initial applications are titrated to cause an immediate cream colored response in the treated retina. The entire avascular retina is treated with near confluent burns, usually taking 1000 to 1500 applications. Care is taken to avoid striking the iris and maintaining laser focus on the retina to avoid damage to the crystalline lens.

Description of Post-Service Work: Following surgery the op note is dictated. Post op orders are written including topical steroids and antibiotics and arrangements made for follow up in 3 to 7 days. The outcome of the procedure discussed with the neonatology team. The course of the procedure and expectations for the next few weeks are reviewed with the family

Post-Service intensity/complexity	4.14	3.00

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*
The CPT Editorial Panel added a new CPT code for retinopathy of prematurity treatment. The new code identifies services provided to a "preterm infant (less than 37 weeks gestation at birth), performed from birth up to 1 year of age (eg, retinopathy of prematurity), photocoagulation or cryotherapy, one or more sessions." These patients had previously been reported with 67228 (which is part of the Third Five-year Review), but it was felt that a separate code for this very small subset of patients was necessary to capture the additional work and risks inherent in dealing with a high risk pediatric population.

The service is performed in the hospital setting on very low birth weight infants at an average post-menstrual age of 37.5 weeks. About 10% of eyes require a repeat treatment, usually in 10-21 days. These are high-risk patients with a 20% likelihood of permanent severe visual impairment and 30% moderate impairment in spite of treatment. They usually have a myriad of associated medical conditions which substantially increases the complexity of the treatment. The professional liability risk is also significantly higher than in the adult population because the risk of blindness is much higher.

The survey revealed that the work involved for 67229 was substantially higher in terms of mental effort, technical skill and psychological stress than the most commonly chosen reference code, 67145. This is not surprising as the treatment (67145) is far less extensive and carries substantially lower risk of an unfavorable visual outcome. In addition far more parent education is necessary prior to the procedure to reduce the risk of failure to complete follow-up after surgery. It is likely this reference code was chosen since it is one of the few retinal laser procedures on the reference list. The more similar laser procedure 67228 was being reconsidered as part of the Five Year Review so it could not be utilized. The next most commonly chosen reference procedures was 67107 with a WRVU of 14.82

The 25th percentile in the survey was 10.43 RVU and the median 15.00 RVU. The current value is 12.72 RVU. The median pre-service, intra-service and post-service times were 45, 75, and 15 minutes. Post-operative visits occur weekly in the first four weeks. The first of these is typically performed as an inpatient (usually 99232), a discharge day visit, and subsequent visits as an outpatient (99213). During month two the examinations are biweekly and during month three a single visit is required. Each of these visits requires reexamination of the anterior segment for evidence of iris neovascularization, cataract development and pupillary dilation for peripheral retinal examination with scleral depression to determine the progression or involution of the retinal disease. In addition many children need coordination of care with community-based vision support programs.

The intraservice time and the proposed work value are similar to another recently RUC reviewed code, 65782 - Ocular surface reconstruction; limbal conjunctival autograft (includes obtaining graft). 65782 has an RVU of 14.98 with slightly longer preservice time and similar intraservice and post service times. The number of post operative follow up visits is higher, but they are 99212 rather than 99213.

The survey respondents suggested a median RVU of 16.0. While we are reluctant to suggest a median value under ordinary circumstances, the consensus panel met by conference call and agreed to recommend WRVU=16.0 to account for the necessary coordination of care, increased number of post-operative visits, the intensity of the intraservice work when compared to the adult population undergoing laser surgery of the retina, and additional technical skill required to treat premature infants.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

April 2007

Nasolacrimal Duct Balloon Catheter Dilation

The CPT Editorial Panel created one new code to describe the distinct procedure of probing the nasolacrimal duct with transluminal balloon catheter dilation when other probing methods have failed.

The RUC reviewed the survey data for code 68816 *Probing of nasolacrimal duct, with or without irrigation; with transluminal balloon catheter dilation* compared to the key reference code 68811 *Probing of nasolacrimal duct, with or without irrigation; requiring general anesthesia* (Work RVU=2.39). The specialty society indicated and the RUC agreed that the survey 25th percentile work RVU of 3.00 was appropriate in comparison to the reference service and this family of codes. The surveyed code, 68816, intra-service time of 25 minutes was comparable to that of the key reference service with 23 minutes physician intra-service time. The RUC reviewed the surveyed pre-service and immediate post-service times and determined that 30 minutes pre-service and 15 minutes immediate post-service times are similar to the reference code 68811 (30 minutes pre-service and 20 minutes post-service) and are appropriate. The specialty society indicated that CPT code 68816 is more difficult technically than 68811 due to the need to position, identify and follow the inflation-deflation balloon protocol, but is not as technically difficult as probing followed by stent placement, code 68815 *Probing of nasolacrimal duct, with or without irrigation; with insertion of tube or stent* (Work RVU=3.24, and 40 minutes intra-service time). Additionally, the mental effort and judgment, technical skill, physical effort and stress associated to perform 68816 were all higher than the key reference service 68811, supporting a slightly higher work RVU. The RUC recommends two level 99212 post-operative visits and a half-day discharge day are required, which is consistent with other codes in this family.

The RUC recommends the survey 25th percentile work RVU of 3.00 for code 68816.

Practice Expense
The RUC reviewed the accepted the direct practice expense inputs for 68816 with the 100 percent assist physician time as indicated.

New Technology
The RUC recommends that CPT code 68816 be placed on the new technology list.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:68816 Tracking Number QQ1 Specialty Society Recommended RVU: **3.00**
Global Period: 010 RUC Recommended RVU: **3.00**

CPT Descriptor: Probing of nasolacrimal duct, with or without irrigation; with transluminal balloon catheter dilation

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 14-month old patient has the diagnosis of nasolacrimal duct obstruction which has been unresolved for six months.

Percentage of Survey Respondents who found Vignette to be Typical: 40%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 12%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: The patient history, physical exam, and any required preoperative tests are reviewed. The parents and the patient if age appropriate are counseled in the preoperative area. Active dacryocystitis is ruled out. The preoperative interval history, note and exam are documented in the patient record. The surgeon answers any additional questions. Then patient co-morbidities are discussed with anesthesia. The operative consent form is reviewed and the operative side is confirmed and marked. The surgeon confirms that the correct diameter balloon catheter and inflation device are available in the operating suite.

Description of Intra-Service Work: The inferior meatus is packed with cottonoids soaked in phenylephrine. The puncta are dilated. The nasolacrimal system is probed and the presence of the probe in the nose is confirmed by visualizing the probe in the nasopharynx or touching the probe with a second probe. Irrigating saline tinted with fluorescein may be irrigated and recovered from in the nose. The probe is removed. A deflated balloon catheter is passed through the superior punctum, canalicular system and into the nasolacrimal duct to the nasal floor. Presence of the balloon catheter in the nose is confirmed. An inflation device is filled with sterile water or saline, connected to the balloon catheter, and the balloon is inflated for 90 seconds. The balloon is then deflated for 60 seconds. The inflation procedure is repeated a second time for 60 seconds, again the balloon is deflated. The balloon is retracted 5 mm, thereby positioned within the lacrimal sac and the proximal nasolacrimal duct. The balloon is inflated and deflated again for two cycles using the method described above. The balloon is deflated fully. The catheter is then rotated clockwise to minimize the profile of the deflated balloon, and withdrawn from the lacrimal system.

Description of Post-Service Work: Post op instructions are communicated to the family. A follow up appointment is scheduled. An operative report is dictated and communication with other health professionals is provided as needed. Post-operative evaluations are typically once or twice during the first ten days after procedure (e.g., one day and one week postop). If symptoms persist, alteration of the medical regimen and/or plans for additional procedures are made.

Time Segments (Mean)		
Pre-Service intensity/complexity	2.83	2.22
Intra-Service intensity/complexity	3.22	2.09
Post-Service intensity/complexity	2.43	2.00

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

AAO is presenting data for valuation of a code that resulted from a submission by industry to the CPT Editorial Panel. This code identifies a new technique for treating nasolacrimal duct obstruction. The procedure involves inflating a balloon that has been placed in the lacrimal drainage system, thus dilating the outflow passage and relieving the obstruction. The typical patient is a child, but it will also be used in adults with the object in both cases to avoid having to perform more extensive nasolacrimal system surgery.

A significant number of the respondents indicated that they felt that the vignette was not typical. The reasons varied, but for some oculoplastic specialists it was that they used it primarily in adults. Some pediatric ophthalmologists felt that the vignette should have mentioned that a standard probing had failed before using this technique. Though that may be the case for these respondents, there are at least three recent studies (including one sponsored by the National Eye Institute of NIH) utilizing this service as primary treatment. We found no systematic difference in work value suggested by those respondents that felt that the vignette was typical and those that did not, and for that reason feel that the survey results are valid. The consensus panel did not feel there was significant difference in physician work between these three clinical settings (adult, primary treatment in a child, secondary treatment in a child), but believe that this procedure is substantially more often provided to young children than any other age group.

The AAO surveyed 175 ophthalmologists and got 33 responses. The 25th percentile work value was 3.00 with a median intraservice time of 25 minutes. Survey respondents indicated that the mental effort and judgment, technical skill, physical effort and stress were all higher than the most frequently chosen reference code 68811. Two level 99212 post op visits are required which is consistent with the other codes in the family, 68811 and 68815.

When the surveys were reviewed by the AAO consensus panel, it was felt that this work value fits well within the family of lacrimal codes and also with other RUC-valued 10-day global codes. A WRVU of 3.00 falls between the value of 68811 which has a WRVU of 2.39 and an IST of 23 minutes and 68815 with a WRVU of 3.24 and an IST of 40 minutes. The new code is more difficult technically than the probing (68811) due to the need to position, identify, and follow the inflation-deflation balloon protocol, but not as technically difficult as probing followed by stent placement (68815) which involves placement of a device to keep the system open.

In addition the value is consistent with other RUC valued codes with 10-day global periods. For example 11623 (a MPC-A code) *Excision, malignant lesion including margins, scalp, neck, hands, feet, genitalia; excised diameter 2.1 to 3.0 cm* has an RVU of 3.02 with an IST of 30 minutes. Code 37609 *Ligation or biopsy, temporal artery* also has a

value of 3.02 with an IST of 30 minutes. There are other examples as well with WRVUs between 2.88 and 3.22 with similar ISTs.

After review of all of the data, the AAO recommends a WRVU of 3.00, the 25th percentile of the survey.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. N/A

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 68815

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Ophthalmology How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 10000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate.

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 700
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate.

Specialty	Frequency	Percentage	0.00 %
Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

April 2007

Cardiac MRI

Improvement in spatial and temporal resolution has expanded the applications of cardiac MRI from predominantly an anatomic test to one that performs accurate physiologic evaluations. Because of this improvement, cardiac MRI is unlike traditional MRI which relies solely on static images to obtain clinical diagnoses. This expansion in technology has led to a test that is now technically more complex to perform and includes more physician work to adjust imaging planes, decide on sequences, evaluate the images, and assimilate the data into an effective treatment plan. Because of the clinical expansion and additional work, new CPT codes and descriptors were needed to more accurately reflect current cardiac MRI practice. To describe the various combinations and permutations of imaging protocols with sufficient granularity for cardiac MRI of the heart, eight new codes were developed by the CPT Editorial Panel in November 2006. Four of the codes involve contrast and four without contrast. These non-contrast and with contrast, morphology and function, with flow/velocity (for physiologic assessment of values, intra cardiac shunts, etc.) and with pharmacologic stress codes will now accurately depict procedural differences in technique and physician work.

1471

The RUC reviewed the specialty society's survey results for the entire set of codes and heard from the specialty on how the technology had changed, whereas increases in the capabilities of the computers used for MR imaging have allowed the development of software for pulse sequences and post-processing algorithms that were not available at the time when the prior codes (CPT codes 75552-75556) were developed. Current techniques use myocardial enhancement for characterizing myocardial disease, details which were unknown when these codes were originally valued. Furthermore, contrast studies in the past were done largely to look for cardiac tumors, but now require analysis of each of 17 segments of the heart, adding a whole new level of complexity to the present-day studies. The RUC agreed that the new technology had increased the physician work since the typical patient is now also more complex. The RUC agreed that because of the nature of this new technology, the specialty had met the compelling evidence criteria and physician work neutrality should not apply.

75557

The RUC compared the specialty's survey results for new CPT code 75557 to its key reference service 74183 *Magnetic resonance (eg, proton) imaging, abdomen; without contrast material(s), followed by with contrast material(s) and further sequences* (work RVU = 2.26, total physician time = 50). The RUC agreed that the physician time and work RVU of 74183 supported the specialty's median survey RVU of 2.35 (60 minutes of total median survey physician time) for code 75557. The RUC also compared code 75557 to other MRI

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association

codes (71550 *Magnetic resonance (eg, proton) imaging, chest (eg, for evaluation of hilar and mediastinal lymphadenopathy); without contrast material(s)* (work RVU = 1.46, physician time = 30) and 74181 *Magnetic resonance (eg, proton) imaging, abdomen; without contrast material(s)* (work RVU = 1.46, physician time = 30) with similar ratios of work RVU/time and concurred that the survey median RVU was appropriate for this new code.

The RUC recommends a physician work relative value of 2.35 for code 75557.

75558

The RUC reviewed the specialty's survey results for new CPT code 75558 in relation to its key reference service 93350 *Echocardiography, transthoracic, real-time with image documentation (2D), with or without M-mode recording, during rest and cardiovascular stress test using treadmill, bicycle exercise and/or pharmacologically induced stress, with interpretation and report* (work RVU = 1.48, total physician time = 40). The RUC agreed that the work value to physician time ratio of 93350 supported the specialty's median survey RVU of 2.60 (65 minutes of total median survey physician time) for code 75558. In addition, the incremental work similar to that between the base code 75557 and 75558 includes flow/velocity analyses. This is analogous to the work of code 93320 *Doppler echocardiography, pulsed wave and/or continuous wave with spectral display (List separately in addition to codes for echocardiographic imaging); complete* (work RVU = 0.38). Adding the work values of 75557 and 93320 yields 2.73 RVUs and supports the more conservative survey median of 2.60 RVUs for code 75558.

1472

The RUC recommends a physician work relative value of 2.60 for code 75558.

75559

The RUC reviewed the specialty's survey results for new CPT code 75559 in relation to its key reference service 93350 *Echocardiography, transthoracic, real-time with image documentation (2D), with or without M-mode recording, during rest and cardiovascular stress test using treadmill, bicycle exercise and/or pharmacologically induced stress, with interpretation and report* (work RVU = 1.48, total physician time = 40). The RUC agreed that the value and physician time of 75559 supported the specialty's median survey RVU of 2.95 (75 minutes of total median survey physician time) as its recommended value. In addition, the incremental work of interpreting images at rest versus at rest and with exercise has been previously assessed by the RUC. Specifically, code 78478 *Myocardial perfusion study with wall motion, qualitative or quantitative study (List separately in addition to code for primary procedure)* (work RVU = 0.50) is a nuclear cardiology imaging add-on code used when stress imaging is added to rest imaging. Also, stress echo code 93350 (work RVU = 1.48) is 0.56 RVUs higher than rest echo code 93307 *Echocardiography, transthoracic, real-time with image documentation (2D) with or without M-mode recording; complete* (work RVU = 0.92). These values support the survey median for 75559 of 2.95, which is 0.60 higher than the base code 75557 (recommended work RVU = 2.35).

The RUC recommends a physician work relative value of 2.95 for code 75559.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association

75560
The RUC reviewed the specialty's survey results for new CPT code 75560 in relation to its key reference service 93350 *Echocardiography, transthoracic, real-time with image documentation (2D), with or without M-mode recording, during rest and cardiovascular stress test using treadmill, bicycle exercise and/or pharmacologically induced stress, with interpretation and report* (work RVU = 1.48, total physician time = 40). The RUC agreed that the value and physician time of 75560 supported the specialty's median survey RVU of 3.00 (80 minutes of total median survey physician time) as its recommended value. In addition, the incremental work of velocity/flow analysis, code 93320 *Doppler echocardiography, pulsed wave and/or continuous wave with spectral display (List separately in addition to codes for echocardiographic imaging); complete* (work RVU = 0.38), and the incremental value of imaging at stress for echo or nuclear images is 0.5 - 0.56, as discussed in the above for 75559. Adding these to the survey median RVU for the base code 75557 would yield 2.35 + 0.38 + 0.5 = 3.23. By this analysis, the survey median for 75560 of 3.00 was conservative to the RUC. Similarly, adding the increments between 75557 and 75558 (2.60 – 2.35 =0.25) and between 75557 and 75559 (2.95 – 2.35 = 0 .60) yields 2.35 +0 .25 + 0.60 = 3.20. The RUC determined that this building block approach also suggests the survey median for 75560 of 3.00 is appropriate. Lastly, the RUC also agreed that evaluation and management code 99205 *Office or other outpatient visit for the evaluation and management of a new patient...* (work RVU = 3.00), as having similar overall physician work.

1473

The RUC recommends a physician work relative value of 3.00 for code 75560.

75561
The RUC reviewed the specialty's survey results for new CPT code 75561 in relation to its key reference service 74183 *Magnetic resonance (eg, proton) imaging, abdomen; without contrast material(s), followed by with contrast material(s) and further sequences* (work RVU = 2.26) and 50 minutes. The RUC agreed that the ratio of RVU/time ratio (work RVU = 2.26, physician time = 50 minutes) for 74183 is similar to the ratio of survey medians for 75561 (work RVU = 2.75, physician time = 65 minutes). The RUC agreed that code 75561 was appropriately rank ordered within its family with a physician work relative value of 2.60.

The RUC recommends a physician work relative value of 2.60 for code 75561.

75562
The RUC reviewed the specialty's survey results for new CPT code 75562 in relation to its key reference service 74183 *Magnetic resonance (eg, proton) imaging, abdomen; without contrast material(s), followed by with contrast material(s) and further sequences* (work RVU = 2.26) and 50 minutes. The RUC agreed that the ratio of RVU/time ratio (work RVU = 2.26, physician time = 50 minutes) for 74183 is similar to the ratio of survey medians for 75561 (work RVU = 2.86, physician time = 75 minutes). The RUC agreed that code 75562 was appropriately rank ordered within its family with a physician work relative value of 2.86.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association

The RUC recommends a physician work relative value of 2.86 for code 75562.

75563

The RUC compared the specialty's survey results for new CPT code 75563 to its key reference service 78492 *Myocardial imaging, positron emission tomography (PET), perfusion; multiple studies at rest and/or stress* (work RVU = 1.87, total physician time = 55). The RUC agreed that the recommended value and physician time of 75563 supported the specialty's median survey RVU of 3.00 (82.50 minutes of total median survey physician time) as its recommended value. The RUC agreed that the ratio of work RVUs to time between the key reference service and code 75563 supports the median survey work RVU of 3.00 and maintains proper rank order within the family of codes. Lastly, the RUC also agreed that evaluation and management code 99205 *Office or other outpatient visit for the evaluation and management of a new patient...* (work RVU = 3.00), as having similar overall physician work.

The RUC recommends a physician work relative value of 3.00 for code 75563.

75564

The RUC reviewed the specialty's survey results for new CPT code 75564 in relation to its key reference service 78492 *Myocardial imaging, positron emission tomography (PET), perfusion; multiple studies at rest and/or stress* (work RVU = 1.87, total physician time = 55). The RUC agreed that the value and physician time of 75564 supported the specialty's median survey RVU of 3.35 (85 minutes of total median survey physician time) as its recommended value. In addition, if 75560 is used as a base code (recommended work RVU = 3.00) and the increment between 75557 and 75561 is added (0.40 RVUs), the sum is 3.40, which is similar to the survey median for 875564 of 3.35.

The RUC recommends a physician work relative value of 3.35 for code 75564.

The RUC agreed that the median survey results were appropriate for the entire family of codes, however, the immediate post service time for each code seemed excessive at 15 minutes. The specialty society explained that there is significant time spent in discussion with the referring physician and the patient in the post service period, however it was agreed that a 5 minute reduction in the immediate post service time was warranted to reflect the time of similar procedures. The RUC recommends an immediate post-service time reduction of 5 minutes from the specialty survey results, so that there is a total of 10 minutes immediate post-service time for each service in the family.

The RUC compared the physician work required to perform the services to all the key reference codes and to the comprehensive new patient evaluation and management code 99205 (work RVU = 3.00). The RUC also reviewed existing codes with imaging contrast and without imaging contrast and agreed that the work RVU interval was similar or below others and therefore seemed appropriate for these new procedures.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association

New Technology: The RUC recommends this family of codes to be added to the new technology list.

Practice Expense:
The RUC reviewed the practice expense recommendations for this new set of Cardiac MRI procedures and made minor adjustments to the clinical labor recommendations from the specialty society to reflect a more typical patient scenario. The RUC understood that these procedures would typically be performed only in the non-facility setting. The RUC recommends the attached practice expense direct inputs.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
Cardiac magnetic imaging differs from traditional MRI in its ability to provide a physiologic evaluation of cardiac function. Traditional MRI relies on static images to obtain clinical diagnoses based upon anatomic information. Improvement in spatial and temporal resolution has expanded the application from an anatomic test and includes physiologic evaluation of cardiac function. Flow and velocity assessment for valves and intracardiac shunts is performed in addition to a function and morphologic evaluation. Use 75559 and 75560 to report pharmacologic wall motion stress evaluation without contrast. Use 75563 and 75564 to report pharmacologic perfusion stress with contrast. Listed procedures may be performed independently or in the course of overall medical care. If the physician providing these services is also responsible for diagnostic workup and/or follow-up care of patient, see appropriate sections also. Only one procedure in the series 75557-75564 is appropriately reported per session. Cardiac magnetic resonance imaging studies may be performed at rest and/or pharmacologic stress. Therefore, the appropriate stress testing code for the 93015-93018 series should be reported in addition to 75559, 75560, 75563, 75564. *(For separate injection procedures for vascular radiology, see **Surgery** section, 36000-36299)* *(For cardiac catheterization procedures, see 93501-93556)*

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:75557 Tracking Number Specialty Society Recommended RVU: **2.35**
Global Period: XXX RUC Recommended RVU: **2.35**

CPT Descriptor: Cardiac magnetic resonance imaging for morphology and function without contrast material;

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: 36-year-old man has syncope and non-sustained ventricular tachycardia suggesting origin in the right ventricle and a family history of sudden cardiac death. Cardiac MRI is ordered to assess the right ventricle structure and function.

Percentage of Survey Respondents who found Vignette to be Typical: 85%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 72%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work:
Review medical chart and records
- Review any prior imaging studies
- Review protocol with technologist
- Describe procedure to patient and obtain consent as needed
- Review source imaging data
- Supervise administration of anxiolytic where applicable

Description of Intra-Service Work:
- Supervise set-up for different anatomical imaging planes
- Review study images and provide input on whether to obtain additional imaging planes or sequences
- Supervise and/or create reconstructions of the heart and mediastinum using an independent workstation
- Adjust the projection of the reconstructions to optimize visualization of anatomy or pathology
- Interpret the source and reformatted images resulting from the study, typically including cine review with the following specific activities:
  - Evaluate the morphological findings in multiple planes
  - Assess biventricular function with ejection fraction and characterization of wall motion abnormalities
- Compare to all pertinent available prior studies
- Dictate report for medical record

Description of Post-Service Work:
- Review and sign report
- Discuss findings with referring physician

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The survey was reviewed by a consensus panel of the specialty societies' RUC committees. The survey data from cardiologists and radiologists were merged and a single recommendation is submitted for each code.

Compelling Evidence for Change: For all of the codes in this family the specialty societies believe that the increased work value is due to new physician work. Increases in the capabilities of the computers used for MR imaging have allowed the development of software for pulse sequences and post-processing algorithms that were not available at the time when the prior codes (CPT Code 75552 - 75556) were developed. Current techniques use myocardial enhancement for characterizing myocardial disease, details which were unknown when these codes were originally valued. Furthermore, contrast studies in the past were done largely to look for cardiac tumors, but now require analysis of each of 17 segments of the heart, adding a whole new level of complexity to the present-day studies.

Current cine images are clearer, providing better spatial and contrast resolution. Therefore, a more complete analysis is now done. The MR system now is used for the full evaluation of the patient's heart. With quicker imaging, more planes are obtained in a shorter time allowing a more detailed evaluation and producing more images. With shorter breath-hold times, sicker patients can now be imaged and analyzed, leading to an increase in overall work and complexity. As the capabilities of MR imaging have become better known, the complexity of patients referred for MR imaging has increased. Flow techniques have become validated in the clinical arena and are now being used to measure and quantify pulmonary-to-systemic flow (Qp/Qs) ratios, velocities (which allow valvular stenosis evaluation), and regurgitant fractions that provide precise assessments of valvular regurgitation. These new techniques have greatly enhanced the diagnostic capabilities of cardiac MR imaging. In the section below, we use several methods to support the validity of the survey median RVU proposed for this code.

Magnitude Estimation and Rank Order:
The specialty societies agreed that median survey value places this code in correct rank order relative to the other 7 cardiac MRI codes. The expert panel reviewed the survey data and agreed that the survey median RVU for this code seems appropriate.

Comparison to Non-cardiology Codes:

Reference Service 74183 (Magnetic resonance (eg, proton) imaging, abdomen; without contrast material(s), followed by with contrast material(s) and further sequences) with 2.26 RVU and 50 minutes of RUC time was chosen as the reference code for 75557. This supports the median survey RVU of 2.35 (65 minutes median survey times) for 75557.

75557 was compared to other MRI codes with similar ratios of RVU/time. These included 71550 (MRI chest w/o contrast, 1.46 RVU, 30 minutes) and 74181 (MRI abdomen w/o contrast, 1.46 RVU, 30 minutes). Recognizing that IWPUT for imaging services has not been validated, the consensus panel noted that IWPUT for 75557, 71550, and 74181 are all in the range of .045 - .049.

Comparison to Other RUC-Surveyed Cardiology Codes

The consensus panel compared the survey values for 75557 to other cardiology imaging codes. Transesophageal echocardiography (93312) has 2.2 RVU and 43 minutes of RUC time. Stress nuclear imaging (78461 and 78478) have 1.73 RVU combined and combined RUC times of 35 minutes. The consensus panel agrees that 75557 is valued appropriately compared to these other 2 common cardiology imaging codes.

Building Block Method:
The consensus panel compared 75557 to 71552 (MRI Chest, RVU = 2.26) added to 76377 (3D rendering with interpretation and reporting of computed tomography, magnetic resonance imaging, ultrasound or other tomographic modality; requiring image post-processing on an independent workstation, RVU = .79). It is reasonable to look at cardiac MRI as the sum of MRI of the chest (71552) plus additional post-processing (76377). Cardiac MRI is heavily dependent on post-processing.

71552	2.26 RVU	41.5 minutes total RUC time
76377	0.79 RVU	30.0 minutes total RUC time
Total	3.09 RVU	71.5 minutes RUC total time

If the value of 76377 were reduced by 50%, yielding total RVU of 2.65, this exceeds the survey median of 75557 (2.35 RVU, 65 minutes) and supports the recommendation to use the median to value this service.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 75552

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Diagnostic Radiology How often? Commonly

Specialty Cardiology How often? Commonly

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 2000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?
1,100 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty.
Please explain the rationale for this estimate.

Specialty Diagnostic Radiology Frequency 850 Percentage 77.27 %

Specialty Cardiology Frequency 220 Percentage 20.00 %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States?

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? No

If no, please select another crosswalk and provide a brief rationale. 70553

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Non-Surgical

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:75558 Tracking Number Specialty Society Recommended RVU: **2.60**

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The survey was reviewed by a consensus panel of the specialty societies' RUC committees. The survey data from cardiologists and radiologists were merged and a single recommendation is submitted for each code.

Compelling Evidence for Change: For all of the codes in this family the specialty societies believe that the increased work value is due to new physician work. Increases in the capabilities of the computers used for MR imaging have allowed the development of software for pulse sequences and post-processing algorithms that were not available at the time when the prior codes (CPT Code 75552 - 75556) were developed. Current techniques use myocardial enhancement for characterizing myocardial disease, details which were unknown when these codes were originally valued. Furthermore, contrast studies in the past were done largely to look for cardiac tumors, but now require analysis of each of 17 segments of the heart, adding a whole new level of complexity to the present-day studies.

Current cine images are clearer, providing better spatial and contrast resolution. Therefore, a more complete analysis is now done. The MR system now is used for the full evaluation of the patient's heart. With quicker imaging, more planes are obtained in a shorter time allowing a more detailed evaluation and producing more images. With shorter breath-hold times, sicker patients can now be imaged and analyzed, leading to an increase in overall work and complexity. As the capabilities of MR imaging have become better known, the complexity of patients referred for MR imaging has increased. Flow techniques have become validated in the clinical arena and are now being used to measure and quantify pulmonary-to-systemic flow (Qp/Qs) ratios, velocities (which allow valvular stenosis evaluation), and regurgitant fractions that provide precise assessments of valvular regurgitation. These new techniques have greatly enhanced the diagnostic capabilities of cardiac MR imaging. In the section below, we use several methods to support the validity of the survey median RVU proposed for this code.

Magnitude Estimation and Rank Order:
The specialty societies agreed that median survey value places this code in correct rank order relative to the other 7 cardiac MRI codes. The expert panel reviewed the survey data and agreed that the survey median RVU for this code seems appropriate.

Comparison to Cardiology Codes:

Reference Service 93307 (Echocardiography, transthoracic, real-time with image documentation (2D) with or without M-mode recording; complete, RVU = .92) was most frequently chosen as a reference for 75558. The consensus panel agreed that 75558 required about 3 times as much work as 93307.

Comparison to Other Non-Cardiology Codes

75558 was compared to other MRI codes with similar ratios of RVU/time. These included 71550 (MRI chest w/o contrast, 1.46 RVU, 30 minutes) and 74181 (MRI abdomen w/o contrast, 1.46 RVU, 30 minutes). Recognizing that IWPUT for imaging services has not been validated, the consensus panel noted that IWPUT for 75558, 71550, and 74181 are all in the range of .045 - .049.

Building Block Method:

Incremental work similar to that between the base code 75557 and 75558 includes flow/velocity analyses. This is analogous to the work of 93320 (Doppler echocardiography, pulsed wave and/or continuous wave with spectral display (List separately in addition to codes for echocardiographic imaging); complete, RVU = .38, 15 minutes) .

75557	2.35 RVU	65 minutes total RUC time
93320	0.38 RVU	15 minutes total RUC time
Total	2.73 RVU	80 minutes RUC total time

93320 is an add-on code, so it would not be reduced by 50%. Adding 75557 and 93320 yields 2.73 RVU and 80 minutes. This supports the more conservative survey medians of 2.6 and 70 minutes as valid for 75558.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 75552

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? No

If no, please select another crosswalk and provide a brief rationale. 72157

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Non-Surgical

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:75559 Tracking Number Specialty Society Recommended RVU: **2.95**
Global Period: XXX RUC Recommended RVU: **2.95**

CPT Descriptor: Cardiac magnetic resonance imaging for morphology and function without contrast material; with stress imaging

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 65-year-old hypertensive female with COPD and worsening shortness of breath scheduled for abdominal aortic aneurysm resection. Preoperative assessment for myocardial ischemia with cardiac MR is requested.

Percentage of Survey Respondents who found Vignette to be Typical: 74%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 72%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work:
- Review medical chart and records
- Review any prior imaging studies
- Review protocol with technologist
- Describe procedure to patient and obtain consent as needed
- Review source imaging data
- Supervise administration of anxiolytic where applicable

Description of Intra-Service Work:
- Supervise set-up for different anatomical imaging planes
- Review study images and provide input on whether to obtain additional imaging planes or sequences
- Supervise and/or create reconstructions of the heart and mediastinum using an independent workstation
- Adjust the projection of the reconstructions to optimize visualization of anatomy or pathology
- Interpret the source and reformatted images resulting from the study, typically including cine review with the following specific activities:
  - Evaluate the morphological findings in multiple planes
  - Assess biventricular function with ejection fraction and characterization of wall motion abnormalities
  - Evaluate multiple cardiac segments at incremental levels of stress for abnormal wall motion
- Compare to all pertinent available prior studies

Description of Post-Service Work:
- Review and sign report
- Discuss findings with referring physician

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The survey was reviewed by a consensus panel of the specialty societies' RUC committees. The survey data from cardiologists and radiologists were merged and a single recommendation is submitted for each code.

Compelling Evidence for Change: For all of the codes in this family the specialty societies believe that the increased work value is due to new physician work. Increases in the capabilities of the computers used for MR imaging have allowed the development of software for pulse sequences and post-processing algorithms that were not available at the time when the prior codes (CPT Code 75552 - 75556) were developed. Current techniques use myocardial enhancement for characterizing myocardial disease, details which were unknown when these codes were originally valued. Furthermore, contrast studies in the past were done largely to look for cardiac tumors, but now require analysis of each of 17 segments of the heart, adding a whole new level of complexity to the present-day studies.

Current cine images are clearer, providing better spatial and contrast resolution. Therefore, a more complete analysis is now done. The MR system now is used for the full evaluation of the patient's heart. With quicker imaging, more planes are obtained in a shorter time allowing a more detailed evaluation and producing more images. With shorter breath-hold times, sicker patients can now be imaged and analyzed, leading to an increase in overall work and complexity. As the capabilities of MR imaging have become better known, the complexity of patients referred for MR imaging has increased. Flow techniques have become validated in the clinical arena and are now being used to measure and quantify pulmonary-to-systemic flow (Qp/Qs) ratios, velocities (which allow valvular stenosis evaluation), and regurgitant fractions that provide precise assessments of valvular regurgitation. These new techniques have greatly enhanced the diagnostic capabilities of cardiac MR imaging. In the section below, we use several methods to support the validity of the survey median RVU proposed for this code.

Magnitude Estimation and Rank Order:
The specialty societies agreed that median survey value places this code in correct rank order relative to the other 7 cardiac MRI codes. The expert panel reviewed the survey data and agreed that the survey median RVU for this code seems appropriate.

Comparison to Other Codes

93350 (Echocardiography, transthoracic, real-time with image documentation (2D), with or without M-mode recording, during rest and cardiovascular stress test using treadmill, bicycle exercise and/or pharmacologically induced stress, with interpretation and report) was most frequently selected as the reference for 75559. The consensus panel agreed that the work of 93350 (1.48 RVU) was about half that of 75559 (survey median 2.95 RVU). (93350 does NOT include the work of monitoring the stress treadmill test.)

75559 was compared to other MRI codes with similar ratios of RVU/time. These included 71550 (MRI chest w/o contrast, 1.46 RVU, 30 minutes) and 73721 (MRI, any joint of lower extremity; w/o contrast, 1.35 RVU, 20 minutes). Recognizing that IWPUT for imaging services has not been validated, the consensus panel noted that IWPUT for 75559, 71550, and 73721 are all in the range of .046 - .049.

Building Block Method:

The incremental work of interpreting images at rest versus at rest and with exercise has been previously assessed by the RUC. Specifically, 78478 is a nuclear cardiology imaging add-on code used when stress imaging is added to rest imaging (RVU = .5). Also, 93350 (stress echo, 1.48 RVU) is .56 RVU higher than 93307 (rest echo, .92 RVU). These values support the survey median for 75559 of 2.95, which is .6 higher than the 75557 base code (2.35 RVU).

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

The number of possible diagnosis and/or the number of management options that must be considered	3.96	2.56
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	4.10	2.94
Urgency of medical decision making	3.96	3.63

Technical Skill/Physical Effort (Mean)

Technical skill required	4.49	2.88
Physical effort required	3.27	2.31

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	3.71	2.63

Outcome depends on the skill and judgment of physician	4.49	3.44
Estimated risk of malpractice suit with poor outcome	3.90	2.88

INTENSITY/COMPLEXITY MEASURES	CPT Code	Reference Service 1
Time Segments (Mean)		
Pre-Service intensity/complexity	3.39	2.69
Intra-Service intensity/complexity	4.53	3.19
Post-Service intensity/complexity	3.78	2.69

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*
The survey was reviewed by a consensus panel of the specialty societies' RUC committees. The survey data from cardiologists and radiologists were merged and a single recommendation is submitted for each code.

Compelling Evidence for Change: For all of the codes in this family the specialty societies believe that the increased work value is due to new physician work. Increases in the capabilities of the computers used for MR imaging have allowed the development of software for pulse sequences and post-processing algorithms that were not available at the time when the prior codes (CPT Code 75552 - 75556) were developed. Current techniques use myocardial enhancement for characterizing myocardial disease, details which were unknown when these codes were originally valued. Furthermore, contrast studies in the past were done largely to look for cardiac tumors, but now require analysis of each of 17 segments of the heart, adding a whole new level of complexity to the present-day studies.

Current cine images are clearer, providing better spatial and contrast resolution. Therefore, a more complete analysis is now done. The MR system now is used for the full evaluation of the patient's heart. With quicker imaging, more planes are obtained in a shorter time allowing a more detailed evaluation and producing more images. With shorter breath-hold times, sicker patients can now be imaged and analyzed, leading to an increase in overall work and complexity. As the capabilities of MR imaging have become better known, the complexity of patients referred for MR imaging has increased. Flow techniques have become validated in the clinical arena and are now being used to measure and quantify pulmonary-to-systemic flow (Qp/Qs) ratios, velocities (which allow valvular stenosis evaluation), and regurgitant fractions that provide precise assessments of valvular regurgitation. These new techniques have greatly enhanced the diagnostic capabilities of cardiac MR imaging. In the section below, we use several methods to support the validity of the survey median RVU proposed for this code.

Magnitude Estimation and Rank Order:
The specialty societies agreed that median survey value places this code in correct rank order relative to the other 7 cardiac MRI codes. The expert panel reviewed the survey data and agreed that the survey median RVU for this code seems appropriate.

Comparison to Other Codes

93350 (Echocardiography, transthoracic, real-time with image documentation (2D), with or without M-mode recording, during rest and cardiovascular stress test using treadmill, bicycle exercise and/or pharmacologically induced stress, with interpretation and report) was most frequently selected as the reference for 75560. The consensus panel agreed that the work of 75560 (survey median 3.0 RVU) was more than twice that of 93350 (1.48 RVU).

75560 was compared to other MRI codes with similar ratios of RVU/time. These included 71550 (MRI chest w/o contrast, 1.46 RVU, 30 minutes) and 74181 (MRI abdomen w/o contrast, 1.46 RVU, 30 minutes). Recognizing that IWPUT for imaging services has not been validated, the consensus panel noted that IWPUT for 75560 (.042) is less than IWPUT for 71550, and (both .049).

Building Block Method:

The incremental work of velocity/flow analysis (93320) for echo is .38, and the incremental value of imaging at stress for echo or nuclear images is .5 - .56, as discussed in the SOR for 73555X3. Adding these to the survey median RVU for the base code 75557 would yield 2.35 + .38 + .5 = 3.23. By this analysis, the survey median for 75560 of 3.0 is conservative. Similarly, adding the increments between 75557 and 75558 (2.6 - 2.35 =.25) and between 75557 and 75559 (2.95 - 2.35 = .6) would yield 2.35 + .25 + .6 = 3.2. This also suggests the survey median for 75560 of 3.0 is conservative.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☒ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☒ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 75553

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Cardiology How often? Commonly

Specialty Radiology How often? Commonly

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 4000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate.

Specialty Cardiology	Frequency 2000	Percentage 50.00 %
Specialty Radiology	Frequency 2000	Percentage 50.00 %
Specialty	Frequency	Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?
2,500 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty.
Please explain the rationale for this estimate.

Specialty Cardiology	Frequency 1500	Percentage 60.00 %
Specialty Radiology	Frequency 1000	Percentage 40.00 %
Specialty	Frequency 0	Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? No

If no, please select another crosswalk and provide a brief rationale. 99205

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Non-Surgical

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:75561 Tracking Number Specialty Society Recommended RVU: **2.60**
Global Period: XXX RUC Recommended RVU: **2.60**

CPT Descriptor: Cardiac magnetic resonance imaging for morphology and function without contrast material(s), followed by contrast material(s) and further sequences;

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 55-year-old male with multi-vessel coronary artery disease and severely reduced left ventricular systolic function is scheduled for bypass surgery. A cardiac MRI with contrast material is scheduled to assess cardiac myocardial viability prior to coronary bypass surgery.

Percentage of Survey Respondents who found Vignette to be Typical: 86%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 66.67%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work:
Review medical chart and records
- Review any prior imaging studies
- Review protocol with technologist
- Describe procedure to patient and obtain consent as needed
- Review source imaging data
- Supervise administration of anxiolytic where applicable

Description of Intra-Service Work:
\• Supervise set-up for different anatomical imaging planes
- Review study images and provide input on whether to obtain additional imaging planes or sequences
- Supervise and/or create reconstructions of the heart and mediastinum using an independent workstation
- Adjust the projection of the reconstructions to optimize visualization of anatomy or pathology
- Interpret source and reformatted images resulting from the study, typically including cine review with the following specific activities:
  - o Evaluate the morphological findings in multiple planes
  - o Assess biventricular function with ejection fraction and characterization of wall motion abnormalities
  - o Interpret pre- and post-contrast images to assess myocardial viability
- Compare to all pertinent available prior studies
- Dictate report for medical record

Description of Post-Service Work:
- Review and sign report
- Discuss findings with referring physician

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*
The survey was reviewed by a consensus panel of the specialty societies' RUC committees. The survey data from cardiologists and radiologists were merged and a single recommendation is submitted for each code.

Compelling Evidence for Change: For all of the codes in this family the specialty societies believe that the increased work value is due to new physician work. Increases in the capabilities of the computers used for MR imaging have allowed the development of software for pulse sequences and post-processing algorithms that were not available at the time when the prior codes (CPT Code 75552 – 75556) were developed. Current techniques use myocardial enhancement for characterizing myocardial disease, details which were unknown when these codes were originally valued. Furthermore, contrast studies in the past were done largely to look for cardiac tumors, but now require analysis of each of 17 segments of the heart, adding a whole new level of complexity to the present-day studies.

Current cine images are clearer, providing better spatial and contrast resolution. Therefore, a more complete analysis is now done. The MR system now is used for the full evaluation of the patient's heart. With quicker imaging, more planes are obtained in a shorter time allowing a more detailed evaluation and producing more images. With shorter breath-hold times, sicker patients can now be imaged and analyzed, leading to an increase in overall work and complexity. As the capabilities of MR imaging have become better known, the complexity of patients referred for MR imaging has increased. Flow techniques have become validated in the clinical arena and are now being used to measure and quantify pulmonary-to-systemic flow (Qp/Qs) ratios, velocities (which allow valvular stenosis evaluation), and regurgitant fractions that provide precise assessments of valvular regurgitation. These new techniques have greatly enhanced the diagnostic capabilities of cardiac MR imaging. In the section below, we use several methods to support the validity of the survey median RVU proposed for this code.

Magnitude Estimation and Rank Order:
The specialty societies agreed that median survey value places this code in correct rank order relative to the other 7 cardiac MRI codes. The expert panel reviewed the survey data and agreed that the survey median RVU for this code seems appropriate.

Comparison to other Codes

Reference Service 74183 (Magnetic resonance (eg, proton) imaging, abdomen; without contrast material(s), followed by with contrast material(s) and further sequences) with 2.26 RVU and 50 minutes of RUC time was most frequently chosen

as the reference code for 75561. The ratio of RVU/time ratio (2.26/50 minutes) for 74183 is similar to the ratio of survey medians for 75561 (2.75 RVU/70 minutes)

75561 was compared to other MRI codes with similar ratios of RVU/time. These included 71550 (MRI chest w/o contrast, 1.46 RVU, 30 minutes) and 74181 (MRI abdomen w/o contrast, 1.46 RVU, 30 minutes). Recognizing that IWPUT for imaging services has not been validated, the consensus panel noted that IWPUT for 75561, 71550, and 74181 are all .049. Also, the recommended value for 75561 is conservative compared to 71551 (MRI chest with contrast, 1.73 RVU, 45 minutes) and 74182 (MRI abdomen with contrast, 1.73 RVU, 45 minutes) with IWPUTs of .051 - .059.

Building Block Method

The incremental work required for imaging with contrast (75561) compared to without contrast (75557) has previously been evaluated by the RUC. Examples include 71550 vs 71551 (MRI chest without versus with contrast, .27 RVU difference), 74181 vs 74182 (MRI abdomen without versus with contrast, .27 RVU difference), and 70551 vs 7052 (MRI brain without versus with contrast, .3 RVU difference). Finally, the incremental work between cardiac MRI without versus with contrast was valued previously (2002) at .4 RVU. If the survey median RVU for 75557 (2.35) is used as a base, adding an increment of .27 - 4 yields a value of 2.62 - 2.75, close to the survey median for 75561 of 2.75.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

Post-Service intensity/complexity	2.64	2.91

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*
The survey was reviewed by a consensus panel of the specialty societies' RUC committees. The survey data from cardiologists and radiologists were merged and a single recommendation is submitted for each code.

Compelling Evidence for Change: For all of the codes in this family the specialty societies believe that the increased work value is due to new physician work. Increases in the capabilities of the computers used for MR imaging have allowed the development of software for pulse sequences and post-processing algorithms that were not available at the time when the prior codes (CPT Code 75552 - 75556) were developed. Current techniques use myocardial enhancement for characterizing myocardial disease, details which were unknown when these codes were originally valued. Furthermore, contrast studies in the past were done largely to look for cardiac tumors, but now require analysis of each of 17 segments of the heart, adding a whole new level of complexity to the present-day studies.

Current cine images are clearer, providing better spatial and contrast resolution. Therefore, a more complete analysis is now done. The MR system now is used for the full evaluation of the patient's heart. With quicker imaging, more planes are obtained in a shorter time allowing a more detailed evaluation and producing more images. With shorter breath-hold times, sicker patients can now be imaged and analyzed, leading to an increase in overall work and complexity. As the capabilities of MR imaging have become better known, the complexity of patients referred for MR imaging has increased. Flow techniques have become validated in the clinical arena and are now being used to measure and quantify pulmonary-to-systemic flow (Qp/Qs) ratios, velocities (which allow valvular stenosis evaluation), and regurgitant fractions that provide precise assessments of valvular regurgitation. These new techniques have greatly enhanced the diagnostic capabilities of cardiac MR imaging. In the section below, we use several methods to support the validity of the survey median RVU proposed for this code.

Magnitude Estimation and Rank Order:
The specialty societies agreed that median survey value places this code in correct rank order relative to the other 7 cardiac MRI codes. The expert panel reviewed the survey data and agreed that the survey median RVU for this code seems appropriate.

Comparison to other Codes

Reference Service 74183 (Magnetic resonance (eg, proton) imaging, abdomen; without contrast material(s), followed by with contrast material(s) and further sequences) with 2.26 RVU and 50 minutes of RUC time was chosen as the

reference code for 75562. The RVU/time ratio of 2.26/50 minutes is similar to the survey medians for 75562 (2.86 RVU/80 minutes).

75562 was compared to other MRI codes with similar ratios of RVU/time. These included 71550 (MRI chest w/o contrast, 1.46 RVU, 30 minutes) and 73721(MRI lower extremity w/o contrast. 1.35 RVU, 20 minutes) recognizing that IWPUT for imaging services has not been validated, the consensus panel noted that IWPUT for 75562 (.042) is less than that of 71550 (.049). Also, the recommended value for 75562 is conservative compared to 71551 (MRI chest with contrast, 1.73 RVU, 45 minutes) and 74182 (MRI abdomen with contrast, 1.73 RVU, 45 minutes) with IWPUTs of .051 - .059.

Building Block Methods
The incremental work of 75562 compared to 75561 would be expected to be similar to the difference between 75557 and 75558, which was .25. By this measure the difference in survey medians between 75561 and 75562 of only .11 is conservative. If 75561 is used as the base code (survey median RVU = 2.75) and the value of 93320 (echo Doppler flow analysis, .38 RVU) is added (as discussed in the SOR for 75558), the sum of 3.13 far exceeds the survey median of 2.86. The consensus panel agreed that either building block approach yields a value higher than the survey median, suggesting that the survey median is a conservative value.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 75554

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? No

If no, please select another crosswalk and provide a brief rationale. 95872

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Non-Surgical

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:75563 Tracking Number Specialty Society Recommended RVU: **3.00**
Global Period: XXX RUC Recommended RVU: **3.00**

CPT Descriptor: Cardiac magnetic resonance imaging for morphology and function without contrast material(s), followed by contrast material(s) and further sequences; with stress imaging

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 75-year-old diabetic male with new onset chest pain has known severe, diffuse, three vessel coronary artery diseases, status post coronary artery bypass surgery and known saphenous vein graft disease, referred for adenosine stress to determine the culprit lesion for possible cardiac intervention depending on the remaining viable myocardium at risk.

Percentage of Survey Respondents who found Vignette to be Typical: 87.50%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 71%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work:
Review medical chart and records
- Review any prior imaging studies
- Review protocol with technologist
- Describe procedure to patient and obtain consent as needed
- Review source imaging data
- Supervise administration of anxiolytic where applicable

Description of Intra-Service Work:
- Supervise set-up for different anatomical imaging planes
- Review study images and provide input on whether to obtain additional imaging planes or sequences
- Supervise and/or create reconstructions of the heart and mediastinum using an independent workstation
- Adjust the projection of the reconstructions to optimize visualization of anatomy or pathology
- Interpret the source and reformatted images resulting from the study, typically including cine review with the following specific activities:
  - o Evaluate the morphological findings in multiple planes
  - o
  - o Assess biventricular function with ejection fraction and characterization of wall motion abnormalities
  - o Evaluate multiple cardiac segments at incremental levels of stress for abnormal wall motion and viability
  - o Interpret pre- and post-contrast images to assess myocardial ischemia and viability
- Compare to all pertinent available prior studies
- Dictate report for medical record

Description of Post-Service Work:
- Review and sign report
- Discuss findings with referring physician

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The survey was reviewed by a consensus panel of the specialty societies' RUC committees. The survey data from cardiologists and radiologists were merged and a single recommendation is submitted for each code.

Compelling Evidence for Change: For all of the codes in this family the specialty societies believe that the increased work value is due to new physician work. Increases in the capabilities of the computers used for MR imaging have allowed the development of software for pulse sequences and post-processing algorithms that were not available at the time when the prior codes (CPT Code 75552 - 75556) were developed. Current techniques use myocardial enhancement for characterizing myocardial disease, details which were unknown when these codes were originally valued. Furthermore, contrast studies in the past were done largely to look for cardiac tumors, but now require analysis of each of 17 segments of the heart, adding a whole new level of complexity to the present-day studies.

Current cine images are clearer, providing better spatial and contrast resolution. Therefore, a more complete analysis is now done. The MR system now is used for the full evaluation of the patient's heart. With quicker imaging, more planes are obtained in a shorter time allowing a more detailed evaluation and producing more images. With shorter breath-hold times, sicker patients can now be imaged and analyzed, leading to an increase in overall work and complexity. As the capabilities of MR imaging have become better known, the complexity of patients referred for MR imaging has increased. Flow techniques have become validated in the clinical arena and are now being used to measure and quantify pulmonary-to-systemic flow (Qp/Qs) ratios, velocities (which allow valvular stenosis evaluation), and regurgitant fractions that provide precise assessments of valvular regurgitation. These new techniques have greatly enhanced the diagnostic capabilities of cardiac MR imaging. In the section below, we use several methods to support the validity of the survey median RVU proposed for this code.

Magnitude Estimation and Rank Order:
The specialty societies agreed that median survey value places this code in correct rank order relative to the other 7 cardiac MRI codes. The expert panel reviewed the survey data and agreed that the survey median RVU for this code seems appropriate.

Comparison to other codes

Reference Service 78492 (Myocardial imaging, positron emission tomography (PET), perfusion; multiple studies at rest and/or stress) was most frequently chosen as the reference code for 75563. The ratio of work/time (1.87 RVU/55 minutes) of 78492 is higher than the work/time of 75563 as surveyed at 3.0/82.5 minutes.

75563 was compared to other MRI codes with similar ratios of RVU/time. These included 71550 (MRI chest w/o contrast, 1.46 RVU, 30 minutes) and 74181 (MRI abdomen w/o contrast, 1.46 RVU, 30 minutes). Recognizing that IWPUT for imaging services has not been validated, the consensus panel noted that IWPUT for 75563 (.040) is less than that of 71550 and 74181 (.049). Also, the recommended value for 75563 is conservative compared to 71551 (MRI chest with contrast, 1.73 RVU, 45 minutes) and 74182 (MRI abdomen with contrast, 1.73 RVU, 45 minutes) with IWPUTs of .051 - .059.

Building Block Method

The incremental work of interpreting images at rest versus at rest and with exercise has been previously assessed by the RUC. Specifically, 78478 is a nuclear cardiology imaging add-on code used when stress imaging is added to rest imaging (RVU = .5). Also, 93350 (stress echo, 1.48 RVU) is .56 RVU higher than 93307 (rest echo, .92 RVU). If 75561 is the base code (survey median 2.75 RVU) and one adds an increment of .5, the sum is 3.25, higher than the survey median of 3.

Similarly, if 75559 (MRI cardiac stress without contrast) is used as the base code (survey median 2.95) and the incremental work associated with contrast vs no contrast (.3 RVU, as discussed in the SOR for 75561), the sum of 3.25 is higher than the survey median for 75563 of 3.0.

Finally, if 75559 (MRI cardiac stress without contrast) is used as the base code (survey median 2.95) and the difference between 75557 and 75560 is used to approximate the incremental work of contrast (.4 RVU), the sum of 3.35 is higher than the survey median for 75563 of 3.0.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☒ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☒ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

** See below survey data table on first page.

Modifier -51 Exempt Status

Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:

Is this new/revised procedure considered to be a new technology or service? Yes

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
78492	XXX	1.86	RUC Time

CPT Descriptor Myocardial imaging, positron emission tomography (PET), perfusion; multiple studies at rest and/or stress

KEY MPC COMPARISON CODES:

Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Most Recent Medicare Utilization	Work RVU	Time Source
71550	XXX	7,880	1.46	RUC Time

CPT Descriptor 1 Magnetic resonance (eg, proton) imaging, chest (eg, for evaluation of hilar and mediastinal lymphadenopathy); without contrast material(s)

MPC CPT Code 2	Global	Most Recent Medicare Utilization	Work RVU	Time Source
73721	XXX	555,923	1.35	RUC Time

CPT Descriptor 2 Magnetic resonance (eg, proton) imaging, any joint of lower extremity; without contrast material

Other Reference CPT Code | Global | Work RVU | Time Source

CPT Descriptor

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 12 **% of respondents:** 26.0 %

TIME ESTIMATES (Median)	CPT Code: 75564	Key Reference CPT Code: 78492	Source of Time RUC Time
Median Pre-Service Time	15.00	0.00	
Median Intra-Service Time	60.00	55.00	
Median Immediate Post-service Time	10.00	0.00	
Median Critical Care Time	0.0	0.00	
Median Other Hospital Visit Time	0.0	0.00	
Median Discharge Day Management Time	0.0	0.00	
Median Office Visit Time	0.0	0.00	
Prolonged Services Time	0.0	0.00	
Median Total Time	**85.00**	**55.00**	
Other time if appropriate			

INTENSITY/COMPLEXITY MEASURES (Mean)

Mental Effort and Judgment (Mean)

The number of possible diagnosis and/or the number of management options that must be considered	4.37	2.50
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	4.52	2.58
Urgency of medical decision making	4.27	3.50

Technical Skill/Physical Effort (Mean)

Technical skill required	4.57	2.92
Physical effort required	3.53	2.25

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	3.70	2.25
Outcome depends on the skill and judgment of physician	4.63	2.42

Estimated risk of malpractice suit with poor outcome	3.87	3.08

INTENSITY/COMPLEXITY MEASURES	CPT Code	Reference Service 1
Time Segments (Mean)		
Pre-Service intensity/complexity	3.89	2.67
Intra-Service intensity/complexity	4.76	3.00
Post-Service intensity/complexity	4.04	2.67

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*
The survey was reviewed by a consensus panel of the specialty societies' RUC committees. The survey data from cardiologists and radiologists were merged and a single recommendation is submitted for each code.

Compelling Evidence for Change: For all of the codes in this family the specialty societies believe that the increased work value is due to new physician work. Increases in the capabilities of the computers used for MR imaging have allowed the development of software for pulse sequences and post-processing algorithms that were not available at the time when the prior codes (CPT Code 75552 - 75556) were developed. Current techniques use myocardial enhancement for characterizing myocardial disease, details which were unknown when these codes were originally valued. Furthermore, contrast studies in the past were done largely to look for cardiac tumors, but now require analysis of each of 17 segments of the heart, adding a whole new level of complexity to the present-day studies.

Current cine images are clearer, providing better spatial and contrast resolution. Therefore, a more complete analysis is now done. The MR system now is used for the full evaluation of the patient's heart. With quicker imaging, more planes are obtained in a shorter time allowing a more detailed evaluation and producing more images. With shorter breath-hold times, sicker patients can now be imaged and analyzed, leading to an increase in overall work and complexity. As the capabilities of MR imaging have become better known, the complexity of patients referred for MR imaging has increased. Flow techniques have become validated in the clinical arena and are now being used to measure and quantify pulmonary-to-systemic flow (Qp/Qs) ratios, velocities (which allow valvular stenosis evaluation), and regurgitant fractions that provide precise assessments of valvular regurgitation. These new techniques have greatly enhanced the diagnostic capabilities of cardiac MR imaging. In the section below, we use several methods to support the validity of the survey median RVU proposed for this code.

Magnitude Estimation and Rank Order:
The specialty societies agreed that median survey value places this code in correct rank order relative to the other 7 cardiac MRI codes. The expert panel reviewed the survey data and agreed that the survey median RVU for this code seems appropriate.

Comparison to other codes

Reference Service 78492 (Myocardial imaging, positron emission tomography (PET), perfusion; multiple studies at rest and/or stress) was most frequently chosen as the reference code for 75563. The consensus panel agreed that 75564 (survey median 3.35 RVU) was more than twice the work of 78492.

75564 was compared to other MRI codes with similar ratios of RVU/time. These included 71550 (MRI chest w/o contrast, 1.46 RVU, 30 minutes) and 74181 (MRI abdomen w/o contrast, 1.46 RVU, 30 minutes). Recognizing that IWPUT for imaging services has not been validated, the consensus panel noted that IWPUT for 75564 (.045) is less than that of 71550 and 74181 (.049). Also, the recommended value for 75564 is conservative compared to 71551 (MRI chest with contrast, 1.73 RVU, 45 minutes) and 74182 (MRI abdomen with contrast, 1.73 RVU, 45 minutes) with IWPUTs of .051 - .059.

Building Block Method

If 75560 is used as the base code (survey median 3.0) and the increment between non-cardiac MRI codes associated with contrast versus no contrast is added (.3) (rationale discussed in SOR for 75561), the sum of 3.3 confirms the survey median of 75564 of 3.35.

If 75560 is used as the base code (survey median 3.0) and the increment between 75557 and 75561 is added (.4 RVU), the sum is 3.4, which further confirms the survey median of 75564 of 3.35.

If 75561 is used as the base code (survey median 2.75) and to this is added the increment associated with exercise (.5 RVU) and flow/velocity mapping (.38 RVU), the sum of 2.75 + .5 +.38 = 3.63 exceeds the survey median for 75564 of 3.35.

Thus, all 3 building block methods support the survey median of 3.35 RVU.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☒ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☒ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 75554

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Cardiology	How often? Commonly
Specialty Radiology	How often? Commonly
Specialty	How often?

Estimate the number of times this service might be provided nationally in a one-year period? 5000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate.

Specialty Cardiology	Frequency 2800	Percentage 56.00 %
Specialty Radiology	Frequency 1500	Percentage 30.00 %
Specialty	Frequency 0	Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 5,000 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty.
Please explain the rationale for this estimate.

Specialty Cardiology	Frequency 2800	Percentage 56.00 %
Specialty Radiology	Frequency 1500	Percentage 30.00 %
Specialty	Frequency	Percentage %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? No

If no, please select another crosswalk and provide a brief rationale. 33233

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Non-Surgical

AMA/Specialty Society Update Process
PERC Summary of Recommendation
XXX Day Global Period
Non Facility Direct Inputs
75557

CPT Long Descriptor: Cardiac magnetic resonance imaging for morphology and function without contrast material;

Sample Size: 600 Response Rate: (%): 11.8 Global Period: XXX

Geographic Practice Setting %: Rural 10 Suburban 24 Urban 66

Type of Practice %:
0 Solo Practice
30 Single Specialty Group
20 Multispecialty Group
50 Medical School Faculty Practice Plan

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The American College of Cardiology (ACC) convened representatives of both the ACC and the Society for Cardiovascular Magnetic Resonance (SCMR) to discuss practice expense inputs. Individuals who participated included cardiologists from across the country representing cardiovascular outpatient centers and private practices. The representatives met via conference call and one (1) face to face meeting to review the data. Survey data from the American College of Radiology (ACR) collected via a similar process was merged into a single recommendation for each code. The recommendations were presented to the ACC's Cardiovascular Relative Value Update Committee (CVRUC). The CVRUC contains 15 representatives from all cardiovascular specialties and general cardiologists who practice in a variety of settings. The CVRUC reviewed the data, standard PERC approved packages and PERC approved inputs for similar procedures and arrived at the attached recommendations via consensus.

Please describe the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

During the pre-service period an MR Technologist typically performs the following activities:

- Review/read x-ray, lab, and pathology reports

Intra-Service Clinical Labor Activities:

During the intra-service period a MR Technologist typically performs the following activities:

- Review charts
- Greet patient and provide gowning
- Obtain vital signs
- Provide pre-service education/obtain consent
- Prepare room, equipment and supplies
- prep chest; apply ekg pads; apply ekg leads; apply coil
- wrap respirator belt,
- Assist physician during procedure

Post-Service: Clinical Labor Activities

During the post-service period a MR Technologist typically performs the following activities:

- save to optical disk; make copies for referring physician
- Conduct follow-up phone calls with patient/family

See Attached Spreadsheet for Clinical Labor, Medical Supplies, and Medical Equipment.

AMA/Specialty Society Update Process
PERC Summary of Recommendation
XXX Day Global Period
Non Facility Direct Inputs
75564

CPT Long Descriptor: Cardiac magnetic resonance imaging for morphology and function without contrast material(s), followed by contrast material(s) and further sequences; with flow/velocity quantification and stress

Sample Size: 600 Response Rate: (%): 7.5 Global Period: XXX

Geographic Practice Setting %: Rural 9.9 Suburban 29.0 Urban 60.1

Type of Practice %:
- 0 Solo Practice
- 32.0 Single Specialty Group
- 25.8 Multispecialty Group
- 40.2 Medical School Faculty Practice Plan

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The American College of Cardiology (ACC) convened representatives of both the ACC and the Society for Cardiovascular Magnetic Resonance (SCMR) to discuss practice expense inputs. Individuals who participated included cardiologists from across the country representing cardiovascular outpatient centers and private practices. The representatives met via conference call and one (1) face to face meeting to review the data. Survey data from the American College of Radiology (ACR) collected via a similar process was merged into a single recommendation for each code. The recommendations were presented to the ACC's Cardiovascular Relative Value Update Committee (CVRUC). The CVRUC contains 15 representatives from all cardiovascular specialties and general cardiologists who practice in a variety of settings. The CVRUC reviewed the data, standard PERC approved packages and PERC approved inputs for similar procedures and arrived at the attached recommendations via consensus.

Please describe the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

During the pre-service period an MR Technologist staff type typically performs the following activities:

During the pre-service period an RN/LPN/MTA staff type typically performs the following activities:

- Review/read x-ray, lab, and pathology reports

Intra-Service Clinical Labor Activities:

During the pre-service period an MR Technologist staff type typically performs the following activities:

- Review charts
- Greet patient and provide gowning
- Provide pre-service education/obtain consent
- Prepare room, equipment and supplies
- start 2 iv's, explain test ,prep chest apply ekg pads and leads
- apply coil engage resp belt,get pt comfortable
- give pt headphones, advance into scanner, maintain communication w/ insrtuctions. Scan basic prot. Bring patint out to hook up to bp cuff and sao2 turn invivo monitor on.
- Explain test to pt. advance pt into scanner. Scan stress prot. Inject contrast. Exit patient
- unhook all equipment from patient
- network and save exam to optical disk

During the intra-service period a RN/LPN/MTA staff type typically performs the following activities:

- set up meds pump. Instruct and discuss side effects w/pt. mix meds
- get baseline vitals both in and out of scanner.monitor vitals until stress testing is complete.
- recover pt to baseline.
- Administer any additional meds if needed
- Assist physician during procedure

Post-Service: Clinical Labor Activities

During the pre-service period an MR Technologist staff type typically performs the following activities:

- Save to optical disk; make copies for referring physician
- Conduct follow-up phone calls with patient/family

See Attached Spreadsheet for Clinical Labor, Medical Supplies, and Medical Equipment.

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

February 2007

Brain and Cerebrospinal Fluid Imaging

The CPT Editorial Panel edited the Nervous System Section, CPT codes 78600-78699, to provide a clearer description of the services describing the number of views captured in various brain imaging services based on current medical practice. The CPT Editorial Panel edited five codes and deleted one code. The CPT Editorial Panel made editorial changes to the descriptors, which did not impact the physician work, however the specialty society recommended edits to the practice expense inputs.

1555

Practice Expense:
The RUC recommends modifications to the practice expense for CPT codes 78600 *Brain imaging, less than four static views*, 78606 *Brain imaging, minimum four static views; with vascular flow* and 78610 *Brain imaging, vascular flow only*. After review of the number of films for the following brain imaging procedures, the RUC recommends the following changes to the direct practice expense inputs:

CPT 78600 reduce the number of films and developer from (2) in to (1)
CPT 78606 reduce the number of films and developer from currently listed (4) to (2)
CPT 78610 reduce the number of films and developer from currently listed (2) to (1)

All other practice expense inputs for this family of codes are consistent with the revised descriptors.

The rationale for these changes is:
- Less than or greater than four views would require (1) one film and developer
- Adding flow to images requires one additional film and developer and is consistent with other nuclear medicine SPECT single study procedures where two (2) films and developer are required.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
e▲78600	K1	Brain imaging, ~~limited procedure~~ less than four static views; ~~static~~	XXX	0.44 (No Change)
e▲78601	K2	with vascular flow	XXX	0.51 (No Change)
e▲78605	K3	Brain imaging, ~~complete study~~ minimum four static views; ~~static~~	XXX	0.53 (No Change)

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

April 2007

PET Imaging

At its February 2007 meeting, the CPT Editorial Panel revised a family of position emission tomography services, 78811-78816, by removing the words "tumor imaging" from the current descriptors. With this change, these services may be reported for other indications, such as for infection. The specialty society purported that the coding change (removing the indication for the procedure) was editorial in nature, consistent with CPT policy, and is in concert with most other codes in the 70000 series. The Panel referred the determination of potential changes to physician work as a result of the descriptor change to the RUC for consideration At the April 2007 RUC meeting, the RUC concluded, based on a review of the coding proposal and the specialty society presentation, that the removal of "tumor imaging" from CPT codes 78811-78816 is editorial in nature and does not require any review of the physician work involved in the service.

1557

The RUC recommends that the current work RVUs be maintained for CPT codes 78811-78816.

New Technology

The services described in CPT codes 78811-78816 do not involve new technology, however, the services do meet the criteria for inclusion on the new technology list because they include established technology used in a new way. **The RUC recommends that codes 78811-78816 be added to the new technology list to review potential changes in valuation after experience in reporting of these services has occurred.**

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
(78810 has been deleted. To report, see 78811-78813) *(For PET of brain, see 78608, 78609)* *(For PET myocardial imaging, see 78459, 78491, 78492)*

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

February 2007

Manual Microdissection

The CPT Editorial Panel created two new codes to differentiate manual and laser microdissection, which was previously captured in one microdissection code, regardless of the method used.

The RUC reviewed the survey data for codes 88381 *Microdissection (ie, sample preparation of microscopically identified target); manual* and 88380 *Microdissection (ie, sample preparation of microscopically identified target); laser capture* and determined that the median work relative value units and physician times were appropriate. The RUC compared code 88381 to the survey reference code 88360 *Morphometric analysis, tumor immunohistochemistry (eg, Her-2/neu, estrogen receptor/progesterone receptor), quantitative or semiquantitative, each antibody; manual* (RVU= 1.10, intra-service time = 35 minutes) and determined that the physician work involved, the intensity and complexity, technical skill and physical effort was slightly higher to perform 88381 compared to the reference service. Code 88381 is more intense than the reference service due to the precise dissection of tissue required and the avoidance of contamination with other DNA during dissection. Additionally, the RUC determined that although the intra-service time is slightly lower for 88381 compared to the reference service, the intensity and complexity of the dissection involved in the procedure is higher. The RUC recommends an intra-service time of 30 minutes for code 88381. **The RUC recommends a work RVU of 1.18 for code 88381.**

The RUC compared code 88380 to the survey reference code 88368 *Morphometric analysis, in situ hybridization, (quantitative or semi-quantitative) each probe; manual* (work RVU=1.40, intra-service time = 45 minutes) and determined that the physician work involved, the intensity and complexity, technical skill and physical effort was slightly higher to perform 88380 compared to the reference service because the laser capture requires more precision than manual microdissection. Additionally, the RUC determined that the survey median intra-service time of 45 minutes is the same as reference code 88368 and is comparably appropriate for code 88380. Although the intra-service times for 88380 and 88368 are identical, the intensity and complexity, mental effort and judgment and technical skill involved to perform the precise dissection of 88380 is higher. Therefore, the RUC recommends a slightly higher work RVU for code 88380. **The RUC recommends a work RVU of 1.56 for code 88380.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

1565

Practice Expense

The RUC reviewed the direct practice expense inputs for these codes and made minor modifications to the clinical labor time for the lab tech and histotech, the number of sterile gloves used and equipment utilized. The final direct practice inputs are attached to this recommendation.

New Technology

Codes 88381 and 88380 represent new technology and the RUC agreed that these codes should be placed on the new technology list to review potential changes in its valuation. **The RUC recommends that codes 88381 and 88380 be added to the list of new technology codes.**

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
▲88380	L1	Microdissection (~~eg, mechanical, laser capture~~ ie, sample preparation of microscopically identified target); laser capture	XXX	1.56
●88381	L2	manual (Do not report 88380 in conjunction with 88381)	XXX	1.18

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:88381 Tracking Number L1 Specialty Society Recommended RVU: **1.18**
Global Period: XXX RUC Recommended RVU: **1.18**

CPT Descriptor: Microdissection (ie, sample preparation of microscopically identified target); manual

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A craniotomy is performed on a 32 year old man with a frontal lobe mass on MRI studies. Two irregular fragments of tissue, (1 x 0.7 x 0.5 and 1.2 x 1.0 x 0.7 cm) are removed, examined grossly, and entirely submitted for fixation and subsequent histologic examination. A diagnosis of glioma is made. Special stains and molecular analysis are requested to resolve tumor classification and guide therapy.

Percentage of Survey Respondents who found Vignette to be Typical: 86%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work:

Description of Intra-Service Work: Following comparison with adjacent stained sections from the same tissue block, areas of glioma are relatively distinct from the background normal brain. The pathologist can separate the tumor from normal-appearing tissue on unstained paraffin sections under a dissecting microscope using a razor blade or scalpel. Tissue from normal and tumor-enriched areas undergo separate DNA preparation and analysis for loss of heterozygosity (LOH) using a panel of simple tandem repeat polymorphic markers directed at specific regions on the short and long arms of chromosomes 1 and 19, respectively. LOH is identified for informative markers in both chromosomal regions tested, indicating a favorable prognosis for this tumor on procarbazine, lomustine, and vincristine therapy.

Description of Post-Service Work:

Outcome depends on the skill and judgment of physician	4.00	3.40

Estimated risk of malpractice suit with poor outcome	2.60	2.40

INTENSITY/COMPLEXITY MEASURES	CPT Code	Reference Service 1
Time Segments (Mean)		
Pre-Service intensity/complexity	2.40	2.20
Intra-Service intensity/complexity	3.60	3.20
Post-Service intensity/complexity	2.60	2.20

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Following the survey, the data were reviewed by CAP's relative value workgroup which includes the American Society of Cytopathology (ASC) RUC advisor, representatives from the general and academic pathology community, and members with molecular pathology experience. The relative value workgroup felt that while the range of RVW and time results was symmetrical and internally consistent, producing a supportable median, due to the low response rate, an Expert Panel was required to validate the findings and make official recommendations on the microdissection codes. The Expert Panel included members of CAP's relative value workgroup and the Molecular Pathology Committee. The expert panel was also supplemented by molecular pathologists who actively perform the surveyed service. The panel supported the survey's median RVU of 1.18 based on validity of the internal consistency of the data and the increase in intensity, complexity and technical skill required to perform manual microdissection in comparison to the key reference code.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 88380

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pathology How often? Rarely

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 5000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.

Specialty Pathology Frequency 5000 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 2,500 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States?

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Non-Surgical

Attestation Statement

As a RUC Advisor, I attest that the integrity of the RUC survey and summary of recommendation forms are based on accurate and complete data to the best of my knowledge. As a RUC Advisor, I acknowledge that violations would be addressed by the executive committee (i.e., RUC Chair, AMA Representative and Alternate AMA Representative).

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:88380 Tracking Number L2 Specialty Society Recommended RVU: **1.56**
Global Period: XXX RUC Recommended RVU: **1.56**

CPT Descriptor: Microdissection (ie, sample preparation of microscopically identified target); laser capture

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A craniotomy is performed on a 32 year old man with a frontal lobe mass on MRI studies. Two irregular fragments of tissue, (1 x 0.7 x 0.5 and 1.2 x 1.0 x 0.7 cm) are removed, examined grossly, and entirely submitted for fixation and subsequent histologic examination. A diagnosis of glioma is made. Special stains and molecular analysis are requested to resolve tumor classification and guide therapy.

Percentage of Survey Respondents who found Vignette to be Typical: 80%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work:

Description of Intra-Service Work: Following comparison with adjacent stained sections from the same tissue block, areas of glioma are infiltrating through normal brain tissue and are nearly inseparable. The pathologist performs laser capture microdissection to individually separate tumor cells from the background brain tissue. Tissue from normal and tumor-enriched areas undergo separate DNA preparation and analysis for loss of heterozygosity (LOH) using a panel of simple tandem repeat polymorphic markers directed at specific regions on the short and long arms of chromosomes 1 and 19, respectively. LOH is identified for informative markers in both chromosomal regions tested, indicating a favorable prognosis for this tumor on procarbazine, lomustine, and vincristine therapy.

Description of Post-Service Work:

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Following the survey, the data were reviewed by CAP's relative value workgroup which includes the American Society of Cytopathology (ASC) RUC advisor, representatives from the general and academic pathology community, and members with molecular pathology experience. The relative value workgroup felt that while the range of RVW and time results was symmetrical and consistent in range, producing a supportable median, due to the low response rate, an Expert Panel was required to validate the findings and make official recommendations on the microdissection codes. The Expert Panel included members of CAP's relative value workgroup and the Molecular Pathology Committee. The expert panel was also supplemented by molecular pathologists who actively perform the surveyed service. The panel supported the survey's median RVU of 1.56 based on validity of the internal consistency of the data and the increase in intensity, complexity and technical skill required to perform laser microdissection in comparison to the key reference code. In addition, on survey data, there is a noteworthy increase in RVW for the 8838X2 of 0.38 with an increase in physician time of 15 minutes over the 8818X1 code.

In comparing the surveyed time between the two codes in this family, the 33% increase would supports an increase in RVW for the 8838X2 of 0.39, for a total of 1.57. This further validates the surveyed median value increase between the two codes in this family of 0.38, for a recommended value of 1.56.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 88380

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

April 2007

Immune Globulin Subcutaneous Infusion

In November 2006, the CPT Editorial Panel created three new codes to provide more specificity to current infusion codes. Current infusion codes describe intravenous routes only. Adding "subcutaneous" as a route of infusion allows for more appropriate coding in the clinical setting. Where patients must be monitored for reaction to the immune globulin when it is first introduced.

90769

The RUC reviewed the specialty society's survey results and recommendations for new CPT code 90769, *Subcutaneous infusion for therapy or prophylaxis (specify substance or drug); initial, up to one hour including pumping set up and establishment of subcutaneous infusion site(s).* The specialty society's key reference code 96413 *Chemotherapy administration, intravenous infusion technique; up to 1 hour, single or initial substance/drug* (work RVU = 0.28) was believed to involve more stress, mental effort, and physician judgment than the surveyed code. The specialty's other reference code, 90765, *Intravenous infusion, for therapy, prophylaxis, or diagnosis (specify substance or drug); initial, up to 1 hour* (work RVU = 0.21), was deemed more appropriate. The RUC agreed that the work inherent in new code 90769, is primarily supervisory and identical to the work involved in 90765. **The RUC recommends a physician work RVU of 0.21 for code 90769.** (with pre-service time of 5 minutes, intra-service time of 10 minutes, and post-service time of 2 minutes for CPT)

90770

The RUC reviewed the specialty society's survey results and recommendations for new CPT code 90770, *Subcutaneous infusion for therapy or prophylaxis (specify substance or drug); each additional (list separately in addition to code for primary procedure) (Report 90770 with 90769) (Report 90770 for infusion intervals of greater than 30 minutes beyond one hour increments.* The RUC agreed that the work inherent in the service is primarily supervisory and identical to the work involved in its key reference service 90766, *Intravenous infusion, for therapy, prophylaxis, or diagnosis (specify substance or drug); each additional hour (List separately in addition to code for primary procedure)* (work RVU = 0.18). The RUC agreed that code 90770 required an additional two minutes of physician time, but was less intense than 90766. **The RUC recommends a work RVU of 0.18 for code 90770.** (with pre-service time of 0 minutes, intra-service time of 5 minutes, and post-service time of 0 minutes for 90770)

1585

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association

90771

The specialty society clarified the process of performing CPT 90771, *Subcutaneous infusion for therapy or prophylaxis (specify substance or drug); additional pump set up with establishment of new subcutaneous infusion site(s) (list separately in addition to 90769) (Report 90771 with 90769) (Report 90769 and 90771 only once per encounter).* After considering the specialty society presentation, the RUC determined that there was no physician work involved in performing the service and should be considered practice expense only. **The RUC recommends that 90771 be valued as practice expense only (work RVU = 0.00).**

New Technology: The RUC recommends this family of codes to be added to the new technology list.

Practice Expense

The RUC reviewed the specialty society's practice expense inputs for this new family of CPT codes. The RUC and the specialty agreed that the codes would typically not be billed with an evaluation and management code and therefore required additional clinical labor time for meeting and greeting the patient and for completing post service medical record documentation. In addition, the RUC agreed that there would be no vital signs taken, and no clinical monitoring for the addition of an infusion pump in code 90771, and the mixture of additional drugs would not require as much time as the first batch and reduced the clinical labor time from 7 minutes to 3. The RUC recommends no practice expense inputs for the facility setting and the following attached direct inputs for the non-facility setting.

1586

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
•90769	SS1	Subcutaneous infusion for therapy or prophylaxis (specify substance or drug); initial, up to one hour including pump set up and establishment of subcutaneous infusion site(s) (For infusions of 15 minutes or less use 90772)	XXX	0.21
• +90770	SS2	each additional hour (list separately in addition to code for primary procedure) (Report 90770 with 90769) (Report 90770 for infusion intervals of greater than 30 minutes beyond one hour increments)	ZZZ	0.18
•+90771	SS3	additional pump set up with establishment of new subcutaneous infusion site(s)	ZZZ	0.00 (Practice Expense

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
		(list separately in addition to 90769) (Report 90771 with 90769) (Report 90769 and 90771 only once per encounter)		Only)

1587

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:90769 Tracking Number SS1 Specialty Society Recommended RVU: **0.25**
Global Period: XXX RUC Recommended RVU: **0.21**

CPT Descriptor: Subcutaneous infusion for therapy or prophylaxis (specify substance or drug); initial, up to one hour including pump set up and establishment of subcutaneous infusion site(s). (For infusions of 15 minutes or less use 90772)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: An 11-year-old 88 lb male with X-linked agammaglobulinemia has been receiving immune globulin replacement therapy on a monthly basis via an indwelling catheter due to vascular access issues. He has been unsuccessful at maintaining an indwelling port without infection.

Percentage of Survey Respondents who found Vignette to be Typical: 94%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: Separate from an independently reported evaluation and management service, the patient records are reviewed. The physician reviews the transition dosing to SCIg with staff which will involve administration of 35 mls per week into 4 sites to be infused over 1-2 hours depending upon patient tolerability. The physician determines the number of infusion sites. The volume per site is 12 mls and administration is usually completed within a 2 hour time frame. Informed consent is obtained.

Description of Intra-Service Work: Review of vital signs taken by the nurse, up to 4 times per hour. Patient is examined prior to the infusion. Administration of SCIg involves the insertion of subcutaneous catheter(s) into the subcutaneous tissue of the abdomen, upper buttocks, lateral thigh, lateral hip and/or upper arm. The physician supervises the clincal nurse. After initial vital signs taken by the nurse, the physician double checks the dose. The clinician prepares SCIg for infusion using aseptic technique to draw up a syringe. The syringe or medication cassette containing SCIg is then loaded into a syringe driver, roller cassette or infusion pump, infusion rates are set for drug delivery, and tubing is primed. Then, the clinician assesses the site locations and inserts subcutaneous catheter(s), either single site or multi-site sets into the tissue. Catheter placement is checked to insure accurate location of each catheter in the subcutaneous space and not in the vascular space. Catheters are secured and drug is delivered over an average of 1-2 hours. Once completed, infusion is discontinued and waste is properly disposed. The initial set up and first hour of infusion is reported with 907X1. Each additional hour is reported with 907X2. The patient is examined after the infusion is completed. Vital signs are again reviewed, and a general exam is performed.

Description of Post-Service Work: Since reactions to the medication can happen even the next day, during discharge the patient is reminded of what can normally be expected. Whether the patient's infusion is reported with 907X1 alone, or in addition to 907X2 and 907X3, the patient is discharged with instructions to care for infusion sites and to check for any infection in the area. Medical record documentation is completed.

Modifier -51 Exempt Status

Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:

Is this new/revised procedure considered to be a new technology or service? Yes

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
96413	XXX	0.28	RUC Time

CPT Descriptor Chemotherapy administration, intravenous infusion technique; up to 1 hour, single or initial substance/drug

KEY MPC COMPARISON CODES:

Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Most Recent Medicare Utilization	Work RVU	Time Source
99211	XXX	10,302,555	0.17	RUC Time

CPT Descriptor 1 Office or other outpatient visit for the evaluation and management of an established patient, that may not require the presence of a physician. Usually, the presenting problem(s) are minimal. Typically, 5 minutes are spent performing or supervising these services.

MPC CPT Code 2	Global	Most Recent Medicare Utilization	Work RVU	Time Source
99213	XXX	111,146,496	0.92	RUC Time

CPT Descriptor 2 Office or other outpatient visit for the evaluation and management of an established patient, which requires at least two of these three key components: An expanded problem focused history; An expanded problem

focused examination; Medical decision making of low complexity. Counseling and coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of low to moderate severity. Physicians typically spend 15 minutes face-to-face with the patient and/or family.

Other Reference CPT Code	Global	Work RVU	Time Source
90765	XXX	0.21	**RUC Time**

CPT Descriptor Intravenous infusion, for therapy, prophylaxis, or diagnosis (specify substance or drug); initial up to one hour

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 6 **% of respondents:** 35.2 %

TIME ESTIMATES (Median)	CPT Code: 90769	Key Reference CPT Code: 96413	Source of Time RUC Time

Prolonged Services Time	0.0	0.00	
Median Total Time	**17.00**	**13.00**	
Other time if appropriate			

INTENSITY/COMPLEXITY MEASURES (Mean)

Mental Effort and Judgment (Mean)

The number of possible diagnosis and/or the number of management options that must be considered	4.25	4.33
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	3.87	4.00
Urgency of medical decision making	3.13	2.83

Technical Skill/Physical Effort (Mean)

Technical skill required	3.29	3.00
Physical effort required	2.71	2.33

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	3.53	3.83
Outcome depends on the skill and judgment of physician	3.88	4.50
Estimated risk of malpractice suit with poor outcome	3.18	3.17

INTENSITY/COMPLEXITY MEASURES	CPT Code	Reference Service 1

Time Segments (Mean)

Pre-Service intensity/complexity	3.41	3.50
Intra-Service intensity/complexity	2.76	2.17
Post-Service intensity/complexity	2.59	2.17

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*
JCAAI distributed 92 survey links to members of the Primary Immune Deficiency Committee of the Academy three times and had contacted the company and had 18 names of physicians who had purchased the SubQ product and contacted them via email and a phone message asking them to participate in the survey. The consensus conference call was held on March 27 and these results are presented from the deliberations of the conference call. Note that industry requested this code for a product just coming to market and we are quite pleased with getting 17 responses, and are short of the 30 required. We thereby request Pre-Facilitation to review this data.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and

accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. SEE LAST PAGE

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) new product

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Allergy/Immunology How often? Sometimes

Specialty Infectious Disease How often? Sometimes

Specialty Oncology How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 1500
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. 360 payers recognize this procedure; with 1300 patients being infused, and most already self-administering the infusions; about 60-70 patients are new to infusions per month

Specialty Allergy/Immunology Frequency 1050 Percentage 70.00 %

Specialty Infectious Disease Frequency 225 Percentage 15.00 %

Specialty Oncology Frequency 225 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 750
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. about half of the patients infused are Medicare patients

Specialty Allergy/Immunology Frequency 525 Percentage 70.00 %

Specialty Infectious Disease Frequency 112 Percentage 14.93 %

Specialty Oncology Frequency 112.5 Percentage 0.00 %

Do many physicians perform this service across the United States? No

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? No

If no, please select another crosswalk and provide a brief rationale. 90765

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Non-Surgical

CPT Code	Pre-Time	Intra-Time	Post-Time	Total Time	Work RVU	IWPUT

INTENSITY/COMPLEXITY MEASURES (Mean)

Mental Effort and Judgment (Mean)

The number of possible diagnosis and/or the number of management options that must be considered	3.33	4.00
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	2.80	3.20
Urgency of medical decision making	2.57	3.00

Technical Skill/Physical Effort (Mean)

Technical skill required	2.71	3.40
Physical effort required	2.29	2.60

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	2.76	3.20
Outcome depends on the skill and judgment of physician	3.00	3.40
Estimated risk of malpractice suit with poor outcome	2.65	3.00

INTENSITY/COMPLEXITY MEASURES	CPT Code	Reference Service 1

Time Segments (Mean)

Pre-Service intensity/complexity		
Intra-Service intensity/complexity	2.24	2.40
Post-Service intensity/complexity		

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*
See 907X1

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. This add-on ZZZ code is reported with 907X1

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) new product

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Allergy/Immunology How often? Sometimes

Specialty Infectious Disease How often? Sometimes

Specialty Oncology How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 1000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. this is less frequent that 907X1

Specialty Allergy/Immunology Frequency 700 Percentage 70.00 %

Specialty Infectious Disease Frequency 150 Percentage 15.00 %

Specialty Oncology Frequency 150 Percentage 15.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 800
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate.

Specialty Allergy/Immunology Frequency 560 Percentage 70.00 %

Specialty Infectious Disease Frequency 120 Percentage 15.00 %

Specialty Oncology Frequency 120 Percentage 15.00 %

Do many physicians perform this service across the United States? No

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Non-Surgical

CPT Code	Pre-Time	Intra-Time	Post-Time	Total Time	Work RVU	IWPUT

PERC Summary of Recommendation
XXX Global Period
Non Facility Direct Inputs

CPT Long Descriptor: **90769** Subcutaneous infusion for therapy or prophylaxis (specify substance or drug); initial, up to one hour including pump set up and establishment of subcutaneous infusion site(s). (For infusions of 15 minutes or less use 90772)
90770 Subcutaneous infusion for therapy or prophylaxis (specify substance or drug); each additional hour (list separately in addition to code for primary procedure) (Report 90770 with 90769) (Report 90770 for infusion intervals of greater than 30 minutes beyond one hour increments)
90771 Subcutaneous infusion for therapy or prophylaxis (specify substance or drug); additional pump set up with establishment of new subcutaneous infusion site(s) (List separately in additional to 90769) (Report 90771 with 90769) (Report 90769 and X3 only once per encounter)

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The Joint Council of Allergy, Asthma and Immunology (JCAAI) and the American Academy of Allergy, Asthma and Immunology have provided the practice expense documents for review at the April 25, 2007 PERC meeting for review. The Primary Immune Deficiency Committee met on March 27 to review the RUC survey data as well as to come to consensus on the practice expense clinical staff, medical supplies and equipment inputs. The committee was representative of practice type, geographic location and represented adult and pediatric allergists.

Please describe the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

- Remove medication from the refrigerator one hour prior to the infusion
- Dosing is based on patient weight and dosage determined for insurance authorization
- Review the physician orders and plan for infusion
- Gather equipment and supplies and double checking the dosing requirements
- Utilizing aseptic technique, prepare the medication, drawing into a syringe and/or loading into the pump
- Set up the infusion pump, insert the cassette and two AA batteries
- Program the infusion pump
- Connect all tubings and for multiple infusions, connect the y-site tubing, keep clamp closed on cassette tubing
- Prime all tubings so that they are free of air
- Wash Hands
- Nurse reinforces the previous explanation by the physician and reviews procedure and prepares the patient again for the infusion experience.

Intra-Service Clinical Labor Activities:

- Vital signs taken at least four times on new patients for the first hour to assess medication tolerance
- About 15 minutes before insertion, apply Emla cream to numb the site(s), if needed
- Inspect sites prior to catheter insertion

- Insert the subcutaneous catheters into 2-4 sites on the abdomen, upper buttocks, lateral thigh, lateral hip or upper arms (average is 4 for adults and 2 for children)
- Wash hands, and cleanse the skin first with alcohol and then betadine
- Nurse talks with the patient through many of these procedures to clinically monitor patient wellbeing, asking questions such as are they feeling warm, itchy, problems breathing, feeling flushed, any pain at the infusion sites, and reviews again the procedure with the patient and caregiver, if present
- Check that the catheter is seated properly before insertion
- Ensure that the catheter is not in a vein and is in subcutaneous tissue by verifying no blood return. For each infusion site, attach a sterile syringe to the end of the primed administration tubing or catheter. If blood flows back into the tubing, discard the needle and tubing and change site(s) and repeat process.
- Slide the needle out of the catheter
- Apply the transparent dressing
- Recheck pump settings and open all clamps
- Turn on the pump
- Monitor the patient
- After completion of each infusion, turn off the pump and remove the catheters
- Massage the site for approximately 1 minute after removing the subcutaneous catheter
- Apply a dressing to the site(s)
- Remove the batteries and cassette from the pump

Post-Service Clinical Labor Activities:

- The nurse restates the physician's instructions on what to expect regarding common reactions at the site: minor swelling and redness, localized rash and/or minor burning, minor irritation/soreness, and minor hardness
- Set up appointment for next infusion
- Ongoing education to demonstrate to the patient and caregiver the procedure in the event that they would eventually be able to self-administer the infusion
- The nurse reviews all discharge orders and answers any questions

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

April 2007

Insertion and Placement of Heart Catheter

In October 2006, the CPT Editorial Panel CPT Modifier Workgroup recommended 93503 *Insertion and placement of flow directed catheter (eg, Swan-Ganz) for monitoring purposes* be removed from the modifier -51 exempt list. The Workgroup asked specialty societies to review the list and bring back any code they determined should be retained on the list. At the February 2007 CPT meeting the specialty societies asked to retain 93503 on the -51 Modifier exempt list. The CPT Modifier Workgroup forwarded 93503 to the RUC. Code 93503 had never been surveyed nor discussed at the RUC previously. The RUC understands that it is tasked with considering whether 93503 should be retained on the modifier -51 exempt list. If so, then support for this position is needed and the RUC must develop a work RVU recommendation consistent with the modifier -51 exempt payment policy. If not, then the RUC should determine whether there is compelling evidence for revaluation of 93503.

1607

FROM THE CPT MANUAL: "Modifier -51: Multiple Procedures: When multiple procedures, other than E/M services, are performed at the same session by the same provider, the primary procedure or service listed may be reported as listed. The additional procedure(s) or service(s) may be identified by appending modifier -51 to the additional procedure or service code(s). Note: This modifier should not be appended to designated "add-on" codes."

The RUC heard a full description of the service and the history of its value. The specialty societies and the RUC understood that the service did have significant time in the pre-service and post-service periods which would disqualify 93503 from the -51 Modifier exempt list (according to the CPT's criteria for inclusion on the list).

FROM CPT: MODIFIER -51 EXEMPTION – INCLUSION/EXCLUSION CRITERIA
"#3 Minimal Amount of Pre-and Post-Service Time Relative to Intra-Service Time and Minimal Number of Visits. As these procedures are usually performed with other procedures, there should be a minimal amount of pre-and post-service time relative to the procedure's intra-service time and there should be a minimal number of post-operative visits associated with the valuations of the procedures on this list."

After significant discussion, the RUC determined that specialty society recommended pre-service time did not accurately reflect the service and decreased it from 20 minutes to 12 minutes, while retaining the post-operative time at 10 minutes. **Due to this detailed review of the pre-service and post-service time to ensure no duplication with other services reported on the same date, the RUC recommends that 93503 be retained on the Modifier -51 Exempt List.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The specialty reviewed the survey results for this procedure and determined that the survey results support the existing value of the code at 2.91 work RVUs. The current value of the code, falls very close to the survey median of 3.00 RVUs. In addition, as the surveyed code's intensity and complexity measures are higher than that of the reference code 36556 *Insertion of non-tunneled centrally inserted central venous catheter; age 5 years or older* (Work RVU=2.50), the current value was believed to be appropriate. **Therefore, the RUC recommends that the new times, 12 minutes of pre-service time, 15 minutes of intra-service time and 10 minutes of post-service time, be associated with 93503 and that the existing value of 2.91 work RVUs be retained for this procedure.**

Practice Expense:
The RUC recommends that the practice expense inputs be retained for this procedure, which is zero PE direct inputs.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
▲⊘93503	DD4	Insertion and placement of flow directed catheter (eg, Swan-Ganz) for monitoring purposes	000	2.91 (No Change)

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:93503 Tracking Number DD4 Specialty Society Recommended RVU: **2.91**
Global Period: 000 RUC Recommended RVU: **2.91**

CPT Descriptor: Insertion and placement of flow directed catheter (eg, Swan Ganz) for monitoring purposes

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 65 year old man with coronary artery disease following failure of lithotripsy to relieve ureteral obstruction from a stone develops circulatory failure. A pulmonary artery catheter is inserted to guide therapy secondary to urosepsis. He is hypotensive and exhibiting difficulty breathing

Percentage of Survey Respondents who found Vignette to be Typical: 85%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 44%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: Pre-service includes: a review of records; lab and diagnostic tests; communication with other professionals; patient and family; scrubbing and preparing the patient; instruments and supplies for the procedure; and positioning the patient for the procedure, which is often difficult due to the unstable nature of the patient. Assessment of antibiotic administration status is made and interventions ordered if needed.

Description of Intra-Service Work: A flow-directed pulmonary artery catheter (PA catheter) is typically introduced percutaneously either into the internal jugular vein or subclavian vein. A large bore introducing catheter is first placed into the vein. Then the PA catheter is sterilely inserted through the introducer. The tip of the catheter is passed down through the right atrium and right ventricle and into the pulmonary artery, sometimes with the use of fluoroscopy for direction (separately reportable). On the tip of the catheter is a balloon, which when inflated will occlude the pulmonary artery. The balloon is inflated during passage of the catheter through the heart. The interaction between right heart blood flow and the resistance created by the balloon facilitates passage of the catheter into the pulmonary artery. As the catheter tip passes through the heart into the lungs, it measures the pressures within the cardiac chambers and pulmonary artery. When the balloon is inflated and occludes the pulmonary artery an estimate of left ventricular end-diastolic pressure (LVEDP)is obtained. LVEDP correlates with preload, an important factor in determining adequacy of intravascular volume status. In addition, the PA catheter helps facilitate measurement of intermittent or continuous cardiac output, typically using a thermodilution technique. Some catheters also allow continuous measurement of mixed venous oxygen saturation (SvO2). Changes in SvO2 may indicate changes in oxygen supply/demand balance, a particularly important factor in the critically ill.

Description of Post-Service Work: Post-service work and time is significantly greater with the PA catheter as the catheter is likely to remain in place in the patient for five days as compared to at the most 1-2 hours for the right heart catheter Because the PA catheter remains in place considerably longer, there is a significantly increased risk of sepsis, venous thrombosis and pulmonary infarction. A procedure note is written in the chart as are any orders including obtaining a chest X-ray for placement and to rule out initial placement complications such as pneumothorax.

Technical skill required	4.39	3.54
Physical effort required	3.57	3.00

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	4.36	3.54
Outcome depends on the skill and judgment of physician	4.39	3.54

Estimated risk of malpractice suit with poor outcome	4.07	3.43

INTENSITY/COMPLEXITY MEASURES	CPT Code	Reference Service 1
Time Segments (Mean)		
Pre-Service intensity/complexity	3.54	2.93
Intra-Service intensity/complexity	4.36	3.39
Post-Service intensity/complexity	3.57	2.79

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

This code comes to the RUC as a result of the CPT review of codes listed in Appendix E – Summary of Codes Exempt from Modifier 51. The Panel agreed that the code met the criteria to remain in this appendix.

While 44% of our respondents indicated that moderate sedation was typical for this procedure, we maintain that it is not inherent to the procedure. Patients may receive "light sedation" and our respondents may have been confused about all the elements inherent in moderate sedation.

The RVUw from the survey indicate that the code is properly valued. The current RVUw is 2.91 which falls very near to our survey median of 3.00. Its complexity/intensity measures are higher than that of the reference code of 36556 with 2.50 work RVUs. We therefore recommend that the code retain its current value.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☒ Other reason (please explain) As a code that is included in CPT Appendix E, it may be reported as a stand alone procedure but is typically adjunctive. We estimate that it is adjunctive 85% of the time.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the

provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.
Anesthesioloigsts perform this most frequently in conjunction with an anesthesia service (00100-01999). Per CMS and CPT, placement of invasive monitoring devices is separate and distinct from an anesthesia service.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 93503

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Anesthesia	How often? Commonly
Specialty Cardiology	How often? Sometimes
Specialty Pulmonary Disease	How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 791484
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. Using the breakdown on file for the Medicare population

Specialty Anestehsia	Frequency 656062	Percentage 82.89 %
Specialty Cardiology	Frequency 35459	Percentage 4.48 %
Specialty Pulmonary Disease	Frequency 23587	Percentage 2.98 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 197,871 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. This Medicare frequency information is taken from the RUC database

Specialty Anesthesia	Frequency 164035	Percentage 82.89 %
Specialty Cardiology	Frequency 8865	Percentage 4.48 %
Specialty Pulmonary Disease	Frequency 5897	Percentage 2.98 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? No

If no, please select another crosswalk and provide a brief rationale. The RUC recommends the current PLI for 93503 be retained

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/Specialty Society RVS Update Committee
Five Year Review - Summary of Recommendations

February 2007

Allergy Test Interpretation

At the 2005 Five Year Review, the Joint Council of Allergy, Asthma & Immunology commented that there is physician work involved in allergy test interpretation services that is not being recognized and not reimbursed through any other codes. The specialty society came to the RUC 2005 Five Year Review and presented physician work values for these allergy codes. At the meeting, the specialty presented each code with physician work representing staff supervision and the interpretation of the tests results. The codes are typically billed with an E/M service which, according to CPT, the "actual performance and/or interpretation of diagnostic tests/studies ordered during a patient encounter are not included in the level of E/M services." The RUC, at the time could not value the codes based upon the CPT descriptor and the survey results and referred the specialty to the CPT Editorial Panel for clarification and possible revision of the codes to include physician work. In February 2006, the CPT Editorial Panel made modifications to these allergy testing codes in order to include the test interpretation and report provided by a physician (pending RUC survey which would prove that physician work was associated with these services).

For the February 2007 RUC meeting, the specialty surveyed over 100 physicians and provided new survey data with "test interpretation and report by a physician" included in the descriptors. The survey respondents indicated that there is physician work in the three services. The RUC believed that there is physician work in these allergy services and understood that the surveys were based on a battery of tests that are typically performed. The physician work and time is computed to be a small fraction of the surveyed results based on the total service. The survey for CPT code 95004 *Percutaneous tests (scratch, puncture, prick) with allergenic extracts, immediate type reaction, including test interpretation and report by a physician, specify number of tests* was based on a battery of 40 tests; 95024 *Intracutaneous (intradermal) tests with allergenic extracts, immediate type reaction, including test interpretation and report by a physician, specify number of tests* was based on a battery of 12 tests, and 95027 *Intracutaneous (intradermal) tests, sequential and incremental, with allergenic extracts for airborne allergens, immediate type reaction, including test interpretation and report by a physician, specify number of tests* was based on a battery of 45 tests. Surveyed physician time and work was then divided by these typical number of tests and modified for the typical patient encounter.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Physician work for these services were compared to the level two office visit code 99212 (work RVU = 0.45) for time and intensity comparisons based on the three batteries of tests. The RUC believed that this "battery of tests" comparison with the Evaluation and Management codes was valid and established relativity between code families. In addition, the RUC and the specialty agreed that code 95024 was typically billed subsequent to 95004 and thus there would be some overlap in physician time. The RUC therefore agreed that there would be zero pre-service time for 95024 and the post service physician time for code 95004 should more appropriately be 5 minutes, rather than 10 from the survey results with the battery of 40 tests. The RUC agreed that although physician work for each of the single tests was minimal, as a battery of tests, the rank order between each of the codes and the relativity with Evaluation and Management codes is established when the work RVUs are all equal to 0.01. The below chart shows the rank order and relativity based on the battery of tests.

CPT Code	Work RVU	Number of Tests	Work RVU for Battery of Tests
95004	**0.01**	40	0.40
95024	**0.01**	12	0.12
95027	**0.01**	45	0.45
99212	0.45		0.45

1622

The RUC recommends work relative values of 0.01 for revised CPT codes 95004, 95024, and 95027.

Practice Expense

The RUC agreed that the existing practice expense inputs that were reviewed in September 2002 were inappropriate and needed to be revised now that the code values were now based on a number of tests rather than on the number of antigens. The RUC reviewed and revised practice expense inputs based on the following batteries of tests; 95002 – 40 tests, 95024 – 12 tests, and 95027 – 45 tests. The RUC eliminated overlapping clinical labor time among the code set and altered the medical supplies and equipment to reflect the number of tests for each allergy code. The RUC agreed that these revisions now reflected the resources used during the typical patient encounter.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	February 2007 Work RVU Recommendation
~~**Allergy sensitivity tests** describe the performance and evaluation of selective cutaneous and mucous membrane tests in correlation with the history, physical examination, and other observations of the patient. The number of tests performed should be judicious and dependent upon the history, physical findings, and clinical judgement. All patients should not necessarily receive the same tests nor the same number of sensitivity tests.~~ ***Immunotherapy (desensitization, hyposensitization)*** *is the parenteral administration . . .* ***Other therapy:*** *for medical conferences on the use of mechanical . . .*				
95004		Percutaneous tests (scratch, puncture, prick) with allergenic extracts, immediate type reaction, including test interpretation and report by a physician, specify number of tests	XXX	0.01
95024		Intracutaneous (intradermal) tests with allergenic extracts, immediate type reaction, including test interpretation and report by a physician, specify number of tests	XXX	0.01

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
2005 FIVE YEAR REVIEW - SUMMARY OF RECOMMENDATION

CPT Code:95004 Tracking Number YY1 Specialty Society Recommended RVU: **0.01**
Global Period: XXX RUC Recommended RVU: **0.01**

CPT Descriptor: Percutaneous tests (scratch, puncture, prick) with allergenic extracts, immediate type reaction, including test interpretation and report by a physician, specify number of tests

The numbers reflected below are for a battery of tests in order to allow comparison with the reference codes; data for a single test can be found in the Table in the compelling evidence section.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 55-year old patient reports increased difficulty with head congestion, sneezing and watery eyes with recurrent episodes of wheezing and coughing that are interfering with his work. The patient is seen on referral from his primary care physician. The specialist orders 40 percutaneous skin tests to determine causes and possible therapies.

Percentage of Survey Respondents who found Vignette to be Typical: 95%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: The physician instructs the staff as to which allergens to test for and at what concentrations based on the patient's history, symptoms, and environmental/lifestyle factors.

Description of Intra-Service Work: The physician examines and interprets the nature and extent of the patient's reaction including the size of the erythema and wheal and evaluates the controls in comparison to the test allergens to determine if the test is negative or positive (and if positive, the level of positivity).

Description of Post-Service Work: The physician synthesizes the test results and prepares, reviews and signs the report.

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99213	XXX	0.92	RUC Time

CPT Descriptor Office or other outpatient visit for the evaluation and management of an established patient, which requires at least two of these three key components: an expanded problem focused history; an expanded problem focused examination; medical decision making of low complexity. Usually, the presenting problem(s) are of low to moderate severity. Physicians typically spend 15 minutes face-to-face with the patient and/or family.

KEY MPC COMPARISON CODES:

Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Most Recent Medicare Utilization	Work RVU	Time Source
99212	XXX	26,139,270	0.45	RUC Time

CPT Descriptor 1 Office or other outpatient visit for the evaluation and management of an established patient, which requires at least two of these three key components: a problem focused history; a problem focused examination; straightforward medical decision making. Usually, the presenting problem(s) are self limited or minor. Physicians typically spend 10 minutes face-to-face with the patient and/or family.

MPC CPT Code 2	Global	Most Recent Medicare Utilization	Work RVU	Time Source
93307	XXX	6,552,729	0.92	RUC Time

CPT Descriptor 2 Echocardiography, transthoracic, real-time with image documentation (2D) with or without M-mode recording; complete

Other Reference CPT Code	Global	Work RVU	Time Source
99212	XXX	0.45	RUC Time

CPT Descriptor Office or other outpatient visit for the evaluation and management of an established patient, which requires at least two of these three key components: a problem focused history; a problem focused examination; straightforward medical decision making. Usually, the presenting problem(s) are self limited or minor. Physicians typically spend 10 minutes face-to-face with the patient and/or family.

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 17 **% of respondents:** 21.2 %

COMPELLING EVIDENCE RATIONALE (Required to be Completed)
Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

JCAAI and AAOA worked together on this survey including developing a common reference set. This code is valued on a per test basis and typically 40 tests are performed. Because of the difficulty of valuing the work and time of a single test, the Research Subcommittee agreed that we could survey this service based on the performance of the full battery of tests. For the battery of 40 tests, the median work value was 0.70 with total time of 20 minutes. Prorating the median work value on a per test basis, results in a work value of 0.02 per test (rounded). This is the value we are recommending.

The table below shows the RVW and time for both the battery of tests and a single test.

95004	Low	25th pctl	Median	75th pctl	High
95004 per test	0.002	0.01	0.02	0.02	0.08
95004 Typical Patient (40 tests)	0.11	0.45	0.70	0.95	3.00
Intra-Service TIME					
95004 per test	0	0.075	0.13	0.25	1.13
95004 Typical Patient (40 tests)	0	3.00	5.00	10.00	45.00

The remainder of our discussion of the rationale for the recommended value is based on the value for a typical battery of tests which is consistent with survey methodology and which we think is easier to grasp.

We believe that a work value of 0.70 for 40 tests is reasonable and supported by the survey data. The most typically selected reference code was code 99213 which has a work value of 0.92 for total time of 23 minutes compared to a work value of 0.70 for total time of 20 minutes. The survey respondents generally considered this code to be more intense/complex than the reference code. Thus, for a service considered more complex and involving only 10 percent or so less total time, the recommended work value is about 25 percent lower.

There are no codes on the MPC list which are in the same family as allergy testing. We therefore considered other codes on the MPC which have XXX global period status-Code 99212 and Code 93307. Code 99212 has an RVW of 0.45 with total time of 16 minutes. The median survey time for Code 95004 was 20 minutes or 25 percent higher. Given the fact that the surveyed code is considered more complex and intense than Code 99213 (the reference code), it stands to reason that the surveyed code is even more complex than Code 99212. Code 93307 has a work value of

0.92 for 28 minutes of total time. Thus, the recommended work value is about 25 percent less and the total time is proportionately less--about 29 percent less.

Finally, we also looked at the values and times assigned to a commonly performed x-ray procedure on the MPC, Code 71020. This code has a work value of 0.22 and total time of 5 minutes. The surveyed code involves 20 minutes of physician time so that adjusting for the 4-fold time difference, the recommended value of 0.70 is actually proportionately less. In our judgment, interpreting 40 subcutaneous allergy tests is certainly as complex or more complex than interpreting a chest x-ray. Given the 4-fold difference in the time-20 minutes vs. 5 minutes-we would consider the recommended value of 0.70 for the battery of tests reasonable in relationship to this commonly performed x-ray procedure.

In summary we believe the recommended work value is supported by survey data, by comparison to the reference code, two MPC codes and the x-ray procedure.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No
   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FIVE YEAR REVIEW SPECIFIC QUESTIONS:

Please indicate the number of survey respondent percentages responding to each of the following questions (for example 0.05 = 5%):

Has the work of performing this service changed in the past 5 years? Yes No

(Use the subset of the people who responded "Yes" to answer the following questions)

A. This service represents new technology that has become more familiar (i.e., less work):
   I agree I do not agree

B. Patients requiring this service are now:
   more complex (more work) less complex (less work) no change

C. The usual site-of-service has changed:
   from outpatient to inpatient from inpatient to outpatient no change

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
2005 FIVE YEAR REVIEW - SUMMARY OF RECOMMENDATION

CPT Code:95024 Tracking Number YY2 Specialty Society Recommended RVU: **0.01**
Global Period: XXX RUC Recommended RVU: **0.01**

CPT Descriptor: Intracutaneous (intradermal) tests with allergenic extracts, immediate type reaction, including test interpretation and report by a physician, specify number of tests

The numbers reflected below are for a battery of tests in order to allow comparison with the reference codes; data for a single test can be found in the Table in the compelling evidence section.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 55-year old patient reports increased difficulty with head congestion, sneezing and watery eyes with recurrent episodes of wheezing and coughing that are interfering with his work. The patient is seen on referral from his primary care physician. The specialist orders 12 intradermal skin tests to determine causes and possible therapies.

Percentage of Survey Respondents who found Vignette to be Typical: 85%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: The physician instructs the staff as to which allergens to test for and at what concentrations based on the patient's history, symptoms, and environmental/lifestyle factors.

Description of Intra-Service Work: The physician examines and interprets the nature and extent of the patient's reaction including the size of the erythema and wheal and evaluates the controls in comparison to the test allergens to determine if the test is negative or positive (and if positive, the level of positivity).

Description of Post-Service Work: The physician synthesizes the test results and prepares, reviews and signs the report.

COMPELLING EVIDENCE RATIONALE (Required to be Completed)
Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

JCAAI and AAOA worked together on this survey including developing a common reference set. This code is valued on a per test basis and typically 12 tests are performed. Because of the difficulty of valuing the work and time of a single test, the Research Subcommittee agreed that we could survey this service for the full battery of tests. For the battery of 12 tests, the median work value recommended was 0.87 with total time of 20 minutes. Prorating the median work value on a per test basis, results in a median work value of 0.07 per test (rounded). However, we are recommending an RVW of 0.04 which is the value represented at the 25th percentile. We think this value provides the correct rank order relationship to Code 95004. While Code 95024 is more complex than Code 95004 and takes additional time per test, we do not think this code should be valued at almost 4 times the value per test of code 95004, which we are recommending be valued at 0.02. We recommend, however, using the survey median time values since these are consistent with the time estimates for 95004 and 95027 and are, we believe, more accurate estimates of the time involved.

The remainder of our discussion of the rationale for the recommended value is based on the value for a typical battery of tests which is consistent with survey methodology and which we think is easier to grasp.

The table below shows the RVW and time for both the battery of tests and a single test.

95024	Low	25th pctl	Median	75th pctl	High
95024 per test	0.008	0.04	0.07	0.08	0.38
95024 Typical Patient (12 tests)	0.09	0.49	0.87	1.00	4.50
Intra-Service TIME					
95024 per test	0	0.03	0.42	0.83	5.00
95024 Typical Patient (12 tests)	0	3.00	5.00	10.00	60.00

The most typically selected reference code was code 99213 which has a work value of 0.92 for total time of 23 minutes. The survey respondents estimated this code to be somewhat more intense/complex than the reference code and the median total time of 20 minutes as slightly lower than the reference code. Our recommended RVW of 0.49 for the full battery of tests is about half of the RVW assigned to the reference code. While a higher RVW might be

justified, based on the median survey response, we believe using the 25th percentile is more appropriate because it more closely reflects the relative relationship of this code to 95004 and to 95027. Thus, in relationship to the reference code, we would consider the recommended value of 0.49 or 0.04 per test certainly reasonable.

There are no codes on the MPC list which are in the same family as allergy testing. We therefore considered other codes on the MPC list which have XXX global period status-Code 99212 and Code 93307. Code 99212 has an RVW of 0.45 with total time of 16 minutes. The survey time for Code 95024 is 20 minutes. However, given the fact that the surveyed code is considered more complex and intense than Code 99213 (the reference code), it stands to reason that the surveyed code is even more complex than Code 99212.

Code 93307 has a work value of 0.92 for 28 minutes of total time. Thus, the recommended work value is about 50 percent of this code while the total time is only about 30 percent less.

Finally, we also looked at the values and times assigned to a commonly performed x-ray procedure on the MPC, Code 71020. This code has a work value of 0.22 and total time of 5 minutes. In our judgment, interpreting 12 intradermal allergy tests is certainly as complex or more complex than interpreting a chest x-ray. Given the 4-fold difference in the time-20 minutes vs. 5 minutes-we would consider the recommended value of 0.49 for the battery of tests reasonable in relationship to this commonly performed x-ray procedure
In summary we believe the recommended work value is supported by survey data, by comparison to the reference code, two MPC codes and the x-ray procedure.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No
   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FIVE YEAR REVIEW SPECIFIC QUESTIONS:

Please indicate the number of survey respondent percentages responding to each of the following questions (for example 0.05 = 5%):

Has the work of performing this service changed in the past 5 years? Yes No

(Use the subset of the people who responded "Yes" to answer the following questions)

A. This service represents new technology that has become more familiar (i.e., less work):
   I agree I do not agree
B. Patients requiring this service are now:
   more complex (more work) less complex (less work) no change
C. The usual site-of-service has changed:
   from outpatient to inpatient from inpatient to outpatient no change

COMPELLING EVIDENCE RATIONALE (Required to be Completed)
Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Code 95027 is generally provided only by AAOA members and JCAAI did not survey for this code. This code is also valued on a per test basis and typically 45 tests are performed~~15~~ allergens at 3 different concentration levels. Because of the difficulty of valuing the work and time of a single test, the Research Subcommittee agreed that we could survey this service for the full battery of tests. For the battery of 45 tests, the median work value recommended is 1.00 with total time of 30 minutes. Prorating the median work value on a per test basis, results in a work value of 0.02 per test (rounded). This is the value we are recommending.

The table below shows the RVW and time for both the battery of tests and a single test.

95027	Low	25th pctl	Median	75th pctl	High
95027 per test	0.004	0.02	0.02	0.03	0.13
95027 Typical Patient (45 tests)	0.20	0.81	1.00	1.37	6.00
Intra-Service TIME					
95027 per test	0.02	0.20	0.22	0.33	1.00
95027 Typical Patient (45 tests)	1.00	9.25	10.00	15.00	45.0

The remainder of our discussion of the rationale for the recommended value is based on the value for a typical battery of tests which is consistent with survey methodology and which we think is easier to grasp.

We believe that the median work value of 1.00 for interpreting 45 intradermal tests is reasonable and supported by the survey data. The most typically selected reference code was code 99203 which has a work value of 1.34 for total time of 29 minutes. This compares to a work value of 1.00 for total time of 30 minutes. The survey respondents generally considered this code to be more considerably more intense/complex than the reference code for all time segments. Thus, for a service considered more complex and involving similar total time, the recommended work value is about 25 percent lower.

There are no codes on the MPC which are in the same family as allergy testing. We therefore considered codes on the MPC which have XXX global period status~~Code~~ 99213 and Code 93307. Code 99213 has a work value of 0.92 for total time of 23 minutes. Since the survey respondents considered the surveyed code to be more complex than the reference code (mid level new patient office visit) it stands to reason that they would similarly consider the surveyed

code to be even more complex than this MPC code. Since the time and complexity is higher, we think the recommended value of 1.0 for the battery of tests is reasonable relative to this code.

Code 93307 has a work value of 0.92 for 28 minutes of total time. Thus, the recommended work value and time are fairly close to this diagnostic procedure.

Finally, we also looked at the values and times assigned to a commonly performed x-ray procedure on the MPC, Code 71020. This code has a work value of 0.22 and total time of 5 minutes. In our judgment, interpreting 45 intradermal allergy tests is certainly as complex or more complex than interpreting a chest x-ray. Given the 6-fold difference in the time-30 minutes vs. 5 minutes-we would consider the recommended value of 1.00 for the battery of tests reasonable in relationship to this commonly performed x-ray procedure..

In summary we believe the recommended work value is supported by survey data, by comparison to the reference code, two MPC codes and the x-ray procedure.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No
   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FIVE YEAR REVIEW SPECIFIC QUESTIONS:

Please indicate the number of survey respondent percentages responding to each of the following questions (for example 0.05 = 5%):

Has the work of performing this service changed in the past 5 years? Yes No

(Use the subset of the people who responded "Yes" to answer the following questions)

A. This service represents new technology that has become more familiar (i.e., less work):
   I agree I do not agree

B. Patients requiring this service are now:
   more complex (more work) less complex (less work) no change

C. The usual site-of-service has changed:
   from outpatient to inpatient from inpatient to outpatient no change

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

April 2007

Electronic Analysis of Implanted Neurostimulator Pulse Generator System

The CPT Editorial Panel replaced Category III codes with three new codes to report the electronic analysis of an implanted neurostimulator pulse generator system. Electrical stimulation of the stomach is a treatment for patients with end-stage gastroparesis who are diabetic and/or post-surgical gastroparesis with drug refractory nausea and vomiting. These codes were originally presented at the February 2007 RUC meeting, however, the specialty society requested that this issue be referred to the April 2007 RUC meeting as they believed that their survey data was flawed and wished to conduct a new survey to evaluate these procedures.

1647

95980

The RUC reviewed the specialty society's survey results for CPT code 95980 *Electronic analysis of implanted neurostimulator pulse generator system (eg, rate, pulse amplitude and duration, configuration of wave form, battery status, electrode selectability, output modulation, cycling, impedance and patient measurements) gastric neurostimulator pulse generator/transmitter; intraoperative, with programming* and thoroughly discussed the physician time and work involved with this service. The RUC agreed with the specialty society that the surveyed physician time for this service does not accurately reflect the service and reduced the surveyed pre-, intra- and post service times dramatically. The specialty society and RUC recommended physician for this procedure are pre-service: 3 minutes, intra-service: 24 minutes, and post-service: 5 minutes. This is an overall reduction of 38 minutes from the surveyed data. The RUC reviewed the specialty society recommended reference service, 93742 *Electronic analysis of pacing cardioverter-defibrillator (includes interrogation, evaluation of pulse generator status, evaluation of programmable parameters at rest and during activity where applicable, using electrocardiographic recording and interpretation of recordings at rest and during exercise, analysis of event markers and device response); single chamber or wearable cardioverter-defibrillator system, with reprogramming* (Work RVU=0.91). The RUC noted that the intra-service time of the surveyed code was lower than the reference code, 24 minutes and 30 minutes respectively. Additionally, the RUC noted that both codes had similar complexity. Therefore, the RUC agrees with the specialty society recommended value of 0.80 RVUs as this value appropriately places this service in comparison to the reference code, 93742. **The RUC recommends 0.80 work RVUs for 95980.**

95981

The RUC reviewed the specialty society's survey results for CPT code 95981 *Electronic analysis of implanted neurostimulator pulse generator system (eg, rate, pulse amplitude and duration, configuration of wave form, battery status, electrode selectability, output modulation, cycling, impedance and patient measurements) gastric neurostimulator pulse generator/transmitter; subsequent, without reprogramming* and thoroughly discussed the physician time and work involved with this service. The RUC agreed with the specialty that the surveyed time for this service does not accurately reflect the service and reduced the surveyed pre-, intra- and post service times dramatically. For this procedure, the physician times that are recommended by the specialty society and the RUC are pre-service: 2 minutes, intra-service: 10 minutes, and post-service: 5 minutes. This is an overall reduction of 13 minutes from the surveyed data. The RUC reviewed the specialty society recommended reference service, 92020 *Gonioscopy*

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

(separate procedure) (Work RVU=0.37). The RUC noted that the total-service time of the surveyed code was lower than the reference code, 17 minutes and 20 minutes respectively. Additionally, the RUC noted that both codes had similar complexity. Therefore, the RUC agrees with the specialty society recommended value of 0.30 RVUs as this value appropriately places this service in comparison to the reference code, 92020. **The RUC recommends 0.30 work RVUs for 95981.**

95982

The RUC reviewed the specialty society's survey results for CPT code 95982 *Electronic analysis of implanted neurostimulator pulse generator system (eg, rate, pulse amplitude and duration, configuration of wave form, battery status, electrode selectability, output modulation, cycling, impedance and patient measurements) gastric neurostimulator pulse generator/transmitter; subsequent, with reprogramming* and thoroughly discussed the physician time and work involved with this service. The RUC agreed with the specialty that the surveyed time for this service does not accurately reflect the time required to perform the service and reduced the surveyed pre-, intra- and post service times dramatically. For this procedure, the specilaty society and RUC recommended physician times are pre-service: 2 minutes, intra-service: 17 minutes, and post-service: 5 minutes. This is an overall reduction of 13 minutes from the surveyed data. The RUC reviewed the reference service, 99307 *Subsequent nursing facility care,* (Work RVU=0.60). The RUC noted that the total-service time of the surveyed code was higher than the reference code, 24 minutes and 20 minutes respectively. Additionally, the RUC noted that both codes had similar complexity. Therefore, the RUC agrees with the specialty society recommended value of 0.65 RVUs as this value appropriately places this service in comparison to the reference code. **The RUC recommends 0.65 RVUs for 95982.**

1648

Practice Expense:

The RUC made slight modifications were made to the clinical labor time recommended by the specialty society to more accurately reflect the work of the clinical labor performing these procedures. These modifications included the removal of a follow-up phone call in the facility setting, and time reductions in reviewing the patient's chart and preparing the room. All other practice expense recommendations were accepted.

New Technology List:

As these codes were previously reported using the Category III codes, the RUC recommends that these services be added to the New Technology List.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
A simple neurostimulator pulse generator... *Code 95970 describes subsequent...* Code 95980 describes intraoperative electronic analysis of implanted gastric neurostimulator pulse generator system, with programming; code 95981 describes subsequent analysis of the device; code 95982 describes subsequent analysis and reprogramming. For electronic analysis and reprogramming related to the morbid obesity, use 00162T.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:95980 Tracking Number M1 Specialty Society Recommended RVU: **0.80**
Global Period: XXX RUC Recommended RVU: **0.80**

CPT Descriptor: Electronic analysis of implanted neurostimulator pulse generator system (e.g., rate, pulse amplitude and duration, configuration of wave form, battery status, electrode selectability, output modulation, cycling, impedenance and patient compliance measurements), gastric neurostimulator pulse generator/transmitter; with interoperative analysis and programming

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 35 year old female with medically refractory diabetic gastroparesis is undergoing insertion of a gastric neurostimulator. Interrogation, analysis and programming of the gastric neurostimulator is requested.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: Assess for possible contraindications. Discuss with patient the nature of the procedure, why it is being performed and possible complications. Provide instructions to patient on preparation for the procedure. Obtain informed consent.

Description of Intra-Service Work: The physician initially programs the gastric neurostimulator and memory card with the stimulator and patient-related information. The interrogation head is placed in a separate bag. The stimulating wires are placed into the neurostimulator by the physician. The impedance between the stimulating wires is measured and analyzed by the physician. If the impedance is out of range, step-wise repeat interrogation, switching the stimulating polarity of the electrodes, removing and reinserting the stimulating leads into the stimulator, and/or removing and replacing the stimulating wires in the stomach is performed until the impedance is within range. Once the interrogation is completed and the impedance is within 200 to 800 ohms, the information is conveyed to the surgeon to facilitate suturing of the electrodes into the stomach. (The stimulating wires are then removed from the neurostimulator, tunneled through the peritoneum into a pocket in the right lower quandrant, and then reattached to the stimulator by the surgeon (separate procedure)). The physician performing the programming then re-interrogates and analyzes the impedance of the gastric neurostimulator. If the impedance is out of range, the stimulating wires are removed, cleaned, and reattached to the neurostimulator, and the impedance is reassessed by the physician in a step-wise manner with repeat interrogation, switching the stimulating polarity of the electrodes, removing and reinserting the stimulating leads into the stimulator, and/or removing and replacing the stimulating wires until proper range of impedance is achieved. This information is conveyed to the surgeon to facilitate closure of the incision(s) (separate procedure). Upon closure of the incision(s), the impedance of the stimulating wires is reassessed and analyzed by the physician in a step-wise manner with repeat interrogation, switching the stimulating polarity of the electrodes, and/or removing and reinserting the stimulating leads into the stimulator, until the impedance is within the proper range. The stimulation settings are then programmed and reviewed. The stimulation rate, pulse width, cycling on/off times, stimulating electrode selections, and the battery status is verified and recorded by the physician. The gastric neurostimulator is turned on by the physician and the interrogating head is removed.

Description of Post-Service Work: At the conclusion of the procedure, the patient is transferred to the recovery room where vital signs are checked. The physician provides the patient and family members with detailed instructions regarding stimulator operations and stimulator parameters, and instructions on how to perform limited modifications of stimulations parameters (such as pulse width and amplitude) at home upon discharge.

Time Segments (Mean)

Pre-Service intensity/complexity	3.33	2.53
Intra-Service intensity/complexity	3.80	3.60
Post-Service intensity/complexity	2.87	2.67

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The American Gastroenterological Association (AGA) and the American Society for Gastrointestinal Endoscopy (ASGE) conducted a survey of code 95980 Electronic analysis of implanted neurostimulator pulse generator system (e.g., rate, pulse amplitude and duration, configuration of wave form, battery status, electrode selectability, output modulation, cycling, impedance and patient compliance measurements), gastric neurostimulator pulse generator/transmitter; with intraoperative analysis and programming. *After reviewing the survey data and convening a consensus panel the societies recommend a value of 1.25 work relative value units (WRVUs).*

Survey Process

The survey was disseminated to a list of 100 users of the gastric neurostimulator technology. A list of users was obtained from the American Motility Society and from the manufacturer. A total of 15 (15% response rate) responses were received.

This code was originally surveyed for the February 2007 RUC meeting. The societies requested to resurvey the code in order to determine if the physician scrubs prior to the procedure. Permission to add a question related to scrubbing to the survey was granted by the RUC research subcommittee. The societies held a conference call with survey participants, with proctoring and participation by a RUC member and AMA staff, to address the question of scrub time. Based on responses received and review by the consensus panel it was determined that scrubbing was not typical for this procedure. Scrub time was excluded from the analysis.

Data Evaluation

Due to the low response rate for the survey, a consensus panel comprised of representatives from AGA and ASGE was convened to review the survey data and responses. The low response rate was felt to be due to a small number of physicians, primarily in academic and referral center settings, who perform this procedure on a regular basis.

The panel of advisors compared the survey data to the reference service:

- 95972, Electronic analysis of implanted neurostimulator pulse generator system (eg, rate, pulse amplitude and duration, configuration of wave form, battery status, electrode selectability, output modulation, cycling, impedance and patient compliance measurements); complex spinal cord, or peripheral (except cranial nerve) neurostimulator pulse generator/transmitter, with intraoperative or subsequent programming, first hour.

Five (5) respondents (33%) chose reference code 95972. No other code was chosen with such high frequency.

Other codes considered by the consensus panel were:

- 93307 - Echocardiography, transthoracic, real-time with image documentation (2D) with or without M-mode recording; complete
- 95819 - Electroencephalogram (EEG); including recording awake and asleep
- 99203 – Office or other outpatient visit for the evaluation and management of a new patient, which requires three key components
- 99204 - Office or other outpatient visit for the evaluation and management of a new patient, which requires three key components

Based on the inclusion of the above codes on the MPC list and the comparability of existing time and WRVU values, the advisors recommended these codes were appropriate comparisons.

The chart below summarizes the data that was considered.

Analysis of Survey Data for 9597X1: Physician Time and WRVU Data for Reference Services

* Survey reference service
** Society recommendation at April 2007 RUC meeting
*** Society recommendation at February 2007 RUC meeting

The societies recognized that the physician time elicited from the survey was slightly inflated and this contributed to the low IWPUT for 95980. After comparing the time data and IWPUT values of the surveyed code to the reference codes the advisors concluded that the survey data support the recommended value of 1.25 WRVUs for 9597X1.

95980 versus 95972
The consensus panel considered the difference in intra-service time for these two procedures. Code 95972 has 60 minutes intra-service time versus 30 minutes for 95980. The consensus panel reviewed the survey data and concluded that the 30 minutes of intra-service time identified by the survey participants was the time spent in the intraoperative analysis and programming of the gastric neurostimulator.

The panel noted the survey participants identified additional pre-and post-time for 95980 compared to 95972. When comparing the surveyed code 95980 to the reference service 95972 it was concluded that the lower IPWUT and the corresponding lower WRVU for 9597X1 was appropriate. The panel concluded that this provided additional validation for the recommendation of 1.25 WRVUs for 95980.

95980 versus 93307 and 95819

When comparing 95980 to 93307 and 95819, the consensus panel noted that code 95980 has a higher intra-service time than either 93307 or 95819. The level of intensity of the service and the complexity of medical decision-making was determined to be more complex for 95980compared to these other services. The consensus panel concluded that the WRVU for 95980 was justified based on a relative value comparison with these other services, providing further support for the society's recommendation of 1.25 WRVUs for 95980.

95980 versus 99203 and 99204
When comparing 95980 to 99203 and 99204, the consensus panel was in agreement that the lower WRVU for 95980 was justified. While the total time for 95980 is higher than for 99203 or 99204, and the medical severity of the typical patient seen for 95980 was determined to be as complex as code 99203, the medical decision making associated with codes 99203 and 99204 is more complex. Code 99203 typically deals with medical decision making of low complexity and presenting problems of moderate severity. Code 99204 typically deals with medical complexity of moderate complexity and presenting problems of moderate to high severity. The consensus panel concluded the WRVU for 95980 was justified based on a relative value comparison with these evaluation / management services.

In view of the above, the AGA and ASGE recommend 1.25 WRVUs for surveyed code 95980.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☒ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. 43647, 090 global, surgeon, 100%; 9597X1, XXX global, gastroenterologist 80% / surgeon 20%

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 95999, Unlisted neurological or neuromuscular diagnostic procedure

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gastroenterology How often? Rarely

Specialty Surgery How often? Rarely

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 4000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate.

Specialty Gastroenterology Frequency 3200 Percentage 80.00 %

Specialty Surgery Frequency 800 Percentage 20.00 %

Do many physicians perform this service across the United States? No

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? No

If no, please select another crosswalk and provide a brief rationale. 93742

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Non-Surgical

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:95981 Tracking Number M2 Specialty Society Recommended RVU: **0.30**
Global Period: XXX RUC Recommended RVU: **0.30**

CPT Descriptor: Electronic analysis of implanted neurostimulator pulse generator system (eg, rate, pulse amplitude and duration, configuration of wave form, battery status, electrode selectability, output modulation, cycling, impedance and patient compliance measurements), gastric neurostimulation pulse generator/transmitter; subsequent analysis without reprogramming.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 42 year old female with medically refractory idiopathic gastroparesis has previously undergone placement of a gastric neurostimulator with initial improvement of her symptoms. The patient is now seen for follow-up with complaints of intermittent nausea and postprandial fullness.

Percentage of Survey Respondents who found Vignette to be Typical: 95%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: Assess for possible contraindications. Discuss with patient the nature of the procedure, why it is being performed and possible complications. Provide instructions to patient on preparation for the procedure. Obtain informed consent.

Description of Intra-Service Work: The interrogation head is placed over the subcutaneous stimulator in the abdomen. The programmer with memory head recognizes the patient's stimulator. Interrogation and measurements of impedance, voltage and current are obtained by the physician, along with the stimulation rate, pulse width, cycling on/off times, stimulating electrode selections, and battery status. These are compared to the settings from the previous visit. The physician determines that no adjustment of the stimulator parameters is required. The stimulation parameters, impedance and operation of the gastric neurostimulator are documented in the patient's medical record. The interrogation procedure is terminated.

Description of Post-Service Work: At the conclusion of the procedure, vital signs are checked, and the results of the analysis are communicated to the patient and caregivers. The physician provides the patient and family members with a copy of the stimulator parameters. Detailed instructions are provided regarding gastric neurostimulator parameters, impedance and operations and limited modifications of stimulations parameters (pulse width and amplitude) at home. Instructions are provided for follow-up care and management, and the patient is discharged when stable.

Modifier -51 Exempt Status

Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:

Is this new/revised procedure considered to be a new technology or service? Yes

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
95970	XXX	0.45	**RUC Time**

CPT Descriptor Electronic analysis of implanted neurostimulator pulse generator system (eg, rate, pulse amplitude and duration, configuration of wave form, battery status, electrode selectability, output modulation, cycling, impedance and patient compliance measurements); simple or complex brain, spinal cord, or peripheral (ie, cranial nerve, peripheral nerve, autonomic nerve, neuromuscular) neurostimulator pulse generator/transmitter, without reprogramming

KEY MPC COMPARISON CODES:

Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Most Recent Medicare Utilization	Work RVU	Time Source
93307	XXX	6,837,459	0.92	**RUC Time**

CPT Descriptor 1 Echocardiography, transthoracic, real-time with image documentation (2D) with or without M-mode recording; complete

MPC CPT Code 2	Global	Most Recent Medicare Utilization	Work RVU	Time Source
92083	XXX	2,504,632	0.50	**RUC Time**

CPT Descriptor 2 Visual field examination, unilateral or bilateral, with interpretation and report; extended examination (eg, Goldmann visual fields with at least 3 isopters plotted and static determination within the central 30¦, or quantitative, automated threshold perimetry, Octopus program G-1, 32 or 42, Humphrey visual field analyzer full threshold programs 30-2, 24-2, or 30/60-2)

Other Reference CPT Code	Global	Work RVU	Time Source
99212	XXX	0.45	**RUC Time**

CPT Descriptor Office or other outpatient visit for the evaluation and management of an established patient, which requires at least two of these three key components: A problem focused history; A problem focused examination; Straightforward medical decision making. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are self limited or minor. Physicians typically spend 10 minutes face-to-face with the patient and/or family.

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 17 **% of respondents:** 77.2 %

Pre-Service intensity/complexity	2.73	2.81
Intra-Service intensity/complexity	3.13	3.22
Post-Service intensity/complexity	2.45	2.54

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The American Gastroenterological Association (AGA) and the American Society for Gastrointestinal Endoscopy (ASGE) conducted a survey of code 95981, Electronic analysis of implanted neurostimulator pulse generator system (e.g., rate, pulse amplitude and duration, configuration of wave form, battery status, electrode selectability, output modulation, cycling, impedance and patient compliance measurements), gastric neurostimulator pulse generator/transmitter; subsequent analysis without reprogramming. *After reviewing the survey data and convening a consensus panel the societies recommend a value of 0.30 work relative value units (WRVUs).*

Survey Process

The survey was disseminated to a list of 100 users of the gastric neurostimulator technology. A total of 22 (22% response rate) responses were received. The list of users was obtained from the American Motility Society and from the manufacturer.

This code was originally surveyed for the February 2007 RUC meeting. When the decision was made during that meeting to resurvey code 95980, code 95981 was pulled in order to address the issues with code 95980, and to re-review the original survey data. Code 95981 was not resurveyed and this analysis represents the data from the original survey process.

Data Evaluation

Due to the low response rate a consensus panel comprised of representatives from AGA and ASGE was convened.

The panel of advisors compared the survey data to the reference service:

- 95970, Electronic analysis of implanted neurostimulator pulse generator system (eg, rate, pulse amplitude and duration, configuration of wave form, battery status, electrode selectability, output modulation, cycling, impedance and patient compliance measurements); simple or complex brain, spinal cord, or peripheral (ie, cranial nerve, peripheral nerve, autonomic nerve, neuromuscular) neurostimulator pulse generator/transmitter, without reprogramming

A total number of 17 respondents (77%) chose reference code 95970. No other code was chosen with such high frequency.

Code 95970 has a total Harvard time of 19 minutes and is valued at 0.45 WRVUs. In comparison the surveyed code has a total time of 30 minutes. When first presented to the RUC in February 2007, the societies had recommended a WRVU of 0.45. Upon further review and analysis, the consensus panel now recommends a WRVU of 0.30 based on the lower intensity and complexity of this service compared to the reference code 95970, which results in a negative IWPUT of -0.008 for 95981. The panel concluded this negative IWPUT could be the result of survey results with slightly inflated physician time.

Considering the limitations of the survey data and the value of the reference service, the panel recommended a WRVU of 0.30.

Other codes considered by the consensus panel were:

- 92083 - Visual field examination, unilateral or bilateral, with interpretation and report; extended examination (eg, Goldmann visual fields with at least 3 isopters plotted and static determination within the central 30¦, or quantitative, automated threshold perimetry, Octopus program G-1, 32 or 42, Humphrey visual field analyzer full threshold programs 30-2, 24-2, or 30/60-2)
- 99212 - Office or other outpatient visit for the evaluation and management of an established patient
- 99307 - Subsequent nursing facility care, per day, for the evaluation and management of a patient
- 95970 - Electronic analysis of implanted neurostimulator pulse generator system (eg, rate, pulse amplitude and duration, configuration of wave form, battery status, electrode selectability, output modulation, cycling, impedance and patient compliance measurements); simple or complex brain, spinal cord, or peripheral (ie, cranial nerve, peripheral nerve, autonomic nerve, neuromuscular) neurostimulator pulse generator/transmitter, without reprogramming
- 77081 - Dual-energy X-ray absorptiometry (DXA), bone density study, 1 or more sites; appendicular skeleton (peripheral) (eg, radius, wrist, heel)
- 93278 - Signal-averaged electrocardiography (SAECG), with or without ECG

Based on these codes' comparability of existing time and WRVU values, the advisors determined that these codes were appropriate additional comparisons.

The chart below summarizes the data that was considered.

Analysis of Survey Data for 95981:
Physician Time and WRVU Data for Reference Services

CPT Code	Pre Time	Intra Time	Post Time	Total Time	WRVU	IWPUT
95981	10	12	8	30	0.30	-.008
95970	--	--	--	19	0.45	--
93307	5	18	5	28	0.92	.039
92083	3	10	0	13	0.50	.043
99212	2	10	4	16	0.45	.032
77081	5	5	10	20	0.22	-0.023
93278	2	4	5	11	0.25	.023

95981 versus 93307 and 92083
When comparing 95981 to 93307 and 92083, the consensus panel noted that code 95981 has a lower intra-service time than either 93307 or 92083. The level of intensity of the service and the complexity of medical decision-making was determined to be less complex for 95981 compared to these other services. The consensus panel concluded that the WRVU recommendation of 0.30 for 95981 was justified based on a relative value comparison with these and other services.

95981 versus 99212
When comparing 95981 to 99212, the consensus panel was in agreement that the lower WRVU for 95981 was justified. While the total time for 95981 is higher than for 99212, the medical severity of the typical patient seen for 95981 was determined to be no more complex than code 99212, which requires straightforward decision making. In code 95981, the patient is seen for follow-up on an outpatient basis, electronic analysis is performed, and the physician determines that no further reprogramming is necessary. The consensus panel concluded the lower WRVU for 95981 was justified based on a relative value comparison with this evaluation / management service.

95981 versus 77081 and 93278
When comparing 95981 to codes 77081 and 93278, the consensus panel noted that the intra-service, pre- and post-times were higher for code 95981 compared to codes 77081 and 93278. The consensus panel carefully considered the physician work and medical decision making associated with code 95981 and noted that even with the potential of slightly inflated times by the survey participants, when comparing code 95981 to codes 77081 and 93278, a higher WRVU for 95981 was justified based on a relative value comparison.

Considering these factors the consensus panel concluded that the available evidence did not support the previous recommendation of 0.45 WRVU, but did support the recommended value of 0.30 WRVUs for 95981.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☒ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

Codes 99212, 99213, 99214 could be reported if the patient with diabetic gastroparesis has co-existent hypertension requiring a separate evaluation and management service.

Code #	Global	Work	Pre Time	Intra Time	Post Time
99212	XXX	0.45	2	10	4
99213	XXX	0.92	3	15	5
99214	XXX	1.42	5	25	10

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:95982 Tracking Number M3 Specialty Society Recommended RVU: **0.65**
Global Period: XXX RUC Recommended RVU: **0.65**

CPT Descriptor: Electronic analysis of implanted neurostimulator pulse generator system (eg, rate, pulse amplitude and duration, configuration of wave form, battery status, electrode selectability, output modulation, cycling, impedance and patient compliance measurements), gastric neurostimulation pulse generator/transmitter; subsequent analysis with reprogramming.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 47 year old female with medically refractory idiopathic gastroparesis has previously undergone placement of a gastric neurostimulator with initial improvement of her symptoms. The patient is now seen for follow-up with worsening symptoms and daily complaints of nausea and intermittent vomiting.

Percentage of Survey Respondents who found Vignette to be Typical: 90%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 100%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: Assess for possible contraindications. Discuss with patient the nature of the procedure, why it is being performed and possible complications. Provide instructions to patient on preparation for the procedure. Obtain informed consent.

Description of Intra-Service Work: The interrogation head is placed over the subcutaneous stimulator in the abdomen. The programmer with memory head recognizes the patient's stimulator. Interrogation and measurements of impedance, voltage and current are obtained by the physician, along with the stimulation rate, pulse width, cycling on/off times, stimulating electrode selections, and battery status. These are compared to the settings from the previous visit. It is determined that there has been a change in impedance and thus a change in the current being applied by the neurostimulator.

The physician determines that adjustment of the stimulator parameters is required. The results of the analysis are communicated to the patient. The stimulator interrogation head is re-placed over the patient's subcutaneous stimulator in the right lower quadrant of the abdomen. The physician reprograms the stimulator to achieve the desired impedance, voltage, current and stimulation. When re-programming is successful, and the gastric neurostimulator is delivering the desired mamps of current, the procedure is terminated. All adjustments made to the stimulation parameters, impedance and ongoing operation of the gastric neurostimulator are documented in the patient's medical record.

Description of Post-Service Work: At the conclusion of the procedure, vital signs are checked, and the results of the analysis are communicated to the patient and caregivers. The physician provides the patient and family members with a copy of the stimulator parameters. Detailed instructions are provided regarding gastric neurostimulator parameters, impedance and operations and limited modifications of stimulations parameters (pulse width and amplitude) at home. Instructions are provided for follow-up care and management, and the patient is discharged when stable.

Modifier -51 Exempt Status

Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:

Is this new/revised procedure considered to be a new technology or service? Yes

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
95973	XXX	0.92	**RUC Time**

CPT Descriptor Electronic analysis of implanted neurostimulator pulse generator system (eg, rate, pulse amplitude and duration, configuration of wave form, battery status, electrode selectability, output modulation, cycling, impedance and patient compliance measurements); complex brain, spinal cord, or peripheral (except cranial nerve, peripheral (except cranial nerve) neurostimulator pulse generator/transmitter, with interoperative or susequent programming, each additional 30 minutes after first hour (list seperately in addition to primary procedure).

KEY MPC COMPARISON CODES:

Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Most Recent Medicare Utilization	Work RVU	Time Source
93307	XXX	6,837,459	0.92	**RUC Time**

CPT Descriptor 1 Echocardiography, Transthoracic, real-time with image documentation (2D) with or without M-mode recording; complete

MPC CPT Code 2	Global	Most Recent Medicare Utilization	Work RVU	Time Source
99212	XXX	25,078,427	0.45	**RUC Time**

CPT Descriptor 2 Office or other outpatient visit for the evaluation and management of an established patient, which requires at least two of these three key components: A problem focused history; A problem focused examination; Straightforward medical decision making. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are self limited or minor. Physicians typically spend 10 minutes face-to-face with the patient and/or family.

Other Reference CPT Code	Global	Work RVU	Time Source
99213	XXX	0.92	RUC Time

CPT Descriptor ffice or other outpatient visit for the evaluation and management of an established patient, which requires at least two of these three key components: An expanded problem focused history; An expanded problem focused examination; Medical decision making of low complexity. Counseling and coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of low to moderate severity. Physicians typically spend 15 minutes face-to-face with the patient and/or family.

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 10 **% of respondents:** 45.4 %

TIME ESTIMATES (Median)

	CPT Code: 95982	Key Reference CPT Code: 95973	Source of Time Harvard Time

Prolonged Services Time	0.0	0.00	
Median Total Time	**24.00**	**30.00**	
Other time if appropriate			

INTENSITY/COMPLEXITY MEASURES (Mean)

Mental Effort and Judgment (Mean)

The number of possible diagnosis and/or the number of management options that must be considered	3.57	3.66
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	3.33	3.38
Urgency of medical decision making	3.09	3.28

Technical Skill/Physical Effort (Mean)

Technical skill required	3.47	3.71
Physical effort required	2.28	2.38

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	2.80	2.90
Outcome depends on the skill and judgment of physician	3.76	3.76
Estimated risk of malpractice suit with poor outcome	2.57	2.76

INTENSITY/COMPLEXITY MEASURES	CPT Code	Reference Service 1
Time Segments (Mean)		
Pre-Service intensity/complexity	3.14	3.23
Intra-Service intensity/complexity	3.47	3.61
Post-Service intensity/complexity	2.71	2.90

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The American Gastroenterological Association (AGA) and the American Society for Gastrointestinal Endoscopy (ASGE) conducted a survey of code 95982, Electronic analysis of implanted neurostimulator pulse generator system (e.g., rate, pulse amplitude and duration, configuration of wave form, battery status, electrode selectability, output modulation, cycling, impedance and patient compliance measurements), gastric neurostimulator pulse generator/transmitter; subsequent analysis with reprogramming. *After reviewing the survey data and convening a consensus panel the societies agreed to recommend a value of 0.65 work relative value units (WRVUs).*

Survey Process

The survey was disseminated to a list of 100 users of the gastric neurostimulator technology. A total of 22 (22% response rate) responses were received. A list of users was obtained from the American Motility Society and from the manufacturer.

This code was originally surveyed for the February 2007 RUC meeting. When the decision was made during that meeting to resurvey code 95980, code 95982 was pulled in order to address the issues with code 95980, and to re-review the original survey data. Code 95982 was not resurveyed and this analysis represents the data from the original survey process.

Data Evaluation

Due to the low response rate a consensus panel comprised of representatives from AGA and ASGE was convened.

The panel of advisors compared the survey data to the reference service:

- 95973, Electronic analysis of implanted neurostimulator pulse generator system (eg, rate, pulse amplitude and duration, configuration of wave form, battery status, electrode selectability, output modulation, cycling, impedance and patient compliance measurements); complex spinal cord, or peripheral (except cranial nerve) neurostimulator pulse generator/transmitter, with intraoperative or subsequent programming, each additional 30 minutes after first hour (List separately in addition to code for primary procedure).

A total number of 10 respondents (45%) chose reference code 95973. No other code was chosen with such high frequency.

Code 95973 has a total RUC-valued physician time of 30 minutes and is valued at 0.92 WRVUs. In comparison the surveyed code, 95982, has a total physician time of 37 minutes and a recommended WRVU of 0.65. This results in an IWPUT of 0.012 for 95982. When first presented to the RUC in February 2007, the societies had recommended a WRVU of 0.92 for 95982. Upon further review and analysis, the consensus panel now recommends a WRVU of 0.65 based on the lower intensity and complexity of this service compared to the reference code 95973. Although the overall physician time was higher for the surveyed code than the reference service, which is a time based service, the panel agreed that 95982 typically represented a less intensive procedure than 95973 and this lower value recommended for code 95982 was appropriate.

Other codes considered by the consensus panel were:

- 93307 – Subsequent nursing facility care, per day, for the evaluation and management of a patient
- 99212 – Office or other outpatient visit for the evaluation and management of an established patient
- 99213 – Office or other outpatient visit for the evaluation and management of an established patient
- 99307 - Subsequent nursing facility care, per day, for the evaluation and management of a patient
- 45330 - Sigmoidoscopy, flexible; diagnostic, with or without collection of specimen(s) by brushing or washing (separate procedure)

The chart below summarizes the data that was considered.

Analysis of Survey Data for 95982:
Physician Time and WRVU Data for Reference Services

CPT Code	Pre Time	Intra Time	Post Time	Total Time	WRVU	IWPUT
95982	10	17	10	37	0.65	.012
95973	--	--	--	30	0.92	--
93307	5	18	5	28	0.92	.039
99212	2	10	4	16	0.45	.032
99213	3	15	5	23	0.92	.049
99307	5	10	5	20	0.60	.038
45330	7	17	8	32	0.96	.037

95982 versus 99212

When comparing 95982 to 99212, the consensus panel determined that the higher WRVU for 95982 was justified. The total time for 95982 is higher than for 99212. The medical severity of the typical patient seen for 95982 was determined to be more complex than code 99212, which requires straightforward decision making. In code 95982, where the patient is seen for follow-up on an outpatient basis, electronic analysis is performed, and the physician determines that further reprogramming is necessary. The consensus panel concluded the higher WRVU for 95981 was justified based on a relative value comparison with this evaluation / management service.

95982 versus 99213 and 93307

When comparing 95982 to codes 99213 and 93307, the consensus panel was in agreement that the lower WRVU for 95982 was justified. While the total time for 95982 is higher than for 99213, the medical severity of the typical patient seen for code 99213 was determined to be more complex than for code 95982. While the intra-time for code 95982 was

1 minute less than code 93307, and the pre- and post- times for code 95982 were higher, the medical severity of the typical patient seen for code 93307 was determined to be more complex than for code 95982. The consensus panel concluded the lower WRVU for 95982 was justified based on a relative value comparison with these evaluation / management services.

95982 versus 99307
When comparing 95982 to codes 99307, the consensus panel determined that the higher WRVU for 95982 was justified. The pre-, intra- and post- time for 95982 is higher than for 99307, and the medical severity of the typical patient seen for code 99307 was determined to be less intense than for code 95982. The consensus panel concluded the higher WRVU for 95982 was justified based on a relative value comparison with this evaluation / management service.

95982 versus 45330
When comparing 95982 to codes 45330, the consensus panel was in agreement that the lower WRVU for 95982 was justified. While the total time for 95982 is equivalent to code 45330, with higher pre- and post- times, the complexity and intensity of code 45330 is higher than for code 95982. The consensus panel concluded the lower WRVU for 95982 was justified based on a relative value comparison with code 45330, a service that is frequently performed by physicians that also perform 95982.

In view of the above, the AGA and ASGE recommend 0.65 WRVUs for surveyed code 95982.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☒ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. Codes 99212, 99213, 99214 could be reported if the patient with diabetic gastroparesis has co-existent hypertension requiring a separate evaluation and management service.

Code #	Global	Work	Pre Time	Intra Time	Post Time
99212	XXX	0.45	2	10	4
99213	XXX	0.92	3	15	5
99214	XXX	1.42	5	25	10

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed)

95999, Unlisted neurological or neuromuscular diagnostic procedure
95973, Electronic analysis of implanted neurostimulator pulse generator system (eg, rate, pulse amplitude and duration, configuration of wave form, battery status, electrode selectability, output modulation, cycling, impedance and patient compliance measurements); complex spinal cord, or peripheral (except cranial nerve) neurostimulator pulse generator/transmitter, with intraoperative or subsequent programming, each additional 30 minutes after first hour (List separately in addition to code for primary procedure)

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gastroenterology How often? Rarely

Specialty Surgery How often? Rarely

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 3000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate.

Specialty Gastroenterology Frequency 2400 Percentage 80.00 %

Specialty Surgery Frequency 600 Percentage 20.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 800
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate.

Specialty Gastroenterology Frequency 640 Percentage 80.00 %

Specialty Surgery Frequency 160 Percentage 20.00 %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? No

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? No

If no, please select another crosswalk and provide a brief rationale. 99307

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Non-Surgical

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

April 2007

Ocular Photoscreening

At the February 2007 CPT Editorial Panel meeting, a pediatric physician provided evidence indicating that since 2003, ocular photoscreening utilization has increased with over 5,000 photoscreening units currently in circulation. The CPT Editorial Panel recognized widespread use of the ocular photo screening Category III code and approved that this code be moved to Category I status.

The RUC initiated the standard Level of Interest process in which specialty societies may survey physicians performing this procedure and present work relative value recommendations to the RUC. No specialty societies indicated an interest in providing a work relative value recommendation.

Ophthalmology and pediatrics both indicated no interest in developing a recommendation for this code. **Therefore, the RUC has no recommendation for physician work or practice expense for code 99174** ***Ocular photoscreening with interpretation and report, bilateral.***

1685

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

February 2007

Initial Day Hospital Neonate Care

The CPT Editorial Panel created a new inpatient neonate code, 99477 *Initial hospital care, per day, for the evaluation and management of the neonate, 28 days of age or less, who requires intensive observation, frequent interventions, and other intensive care services* to describe the initial day hospital evaluation and management services provided to a sick newborn patient (28 days or less) who requires intensive observation and monitoring, but is not a normal newborn nor meets the CPT definition of critically ill newborn.

1686

The RUC reviewed code 99477 and determined that the survey median work RVU of 7.00 and physician times of 30 minutes pre-service, 77.50 minutes intra-service and 40 minutes post-service were reflect the accurate time spent by the physician. The RUC examined the reference code 99255 *Inpatient consultation for a new or established patient* (work RVU=4.00, physician times = 30 pre, 60 intra, and 25 post) and determined that this reference was appropriate as it was the reference code with the highest RVU and closest comparison offered on the reference service list. The RUC further examined procedures frequently performed during this initial day hospital neonate care service and used a building block analysis to support the survey median of 7.00 RVUs. By adding the reference service code 99255 work RVUs (4.00) and the increments of work for the procedures usually performed in 99477 (2.73, as shown in the calculation below) the total work RVU (6.73) is relative to the survey median 7.00 for 99477. The RUC clarified that typically there are no other services reported with 99477.

Procedures usually performed within 99477 are:
62270 *Spinal puncture, lumbar, diagnostic*
36510 *Catheterization of umbilical vein for diagnosis or therapy, newborn*
36600 *Arterial puncture, withdrawal of blood for diagnosis*
51000 *Aspiration of bladder by needle*
43752 *Naso- or oro-gastric tube placement, requiring physician's skill and fluoroscopic guidance (includes fluoroscopy, image documentation and report)*

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

90744 *Therapeutic, prophylactic or diagnostic injection (specify substance or drug); intravenous push, single or initial substance/drug*

The RUC recommends a work RVU of 7.00 for 99477.

Building Block Analysis for 99477

Code	Pre-Service Time	Intra-Service Time	Post-Service Time	Total Time	RVW	Total IWPUT	Intra-Service IWPUT
62270	15.00	20.00	10.00	45.00	1.37	0.0405	0.8100
36510	12.00	20.00	10.00	42.00	1.09	0.0299	0.5972

						Total	2.7256
				99255 (4.00) + 2.7256 =			**6.73**

1687

Practice Expense

The RUC recommends no direct practice expense inputs for code 99477 because this service is typically performed in the facility setting.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation

The following codes are...

For initial inpatient encounters...

For admission services for the neonate (28 days of age or less) requiring intensive observation and monitoring services see 99477.

When the patient is admitted...

Evaluation and management services...

Inpatient Neonatal and Pediatric Critical Care Services

The following codes...

The initial day neonatal critical care code...

Codes 99295, 99296...

Codes 99293, 99294...

When a neonate or infant is not critically ill, but requires intensive observation, frequent interventions and other intensive care services, the Continuing Intensive Care Services codes (99298, 99299, 99300) should be used to report services for those neonates/infants with present body weight of 5000 grams or less. When the present body weight of those neonates/infants exceeds 5000 grams, the Subsequent Hospital Care Services codes (99231-99233) should be used. To report initial services to the infant requiring intensive observation, frequent interventions and other intensive care services see 99477.

To report critical care services..

Care rendered under 99293-00206..

The pediatric and neonatal critical care codes include those procedures listed above for the hourly critical care codes (99291, 99292). In addition, the following procedures are also included in the bundled (global) pediatric and neonatal critical care service codes (99293-99296), and the initial and continuing intensive care codes (99477, 99298-99300), umbilical venous (36510) and umbilical arterial catheters (36660), other arterial catheters (36140, 36620), central (36555) or peripheral vessel catheterization (36000), vascular access procedures (36400, 36405, 36406), vascular punctures (36420, 36600), oral or nasogastric tube placement (43752), endotracheal intubation (31500), lumbar puncture (62270), suprapubic bladder aspiration (51000), bladder

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:99477 Tracking Number N1 Specialty Society Recommended RVU: **7.00**
Global Period: XXX RUC Recommended RVU: **7.00**

CPT Descriptor: Initial hospital care, per day, for the evaluation and management of the neonate, 28 days of age or less, who requires intensive observation, constant monitoring, and other intensive care services

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 2250 gram infant is born at 36-37 weeks gestation by the vaginal route to a mother with unknown Group B Streptococcal Disease status. At six hours of life, the baby develops the sudden appearance of tachypnea, grunting, thermal instability, mild tachycardia and cyanosis responsive to supplemental oxygen. The physician is summoned to the nursery, examines the patient, and admits the infant to the neonatal intensive care unit.

Percentage of Survey Respondents who found Vignette to be Typical: 92%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: The physician speaks to the nurse over the telephone and comes to the nursery. The physician again converses with the nurse, reviews the prenatal, labor and delivery summary, and the nursery transitional record over the previous 6 hours of life. The obstetrician is called for further information regarding the antepartum and intrapartum period.

Description of Intra-Service Work: The physician undertakes a complete physical examination of the infant. After completion of the examination, a blood culture, CBC, chest x-ray, and blood glucose are ordered. A spinal tap (62270) is obtained, an umbilical venous catheter (36510) is placed, and a flat plate of the abdomen is ordered to check catheter position. The baby is placed on nasal cannula oxygen and a blood gas is obtained through a radial arterial sample (36600). The physician speaks with the parents, the obstetrician, and the pediatrician.

Description of Post-Service Work: The physician completes the admission history, physical examination, and orders and writes the admission note. The chest radiograph is reviewed for the presence of pneumonia and the flat plate of the abdomen is evaluated for catheter position. The blood gas is reviewed and an appropriate concentration of oxygen is ordered. The CBC, glucose, spinal tap, and urine analysis are evaluated. IV fluids are given and appropriate antibiotics are ordered. The patient is re-evaluated several times during the initial 24 hours of care with changes in oxygen concentration and fluid administration as indicated. The parents, obstetrician, and pediatrician are kept informed.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

An expert panel was convened. After thorough review of the work survey results, the panel agreed to recommend the survey median of 7.00.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 99223

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pediatrics How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 120000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.

Specialty Pediatrics Frequency 120000 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 0
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty.

Specialty Pediatrics Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? No

If no, please select another crosswalk and provide a brief rationale. Code 99298 would be a more appropriate PLI crosswalk since it describes a similar service, albeit for subsequent days of care (as opposed to the initial day of care as described by code 99260X).

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Non-Surgical

Attestation Statement

As a RUC Advisor, I attest that the integrity of the RUC survey and summary of recommendation forms are based on accurate and complete data to the best of my knowledge. As a RUC Advisor, I

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

February and April 2007

Team Conferences

In November 2006, the CPT Editorial Panel created CPT codes 99365 *Medical team conference with interdisciplinary team of health care professionals, face to face with patient and/or family, 30 minutes or more; participation by physician* and 99367 *Medical team conference with interdisciplinary team of health care professionals, patient and/or family not present, 30 minutes or more; participation by physician* to differentiate team conferences at which the patient is present and when the patient is not present.

1698

The CPT Editorial Panel also developed new codes corresponding to non-physician services. The RUC reviewed and submitted the following recommendations on the physician (MD/DO) services only. The HCPAC independently reviewed and submitted separate recommendations on the non-physicians services.

The CPT Executive Committee subsequently reconsidered CPT code 99365. Discussions initiated by the RUC process indicated that team conference services by the physician with the patient and/or family present may be reported using appropriate E/M codes. A research of materials from the creation of the E/M codes indicates that the language concerning face-to-face time and counseling and coordination of care appears to have been included so as to address meetings conducted for the purpose of coordinating care. The Executive Committee confirmed that the E/M codes would be appropriate when counseling and coordination of care dominate the service and the patient and/or family is present. It is unlikely any significant number of team conferences would not be for the purpose of counseling and/or coordination of care. The E/M codes have greater flexibility than a single code for a team conference by a physician, patient and/or family present. Therefore, the RUC proposed the CPT code 99365 be rescinded. The introductory text from the team conference section is revised to account for this interpretation by removing other restrictions and referencing E/M. The requirement for direct participation in the care of the patient remains in response to concerns that the E/M codes would be improperly reported when the physician role was simply to attend a conference about the patient. **The CPT Executive Committee recommends that CPT code 99365 be rescinded.**

The RUC reviewed the survey data for 99367 and compared it to its reference code 99374 *Physician supervision of a patient under care of home health agency (patient not present) in home, domiciliary or equivalent environment* (Work RVU=1.10). The RUC agreed that 99374 was a good reference for the surveyed code as both codes are non-face-to-face services. Although, when comparing the two codes, the RUC noted that 99374 was deemed to be a slightly more intense procedure to perform and had slightly more total service time associated with it as compared to the surveyed code (40 minutes and 34 minutes, respectively), the RUC believed these two codes to be equal in overall work. Therefore, the RUC recommends a

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

work RVU of 1.10 RVUs for 99367 which is a value slightly below the 25th percentile of the survey data. **The RUC recommends 1.10 work RVUs for 99367.**

Practice Expense:
The RUC recommends no practice expense inputs for 99367.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
~~Physician case management is a process in which a physician is responsible for direct care of a patient, and for coordinating and controlling access to or initiating and/or supervising other health care services needed by the patient.~~ Case management is a process in which a physician or another qualified health care professional is responsible for direct care of a patient and, additionally, for coordinating, managing access to, initiating and/or supervising other healthcare services needed by the patient. **Medical Team Conferences** Medical team conferences include face-to-face participation by a minimum of three qualified health care professionals from different specialties or disciplines (each of whom provide direct care to the patient), with or without the presence of the patient, family member(s), community agencies, surrogate decision maker(s) (eg, legal guardian) and/or caregivers(s). The participants are actively involved in the development, revision, coordination and implementation of healthcare services needed by the patient. Reporting participants shall have performed face to face evaluations/treatments of the patient, independent of any team conference, within the previous 60 days. Physicians may report their time spent in a team conference with the patient and/or family present using Evaluation and Management codes and time as the key controlling factor for code selection when counseling and/or coordination of care dominates the service. These introductory guidelines do not apply to services reported using Evaluation and Management codes (see E/M services guidelines). However, the physician must be directly involved with the patient, providing face to face services outside of the conference visit with other providers or agencies. Reporting participants shall document their participation in the team conference as well as their contributed information and subsequent treatment recommendations No more than one individual from the same specialty may report 99365-9936X4 at the same encounter. Individuals should not report when their participation in the medical team conference is part of a facility or organizational service contractually provided by the organizational or facility provider.				

1699

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
The team conference starts at the beginning of the review of an individual patient and ends at the conclusion of the review. Time related to record keeping and report generation is not reported. The reporting participant shall be present for all time reported. The time reported is not limited to the time that the participant is communicating to the other team members or patient and/or family. Time reported for medical team conferences may not be used in the determination of time for other services such as care plan oversight (99374-99380), home, domiciliary or rest home care plan oversight (99339-99340), prolonged services (99354-99359), psychotherapy, or any Evaluation and Management service. For team conferences where the patient is present for any part of the duration of the conference, report the team conference face-to-face codes.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:99367 Tracking Number C3 Specialty Society Recommended RVU: **1.10**
Global Period: XXX RUC Recommended RVU: **1.10**

CPT Descriptor: Medical team conference with interdisciplinary team of health care professionals, patient and/or family not present, 30 minutes or more; participation by physician

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A patient with a neurological disorder, weight loss and functional limitations lives at home with a caregiver. The functional limitations include impaired cognition, mobility, communication and dependencies in basic activities of daily living. The condition is such that the problems and functional limitations are likely to be alleviated with appropriate care and therapies. The optimal care plan needs to be devised in a coordinated manner given the multiple domains requiring attention (biomedical, psychological, social and functional) and multiple healthcare professionals involved in the care of the patient. After undergoing evaluations (each reported separately) by the appropriate disciplines/specialties a team conference is convened.

Percentage of Survey Respondents who found Vignette to be Typical: 83%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: Chart review prior to conference.

Description of Intra-Service Work: The conference is attended by the physician and/or non-physician providers.

Description of Post-Service Work: This service includes the individual clinician's post conference creation of documentation of his/her participation in the team conference, including documenting contributed information and treatment recommendations, and review of the care plan for the patient.

CPT Descriptor 2

Other Reference CPT Code	Global	Work RVU	Time Source
99242	XXX	1.34	RUC Time

CPT Descriptor Office consultation for a new or established patient, which requires these three components: an expanded problem focused history; an expanded problem focused examination; straightforward medical decision making. Counseling and coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate severity. Physicians typically spend 30 minutes face-to-face with the patient and/or family.

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 11 **% of respondents:** 47.8 %

Intra-Service intensity/complexity	3.74	3.22
Post-Service intensity/complexity	3.13	2.91

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

An expert panel was convened with representatives from AGS. AAP, APA, and AAPMR reviewed changes in recommendations and support the AGS changes.

The description of pre service work says: N/A - this did not go to the respondents and the N/A was incorrect - there is chart review involved before the conference - the surveyees thought this took 10 min - our expert panel thought 5 min was sufficient; the description of post-service work, which also did not go to surveyees, incorrectly included some intraservice work. The only post-service work is the last sentence of the post service work description - specifically, documentation of the physicians participation and any management plan, as appropriate and review of the summary report when it comes out. The surveyees estimated that this took 15 min. We believe that the surveyees may have incorrectly assumed that post service work also included a phone call to the patient or preparing the post conference summary. Therefore, our expert panel reduced the post service time to 5 min.

Work RVUs - Our expert panel recommends 1.1 RVUs for 99367 and 1.20 RVUs for X1. The most appropriate comparator code to 99367 is 99374 which was the reference service chosen most often by respondents. Both codes are non-face-to-face codes and the intensity of 99367 is slightly lower than 99374 because multiple physicians are present at the conference and only a single physician performs 99374. 99374 has an intraservice time of 20 min and a total time of 34 minutes while 99367 has an intraservice time of 30 min and a total time of 40 minutes. The recommended work RVU of 1.1, which is identical to 99374, is based on the longer intraservice time and slightly

lower intensity of 99367 as compared to 99374. This RVU is below the survey 25th percentile and places the two codes in proper rank order.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 99361

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pediatrics How often? Commonly

Specialty Geriatrics How often? Commonly

Specialty Physical Medicine & Rehabilitation How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 802000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.

Specialty Pediatrics Frequency 200000 Percentage 24.93 %

Specialty Geriatrics Frequency 550000 Percentage 68.57 %

Specialty Physical Medicine & Rehabilitation Frequency 2000 Percentage 0.24 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 538,900 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty.

Specialty Pediatrics Frequency 0 Percentage 0.00 %

Specialty Geriatrics Frequency 522500 Percentage 96.95 %

Specialty Physical Medicine & Rehabilitation Frequency 1400 Percentage 0.25 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Non-Surgical

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

February 2007

Non Face-to-Face Physician Services

The CPT Editorial Panel created four new codes describing Evaluation and Management services performed by a physician via telephone or on-line. Typically these calls involve the physician obtaining a history of the patient, assessing the patient's condition, making a medical decision and communicating that decision via the phone/e-mail to the patient. Over the last two decades medicine has seen the rapid increase of medical information and communications technology. Combined with changing consumer and health plan expectations for enhanced access to care, a new focus on chronic disease management and continued pressure to reduce the codes of medical services, physicians are providing more care to patients in a "non-face-to-face" manner. Additionally, these services describe physician work that is currently not captured in any other CPT codes.

1714

The CPT Editorial Panel also developed new codes corresponding to non-physician services. The RUC reviewed and submitted the following recommendations on the physician (MD/DO) services only. The HCPAC independently reviewed and submitted separate recommendations on the non-physicians services.

The RUC reviewed the specialty societies' survey results for codes 99441-99444 *Telephone and Online Evaluation and Management services.* Physicians from various specialties perform these services. Therefore, seven different specialties were involved in surveying these services to appropriately capture the typical physician time and work involved. Approximately 500 physicians completed the surveys for 99441-99443, with median annual service performance rates of 190, 100, and 35, respectively. Additionally, 150 physicians completed the survey for code 99444 *Online Evaluation and Management*, indicating a median annual performance rate of 10.

99441

The RUC reviewed the specialty societies survey results for code 99441 *Telephone Evaluation and Management, 5-10 minutes of medical discussion* and thoroughly discussed the physician time and work involved in this service. The RUC determined that the physician time for 99441 was slightly lower than the survey reference service code 99212 *Office or other outpatient visit for the Evaluation and Management of an established patient* (RVU=0.45, 2 minutes pre-, 10 minutes intra- and 4 minutes post-service time). The presenting specialty societies and the RUC agreed that the physician work for code 99441 should be lower than the survey

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

reference code 99212 but slightly higher than 99211 *Office or other outpatient visit for the Evaluation and Management of an established patient, that may not require the presence of a physician* (RVU=0.17, 5 minutes intra-service and 2 minutes post-service time). The RUC determined that using a magnitude estimation of 150% of the work RVUs for code 99211 would appropriately place 99441 in the proper rank order within the Evaluation and Management services family (0.17 x 150% = 0.25). **The RUC recommends a work RVU of 0.25 for code 99441. The RUC recommends 1 minute pre-service, 8 minutes intra-service and 4 minutes post-service time for code 99441.**

99442 and 99443

The RUC reviewed the specialty societies survey results for codes 99442 *Telephone Evaluation and Management, 11-20 minutes of medical discussion* and 99443 *Telephone Evaluation and Management, 21-30 minutes of medical discussion* and thoroughly discussed the physician time and work involved in these services. The RUC determined that the RVU presented by the specialty societies for 99442, the 25th percentile work relative value of 0.60, was slightly high in relation to the RUC recommended value for 99441 (0.25 RVUs). The presenting specialty societies and the RUC agreed using a magnitude estimation for 99442 and 99443 would be appropriate to properly values these services within the Evaluation and Management family of services. The RUC determined that 99442 would be twice the recommended value for 99441 (0.25 x 2 = 0.50). Additionally, the RUC determined that 99443 would be three times the recommended value for 99441 (0.25 x 3 = 0.75). **The RUC recommends a work RVU of 0.50 for code 99442 and 1 minute pre-service, 15 minutes intra-service and 5 minutes post-service physician time. The RUC recommends a work RVU of 0.75 for code 99443 and 1 minute pre-service, 25 minutes intra-service and 10 minutes post-service physician time.**

1715

99444

The RUC discussed code 99444 *Online Evaluation and Management* and concluded that the definition of work and physician time and complexity involved in this service were unclear, therefore making it difficult to recommend a specific work relative value. The specialty societies agreed and recommended that code 99444 be carrier-priced. The specialty societies indicated that they will bring this code back to CPT in order to develop a clearer definition of this service. **The RUC recommends that code 99444 be carrier-priced for CY 2008.**

Practice Expense

The PERC and RUC reviewed the direct practice expenses for 99441-99443 and slightly modified the conduct phone calls/call in prescriptions by the RN/LPN/MTA from 4 to 3 minutes and "other clinical activity" to zero. The presumption was that the typical service would include the clinical staff calling in a prescription. **The RUC recommends the modified practice expense as attached.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

New Technology and New Physician Work

The RUC recommends that codes 99441-99443 be added to the new technology list to review potential changes in valuation after experience in reporting of these services has occurred. Additionally, the RUC recommends that these services involve new physician work not currently compensated within the physician payment system.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
Telephone services are non-face-to-face E/M services provided by a physician to a patient using the telephone. These codes are used to report episodes of care by the physician initiated by an established patient or guardian of an established patient. If the telephone service ends with a decision to see the patient within 24 hours or next available urgent visit appointment, the code is not reported; rather the encounter is considered part of the preservice work of the subsequent E/M service, procedure and visit. Likewise if the telephone call refers to an E/M service performed and reported by the physician within the previous seven days (either physician requested or unsolicited patient follow-up) or within the period of the previously completed procedure, then the service(s) are considered part of that previous E/M service or procedure. (Do not report 99441-99443 if reporting 99441-99444 performed in the previous seven days.)				
●99441	O1	Telephone evaluation and management service provided by a physician to an established patient, parent, or guardian not originating from a related E/M service provided within the previous seven days nor leading to an E/M service or procedure within the next 24 hours or soonest available appointment; 5-10 minutes of medical discussion	XXX	0.25
●99442	O2	11-20 minutes of medical discussion	XXX	0.50
●99443	O3	21-30 minutes of medical discussion (Do not report 99441-99443 when using 99339-99340, 99374-99380 for the same call(s)) (Do not report 99441-99443 for anticoagulation management when reporting 99363-99364)	XXX	0.75
Online Medical Evaluation An online electronic medical evaluation is a non-face-to-face E/M service by a physician to a patient using Internet resources in response to a patient's online inquiry. Reportable services involve the physician's personal timely response to the patient's inquiry and must involve permanent storage (electronic or hard copy) of the encounter. This service is reported only once for the same episode of care during a secen day period, although multiple physicians				

1716

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
could report their exchange with the same patient. If the online medical evaluation refers to an E/M service previously performed and reported by the physician within the previous seven days (either physician requested or unsolicited patient follow-up) or within the postoperative period of the previously completed procedure, then the service(s) are considered covered by the previous E/M service or procedure. A reportable service encompasses the sum of communication (eg, related telephone calls, prescription provision, laboratory orders) pertaining to the online patient encounter.				
●99444	04	Online evaluation and management service provided by a physician to an established patient, guardian or health care provider not originating from a related E/M service provided within the previous 7 days, using the Internet or similar electronic communications network (Do not report 99444 when using 99339-99340, 99374-99380 for the same communication(s)) (Do not report 99444 for anticoagulation management when reporting 99363 to 99364)	XXX	Carrier-Priced
~~**Telephone Calls**~~				
D 99371		~~Telephone call by a physician to patient or for consultation or medical management or for coordinating medical management with other health care professionals (eg, nurses, therapists, social workers, nutritionists, physicians, pharmacists); simple or brief (eg, to report on tests and/or laboratory results, to clarify or alter previous instructions, to integrate new information from other health professionals into the medical treatment plan, or to adjust therapy)~~	XXX	N/A
D 99372		~~intermediate (eg, to provide advice to an established patient on a new problem, to initiate therapy that can be handled by telephone, to discuss test results in detail, to coordinate medical management of a new problem in an established patient, to discuss and evaluate new information and details, or to initiate new plan of care)~~	XXX	N/A
D 99373		~~complex or lengthy (eg, lengthy counseling session with anxious or distraught patient, detailed or prolonged discussion with family members regarding seriously ill patient, lengthy communication necessary to coordinate complex services of several different health professionals working on different aspects of the total patient care~~	XXX	N/A

Category III **Online Medical Evaluation** ~~An online medical evaluation is a type of Evaluation and Management (E/M) service provided by a physician or qualified health care professional to a patient using internet resources in response to the patient's online inquiry. Reportable services involve the physician's personal timely response to the patient's inquiry and must involve permanent storage (electronic or hard copy) of the encounter. This service should not be reported for patient contacts (eg, telephone calls) considered to be pre-service or post-service work for other E/M or non E/M services. A reportable service would encompass the sum of communication (eg, related telephone calls, prescription provision, laboratory orders) pertaining to the online patient encounter or problem(s).~~				
D 0074T		~~Online evaluation and management service, per encounter, provided by a physician, using the Internet or similar electronic communications network, in response to a patient's request, established patient~~ (0074T has been deleted. To report, use 99444)		N/A

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:99441 Tracking Number O1 Specialty Society Recommended RVU: **0.35**
Global Period: XXX RUC Recommended RVU: **0.25**

CPT Descriptor: Telephone evaluation and management service provided by a physician to an established patient, parent, or guardian not originating from a related E/M service provided within the previous seven days nor leading to an E/M service or procedure within the next 24 hours or soonest available appointment; 5-10 minutes of medical discussion.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A patient known to the physician calls with a new complaint. The physician obtains a brief history and the patient's present medication use and makes treatment recommendations, all of which are recorded in the patient's medical record. The patient is instructed and advised to call if the symptoms fail to improve with the recommended treatment. The call lasts 8 minutes. No office visit is required.

Percentage of Survey Respondents who found Vignette to be Typical: 90%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: The physician reviews records and communicates with other professionals regarding the patient as appropriate.

Description of Intra-Service Work: The physician obtains a brief history via phone, assesses the patients condition, makes a medical decision, and communictates that decision via phone to the patient.

Description of Post-Service Work: The physician documents the telephone call and oversees care plan. The physician also has discussion with family members or other health professionals associated with the delivery of care to this patient until the next E/M service is provided.

Modifier -51 Exempt Status

Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:

Is this new/revised procedure considered to be a new technology or service? Yes

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99212	XXX	0.45	**CMS Time File**

CPT Descriptor Office or other outpatient visit for the evaluation and management of an established patient, which requires at least two of these three key components: a problem focused history; a problem focused examination; straightforward medical decision making. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are self limited or minor. Physicians typically spend 10 minutes face-to-face with the patient and/or family.

KEY MPC COMPARISON CODES:

Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The RUC advisors for the participating specialty societies met by conference call to review and discuss the survey results. All of the surveying organizations except the American College of Physicians (ACP) used a panel sample; ACP used a random sample.

For 993XX1, the advisors noted that respondents rated the intensity and complexity of 993XX1 very similar to the key reference code, 99212, with the ratings for 993XX1 being slightly higher in each time segment and for all areas except physical effort. The advisors also noted the nearly identical total time of 993XX1 and 99212. The advisors agreed that 99212 was an appropriate key reference service, since a self-limited or minor presenting problem (as described in 99212) is consistent with a telephone evaluation and management service of 5 to 10 minutes duration (as described in 993XX1). Accordingly, consistent with the survey data, the specialty societies agreed to recommend the survey median of 0.45 work RVUs for 993XX1, which is also the current work RVUs assigned to the key reference code, 99212.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.

- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. (not applicable)

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) This service was not previously reported.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The RUC advisors for the participating specialty societies met by conference call to review and discuss the survey results. All of the surveying organizations except the American College of Physicians (ACP) used a panel sample; ACP used a random sample. For 993XX2, the advisors noted that respondents rated the intensity and complexity of 993XX2 very similar to the key reference code, 99213, for each time segment. They also noted that respondents consistently rated the intensity and complexity of 993XX2 higher than 99213 in all areas of mental effort and judgment, technical skill/physical effort, and psychological stress. The advisors also noted the identical time elements (pre-, intra-, and post-service) of 993XX2 and 99213. The advisors agreed that 99213 was an appropriate key reference service, since a presenting problem of low or moderate severity (as described in 99213) is consistent with a telephone evaluation and management service of 11 to 20 minutes duration (as described in 993XX2). Accordingly, consistent with the survey data, the specialty societies agreed to recommend the survey median of 0.90 work RVUs for 993XX2, which is almost the same as the work RVUs assigned to the key reference service, 99213, in 2007.

CPT Code:99443 Tracking Number O3 Specialty Society Recommended RVU: **0.92**
Global Period: XXX RUC Recommended RVU: **0.75**

CPT Descriptor: Telephone evaluation and management service provided by a physician to an established patient, parent, or guardian not originating from a related E/M service provided within the previous seven days nor leading to an E/M service or procedure within the next 24 hours or soonest available appointment; 21-30 minutes of medical discussion.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: An established patient with special needs calls to discuss onset of new and disturbing symptoms. During a 25 minute phone call, the physician reviews the history and review of systems, the description of symptoms, and current medications. She makes a recommendation to change the present medication regimen, provides reassurance, both of which are recorded in the patient's medical record, and requests follow-up in the office in one week or sooner if needed.

Percentage of Survey Respondents who found Vignette to be Typical: 75%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: The physician reviews records and communicates with other professionals regarding the patient as appropriate.

Description of Intra-Service Work: The physician obtains a history and review of systems via phone, assesses the patients condition, makes a medical decision, and communictates that decision via phone to the patient.

Description of Post-Service Work: The physician documents the telephone call and oversees care plan. The physician also has discussion with family members or other health professionals associated with the delivery of care to this patient until the next E/M service is provided.

Modifier -51 Exempt Status

Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:

Is this new/revised procedure considered to be a new technology or service? Yes

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99214	XXX	1.42	CMS Time File

CPT Descriptor Office or other outpatient visit for the evaluation and management of an established patient, which requires at least two of these three key components: a detailed history; a detailed examination; medical decision making of moderate complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 25 minutes face-to-face with the patient and/or family.

KEY MPC COMPARISON CODES:

Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

Intra-Service intensity/complexity	3.94	3.95
Post-Service intensity/complexity	3.54	3.77

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The RUC advisors for the participating specialty societies met by conference call to review and discuss the survey results. All of the surveying organizations except the American College of Physicians (ACP) used a panel sample; ACP used a random sample. For 993XX3, the advisors noted that respondents rated the intensity and complexity of 993XX3 similar to and slightly less than that of the key reference code, 99214, for all areas and in each time segment. The advisors also noted the identical pre- and post-service time of 993XX3 and 99214, while intra-service and, therefore, total time, for 993XX3 was just 5 minutes less than 99214. The advisors agreed that 99214 was an appropriate key reference service, since a presenting problem of moderate to high severity (as described in 99214) is consistent with a telephone evaluation and management service of 21 to 30 minutes duration (as described in 993XX3). Accordingly, consistent with the survey data, the specialty societies agreed to recommend the survey median of 1.35 work RVUs for 993XX3, which is less than the current work RVUs assigned to the key reference code, 99214, reflecting the lower intensity and shorter time of the 993XX3.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.

- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. (not applicable)

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) This service was not previously reported.

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty (See attached table.) How often?

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 5215455
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.

Specialty (See attached table.) Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 833,881 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty.

Specialty (See attached table.) Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

April 2007

Smoking Cessation

In response to recent developments in the area of tobacco control, the CPT Editorial Panel created two new codes to report tobacco counseling cessation services. Currently there are existing G-codes to report these services, G0375 *Smoking and tobacco use cessation counseling visit; intermediate, greater than 3 minutes up to 10 minutes* (CMS Assigned Value of 0.24 RVUs) and G0376 *Smoking and tobacco use cessation counseling visit; intensive, greater than 10 minutes* (CMS Assigned Value of 0.48 RVUs).

99406 - *Smoking and tobacco use cessation counseling visit; intermediate, greater than 3 minutes up to 10 minutes*

1743

The RUC reviewed the survey results for CPT code 99406 and agreed with the specialty society that the pre-service and post-service physician times as recommended by the survey respondents did not accurately reflect the service. Therefore, the RUC accepted the specialty society recommended modified physician times of no pre-service time and no post-service time as this procedure is typically billed with an evaluation and management service. The RUC determined that the pre-service and post-service time for the smoking cessation counseling would be accounted for in the evaluation and management service. The RUC compared the surveyed code to its reference code 99211 *Office or other outpatient visit for the evaluation and management of an established patient,* (Work RVU=0.17). The RUC noted that the total service times for both codes was the same, 7 minutes. However, the RUC noted that the intensity/complexity measures demonstrated that the surveyed code was a more intense service to provide as compared to the reference code, 99211. Given the same total service time and that the surveyed code has more intensity and complexity associated with it as compared to the reference code, the RUC determined that the current work RVU associated with G0375 would be an appropriate crosswalk for this service, 0.24 RVUs. This proposed value of 0.24 RVUs is slightly higher than the 25th percentile of the survey data. **The RUC recommends 0.24 work RVUs for 99406.**

99407 *Smoking and tobacco use cessation counseling visit; intensive, greater than 10 minutes*

The RUC reviewed the survey results for CPT code 99407 and agreed with the specialty society that the pre-service and post-service physician times as recommended by the survey respondents did not accurately reflect the service. Therefore, the RUC accepted the specialty society recommended modified times of no pre-service time and no post-service time as this procedure is typically billed with an evaluation and management service. The RUC determined that the pre-service and post-service time for the smoking cessation counseling would be accounted for in the evaluation and management service. The RUC compared the surveyed code to its reference code 99401 *Preventive medicine counseling and/or risk factor reduction intervention(s) provided to an individual (separate procedure); approximately 15 minutes,* (Work RVU=0.48). The RUC noted that the total service times for both codes was the same, 15 minutes. Further, the RUC noted that the intensity/complexity measures demonstrated that the surveyed code was a more intense service to provide as compared to the reference code. Given the same total service time and that the surveyed code has more

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association

intensity and complexity associated with it as compared to the reference code, the RUC determined that the median of the survey data of 0.50 RVUs was appropriate. This value is further supported by the current work RVU associated with G0376, 0.48 RVUs. **The RUC recommends 0.50 work RVUs for 99407.**

Practice Expense
The RUC recommends one direct practice expense input associated with both of these procedures, a patient education booklet in the non-facility setting.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
These codes are used to report services provided face-to-face by a physician or other qualified healthcare professional ~~to individuals at a separate encounter~~ for the purpose of promoting health and preventing illness or injury. They are distinct from Evaluation and Management services that may be reported separately when performed. Risk factor reduction services are used for persons without a specific illness for which the counseling might otherwise be used as part of treatment. Preventive medicine counseling and risk factor reduction interventions ~~provided as a separate encounter~~ will vary with age and should address such issues as family problems, diet and exercise, substance ~~ab~~use, sexual practices, injury prevention, dental health~~.~~ and diagnostic and laboratory test results available at the time of the encounter. Behavior change interventions are for persons who have a behavior that is often considered an illness itself, such as tobacco use and addiction, substance abuse/misuse or obesity. Behavior change services may be reported when performed as part of the treatment of condition(s) related to or potentially exacerbated by the behavior, or when performed to change the harmful behavior that has not yet resulted in illness. Any Evaluation and Management (E/M) services reported on the same day must be distinct and time spent providing these services may not be used as a basis for the E/M code selection. Behavior change services involve specific validated interventions of assessing readiness for change and barriers to change, advising a change in behavior, assisting by providing specific suggested actions and motivational counseling and arranging for services and follow-up. ~~These codes are not to be used to report counseling and risk factor reduction interventions provided to patients with symptoms or established illness. For counseling individual patients with symptoms or established illness, use the appropriate office, hospital or consultation or other evaluation and management codes.~~ For counseling groups of patients with symptoms or established illness, use 99078.

** See below survey data table on first page.

Modifier -51 Exempt Status

Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:

Is this new/revised procedure considered to be a new technology or service? No

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99211	XXX	0.17	RUC Time

CPT Descriptor Office or other outpatient visit for the evaluation and management of an established patient, that may not require the presence of a physician. Usually, the presenting problem(s) are minimal. Typically, 5 minutes are spent performing or supervising these services.

KEY MPC COMPARISON CODES:

Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Most Recent Medicare Utilization	Work RVU	Time Source
99211	XXX	10,302,555	0.17	RUC Time

CPT Descriptor 1 Office or other outpatient visit for the evaluation and management of an established patient, that may not require the presence of a physician. Usually, the presenting problem(s) are minimal. Typically, 5 minutes are spent performing or supervising these services.

MPC CPT Code 2	Global	Most Recent Medicare Utilization	Work RVU	Time Source
99213	XXX	111,146,496	0.92	RUC Time

CPT Descriptor 2 Office or other outpatient visit for the E/M of an established patient, which requires at least two of these three components: an expanded problem focused history; and expanded problem focused exam; and medical decision making of low complexity. Usually, the presenting problem(s) are of low to moderate severity. Physicians typically spend 15 minutes face-to-face with the patient and/or family.

Other Reference CPT Code	Global	Work RVU	Time Source
99212	XXX	0.45	**RUC Time**

CPT Descriptor Office or other outpatient visit for the evaluation and management of a new patient, which requires at least two of these three components: a problem focused history; a problem focused exam; and straightforward medical decision making. Usually, the presenting problem(s) are self-limited or minor. Physicians typically spend 10 minutes face-to-face with the patient and/or family.

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 11 **% of respondents:** 27.5 %

TIME ESTIMATES (Median)

	CPT Code: 99406	Key Reference CPT Code: 99211	Source of Time RUC Time
Median Pre-Service Time	0.00	0.00	
Median Intra-Service Time	7.00	5.00	
Median Immediate Post-service Time	0.00	2.00	
Median Critical Care Time	0.0	0.00	
Median Other Hospital Visit Time	0.0	0.00	
Median Discharge Day Management Time	0.0	0.00	
Median Office Visit Time	0.0	0.00	
Prolonged Services Time	0.0	0.00	
Median Total Time	**7.00**	**7.00**	
Other time if appropriate			

INTENSITY/COMPLEXITY MEASURES (Mean)

Mental Effort and Judgment (Mean)

The number of possible diagnosis and/or the number of management options that must be considered	1.55	1.55
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	2.65	2.36
Urgency of medical decision making	1.91	1.78

Technical Skill/Physical Effort (Mean)

Technical skill required	1.85	1.55

Physical effort required	2.00	1.64

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	1.68	1.36
Outcome depends on the skill and judgment of physician	2.45	2.36
Estimated risk of malpractice suit with poor outcome	1.78	1.63

INTENSITY/COMPLEXITY MEASURES	CPT Code	Reference Service 1

Time Segments (Mean)

Pre-Service intensity/complexity	2.43	2.00
Intra-Service intensity/complexity	3.03	2.91
Post-Service intensity/complexity	1.41	1.00

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The American College of Chest Physicians, American Thoracic Society, and American College of Physicians sent an e-mail to appropriate groups asking them to participate in this survey. Those that expressed interest in surveying were sent the covering e-mail and surveymonkey.com link. A consensus conference was held on March 26, 2007 where it was decided to recommend the existing value (G0375) of 0.24RVUs for 99406. We believe the median value is too high, and the 25th percentile is too low. We have recommended lowering the surveyed pre-service and post-service times.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. See last page.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) G0375

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pulmonary How often? Sometimes

Specialty Internal Medicine How often? Sometimes

Specialty Other Primary Care How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 32000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. took one hundred fold CMS data

Specialty Pulmonary Frequency 3200 Percentage 10.00 %

Specialty Internal Medicine Frequency 12800 Percentage 40.00 %

Specialty Other Primary Care Frequency 16000 Percentage 50.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?
1,600 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty.
Please explain the rationale for this estimate. took ten percent higher than CMS data

Specialty Pulmonary Frequency 160 Percentage 10.00 %

Specialty Internal Medicine Frequency 640 Percentage 40.00 %

Specialty Other Primary Care Frequency 800 Percentage 50.00 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Non-Surgical

Code	Pre Time	Intra Time	Post Time	Total Time	Work RVU

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:99407 Tracking Number VV2 Specialty Society Recommended RVU: **0.50**
Global Period: XXX RUC Recommended RVU: **0.50**

CPT Descriptor: Smoking and tobacco use cessation counseling visit; intensive, greater than 10 minutes

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 48 year smoker with hypertension and obesity receives a tobaccos cessation behavioral intervention.

Percentage of Survey Respondents who found Vignette to be Typical: 93%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: N/A

Description of Intra-Service Work: Motivational interviewing addressing relevance, risks, rewards, and roadblocks is utilized. Barriers to change and methods to overcome the barriers are discussed , including pharmacologic adjuncts, behavioral techniquest, nicotine replacement, and combining methods. The physician prescribes pharmacolgic aids to tobacco cessation. Referral to a community support group is made. The session is documented.

Description of Post-Service Work: N/A

Modifier -51 Exempt Status

Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:

Is this new/revised procedure considered to be a new technology or service? No

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99401	XXX	0.48	RUC Time

CPT Descriptor Preventive medicine counseling and/or risk factor reduction intervention(s) provided to an individual (separate procedure); approximately 15 minutes

KEY MPC COMPARISON CODES:

Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Most Recent Medicare Utilization	Work RVU	Time Source
99212	XXX	25,078,427	0.45	RUC Time

CPT Descriptor 1 Office or other outpatient visit for the evaluation and management of a new patient, which requires at least two of these three components: a problem focused history; a problem focused exam; and straightforward medical decision making. Usually, the presenting problem(s) are self-limited or minor. Physicians typically spend 10 minutes face-to-face with the patient and/or family.

MPC CPT Code 2	Global	Most Recent Medicare Utilization	Work RVU	Time Source
99214	XXX	59,530,625	1.42	RUC Time

CPT Descriptor 2 Office or other outpatient visit for the E/M of an established patient, which requires at least two of these three components: a detailed history; a detailed exam; and medical decision making of moderate complexity. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 25 minutes face-to-face with the patient and/or family.

Other Reference CPT Code	Global	Work RVU	Time Source
99213	XXX	0.92	**RUC Time**

CPT Descriptor Office or other outpatient visit for the E/M of an established patient, which requires at least two of these three components: an expanded problem focused history; and expanded problem focused exam; and medical decision making of low complexity. Usually, the presenting problem(s) are of low to moderate severity. Physicians typically spend 15 minutes face-to-face with the patient and/or family.

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 13 **% of respondents:** 32.5 %

TIME ESTIMATES (Median)	**CPT Code: 99407**	**Key Reference CPT Code: 99401**	**Source of Time RUC Time**
Median Pre-Service Time	0.00	0.00	
Median Intra-Service Time	15.00	15.00	
Median Immediate Post-service Time	0.00	0.00	
Median Critical Care Time	0.0	0.00	
Median Other Hospital Visit Time	0.0	0.00	
Median Discharge Day Management Time	0.0	0.00	
Median Office Visit Time	0.0	0.00

Median Total Time	**15.00**	**15.00**	
Other time if appropriate			

INTENSITY/COMPLEXITY MEASURES (Mean)

Mental Effort and Judgment (Mean)

The number of possible diagnosis and/or the number of management options that must be considered	1.90	1.62
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	3.35	3.31
Urgency of medical decision making	2.18	2.23

Technical Skill/Physical Effort (Mean)

Technical skill required	2.38	2.38

Physical effort required	2.51	2.54

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	2.08	2.00
Outcome depends on the skill and judgment of physician	2.83	2.46
Estimated risk of malpractice suit with poor outcome	2.00	2.15

INTENSITY/COMPLEXITY MEASURES	CPT Code	Reference Service 1

Time Segments (Mean)

Pre-Service intensity/complexity	2.63	2.69
Intra-Service intensity/complexity	3.25	3.15
Post-Service intensity/complexity	1.55	1.46

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The American College of Chest Physicians, American Thoracic Society, and American College of Physicians sent an e-mail to appropriate groups asking them to participate in this survey. Those that expressed interest in surveying were sent the covering e-mail and surveymonkey.com link. A consensus conference was held on March 26, 2007 where it was decided to recommend the existing value (G0375) of 0.24RVUs for 99406. We believe the median value is too high, and the 25th percentile is too low. We have recommended lowering the surveyed pre-service and post-service times.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. See last page.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) G0376

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pulmonary How often? Sometimes

Specialty Internal Medicine How often? Sometimes

Specialty Other Primary Care How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 1600
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. tenfold higher than CMS data

Specialty Pulmonary Frequency 160 Percentage 10.00 %

Specialty Internal Medicine Frequency 640 Percentage 40.00 %

Specialty Other Primary Care Frequency 800 Percentage 50.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 160
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. same as existing data

Specialty Pulmonary Frequency 16 Percentage 10.00 %

Specialty Internal Medicine Frequency 64 Percentage 40.00 %

Specialty Other Primary Care Frequency 80 Percentage 50.00 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Non-Surgical

99407 Smoking and tobacco use cessation counseling visit; intensive, greater than 10 minutes

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The practice expenses were developed by the ACCP Practice Management Committee and the American Thoracic Society Clinical Practice Committee and discussed at the March 26 consensus conference call with the American College of Physicians. There is good practice-type and geographical representation with the three groups involved.

Please describe the clinical activities of your staff:

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

April 2007

Alcohol, Drug Screening and Brief Intervention

The CPT Editorial Panel created two new codes to report alcohol, drug screening and brief intervention (SBI). SBI describes a type of physician/patient interaction that requires a significant amount of time and additional skills required by the provider to deliver. SBI techniques are discrete, clearly distinguishable clinical procedures that are effective in identifying and ameliorating an under-treated public health epidemic that affects as many as 20% of adults in the United States.

99408 - *Alcohol and/or substance (other than tobacco) abuse structured screening (eg, AUDIT, DAST) and brief intervention (SBI) services; 15 to 30 minutes*

1765

The RUC reviewed the survey results for CPT code 99408 and agreed with the specialty society that the pre-service and post-service physician time as recommended by the survey respondents did not accurately reflect the service. Therefore, the RUC accepted the specialty society recommended modified times of no pre-service time and no post-service time as this procedure is typically billed with an evaluation and management service. The RUC determined that the pre-service and post-service time for the alcohol, drug screening and brief intervention would be accounted for in the evaluation and management service. The RUC compared the surveyed code to its reference code 99402 *Preventive medicine counseling and/or risk factor reduction intervention(s) provided to an individual (separate procedure); approximately 30 minutes,* (Work RVU=0.98). The RUC noted that the total service times for the reference code were higher than the surveyed code, 30 minutes and 20 minutes respectively. Further, the RUC noted that the intensity/complexity measure of the intra-service time associated with both procedures was identical and therefore demonstrate that the surveyed code has a similar intensity to the reference code. Given the same intensity and complexity and that the surveyed code has less total service time as compared to the reference code, the RUC agreed with the specialty society's recommendation of 0.65 RVUs which is two-thirds of the work RVU associated with the reference code, 99402. **The RUC recommends 0.65 work RVUs for 99408.**

99409 - *Alcohol and/or substance (other than tobacco) abuse structured screening (eg, AUDIT, DAST) and brief intervention (SBI) services; greater than 30 minutes*

The RUC reviewed the survey results for CPT code 99409 and agreed with the specialty society that the physician time as recommended by the survey respondents did not accurately reflect the service. Therefore, the RUC accepted the specialty society recommended modified times of no pre-service time and no post-service time as this procedure is typically billed with an evaluation and management service. The RUC determined that the pre-service and post-service time for the alcohol, drug screening and brief intervention would be accounted for in the evaluation and management service. The RUC agreed with the specialty society's recommendation that this service typically requires double the time to perform in comparison to

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association

99408 *Alcohol and/or substance (other than tobacco) abuse structured screening (eg, AUDIT, DAST) and brief intervention (SBI) services; 15 to 30 minutes* (RUC recommended Work RVU=0.65). Therefore, the RUC agreed that the appropriate intra-service time for this procedure was 40 minutes. Further the RUC agreed that performing this service would require twice the amount of physician work as 99408 and therefore recommends that 99409 be valued at 1.30 RVUs. The RUC further supported this work RVU by comparing this procedure to 99403 *Preventive medicine counseling and/or risk factor reduction intervention(s) provided to an individual (separate procedure); approximately 45 minutes* (Work RVU=1.46). Reference code 99403 has slightly more intra-service time as compared to the surveyed code 45 minutes and 40 minutes, respectively with similar intensity. Therefore given its comparison to 99408 and 99403, the RUC agrees that 1.30 work RVUs is an appropriate value for this procedure. **The RUC recommends 1.30 work RVUs for 99409.**

Practice Expense:
The RUC recommends one practice expense input associated with each of these procedures, a patient education booklet in the non-facility setting.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
Behavior Change Interventions, Individual **Evaluation and Management Services** **Preventative Medicine Services**				
● 99408	WW1	Alcohol and/or substance (other than tobacco) abuse structured screening (eg, AUDIT, DAST) and brief intervention (SBI) services; 15 to 30 minutes (Do not report services of less than 15 minutes with 99408)	XXX	0.65
● 99409	WW2	greater than 30 minutes (Do not report 99409 with 99408) (Do not report 99408 or 99409 with 99420) (Use codes 99408 and 99409 only for initial screening and brief intervention)	XXX	1.30

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:99408 Tracking Number WW1 Specialty Society Recommended RVU: **0.65**
Global Period: XXX RUC Recommended RVU: **0.65**

CPT Descriptor: 994XX3 Alcohol and/or substance (other than tobacco) abuse structured screening (eg. AUDIT, DAST); and brief intervention (SBI) services, 15 to 30 minutes (Do not report services of less than 15 minutes with 994XX3)

Behavior change interventions are for persons who have a behavior that is often considered an illness itself, such as tobacco use and addiction, substance abuse/misuse or obesity. Behavior change services may be reported when performed as part of the treatment of condition(s) related to or potentially exacerbated by the behavior, or when performed to change the harmful behavior that has not yet resulted in illness. Any Evaluation and Management (E/M) services reported on the same day must be distinct and time spent providing these services may not be used as a basis for the E/M code selection. Behavior change services involve specific validated interventions of assessing readiness for change and barriers to change, advising a change in behavior, assisting by providing specific suggested actions and motivational counseling and arranging for services and follow-up.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 21 year old college student reports to the school infirmary after injuring his leg after falling down several steps.

Percentage of Survey Respondents who found Vignette to be Typical: 63%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: N/A

Description of Intra-Service Work: The qualified healthcare professional performs an intervention which provides the patient with a specific set of tools and a plan to increase their likelihood of successfully decreasing their alcohol consumption and/or drug use. The components of the intervention include feedback concerning results found with the screening instrument and within the medical record about the quantity and frequency of alcohol (or drugs) consumed by the patient in comparison to national norms; a discussion of negative physical, emotional, occupational consequences that have occurred; and the overall severity of the problem. Feedback is accompanied by advice that is customized to the patient's own unique medical and social situation about clinically appropriate behavioral change goals. The qualified healthcare professional engages the patient in a joint decision-making process regarding alcohol and/or drug use. Plans for follow-up are discussed and agreed to. These interventions have the objective of providing the patient with tools to change their attitude towards alcohol and/or drug use and to manage high-risk use situations. This intervention requires specific training and/or experience in techniques eliciting accurate information, developing a specific treatment plan to which the patient is committed, and motivating the patient toward behavioral change.

Modifier -51 Exempt Status

Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:

Is this new/revised procedure considered to be a new technology or service? No

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99402	XXX	0.98	RUC Time

CPT Descriptor Preventive medicine counseling and/or risk factor reduction intervention(s) provided to an individual (separate procedure); approximately 30 minutes

KEY MPC COMPARISON CODES:

Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Most Recent Medicare Utilization	Work RVU	Time Source
99213	XXX	111,146,496	0.92	RUC Time

CPT Descriptor 1 Office or other outpatient visit for the evaluation and management of an established patient, which requires at least two of these three key components: An expanded problem focused history; An expanded problem focused examination; Medical decision making of low complexity. Counseling and coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of low to moderate severity. Physicians typically spend 15 minutes face-to-face with the patient and/or family.

MPC CPT Code 2	Global	Most Recent Medicare Utilization	Work RVU	Time Source
99232	XXX	51,811,800	1.39	RUC Time

CPT Descriptor 2 Subsequent hospital care, per day, for the evaluation and management of a patient, which requires at least two of these three key components: An expanded problem focused interval history; An expanded problem focused examination; Medical decision making of moderate complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the patient is responding inadequately to therapy or has developed a minor complication. Physicians typically spend 25 minutes at the bedside and on the patient's hospital floor or unit.

Other Reference CPT Code	Global	Work RVU	Time Source
99251	XXX	1.00	**RUC Time**

CPT Descriptor Inpatient consultation for a new or established patient, which requires these three key components: A problem focused history; A problem focused examination; and Straightforward medical decision making. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are self limited or minor. Physicians typically spend 20 minutes at the bedside and on the patient's hospital floor or unit.

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 5 **% of respondents:** 16.6 %

TIME ESTIMATES (Median)

INTENSITY/COMPLEXITY MEASURES	CPT Code	Reference Service 1

Time Segments (Mean)

Pre-Service intensity/complexity	2.20	2.00
Intra-Service intensity/complexity	4.40	4.40
Post-Service intensity/complexity	2.60	2.40

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The American Psychiatric Association, American College of Physicians and the American Academy of Family Physicians surveyed 125 psychiatrists, internists and family physicians with experience in screening for and performing interventions around alcohol and/or substance use. Physicians were sent a covering email and a link to the survey housed on surveymonkey.com. A consensus conference was held on April 2, 2007 where it was decided to recommend the median RVU 1.10 for 99408. The median was chosen because the intra service time was lower than the reference code however the intensity, as noted in the survey data, was higher in specific areas than that for the reference code. For instance, we believe the data collection and synthesis of the data is more complex than with a straightforward counseling session. We believe the median post service time from the survey is too high so are recommending a lower time for that segment.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) This service has not been previously reported.

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Psychiatry How often? Sometimes

Specialty Internal Medicine How often? Sometimes

Specialty Family Medicine How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 600,000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. Based on estimates from WHO and CDC

Specialty Psychiatry Frequency 120000 Percentage 20.00 %

Specialty Internal Medicine Frequency 240000 Percentage 40.00 %

Specialty Family Medicine Frequency 240000 Percentage 40.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 60,000 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 10% of above

Specialty Psychiatry Frequency 12000 Percentage 20.00 %

Specialty Internal Medicine Frequency 24000 Percentage 40.00 %

Specialty Family Medicine Frequency 24000 Percentage 40.00 %

Do many physicians perform this service across the United States? No

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Non-Surgical

Modifier -51 Exempt Status

Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:

Is this new/revised procedure considered to be a new technology or service? No

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99214	XXX	1.42	RUC Time

CPT Descriptor Office or other outpatient visit for the evaluation and management of an established patient, which requires at least two of these three key components: A detailed history; A detailed examination; Medical decision making of moderate complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 25 minutes face-to-face with the patient and/or family.

KEY MPC COMPARISON CODES:

Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Most Recent Medicare Utilization	Work RVU	Time Source
99214	XXX	59,530,625	1.42	RUC Time

CPT Descriptor 1 Office or other outpatient visit for the evaluation and management of an established patient, which requires at least two of these three key components: A detailed history; A detailed examination; Medical decision making of moderate complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 25 minutes face-to-face with the patient and/or family.

Most Recent

MPC CPT Code 2	Global	Medicare Utilization	Work RVU	Time Source
99243	XXX	5,130,023	1.88	**RUC Time**

CPT Descriptor 2 Office consultation for a new or established patient, which requires these three key components: A detailed history; A detailed examination; and Medical decision making of low complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate severity. Physicians typically spend 40 minutes face-to-face with the patient and/or family.

Other Reference CPT Code	Global	Work RVU	Time Source
99252	XXX	1.50	**RUC Time**

CPT Descriptor Inpatient consultation for a new or established patient, which requires these three key components: An expanded problem focused history; An expanded problem focused examination; and Straightforward medical decision making. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of low severity. Physicians typically spend 40 minutes at the bedside and on the patient's hospital floor or unit.

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 3 **% of respondents:** 11.1 %

TIME ESTIMATES (Median)	**CPT Code: 99409**	**Key Reference CPT Code:** 99214	**Source of Time**
Median Pre-Service Time	0.00	5.00	**RUC Time**
Median Intra-Service Time	40.00	25.00	
Median Immediate Post-service Time	0.00	10.00	
Median Critical Care Time	0.0	0.00	
Median Other Hospital Visit Time	0.0	0.00	
Median Discharge Day Management Time	0.0	0.00	
Median Office Visit Time	0.0	0.00	
Prolonged Services Time	0.0	0.00	
Median Total Time	**40.00**	**40.00**	
Other time if appropriate			

INTENSITY/COMPLEXITY MEASURES (Mean)

Mental Effort and Judgment (Mean)

The number of possible diagnosis and/or the number of management options that must be considered	4.00	3.67
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	2.67	3.00
Urgency of medical decision making	3.67	3.00

Technical Skill/Physical Effort (Mean)

Technical skill required	4.67	4.00
Physical effort required	2.33	2.67

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	3.33	3.67
Outcome depends on the skill and judgment of physician	5.00	4.00
Estimated risk of malpractice suit with poor outcome	2.67	2.67

INTENSITY/COMPLEXITY MEASURES	CPT Code	Reference Service 1

Time Segments (Mean)

Pre-Service intensity/complexity	2.33	2.33
Intra-Service intensity/complexity	4.33	4.33
Post-Service intensity/complexity	3.00	2.67

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The American Psychiatric Association, the American College of Physicians and the American Academy of Family Physicians surveyed 125 psychiatrists, internists and family physicians with experience in screening for and performing interventions around alcohol and/or substance use. Physicians were sent a covering email and a link to the survey housed on surveymonkey.com. A consensus conference was held on April 2, 2007 to review the data.

The survey data is insufficient and seriously flawed to merit a recommendation based on the data provided for the following reasons: 1) the number of survey respondents did not meet the RUC threshold of 30; 2) it appears from the survey data that the respondents did not follow the CPT descriptor as it indicates that this code is used when the face-to-face portion of the service provided exceeds 30 minutes, while almost half the survey respondents listed an intra-service time of less than 30 minutes; 3) there was wide variation in both times and proposed RVUs for the new services.

In lieu of the survey data we propose using a building block methodology based on the recommended RVU for the 99408. Based on the CPT descriptor, the 99409 can only be used beginning at the 31st minute of intra-service time. The survey data for the 99408 suggests that the median time is 20 minutes; using the building block method, this would suggest that the RVU for 99409 would be 1.5 times greater than the value for 99408. Should 99408 be given a value of 1.1 RVUs then 99409 would be valued at 1.65 RVUs.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) This service has not been previously reported.

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Psychiatry How often? Sometimes

Specialty Internal Medicine How often? Sometimes

Specialty Family Medicine How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 400000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. Estimates from WHO and CDC

Specialty Psychiatry Frequency 100000 Percentage 25.00 %

Specialty Internal Medicine Frequency 150000 Percentage 37.50 %

Specialty Family Medicine Frequency 150000 Percentage 37.50 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 40,000 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 10% of WHO/CDC data

Specialty Psychiatry Frequency 10000 Percentage 25.00 %

Specialty Internal Medicine	Frequency 15000	Percentage 37.50 %
Specialty Family Medicine	Frequency 15000	Percentage 37.50 %

Do many physicians perform this service across the United States? No

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale. NA

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Non-Surgical

HCPAC RECOMMENDATIONS

FOR CPT 2008

RUC Meetings:
October 2006, February 2007
and April 2007

AMA
AMERICAN
MEDICAL
ASSOCIATION

May 30, 2007

Leslie Norwalk
Acting Director
Center for Medicare Management
Centers for Medicare and Medicaid Services
7500 Security Boulevard
Baltimore, MD 21244

Dear Ms. Norwalk:

It is with pleasure that we submit to the Centers for Medicare and Medicaid Services (CMS), on behalf of the RUC Health Care Professionals Advisory Committee (HCPAC) Review Board, work relative value and direct practice expense inputs for new and revised codes for CPT 2008.

These work relative value and direct practice expense input recommendations address the following new codes:

- Non Face-to-Face Qualified Healthcare Professional Services
- Team Conferences – Participation by Non-Physician Qualified Health Care Professional
- Standardized Cognitive Performance Testing

The CPT Editorial Panel also developed new codes corresponding s for the non face-to-face services and team conference services provided by physicians (MDs/DOs). The RUC reviewed and submitted recommendations on the physician (MD/DO) services only. The HCPAC independently reviewed and submitted separate recommendations on the non-physicians services.

The RUC HCPAC Review Board looks forward to continued CMS representation at our meetings and your effort to ensure a fair review of the enclosed recommendations.

If you have any questions please contact AMA staff, Susan Clark, at (312) 464-4308 or via e-mail at Susan.Clark@ama-assn.org.

Sincerely,

Arthur R. Traugott, MD

Health Care Professionals Advisory Committee
Summary of Recommendations

April 2007

Non Face-to-Face Qualified Healthcare Professional Services

The CPT Editorial Panel created four new codes describing Evaluation and Management services performed by a qualified healthcare professional via telephone or on-line. Typically, these calls involve the health care professional obtaining a history of the patient, assessing the patient's condition, making a medical decision and communicating that decision via the phone/e-mail to the patient. Over the last two decades, medicine has seen the rapid increase of medical information and communications technology. Combined with changing consumer and health plan expectations for enhanced access to care, a new focus on chronic disease management and continued pressure to reduce the codes of medical services, qualified healthcare professionals are providing more care to patients in a "non-face-to-face" manner. Additionally, these services describe work that is currently not captured in any other CPT codes.

The American Dietetic Association (ADA) and the American Physical Therapy Association (APTA), presented work relative value recommendations for the Non Face-to-Face Qualified Health Care Professional Services. The HCPAC reviewed the survey results and compared them to the Non Face-to Face Physician Services. After a detailed discussion, the HCPAC determined that the non-physician work was equivalent to the physician work for codes 98966-98968.

98966
First the HCPAC reviewed code 98966 *Telephone assessment and management service provided by a qualified non-physician health care professional to an established patient; 5-10 minutes of medical discussion.* The HCPAC determined that the survey median of 0.37 was too high compared to the physician code 99441 *Telephone assessment and management service provided by a physician to an established patient; 5-10 minutes of medical discussion* (work RVU recommendation = 0.25). The HCPAC chose to recommend the same time and work values at the code described to define physician work. The HCPAC agreed that 1 minute pre-service, 8 minutes intra-service and 4 minutes post-service time was appropriate for code 98966. **The HCPAC recommends a work RVU of 0.25 for 98966.**

98967
The HCPAC reviewed code 98967 *Telephone assessment and management service provided by a qualified non-physician health care professional to an established patient; 11-20 minutes of medical discussion.* The HCPAC determined that the survey median of 0.45 was similar compared to the physician code 99442 *Telephone assessment and management service provided by a physician to an established patient; 11-20 minutes of medical discussion* (work RVU recommendation = 0.50). The HCPAC chose to recommend the same time and work values at the code described

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

to define physician work. The HCPAC agreed that 1 minute pre-service, 15 minutes intra-service and 5 minutes post-service time was appropriate for code 98967. **The HCPAC recommends a work RVU of 0.50 for 98967.**

98968

The HCPAC reviewed code *98968 Telephone assessment and management service provided by a qualified non-physician health care professional to an established patient; 21-30 minutes of medical discussion.* The HCPAC determined that the survey median of 0.50 was too low compared to the physician code 99443 *Telephone assessment and management service provided by a physician to an established patient; 21-30 minutes of medical discussion* (work RVU recommendation = 0.75). The HCPAC chose to recommend the same time and work values at the code described to define physician work. The HCPAC agreed that 1 minute pre-service, 25 minutes intra-service and 10 minutes post-service time was appropriate for code 98968. **The HCPAC recommends a work RVU of 0.75 for 98968.**

98969

Lastly, the HCPAC reviewed code 98969 *Online evaluation and management service provided by a qualified non-physician health care professional to an established patient.* The HCPAC concluded, that as the physician code 99444 *Online evaluation and management service provided by a physician to an established patient* (RUC recommendation = carrier-priced), the definition of work and health care professional time and complexity involved in this service was unclear, therefore making it difficult to recommend a specific work relative vale. **The HCPAC recommends that code 98969 be carrier-priced for CY 2008.**

Practice Expense

The PERC and HCPAC reviewed the direct practice expenses for 98966-98968 in February 2007 when these services were initially presented. The practice expense input recommendations are the same as those recommended for the physician non face-to-face services. **The HCPAC recommends 3 minutes post-service phone call by and RN/LPN/MTA for 98966-98968.**

New Technology and New Work

The HCPAC recommends that 98966-98968 be added to the new technology list to review changes in the valuation after experience in reporting these service has occurred (as the physician non face-to-face codes are also recommended to be added to the new technology list). Additionally, the HCPAC recommends that these services involve new work not currently compensated within the physician payment system.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
Telephone services are non-face-to-face E/M services provided by a physician to a patient using the telephone. These codes are used to report episodes of care				

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
by the physician initiated by an established patient or guardian of an established patient. If the telephone service ends with a decision to see the patient within 24 hours or next available urgent visit appointment, the code is not reported; rather the encounter is considered part of the preservice work of the subsequent E/M service, procedure and visit. Likewise if the telephone call refers to an E/M service performed and reported by the physician within the previous seven days (either physician requested or unsolicited patient follow-up) or within the period of the previously completed procedure, then the service(s) are considered part of that previous E/M service or procedure. (Do not report 99441-99443 if reporting 99441-99444 performed in the previous seven days)				
●99441	O1	Telephone evaluation and management service provided by a physician to an established patient, parent, or guardian not originating from a related E/M service provided within the previous seven days nor leading to an E/M service or procedure within the next 24 hours or soonest available appointment; 5-10 minutes of medical discussion	XXX	0.25 (RUC Recommendation)
●99442	O2	11-20 minutes of medical discussion	XXX	0.50 (RUC Recommendation)
●99443	O3	21-30 minutes of medical discussion (Do not report 99441-99443 when using 99339-99340, 99374-99380 for the same call(s)) (Do not report 99441-99443 for anticoagulation management when reporting 99363-99364)	XXX	0.75 (RUC Recommendation)
Online Medical Evaluation An online electronic medical evaluation is a non-face-to-face E/M service by a physician to a patient using Internet resources in response to a patient's online inquiry. Reportable services involve the physician's personal timely response to the patient's inquiry and must involve permanent storage (electronic or hard copy) of the encounter. This service is reported only once for the same episode of care during a secen day period, although multiple physicians could report their exchange with the same patient. If the online medical evaluation refers to an E/M service previously performed and reported by the physician within the previous seven days (either physician requested or unsolicited patient follow-up) or within the postoperative period of the previously completed procedure, then the service(s) are considered covered by the previous E/M service or procedure. A reportable service encompasses the sum of communication (eg, related telephone calls, prescription provision, laboratory orders) pertaining to the online patient encounter.				
●99444	O4	Online evaluation and management service provided by a physician to an established patient, guardian or health care provider not originating from a	XXX	Carrier Priced

Likewise if the telephone call refers to a service performed and reported by the qualified health care professional within the previous seven days (either provider requested or unsolicited patient follow-up) or within the postoperative period of the previously completed procedure, then the service(s) are considered part of that previous service or procedure. (Do not report 98966-98969 if reporting 98966-98969 performed in the previous seven days.)				
●98966	O5	Telephone assessment and management service provided by a qualified non-physician health care professional to an established patient, parent, or guardian not originating from a related assessment and management service provided within the previous seven days nor leading to an assessment and management service or procedure within the next 24 hours or soonest available appointment; 5-10 minutes of medical discussion	XXX	0.25
●98967	O6	11-20 minutes of medical discussion	XXX	0.50
●98968	O7	21-30 minutes of medical discussion	XXX	0.75
Online Medical Evaluation An online electronic medical evaluation is a non-face-to-face assessment and management service by a qualified health care professional to a patient using Internet resources in response to a patient's online inquiry. Reportable services involve the provider's personal timely response to the patient's inquiry and must involve permanent storage (electronic or hard copy) of the encounter. This service is reported only once for the same episode of care during a seven day period, although multiple qualified healthcare professionals could report their exchange with the same patient. If the online medical evaluation refers to an assessment and management service previously performed and reported by the provider within the previous seven days (either provider requested or unsolicited patient follow-up) or within the postoperative period of the previously completed procedure, then the service(s) are considered covered by the previous assessment and management office service or procedure. A reportable service encompasses the sum of communication (eg, related telephone calls, prescription provision, laboratory orders) pertaining to the online patient encounter.				
●98969	O8	Online evaluation and management service provided by a qualified non-physician health care professional to an established patient, guardian or health care provider not originating from a related assessment and	XXX	Carrier Priced

		management service provided within the previous 7 days, using the Internet or similar electronic communications network (Do not report 98969 when using 99339-99340, 99374-99380 for the same communication(s)) (Do not report 98969 for anticoagulation management when reporting 99363 to 99364)		
Category III **Online Medical Evaluation** ~~An online medical evaluation is a type of Evaluation and Management (E/M) service provided by a physician or qualified health care professional to a patient using internet resources in response to the patient's online inquiry. Reportable services involve the physician's personal timely response to the patient's inquiry and must involve permanent storage (electronic or hard copy) of the encounter. This service should not be reported for patient contacts (eg, telephone calls) considered to be pre-service or post-service work for other E/M or non-E/M services. A reportable service would encompass the sum of communication (eg, related telephone calls, prescription provision, laboratory orders) pertaining to the online patient encounter or problem(s).~~				
D 0074T		~~Online evaluation and management service, per encounter, provided by a physician, using the Internet or similar electronic communications network, in response to a patient's request, established patient~~ (0074T has been deleted. To report, use 99444)		N/A
Evaluation and Management **Care Plan Oversight** *Care Plan Oversight Services are reported separately from codes for office/outpatient, hospital, home, nursing facility, or domiciliary*, or non-face-to-face *services. The complexity ...* The work involved in providing very low intensity or infrequent supervision services is included in the pre- and post-encounter work for home, office/outpatient and nursing facility or domiciliary visit codes. (For care plan oversight services of patients in the home, domiciliary, or rest home (eg, assisted living facility) under the individual supervision of a physician, see 99339,99340)

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:98966 Tracking Number O5 Specialty Society Recommended RVU: **0.37**
Global Period: XXX RUC Recommended RVU: **0.25**

CPT Descriptor: Telephone evaluation and management service provided by a qualified non-physician health care professional to an established patient, parent, or guardian not originating from a related E/M service provided within the previous seven days nor leading to an E/M service or procedure within the next 24 hours or soonest available appointment; 5-10 minutes of medical discussion

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 67 year old female with diabetes requested assistance in how to incorporate a new food product into her meal plan established 3 weeks ago with the Registered Dietitian (RD).

OR

A 40 year old male with a history of anterior cruciate ligament reconstruction of the left knee calls his physical therapist with a complaint of increased discomfort and edema around the knee after performing the home exercise program twice each day. The therapist asked the patient to summarize the home exercise program and a discrepancy was noted in the number of repetitions that the patient was performing and what had been recommended. The therapist reinforced the parameters of the recommended home exercise program, recommended the use of ice following the exercises and instructed the patient to keep their next scheduled therapy appointment. The telephone encounter lasted 10 minutes.

Percentage of Survey Respondents who found Vignette to be Typical: 98%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: The qualified healthcare professional reviews the patient's phone inquiry, reviews the medical record and the previously prepared exercise program or nutrition plan and goals, and accesses resources to share and discuss with patient.

Description of Intra-Service Work: During the phone conversation, the RD reviews the product's serving size, carbohydrate content and the current meal plan with the patient. The RD counsels the patient on appropriate new product serving size, reinforced adherence to the meal plan, encouraged ongoing completion of food and blood glucose records and reminded patient of her next scheduled appointment.

OR
First, the therapist listened to the patient's complaints. The therapist then asked appropriate questions concerning the home exercise program and use of ice, use of medications, level of activity level during the day, use of a brace and use of an assistive device for gait. The therapist determined that the patient had not properly followed the home exercise instructions and was not applying ice following the home program. The therapist reviewed the home program, made the appropriate recommendations and instructed the patient to keep their next scheduled appointment.

Description of Post-Service Work: The qualified healthcare professional documents the patient interaction in the medical record, notifies the referring physician of the phone call with the patient, and directs staff to mail the summary of instructions provided and educational materials to patient.

Time Segments (Mean)		
Pre-Service intensity/complexity	1.74	2.50
Intra-Service intensity/complexity	3.43	3.71
Post-Service intensity/complexity	2.20	2 71

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

ADA and APTA recommend the above RVU and Pre-, Intra-, and Post-service times even though both data sets had variability in the reported reference service codes. Based on the distinct services provided by both professionals, as described in the vignettes, and the professionals' experience completing the work survey, we anticipated differences in the reported reference service code.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) Not previously reported

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty ADA How often? Commonly

Specialty APTA How often? Commonly

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 875000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. Compiled frequency estimates from MDs, APTA and ADA.

Specialty ADA Frequency 775000 Percentage 88.57 %

Specialty APTA Frequency 100000 Percentage 11.42 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 462,000 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate.

Specialty ADA Frequency 362000 Percentage 78.35 %

Specialty APTA Frequency 100000 Percentage 21.64 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Non-Surgical

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:98967 Tracking Number 06 Specialty Society Recommended RVU: **0.45**
Global Period: XXX RUC Recommended RVU: **0.50**

CPT Descriptor: Telephone evaluation and management service provided by a qualified non-physician health care professional to an established patient, parent, or guardian not originating from a related E/M service provided within the previous seven days nor leading to an E/M service or procedure within the next 24 hours or soonest available appointment; 11-20 minutes of medical discussion.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 68 year old male with insulin dependent diabetes, called the Registered Dietitian (RD) with a complaint of several mid-morning low blood sugar readings following the implementation of his 30-minute, new exercise regimen.

OR
A 54 year old woman with a history of rheumatoid arthritis and metacarpalphalangeal arthroplasties of her dominant hand called her occupational therapist because of post-operative pain and difficulty with use of the dynamic outrigger orthotic during the day and positioning at night. The therapist reviewed the patient's understanding of the instructions that had been provided at the last office visit and made specific recommendations regarding number of repetitions of the exercises, elevation of the extremity to help reduce edema, recommendations for positioning during the night, and use of cold applications for temporary pain relief . The telephone encounted lasted 15 minutes.

Percentage of Survey Respondents who found Vignette to be Typical: 88%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: The qualified healthcare professional reviews the patient's phone inquiry, reviews the medical record and the previously prepared exercise program or nutrition plan and goals, and accesses resources to share and discuss with patient.

Description of Intra-Service Work: The RD verifies the patient's understanding of his hypoglycemia management and reviewed the patient's self-reported glucose monitoring records. After discussion of the prescribed meal plan provided at the last office visit, the RD reviews the patient's understanding of his meal plan and pre-workout meal regimen, and reinforces concepts to avoid hypoglycemia with future exercise.
OR
The therapist listened to the patient's complaints. The therapist then asked appropriate questions concerning tolerance to the orthotic (e.g.wearing time, exercise in the outrigger, pressure points), elevation of the extremity during the day and night, medication use, home exercise program, and management of ADLs. Recommendations were made regarding the specific exercises that should be performed including number of repetitions and frequency, positioning of the limb during the day and at night, precautions regarding skin integrity and protection of the sutures, and use of ice to help control pain.

Description of Post-Service Work: The qualified healthcare professional documents the patient interaction in the medical record, notifies the referring physician of the phone call with the patient, and directs staff to mail the summary of instructions provided and educational materials to patient.

Estimate the number of times this service might be provided nationally in a one-year period? 567100
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. Compiled frequency estimates from MDs, APTA and ADA.

Specialty ADA Frequency 467100 Percentage 82.36 %

Specialty APTA Frequency 100000 Percentage 17.63 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 359,500 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate.

Specialty ADA Frequency 259500 Percentage 72.18 %

Specialty APTA Frequency 100000 Percentage 27.81 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Non-Surgical

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:98968 Tracking Number 07 Specialty Society Recommended RVU: **0.50**
Global Period: XXX RUC Recommended RVU: **0.75**

CPT Descriptor: Telephone evaluation and management service provided by a qualified non-physician health care professional to an established patient, parent, or guardian not originating from a related E/M service provided within the previous seven days nor leading to an E/M service or procedure within the next 24 hours or soonest available appointment; 21-30 minutes of medical discussion.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 65 year old female with congestive heart failure calls the Registered Dietitian (RD) based on concerns about lower extremity edema following consumption of foods served at a family reunion.

OR
The parent of an 15 year old male with a history of recent T10 spinal cord injury called the physical therapist regarding the recommended home exercise program, proper positioning and seating in the wheelchair, and a newly discovered area of skin irritation on the right buttock. The therapist inquired as to the current exercise program that was being followed including the frequency and intensity of the exercises, the length of time the patient was spending in the wheelchair, the extent of the patient's management of his transfers and mobility in the wheelchair as well as specific inquiries concerning the area of possible skin breakdown on the buttocks. The therapist reviewed and modified the home program, and made recommendations regarding the length of time continuously spent in the wheelchair and precautions to maintain skin integrity It was recommended that the patient return for follow-up within one week unless the skin irritation did not improve or worsened.

Percentage of Survey Respondents who found Vignette to be Typical: 72%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: The qualified healthcare professional reviews the patient's phone inquiry, reviews the medical record and the previously prepared exercise program or nutrition plan and goals, and accesses resources to share and discuss with patient.

Description of Intra-Service Work: The RD reviews the patient's recent food intake and compared it to the prescribed meal pattern- paying particular attention to sodium and fluid consumption. The RD identifies high sodium foods that contributed to the patient's current symptoms, and counsels the patient on lower sodium alternatives. The RD counsels the patient on her daily fluid recommendations and encouraged the patient to measure her fluid consumption and body weight daily. The RD instructs the patient to call and report any weight fluctuation greater than 2-3 lbs/day. The RD recommends that the patient return for follow-up in 1-2 weeks unless rapid weight gain, increased shortness of breath, or other symptoms of worsening heart failure occurred in which case the patient is told to call her physician.

or
The therapist listened to the patient's complaints and parental concerns. The therapist then asked appropriate questions of the patient and parent concerning the time spent in the wheelchair in and out of the home environment, level of activity during the day while in the chair, description of the skin irritation on the buttocks, participation in the home exercise program and management of mobility, transfers in and out of the wheelchair and ADLs. The therapist made recommendations concerning transfer techniques in and out of the chair to reduce friction force on the buttocks, duration of sitting time in the wheelchair including recommendations to spend additional time each day lying prone so that the skin irritation could heal. Recommendations were also made concerning pressure relief strategies while in the chair and

revisions to the home exercise program were suggested. The therapist recommended a follow-up visit within one week unless the skin irritation did not improve or worsened.

Description of Post-Service Work: The qualified healthcare professional documents the patient interaction in the medical record, notifies the referring physician of the phone call with the patient, and directs staff to mail the summary of instructions provided and educational materials to patient.

SURVEY DATA

INTENSITY/COMPLEXITY MEASURES (Mean)

Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	3.91	3.64
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	3.53	3 55
Urgency of medical decision making	4 09	3.32
Technical Skill/Physical Effort (Mean)		
Technical skill required	3.96	3.95
Physical effort required	1.87	3 27
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	4.21	3.23
Outcome depends on the skill and judgment of physician	4.19	4.05
Estimated risk of malpractice suit with poor outcome	3.98	3.36

INTENSITY/COMPLEXITY MEASURES	CPT Code	Reference Service 1
Time Segments (Mean)		
Pre-Service intensity/complexity	2.11	2.32
Intra-Service intensity/complexity	4.09	4.18
Post-Service intensity/complexity	2.91	2.77

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

ADA and APTA recommend the above RVU and Pre-, Intra-, and Post-service times even though both data sets had variability in the reported reference service codes. Based on the distinct services provided by both professionals, as described in the vignettes, and the professionals' experience completing the work survey, we anticipated differences in the reported reference service code.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) Not previously reported

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty ADA How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 383907
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate.

Specialty ADA Frequency 283907 Percentage 73.95 %

Specialty APTA Frequency 100000 Percentage 26.04 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 232,667 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate.

Specialty ADA Frequency 132667 Percentage 57.02 %

Specialty APTA Frequency 100000 Percentage 42.97 %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States?

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Non-Surgical

Specialty Society Update Process
PERC Summary of Recommendation
XXX Global Period
Non Facility Direct Inputs

CPT Long Descriptor: Telephone evaluation and management service provided by a qualified non-physician health care professional to an established patient, parent, or guardian not originating from a related E/M service provided within the previous seven days nor leading to an E/M service or procedure within the next 24 hours or soonest available appointment; 5-10 minutes of medical discussion.

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:
The American Dietetic Association utilized an expert panel to discuss and prepare practice expense recommendations for the non-face-to-face codes, 98966-X4. The expert panel consisted of six registered dietitian practitioners from a variety of practice settings and geographical locations. The American Physical Therapy Association convened a group of five physical therapists familiar with the services described by the codes was consulted. Their consensus opinion was then coordinated with other societies who surveyed similar codes (993X1 - X4).

Both expert panels' data and description of the clinical staff's pre- and post-service activities were identical, so both group's data was merged.

Please describe the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

The clinical staff receives the call from the patient. Clinical staff requests the patient's medical record and collects the health care professional's documentation note from the patient's last appointment. Clinical staff discusses patient's phone inquiry with the health care professional. The decision is made to have the health care professional call the patient to discuss the problem.

Intra-Service Clinical Labor Activities:
NA

Post-Service Clinical Labor Activities:
The clinical staff collects materials discussed over the call from the health care professional and mails educational print materials and summary of exercise or nutrition plan to the patient and physician. The patient's chart is filed in the health care professional's office.

Summary of Recommendations

February 2007

Team Conferences

The CPT Editorial Panel created CPT codes 99366 *Medical team conference with interdisciplinary team of health care professionals, face to face with patient and/or family, 30 minutes or more; participation by non-physician qualified health care professional* and 99368 *Medical team conference with interdisciplinary team of health care professionals, patient and/or family not present, 30 minutes or more; participation by non-physician qualified health care professional* to differentiate team conferences at which the patient is present and when the patient is not present and differentiate the various healthcare professionals who may participate in the team conference.

The HCPAC reviewed the specialty societies survey results for codes 99366 and 99368. These services are performed by a health care professionals from various professions. Therefore, six different professions were involved in surveying these services to appropriately capture the typical time and work involved. Approximately 160 health care professionals completed the surveys for 99366 and 145 completed surveys for 99368, with median annual service performance rates of 30 and 35, respectively.

The HCPAC thoroughly reviewed the specialty societies survey results and recommendations for codes 99366 *Team Conference, health care professionals, patient present* and 99368 *Team Conference, health care professionals, patent not present.* The HCPAC agreed that 99366 would involve slightly more physician work than 99368 because there is more involvement when the patient and/or family is present. The HCPAC concluded that the survey results were flawed because the survey respondents had overestimated physician time due to the key reference service chosen 99242 *Office consultation for a new or established patient* (work RVU=1.34). CPT code 99242 is not a service typically performed by these health care professionals. The reference service poorly compared to the work and time involved to perform these team conference services. The survey resulted in inappropriately high RVUs compared to other health care professional services and there was not appropriate rationale for the health care professionals' recommended work relative value units.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

In order to standardized the time to 30 minutes and properly value these team conference services, the HCPAC then performed a weighted average based on the survey median work values per specialty, with an intra-service time of 30 minutes. The weighted RVU for 99366 was calculated as follows:

Weighted Average for 99366

A	B	C	D	E
HCPAC Society	**Proposed Intra-Service Time / Survey Median Intra-Time**	**Column B x Survey Median Work Value**	**Column C x Percentage of Total Respondents**	**Total**
ASHA	30/35 = 0.86	0.86 x 1.13 = 0.97	0.97 x 28% = 0.27	0.27
ADA	30/45 = 0.66	0.66 x 1.37 = 0.91	0.91 x 24% = 0.22	0.22
APA	30/60 = 0.50	0.50 x 1.25 = 0.63	0.63 x 21% = 0.13	0.13
AOTA	30/52.5 = 0.57	0.57 x 1.20 = 0.68	0.68 x 16% = 0.11	0.11
APTA	30/35 = 0.86	0.86 x 1.10 = 0.94	0.94 x 7% = 0.06	0.06
NASW	30/45 = 0.66	0.66 x 1.30 = 0.86	0.86 x 4% = 0.03	0.03
			Weighted RVU =	**0.82**

The weighted average calculation produced a work relative value of 0.82. The HCPAC determined that a 0.82 work RVU was appropriate when compared to commonly reported codes by other health care professionals such as occupational therapists, physical therapists and dieticians. For example, code 97110 *Therapeutic procedure, one or more areas, each 15 minutes; therapeutic exercises to develop strength and endurance, range of motion and flexibility* valued at (RVU=0.45) or code 97803 *Medical nutrition therapy; re-assessment and intervention, individual, face-to-face with the patient, each 15 minutes* valued at (RVU=0.37), both which are valued at 15 minute increments. Therefore, if these services are doubled to 30 minutes, for a comparable reference to code 99366, the RVUs equal 0.90 and 0.74 respectively. Thus placing the RVU recommendation of 0.82 for 99366 appropriately relative to similar health care professional services. **The HCPAC recommends a work RVU of 0.82 for code 99366.**

The HCPAC analyzed the survey pre-, intra-, and post-service survey times and determined that these times were too high, relative to similar services performed by health care professionals. The HCPAC compared the surveyed pre/intra/post times to the aforementioned commonly reported codes by other health care professionals, 97110 (2/14/2 minutes) and 97803 (0/15/0 minutes). If these 15 minute timed reference codes are doubled to adequately compare this 30 minute service, the times of 5/30/5 for 99366 and 99368 are appropriate. Additionally, these timed codes state 30 minutes or more in the code descriptor and the HCPAC felt that 30 minutes intra-service time appropriately measured the intensity and complexity involved in performing these services. **The HCPAC recommends a pre-service time of 5 minutes, intra-service time of 30 minutes, and immediate post-service time of 5 minutes for 99366.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The HCPAC analyzed the specialty societies survey data for code 99368 *Team Conference, health care professionals, patent not present.* The HCPAC determined to crosswalk the percentage difference of the survey recommended RVU with the final recommended RVU for code 99366 (0.82/1.25) and apply this percentage difference to the survey recommended RVU to establish an appropriate rank order. The resulting work RVU recommendation is 0.72. **The HCPAC recommends a pre-service time of 5 minutes, intra-service time of 30 minutes, and immediate post-service time of 5 minutes for 99368. The HCPAC recommends a work RVU of 0.72 for code 99368.**

Practice Expense

The HCPAC reviewed the practice expense associated with 99366 and determined that typically when a patient is present they are greeted and receive a educational booklet. However, there are at least three health care professionals involved, so the greet time and one booklet are divided by 3 to apportion between providers who will all bill for this service. The HCPAC recommends less than one minute of greeting the patient (0.33 minutes, 1 minute of meet and greet time divided by 3 health care professionals). The HCPAC determined that a blended RN/LPN/MTA clinical labor mix typically provides the greeting. Additionally, the HCPAC recommends 1/3 or 0.33 of a patient education booklet as part of the medical supplies for code 99366. The HCPAC determined that there is no practice expense associated with code 99368.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
~~Physician case management is a process in which a physician is responsible for direct care of a patient, and for coordinating and controlling access to or initiating and/or supervising other health care services needed by the patient.~~ Case management is a process in which a physician or another qualified health care professional is responsible for direct care of a patient and, additionally, for coordinating, managing access to, initiating and/or supervising other healthcare services needed by the patient. **Medical Team Conferences** Medical team conferences include face-to-face participation by a minimum of three qualified health care professionals from different specialties or disciplines (each of whom provide direct care to the patient), with or without the presence of the patient, family member(s), community agencies, surrogate decision maker(s) (eg, legal guardian) and/or caregivers(s). The participants are actively involved in the development, revision, coordination and implementation of healthcare services needed by the patient. Reporting participants shall have performed face to face evaluations/treatments of the patient, independent of any team conference, within the previous 60 days.

SUMMARY OF RECOMMENDATION

CPT Code:99366 Tracking Number C2 Specialty Society Recommended RVU: **1.34**
Global Period: XXX RUC Recommended RVU: **0.82**

CPT Descriptor: Medical team conference with interdisciplinary team of health care professionals, face to face with patient and/or family, 30 minutes or more; participation by non-physician qualified health care professional

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: Typical Patient - A patient with a neurological disorder, weight loss and functional limitations lives at home with a caregiver. The functional limitations include impaired cognition, mobility, communication and dependencies in basic activities of daily living. The condition is such that the problems and functional limitations are likely to be alleviated with appropriate care and therapies. The optimal care plan needs to be devised in a coordinated manner given the multiple domains requiring attention (biomedical, psychological, social and functional) and multiple healthcare professionals involved in the care of the patient. After undergoing evaluations (each reported separately) by the appropriate disciplines/specialties a team conference is convened.

Percentage of Survey Respondents who found Vignette to be Typical: 79%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: The non-physician providers gather data and review the patient's chart and other pertinent information to prepare for the team consultation. Documentation and records from the individual provider is also collected and reviewed for the team consultation

Description of Intra-Service Work: The conference is attended by the non-physician and/or physician providers and the patient/patient's family member(s). After discussion, the group devises and approves a plan which includes specified goals, use of medical, nutrition and rehabilitative services and referral to community support services. All participants are engaged in the development, review and formulation of the care plan for the patient. Patient/patient's family member(s) receive educational brochure pertinent to the care plan.

Description of Post-Service Work: A summary report is written and made available to all participants and patient/patient's caregiver but its generation/compilation are reported separately.

Follow-up phone call to the patient/patient's family member(s) to assess understanding and implementation of the patient care plan.

This service does include the individual clinician's post conference creation of documentation of his/her participation in the team conference, including documenting contributed information and treatment recommendations, and review of the care plan for the patient.

Post-Service intensity/complexity	3.35	3.29

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

After completing a convenience survey among HCPAC (non-physician) society providers (159 responses obtained), an expert panel (including APA, APTA, AOTA, ASHA, NASW and ADA) was convened to review and determine final work RVU recommendations for team conference codes 993699366 and 99368. After noting similarities in the reference service code and work RVU proposed values across all of these societies, the HCPAC societies contacted the physician groups who surveyed the team conference codes 993699365 and 99367 (AAP, APA, AGS and AAPMR) to review and discuss the work RVU recommendations.

While the HCPAC and physician groups have different experiences with completing the AMA work surveys, based on the collective number of survey responses and similar data across all groups, the work RVU data was merged. The HCPAC and physician panel agreed on the survey median work RVU of 1.34 for 99366 and 99365. This decision was based on the expert panel's agreement that the work effort is the same regardless of provider type who participates in the team conference. The 1.34 work RVU for 99366 is further supported based on the HCAPC survey data indicating the service involves 45 minutes intra-service time, longer than many of the intra-services times for codes included on the reference service list.

Additionally, the panel felt 99365 and 99366 include more intense work effort than 99367 and 99368 since the patient and/or family member are present during the team conference. A dynamic, highly engaged conference is required to plan and implement the care plan with the patient and family member(s). In the 99365 and 99366 work effort, the healthcare provider(s) translate clinical information in layman's terms for increased

comprehension by the family/patient, respond to the family/patient questions, incorporate new information from the family/patient into the decision-making process, and adjust the care plan based on new information and family/patient input. All these activities increase the healthcare provider's work effort. The recommended work value is also supported by the complexity of the patient/patient's condition that requires active participation of at least 3 healthcare providers who participate on the team conference.

The expert panel feels the recommended work RVU of 1.34 for team conference codes 99366 and 99365 places these codes in correct rank order with the reference service code (99242; work RVU 1.34) as well as other E/M codes. The panel reviewed E/M codes which represent much less time with the patient- 99214 (work RVU 1.42 for 25 minutes) and 99213 (work RVU = 0.92 for 15 minutes). The panel feels the recommended work value for 99366 and 99365 represents correct rank order based on this E/M code review.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 99361 however this code does not match the new description of 9936X2

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty ADA and ASHA	How often? Commonly
Specialty APTA and AOTA	How often? Commonly
Specialty APA and NASW	How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 100000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.

Specialty ADA and ASHA	Frequency 33333	Percentage 33.33 %
Specialty APTA and AOTA	Frequency 33333	Percentage 33.33 %
Specialty APA and NASW	Frequency 33333	Percentage 33.33 %

Modifier -51 Exempt Status

Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:

Is this new/revised procedure considered to be a new technology or service?

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99379	XXX	1.10	RUC Time

CPT Descriptor Physician supervision of a nursing facility patient (patient not present) requiring complex and multidisciplinary care modalities involving regular physician development and/or revision of care plans, review of subsequent reports of patient status, review of related laboratory and other studies, communication (including telephone calls) for purposes of assessment or care decisions with health care professional(s), family member(s), surrogate decision maker(s) (eg, legal guardian) and/or key caregiver(s) involved in patient's care, integration of new information into the medical treatment plan and/or adjustment of medical therapy, within a calendar month; 15-29 minutes

KEY MPC COMPARISON CODES:

Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Most Recent Medicare Utilization	Work RVU	Time Source
CPT Descriptor 1				
MPC CPT Code 2	Global	Most Recent Medicare Utilization	Work RVU	Time Source

CPT Descriptor 2

Other Reference CPT Code	Global	Work RVU	Time Source
99242	XXX	1.34	**RUC Time**

CPT Descriptor Office consultation for a new or established patient, which requires these three key components: an expanded problem focused history; an expanded problem focused examination; and straightforward medical decision making. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of low severity. Physicians typically spend 30 minutes face-to-face with the patient and/or family.

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 27 **% of respondents:** 18.7 %

Post-Service intensity/complexity	3.33	3 30

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

After completing a convenience survey among HCPAC (non-physician) society providers (144 responses obtained), an expert panel (including APA, APTA, AOTA, ASHA, NASW and ADA) was convened to review and determine final work RVU recommendations for team conference codes 99366 and 99368. After noting similarities in the reference service code and work RVU proposed values across all of these societies, the HCPAC societies contacted the physician groups who surveyed the team conference codes 99365 and 99367 (AAP, APA, AGS and AAPMR) to review and discuss the work RVU recommendations.

While the HCPAC and physician groups have different experiences with completing the AMA work surveys, based on the collective number of survey responses and similar data across all groups, the work RVU data was merged. The HCPAC and physician panel agreed on the survey median work RVU of 1.30 for 99368 and 99367. This decision was based on the expert panel's agreement that the work effort is the same regardless of provider type who participates in the team conference.

The 1.30 recommended work value demonstrates rank order between 993899366 and 99368 where 99368 has a lower work RVU since the patient and/or family member are not present during the team conference. Survey data supports the lower value for 99368 with an intra-service time of 30 minutes compared to 99366 intra-service time of 45 minutes.

The HCPAC and physician expert panel feels the recommended work RVU of 1.30 for team conference codes 99368 and 99367 places these codes in correct rank order with other reference service codes that have lower pre-, intra- and post service times (99379 work RVU 1.10, and 99374 work RVU 1.10). Rank order for the proposed 99368 and 99367 RVU of 1.30 is also supported through the expert panels' review of E/M codes 99213 and 99214; both represent less time with the patient (99213 work RVU 0.92 for 15 minutes and 99214 work RVU 1.42 for 25 minutes).

The recommended work value is also supported by the complexity of the patient/patient's condition that requires active participation of at least 3 healthcare providers who participate on the team conference. The conferences are 30 minutes or more, requiring interpretation of the multi-disciplinary clinical findings and spontaneous decision making to formulate the care plan.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 99361

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty ADA and ASHA	How often? Commonly
Specialty APTA and AOTA	How often? Commonly
Specialty APA and NASW	How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 100000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.

Specialty ADA and ASHA	Frequency 33333	Percentage 33.33 %
Specialty APTA and AOTA	Frequency 33333	Percentage 33.33 %
Specialty APA and NASW	Frequency 33333	Percentage 33.33 %

AMTA/Specialty Society Update Process
PERC Summary of Recommendation
XXX Global Period
Non Facility Direct Inputs

CPT Long Descriptor: Medical Team Conference with interdisciplinary team of health care professionals, face-to-face with patient and/or family, 30 minutes or more; participation by non-physician qualified health care professional.

An expert consensus panel was used to develop direct practice expense inputs for the team conference code 99366. The expert panel included HCPAC representatives from American Physical Therapy Association; American Psychological Association; American Speech, Language, and Hearing Association and the American Dietetic Association. These groups based their discussions on PE data obtained from the respective group's members.

Please describe the clinical activities of your staff:

Pre-Service Clinical Labor Activities:
None

Intra-Service Clinical Labor Activities:
The clinical staff person greets the patient and/or family member(s) and takes them to the conference room.

Post-Service Clinical Labor Activities:
None.

Supplies: (see PERC spreadsheet)
One patient education booklet

DATE: January 9, 2007

TO: William Rich, MD
Chair, AMA/Specialty Society RVS Update Committee

FROM: The American Occupational Therapy Association; American Physical Therapy Association; American Psychological Association; American Speech, Language, and Hearing Association; National Association of Social Workers, and the American Dietetic Association

Re: Direct Practice Expense Inputs for Code 99368 (team conference code without patient/family member present; Tracking Code C4)

Dear Dr Rich:

Code 99368 (*Medical team conference with interdisciplinary team of health care professionals, patient and/or family not present, 30 minutes or more; participation by non-physician qualified health care professional*) is one of the team conference codes being considered at the February 2007 RUC meeting.

The American Occupational Therapy Association; American Physical Therapy Association; American Psychological Association; American Speech, Language, and Hearing Association; National Association of Social Workers, and the American Dietetic Association convened an expert panel to review direct practice expense for this code, 99368, and 99366. The panel determined there is no direct practice expense for 99368 in either the facility or non-facility setting.

If you have any questions, please contact Pam Michael, MBA, RD, American Dietetic Association staff, at 312-899-4747 or PMichael@eatright.org. Thank you.

Health Care Professionals Advisory Committee
Summary of Recommendations

April 2007

Standardized Cognitive Performance Testing

Prior to 2006, previous CPT code 96115 *Evaluation of Neurobehavioral Status*, was used jointly by neurologists, psychologists, speech-language pathologists, and occupational therapists to assess the orientation, memory, visual-spatial orientation, high-level language function, and other executive function abilities that have been compromised by acute neurological events. Effective January 2006, CPT code 96115 was deleted and replaced with CPT code 96116 *Neurobehavioral status exam (clinical assessment of thinking, reasoning and judgment, eg, acquired knowledge, attention, language, memory, planning and problem solving, and visual spatial abilities), per hour of the psychologist's or physician's time, both face-to-face time with the patient and time interpreting test results and preparing the report*, which may only be reported by physicians or psychologists. Consequently, speech-language pathologists and occupational therapists were not able to report this frequently performed procedure. Therefore, in February 2007, the CPT Editorial panel created a new code so that speech-language pathologists, occupational therapists and other health care professionals may report when they are performing a battery of standardized tests evaluating many aspects of neurocognitive functions.

The American Speech-Language-Hearing Association (ASHA) and American Occupational Therapy Association (AOTA), presented work relative value recommendations for 96125 *Standardized cognitive performance testing (eg, Ross Information Processing Assessment) per hour of a qualified health care professional's time, both face-to-face time with the patient and time interpreting test results and preparing the report.* The HCPAC compared 96125 to the survey reference code 96116 *Neurobehavioral status exam, per hour of the psychologist's or physician's time, both face-to-face time with the patient and time interpreting test results and preparing the report* (work RVU=1.86). Although the survey median work RVU was 1.86 for 96125, the same as reference code 96116, the HCPAC determined that 96125 was not comparable to this reference service and the proposed work RVU was too high. The HCPAC determined that the survey median did not fall within the appropriate range of work RVUs for occupational therapists and speech pathologists and would cause an inter-specialty rank order anomaly.

The HCPAC determined that code 96125 would more appropriately fall between code 97003 *Occupational therapy evaluation* (45 minutes intra-service time, work RVU = 1.20, add an increment of 0.40 RVUs to equal 1 hour, RVU = 1.60) and 97750 *Physical performance test or measurement (eg, musculoskeletal, functional capacity), with written report, each 15 minutes* (work RVU=0.45 x 4 to equal one hour, RVU = 1.80). The HCPAC determined that a work RVU of 1.70 (1.60+1.80/2=1.70) for 96125 would place this service in the appropriate rank order. **The HCPAC recommends a work RVU of 1.70 for code 96125. The HCPAC recommends 7 minutes pre-service time and 60 minutes intra-service time as these times accurately reflect the work performed.**

Practice Expense
The HCPAC reviewed and approved the practice expense inputs of two neurobehavioral status forms for code 96125.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:96125 Tracking Number N/A Specialty Society Recommended RVU: **1.86**
Global Period: XXX RUC Recommended RVU: **1.70**

CPT Descriptor: Standardized cognitive performance testing (eg Ross Information Processing Assessment) per hour of health care professional's time, face-to-face time with the patient with interpretation and written report

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 36 year old male status post motor vehicle accident with subsequent traumatic brain injury is reffered to the healthcare professional for standardized cognitive performance testing following a recent dischage

Percentage of Survey Respondents who found Vignette to be Typical: 67%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: The qualified health care professional reviews pertinent records and selects the tests for administration.

Description of Intra-Service Work: The qualified health care professional selects and completes a face-to-face administration of the appropriate standardized test(s) to examine the patient's current level of functional cognitive performance. Raw and standardized scores are derived and analyzed. A written report is then prepared by the qualified health care professional and sent to the referring physician.

Description of Post-Service Work:

Post-Service intensity/complexity	3.51	3 38

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

This code is reported on a per hour basis. The time includes face-to-face time and the time for the interpretation and report. For this reason we are eliminating the median post-service time of 30 minutes reflected on the surveys. This is consistent with the reference code of 96116, Neurobehavioral status examination, which was the code used through 2005 to report by speech language pathologists, occupational therapists and clinical social workers to report this service. In addition, the typical time for performing this service is 2 hours. Thus, we are proposing to allocate the 20 minutes of pre-service time over the 2 units of service which would reduce the pre-service time to 10 minutes. We think the survey median RVW of 1.86 is reasonable in relationship to the reference code and the codes on the MPC list. The IWPUT for this code using 10 minutes of pre time, 60 minutes of intra time and 0 minutes of post time is 0.027.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.

☐ Historical precedents.
☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) Under 96115

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty SLP How often? Sometimes

Specialty OT How often? Sometimes

Specialty Social Work How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 75000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. This code is used more in the under-Medicare-age population.

Specialty SLP Frequency 40000 Percentage 53.33 %

Specialty OT Frequency 30000 Percentage 40.00 %

Specialty Social Work Frequency 5000 Percentage 6.66 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 12,000 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. According to 2004 Medicare data, 4,638 claim lines were billed for occupational therapy services performed under code 96115. CPT 96115 was the 20th of 67 most frequently reported CPT code for speech-language pathology services. The total number of units for 96115 was 2,238.

Specialty SLP Frequency 6500 Percentage 54.16 %

Specialty OT Frequency 5000 Percentage 41.66 %

Specialty Social Work Frequency 500 Percentage 4.16 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

CPT Code: 96125

AMA/Specialty Society Update Process
PERC Summary of Recommendation
XXX Global Period
Non Facility Direct Inputs

CPT Long Descriptor: **Standardized cognitive performance testing (eg Ross Information Processing Assessment) per hour of health care professional's time, face-to-face time with the patient with interpretation and written report**

Sample Size:_____ Response Rate: (%):_____ Global Period:_____

Geographic Practice Setting %: Rural____ Suburban_____ Urban_____

Type of Practice %: _____Solo Practice
_____Single Specialty Group
_____Multispecialty Group
_____Medical School Faculty Practice Plan

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

Practice expense items were determined by an expert consensus panel for the disposable supplies necessary for this procedure. There is no staff time nor is there capital equipment that is to be included as practice expense. The main items of practice expense for this procedure were standardized test forms. It should be noted that the cost of these forms were pro-rated over what we expect to be a typical 2 hour contact.

Please describe the clinical activities of your staff: **N/A**

Pre-Service Clinical Labor Activities:

Intra-Service Clinical Labor Activities:
