RUC Recommendations for CPT 2008 Volume I

RUC Meetings September 2006, February 2007 and April 2007

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
RUC RECOMMENDATIONS FOR CPT 2008

TABLE OF CONTENTS
Volume I

Anesthesia for Radiologic Spine Procedures	1
Soft Tissue Brachytherapy Implant Placement	2
Application of Cranial Tongs	3
External Fixation	4
Computer Navigation	5
Temporomandibular Joint Manipulation	6
Interstitial Fiducial Marker Placement	7
Three Column Osteotomy	8
Internal or External Fixation – Shoulder/Elbow	9
Epicondylitis Procedures	10
Internal or External Fixation – Elbow/Hand	11
Femoral Head Fracture Treatment	12
Internal or External Fixation – Hip/Knee	13
Open Knee Osteochondral Autograft	14
Posterior Malleolar Fracture Treatment	15
Fibula Malunion	16
Internal or External Fixation – Foot/Ankle	17

Volume II

Open Osteochondral Talus Graft	18
Arthroscopic Biceps Tenodesis	19

Subtalar Arthroscopy	20
Insert Emergency Airway	21
Add-On Maze	22
Valve Sparing Aortic Annulus Reconstruction	23
Wireless Pressure Sensor Implantation and Study	24
Brachial-Ulnar Bypass Graft	25
Non-Implantable Venous Access Device Blood Draws	26
Arterial Catheterization	27
Head and Neck Interstitial Brachytherapy Needle or Catheter Placement	28
Peritoneal Tumor Ablation	29
G-, J-, G-J, C-Tube Procedures	30
Transuretheral Ureteral Stent Tube Exchange and Removal	31
Intra-Abdominal Voiding Pressure	A
Pelvic Interstitial Brachytherapy Needle or Catheter Placement	B
Percutaneous Renal Tumor Cryotherapy	C
Prostate Laser Enucleation	D
Laparoscopic Paravaginal Defect Repair	E
Laparoscopic Total Hysterectomy	F
Viterectomy with Epiretinal Membrane Stripping	G
Retinopathy Treatment	H
Nasolacrimal Duct Balloon Catheter Dilation	I
Cardiac MRI	J
Brain and Cerebrospinal Fluid Imaging	K

PET Imaging	L
Manual Microdisection	M
Immune Globulin Subcutaneous Infusion	N
Insertion and Placement of Heart Catheter	O
Allergy Test Interpretation	P
Electronic Analysis of Implanted Neurostimulator Pulse Generator System	Q
Ocular Photoscreening	R
Initial Day Hospital Neonate Care	S
Team Conference	T
Non-Face-to-Face Physician Services	U
Smoking Cessation	V
Alcohol, Drug Screening and Brief Intervention	W

AMERICAN
MEDICAL
ASSOCIATION

May 30, 2007

Leslie Norwalk
Acting Director
Center for Medicare Management
Centers for Medicare and Medicaid Services
7500 Security Boulevard
Baltimore, MD 21244

Dear Ms. Norwalk:

It is with pleasure that I submit to the Centers for Medicare and Medicaid Services (CMS), on behalf of the American Medical Association (AMA)/Specialty Society RVS Update Committee (RUC), work relative value and direct practice expense input recommendations for new and revised codes for CPT 2008. In addition, I submit the work relative value and direct practice expense input recommendations for codes identified in the third Five-Year Review. At this time, the RUC is also submitting physician time data corrections and updates for existing services as well as comments regarding specific payment policies for consideration in the 2008 Medicare Physician Payment Schedule *Proposed Rule*. The RUC Health Care Professionals Advisory Committee Review Board is separately forwarding its recommendations to CMS.

Cost estimates for medical supplies and equipment not listed on "CMS's Labor, Supply, and Equipment List for the Year 2007" are based on provided source(s) as noted, such as manufacturer's catalogue prices and may not reflect the wholesale prices, quantity or cash discounts, prices for used equipment or any other factors which may alter the cost estimates. The RUC shares this information with CMS without making specific recommendations on the pricing for supplies and equipment.

CPT 2008 New and Revised Codes

Enclosed are two binders of RUC recommendations for new and revised codes. The total number of coding changes for CPT 2008 is 332, including 118 additions, 186 revisions and 28 deletions. Thirty of these new and revised codes are not payable on the RBRVS (eg, laboratory services and vaccines), and accordingly, the RUC does not submit any information on these codes. In addition, seven of these new codes were reviewed by the RUC HCPAC Review Board as these codes describe services provided by non-MD/DO health professionals. Of the remaining 267 new and revised codes, the RUC submits 266 recommendations at this time. The RUC does not submit a recommendation for code 99174 *Ocular photoscreening with interpretation and report, bilateral*, due to a lack of specialty interest in developing recommendations.

The RUC is recommending that eleven codes be carrier priced in 2008. In addition, the RUC recommends interim values for 15 codes. The summary table in the attached binders and in the enclosed CD, specifically identifies the G-, J-, G-J, C-Tube Procedures (49441-49465 and 43760), Femoral Head Fracture (27267-27269) and Computer Navigation (20985-20987) to be re-reviewed at the September 2007 RUC Meeting. I will send any new information related to these services to CMS immediately following the meeting.

Also included in these binders and on the enclosed CD, are physician time data for each of the CPT codes reviewed at the September 2006, February 2007 and April 2007 RUC meetings. The RUC continues to review physician time data to ensure that the most accurate data is utilized in the CMS practice expense methodology.

2005 Five-Year Review Issues

Enclosed in a separate binder are recommendations for nine issues identified for review in the most previous Five-Year Review. These issues include:

- Partial Mastectomy (19301)
- Insertion of Heart Pacemaker (33207)
- Anoscopy and Proctosigmoidoscopy (45300, 45303, 45305, 45307, 45308, 45309, 45315, 45317, 45320, 45321, 45327, 46600, 46604, 46606, 46608, 46610, 46611, 46612, 46614, 46615)
- Eye Exams (92002-92014)
- Audiology and Speech-Language Pathology Services (92557, 92567, 92568, 92569, 92579, 92601, 92602, 92603, 92604)
- Doppler Color Flow (93325)
- Nursing Facility Care (99304-99318)
- Domiciliary Care (99326-99328, 99334-99337)
- Home Care (99343-99345, 99347-99350)

Also included with these recommendations are physician time data for each of the Five-Year Review issues discussed.

CMS Requested Review of Practice Expense Inputs

Enclosed are direct practice expense refinement recommendations for eight issues as requested by CMS and reviewed at the February and April 2007 meetings of the RUC.

The issues include:

- Transcatheter Placement of Intravascular Stent(s) (37205, 37206, 75960)
- OB/GYN Procedures – Supply Pack (All OB/GYN Procedures)
- Gynecologic Oncology (All GYN/ONC Procedures)
- Computer Aided Detection (CAD) Breast Mammography (77051, 77052)
- Dual-Energy X-Ray Absorptiometry (77080-77082)
- Proton Beam Treatment Delivery (77520-77525)
- Remote Afterloading High Intensity Brachytherapy (77781-77784)
- Cardiac Catheterization (93501-93572)

Other RUC Recommendations

As CMS develops the Proposed Rule for the 2008 Physician Payment Schedule, I ask that you consider several pending RUC recommendations.

Anesthesia Recommendations
CMS requested a RUC review of anesthesia services in the *Final Rule* published in the December 1, 2006 *Federal Register*. CMS stated that, "Although anesthesia services are paid under the Physician Fee Schedule, they are paid on the basis of an anesthesia code-specific base unit and time units that vary based on the anesthesia time of the case. Since anesthesia services do not have a work values per codes as do other medical services, a work value must be imputed for each anesthesia code. As a result of its relationship with the RUC and the past recommendations for valuing anesthesia services, which were discussed in detail in the June 29, 2006 Proposed Notice, the American Society of Anesthesiologists (ASA) requested that we address the valuation of anesthesia services reported under CPT code 00100 through 01999. The ASA furnished an analysis that builds on the methodology used in the last 5 Year Review for the valuation of work for anesthesia services. We recommend that the valuation of anesthesia services, namely the proposed valuation of the post-induction time, be referred to the AMA RUC for review and consideration."

To address this request the RUC formed the Anesthesia Workgroup which reviewed this issue at length during two conference calls and three face-to-face meetings. Based on the extensive review of all the building block components and validation of Post-Induction

Period Procedure Anesthesia (PIPPA) work by surgeons on the Workgroup familiar with anesthesia services associated with their specialty, the Workgroup reached unanimous agreement that the revised model predicts anesthesia undervaluation. **The RUC recommends to CMS that Anesthesia work is undervalued by 32%.**

The RUC also identified three anesthesia services that may be misvalued based on this analysis and recommend that CMS allow review of the base units for at an upcoming RUC meeting:

00142 ***Anesthesia for procedures on eye; lens surgery****
00210 ***Anesthesia for intracranial procedures; not otherwise specified****
00562 ***Anesthesia for procedures on heart, pericardial sac, and great vessels of chest; with pump oxygenator****

**Assumed to be overvalued, base unit too high or incorrect quintile assumption in the second Five-Year Review valuation.*

Supporting documents including the specific recommendations made by the Anesthesia Workgroup, the anesthesia quintile intensity retrofit calculations, the anesthesia regression versus quintile comparison, and the final anesthesia services calculations using the building block methodology as approved by the RUC, are enclosed in the Other RUC Recommendations Binder.

Budget Neutrality – Work Adjuster
The Omnibus Budget Reconciliation Act of 1989 requires that increases or decreases in relative value units (RVUs) for a year may not cause the amount of expenditures for the year to differ by more than $20 million from what expenditures would have been in the absence of these changes. To limit the increases in Medicare expenditures as mandated by the statute, CMS has applied a new "work adjuster" to ensure budget neutrality following the implementation of the improved work RVUs from the most recent Five-Year Review of the RBRVS. **The RUC argues that applying budget neutrality to the work RVUs to offset the improvements in E/M and other services is a step backward and strongly urges CMS to apply the necessary adjustments to the conversion factor.**

From 1998 to present, CMS has implemented all work neutrality adjustments by adjusting the Medicare conversion factor. CMS did not explain why it altered this long utilized method and moved backward to an approach that the agency itself remarked was inappropriate. The RUC requests that CMS consider the history and these additional arguments and apply budget neutrality to the conversion factor:

1.) Adjusting the conversion factor does not affect the relativity of services reflected in the recommended RVUs. Adjusting the RVUs has the potential to inappropriately affect relativity and dampen the improvements to the E/M services valuation. CMS has publicly lauded the RUC for recommending these increases to E/M and we would surmise that the agency would want to achieve the full benefit of these improvements.

2.) An adjustment in the Medicare conversion factor is preferable because it has less impact on other payers who use the Medicare RVUs. That is, an adjustment in the Medicare conversion factor will not necessarily affect the payment rates of other payers who use the Medicare RVUs and their own conversion factors. However, any adjustment in the RVUs will impact the payment rates of such payers. The payment rates of payers who peg their rates to a percentage of Medicare will be affected regardless. The RUC believes that CMS must consider such "ripple effects" as it decides how to adjust for work neutrality.

3.) The RUC believes an adjustment to the conversion factor recognizes that budget neutrality is mandated for monetary reasons. Thus, the conversion factor, as the monetary multiplier in the Medicare payment formula, is the most appropriate place to adjust for budget neutrality

4.) Applying the work neutrality adjustment to the conversion factor would coincide with CMS' current mission of making Medicare payment transparent.

Equipment Assumptions – Equipment Utilization Data
CMS currently utilizes an interest rate of 11% in pricing medical equipment. CMS has acknowledged that this rate is too high and requested comments regarding the appropriate interest rate. The RUC also discussed and agreed that the interest rate currently utilized is too high. The RUC agreed that the interest rate should fluctuate according to market conditions, rather than a fixed rate. The cost of capital is a legitimate expense of a physician's office and should be linked to prevailing rates. **CMS should adjust the 11% cost of capital rate to a market competitive rate.**

Equipment Assumptions – Cost of Capital Assumptions
CMS requested information on how it should reflect the utilization rate, particularly for high cost equipment. Currently, CMS uses a 50% utilization rate for all equipment. The RUC has discussed whether there should be a different rate for all equipment or just for the equipment set by specific cost thresholds. The RUC indicated that the cost of capital may not have a direct linear relationship with equipment utilization. Further, the RUC discussed whether consideration should be given to impacts on rural payment, as utilization rates may not be as high as in urban areas. The RUC recommends that the existing CMS standard of 50% utilization rate for all equipment is not an accurate measure. **CMS should consider using a higher rate for all equipment, providing an opportunity to specialty societies to provide data to support lower utilization rates, if appropriate, based on clinical or geographic considerations.**

Practice Expense Inputs - Supplies
The Practice Expense Subcommittee and the RUC in an effort to continually refine the RUC's process of developing practice expense recommendations agreed that some

mechanism should be in place to distinguish high priced disposables medical supplies, from the practice expense methodology so that the inequities of the scaling factors do not cause as many anomalies in the practice expense specialty pools and in practice expense relative values. The RUC recommends:

CMS set a specific reasonable threshold for the creation of J codes on high priced disposable medical supplies, and that an impact analysis be performed to find out how individual specialty's and practice expense pools would be affected. In addition, medical supplies used in the practice expense methodology, priced at or above $200, should be re-priced on an annual basis.

Members of the subcommittee believed that an initial reasonable threshold could be $250.00.

Professional Liability Insurance
In 1999, and consistently since 2004, the RUC has urged CMS to address a significant problem in the PLI RVU determinations for services with a technical component and professional component. The current CMS methodology generates a higher PLI relative value for the technical component portion than the professional component. One particularly poignant example of this inverse relationship is found in 77057, *Screening mammography, bilateral (2-view film study of each breast)* For this service, carrying a considerable amount of risk in screening for cancer, the PLI RVU for the professional component is .03, while the technical component is .07. The professional component PLI RVU includes the interpretation of results and the most significant amount of liability, but is valued less than half of the technical component PLI RVU, which accounts for only the risk posed by the equipment and the imaging process.

In the Final Rule for the 2005 Physician Payment Schedule, CMS responded to the continuing RUC comments as follows:

> *Physician work RVUs are used to adjust for risk of service. Because technical component services do not have physician work RVUs, they are still valued using charge-based RVUs instead of the resource-based malpractice RVU methodology. We look forward working with the ACR and the other interested specialty organizations to examine alternative methodologies that would allow technical component services to also reflect resource-based malpractice RVUs.*

At a minimum, CMS should appropriately reallocate PLI RVUs within the physician fee schedule by accepting the RUC interim recommendation to establish the technical component PLI RVU to be equivalent to the professional component PLI RVU for each

CPT code. **A more appropriate strategy would develop a methodology to ensure that the technical component PLI RVUs reflect resource-based professional liability costs.**

CMS Definition of Pre-time
The RUC requests that CMS consider a modification to the definition of physician pre-service time to be consistent with the pre-service definition utilized for the practice expense methodology. The current CMS definition of pre-service time for physicians is as follows:

Pre-service period
The pre-service period includes physician services provided from the day before the operative procedure until the time of the operative procedure and may include the following:

- *Hospital admission work-up.*
- *The pre-operative evaluation may include the procedural work-up, review of records, communicating with other professionals, patient and family, and obtaining consent.*
- *Other pre-operative work may include dressing, scrubbing, and waiting before the operative procedure, preparing patient and needed equipment for the operative procedure, positioning the patient and other "non-skin-to-skin" work in the OR.*

*The following services are **not included**:*

- *Consultation or evaluation at which the decision to provide the procedure was made (reported with modifier -57).*
- *Distinct evaluation and management services provided in addition to the procedure (reported with modifier -25).*
- *Mandated services (reported with modifier -32).*

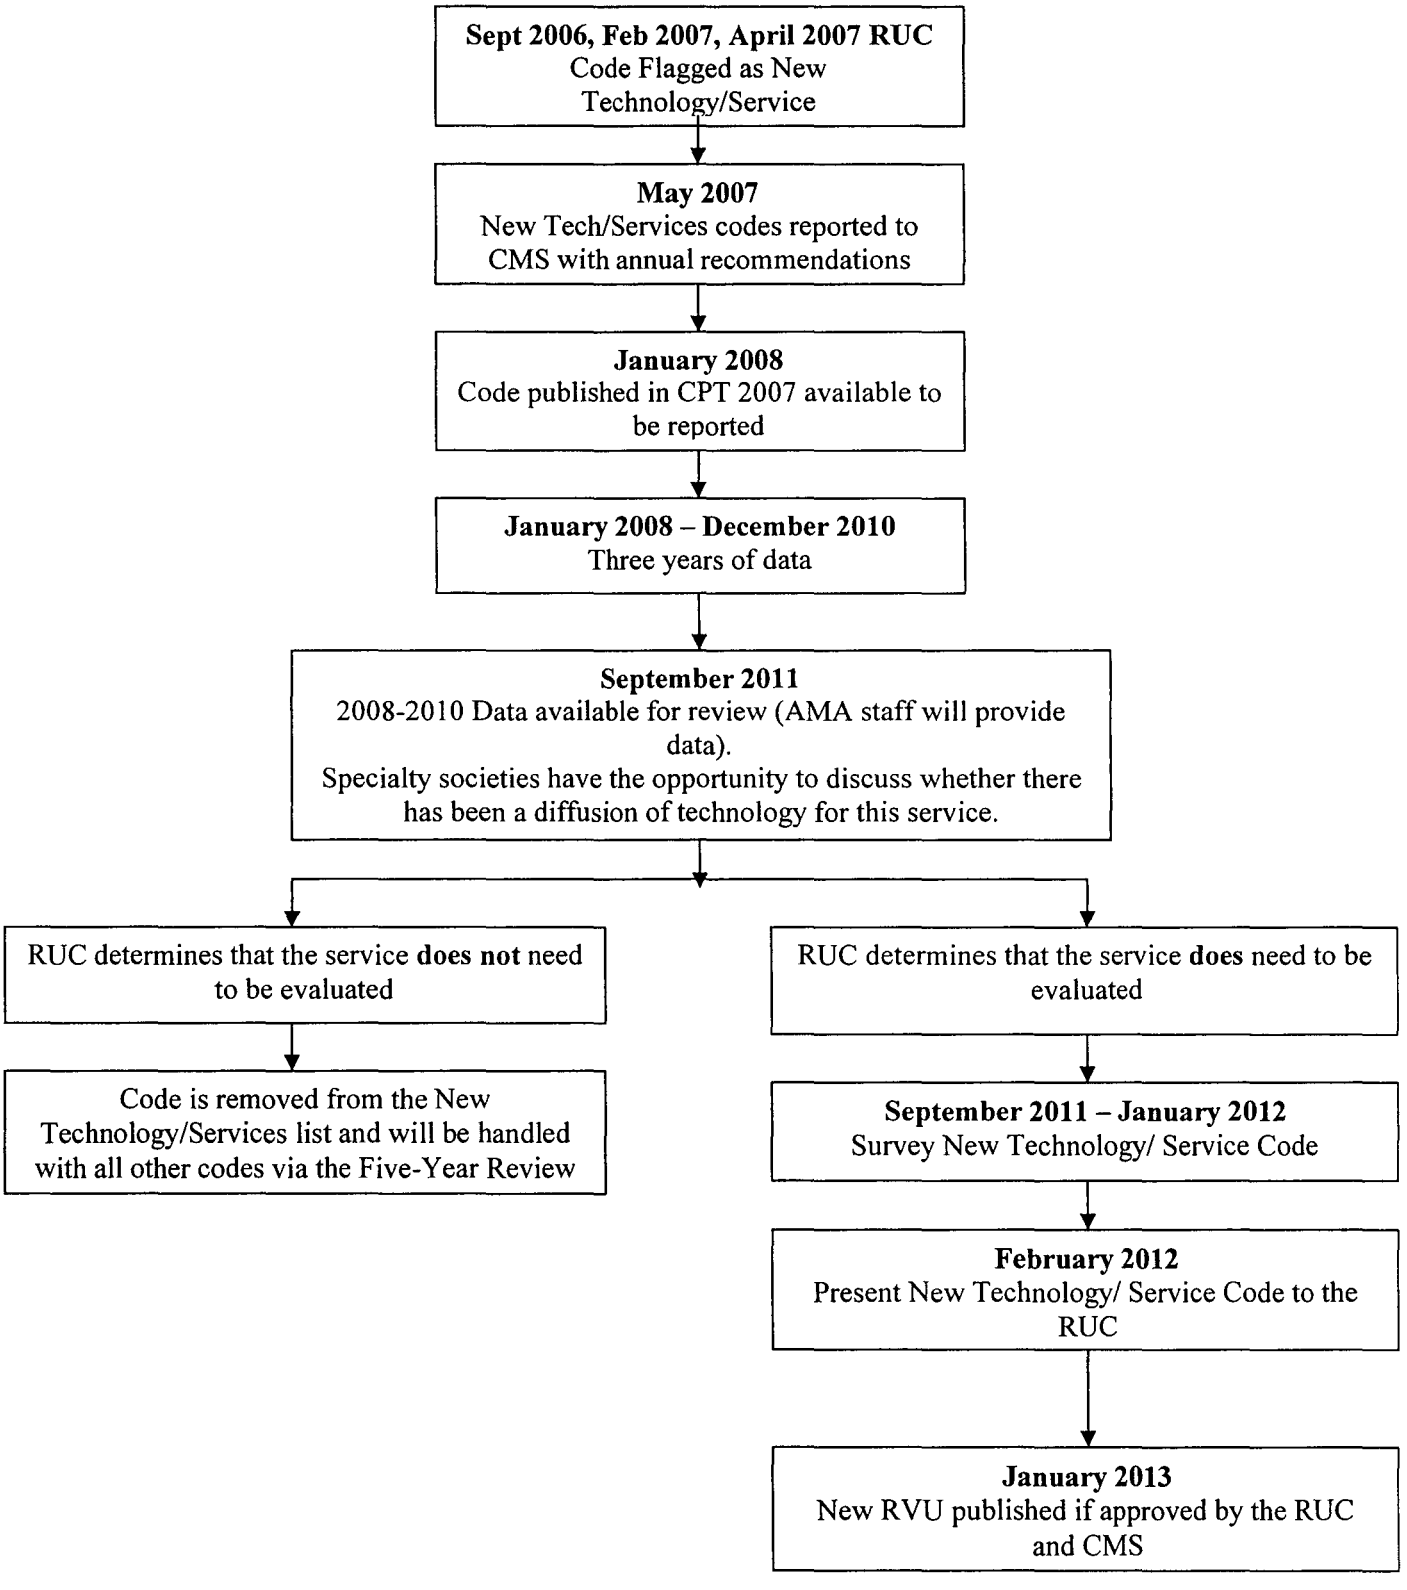
The RUC recommends that the physician pre-service period instead begin when the decision for surgery is made. Physicians may engage in many of these pre-service activities (eg, review of records, communicating with other professionals, etc) prior to the day before the operative procedure.

<u>Five Year Review Identification Workgroup and New Technology/Services Identification/Review Process</u>

Based on previous MedPAC discussions and recommendations to Congress, CMS led initiatives to identify misvalued services, and its own mission to ensure correct valuation of all codes, the RUC concurred that there should be a process to identify such codes.

This workgroup initially convened in October 2006 and February 2007. Through this process, the RUC has begun to identify services incorporating new technology, which are likely to change in value, for subsequent review in order to minimize future misvaluation. The RUC is also developing other objective measures to identify misvalued services.

At its April 2006 meeting, the RUC adopted a process to identify and review codes that represent new technology or services that have the potential to change in value. First, a code is identified as a new technology/service at the RUC meeting in which it is initially reviewed. Second, the code is identified as a new technology/service in the next version of the RUC database with the date it is to be re-reviewed. Third, the code will be reviewed according to this schedule (depending on what meeting in the CPT/RUC cycle it is initially reviewed) after at least three years of data are available. A flow chart providing a detailed description of this process is below. The RUC has already identified 78 of these procedures through its new and revised process. A table of these codes identified as new technology/services has been attached.



We appreciate your consideration of the RUC's recommendations. You may contact Sherry Smith at the AMA with any questions regarding this submission

Sincerely,

William L. Rich, III, MD, FACS

Baltimore, MD 21244

Dear Ms. Norwalk:

It is with pleasure that we submit to the Centers for Medicare and Medicaid Services (CMS), on behalf of the RUC Health Care Professionals Advisory Committee (HCPAC) Review Board, work relative value and direct practice expense inputs for new and revised codes for CPT 2008.

These work relative value and direct practice expense input recommendations address the following new codes:

- Non Face-to-Face Qualified Healthcare Professional Services
- Team Conferences – Participation by Non-Physician Qualified Health Care Professional
- Standardized Cognitive Performance Testing

The CPT Editorial Panel also developed new codes corresponding s for the non face-to-face services and team conference services provided by physicians (MDs/DOs). The RUC reviewed and submitted recommendations on the physician (MD/DO) services only. The HCPAC independently reviewed and submitted separate recommendations on the non-physicians services.

The RUC HCPAC Review Board looks forward to continued CMS representation at our meetings and your effort to ensure a fair review of the enclosed recommendations.

If you have any questions please contact AMA staff, Susan Clark, at (312) 464-4308 or via e-mail at Susan.Clark@ama-assn.org.

Sincerely,

Arthur R. Traugott, MD

Leslie Norwalk
Acting Director
Center for Medicare Management
Centers for Medicare and Medicaid Services
7500 Security Boulevard
Baltimore, MD 21244

Dear Ms. Norwalk:

It is with pleasure that I submit to the Centers for Medicare and Medicaid Services (CMS), on behalf of the American Medical Association (AMA)/Specialty Society RVS Update Committee (RUC), work relative value and direct practice expense input recommendations for new and revised codes for CPT 2008. In addition, I submit the work relative value and direct practice expense input recommendations for codes identified in the third Five-Year Review. At this time, the RUC is also submitting physician time data corrections and updates for existing services as well as comments regarding specific payment policies for consideration in the 2008 Medicare Physician Payment Schedule *Proposed Rule*. The RUC Health Care Professionals Advisory Committee Review Board is separately forwarding its recommendations to CMS.

Cost estimates for medical supplies and equipment not listed on "CMS's Labor, Supply, and Equipment List for the Year 2007" are based on provided source(s) as noted, such as manufacturer's catalogue prices and may not reflect the wholesale prices, quantity or cash discounts, prices for used equipment or any other factors which may alter the cost estimates. The RUC shares this information with CMS without making specific recommendations on the pricing for supplies and equipment.

CPT 2008 New and Revised Codes

Enclosed are two binders of RUC recommendations for new and revised codes. The total number of coding changes for CPT 2008 is 332, including 118 additions, 186 revisions and 28 deletions. Thirty of these new and revised codes are not payable on the RBRVS (eg, laboratory services and vaccines), and accordingly, the RUC does not submit any information on these codes. In addition, seven of these new codes were reviewed by the RUC HCPAC Review Board as these codes describe services provided by non-MD/DO health professionals. Of the remaining 267 new and revised codes, the RUC submits 266 recommendations at this time. The RUC does not submit a recommendation for code 99174 *Ocular photoscreening with interpretation and report, bilateral*, due to a lack of specialty interest in developing recommendations.

The RUC is recommending that eleven codes be carrier priced in 2008. In addition, the RUC recommends interim values for 15 codes. The summary table in the attached binders and in the enclosed CD, specifically identifies the G-, J-, G-J, C-Tube Procedures (49441-49465 and 43760), Femoral Head Fracture (27267-27269) and Computer Navigation (20985-20987) to be re-reviewed at the September 2007 RUC Meeting. I will send any new information related to these services to CMS immediately following the meeting.

Also included in these binders and on the enclosed CD, are physician time data for each of the CPT codes reviewed at the September 2006, February 2007 and April 2007 RUC meetings. The RUC continues to review physician time data to ensure that the most accurate data is utilized in the CMS practice expense methodology.

2005 Five-Year Review Issues

Enclosed in a separate binder are recommendations for nine issues identified for review in the most previous Five-Year Review. These issues include:

- Partial Mastectomy (19301)
- Insertion of Heart Pacemaker (33207)
- Anoscopy and Proctosigmoidoscopy (45300, 45303, 45305, 45307, 45308, 45309, 45315, 45317, 45320, 45321, 45327, 46600, 46604, 46606, 46608, 46610, 46611, 46612, 46614, 46615)
- Eye Exams (92002-92014)
- Audiology and Speech-Language Pathology Services (92557, 92567, 92568, 92569, 92579, 92601, 92602, 92603, 92604)
- Doppler Color Flow (93325)
- Nursing Facility Care (99304-99318)
- Domiciliary Care (99326-99328, 99334-99337)
- Home Care (99343-99345, 99347-99350)

Also included with these recommendations are physician time data for each of the Five-Year Review issues discussed.

CMS Requested Review of Practice Expense Inputs

Enclosed are direct practice expense refinement recommendations for eight issues as requested by CMS and reviewed at the February and April 2007 meetings of the RUC.

The issues include:

- Transcatheter Placement of Intravascular Stent(s) (37205, 37206, 75960)
- OB/GYN Procedures – Supply Pack (All OB/GYN Procedures)
- Gynecologic Oncology (All GYN/ONC Procedures)
- Computer Aided Detection (CAD) Breast Mammography (77051, 77052)
- Dual-Energy X-Ray Absorptiometry (77080-77082)
- Proton Beam Treatment Delivery (77520-77525)
- Remote Afterloading High Intensity Brachytherapy (77781-77784)
- Cardiac Catheterization (93501-93572)

Other RUC Recommendations

As CMS develops the Proposed Rule for the 2008 Physician Payment Schedule, I ask that you consider several pending RUC recommendations.

Anesthesia Recommendations
CMS requested a RUC review of anesthesia services in the *Final Rule* published in the December 1, 2006 *Federal Register*. CMS stated that, "Although anesthesia services are paid under the Physician Fee Schedule, they are paid on the basis of an anesthesia code-specific base unit and time units that vary based on the anesthesia time of the case. Since anesthesia services do not have a work values per codes as do other medical services, a work value must be imputed for each anesthesia code. As a result of its relationship with the RUC and the past recommendations for valuing anesthesia services, which were discussed in detail in the June 29, 2006 Proposed Notice, the American Society of Anesthesiologists (ASA) requested that we address the valuation of anesthesia services reported under CPT code 00100 through 01999. The ASA furnished an analysis that builds on the methodology used in the last 5 Year Review for the valuation of work for anesthesia services. We recommend that the valuation of anesthesia services, namely the proposed valuation of the post-induction time, be referred to the AMA RUC for review and consideration."

To address this request the RUC formed the Anesthesia Workgroup which reviewed this issue at length during two conference calls and three face-to-face meetings. Based on the extensive review of all the building block components and validation of Post-Induction

Period Procedure Anesthesia (PIPPA) work by surgeons on the Workgroup familiar with anesthesia services associated with their specialty, the Workgroup reached unanimous agreement that the revised model predicts anesthesia undervaluation. **The RUC recommends to CMS that Anesthesia work is undervalued by 32%.**

The RUC also identified three anesthesia services that may be misvalued based on this analysis and recommend that CMS allow review of the base units for at an upcoming RUC meeting:

00142 ***Anesthesia for procedures on eye; lens surgery****
00210 ***Anesthesia for intracranial procedures; not otherwise specified****
00562 ***Anesthesia for procedures on heart, pericardial sac, and great vessels of chest; with pump oxygenator****

**Assumed to be overvalued, base unit too high or incorrect quintile assumption in the second Five-Year Review valuation.*

Supporting documents including the specific recommendations made by the Anesthesia Workgroup, the anesthesia quintile intensity retrofit calculations, the anesthesia regression versus quintile comparison, and the final anesthesia services calculations using the building block methodology as approved by the RUC, are enclosed in the Other RUC Recommendations Binder.

Budget Neutrality – Work Adjuster
The Omnibus Budget Reconciliation Act of 1989 requires that increases or decreases in relative value units (RVUs) for a year may not cause the amount of expenditures for the year to differ by more than $20 million from what expenditures would have been in the absence of these changes. To limit the increases in Medicare expenditures as mandated by the statute, CMS has applied a new "work adjuster" to ensure budget neutrality following the implementation of the improved work RVUs from the most recent Five-Year Review of the RBRVS. **The RUC argues that applying budget neutrality to the work RVUs to offset the improvements in E/M and other services is a step backward and strongly urges CMS to apply the necessary adjustments to the conversion factor.**

From 1998 to present, CMS has implemented all work neutrality adjustments by adjusting the Medicare conversion factor. CMS did not explain why it altered this long utilized method and moved backward to an approach that the agency itself remarked was inappropriate. The RUC requests that CMS consider the history and these additional arguments and apply budget neutrality to the conversion factor:

1.) Adjusting the conversion factor does not affect the relativity of services reflected in the recommended RVUs. Adjusting the RVUs has the potential to inappropriately affect relativity and dampen the improvements to the E/M services valuation. CMS has publicly lauded the RUC for recommending these increases to E/M and we would surmise that the agency would want to achieve the full benefit of these improvements.

2.) An adjustment in the Medicare conversion factor is preferable because it has less impact on other payers who use the Medicare RVUs. That is, an adjustment in the Medicare conversion factor will not necessarily affect the payment rates of other payers who use the Medicare RVUs and their own conversion factors. However, any adjustment in the RVUs will impact the payment rates of such payers. The payment rates of payers who peg their rates to a percentage of Medicare will be affected regardless. The RUC believes that CMS must consider such "ripple effects" as it decides how to adjust for work neutrality.

3.) The RUC believes an adjustment to the conversion factor recognizes that budget neutrality is mandated for monetary reasons. Thus, the conversion factor, as the monetary multiplier in the Medicare payment formula, is the most appropriate place to adjust for budget neutrality

4.) Applying the work neutrality adjustment to the conversion factor would coincide with CMS' current mission of making Medicare payment transparent.

Equipment Assumptions – Equipment Utilization Data
CMS currently utilizes an interest rate of 11% in pricing medical equipment. CMS has acknowledged that this rate is too high and requested comments regarding the appropriate interest rate. The RUC also discussed and agreed that the interest rate currently utilized is too high. The RUC agreed that the interest rate should fluctuate according to market conditions, rather than a fixed rate. The cost of capital is a legitimate expense of a physician's office and should be linked to prevailing rates. **CMS should adjust the 11% cost of capital rate to a market competitive rate.**

Equipment Assumptions – Cost of Capital Assumptions
CMS requested information on how it should reflect the utilization rate, particularly for high cost equipment. Currently, CMS uses a 50% utilization rate for all equipment. The RUC has discussed whether there should be a different rate for all equipment or just for the equipment set by specific cost thresholds. The RUC indicated that the cost of capital may not have a direct linear relationship with equipment utilization. Further, the RUC discussed whether consideration should be given to impacts on rural payment, as utilization rates may not be as high as in urban areas. The RUC recommends that the existing CMS standard of 50% utilization rate for all equipment is not an accurate measure. **CMS should consider using a higher rate for all equipment, providing an opportunity to specialty societies to provide data to support lower utilization rates, if appropriate, based on clinical or geographic considerations.**

Practice Expense Inputs - Supplies
The Practice Expense Subcommittee and the RUC in an effort to continually refine the RUC's process of developing practice expense recommendations agreed that some

mechanism should be in place to distinguish high priced disposables medical supplies, from the practice expense methodology so that the inequities of the scaling factors do not cause as many anomalies in the practice expense specialty pools and in practice expense relative values. The RUC recommends:

CMS set a specific reasonable threshold for the creation of J codes on high priced disposable medical supplies, and that an impact analysis be performed to find out how individual specialty's and practice expense pools would be affected. In addition, medical supplies used in the practice expense methodology, priced at or above $200, should be re-priced on an annual basis.

Members of the subcommittee believed that an initial reasonable threshold could be $250.00.

Professional Liability Insurance
In 1999, and consistently since 2004, the RUC has urged CMS to address a significant problem in the PLI RVU determinations for services with a technical component and professional component. The current CMS methodology generates a higher PLI relative value for the technical component portion than the professional component. One particularly poignant example of this inverse relationship is found in 77057, *Screening mammography, bilateral (2-view film study of each breast)* For this service, carrying a considerable amount of risk in screening for cancer, the PLI RVU for the professional component is .03, while the technical component is .07. The professional component PLI RVU includes the interpretation of results and the most significant amount of liability, but is valued less than half of the technical component PLI RVU, which accounts for only the risk posed by the equipment and the imaging process.

In the Final Rule for the 2005 Physician Payment Schedule, CMS responded to the continuing RUC comments as follows:

> *Physician work RVUs are used to adjust for risk of service. Because technical component services do not have physician work RVUs, they are still valued using charge-based RVUs instead of the resource-based malpractice RVU methodology. We look forward working with the ACR and the other interested specialty organizations to examine alternative methodologies that would allow technical component services to also reflect resource-based malpractice RVUs.*

At a minimum, CMS should appropriately reallocate PLI RVUs within the physician fee schedule by accepting the RUC interim recommendation to establish the technical component PLI RVU to be equivalent to the professional component PLI RVU for each

CPT code. **A more appropriate strategy would develop a methodology to ensure that the technical component PLI RVUs reflect resource-based professional liability costs.**

CMS Definition of Pre-time
The RUC requests that CMS consider a modification to the definition of physician pre-service time to be consistent with the pre-service definition utilized for the practice expense methodology. The current CMS definition of pre-service time for physicians is as follows:

Pre-service period
The pre-service period includes physician services provided from the day before the operative procedure until the time of the operative procedure and may include the following:

- *Hospital admission work-up.*
- *The pre-operative evaluation may include the procedural work-up, review of records, communicating with other professionals, patient and family, and obtaining consent.*
- *Other pre-operative work may include dressing, scrubbing, and waiting before the operative procedure, preparing patient and needed equipment for the operative procedure, positioning the patient and other "non-skin-to-skin" work in the OR.*

The following services are ***not included****:*

- *Consultation or evaluation at which the decision to provide the procedure was made (reported with modifier -57).*
- *Distinct evaluation and management services provided in addition to the procedure (reported with modifier -25).*
- *Mandated services (reported with modifier -32).*

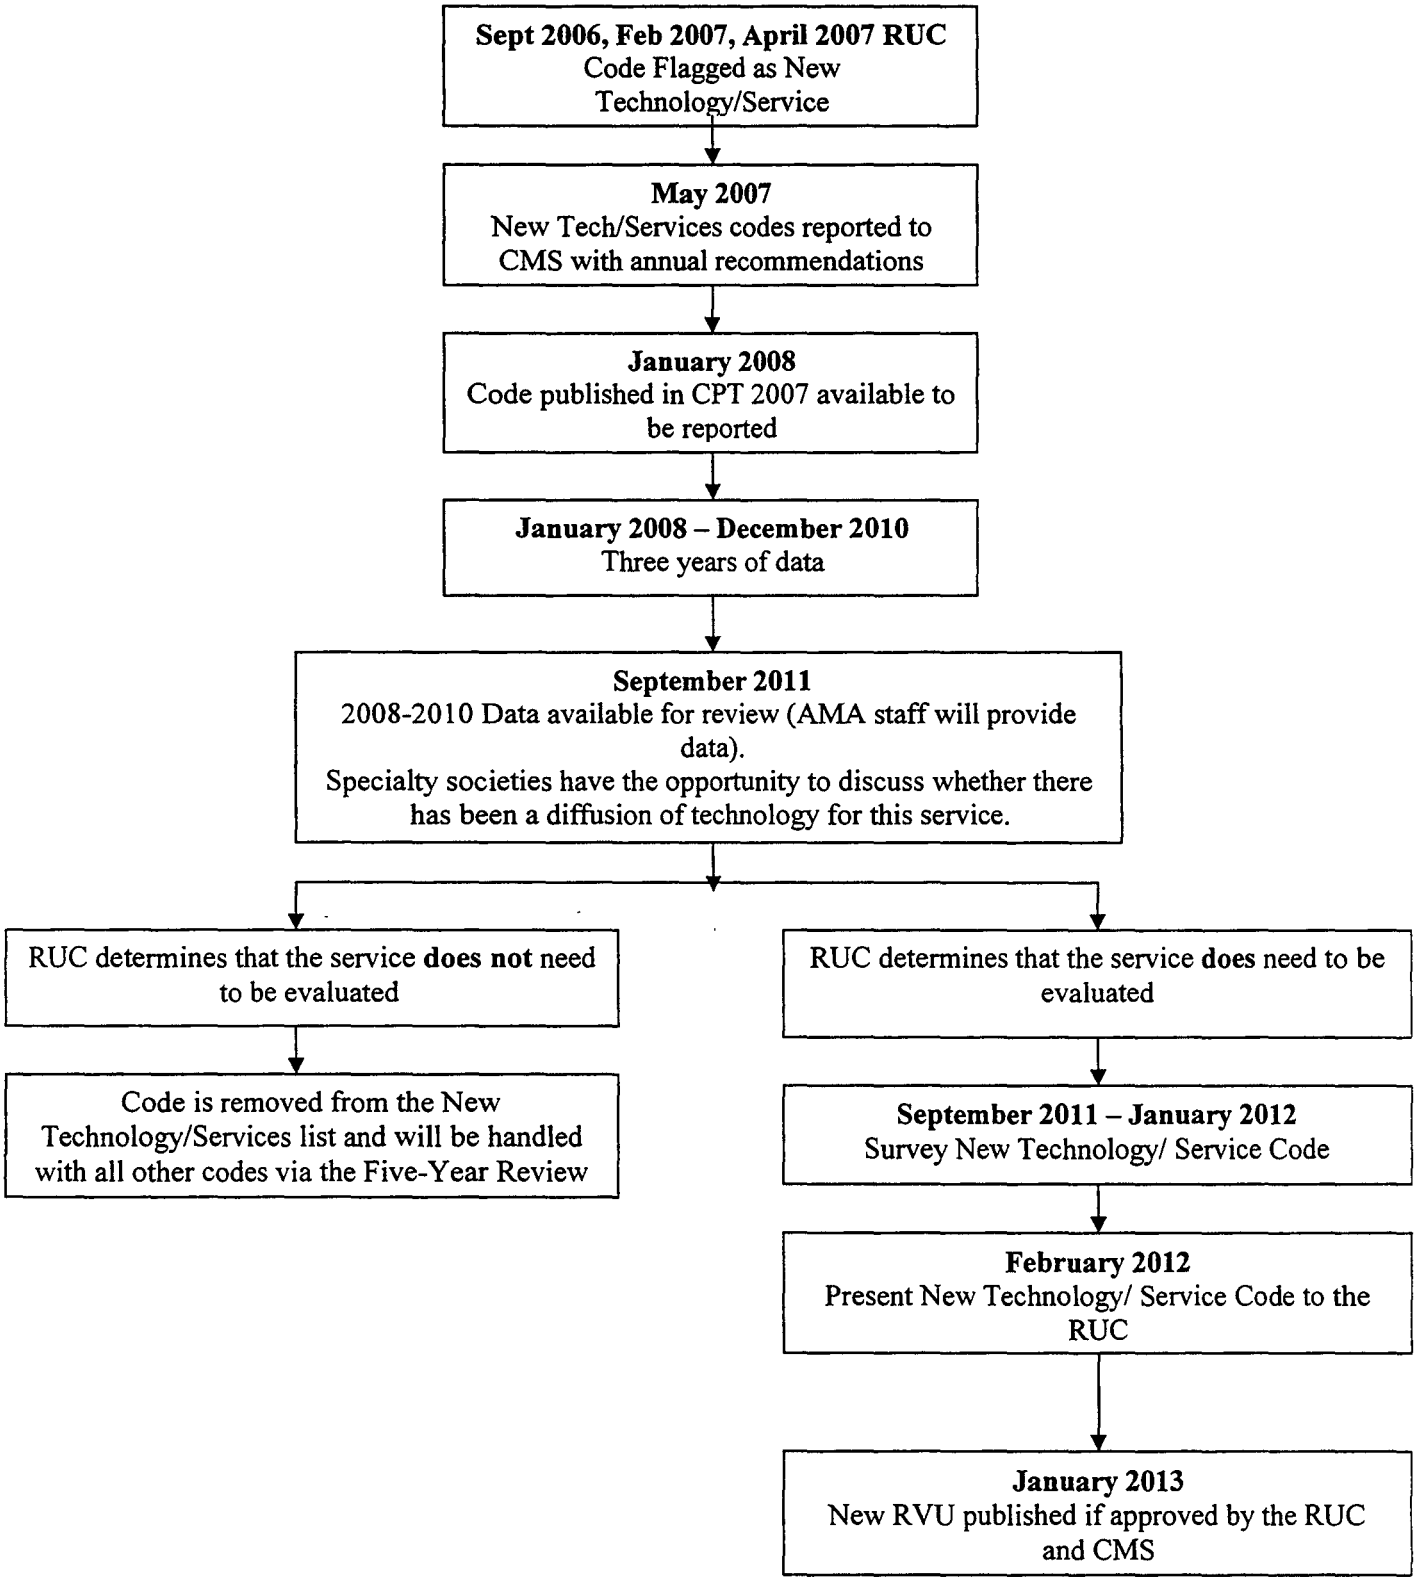
The RUC recommends that the physician pre-service period instead begin when the decision for surgery is made. Physicians may engage in many of these pre-service activities (eg, review of records, communicating with other professionals, etc) prior to the day before the operative procedure.

Five Year Review Identification Workgroup and New Technology/Services Identification/Review Process

Based on previous MedPAC discussions and recommendations to Congress, CMS led initiatives to identify misvalued services, and its own mission to ensure correct valuation of all codes, the RUC concurred that there should be a process to identify such codes.

This workgroup initially convened in October 2006 and February 2007. Through this process, the RUC has begun to identify services incorporating new technology, which are likely to change in value, for subsequent review in order to minimize future misvaluation. The RUC is also developing other objective measures to identify misvalued services.

At its April 2006 meeting, the RUC adopted a process to identify and review codes that represent new technology or services that have the potential to change in value. First, a code is identified as a new technology/service at the RUC meeting in which it is initially reviewed. Second, the code is identified as a new technology/service in the next version of the RUC database with the date it is to be re-reviewed. Third, the code will be reviewed according to this schedule (depending on what meeting in the CPT/RUC cycle it is initially reviewed) after at least three years of data are available. A flow chart providing a detailed description of this process is below. The RUC has already identified 78 of these procedures through its new and revised process. A table of these codes identified as new technology/services has been attached.



We appreciate your consideration of the RUC's recommendations. You may contact Sherry Smith at the AMA with any questions regarding this submission

Sincerely,

William L. Rich, III, MD, FACS

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

April 2007

Anesthesia for Radiologic Spine Procedures

The CPT Editorial Panel created two new codes and deleted one existing code to clearly differentiate between anesthesia care for diagnostic and therapeutic radiological procedures on the spine.

The RUC reviewed the survey data for CPT code 01935 *Anesthesia for percutaneous image guided procedures on the spine and spinal cord; diagnostic.* The RUC agreed with the specialty that CPT code 01992 *Anesthesia for diagnostic or therapeutic nerve blocks and injections (when block or injection is performed by a different provider); prone position* (Base Unit=5.00) was an excellent reference for this code. Although the intra-service time of the surveyed code was higher than the reference code, 55 minutes and 30 minutes respectively, the intensity/complexity measures for these two procedures demonstrate that these two procedures require very similar intensity and complexity to perform. Therefore, the RUC agreed with the specialty society that the base unit for this procedure should be valued at 5.00 base units, the 25th percentile and median of the survey. **The RUC recommends 5.00 Base Units for 01935.**

The RUC reviewed the survey data for CPT code 01936 *Anesthesia for percutaneous image guided procedures on the spine and spinal cord; therapeutic.* The RUC noted that the reference code 00630 *Anesthesia for procedures in lumbar region; not otherwise specified* (Base Unit=8.00) had significantly more total service time associated with it compared to the surveyed code, 196 minutes and 115 minutes respectively. Conversely, the surveyed code demonstrated slightly higher intensity and complexity measures compared to the reference code. However, because this code is subject to work neutrality policy, the specialty society recommended the 5.00 Base Units for this procedure, which is the 25th percentile of their survey data. The RUC agreed with this rationale for valuation. **The RUC recommends 5.00 Base Units for 01936.**

Practice Expense:
The RUC recommends the anesthesiology practice expense standard of 8 minutes of clinical labor time consisting of 3 minutes of anesthesia scheduling and 5 minutes of case assignment, scheduling coordination and completion of forms in the facility setting.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
●01935	P1	Anesthesia for percutaneous image guided procedures on the spine and spinal cord; diagnostic	XXX	5.00
●01936	P2	therapeutic	XXX	5.00
D 01905		~~Anesthesia for myelography, discography, vertebroplasty~~ (01905 has been deleted. To report, see 01935 or 01936)	XXX	N/A

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
ANESTHESIA SUMMARY OF RECOMMENDATION

CPT Code:01935 Tracking Number: P1Specialty Society Recommended Base Unit Value: **5**
Global Period:XXX RUC Recommended Base Unit Value: **5**

CPT Descriptor: Anesthesia for percutaneous image guided procedures on the spine and spinal cord; diagnostic

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 68 year-old man with an anxiety disorder, chronic pain requiring opioids for control, and severe back and radicular pain secondary to possible herniated discs or arthritis presents for discography of the L3/L4, L4/L5 and L5/S1 disks in the prone position. A previous attempt at discography under moderate sedation was abandoned due to the patient suffering a panic attack during the procedure.

Percentage of Survey Respondents who found Vignette to be Typical: 96.00%

Description of Pre-Service Work:
Obtain a careful medical history, systems review and a physical examination, with emphasis on the cardiopulmonary system and assessment of the airway in anticipation of managing the airway in a patient in the prone position. Note current medication and allergies with special attention to cardiovascular and pain medications, particularly opioids since there can be significant opioid tolerance and dependence in patients on long term opioid therapy.

Counsel the patient regarding anesthesia, including analgesic medications, anesthetic agents, monitoring, the possibility of endotracheal intubation, and possible complications

Prepare anesthesia equipment and drugs.

Review the record and any interim data, reassess the patient and obtain informed consent for anesthesia (including discussion of anesthesia risks)

Description of Intra-Service Work:
Confirm informed consent, start a peripheral intravenous catheter, administer an anxiolytic, and accompany the patient to the radiology suite.

Attach routine monitors (ECG, Pulse Oximetry, NIBP, end-tidal CO2) on the patient, assist in positioning the patient in the prone position on the operating/procedure table, and apply a nasal cannula or face mask to provide supplemental oxygen during the sedation and procedure.

Once the patient is properly positioned for surgery and all areas of concern are addressed, there is final confirmation of patient identification, surgical procedure and antibiotic administration before the procedure begins.

Administer sedation agents to provide comfort and anxiolysis while still maintaining spontaneous ventilation and hemodynamic stability. At points during the procedure the patient must be able to describe whether or not his typical pain is recreated during discography. This requires that the anesthesiologist carefully titrate sedation and analgesia to allow the patient to awaken quickly to a cogent but analgesic state. Analgesia is often a challenge in these patients as they often have opioid tolerance and may have tried to reduce their medications prior to surgery in an attempt to reveal their pain syndrome more effectively.

At the end of the procedure, the anesthesiologist assists in turning the patient supine and transferring him to the post anesthetic care unit where he will be cared for by the recovery room nursing staff until discharge.

Description of Post-Service Work:
Order appropriate analgesia/antiemetic as needed for post procedure discomfort.

Dispose of anesthesia equipment and drugs consistent with JCAHO standards.

Make a postoperative evaluation in the post anesthesia care unit to determine satisfactory recovery from anesthetic care and determine if any anesthetic related complications have occurred.

Discharge patient from the unit.

Make a post-PACU visit to inquire about any adverse sequelae.

SPECIALTY SOCIETY RECOMMENDED DATA

Check here ☒ if the specialty society recommended data is the same as survey data (Median Base Unit Value and Time). Do not tab through the following table - **proceed to the new technology/service box.**

However, if your society's recommendation is different than following table.

CPT Code: 01935	
	Specialty Recommended
Base Unit Value:	
Pre-Anesthesia Time:	
Intra-op Anesthesia Time:	
Post-Anesthesia Time:	

New Technology/Service:

Is this new/revised procedure considered to be a new technology or service? No

KEY REFERENCE SERVICE:

Key CPT Code	Global	Base Unit Value	Time Source
01992	XXX	5	RUC Time

CPT Descriptor Anesthesia for diagnostic or therapeutic nerve blocks and injections (when block or injection is performed by a different provider); prone position

KEY MPC COMPARISON CODES:

Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Most Recent Medicare Utilization	Base Unit Value	Time Source
CPT Descriptor 1				
MPC CPT Code 2	Global	Most Recent Medicare Utilization	Base Unit Value	Time Source
CPT Descriptor 2				

Other Reference CPT Code	Global	Base Unit Value	Time Source
00630	XXX	8	CMS Time File

CPT Descriptor Anesthesia for procedures in lumbar region; not otherwise specified

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 10

TIME ESTIMATES (Median)	New/Revised CPT Code: 01935	Key Reference CPT Code: 01992	Time Source: RUC Time
Median Pre-Service Time	20.00	15.00	
Median Intra-Service Time	55.00	30.00	
Median Post-service Time	15.00	10.00	
Median Total Time	**90.00**	**55.00**	
		Calculate total reference time tab here	

INTENSITY/COMPLEXITY MEASURES (Mean)

Mental Effort and Judgement (Mean)

The number of possible diagnosis and/or the number of management options that must be considered	2.80	2.80
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	3.00	3.00
Urgency of medical decision making	3.20	3.10

Technical Skill/Physical Effort (Mean)

Technical skill required	3.20	3.20
Physical effort required	3.20	3.20

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	3.40	3.30
Outcome depends on the skill and judgement of physician	3.30	3.30
Estimated risk of malpractice suit with poor outcome	3.50	3.40

INTENSITY/COMPLEXITY MEASURES	CPT Code	Reference Service 1
Time Segments (Mean)		
Pre-Anesthesia intensity/complexity	2.90	2.80
Intra-Op Anesthesia intensity/complexity	3.30	3.10
Post-Anesthesia intensity/complexity	2.90	2.80

ADDITIONAL RATIONALE

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*
We agreed with our respondents' choice of 01992 as a reference code. Code 01992 has a base unit value of 5 which is the survey's 25th and median values. The intensity/complexity rankings between the code under review and the reference service were remarkable similar. This validates our recommended base unit value.

This code, along with 01936 – Anesthesia for percutaneous image guided procedures on the spine and spinal cord; therapeutic – was previously reported with code 01905 – Anesthesia for myelography, discography, vertebroplasty. Code 01905, which carried a base unit value of 5, has been deleted and replaced with this pair of codes because the anesthesia work involved differs depending on the type of spine procedure being performed and also on the typical patient undergoing the specific procedure. The base value assigned to 01905 is an accurate reflection of the work, skill, intensity and complexity associated with anesthesia for percutaneous imaged guide procedures that are diagnostic in nature.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this new/revised code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this new/revised code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 01905

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Anesthesia	How often? Sometimes
Specialty	How often?
Specialty	How often?

Estimate the number of times this service might be provided nationally in a one-year period? 25000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate.

Specialty Anesthesia	Frequency 25000	Percentage	100%
Specialty	Frequency	Percentage	
Specialty	Frequency	Percentage	

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 7500 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty.
Please explain the rationale for this estimate.

Specialty Anesthesia	Frequency 7500	Percentage	100.00%
Specialty	Frequency	Percentage	
Specialty	Frequency	Percentage	

Do many physicians perform this service across the United States? Yes

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
ANESTHESIA SUMMARY OF RECOMMENDATION

CPT Code:01936 Tracking Number: P2Specialty Society Recommended Base Unit Value: **5**
Global Period:XXX RUC Recommended Base Unit Value: **5**

CPT Descriptor: Anesthesia for percutaneous image guided procedures on the spine and spinal cord; theraeputic

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 75 year-old woman presents with severe, presistent back pain and progressive spinal deformity, secondary to osteoporotic vertebral collapse. Radiographic imaging including MRI confirms the recent compression fracture at L3. A bone biopsy and percutaneous vertebral augmentation with fracture reduction using a mechanical device to create a cavity is planned.

Percentage of Survey Respondents who found Vignette to be Typical: 89.00%

Description of Pre-Service Work:
Obtain a thorough medical history.

Perform physical examination with special attention to the patient's co-morbidities, medications and allergies. The physical exam concentrates on cardiac and pulmonary status, especially as it pertains to the potential pulmonary effects due to kyphoscoliosis that can occur in these patients. Range of motion testing is important in this group as there may be quite restricted movement of the neck, upper and lower extremities and the airway due the severity of their arthritis and associated ankylosis of the spine.

Review the pertinent laboratory data, along with ECG, chest radiograph and other tests that may be significant in this patient population.

Discuss the anesthesia care including anxiolysis, analgesia, general anesthesia, intubation and prone positioning with the patient and family.

Prepare anesthesia equipment and drugs.

Review and assess the record and any interim data.

Obtain informed consent for anesthetic management of the patient (including discussion of anesthesia risks).

Description of Intra-Service Work:
Start a peripheral intravenous catheter, administer an anxiolytic, and accompany the patient to the radiology suite. In the radiology suite, the patient usually receives a small amount of sedation during placement of standard monitors (ECG, Pulse Oximetry, NIBP, end-tidal CO2).

Place a mask over the patient's nose and mouth and administer 100% oxygen prior to induction of general anesthesia.

Infuse an intravenous anesthetic agent (propofol, etomidate, or Pentothal) to induce general anesthesia.

Once the patient is anesthetized and controlled ventilation is established, administer a muscle relaxant (rocuronium, vecuronium, succinylcholine) to facilitate placement of the endotracheal tube.

Once confirmation of the endotracheal tube is established by end-tidal CO2 and auscultation of the chest and abdomen,
secure the endotracheal tube,
position an oral temperature probe, and
administer oxygen and inhalational anesthetic agents as necessary to achieve an adequate depth of anesthesia.

When the patient is ready from an anesthetic point of view (hemodynamically stable, adequately ventilated via a secure airway), direct positioning the patient in the prone position. Placing patients in the prone position under general anesthesia always requires special attention to body alignment and appropriate relief/padding of pressure points (elbows, knees, face, eyes, shoulders, neck); however this patient population is an additional risk due to their usual limitation of range of motion caused by osteoporosis and arthritis. A warm air blanket is positioned over the patient avoiding the surgical field to maintain normothermia.

Once the patient is properly positioned for surgery and all areas of concern are addressed, there is final confirmation of patient identification, surgical procedure, and antibiotic administration before the procedure begins.

Closely monitor the patient throughout the procedure (ECG, oximetry, NIBP, temperature) with additional attention regarding the potential hazards associated with the prone position (inadvertent loss of endotracheal tube, potential ventilation difficulties). This group of older patients tends toward hemodynamic instability due to co-morbidities, associated dehydration and longstanding hypertension.

At the end of the procedure,
turn off the anesthetic agents,
reverse the neuromuscular relaxants, and
administer appropriate analgesia to facilitate emergence.

The patient is turned to the supine position and emergence proceeds while the anesthesiologist carefully and repeatedly assesses vital signs, level of consciousness, ventilatory effort, end-tidal CO2, return of muscle strength, and oxygenation status.

Once the patient has adequately satisfied the requirements for extubation, remove the endotracheal tube and continue to assess the airway for adequacy of ventilation, and administer additional oxygen through a face mask or nasal cannula.

Transfer the patient to the PACU for further recovery and give report to PACU nurse.

Description of Post-Service Work:
Write appropriate orders for analgesia and antiemetis to ensure patient comfort and safety.

Dispose of anesthesia equipment and drugs consistent with JCAHO standards.

Make a postoperative evaluation in the post anesthesia care unit to determine satisfactory recovery from anesthetic care and determine if any anesthetic related complications have occurred.

Discharge the patient from the unit.

Make a post-PACU visit to inquire about any adverse sequelae.

SURVEY DATA

ADDITIONAL RATIONALE

Describe the process by which your specialty society reached your final recommendation. *If your society has us IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Recommendations for the appropriate formula and format.*
We agree with our respondents that the base unit value for 01936 should be less than the value assigned to the reference service of 00630 (8 base units). We acknowledge that our respondents' complexity/intensity measures are slightly higher for 01936 than 00630 but none the less, we are recommending 6 base units for code 01936; a value that falls between the 25th and median survey values.

This code, along with 01935 – Anesthesia for percutaneous image guided procedures on the spine and spinal cord; diagnostic – was previously reported with code 01905 – Anesthesia for myelography, discography, vertebroplasty. Code 01905, which carried a base unit value of 5, has been deleted and replaced with this pair of codes because the anesthesia work involved differs depending on the type of spine procedure being performed and also on the typical patient undergoing the specific procedure.

With the recent approval of new codes for therapeutic percutaneous procedures on the spine, such as vertebral augmentation, anesthesiologists are seeing a new group of patients for new procedures. The procedures are more painful and typically require general anesthesia. The patients tend to be elderly and more complex medically.

There is a higher level of intensity involved in anesthesia for the therapeutic procedures because we anticipate that both the anesthesia and the procedure cause hemodynamic instability in these patients. That is not the case in the anesthesia for diagnostic procedures as will be reported with code 01935. Specifically, in the cases in which artificial cement is injected under fairly high pressure (eg, vertebroplasty, vertebral augmentation) it is imperative to maintain high venous pressure to avoid embolic events. In particular, the patients tend to have cardiopulmonary fragility to the extent that the hemodynamic changes engendered by these techniques require significant work by the anesthesiologist to maintain hemodynamic homeostasis.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this new/revised code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this new/revised code is reported with multiple coc Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 01905

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Anesthesia	How often? Sometimes
Specialty	How often?
Specialty	How often?

Estimate the number of times this service might be provided nationally in a one-year period? 20000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate.

Specialty Anesthesia	Frequency 20000	Percentage	100
Specialty	Frequency	Percentage	
Specialty	Frequency	Percentage	

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 10000 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty.
Please explain the rationale for this estimate.

Specialty Anesthesia	Frequency 10000	Percentage	10000.00%
Specialty	Frequency	Percentage	
Specialty	Frequency	Percentage	

Do many physicians perform this service across the United States? Yes

Sample Size:_____ Response Rate: (%):_____ Global Period:_____

Geographic Practice Setting %: Rural____ Suburban_____ Urban_____

Type of Practice %: _____Solo Practice
_____Single Specialty Group
_____Multispecialty Group
_____Medical School Faculty Practice Plan

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

We are requesting the standard anesthesia PE package as approved by the PERC/RUC in April 2006

CMS requested the PERC discuss the appropriateness of direct practice expense of clinical labor employed by the physician as a cost in the facility setting. The PERC carefully discussed the recommendation by the American Society of Anesthesiology of 11 minutes and agreed that this was a direct practice expense however 8 minutes of clinical labor time was more appropriate. The PERC recommends 8 minutes of clinical labor time for all anesthesia codes consisting of 3 minutes of anesthesia scheduling and 5 minutes of case assignment, scheduling coordination, and completion of forms.

Please describe the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

3 minutes - anesthesia scheduling

5 minutes - case assignment, scheduling coordination and completion of forms

Intra-Service Clinical Labor Activities:
N/A

Post-Service Clinical Labor Activities:

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

April 2007

Soft Tissue Brachytherapy Implant Placement

In February 2007, the CPT Editorial Panel created a new Category I code to provide more specificity in describing the surgical placement of brachytherapy needles or catheters. The new code describes the placement of brachytherapy needles and/or catheters into muscle and/or soft tissue.

The RUC reviewed the specialty society's survey of 47 radiation oncologists for code 20555 *Placement of needles or catheters into muscle and/or soft tissue for subsequent interstitial radioelement application (at the time of or subsequent to the procedure)* and agreed that those surveyed had overestimated the pre-service evaluation and positioning time associated in comparison to similar services. The RUC determined that code 20555 is similar in physician work, time and intensity to 19298 *Placement of radiotherapy afterloading brachytherapy catheters (multiple tube and button type) into the breast for interstitial radioelement application following (at the time of or subsequent to) partial mastectomy, includes imaging guidance* (work RVU = 6.00), which is the same value as the lowest work RVU response from the specialty's survey. The RUC also agreed that the physician time pre-service evaluation time should be similar to that of code 19298.

The RUC recommends the physician work relative value of 6.00 for code 20555. (with a pre-service evaluation time of 30 minutes, positioning of 5 minutes,15 minutes for scrub, dress, and wait, intra-service time of 70 minutes, and an immediate post service time of 30 minutes.)

Practice Expense

The RUC recommends no direct practice expense inputs in the non-facility setting for this facility only service. A practice expense spreadsheet is attached with recommendations for clinical labor staff time associated with typical facility service.

CPT Code (•New)	Tracking Number	CPT Code Descriptor	Global Period	Work RVU Recommendation
●20555	Q1	Placement of needles or catheters into muscle and/or soft tissue for subsequent interstitial radioelement application (at the time of or subsequent to the procedure)	000	6.00

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:20555 Tracking Number Q1 Specialty Society Recommended RVU: **8.00**
Global Period: 000 RUC Recommended RVU: **6.00**

CPT Descriptor: Placement of needles or catheters into muscle and/or soft tissue for subsequent interstitial radioelement application (at the time of or subsequent to the procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 40-year old man presents with a painful mass in the anterior thigh. MRI confirms a 12 cm infiltrative mass in the anterior compartment of the thigh. Incisional biopsy shows a high grade liposarcoma. Following wide surgical resection of the mass, catheters are implanted throughout and surrounding the tumor bed for subsequent afterloading brachytherapy.

Percentage of Survey Respondents who found Vignette to be Typical: 98%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 41%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: Review initial exams, radiation and chemotherapy records including related toxicities and current labs. Obtain consent and educate patient and family about procedure. Review preoperative imaging and plan catheter placement. Discuss implant volume, placement and spacing with the brachytherapy team. Select, assemble, and ᶜ necessary order requisite brachytherapy catheters and supplies. Dress, scrub and wait. The anatomic extent of the ɹmor is outlined on the patient's skin and the margins for brachytherapy implantation discussed with the orthopedic surgical oncologist. The patient is positioned and prepped The gross tumor is resected by the surgeon and the wound left open for the brachytherapy catheter placement.

Description of Intra-Service Work: Clips are placed to mark the 3-dimensional relationships of the tumor margins. An implant is designed accounting for directionality and wound closure and appropriate implant catheters are selected.

Entrance and exit sites are outlined on the skin surface with a sterile marking pen. Needles are introduced through a transcutaneous needle stick. The leader portion of the catheter is inserted into the needle and exited within the wound. The needle and catheter are pulled into the wound and the needle is removed. The catheter has a button on the end to fix it to the skin and prevent it from pulling through the skin at the entrance site. A series of Jackson-Pratt (JP) drainages are inserted perpendicular to the direction of the implant catheters to create a scaffolding. The leader portion of the catheters is threaded through the drain wholes in the JP drainages in series. Another skin stick is then performed to create an exit site, the catheter is inserted and the needle is removed. The catheter is fixed into position by an additional color-coded fixing buttons.

The catheters are inserted one at a time until a total of 30 implant catheters have been placed. As each catheter is placed the relationship of one catheter to the next and the relationship of the implant to the target volume is assessed. During the course of the implant procedure the wound margins are approximated to ensure that wound closure will not become problematic. The entrance and exit fixing buttons are brought down snug but not tight to the skin. The wound is closed by the surgeon. Excess leader and catheter ends are cut and discarded. The stiffening leader within the catheters is removed with wire strippers. The radiation oncologist designs and places a dressing so that the catheters are not ɯaged.

Description of Post-Service Work: The radiation oncologist then diagrams the implant in the patient's medical record; dictates the procedure report and write orders. The patient is examined, paying close attention to catheter wounds. The physician then communicates with physics/dosimetry staff regarding subsequent radioelement application and answers all patient and family questions. Coordinates post operative imaging.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Almost fifty physician work surveys were completed by our membership for this new CPT code. The data from those surveys were collected, reviewed and analyzed by a consensus panel, consisting of members of ASTRO's Health Policy nd Code Development and Valuation Committee, as well as brachytherapy experts in the field of radiation oncology. he group reviewed the surveyed data and feels that the data supports a recommendation to accept the 25th percentile RVU value of 8.00.

The panel reviewed the data for this new CPT code, along with the reference service code and the two other new CPT codes for similar procedures, being presented at this RUC meeting. The panel has reviewed the family of these codes and feels that following is an appropriate rank order:

Surveyed Code:	41019	IWPUT 0.09723
Reference Service Code:	55876	IWPUT 0.09482
Surveyed Code:	55920	IWPUT 0.09167
Surveyed Code: *(this survey)*	**20555**	**IWPUT 0.083**

The panel feels the procedure described by this new CPT code is less intense then the work described in the reference service code and the other two new procedure codes.

The panel also recommends that the median surveyed are appropriate for this procedure (*one exception) and therefore should be entered into the RUC database: 30 minutes day preceding, 15 minutes of pre-service evaluation time, 15 minutes for pre-service positioning, 70 minutes of intra-service time, and 30 minutes of immediate post-service time. The society recommends 15 minutes for pre-service scrub, dress and wait be entered into the RUC database, instead of the median of 17.5.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed)
CPT code 20999; Unlisted procedure, musculoskeletal system, general.

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Radiation Oncology How often? Sometimes

Specialty Orthopedic Surgery How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 400
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This type of procedure will most likely be done infrequently, and will almost always be done by a radiation oncologist. There may be occasional instances when it will be performed by a surgeon and therefore we have indicated that below.

Specialty Radiation Oncology Frequency 360 Percentage 90.00 %

Specialty Orthopedic Surgery Frequency 40 Percentage 10.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 300
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. It is estimated that approximately 2/3 of the total number of times this service us provided annually (400 as indicated above) will be performed on patients in the Medicare program. Again, the procedure will most likely be performed by a radiation oncologist, however, an orthapedic surgeron may perform this procedure.

Specialty Radiation Oncology Frequency 270 Percentage 90.00 %

Specialty Orthopedic Surgery Frequency 30 Percentage 10.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? No

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? No

If no, please select another crosswalk and provide a brief rationale. 19298

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

000 Day Global Period
Facility Direct Inputs

CPT Long Descriptor: Placement of needles or catheters into muscle and/or soft tissue for subsequent interstitial radioelement application (at the time of or subsequent to the procedure)

Sample Size: N/A **Response Rate: (%):** N/A **Global Period:** 000

EXPERT PANEL USED TO DEVELOP RECOMMENDATION

Geographic Practice Setting %: **All geographic practice settings represented.**

Type of Practice %: **All practice types represented.**

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The American Society of Therapeutic Radiology and Oncology (ASTRO) prepared these practice expense reccommendations using a consensus panel of physicians comprised of members from ASTRO's Health Policy Committee, Code Development and Valuation Committee (CDVC), as well as those physicians that perform brachytherapy implant placement procedures. The consensus panel included physician representatives from states in various regions of the United States and all demographic areas.
The consensus panel members held several conference calls to evaluate the non-physician clinical labor times, medical supplies, and equipment, based upon the panel members' experience with the procedure under consideration. Preliminary recommendations for direct inputs were drafted and distributed for discussion by the panel during these conference calls, which led to the final formulated practice expense recommendations for CPT® code 20555; *Placement of needles or catheters into muscle and/or soft tissue for subsequent interstitial radioelement application (at the time of or subsequent to the procedure)*. Although ASTRO was also scheduled to make non-facility practice expense recommendations for this procedure, we felt that it was appropriate to only make recommendations for the facility setting at this time.

Please describe the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

Schedule procedure, confirm all applicable supplies and devices are available.

Retrieve and compile all relevant clinical information, including all preoperative imaging studies, and patient's medical record for review by the physician. Verify orders, and confirm procedure protocol with physician.

Contact patient on the day before the procedure to provide educational information regarding the procedure and provide them with any additional information they may request. Obtain informed consent and confirm adherence to pre procedure protocol.

Intra-Service Clinical Labor Activities:

N/A

Post-Service Clinical Labor Activities:

Initiate phone calls for physician and call in prescriptions as applicable.

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

April 2007

Application of Cranial Tongs

In October 2006, the CPT Editorial Panel CPT Modifier Workgroup recommended 20660 *Application of cranial tongs, caliper, or stereotactic frame, including removal (separate procedure)* be removed from the modifier -51 exempt list. The Workgroup asked specialty societies to review the list and bring back any code they felt should be retained on the list. At the February 2007 CPT meeting the specialty societies asked to retain 20660 on the -51 Modifier exempt list. The CPT Modifier Workgroup forwarded 20660 to the RUC. Code 20660 had never been surveyed nor discussed at the RUC previously. The RUC understood that it was tasked with considering whether 20660 should be retained on the modifier -51 exempt list. If so, then support for this position is needed and the RUC must develop a work RVU recommendation consistent with the modifier -51 exempt payment policy. If not, then the RUC should determine whether there is compelling evidence for revaluation of 20660.

FROM THE CPT MANUAL: "Modifier -51: Multiple Procedures: When multiple procedures, other than E/M services, are performed at the same session by the same provider, the primary procedure or service listed may be reported as listed. The additional procedure(s) or service(s) may be identified by appending modifier -51 to the additional procedure or service code(s). Note: This modifier should not be appended to designated "add-on" codes."

The RUC heard a full description of the service and the history of its value. The specialty societies and the RUC understood that the service did have significant time in the pre-service and post service periods which disqualifies 20660 from the -51 Modifier exempt list (according to the CPT's criteria for inclusion on the list).

FROM CPT: MODIFIER -51 EXEMPTION – INCLUSION/EXCLUSION CRITERIA
"#3 Minimal Amount of Pre-and Post-Service Time Relative to Intra-Service Time and Minimal Number of Visits. As these procedures are usually performed with other procedures, there should be a minimal amount of pre-and post-service time relative to the procedure's intra-service time and there should be a minimal number of post-operative visits associated with the valuations of the procedures on this list."

Based on the above criteria, the RUC concurs with the CPT Editorial Panel that 20660 be removed from the Modifier -51 Exempt List.

The RUC considered whether there is compelling evidence for re-valuation of 20660. The specialty society explained that when 20660 is performed as part of a surgical procedure to stabilize the neck, that it is bundled with that surgical code. The RUC understood that it was considering the service described by 20660 only when it is done as a stand-alone code. The RUC noted that it is often performed with an E/M service. The RUC agreed that removal from the -51 exempt modifier list was an adequate reason for re-valuation.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The RUC reviewed the specialties' survey results in order to value the service. Code 20660 was originally valued by Harvard and recommended to CMS as a 090 day global service in 1992 with a work RVU of 3.81. In 1993, CMS dropped the value to 2.57 and changed the service to a 000 day global, and placed 20660 on the -51 Modifier Exempt list.

The RUC agreed that survey respondents mis-classified some intra-service time for 20660. Specifically, physician work of positioning the patient was classified by survey respondents as pre-service. The RUC and specialties agreed that due to the critical nature of injury in these patients (unstable cervical fracture), the physician's intra- work begins when he personally stabilizes the neck while transferring the patient to the traction bed. All participants agreed to reallocate 15 minutes of pre-service positioning time to the intra-service period, and eliminate 10 minutes of pre-service evaluation time. All changes of physician time are shown in the table below and were used in the following crosswalks.

Physician Time	Pre-Eval	Pre-Positioning	Pre-Scrub, Dress, Wait	Intra-Service	Immediate Post	Total Physician Time
Original Rec	20	0	15	47	19	101
RUC Rec	**20**	**0**	**10**	**30**	**30**	**90**

The RUC compared the service to MPC listed code 19103 *Biopsy of breast; percutaneous, automated vacuum assisted or rotating biopsy device, using imaging guidance* (work RVU = 3.69, 000 global). CPT Code 20660 and 19103 have the same amount of intra-service time, 30 minutes although CPT code 20660 requires a higher intensity to complete. Based on the specialties' survey results, an enhanced understanding of the service resulting in a reallocation of physician time, and comparisons of similar services across specialties, the RUC believed the specialty societies survey median of 4.00 work RVUs was appropriate. **The RUC recommends a relative work value of 4.00 RVUs for code 20660.**

Practice Expense

After further discussion with the specialty societies, it became clear that 20660 is not performed in the non-facility setting. **The RUC recommends no practice expense inputs in the facility and non-facility settings.**

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
▲20660	DD1	Application of cranial tongs, caliper, or stereotactic frame, including removal (separate procedure)	000	4.00

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:20660 Tracking Number DD1 Specialty Society Recommended RVU: **2.51**
Global Period: 000 RUC Recommended RVU: **4.00**

CPT Descriptor: Application of cranial tongs, caliper, or stereotactic frame, including removal (separate procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: An 18 year old male in automobile crash presents to the emergency department with neck pain and upper extremity weakness. Radiographs demonstrate a cervical spine fracture, focal kyphosis and subluxation of adjacent cervical vertebrae. Cranial tongs are applied for emergent cervical spine protection and stabilization while planning additional work-up and imaging studies.

Percentage of Survey Respondents who found Vignette to be Typical: 70%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 61%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: The physician reviews spinal imaging studies, the past medical history and appropriate lab studies. Informed consent with the patient and family are obtained. The patient is examined neurologically just prior to placement of cranial tongs. Subsequently, the work of pre-op shave, prep, scrub and equipment setup including bed attachments of pulley system and the rope, weights, hooks, and tongs is performed. The height and angle of the pulley system are established to obtain the ideal vector of traction for the particular fracture type.

Description of Intra-Service Work: The skin above the ear on both sides of the head is injected with a local anesthetic. The cranial tongs are positioned and betadine ointment is placed on the pin tips. The pins are then serially d gradually advanced through the skin bilaterally until they are firmly situated in the outer table of the cranium. Often, additional local anesthetic is added as the pins penetrate deeper. The pressure indicator is examined to insure that the pins are not advanced too far. Slight manual traction is applied in ensure secure positioning in the skull's outer table.

Description of Post-Service Work: The tongs are connected by a cord over a pulley to a set of weights that provide traction. Post-operative x-rays are reviewed to insure that the dislocation is reduced and/or there is not any over distraction of the unstable level. The patient is stabilized and closely observed with neurological reexamination for any post-traction neurological deterioration. An operative report is dictated. The surgeon communicates with the family and referring physician (including written and telephone reports and orders). Several days later, after surgical internal stabilization of the spine, the tongs are removed.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

In the Harvard submission to CMS in March 1992 (preliminary phase 3D data), code 20660 was studied as a 090-day obal code. Intraservice work on the Harvard scale was 230 and pre/post work on the Harvard scale was 230 equal to a .otal Harvard work value of 460. The 1992 MFS valued this code at less than total work (1992 RVW=3.81, instead of 4.64) with a 090-day global period. In 1993, the MFS RVW for this code was reduced to 2.57, the global period was changed to 000, and one hospital visit and 3 office visits from the Harvard study were removed from the database. The value of 2.57 is approximately equal to the Harvard intra work of 230, scaled to the MFS, which indicates a 50% reduction was applied to the new value in 1993 when the global period was changed. CMS multiple procedure rule = "0" (ie, does not apply) confirms the 50% reduction is already in place for this code. Additionally, note that the full descriptor for this code reads: Application of cranial tongs, caliper, or stereotactic frame, including removal (separate procedure). The pre and post time for this code are clinically separate from evaluation and management services and are related specifically to the work of this procedure alone and not redundant for any additional procedures that may be performed. Therefore CMS accepted this code as -51 modifier exempt.

We believe that the value for this code at 2.51 may be understated, given the intensity and complexity of the patients that require this procedure, typically performed for a cervical fracture/dislocation. However, we understand that the undervaluation as demonstrated by the survey is a five year review issue and therefore we are recommending that the current value and -51 modifier exempt status remain unchanged. We believe our survey data not only validate this recommendation, but support identification of this code as misvalued such that it should be reconsidered at the next five year review.

Our panel reviewing the survey was surprised by the survey result that showed 61% of the time conscious sedation was used and they wondered if the surveyees thought that local anesthetic qualified as conscious sedation. Our panel does not believe that conscious sedation is typically used with this code.

ERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
☐ Multiple codes are used to maintain consistency with similar codes.
☐ Historical precedents.
☒ Other reason (please explain) A separately identifiable evaluation and management service may be performed to identify the type of injury that would require placement of axial cervical traction using cranial tongs.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. An evaluation and management code (typically 99253-99255) would be reported with either the -25 or -57 modifier on the same day of service.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 20660

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Neurosurgery How often? Sometimes

Specialty Orthopaedic Surgery How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 10000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. The Medicare frequency for this code is 3,261. Many of the patients who undergo this procedure are automobile accident victims and are younger than the Medicare age population. We would estimate that the Medicare population is about one third of the total national number.

Specialty Orthopaedics Frequency 3000 Percentage 30.00 %

Specialty Neurosurgery Frequency 6000 Percentage 60.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 3,261 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty.
Please explain the rationale for this estimate. This is the 2005 frequency from the RUC database

Specialty Orthopaedics Frequency 1000 Percentage 30.66 %

Specialty Neurosurgery Frequency 2000 Percentage 61.33 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

April 2007

External Fixation

At the February 2007 CPT Editorial Panel meeting, the Panel accepted the request to establish two codes: 20695 *Stereotactic computer-assisted adjustment of multi-planar dynamic external fixation system (eg, spatial frame), including imaging; initial alignment, assessment and computation of adjustment schedule(s)*and 20696 *Stereotactic computer-assisted adjustment of multi-planar dynamic external fixation system (eg, spatial frame), including imaging; exchange of each strut* to report stereotactic, computer-assisted adjustment of multiplanar dynamic external fixation systems. In consideration of this request at the April 2007 RUC meeting, it was recommended, at the request of the specialties, that the codes be rescinded. This action would allow the specialties the opportunity to revise the descriptors to more accurately describe the service specifically to clarify that the computerized schedule is distinct from the application of the fixation device. The CPT Executive Committee reviewed this request made by the specialty society and the RUC and agreed that these codes should be rescinded. **The CPT Executive Committee rescinds CPT codes 20695 and 20696.**

45

In October 2006, the CPT Editorial Panel CPT Modifier Workgroup recommended 20690 *Application of a uniplane (pins or wires in one plane), unilateral, external fixation system* and 20692 *Application of a multiplane (pins or wires in more than one plane), unilateral, external fixation system (eg, Ilizarov, Monticelli type)* be removed from the Modifier -51 Exempt List. The Workgroup asked specialty societies to review the list and bring back any code they believed should be retained on the list. At the February 2007 CPT meeting, the specialty societies asked to retain 20690 and 20692 on the -51 Modifier exempt list. The CPT Modifier Workgroup forwarded 20690 and 20962 to the RUC. The RUC understands that it is tasked with considering whether 20690 and 20692 should be retained on the modifier -51 exempt list. If so, then support for this position is needed and the RUC must develop a work RVU recommendation consistent with the modifier -51 exempt payment policy. If not, then the RUC should determine whether there is compelling evidence for revaluation of 20690 and 20692.

FROM THE CPT MANUAL: "Modifier -51: Multiple Procedures: When multiple procedures, other than E/M services, are performed at the same session by the same provider, the primary procedure or service listed may be reported as listed. The additional procedure(s) or service(s) may be identified by appending modifier -51 to the additional procedure or service code(s). Note: This modifier should not be appended to designated "add-on" codes."

The RUC heard a full description of these services and the history of their value. The specialty societies and the RUC understood that both of these services have significant time in the pre-service and post service periods which would disqualify 20690 and 20692 from the -51 Modifier exempt list (according to the CPT's criteria for inclusion on the list).

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

FROM CPT: MODIFIER -51 EXEMPTION – INCLUSION/EXCLUSION CRITERIA
"#3 Minimal Amount of Pre-and Post-Service Time Relative to Intra-Service Time and Minimal Number of Visits. As these procedures are usually performed with other procedures, there should be a minimal amount of pre-and post-service time relative to the procedure's intra-service time and there should be a minimal number of post-operative visits associated with the valuations of the procedures on this list."

As both of these procedures have significant pre-service and post-service times associated with them, the RUC agreed with the specialty society that these codes should be valued as stand alone procedures and should be removed from the Modifier -51 Exempt List. **The RUC concurs with the CPT Editorial Panel that 20690 and 20692 be removed from the Modifier -51 Exempt List.**

As the RUC works under the presumption that all services on the physician fee-schedule are correctly valued, the specialty society provided compelling evidence to support its recommendation of 8.65 RVUs for 20690 and 16.00 RVUs for 20692, which is an increase over the existing value of 20690 and 20692, 3.67 and 6.40 RVUs respectively. The specialty society explained that the codes had never been reviewed by the RUC as 090 day global procedure.

In the Harvard submission to CMS in March 1992 , code 20690 was studied as a 090-day global. However CMS shose not to use the Harvard data and the 1992 MFS published RVW was 3.71 with a ZZZ global period. From 1992 to 1999 (interim), the global period was ZZZ. From 1999 to present, the global period is 090. No explanation was provided in any Federal Register text about this change. A similar history exists for CPT code 20692. In the Harvard submission to CMS in March 1992, code 20692 was studied as a 090-day global code The 1992 MFS published RVW was 6.76 with a ZZZ-day global period. Additional sources confirm a ZZZ global period through 1998. From 1999 to present, the global period is 090. No explanation was provided in any Federal Register text about this change.

Given this history, it is clear that the current values and time information are not related to a code with a 90-day global period. Additionally, it is clear that these codes have never been properly reviewed by the RUC. The RUC reviewed this compelling evidence and agreed with the specialty that there is evidence that incorrect assumptions were made in the previous valuation of the service.

The RUC reviewed the specialty societies' survey results for 20690 *Application of a uniplane (pins or wires in one plane), unilateral, external fixation system* and thoroughly discussed the physician time and work associated with this service in comparison to its reference code 24566 *Percutaneous skeletal fixation of humeral epicondylar fracture, medial or lateral, with manipulation* (Work RVU=8.86). The specialty society modified the pre-service time associated with the surveyed code to better reflect the pre-service time evaluation associated with this procedure. The RUC compared the service times of both procedures and noted that the intra-service time for the reference code is the same as the surveyed code, 60 minutes. Additionally, the RUC noted that when comparing the intensity/complexity measures of the surveyed code to the reference code that the reference code requires more overall intensity to perform than the surveyed code. Therefore, the RUC agreed that because of the same amount of intra-service time and the greater overall intensity associated with the reference code in comparison to the surveyed code, the RUC recommends the

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

25th percentile of the survey data, 8.65 RVUs for 20690. The RUC believes that this value appropriately places the surveyed code in comparison to the reference code. **The RUC recommends 8.65 work RVUs for 20690.**

The RUC reviewed the specialty societies' survey results for 20692 *Application of a multiplane (pins or wires in more than one plane), unilateral, external fixation system (eg, Ilizarov, Monticelli type)* and thoroughly discussed the physician time and work associated with this service in comparison to its reference code 27447 *Arthroplasty, knee, condyle and plateau; medial AND lateral compartments with or without patella resurfacing (total knee arthroplasty)* (Work RVU=23.04). The specialty societies modified the post-operative visits associated with the surveyed code to better reflect the post-operative care associated with this procedure. After considerable review, the specialty societies offered another reference code as they believed the reference code selected by the survey respondents was not appropriate. The specialty societies proposed CPT code 20664 *Application of halo, including removal, cranial, 6 or more pins placed, for thin skull osteology (eg, pediatric patients, hydrocephalus, osteogenesis imperfecta), requiring general anesthesia* (Work RVU=9.86). The specialty society stated that 20692 had significantly more total time associated with it in comparison to the proposed reference code, 474 minutes and 405 minutes, respectively. Further, the specialty societies agreed that 20692 was a significantly more complex procedure to perform than 20664. Therefore, the RUC agreed that because the surveyed code has significantly more total service time associated with it and the greater overall intensity associated with the surveyed code in comparison to the proposed reference code, the RUC recommends the 25th percentile of the survey data, 16.00 RVUs for 20692. The RUC believes that this value appropriately places the surveyed code in comparison to the reference code. **The RUC recommends 16.00 work RVUs for 20692.**

47

Practice Expense:
The RUC reviewed the specialty societies recommended practice expense inputs for 20690 and 20692. The RUC noted that the specialty societies recommended the standard 090 day global practice expense input packages for these procedures. However, the specialty recommended and the RUC agreed that the pre-service time for 20690 performed in the facility be removed as this procedure is typically emergent. The revised practice expense recommendation are attached.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommenda-tion
20690	R1	Application of a uniplane (pins or wires in one plane), unilateral, external fixation system	090	8.65
20692	R2	Application of a multiplane (pins or wires in more than one plane), unilateral, external fixation system (eg, Ilizarov, Monticelli type)	090	16.00

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:20690 Tracking Number R1 Specialty Society Recommended RVU: **8.65**
Global Period: 090 RUC Recommended RVU: **8.65**

CPT Descriptor: Application of a uniplane (pins or wires in one plane), unilateral, external fixation system

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: An 18-year-old male sustains a comminuted fracture of his proximal right tibia and fibula in a motorcycle crash requiring external fixation. Application of a uniplanar, half-pin external fixator is planned spanning the knee and fracture, extending from the femur to the tibia.

Percentage of Survey Respondents who found Vignette to be Typical: 94%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work:
- Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
  Verify that all required instruments and supplies are available
- Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulation drapes
- Assess position of the extremities and head, adjust as needed
- The patient's leg is placed properly on the table and positioned with proper bolstering to aid surgical exposure.
- Indicate areas of skin to be prepped and mark pin sites
- The leg is prepped and draped.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work:
The procedure contemplates that the fracture has already been reduced by other means. A spanning fixator will be placed from the femoral shaft down to the tibial shaft across the fracture site. A minimum of two pins sites are selected on the femur and at least two on the tibia. The pins are placed so as to minimize danger to neurovascular structures and impalement of musculotendinous units. After the pin sites are selected, the following procedures are performed for each pin site:A 1.5 cm incision is made in the skin over each intended insertion site on at a time. A tonsilar hemostat is used to spread the soft tissues down to the level of the bone. A trochar is passed down to the level of the bone to protect soft tissues. A drill is passed through the trochar down to the bone and used to drill through both cortices of the bone. The drill is with drawn and a threaded fixator pin is drilled into the bone across both cortices. Stability of the pin is tested by manual stressing it. After the pins are inserted, they are connected to a bar construct which spans from the femur to tibia using rod-pin connectors. The set screws are provisionally tightened. Reduction of the fracture and alignment are checked by radiographs. The set screws are fully tightened. Skin tracts are released where there is tension on the skin

escription of Post-Service Work: Post-service work: in facility
- Sterile dressings are applied.
- Monitor patient stabilization in the recovery room.
- Consultation with the family and patient regarding the surgery and postoperative regimen.
- Communication with health care professionals including written and oral reports and orders.

- Postoperative care is coordinated with recovery room nursing staff.
- The patient's vital signs are checked.
- The circulation, sensation and motor function of the extremity are assessed.
- The patient is discharged to the orthopaedic floor for monitoring of compartment syndrome.

Discharge day:

- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Physical therapy for the uses of crutches or walker is ordered
- Write prescriptions for medications needed post-discharge.
- Dictation of an operative report
- Procedure note is written in the patient chart
- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Order and review periodic films
- Assess circulation, sensation and motor function of the extremity
- Order occupational therapy
- Supervision of rehabilitation
- Monitor physical therapy
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions
- Dictate progress notes for medical record

Post-Service intensity/complexity	3.14	2.83

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

CPT codes 20690 and 20692 have been discussed at (at least) the last two CPT Panel meetings. Two issues have brought these codes to the RUC for review: 1) the codes have been taken off of the -51 modifier exempt list; and 2) the codes have never been reviewed as 90-day globals and were part of a review of ORIF codes. Below is a history of database information for each code:

History 20690:

In the Harvard submission to CMS in March 1992 (preliminary phase 3D data), code 20690 was studied as a 090-day global code with a vignette of "Application of external fixation system (eg, Hoffman)". The recorded times were 32/80/20 (pre/intra/post), 2 hospital, and 4 office visits. Total Harvard time was 206 minutes and total Harvard work was 481 (or 4.90 scaled to the MFS).

The 1992 MFS published RVW was 3.71 with a ZZZ global period. [From Harvard, this code had a final "pack" or global designation of "sss" which denotes a secondary code (usually billed in addition to another service).]

In 1999, the Harvard times (noted above) were discarded and a predicted total time of 99 minutes was implemented for practice expense purposes.

From 1992 to 1999(interim), the global period was ZZZ. In 1998, the RVW was 3.52.

Additional sources confirm a ZZZ global period through 1998. In 1997, the CPEP(3) data list zero for post-op visits. Also, in 1997, Dan Dunn's file submission to CMS regarding increases in the payment for global services due to the increase in EM services after the first 5YR, listed this code as having a ZZZ global period.

From 1999(final) to present, the global period is 090. In 2007, the RVW is 3.67. No explanation was provided in any Fed Reg text about this change.

History 20692:

In the Harvard submission to CMS in March 1992 (preliminary phase 3D data), code 20692 was studied as a 090-day global code with a vignette of "Applic. of a multiplane, unilat., ext fixation syst". The only recorded time was 114 minutes for intra time and Harvard intra work was presented as 392.

The 1992 MFS published RVW was 6.76 with a ZZZ-day global period. [From Harvard, this code had a final "pack" or global designation of "sss" which denotes a secondary code (usually billed in addition to another service).]

In 1999, the Harvard times (noted above) were discarded and a predicted total time of 159 minutes was calculated for practice expense purposes.

From 1992 to 1999(interim), the global period was ZZZ. In 1998, the RVW was 6.41.

Additional sources confirm a ZZZ global period through 1998. In 1997, the CPEP(3) data list zero for post-op visits. Also, in 1997, Dan Dunn's file submission to CMS regarding increases in the payment for global services due to the increase in EM services after the first 5YR, listed this code as having a ZZZ global period.

From 1999(final) to present, the global period is 090. In 2007, the RVW is 6.40. No explanation was provided in any Fed Reg text about this change.

Given this history, it is clear that the current values and time information are not related to a code with a 90-day global period. Additionally, it is clear that these codes have never been properly reviewed and have values that are based on prediction.

RATIONALE FOR RECOMMENDATION:

In response to the CPT changes and a request by the RUC and CMS, A survey was sent to orthopaedic surgeons representing general orthopaedics, trauma, and foot and ankle surgery. A consensus panel of experts representing orthopaedic subspecialty societies (general orthopaedics, arthroscopy, trauma, shoulder and elbow, hand, hip & knee, foot & ankle, total joint, sports medicine) reviewed the survey data compared with the reference code and other orthopaedic services. The panel agreed that both 20960 and 20962 can be performed as a stand alone code for fixation of a fracture or deformity and therefore should correctly have a global period of 90-days. Further, the panel agreed that the current values for the codes are not based on 90 days of care.

20690: The panel compared 20690 to two equally cited key reference codes 24566 (Percutaneous skeletal fixation o. humeral epicondylar fracture, medial or lateral, with manipulation) and 25606 (Percutaneous skeletal fixation of distal radial fracture or epiphyseal separation). The typical patient requiring 20690 will likely be a trauma victim and will required admission to the hospital, with greater postoperative work compared to the reference codes. The survey median RVW of 11.00 (IWPUT=0.056) is recommended. This value correctly sets 20690 greater than the reference codes, taking into consideration the significant postoperative work for these patients.

20692: The panel compared 20692 to key reference code 27447 (total knee). The intra-service times and hospital visits are similar for both codes, however, 20692 would require significantly more office visits. The survey median RVW of 21.00 (IWPUT=0.069) is recommended. This value correctly sets 20692 less than 27447 because the panel felt that the greater intensity of 27447 outweighed the additional office visits for 20692.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☒ Other reason (please explain) (separate procedure)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 20690

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?
4,100 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty.
Please explain the rationale for this estimate. database

Specialty ortho Frequency 3485 Percentage 85.00 %

Specialty podiatry Frequency 410 Percentage 10.00 %

Specialty others Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:20692 Tracking Number R2 Specialty Society Recommended RVU: **16.00**
Global Period: 090 RUC Recommended RVU: **16.00**

CPT Descriptor: Application of a multiplane (pins or wires in more than one plane), unilateral, external fixation system (eg, Ilizarov, Monticelli type)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 30-year-old male, with an acquired limb length discrepancy and tibial non-union (the result of a prior trauma) is scheduled for reconstructive surgery using a multiplanar, tensioned wire external fixation system designed for deformity correction and controlled mechanical distraction osteogenesis.

Percentage of Survey Respondents who found Vignette to be Typical: 80%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: • Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
- Verify that all required instruments and supplies are available
- Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulation drapes
- Assess position of the extremities and head, adjust as needed
- The patient's leg is placed properly on the table and positioned with proper bolstering to aid surgical exposure.
- Indicate areas of skin to be prepped and mark pin sites
- • The leg is prepped and draped.
- A detailed plan for gradual mechanical correction of the deformity, docking and compression at the non-union site and mainaitainace until complete healing. This is completely detailed for the patient.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work:
The procedure contemplates placing pin clusters above and below the deformed nonunion and connecting the clusters to screw driven actuators which will gradually correct the deformity, compress it for healing and the immobilized it until complete consolidation. A spanning fixator will be placed from the proximal tibia down to the distal tibia across the deformity site. A minimum of two pins sites are selected on proximal tibia and at least two on the distal tibia. The pins are placed so as to minimize danger to neurovascular structures and impalement of musculotendinous units. After the pin sites are selected, the following procedures are performed for each pin site: Pins may be either fine wires which completely pass through the leg and tibia or stouter half-pins which are placed unilaterally. Fine wires are drilled through skin across the bone and out the other side. Half pins are inserted as follows: A 1.5 cm incision is made in the skin over each intended insertion site on at a time. A tonsilar hemostat is used to spread the soft tissues down to the level of the bone. A trochar is passed down to the level of the bone to protect soft tissues. A drill is passed through the troch down to the bone and used to drill through both cortices of the bone. The drill is withdrawn and a threaded fixator pin drilled into the bone across both cortices. Stability of the pin is tested by manual stressing it. After each cluster of pins is inserted, they are connected to a multi-pin connector or ring. Fine wires may need to be tensioned to maintain stiffness of the device. The clusters are then connected by screw-activated struts which will be used to gradually correct and

compress the deformity. The set screws are provisionally tightened. Placement of the device and alignment are checked by radiographs. The set screws are fully tightened. Skin tracts are released where there is tension on the skin

Description of Post-Service Work:
ost-service work: in facility
sterile dressings are applied.

- Monitor patient stabilization in the recovery room.
- Consultation with the family and patient regarding the surgery and postoperative regimen.
- Communication with health care professionals including written and oral reports and orders.
- Postoperative care is coordinated with recovery room nursing staff.
- The patient's vital signs are checked.
- The circulation, sensation and motor function of the extremity are assessed.
- The patient is discharged to the orthopaedic floor for monitoring of compartment syndrome.

Discharge day:

- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Physical therapy for the uses of crutches or walker is ordered
- Write prescriptions for medications needed post-discharge.
- Dictation of an operative report
- Procedure note is written in the patient chart
- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions

Order and review periodic films
Assess circulation, sensation and motor function of the extremity

- Order occupational therapy
- Supervision of rehabilitation
- Monitor physical therapy
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions
- Dictate progress notes for medical record

Post-Service intensity/complexity	4.43	2.70

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

CPT codes 20690 and 20692 have been discussed at (at least) the last two CPT Panel meetings. Two issues have brought these codes to the RUC for review: 1) the codes have been taken off of the -51 modifier exempt list; and 2) the codes have never been reviewed as 90-day globals and were part of a review of ORIF codes. Below is a history of database information for each code:

History 20690:

In the Harvard submission to CMS in March 1992 (preliminary phase 3D data), code 20690 was studied as a 090-day global code with a vignette of "Application of external fixation system (eg, Hoffman)". The recorded times were 32/80/20 (pre/intra/post), 2 hospital, and 4 office visits. Total Harvard time was 206 minutes and total Harvard work was 481 (or 4.90 scaled to the MFS).

The 1992 MFS published RVW was 3.71 with a ZZZ global period. [From Harvard, this code had a final "pack" or global designation of "sss" which denotes a secondary code (usually billed in addition to another service).]

In 1999, the Harvard times (noted above) were discarded and a predicted total time of 99 minutes was implemented for practice expense purposes.

From 1992 to 1999(interim), the global period was ZZZ. In 1998, the RVW was 3.52.

Additional sources confirm a ZZZ global period through 1998. In 1997, the CPEP(3) data list zero for post-op visits. Also, in 1997, Dan Dunn's file submission to CMS regarding increases in the payment for global services due to the increase in EM services after the first 5YR, listed this code as having a ZZZ global period.

From 1999(final) to present, the global period is 090. In 2007, the RVW is 3.67. No explanation was provided in any Fed Reg text about this change.

History 20692:

In the Harvard submission to CMS in March 1992 (preliminary phase 3D data), code 20692 was studied as a 090-day global code with a vignette of "Applic. of a multiplane, unilat., ext fixation syst". The only recorded time was 114 minutes for intra time and Harvard intra work was presented as 392.

The 1992 MFS published RVW was 6.76 with a ZZZ-day global period. [From Harvard, this code had a final "pack" or global designation of "sss" which denotes a secondary code (usually billed in addition to another service).]

In 1999, the Harvard times (noted above) were discarded and a predicted total time of 159 minutes was calculated for practice expense purposes.

From 1992 to 1999(interim), the global period was ZZZ. In 1998, the RVW was 6.41.

Additional sources confirm a ZZZ global period through 1998. In 1997, the CPEP(3) data list zero for post-op visits. Also, in 1997, Dan Dunn's file submission to CMS regarding increases in the payment for global services due to the increase in EM services after the first 5YR, listed this code as having a ZZZ global period.

From 1999(final) to present, the global period is 090. In 2007, the RVW is 6.40. No explanation was provided in any Fed Reg text about this change.

Given this history, it is clear that the current values and time information are not related to a code with a 90-day global period. Additionally, it is clear that these codes have never been properly reviewed and have values that are based on prediction.

RATIONALE FOR RECOMMENDATION:

In response to the CPT changes and a request by the RUC and CMS, A survey was sent to orthopaedic surgeons representing general orthopaedics, trauma, and foot and ankle surgery. A consensus panel of experts representing orthopaedic subspecialty societies (general orthopaedics, arthroscopy, trauma, shoulder and elbow, hand, hip & knee, foot & ankle, total joint, sports medicine) reviewed the survey data compared with the reference code and other orthopaedic services. The panel agreed that both 20960 and 20962 can be performed as a stand alone code for fixation of a fracture or deformity and therefore should correctly have a global period of 90-days. Further, the panel agreed that the current values for the codes are not based on 90 days of care.

20690: The panel compared 20690 to two equally cited key reference codes 24566 (Percutaneous skeletal fixation of humeral epicondylar fracture, medial or lateral, with manipulation) and 25606 (Percutaneous skeletal fixation of distal radial fracture or epiphyseal separation). The typical patient requiring 20690 will likely be a trauma victim and will required admission to the hospital, with greater postoperative work compared to the reference codes. The survey median RVW of 11.00 (IWPUT=0.056) is recommended. This value correctly sets 20690 greater than the reference codes, taking into consideration the significant postoperative work for these patients.

20692: The panel compared 20692 to key reference code 27447 (total knee). The intra-service times and hospital visits are similar for both codes, however, 20692 would require significantly more office visits. The survey median RVW of 21.00 (IWPUT=0.069) is recommended. This value correctly sets 20692 less than 27447 because the panel felt that the greater intensity of 27447 outweighed the additional office visits for 20692.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☒ Other reason (please explain) (separate procedure)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 20692

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

AMA/Specialty Society Update Process
PERC Summary of Recommendation
010 or 090 Day Global Periods
Facility Direct Inputs

CPT Long Descriptor:

20690: Application of a uniplane (pins or wires in one plane), unilateral, external fixation system

20692: Application of a multiplane (pins or wires in more than one plane), unilateral, external fixation system (eg, Ilizarov, Monticelli type)

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

A consensus panel of experts representing orthopaedic subspecialty societies (general orthopaedics, arthroscopy, trauma, shoulder and elbow, hand, hip & knee, foot & ankle, total joint, sports medicine) reviewed the practice expense details for the survey codes relative to other facility-only 90-day global orthopaedic services.

Please describe the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

During the pre-service period, clinical staff conducts the standard pre-service activities: An RN/LPN/MA completes pre-service diagnostic and referral forms, coordinates pre-surgery services, schedules space and equipment in facility, provides pre-service education/obtains consent, and conducts follow-up phone calls.

Intra-Service Clinical Labor Activities:

Standard times for the activities necessary in the office and 100% of physician time were applied.
The standard 12 minutes has been applied for the inpatient procedure for discharge day management services from the facility.

Post-Service Clinical Labor Activities:

The standard times have been applied for post-service clinical labor time.

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

April 2007

Computer Navigation

The CPT Editorial Panel created three new Category I CPT codes in February 2007 to replace three Category III CPT codes used to describe computer assisted navigation for musculoskeletal surgical procedures. Since the establishment of the Category III codes, adequate evidence on the improved results with this technology have been published to warrant the conversion of these codes to Category I codes. The Panel also concluded that an add-on code was necessary to describe this extra effort since the use of this technology requires additional physician work, complexity and time beyond that normally involved in a musculoskeletal procedure.

20985

The RUC considered the specialty society survey results and presentation for CPT code 20985, *Computer assisted surgical navigational procedure for musculoskeletal procedures; image-less*. The RUC reviewed the survey results in comparison to the key reference service code 22522, *Percutaneous vertebroplasty, one vertebral body, unilateral or bilateral injection; each additional thoracic or lumbar vertebral body (List separately in addition to code for primary procedure)*, (work RVU = 4.30, intra-time = 50 minutes). The reference service code has significantly more intra-service time, 50 minutes compared to 20 minutes; however, the surveyed code requires much greater mental effort and judgment as well as technical skill and physical effort. Based on this comparison, the RUC agreed that the 25th percentile of the survey results (work RVU = 2.50), slightly more than half the work RVU of the reference service, was appropriate. The RUC agreed with the specialty society's recommendation of 10 minutes of pre-time, despite the fact that the service will be reported as a ZZZ global period, add-on procedure. Typically, ZZZ codes contain no pre- or post-service time. The presenters noted that 20985 differed from other add-on services with respect to pre-time because of the significant time and effort required to initiate and calibrate computer navigation equipment as well as additional patient positioning time for the computer navigation to be used. However, as an add-on procedure, the RUC disagreed with the specialty society's recommendation to include five minutes of post-service time. The time was considered duplicative of any post-time which would be included in the procedure codes reported with code 20985. The time was revised to pre-service time of 10 minutes, intra-service time of 20 minutes and post-service time of zero minutes for CPT code 20985.

The RUC recommends a work RVU of 2.50 for CPT code 20985.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The RUC recommends no practice expense inputs for this add-on code.

The RUC also noted that the service used for professional liability insurance (PLI) crosswalk for CPT code 20985 (CPT code 22522) has a work RVU of nearly twice its recommended work RVU. As such, the RUC recommended a more appropriate PLI reference service, 22103, *Partial excision of posterior vertebral component (eg, spinous process, lamina or facet) for intrinsic bony lesion, single vertebral segment; each additional segment (List separately in addition to code for primary procedure)*, (work RVU = 2.34).

20986

The RUC considered the specialty society survey results and recommendations for CPT code 20986, *Computer assisted surgical navigational procedure for musculoskeletal procedures; image-less; with image-guidance based on intra-operatively obtained images (eg fluoroscopy, ultrasound)*. Because of the low response rate (n = 21) and the service performance rate (median = 0), the RUC concluded that the survey results were unreliable and could not make an appropriate recommendation of physician work based on these data. As such, the RUC agreed that the service should be interim valued as carrier priced and requested that the specialty society re-survey CPT code 20986 for the September 2007 RUC meeting.

70

The RUC recommends that CPT code 20986 be interim valued as carrier priced.

20987

The RUC considered the specialty society survey results and recommendations for CPT code 20987, *Computer assisted surgical navigational procedure for musculoskeletal procedures; image-less; with image-guidance based on pre-operative images (eg, CT, MRI)*. Because of the low response rate (n = 21) and the service performance rate (median = 0), the RUC concluded that the survey results were unreliable and could not make an appropriate recommendation of physician work based on these data. As such, the RUC agreed that the service should be interim valued as carrier priced and requested that the specialty society re-survey CPT code 20987 for the September 2007 RUC meeting.

The RUC recommends that CPT code 20987 be interim valued as carrier priced.

New Technology

Because of the new codes were developed from Category III CPT codes, the low survey response rates, and at the request of the specialty society, **the RUC recommends codes 20985, 20986, and 20987 be added to the New Technology list.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:20985 Tracking Number S1 Specialty Society Recommended RVU: **2.50**
Global Period: ZZZ RUC Recommended RVU: **2.50**

CPT Descriptor: Computer assisted surgical navigational procedure for musculoskeletal procedures; image-less (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 65-year-old woman presents with increasing pain when walking and stair climbing. Examination shows an antalgic gait, bilateral varus knee deformities, painful crepitus of both medial joint lines, and limited knee range of motion. Standing planar radiographs demonstrate complete loss of medial joint space, marginal osteophytes, and wear of the medial subchondral bone. A unilateral knee replacement and deformity correction is planned with image-less computer assisted navigation. [Note: When completing this survey, consider ONLY the additional physician work for this add-on service. The primary procedure(s) would be reported separately.]

Percentage of Survey Respondents who found Vignette to be Typical: 86%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work:
ADDITIONAL Pre-service work

At the time of the initial visit, in addition to the standard discussion of total knee replacement, the surgeon spends additional time discussing the use of computer navigation as an adjunct to the total knee procedure. This involves explaining the rationale for the use of the system, how it helps align the knee and that the surgery may be somewhat longer and more complicated. The explanation describes the use of additional small incisions for placement of the pins through the bone along with the additional risks of wound healing issues at the pin sight and the risk of a fracture through one of the pin holes.

- Prior to the surgical procedure and positioning, the computer navigation unit is brought into the room and following booting up of the computer, the surgeon activates the navigation software and enters patient specific information such as identifiers, surgeon, and side of surgery.
- Setup options for the program are checked and adjusted as necessary
- Once the patient has been positioned on the operating table, the navigation unit is moved into place so the intra-operative trackers will be in the field of view of the cameras and the surgeon will be able to see the computer monitor screen

Description of Intra-Service Work: Pins are placed through the tibia and femur to which clamps are attached to hold the trackers that will be used during the surgical procedure. If these are placed outside the intended surgical wound, they are inserted percutaneously through separate stab wounds and engage to one or both cortices. One or two pins may be used on the tibia and femur. If the pins are placed inside the operative wound, the pins are placed after the surgical exposure. Other systems employ small electromagnetic trackers that are also attached to the femur and tibia.
Once the pins are placed, the navigation trackers are secured to them. The trackers may be passive devices with reflective balls whose position is determined by infra-red light signals sent from the camera system which senses their position. They may also be active devices that emit infra-red light signals that are sensed by a camera system. The initial art of the procedure is to register these trackers with the computer navigation system.
ollowing activation and identification of the trackers, the registration process begins with moving the hip in a circular fashion that allows the computer software to identify the center of the sphere created in space which is also the center of the femoral head. Following surgical exposure, the bony landmarks of the femur and tibia are identified individually by directed digitization with a "pointer" device that also has tracker components on it. The landmarks identified are generally the medial epicondyle, the lateral epicondyle, distal femoral center, axis of the femoral trochlear groove, the

surfaces of the medial and lateral distal and posterior condyles and the topography of the medial and lateral anterior distal femur. The tibia is then registered by digitizing the center of the tibial plateau, the anterior-posterior axis of the tibia and the surfaces of the medial and lateral tibial condyles. The ankle center is found by digitizing the tips of the medial and lateral malleoli and the point between them.

After the anatomy has been registered, an initial assessment is made of the range of motion of the knee with the va displayed on the computer screen. The amount of angular deformity and degree of ligament imbalance are also determined. With this information, some systems then also determine an optimal implant size and position with the bone cuts needed to place it.

In all total knee systems, the instruments are designed to place metal cutting blocks that are used to guide the power saws for the bone cuts. With navigation, these are positioned and pinned into place using navigated guidance while following the position of the block relative to the bone on the computer screen. Once the blocks are placed, the bone cuts are made with a saw in the same manner as it would be for a conventional total knee. However, once the cut is completed, with navigation there is an opportunity to check the accuracy of the cut which may be off due to cutting errors made by the surgeon or deflection of the blade by sclerotic bone. With navigation, each cut can be verified with the opportunity to re-do or adjust the cut. The navigation verification and subsequent correction of the bony cuts involve extra time and work. Either the tibia or femur may be cut first in these systems. Implant sizing and positioning of additional cutting blocks to finish the shaping of the femur is done with navigated guidance followed by the saw cuts as would be done in a standard total knee.

After the bony cuts are made, a trial reduction is performed and the navigation system is used to check the overall mechanical alignment (the general goal is to achieve 0° of varus/valgus). The navigation system can also be used to quantify whether the collateral ligaments are balanced (equal tension on both sides) to determine if soft tissue releases are needed. The navigation system also shows if the procedure has resulted in full range of motion, especially extension to a least 0°, or a straight knee. If these goals are not achieved, the appropriate surgical technique or modification of the implant choices is made using the navigation screen as a guide.

Following the trial reduction and preparation of the bone, the implants are inserted, usually with bone cement for fixation. As the bone cement is curing, navigation can be used to make minor adjustments in alignment and extension to ensure that the alignment and range of motion goals are maintained as the bone cement hardens. Once the implants are fixed, the final alignment, ligament stability and range of motion are recorded with the software system.

At the conclusion of the surgical procedure, the trackers are removed and the pins backed out of the femur and tibia. T wounds are closed.

Description of Post-Service Work: NA

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

A survey was sent to orthopaedic surgeons representing general orthopaedics, trauma, and shoulder & elbow surgery. A consensus panel of experts representing orthopaedic subspecialty societies (general orthopaedics, arthroscopy, trauma, shoulder and elbow, hand, hip & knee, foot & ankle, total joint, sports medicine) reviewed the survey data compared with the reference code and other orthopaedic services. The panel agreed that this add-on service require additional pre-and post-service time (as described above) that is distinctly related to this code and not the primary procedure. The survey 25th percentile RVW of 2.50 is recommended. This value correctly sets this new code relatively less than the reference code.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. add-on most typically to total joint replacement codes

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) deleted codes 0054T-0056T

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

1549 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty.
Please explain the rationale for this estimate. Medicare Database for relevent T Code

Specialty ortho Frequency 1549 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? No

If no, please select another crosswalk and provide a brief rationale. 22103, Partial excision of posterior vertebral component (eg, spinous process, lamina or facet) for intrinsic bony lesion, single vertebral segment; each additional segment (List separately in addition to code for primary procedure) (work RVU = 2.34) because it is comparable in work RVU and specialty.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/Specialty Society Update Process
PERC Summary of Recommendation
ZZZ Day Global Periods
Facility Direct Inputs

CPT Long Descriptor:

20985 Computer assisted surgical navigational procedure for musculoskeletal procedures; image-less (List separately in addition to code for primary procedure)

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

A consensus panel of experts representing orthopaedic subspecialty societies (general orthopaedics, arthroscopy, trauma, shoulder and elbow, hand, hip & knee, foot & ankle, total joint, sports medicine) reviewed the practice expense details for the survey code relative to other facility-only ZZZ global orthopaedic services.

We recommend no clinical labor, supplies, or equipment related to this add-on service.

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

October 2006

Temporomandibular Joint Manipulation

The CPT Editorial Panel created a new code category I CPT code, 21073, *Manipulation of temporomandibular joint (TMJ), therapeutic, requiring general anesthesia*, to report an existing service for complex manipulation of the temporomandibular joint that has not been adequately codified in CPT.

The RUC reviewed the specialty society's survey results for new CPT code 21073 and the use of the key reference service code, 21485, *Closed treatment of temporomandibular joint dislocation; complicated (e.g., recurrent requiring intermaxillary fixation or splinting), initial or subsequent* (work RVU = 3.98, total time = 200). Members of the RUC noted that the reference service list included codes with a range of work RVUs of 2.73 - 46.37. It was agreed that a greater number of lower RVU reference services should have been included. Because of this, the RUC agreed that the survey was positively skewed due to overestimation and subsequent magnitude increases by respondents. The resulting overestimations lead to high pre-service time responses and higher RVU estimations than appropriate. In addition, the RUC noted that the pre-service positioning time is too high for the services being provided. As such, the RUC reduced the pre-service positioning time to 5 minutes, reducing the total pre-service time to 25 minutes. Considering all of the above, the committee believed the 25th percentile survey work RVU (3.80) was appropriate for the service.

Additionally, the RUC discussed the post-operative visits and agreed, due to the typical patient as well as the nature of the service, that four follow-up office visits were appropriate. However, the RUC determined that the intensity of the first post-operative visit was too high and recommended that the 99213 visit be reduced to a 99212. The resulting reduction in RVU is 0.47. In summary, correcting for the 25th percentile value (3.80) and subtracting .47 yields a recommended value of 3.33 RVU. **The RUC recommends a relative work value of 3.33 for code 21073 with a pre-service time of 25 minutes.**

Practice Expense
The RUC approved the standard 090 day global direct practice expense inputs. Additionally, the RUC reviewed and accepted the amended practice expense inputs.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:21073 Tracking Number A1 Specialty Society Recommended RVU: **4.15**
Global Period: 090 RUC Recommended RVU: **3.33**

CPT Descriptor: Manipulation of temporomandibular joint (TMJ), therapeutic requiring general anesthesia
(For TMJ, manipulation without general anesthesia, see 97140, 98925-98929, or 98943)
(Monitored Anesthesia Care (MAC) is considered General Anesthesia)
(For closed treatment of temporomandibular dislocation, see 21480, 21485)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 22-year-old female presents with a long-standing history of clicking and popping of the jaw. For the last 3 months, she has limited opening restricted to 20 mm (normal being 45 mm). She will undergo manipulation of the temporomandibular joint in the office under general anesthesia. (Note: The provision of anesthesia is reported separately).

Percentage of Survey Respondents who found Vignette to be Typical: 91%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical?

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work:
- Imaging studies are carefully reviewed including x-rays (e.g., orthopantomograph), CT scans, and MRIs. Consultation is completed with the referring physician, dentist, ER department and other healthcare professionals
- The family and patient are apprised of the proposed procedure.
- The risks and complications associated with the procedure are discussed with the patient and family.
- Informed consent is obtained.
- The surgeon goes to the operatory and verifies that appropriate equipment and supplies are available
- The patient is brought to the operatory and placed onto the operatory unit/table in the semi-recumbent position.
- The position of the head is checked and adjusted.
- The pre-operative findings (range of motion, direction of motion including deviations or deflections, pain with palpation, etc.) are reconfirmed.
- The surgical assistant and surgeon then scrub and dress
- "Time Out" was called for staff and doctor re-verify patient, procedure and procedure site. -

Description of Intra-Service Work: Anesthetize the temporomandibular joint.
Anesthetize the muscles (masseter, temporalis, medial pterygoid, lateral pterygoid) as necessary.
After applying protective layers of gauze around the thumbs and additional gloves, the surgeon enters the oral cavity. Pressure is applied to the posterior mandible bilaterally, keeping the mandible in the retruded position and gradually distracting the condyle inferiorly. The mandible is then simultaneously moved side to side. The surgeon re-establishes appropriate superior joint space translation and inferior joint space translation with this bi-manual maneuvering, the success of which is evaluated by the range of motion and absence of clicking. This is repeated as needed until the maximum range of motion is achieved which is measured and recorded. Post-procedure palpation exam is performed and the findings are recorded.
The pre-fabricated inter-occlusal stabilization splint is then inserted. The new bite is then marked with marking ribbon intra-orally. Adjustments are made with a handpiece, bur and irrigation extra-orally. This is repeated for each opposing oth until all interferences are eliminated and the occlusion is even and stable across the occlusal arch.

Description of Post-Service Work: -- The patient's active interincisal ROM at conclusion is measured; this is a separate evaluation from the intra-procedure evaluation. A custom homecare physical therapy tool is fabricated from tongue depressors. Detailed home care physical therapy instructions are demonstrated to patient and family.

- Monitoring patient stabilization in the recovery room.
- Consultation with the family and patient regarding the surgery and post-manipulation dietary regimen.
- Communication with health care professionals including written and oral reports and orders.
- The patient's vital signs are checked.
- The motor and sensory function of are evaluated and recorded.
- Postoperative imaging studies (orthopantomograph) are obtained and reviewed by the surgeon.

INTENSITY/COMPLEXITY MEASURES (Mean)

Mental Effort and Judgment (Mean)

The number of possible diagnosis and/or the number of management options that must be considered	2.76	2.46
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	2.94	2.77
Urgency of medical decision making	2.59	2.69

Technical Skill/Physical Effort (Mean)

Technical skill required	3.00	3.08
Physical effort required	2.68	2.77

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	2.24	2.46
Outcome depends on the skill and judgment of physician	3.00	2.92
Estimated risk of malpractice suit with poor outcome	2.71	2.85

INTENSITY/COMPLEXITY MEASURES	CPT Code	Reference Service 1
Time Segments (Mean)		
Pre-Service intensity/complexity	2.88	2.64
Intra-Service intensity/complexity	2.82	2.79
Post-Service intensity/complexity	2.41	2.46

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*
The reference service code 21485 does not have surveyed time, but "relatively" the new code would require more work. The preservice work for 21073 is very similar to 21030 and 21040, therefore we are suggesting a reduction in pre-service time, broken into the components as shown. 21073 would require additional office visits compared with 21030 and 21040 for range of motion and/or relapse monitoring. The median RVW places 21073 correctly, greater than the RVU for the reference code 21485 and less than the RVU for open procedures 21030 and 21040.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 21299 Unlisted craniofacial and maxillofacial procedure

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Oral and Maxillofacial Surgery How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 25000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.

Specialty Oral and Maxillofacial Surgery Frequency 25000 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 300
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty.

Specialty Oral and Maxillofacial Surgery Frequency 300 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

---

Attestation Statement

As a RUC Advisor, I attest that the integrity of the RUC survey and summary of recommendation forms are based on accurate and complete data to the best of my knowledge. As a RUC Advisor, I acknowledge that violations would be addressed by the executive committee (i.e., RUC Chair, AMA Representative and Alternate AMA Representative).

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

A consensus panel of physicians from the AAOMS representing a broad mix of categories of type of practice and geographic areas developed direct practice expense details for this procedure code

Please describe the clinical activities of your staff:

Pre-Service Clinical Labor Activities:
The surgical assistant prepares the room and room equipment, lighting suction and supplies needed for the procedures; identifies, greets and escorts the patient to the procedure room; assembles patient chaperone(s) for doctor to apprise them of planned procedure; assembles pre-procedural imaging studies and records; assists in positioning the patient; records findings of immediate pre-procedural examination; scrubs and dresses; participates in "time-out".

Intra-Service Clinical Labor Activities:
During the procedure the surgical assistant prepares local anesthetic and aspirating syringe assembly; applies pressure to injection sites as needed, provides retraction during the procedure for intra-oral access, and provides continuous suction of saliva from the oral cavity. If the doctor is able to successfully manipulate the temporomandibular joint, the assistant will then apply the appropriate digital protection and manipulates the joints while the doctor palpates both joints during translation and rotation to verify adequate movement. For purposes of the splint adjustment the assistant assembles the drill and burs, provides suction and irrigation while the splint is being adjusted intra-orally and/or extra-orally, assembles and changes occlusal marking tape during the adjustment, and provides final polishing for the splint. The assistant records the findings of the immediate post-procedure exam.

Post-Service Clinical Labor Activities:
The surgical assistant removes the patient records and studies used during the procedure, cleans the room, cleans and sterilizes the drill assembly and burs, disposes of used supplies, completes post-procedure imaging requisitions, evaluates condition of local anesthesia injections sites, escorts the patient's family/chaperone to the recovery area, answers questions regarding instructions for home care physical therapy instructions given by the doctor, instructs family/chaperone in wear, removal and hygiene procedures of splint, establishes follow-up appointment.

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

April 2007

Interstitial Fiducial Marker Placement

The CPT Editorial Panel created three new codes to describe the implantation of fiducial markers, electromagnetic transducers or dosimeters to localize tumors during image-guided radiotherapy in the head or neck, intra-thoracically or intra-abdominally.

The Society of Interventional Radiology (SIR) and American College of Radiology (ACR) surveyed the interstitial fiducial marker placement codes. However, the survey response rates were low, with four to eight respondents per code. SIR indicated that this procedure is rarely performed and does not meet the criteria to be a category I code as being widely performed. The American Society for Therapeutic Radiology and Oncology (ASTRO) representatives indicated that these procedures are performed in conjunction with radiation therapy, particularly SBRT, and the low response rate could likely be attributed the use of a random survey sample that didn't reach the appropriate audience. The RUC was concerned that the CPT coding proposal and RUC testimony on volume were inconsistent. **The RUC agreed that the survey data was not representative and determined that they could not develop work RVU recommendations based on this data. The RUC referred codes 21112, 21520, and 49437 back to CPT. The CPT Executive Committee rescinded these codes for *CPT 2008* and specialty societies will need to submit a new coding proposal to CPT in order to create new Category I CPT codes for interstitial fiducial marker placement.**

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

April 2007

Three Column Osteotomy

In February 2007, the CPT Editorial Panel created three new Category I CPT codes to describe a group of procedures to address osteotomies performed through one column of the spine (the posterior column). Advances in surgical technique, instrumentation and intra-operative hemodynamic management have allowed for osteotomies that go through all three columns to be performed from a posterior approach. Three column osteotomies take significantly more time to perform and are associated with additional risk. Three CPT codes needed to be developed to address more complex deformities and allow greater degrees of correction than single column osteotomies.

22206

103

The RUC reviewed the specialty societies' survey results and presentation for code 22206, *Osteotomy of spine, posterior or posterolateral approach, three columns, one vertebral segment (eg, pedicle/vertebral body subtraction); thoracic.* The randomized survey, completed by 80 neurological surgeons and orthopaedic surgeons representing spine and general orthopaedics, was reviewed by an expert panel to ensure accuracy, validity and relativity of the survey results. The specialties and the RUC agree that the survey's median pre-, intra-, and post-service times as well as the post-operative visits required for this intense procedure were accurate. The RUC also reviewed the key reference service selected by nearly half of the survey respondents, 63101, *Vertebral corpectomy (vertebral body resection), partial or complete, lateral extracavitary approach with decompression of spinal cord and/or nerve root(s) (eg, for tumor or retropulsed bone fragments); thoracic, single segment* (work RVU = 33.92). The RUC noted that the reference service contained significantly less intra-service time than the surveyed code, 215 minutes versus 300 minutes, respectively. In addition to this difference with the reference service, the surveyed code requires significantly more intensity and complexity in technical skill, risk of complications, judgment of the physician, and malpractice risk. Based on the quality of the survey data presented and relativity to the key reference service, the RUC agreed with the specialty societies' recommendation of the survey median RVU of 37.00.

The RUC recommends the survey median work RVU of 37.00 for code 22206.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

22207

The RUC reviewed the specialty societies' survey results and presentation for code 22207, *Osteotomy of spine, posterior or posterolateral approach, three columns, one vertebral segment (eg, pedicle/vertebral body subtraction); lumbar.* The randomized survey, completed by 80 neurological surgeons and orthopaedic surgeons representing spine and general orthopaedics, was reviewed by an expert panel to ensure accuracy, validity and relativity of the survey results. The specialties and the RUC agree that the survey's median pre-, intra-, and post-service times as well as the post-operative visits required for this intense procedure were accurate. The RUC also reviewed the key reference service selected by more than half of the survey respondents, 63087, *Vertebral corpectomy (vertebral body resection), partial or complete, combined thoracolumbar approach with decompression of spinal cord, cauda equina or nerve root(s), lower thoracic or lumbar; single segment* (work RVU = 37.38). The RUC noted that the reference service contained less intra-service time than the surveyed code, 265 minutes versus 300 minutes. Additionally, the surveyed code requires only slightly more mental effort and judgment, technical skill, physical effort, psychological stress, and intensity/complexity per time segment than the reference service. Based on the quality of the survey data presented and relativity to the key reference service, the RUC agreed with the specialty societies' recommendation of the survey median RVU of 36.50.

The RUC recommends the survey median work RVU of 36.50 for code 22207.

104

22208

The RUC reviewed the specialty societies' survey results and presentation for code 22208, *Osteotomy of spine, posterior or posterolateral approach, three columns, one vertebral segment (eg, pedicle/vertebral body subtraction); each additional vertebral segment (List separately in addition to primary procedure).* The RUC also reviewed the key reference service, 22216, *Osteotomy of spine, posterior or posterolateral approach, one vertebral segment; each additional vertebral segment (List separately in addition to primary procedure),* (work RVU = 6.03), in relation to the surveyed code and noted that the reference service required only half of the intra-service time, 60 minutes versus 120 minutes. In addition to the broad difference in time, the surveyed code also requires greater intensity and complexity to perform. The RUC agreed that the median work RVU from the specialty societies' survey, compared to the key reference service, was justified. However, as an add-on service with a global period of ZZZ, the RUC found there to be duplicative work described in the pre-service and intra-service times. The presenters agreed with the RUC regarding pre-time and recommended a reduction in the work RVUs consistent with the duplicative time accounted for in the pre-service period. Using an IWPUT calculation or building block methodology, the RUC backed-out the work RVUs associated with the 15 minutes of pre-service time originally proposed by the specialty and removed the 15 minutes from the service. Multiplying the time by the intensity associated with pre-service time (10 minutes of pre-service evaluation time at 0.0224 and 5 minutes of pre-service positioning time also at 0.0224), resulted in a reduction of 0.34 work RVUs [15 minutes x 0.0224 = 0.34] from the survey median RVU, accounting for a recommended work RVU of 9.66 [10.00

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright bv the American Medical Association.

– 0.34 = 9.66]. The RUC recommends a pre-service time of 0 minutes, intra-service time of 120 minutes, and immediate post-service time of 15 minutes.

The RUC recommends a work RVU of 9.66 for code 22208.

Practice Expense
The RUC recommends the practice expense inputs as amended by the PERC in the facility setting for 22206-22208, removing duplicative clinical staff time in the pre-service period.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
To report arthrodesis... *To report instrumentation procedures...* *To report bone graft...* *For the following codes...* Spinal osteotomy procedures are reported when (a) portion(s) of the vertebral segment(s) is cut and removed in preparation of re-aligning the spine as part of a spinal deformity correction. For excision of an intrinsic lesion of the vertebra without deformity correction, see 22100-22116. For decompression of the spinal cord and/or nerve roots, see 63001-63308. The three columns are defined as: anterior (anterior two-thirds of the vertebral body), middle (posterior third of the vertebral body and the pedicle), and posterior (articular facets, lamina and spinous process)

SUMMARY OF RECOMMENDATION

CPT Code:22206 Tracking Number U1 Specialty Society Recommended RVU: **37.00**
Global Period: 090 RUC Recommended RVU: **37.00**

CPT Descriptor: Osteotomy of spine, posterior or posterolateral approach, three columns, one vertebral segment (eg, pedicle/vertebral body subtraction); thoracic

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 50-year-old woman presents with persistent disabling spine pain and progressive spinal deformity. Non-operative therapy is unsuccessful. Examination documents loss of normal sagittal and/or coronal alignment. Imaging studies confirm the presence of thoracic kypho-scoliosis.

Percentage of Survey Respondents who found Vignette to be Typical: 75%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: The medical record is reviewed and the history is updated to ensure that the patient is stable for the planned surgical procedure. The radiographic studies are reviewed and the site of the osteotomy and the amount of correction required is planned. The surgeon confers with the patient and family; explaining the current condition and planned surgery. Questions are answered, consent is obtained and a note written in the record. The surgeon confers with the anesthesiologist, the neurophysiologist for intraoperative monitoring, cell saver blood collection personnel, the representative from the implant company, and the operating room staff to review positioning, the intraoperative plan and equipment needs. The surgical site is marked. Images are hung in the operating room. The patient is anesthetized and is positioned prone on the operating room table. The surgeon scrubs and the surgical site is prepped and draped into a sterile field.

Description of Intra-Service Work: Local anesthetic is infiltrated at the incision site. Incision is made through the skin and subcutaneous tissue. Dorsal fascia is incised and subperiosteal dissection is carried out along the spinous process, lamina, transverse processes, and rib heads exposing T10, T11, and T12. The appropriate level is marked and checked with imaging (x-ray or fluoroscopy). A T10, T11, and T12 laminectomy is performed. Bilateral T10-11 and T11-12 complete facetectomy is performed exposing and decompressing T10, T11, and T12 bilaterally. Bilateral T11 pedicle resection is performed. Proximal rib is resected bilaterally. Bone wax is applied to the bony surfaces. The T11 nerve root is retracted medially while a posterior wedge of vertebral body is resected. This is then repeated from the contralateral side of the spine. The end plates are preserved. Deformity correction is then performed and assessed with intraoperative imaging (x-ray or fluoroscopy). Hemostasis is achieved and copious irrigation is used. Additional decompression or osteotomies if required at separate levels may be performed (coded separately). . Arthrodesis and instrumentation may be performed (coded separately). An image is taken to document final alignment. Intraoperative neurophysiological monitoring is repeatedly examined throughout the case (coded separately). Local anesthetic is used to infiltrate the paraspinal musculature and the subcutaneous tissue. Sufascial drain is placed. The wound is then closed in layers and a dressing is placed.

Description of Post-Service Work: The patient is placed on the stretcher and assessed neurologically once awake. The patient is then taken to the recovery room. The surgeon calls the family and describes the findings at operation and answers their questions. Post operative orders are written and a note is dictated. The surgeon maintains contact with ICU staff. During the postoperative hospitalization, the patient is examined for neurologic function. The dressing is inspected and changed as needed. Drain output (if inserted), fluid balance, postoperative laboratory values are reviewed and blood transfusion is ordered if needed. Postoperative X-rays are reviewed showing the alignment of the spine. A physiotherapy and/or physiatry consultation are requested. The referring physician is contacted and informed about the

results of surgery. Daily visits are made while on the hospital floor. The drain tube and the Foley catheter are removed when appropriate, and the wound is inspected and the dressing changed. Activity parameters are modified to advance the patient's ambulation and mobility. The patients diet is advanced as tolerated. Questions from the physiotherapy staff are answered. Daily notes are written documenting the in-hospital progress. Calls are made to arrange for physiotherapy visits after discharge. Discharge summary is dictated and prescriptions are provided.

After discharge, the patient returns to the office for suture removal and wound check. Questions regarding physiotherapy and activity levels are answered. Phone calls are answered concerning pain levels and activity restrictions. Subsequent follow-up office visits are schedule to review activity levels and physiotherapy. X-rays of the spine are ordered and reviewed showing the alignment of the spine. Prescription medication refills are reviewed and written. An exercise program is recommended and printed material regarding therapy is provided to the patient.

Time Segments (Mean)		
Pre-Service intensity/complexity	4.36	4.14
Intra-Service intensity/complexity	4.86	4.86
Post-Service intensity/complexity	4.08	4.08

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*
A survey was sent by AANS/CNS, NASS and AAOS to neurological surgeons and orthopaedic surgeons representing spine and general orthopaedics. A consensus panel of experts representing neurosurgery, orthopaedics and spine surgery reviewed the survey data compared with the reference code and other orthopaedic and podiatric services. The urvey had a large number of respondents, 80, and tight ranges for RVW and times.

The panel felt the median RVW of 37.00 and intra-service time of 300 minutes were both accurate. The panel felt that the most commonly cited reference code, 63101 provided a good reference in that 22206 takes more time but is less intense than 63101. Thus we recommend the survey median RVW of 37.00 as the correct value for this procedure. We believe this maintains appropriate relativity with the reference code, as well as with the other new procedure codes within this family, particularly the lumbar code which is slightly less intense than the thoracic code and appropriately valued slightly less. The panel felt the survey recommended times for 22206 are all appropriate and accurate and that six post-operative days included a full day discharge (99238) and four post-operative office visits are typical for this procedure.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☒ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

	CPT Code	Global Period	RVW	Pre-Service	Intra-Service	Post-Service
3.	222X6	90	37	130	300	45
4.	22610-51	90	8.54	44	75	69
5.	22614	zzz	6.43		40	
6.	22614	zzz	6.43		40	
7.	22614	zzz	6.43		40	
8.	22842	zzz	12.56		105	
	Total		77.39	174	600	114

9.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) CPT Code 22212 or unlisted 22899.

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Neurosurgery How often? Rarely

Specialty Orthopaedics How often? Rarely

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 200
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. 22212 or 22899 unlisted were two likely methods of reporting. For those reported as 22212, this had a Medicare frequency reported in the RUC data base of approximately 200 cases per year. Of this we estimate fewer than half of those cases will now be described by 222X6. We also estimate that the Medicare population will comprise approximately 50 % of the patient population who undergo 222X6.

Specialty Neurosurgery Frequency 66 Percentage 33.00 %

Specialty Orthopaedics Frequency 134 Percentage 67.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 100
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. see above rationale

Specialty Neurosurgery Frequency 33 Percentage 33.00 %

Specialty Orthopaedics Frequency 67 Percentage 67.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? No

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? No

If no, please select another crosswalk and provide a brief rationale. CPT Code 22804 is more appropriate because it is also a posterior spine approach and defiinitive procedure code specifically for treatment of spinal deformity with orthopaedic predominance and similar times.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:22207 Tracking Number U2 Specialty Society Recommended RVU: **36.50**
Global Period: 090 RUC Recommended RVU: **36.50**

CPT Descriptor: Osteotomy of spine, posterior or posterolateral approach, three columns, one vertebral segment (eg, pedicle/vertebral body subtraction); lumbar

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 45-year-old man presents with persistent disabling spine pain and progressive spinal deformity. Non-operative therapy is unsuccessful. Examination documents loss of normal sagittal and/or coronal alignment. Imaging studies confirm the presence of thoraco-lumbar scoliosis and kyphosis.

Percentage of Survey Respondents who found Vignette to be Typical: 75%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: The medical record is reviewed and the history is updated to ensure that the patient is stable for the planned surgical procedure. The radiographic studies are reviewed and the site of the osteotomy and the amount of correction required is planned. The surgeon confers with the patient and family; explaining the current condition and planned surgery. Questions are answered, consent is obtained and a note written in the record. T surgeon confers with the anesthesiologist, the neurophysiologist for intraoperative monitoring, the cell saver blc collection team, the representative from the implant company and the operating room staff to review positioning, the intraoperative plan and equipment needs. The surgical site is marked. Images are hung in the operating room. The patient is anesthetized and is positioned prone on the operating room table. The surgeon scrubs and the surgical site is prepped and draped into a sterile field.

Description of Intra-Service Work: Local anesthetic is infiltrated at the incision site. Incision is made through the skin and subcutaneous tissue. Dorsal fascia is incised and subperiosteal dissection is carried out along the spinous process, lamina, and transverse processes exposing L2, L3, and L4. The appropriate level is marked and checked with imaging (xray or fluoroscopy). A L2, L3, and L4 laminectomy is performed. Bilateral L2-3 and L3-4 complete facetectomy is performed exposing and decopmpressing L2, L3, and L4 bilaterally. Bilateral L3 pedicle resection is performed. Bone wax is applied to the bony surfaces. The L3 nerve root is retracted medially while a posterior wedge of vertebral body is resected. This is then repeated from the contralateral side of the spine. The end plates are preserved. Deformity correction is then performed and assessed with intraoperative imaging (xray or fluoroscopy). Hemostasis is achieved and copious irrigation is used. Additional decompression or osteotomies if required at separate levels may be performed (coded separately). Arthrodesis and instrumentation may be performed (coded separately). An image is taken to document final alignment. Local anesthetic is used to infiltrate the paraspinal musculature and the subcutaneous tissue. A subfascial drain is placed. The wound is then closed in layers and a dressing is placed.

Description of Post-Service Work: The patient is placed on the stretcher and assessed neurologically once awake. The patient is then taken to the recovery room. The surgeon calls the family and describes the findings at operation and answers their questions. Post operative orders are written and a note is dictated. The surgeon maintains contact with ICU staff. During the postoperative hospitalization, the patient is examined for neurologic function. The dressing inspected and changed as needed. Drain output (if inserted), fluid balance, postoperative laboratory values are review and blood transfusion is ordered if needed. Postoperative X-rays are reviewed showing the alignment of the spine. A physiotherapy and physiatry consultation is requested. The referring physician is contacted and informed about the results of surgery. Daily visits are made while on the hospital floor. The drain tube and the Foley catheter are removed when appropriate, and the wound is inspected and the dressing changed. Activity parameters are modified to advance the

patient's ambulation and mobility. The patient's diet is advanced as tolerated. Questions from the physiotherapy staff are answered. Daily notes are written documenting the in-hospital progress. Calls are made to arrange for physiotherapy visits after discharge. A discharge summary is dictated and prescriptions are written.

After discharge, the patient returns to the office for suture removal and wound check. Questions regarding physiotherapy and activity levels are answered. Phone calls are answered concerning pain levels and activity restrictions. Subsequent follow-up office visits are schedule to review activity levels and physiotherapy. X-rays of the spine are ordered and reviewed showing the alignment of the spine. Prescription medication refills are reviewed and written. An exercise program is recommended and printed material regarding therapy is provided to the patient.

Time Segments (Mean)		
Pre-Service intensity/complexity	4.33	4.16
Intra-Service intensity/complexity	4.93	4.56
Post-Service intensity/complexity	4.05	4.06

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*
A survey was sent by AANS/CNS, NASS and AAOS to neurological surgeons and orthopaedic surgeons representing spine and general orthopaedics. A consensus panel of experts representing neurosurgery, orthopaedics and spine surgery reviewed the survey data compared with the reference code and other orthopaedic and podiatric services. The survey had a large number of respondents, 80, and tight ranges for RVW and times.

The panel felt the median RVW of 36.50 and intra-service time of 300 minutes were both accurate. The panel felt that the most commonly cited reference code, 63087 provided a solid reference in that 22207 takes slightly more time and less intense than 63087. Thus we recommend the survey median RVW of 36.50 as the correct value for this procedure. We believe this maintains appropriate relativity with the reference code, as well as with the other new procedure codes within this family, particularly the thoracic code which is slightly more intense than the lumbar code and appropriately valued slightly higher. The panel felt the survey recommended times for 22207 are all appropriate and accurate and that six post-operative days included a full day discharge (99238) and four post-operative office visits are typical for this procedure.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and

accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

		CPT Code	Global Period	RVW	Pre-Service	Intra-Service	Post-Service
3.	3.	222X7	90	36.50	130	300	45
4.	4.	22612-51	90	11.69	47.5	75	15
5.	5.	22614	zzz	6.43		40	
6.	6.	22614	zzz	6.43		40	
7.	7.	22614	zzz	6.43		40

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 22214 or unlisted code 22899

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Neurosurgey How often? Rarely

Specialty Orthopaedic How often? Rarely

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 500
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. 22214 or the unlisted code 22899 were previously used to report this service. Code 22214, had a Medicare frequency reported in the RUC data base of approximately 1000 cases per year. Of this we estimate fewer than 25% of those cases would noe be described by 222X7.. We also estimate that the Medicare population will comprise approximately 50 % of the patient population who undergo 222X7.Additionally in the RUC database the proportionate distrubution per specialty is 75% Orthopaedics and 25% Neurosurgery.

Specialty Neurosurgery Frequency 125 Percentage 25.00 %

Specialty Orthopaedics Frequency 375 Percentage 75.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 250
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. see rationale above

Specialty Neurosurgery Frequency 62 Percentage 24.80 %

Specialty Orthopaedics Frequency 183 Percentage 73.20 %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? No

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? No

If no, please select another crosswalk and provide a brief rationale. CPT Code 22804 is more appropriate because also a posterior spine deformity code with orthopaedic predominance and similar times.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:22208 Tracking Number U3 Specialty Society Recommended RVU: **9.66**
Global Period: ZZZ RUC Recommended RVU: **9.66**

CPT Descriptor: Osteotomy of spine, posterior or posterolateral approach, three columns, one vertebral segment (eg, pedicle/vertebral body subtraction); each additional vertebral segment (List separately in addition to primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 47-year-old woman presents with persistent disabling spine pain and progressive spinal deformity. Non-operative therapy is unsuccessful.
Examination documents loss of normal sagittal and/or coronal alignment.
Imaging studies confirm the presence of thoraco-lumbar scoliosis and severe kyphosis.

Percentage of Survey Respondents who found Vignette to be Typical: 75%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: N/A

Description of Intra-Service Work: The existing incision is extended through the skin and subcutaneous tissue. Dorsal fascial incision is extended and subperiosteal dissection is carried out along the spinous process, lamina, and transverse processes exposing the adjacent levels (T12, L1). The appropriate level is marked and checked with imaging (x-ray or fluoroscopy). Additional laminectomies (T12, L1) are performed. Bilateral additional complete facetectomies (T12-L1, L1-2) are performed exposing and decopmpressing the adjacent nerve roots (T12, L1) bilaterally. Bilateral (L1) pedicle resection is performed. Bone wax is applied to the bony surfaces. The (L1) nerve root is retracted medially while a posterior wedge of vertebral body is resected. This is then repeated from the contralateral side of the spine. The end plates are preserved. Deformity correction is then performed and assessed with intraoperative imaging (x-ray or fluoroscopy). Hemostasis is achieved and copious irrigation is used. Additional decompression at other levels may be performed (coded separately). Arthrodesis and instrumentation may be performed (coded separately).

Description of Post-Service Work: Physician checks for and corrects coagulopathy, and checks Ca/Mg levels, as increased coaguloapthy is a risk with additional levels. Communication with the consultant hematologist and blood bank is performed to correct blood and coagulation product deficits. The patient is likely to remain intubated postoperatively as a consequence of the prolonged surgery and significant fluid replacements. Ventilatory management will be instituted by the surgeon or in conjunction with an intensivist or pulmonologist. Diuresis is often required to facilitate extubation by the following morning, particularly if additional blood or coagulation products are given.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*
A survey was sent by AANS/CNS, NASS and AAOS to neurological surgeons and orthopaedic surgeons representing pine and general orthopaedics. A consensus panel of experts representing neurosurgery, orthopaedics and spine surgery reviewed the survey data compared with the reference code and other orthopaedic and podiatric services. The survey had a large number of respondents with experience with the procedure of 45.

The panel felt the median RVW from the survey respondents of 10.00 and intra-service time of 120 minutes were both accurate for this add-on code. The panel felt that the most commonly cited reference code, 22216 provided a solid reference in that 22208 takes more time (including 15 minutes pre-time for this add-on procedure that is for patient evaluation and consultation prior to the surgery) and more intense than 22216. Thus we recommend the survey median RVW of 10.00 as the correct value for this procedure. We believe this maintains appropriate relativity with the reference code, as well as with the other new procedure codes within this family which are the parent codes for this procedure. The panel felt the survey recommended times for 22208 are all appropriate. 15 minutes pre-service time was justified for additional consultation, x-ray review and surgical planning given the additional risk and complexity associated with performing an additional level for this procedure, particularly with respect to hematology consultation, preoperative discussion of blood transfusion risks, arrangement of autologous or directed-donor blood, and preparation of the blood bank for the expected transfusion needs. Additional 15 minutes of post service time is required because the patients are more complex due to the additional surgical time and blood loss associated with the addition of a level to the base procedure. In addition, fluid management including diuresis and ventilatory management are commonly required. The panel felt that it would be extremely rare that this procedure would be performed at more than two levels as the surgical morbidity increases significantly with each additional level.

ERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

February 2007

Internal or External Fixation-Shoulder/Elbow

As part of the 2005 Five Year Review Process, the American Academy of Orthopaedic Surgery (AAOS) commented that the compelling evidence rationale for examining the work RVU for the fracture treatment codes is that there is evidence that incorrect assumptions were made in the valuation of these codes due to lack of clarity of the CPT descriptor. In particular, the CPT descriptor states "with or without internal or external fixation." However, it is unclear whether the previous valuation for the code included the situation when internal and external fixation is applied to a fracture site. Therefore, the RUC recommended that these codes be referred to the CPT Editorial Panel for further clarification.

At the October 2007 CPT Editorial Panel Meeting, the AAOS recommended to the CPT Editorial Panel that the identified fracture treatment codes in the musculoskeletal section of CPT that include the nomenclature "internal or external" fixation should be clarified to state that external fixation should be an adjunctive procedure to these procedures. The CPT Editorial Panel agreed with the specialty that these codes needed to be clarified and removed reference to external fixation from 64 CPT codes. These 64 codes were divided into four categories based on location: Shoulder/Elbow, Elbow/Hand, Hip/Knee and Foot/Ankle. At the February 2007 RUC Meeting, three of these categories were discussed: Shoulder/Elbow, Elbow/Hand and Foot/Ankle. The Hip/Knee codes will be discussed at the April 2007 RUC Meeting.

Between 225 and 450 orthopaedic providers participated in each of the surveys. These respondents included physicians from general orthopaedic surgery, shoulder and elbow surgery and orthopaedic trauma surgery. After the results from all of these groups were tablulated, a concensus committee of physicians representing the American Academy of Orthopaedic Surgeons, American Shoulder and Elbow Surgeons, Arthroscopy Association of North America and the Orthopaedic Trauama Association met to discuss the survey data for the revised orthopaedic codes. During this review, the specialties determined that they would recommend the 25th percentile for codes in situations where all of the fracture codes, when they were arrayed in order of complexity, it was rational to recommend the 25th percentile RVU value as a means to maintain rank order. Furthermore, the specialty societies reviewed the resulting IWPUTs associated with the revised codes and determined that these IWPUT values validated the recommended work RVUs.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The RUC reviewed the compelling evidence for these procedures. The specialty societies claimed that because the CPT descriptors originally contained the phrase "with or without internal or external fixation," it is difficult to imagine what the original Harvard survey data actually represented. Furthermore, an Abt study was performed in 1992 for RUC consideration. This study produced percentage relationships to key reference codes, but not surveyed time and visit data. Some of these recommendations were accepted by the RUC and CMS and others were adjusted up or down but no changes were made to the Harvard time and visit data, if available. Therefore, the specialty society believes that there is little, if any, relationship between the Harvard database time and visit information and the current work RVUs.

Furthermore, the specialty societies stated that there was a significant change in the technology for how these procedures are performed. The surgical treatments use open anatomical reduction and internal fixation has been made more complex with the introduction of new imaging methods such as computed tomography which allows better detection of the fracture pathology and provides the basis for new surgical strategies. There are also new internal fixation devices which require more work. Further, the patient population has changed, as women over 50 are a fast growing segment of the population. A huge percentage of these patients are osteoporatic – making fracture fixation and maintenance of fixation far more difficult. Also, for several of the identified procedures, the provider of the services have changed and were not a part of the original Harvard studies such as the American Shoulder and Elbow Surgeons. The specialty societies conducted a full RUC survey of all codes, and for almost all of the codes, recommended the 25th percentile or the median RVU of the specialty survey data. It should also be noted that the RUC is recommending reductions in work RVUs for three codes of the codes in this family, 23616 and 24575.

136

The RUC thoroughly reviewed these codes, and as part of this review, the specialties explained that they felt strongly that a 99214 office visit was appropriate for two of the codes within this family and however, based on discussions at the RUC meeting the specialty agreed to lower the intensity of this visit to a 99213 office visit. The RUC reviewed CPT code 20690 *Application of a uniplane (pins or wires in one plane), unilateral, external fixation system* and 20692 *Application of a multiplane (pins or wires in more than one plane), unilateral, external fixation system (eg, Ilizarov, Monticelli type).* It is the RUC's understanding that the utilization for these two procedures will not change with this coding change made by the CPT Editorial Panel. Therefore, the RUC believes that there will be no budget neutrality impact for these recommendations. However, the RUC welcomes a retrospective review of this issue in the future.

AMA/Specialty Society RVS Update Committee
RUC Recommendations - Internal or External Fixation
CPT Code Order

CPT Code	*Descriptor*	*Global*	*RUC Rec Work RVU*	*RUC Rationale*
23515	Open treatment of clavicular fracture, includes internal fixation, when performed	090	11.00	The RUC reviewed CPT code 23515 Open treatment of clavicular fracture, includes internal fixation, when performed and compared it to its reference code 29827 Arthroscopy, shoulder, surgical; with rotator cuff repair (Work RVU=15.44). The RUC compared the intra-service times for these procedures and noted that 23515 had less intra-service time associated with it as compared to 29827, 90 and 120 minutes, respectively. The RUC compared the intensity complexity measures of 23515 amd 29827 and noted that the reference code required more technical skill to perform and had a more intense intra-service period as compared to 23515. Therefore, the RUC agreed that the median of the survey data, 11.00 RVUs, appropriately places this code in comparison to the reference code. For further support the RUC compared this procedure to MPC code 28299 Correction, hallux valgus (bunion), with or without sesamoidectomy; by double osteotomy (Work RVU=11.39) and determined that 11.00 work RVUs was appropriate for 23515 as 28299 has slightly more total service time associated with it in comparison to 23515, 299 minutes and 287 minutes respectively. The RUC recommends 11.00 RVUs for 23515.
23585	Open treatment of scapular fracture (body, glenoid or acromion) includes internal fixation	090	16.25	The RUC reviewed CPTcode 23585 Open treatment of scapular fracture (body, glenoid or acromion) includes internal fixation and compared it to its reference code 27447 Arthroplasty, knee, condyle and plateau; medial AND lateral compartments with or without patella resurfacing (total knee arthroplasty) (Work RVU=23.04). The RUC noted that the total service time for the surveyed code was lower than the reference code, 407 minutes and 469 minutes respectively. Furthermore, the RUC compared the intensities of these procedures and determined that because, 23585 is one of the most complex of the procedures performed for reduction and internal fixation of shoulder fractures and typically requires an extensive exposure of the scapula with significant muscle disection and identification and protection of the suprascapular nerve and artery, it was deemed a more intensive procedure than the reference code 27447. However, the RUC agreed that to keep this code in proper rank order with other codes in the family, such as 23680 Open treatment of shoulder dislocation, with surgical or anatomical neck fracture, includes internal fixation, when performed (RUC recommended value of 15.00 RVUs) and 23616 Open treatment of proximal humeral (surgical or anatomical neck) fracture, includes internal fixation, when performed, includes repair of tuberosity(s) , when performed; with proximal humeral prosthetic replacement (RUC recommended value of 21.00 RVUs), the value associated with this procedure should be the 25th percentile of the survey, 16.25 RVUs. The RUC recommends 16.25 RVUs for 23585.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
23615	Open treatment of proximal humeral (surgical or anatomical neck) fracture, includes internal fixation, when performed, includes repair of tuberosity(s), when performed;	090	14.00	The RUC reviewed CPT code 23615 Open treatment of proximal humeral (surgical or anatomical neck) fracture, includes internal fixation, when performed, includes repair of tuberosity(s), when performed; and compared it with its reference code 29827 Arthroscopy, shoulder, surgical; with rotator cuff repair (Work RVU=15.44). The RUC noted that the surveyed code has significantly less intra-service time associated with it as compared to the reference code, 90 minutes and 130 minutes, respectively. Further, the RUC noted that the reference service required more physical effort to perform and has a more complex intra-service period as compared to 23615. The RUC reviewed several other codes under review in this family, such as 23670 Open treatment of shoulder dislocation, with fracture of greater humeral tuberosity, includes internal fixation, when performed (RUC Recommended value=14.00 RVUs) 25575 Open treatment of radial AND ulnar shaft fractures, with internal fixation, when performed; of radius AND ulna (RUC recommended value=14.00). The RUC determined that because all of these services had the same intra-servce time, 90 minutes and because they all involve similar complexity and intensity to perform the service, the RUC agreed that the 25th percentile of the survey, 14.00 RVU appropriately places this service in comparison to 23670, 25575 and the key reference service 29827. The RUC recommends 14.00 RVU for 23615.
23616	Open treatment of proximal humeral (surgical or anatomical neck) fracture, includes internal fixation, when performed, includes repair of tuberosity(s) , when performed; with proximal humeral prosthetic replacement	090	21.00	The RUC reviewed CPT code 23616 Open treatment of proximal humeral (surgical or anatomical neck) fracture, includes internal fixation, when performed, includes repair of tuberosity(s) , when performed; with proximal humeral prosthetic replacement and compared it with its reference code 23472 Arthroplasty, glenohumeral joint; total shoulder (glenoid and proximal humeral replacement (eg, total shoulder)) (Work RVU=22.47). The RUC agreed that the specialty society recommended 99214 office visit should be removed and replaced with a 99213 office visit as this is more typical of the post-operative care for this procedure. This change in the post-operative visits results in three 99213 office visits and one 99212 office visits being associated with this procedure. The RUC noted that 23616 has less intra-service time associated with it as compared to the reference code, 120 minutes and 165 minutes, respectively. Although 23472 has longer intra-service times than the surveyed code, with 23616 comminution is frequently present which makes correct positioning of the prosthesis and stable repair of the tuberosity fragments difficult this makes 23616 a very intensive procedure to perform. For further support the RUC reviewed MPC code 50546 Laparoscopy, surgical; nephrectomy, including partial ureterectomy (Work RVU=21.69). The RUC noted that 50546 had a longer intra-service time in comparison to 23616, 205 minutes and 120 minutes, respectively. Therefore, the RUC agreed that the median value of 21.00 RVUs is appropriate and correctly places this code in comparison to the reference code, 23472 and 50546. The RUC noted that the proposed value for this procedure, 21.00 RVUs, is less than the existing value, 21.68 RVUs. The RUC recommends 21.00 RVUs for 23616.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
23630	Open treatment of greater humeral tuberosity fracture, includes internal fixation, when performed	090	12.00	The RUC reviewed CPT code 23630 Open treatment of greater humeral tuberosity fracture, includes internal fixation, when performed and compared it to its reference code 23420 Reconstruction of complete shoulder (rotator) cuff avulsion, chronic (includes acromioplasty) (Work RVU=14.75). The RUC noted that the intra-service time of the surveyed code was far less than the intra-service time of the reference code, 70 minutes and 120 minutes. The RUC also noted that although 23630 is a shoulder fracture that commonly occurs in tandem with poor bone quality, making fixation of the fragment difficult and tenuous, the reference code is a more intensive procedure to perform. This comparison of intensity is demonstrated in the intensity measure of the intra-service time associated with the surveyed code, as it is less than the intensity associated with the reference code. Therefore, the RUC recommends the 25th percentile of the survey for this procedure, 12.00 RVUs. For further support, the RUC compared 23630 to MPC code 60220 Total thyroid lobectomy, unilateral; with or without isthmusectomy (Work RVU=12.29). The RUC noted that as 23630 has less intra-service time as compared to 60220, 70 minutes and 90 minutes, the recommended work RVU of 12.00 appropriately places this code in comparison to 60220 as well as the reference code, 23420. The RUC recommends 12.00 RVU for 23630.
23670	Open treatment of shoulder dislocation, with fracture of greater humeral tuberosity, includes internal fixation, when performed	090	14.00	The RUC reviewed CPT code 23670 Open treatment of shoulder dislocation, with fracture of greater humeral tuberosity, includes internal fixation, when performed and compared it with its reference code 23420 Reconstruction of complete shoulder (rotator) cuff avulsion, chronic (includes acromioplasty) (Work RVU=14.75). The RUC noted that the surveyed code has significantly less intra-service time associated with it as compared to the reference code, 90 minutes and 120 minutes, respectively. However, all of the intensity and complexity measures demonstrated that the surveyed code was significanly more difficult to perform than the reference code. The RUC reviewed several other codes under review in this family, such as 23615 Open treatment of proximal humeral (surgical or anatomical neck) fracture, includes internal fixation, when performed, includes repair of tuberosity(s), when performed; (RUC recommended value of 14.00 RVUs) and 25575 Open treatment of radial AND ulnar shaft fractures, with internal fixation, when performed; of radius AND ulna (RUC recommended value of 14.00 RVUs). The RUC determined that because all of these services had the same intra-servce time, 90 minutes and because they all involve similar complexity and intensity to perform the service, the RUC agreed that the 25th percentile of the survey, 14.00 RVU appropriately places this service in comparison to 23615, 25575 and the key reference service 23420. The RUC recommends 14.00 RVU for 23670.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
23680	Open treatment of shoulder dislocation, with surgical or anatomical neck fracture, includes internal fixation, when performed	090	15.00	The RUC reviewed CPT code 23680 Open treatment of shoulder dislocation, with surgical or anatomical neck fracture, includes internal fixation, when performed and compared it to its reference code 29827 Arthroscopy, shoulder, surgical; with rotator cuff repair (Work RVU=15.44). The RUC noted that 23680 and 29827 have the same pre-service time (75 minutes) and intra-service time (120 minutes). The RUC agreed that that in addition to the times for these two procedures being the same that the complexity and work associated with them is similar as well. Therefore the RUC recommends the 25th percentile of the survey 15.00 RVUs to reflect this similarity in service times and work. The RUC recommends 15.00 RVUs for 23680.
24545	Open treatment of humeral supracondylar or transcondylar fracture, includes internal fixation, when performed; without intercondylar extension	090	15.00	The RUC reviewed CPT code 24545 Open treatment of humeral supracondylar or transcondylar fracture, includes internal fixation, when performed; without intercondylar extension and compared it to its reference code 25609 Open treatment of distal radial intra-articular fracture or epiphyseal separation; with internal fixation of 3 or more fragments (Work RVU=14.12). The RUC reviewed the total-service times for both codes and found them to be comparable, 361 minutes and 358 minutes. However, the RUC noted that the intensity/complexity measures for 24545 were significantly higher in comparison to 25609 as the complexity and risk for complication involved in 24545 is much greater than 25609. Therefore the RUC agreed that the median value of 15.00 RVU appropriately places this code in comparison to the reference code. The RUC recommends a work RVU of 15.00 for code 24545.
24546	Open treatment of humeral supracondylar or transcondylar fracture, includes internal fixation, when performed; with intercondylar extension	090	17.01	The RUC reviewed CPT code 24546 Open treatment of humeral supracondylar or transcondylar fracture, includes internal fixation, when performed; with intercondylar extension and compared it with its reference code 23472 Arthroplasty, glenohumeral joint; total shoulder (glenoid and proximal humeral replacement (eg, total shoulder)) (Work RVU=22.47). The RUC agreed that the specialty society recommended 99214 office visit should be removed and replaced with a 99213 office visit as this is more typical of the post-operative care for this procedure. This change in the post-operative visits results in three 99213 office visits and a 99212 office visit being associated with this procedure. However, after comparing 24546 with 23472, the RUC determined that this reference code was not a suitable comparison. The RUC agreed that the better reference code would be 24545 Open treatment of humeral supracondylar or transcondylar fracture, includes internal fixation, when performed; without intercondylar extension (RUC recommended RVU=15.00 RVUs). The RUC compared the total service times for both procedures and determined at 24546 had a longer intra service time in comparison to 24545, 150 minutes and 120 minutes. The RUC also agreed that the intensity/complexity of performing 24546 is significantly higher that performing 24545 as 24545 is an extra-articular fracture and 24546 is an intra-articular fracture requiring extensive exposure of the joint. Therefore, to calculate the recommended RVUs for this procedure, the RUC started with the 25th percentile of the survey data, 16.34 RVUs and added a work RVU increment of 2.01, the difference in intra-service times between 24546 and 24545 (30 minutes) multiplied by the IWPUT of 24545 (0.067). This calculation results in a value of 17.01 RVUs. The RUC recommends 17.01 RVUs for 24546.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
24575	Open treatment of humeral epicondylar fracture, medial or lateral, includes internal fixation, when performed	090	11.00	The RUC reviewed CPT code 24575 Open treatment of humeral epicondylar fracture, medial or lateral, includes internal fixation, when performed and compared it to its reference code 25608 Open treatment of distal radial intra-articular fracture or epiphyseal separation; with internal fixation of 2 fragments (Work RVU=10.86). The RUC reviewed the total-service times for both codes and found them to be comparable, 305 minutes and 308 minutes. Therefore the RUC agreed that the median value of 11.00 RVU appropriately places this code in comparison to the reference code. For further support the RUC compared this procedure to MPC code 28299 Correction, hallux valgus (bunion), with or without sesamoidectomy; by double osteotomy (Work RVU=11.39) and determined that 11.00 work RVUs was appropriate for 24575 as 28299 has more intra- service time associated with it in comparison to 24575, 90 minutes and 60 minutes, respectively. The RUC noted that the proposed value for this procedure, 11.00 RVUs, is slightly less than the existing value, 11.02 RVUs. The RUC recommends 11.00 RVUs for 24575.
24579	Open treatment of humeral condylar fracture, medial or lateral, includes internal fixation, when performed	090	13.00	The RUC reviewed CPT code 24579 Open treatment of humeral condylar fracture, medial or lateral, includes internal fixation, when performed and compared it to 25609 Open treatment of humeral condylar fracture, medial or lateral, includes internal fixation, when performed (Work RVU=14.12). The RUC noted that the intra-service time for the surveyed code is significantly less than the reference code, 90 minutes and 120 minutes. Furthermore, the RUC noted that the reference code requires more mental effort and judgement and technical skill to perform in comparison to 24579. Because of a lower intra-service time and lower intensity and complexity measures of the surveyed code in comparison to the reference code, the RUC recommends the survey median work RVU, 13.00 RVUs for 24579 as it appropriately places this code in comparison to the reference code. For further support the RUC compared 24579 to 24575 Open treatment of humeral epicondylar fracture, medial or lateral, includes internal fixation, when performed (RUC recommended value=11.00 RVU). The RUC noted that these procedures are similar except 24579 has the addition of an intraarticular extension involving the entire condylar structure. The same neurovascular structures are at risk in 24579 and 24575 except 24579 has the added complexity of obtaining and holding the articular surface reduced anatomically to maintain joint congruity. Because of these comparisons to a reference code and another code within the family, the RUC recommends 13.00 RVUs for 24579.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
24635	Open treatment of Monteggia type of fracture dislocation at elbow (fracture proximal end of ulna with dislocation of radial head), includes internal fixation, when performed	090	10.00	The RUC reviewed CPT code 24635 Open treatment of Monteggia type of fracture dislocation at elbow (fracture proximal end of ulna with dislocation of radial head), includes internal fixation, when performed and compared it to its reference code 25607 Open treatment of distal radial extra-articular fracture or epiphyseal separation, with internal fixation (Work RVU=9.35). The RUC noted that the total service time for 24635 is higher than the total service time for 25607, 291 minutes and 275 minutes, respectively. Furthermore, the work for 24635 is greater than 25607 because the dislocated radial head must be treated in addition to the ulna fracture and post-operatively there is a danger of neurovascular injury and compartment syndrome. Close monitoring is required. This is demonstrated in the intensity/complexity measures which indicate that the surveyed code requies greater mental effort and judgement, greater technical skill and greater physical effort to perform in comparison to the reference code. Furthermore, the RUC noted that this service requires a hospital stay as there is significant monitoring of circulation, sensation and motor function of the involved extremity. Therefore, the RUC agreed that the 25th percentile of the survey data, 10.00 work RVUs accurately places this code in comparison to the reference code. The RUC noted that the proposed value for this procedure, 10.00 RVUs, is less than the existing value, 13.56 RVUs. The RUC recommends 10.00 work RVUs for 24635.
24685	Open treatment of ulnar fracture proximal end (olecranon process), includes internal fixation, when performed	090	9.50	The RUC reviewed CPT code 24685 Open treatment of ulnar fracture proximal end (olecranon process), includes internal fixation, when performed and compared it to its reference code 25607 Open treatment of distal radial extra-articular fracture or epiphyseal separation, with internal fixation (Work RVU=9.35). The RUC noted that while both services have an intra-service time of 60 minutes, the surveyed procedure is more complex than the reference code as 24685 is intraarticular and 25607 is extraarticular. This complexity of the intra-service is also noted in the intra-service intensity complexity measure which shows that the surveyed code's intra-service period is more intense than the intra-service time associated with the reference code. Furthermore, the intensity/complexity measures indicate that the surveyed code requires greater mental effort and judgment, greater technical skill and greater physical effort to perform in comparison to the reference code. Therefore, the RUC agreed that the 25th percentile of the survey data, 9.50 work RVUs, accurately places this code in comparsion to the reference code. The RUC recommends 9.50 work RVUs for 24685.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
25515	Open treatment of radial shaft fracture, includes internal fixation, when performed	090	10.00	The RUC reviewed CPT code 25515 Open treatment of radial shaft fracture, includes internal fixation, when performed and compared it with its reference code 25608 Open treatment of distal radial intra-articular fracture or epiphyseal separation; with internal fixation of 2 fragments (work RVU=10.86). The RUC noted that the intra-service time for the surveyed code is less than the intra-service time for the reference code (60 minutes and 90 minutes, respectively). The RUC also compared the intensity/complexity measures of the surveyed code and the reference code and determined that the reference code required more technical skill, physical effort, mental effort and judgment to perform than the reference code. With the lower amount of intra-service time and lower intensity/complexity measures as compared to 25608, the RUC agreed that the 25th percentile of survey, 10.00 work RVU appropriately places 25515 in comparison to the reference code. The RUC recommends 10.00 work RVUs for 25515.
25525	Open treatment of radial shaft fracture, with internal fixation, when performed, and closed treatment of dislocation of distal radioulnar joint (Galeazzi fracture/dislocation), with percutaneous skeletal fixation, when performed	090	12.00	The RUC reviewed CPT code 25525 Open treatment of radial shaft fracture, with internal fixation, when performed, and closed treatment of dislocation of distal radioulnar joint (Galeazzi fracture/dislocation), with percutaneous skeletal fixation, when performed and compared it with its reference code 25608 Open treatment of distal radial intra-articular fracture or epiphyseal separation; with internal fixation of 2 fragments (work RVU=10.86). The RUC agreed that the specialty society recommended 99214 office visit should be lowered to a 99213 office visit as this is more typical of the post-operative care for this procedure. This change in the post-operative visits results in three 99213 office visits and one 99212 office visits being associated with this procedure. With this change, the RUC noted that the total service times for both of these codes are comparable, 303 minutes and 305 minutes. However, the RUC noted that the surveyed code required greater mental effort and judgment and physicial effort to perform in comparison to the reference code. Therefore, due to comparable total service times but greater intensity/complexity measures, the RUC recommends the survey median, 12.00 RVU for this procedure. For further support, the RUC compared 25525 to MPC code 60220 Total thyroid lobectomy, unilateral; with or without isthmusectomy (Work RVU=12.29). The RUC noted that as 25525 has less intra-service time as compared to 60220, 70 minutes and 90 minutes, the recommended work RVU of 12.00 appropriately places this code in comparison to 60220 as well as the reference code, 25608. The RUC noted that the proposed value for this procedure, 12.00 RVUs, is less than the existing value, 12.69 RVUs. The RUC recommends 12.00 RVU for 22525.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
25526	Open treatment of radial shaft fracture, with internal fixation, when performed, and open treatment of distal radioulnar joint, with internal fixation, when performed (Galeazzi fracture/dislocation), includes repair of triangular fibrocartilage complex	090	15.00	The RUC reviewed CPT code 25526 Open treatment of radial shaft fracture, with internal fixation, when performed, and open treatment of distal radioulnar joint, with internal fixation, when performed (Galeazzi fracture/dislocation), includes repair of triangular fibrocartilage complex and compared it to its reference code 25609 Open treatment of distal radial intra-articular fracture or epiphyseal separation; with internal fixation of 3 or more fragments. The RUC agreed that the specialty society recommended 99214 office visit should be removed and two 99212 office visit should be added as this is more typical of the post-operative care for this procedure. This change in the post-operative visits results in two 99213 office visits and three 99212 office visits being associated with this procedure. With these changes, the RUC noted that the surveyed code has more total service time associated with it in comparison to the reference code, 398 minutes and 358 minutes, respectively. Further, the RUC noted that the surveyed code required more mental effort and judgement and more physical effort to perform and has a more complex intra-service period as compared to 25609. The difficulty of this procedure can be explained as this is the most complex of the hand procedures reviewed because this procedure consists of two separate procedures, an open reduction internal fixation of the radius which places the radial nerve in danger as well as the radial artery and a separate arthrotomy of the ulnocarpal joint and repair of the triangular fibrocartilage complex. Because of the increased total service time as well as the higher intensity/complexity measures associated with 25526 in comparison to its reference code, the RUC recommends the survey median of 15.00 work RVU for 25526. The RUC recommends 15.00 RVUs for 25526.
25545	Open treatment of ulnar shaft fracture, includes internal fixation, when performed	090	9.00	The RUC reviewed CPT code 25545 Open treatment of ulnar shaft fracture, includes internal fixation, when performed in compairison to 25607 Open treatment of distal radial extra-articular fracture or epiphyseal separation, with internal fixation (Work RVU=9.35). The RUC noted that the surveyed code and the reference code had the same intra-service time, 60 minutes. The RUC noted that 25545 requires a 99231 hospital visit as there is a danger of neurovascular injury and compartment syndrome and close monitoring is needed. The RUC also noted that the reference code requires greater endurance of psychological stress to perform as compared to the surveyed code. The RUC compared this procedure to 26665 Open treatment of carpometacarpal fracture dislocation, thumb (Bennett fracture), includes internal fixation, when performed (RUC recommended value of 9.00 RVUs) and MPC code 14060 Adjacent tissue transfer or rearrangement, eyelids, nose, ears and/or lips; defect 10 sq cm or less (Work RVU=9.07 and noted that because all of these procedures had similar work and the same intra-service time, 60 minutes, that they should all be valued the similarly. Therefore, because of all of these comparisons, the RUC recommends the median survey RVU, 9.00 work RVUs. The RUC noted that the proposed value for this procedure, 9.00 RVUs, is less than the existing value, 9.09 RVUs. The RUC recommends 9.00 Work RVUs for 25545.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
25574	Open treatment of radial AND ulnar shaft fractures, with internal fixation, when performed; of radius OR ulna	090	10.00	The RUC reviewed CPT code 25574 Open treatment of radial AND ulnar shaft fractures, with internal fixation, when performed; of radius OR ulna and compared it with its reference code 25608 Open treatment of distal radial intra-articular fracture or epiphyseal separation; with internal fixation of 2 fragments (work RVU=10.86). The RUC noted that the intra-service time for the surveyed code is less than the intra-service time for the reference code (60 minutes and 90 minutes, respectively). The RUC also compared the intensity/complexity measures of the surveyed code and the reference code and determined that the reference code required more technical skill, mental effort and judgement to perform than the reference code. With the lower amount of intra-service time and lower intensity/complexity measures as compared to 25608, the RUC agreed that the 25th percentile of survey, 10.00 work RVU appropriately places 25574 in comparison to the reference code. The RUC recommends 10.00 work RVUs for 25574.
25575	Open treatment of radial AND ulnar shaft fractures, with internal fixation, when performed; of radius AND ulna	090	14.00	The RUC reviewed CPT code 25575 Open treatment of radial AND ulnar shaft fractures, with internal fixation, when performed; of radius AND ulna and compared it with its reference code 25609 Open treatment of distal radial intra-articular fracture or epiphyseal separation; with internal fixation of 3 or more fragments (Work RVU=14.12). The RUC agreed that the specialty society recommended 99214 office visit should be removed and two 99212 office visit should be added as this is more typical of the post-operative care for this procedure. This change in the post-operative visits results in two 99213 office visits and three 99212 office visits being associated with this procedure. With these changes, the RUC noted that the surveyed code has less total service time associated with it in comparison to the reference code, 342 minutes and 358 minutes, respectively. Further, the RUC noted that the reference service required more technical skill, physical effort and more psychological stress to perform and has a more complex intra-service period as compared to 25609. The RUC reviewed several other codes under review in this family, such as 23670 Open treatment of shoulder dislocation, with fracture of greater humeral tuberosity, includes internal fixation, when performed (RUC Recommended wRVU=14.00 RVUs) 23615 Open treatment of proximal humeral (surgical or anatomical neck) fracture, includes internal fixation, when performed, includes repair of tuberosity(s), when performed; (RUC recommended wRVU=14.00). The RUC determined that because all of these services had the same intra-servce time, 90 minutes and because they all involve similar complexity and intensity to perform the service, the RUC agreed that the median of the survey, 14.00 RVUs appropriately places this service in comparison to 23670, 23615 and the key reference service 25609. The RUC recommends 14.00 RVUs for 25575.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
25628	Open treatment of carpal scaphoid (navicular) fracture, includes internal fixation, when performed	090	11.00	The RUC reviewed CPT code 25628 Open treatment of carpal scaphoid (navicular) fracture, includes internal fixation, when performed and compared it with its reference code 25394 Osteoplasty, carpal bone, shortening (work RVU=10.71). The RUC noted that the total service time for the surveyed code is more than the total service time for the reference code (277 minutes and 250 minutes, respectively). The RUC also compared the intensity/complexity measures of the surveyed code to the reference code and determined that the surveyed code required more technical skill, physical and mental effort and judgement to perform than the reference code. With the higher amount of total service time and higher intensity/complexity measures as compared to 25394, the RUC agreed that the 25th percentile of survey, 11.00 work RVU appropriately places 25628 in comparison to the reference code. The RUC recommends 11.00 work RVUs for 25628.
26615	Open treatment of metacarpal fracture, single, includes internal fixation, when performed, each bone	090	8.00	The RUC reviewed CPT code 26615 Open treatment of metacarpal fracture, single, includes internal fixation, when performed, each bone and compared it with its reference code 25607 Open treatment of distal radial extra-articular fracture or epiphyseal separation, with internal fixation (work RVU=9.35). The RUC noted that the intra-service time for the surveyed code is less than the intra-service time for the reference code (45 minutes and 60 minutes, respectively). The RUC also compared the intensity/complexity measures of the surveyed code to the reference code and determined that the reference code required more mental effort and judgement and more psychological stress. With the lower amount of intra-service time and lower intensity/complexity measures as compared to 25607, the RUC agreed that the 25th percentile of survey, 8.00 work RVU appropriately places 26615 in comparison to the reference code. The RUC recommends 8.00 work RVUs for 26615.
26650	Percutaneous skeletal fixation of carpometacarpal fracture dislocation, thumb (Bennett fracture), with manipulation, with external fixation	090	6.00	The RUC reviewed CPT code 26650 Percutaneous skeletal fixation of carpometacarpal fracture dislocation, thumb (Bennett fracture), with manipulation, with external fixation and compared it to its reference code 25651 Percutaneous skeletal fixation of ulnar styloid fracture (work RVU=5.68). The RUC compared the total service times for these procedures and noted that the surveyed code (197 minutes of total service time) had more total service time associated with it than the 25651 (190 minutes of total service time). The RUC also compared the office visits associated with this procedure and noted that although they both have four post-operative office visits associated with them, the surveyed code has two 99213 and two 99212 visits associated with it while 25651 has one 99213 and three 99212 associated with it, which suggests the surveyed code involves more complex post operative care as compared to the reference code. This difference in the intensity of the post-operative care is also demonstrated in the post-operative intensity/complexity measures which show that the post service time segment of the surveyed code has a greater intensity associated with it as compared to the reference code. Therefore, because of the greater total service time and the more intense post-operative visits, the RUC agreed that the median RVU of the survey data appropriately places 26650 in comparison to 25651. The RUC recommends 6.00 RVUs for 26650.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
26665	Open treatment of carpometacarpal fracture dislocation, thumb (Bennett fracture), includes internal fixation, when performed	090	9.00	The RUC reviewed CPT code 26665 Open treatment of carpometacarpal fracture dislocation, thumb (Bennett fracture), includes internal fixation, when performed in comparison to 25652 Open treatment of ulnar styloid fracture (Work RVU=7.92). The RUC noted that the surveyed code had a greater total service time associated with it in comparison to the reference code, 237 minutes and 225 minutes, respectively. The RUC also noted that the surveyed procedure requires greater physicial effort and an endurance of greater psychological stress to perform as compared to the reference code. Furthermore, the surveyed code is a more complex procedure to perform than the reference code given the increased intensity of dealing with an intraarticular fracture as demonstrated in the intensity/complexity time measures which shows that surveyed code is a much more intense procedure to perform than the reference code. The RUC agreed that because of the larger total service time and the greater amount of intensity and complexity associated with the surveyed code as compared to the reference code, the RUC recommends the median survey RVU, 9.00 work RVUs. In addition, the RUC agreed this value is appropriate because it has similar work and the same intra-service time as MPC code 14060 Adjacent tissue transfer or rearrangement, eyelids, nose, ears and/or lips; defect 10 sq cm or less (Work RVU=9.07). The RUC recommends 9.00 Work RVUs for 26665.
26685	Open treatment of carpometacarpal dislocation, other than thumb; includes internal fixation, when performed, each joint	090	8.00	The RUC reviewed CPT code 26685 Open treatment of carpometacarpal dislocation, other than thumb; includes internal fixation, when performed, each joint and compared it with its reference code 25652 Open treatment of ulnar styloid fracture (work RVU=7.92). The RUC noted that the intra-service times for both procedures are 60 minutes. The RUC also compared the office visits associated with this procedure and noted that although they both have four post-operative office visits associated with them, the surveyed code has two 99213 and two 99212 visits associated with it while 25652 has one 99213 and three 99212 associated with it which suggests the surveyed code has a more complex post operative care as compared to the reference code. This difference in the intensity of the post-operative care is also demonstrated in the post-operative intensity/ complexity measure which shows that the post service time segment of the surveyed code has a greater intensity associated with it as compared to the reference code. With the same amount of intra-service time and slightly different office visits as compared to 25652, the RUC agreed that the median of the survey, 8.00 work RVUs appropriately places 26685 in comparison to the reference code, 26615 Open treatment of metacarpal fracture, single, includes internal fixation, when performed, each bone and 28645 Open treatment of metatarsophalangeal joint dislocation, includes internal fixation, when performed which all have the same complexity and proposed work RVU. The RUC recommends 8.00 work RVUs for 26685.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
26715	Open treatment of metacarpophalangeal dislocation, single, includes internal fixation, when performed	090	7.95	The RUC reviewed CPT code 26715 Open treatment of metacarpophalangeal dislocation, single, includes internal fixation, when performed and compared it to its reference code, 25671 Percutaneous skeletal fixation of distal radioulnar dislocation (Work RVU=6.32). The RUC compared the total service times for these procedures and noted that the surveyed code (220 minutes of total service time) had more total service time associated with it than the 25671 (210 minutes of total service time). The RUC also compared the office visits associated with this procedure and noted that although they both have four post-operative office visits associated with them, the surveyed code has two 99213 and two 99212 visits associated with it while 25651 has one 99213 and three 99212 associated with it which suggests the surveyed code involves more complex post operative care as compared to the reference code. This difference in the intensity of the post-operative care is also demonstrated in the post-operative intensity/ complexity measure which shows that the post service time segment of the surveyed code has a greater intensity associated with it as compared to the reference code. Therefore, because of the greater total service time and the more intense post-operative visits, the RUC agreed that the median RVU of the survey data 7.95 work RVUs, appropriately places 26715 in comparison to 25671. Furthermore, the RUC agreed that this value correctly places this procedure in terms of complexity in comparison to other orthopaedic codes such that it is more complex than 26785 Open treatment of interphalangeal joint dislocation, includes internal fixation, when performed, single (RUC recommended work RVU =7.45 work RVU) and has similar complexity to 28645 Open treatment of metatarsophalangeal joint dislocation, includes internal fixation, when performed (RUC recommended work RVU=8.00). The RUC recommends 7.95 RVUs for 26715.
26735	Open treatment of phalangeal shaft fracture, proximal or middle phalanx, finger or thumb, includes internal fixation, when performed, each	090	8.40	The RUC reviewed CPT code 26735 Open treatment of phalangeal shaft fracture, proximal or middle phalanx, finger or thumb, includes internal fixation, when performed, each and compared it with its reference code 25608 Open treatment of distal radial intra-articular fracture or epiphyseal separation; with internal fixation of 2 fragments (work RVU=10.86). The RUC noted that the intra-service time for the surveyed code is less than the intra-service time for the reference code (60 minutes and 90 minutes, respectively). The RUC also compared the intensity/complexity measures of the surveyed code to the reference code and determined that the reference code required more physical effort and more psychological stress to perform than the surveyed code. With the lower amount of intra-service time and lower intensity/complexity measures as compared to 25608, the RUC agreed that the 25th percentile of survey, 8.40 work RVUs appropriately places 26735 in comparison to the reference code. Furthermore, the RUC compared the surveyed code with MPC code 14040 Adjacent tissue transfer or rearrangement, forehead, cheeks, chin, mouth, neck, axillae, genitalia, hands and/or feet; defect 10 sq cm or less (Work RVU=8.44) and agreed that 8.40 RVU was an approriate value for the surveyed code because the surveyed code had similar total-service time as compared to this procedure, 237 minutes and 223 minutes, respectively. The RUC recommends 8.40 work RVUs for 26735.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
26746	Open treatment of articular fracture, involving metacarpophalangeal or interphalangeal joint, includes internal fixation, when performed, each	090	11.10	The RUC reviewed CPT code 26746 Open treatment of articular fracture, involving metacarpophalangeal or interphalangeal joint, includes internal fixation, when performed, each and compared it to its reference code 25608 Open treatment of distal radial intra-articular fracture or epiphyseal separation; with internal fixation of 2 fragments (Work RVU=10.86). The RUC reviewed the total-service times for both codes and found them to be comparable, 303 minutes and 305 minutes. However, the RUC noted that the intensity/complexity measures for 26746 were significantly higher in comparison to 25608 as the complexity and risk for complication involved in 26746 is much greater than 25608. Therefore the RUC agreed that the median value of 11.10 RVU appropriately places this code in comparison to the reference code. For further support the RUC compared this procedure to MPC code 28299 Correction, hallux valgus (bunion), with or without sesamoidectomy; by double osteotomy (Work RVU=11.39) and determined that 11.10 work RVUs was appropriate for 26746 as 28299 has more intra- service time associated with it in comparison to 27832, 90 minutes and 83 minutes respectively. The RUC recommends 11.10 RVUs for 26746.
26765	Open treatment of distal phalangeal fracture, finger or thumb, includes internal fixation, when performed, each	090	6.60	The RUC reviewed CPT code 26765 Open treatment of distal phalangeal fracture, finger or thumb, includes internal fixation, when performed, each and compared it with its reference code 25652 Open treatment of ulnar styloid fracture (work RVU=7.92). The RUC noted that the intra-service time for the surveyed code is less than the intra-service time for the reference code (45 minutes and 60 minutes, respectively). The RUC also compared the intensity/complexity measures of the surveyed code and the reference code and determined that the reference code required more technical and physical effort, more psychological stress and had increased intensity to perform as compared to the surveyed code. With the lower amount of intra-service time and lower intensity/complexity measures as compared to 25652, the RUC agreed that the 25th percentile of survey, 6.60 work RVU appropriately places 26765 in comparison to the reference code. The RUC recommends 6.60 work RVUs for 26765.
26785	Open treatment of interphalangeal joint dislocation, includes internal fixation, when performed, single	090	7.45	The RUC reviewed CPT code 26785 Open treatment of interphalangeal joint dislocation, includes internal fixation, when performed, single and compared it with its reference code 25652 Open treatment of ulnar styloid fracture (work RVU=7.92). The RUC noted that the intra-service time for the surveyed code is less than the intra-service time for the reference code (45 minutes and 60 minutes, respectively). The RUC also compared the intensity/complexity measures of the surveyed code and the reference code and determined that the reference code required more technical and physical effort, more psychological stress and had increased intensity to perform as compared to the surveyed code. With the lower amount of intra-service time and lower intensity/complexity measures as compared to 25652, the RUC agreed that the 25th percentile of survey, 7.45 work RVU appropriately places 26785 in comparison to the reference code. The RUC recommends 7.45 work RVUs for 26785.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
27766	Open treatment of medial malleolus fracture, includes internal fixation, when performed	090	8.50	The RUC reviewed CPT code 27766 Open treatment of medial malleolus fracture, includes internal fixation, when performed and compared it with its reference code 25607 Open treatment of distal radial extra-articular fracture or epiphyseal separation, with internal fixation (work RVU=9.35). The RUC noted that the intra-service time for the surveyed code is less than the intra-service time for the reference code (45 minutes and 60 minutes, respectively). The RUC noted that this procedure requires a 99231 hospital stay because of the risk of post-operative complications. The RUC also compared the intensity/complexity measures of the surveyed code and the reference code and determined that the reference code required more technical skill, physical effort and more psychological stress to perform than the reference code. With the lower amount of intra-service time and lower intensity/complexity measures as compared to 25607, the RUC agreed that the 25th percentile of survey, 8.50 work RVU appropriately places 27766 in comparison to the reference code. The RUC noted that the proposed value for this procedure, 8.50 RVUs, is less than the existing value, 8.73 RVUs. The RUC recommends 8.50 work RVUs for 27766.
27784	Open treatment of proximal fibula or shaft fracture, includes internal fixation, when performed	090	10.45	The RUC reviewed CPT code 27784 Open treatment of proximal fibula or shaft fracture, includes internal fixation, when performed and compared it with its reference code 25607 Open treatment of distal radial extra-articular fracture or epiphyseal separation, with internal fixation (Work RVU=9.35). The RUC noted that the total service time of 27784 is higher than the total service time of the reference code, 281 minutes and 275 minutes, respectively. The RUC reviewed the intensity complexity measures associated with 27784 and 25607. The RUC noted that 27784 requires more technical skill, physical effort and psychological stress to perform than the reference code. With the higher amount of total service time of the surveyed code in comparison to the reference code and the higher intensity/complexity measures of the surveyed code in comparison to the reference code, the RUC agreed that the median of the survey, 10.45 RVUs appropriately places this code in comparison to the reference codes. For further support, the RUC compared this code to MPC code 66984 Extracapsular cataract removal with insertion of intraocular lens prosthesis (one stage procedure), manual or mechanical technique (eg, irrigation and aspiration or phacoemulsification) (Work RVU=10.36) and agreed that the recommended value of 10.45 RVU for 27784 was appropriate as the intra-service time for 27784 is significantly more than the 66984, 60 minutes and 30 minutes, respectively. The RUC recommends 10.45 RVUs for 27784.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
27792	Open treatment of distal fibular fracture (lateral malleolus), includes internal fixation, when performed	090	10.50	The RUC reviewed CPT code 27792 Open treatment of distal fibular fracture (lateral malleolus), includes internal fixation, when performed and compared it with its reference code 28299 Correction, hallux valgus (bunion), with or without sesamoidectomy; by double osteotomy (Work RVU=11.39). The RUC noted that the intra-service time of 27792 is significantly less than the intra-service time of the reference code, 60 minutes and 90 minutes, respectively. The RUC also noted that the care for this type of fracture is slightly more complex than 27784 Open treatment of proximal fibula or shaft fracture, includes internal fixation, when performed (RUC Recommended Value=10.45). With the lower amount of intra-service time of the surveyed code in comparison to the reference code and maintaining the proper rank order between the surveyed code and 27784, the RUC agreed that the median of the survey, 10.50 RVUs appropriately places this code in comparison to the reference codes. For further support, the RUC compared this code to MPC code 66984 Extracapsular cataract removal with insertion of intraocular lens prosthesis (one stage procedure), manual or mechanical technique (eg, irrigation and aspiration or phacoemulsification) (Work RVU=10.36) and agreed that the recommended value of 10.50 RVU for 27792 was appropriate as the intra-service time for 27792 is significantly more than the 66984, 60 minutes and 30 minutes, respectively. The RUC recommends 10.50 RVUs for 27792.
27814	Open treatment of bimalleolar ankle fracture, includes internal fixation, when performed	090	11.50	The RUC reviewed CPT code 27814 Open treatment of bimalleolar ankle fracture, includes internal fixation, when performed and compared it to its reference code 25609 Open treatment of distal radial intra-articular fracture or epiphyseal separation; with internal fixation of 3 or more fragments (Work RVU=14.12). The RUC compared the intra-service times for these procedures and noted that 27814 had less intra-service time associated with it as compared to 25609, 90 and 120 minutes, respectively. The RUC compared the intensity complexity measures of 27814 amd 25609 and noted that the reference code required more physical effort, mental effort and judgement to perform as compared to 23515. Therefore, the RUC agreed that the 25th percentile of the survey data, 11.50 RVUs, appropriately places this code in comparison to the reference code. For further support the RUC compared this procedure to MPC code 28299 Correction, hallux valgus (bunion), with or without sesamoidectomy; by double osteotomy (Work RVU=11.39) and determined that 11.50 work RVUs was appropriate for 27814 as 28299 has the less total service time than the 27814, 299 minutes and 346 minutes respectively. The RUC recommends 11.50 RVUs for 27814.
27822	Open treatment of trimalleolar ankle fracture, with internal fixation, when performed, medial and/or lateral malleolus; without fixation of posterior lip	090	12.12	The RUC reviewed CPT code 27822 Open treatment of trimalleolar ankle fracture, with internal fixation, when performed, medial and/or lateral malleolus; without fixation of posterior lip and agreed that there was not compelling evidence to review it because the nature of the work involved in providing this service has not substantially changed since the RUC last reviewed it in 2000. The RUC recommends that the new surveyed times be applied to this code and that the work RVUs for 27822 be maintained at its current value, 12.12.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
27823	Open treatment of trimalleolar ankle fracture, with internal fixation, when performed, medial and/or lateral malleolus; with fixation of posterior lip	090	14.26	The RUC reviewed CPT code 27823 Open treatment of trimalleolar ankle fracture, with internal fixation, when performed, medial and/or lateral malleolus; with fixation of posterior lip and agreed that there was not compelling evidence to review it because the nature of the work involved in providing this service has not substantially changed since the RUC last reviewed it in 2000. The RUC recommends that the new surveyed times be applied to this code and that the work RVUs for 27823 be maintained at its current value, 14.26 RVUs.
27826	Open treatment of fracture of weight bearing articular surface/portion of distal tibia (eg, pilon or tibial plafond), with internal fixation, when performed; of fibula only	090	12.00	The RUC reviewed CPT code 27826 Open treatment of fracture of weight bearing articular surface/portion of distal tibia (eg, pilon or tibial plafond), with internal fixation, when performed; of fibula only and compared it to its reference code 25609 Open treatment of distal radial intra-articular fracture or epiphyseal separation; with internal fixation of 3 or more fragments (Work RVU=14.12). The RUC agreed that the specialty society recommended 99214 office visit should be lowered to a 99213 office visit as this is more typical of the post-operative care for this procedure. This change in the post-operative visits results in three 99213 office visits and one 99212 office visits being associated with this procedure. The RUC noted that the intra-service time of the surveyed code was far less than the intra-service time of the reference code, 60 minutes and 120 minutes. The RUC compared the intensity/complexity mesaures for these procedures and noted that they were comparable. The RUC after revieweing these times and complexity measures associated with the key reference code and the surveyed code agreed that this surveyed code has the same amount of complexity and work as 25525 Open treatment of radial shaft fracture, with internal fixation, when performed, and closed treatment of dislocation of distal radioulnar joint (Galeazzi fracture/dislocation), with percutaneous skeletal fixation, when performed, 23630 Open treatment of greater humeral tuberosity fracture, includes internal fixation, when performed and 25585 Open treatment of talotarsal joint dislocation, includes internal fixation, when performed and therefore recommends that this procedure be valued the same as these other reference codes (all three codes RUC recommended RVU=12.00). The RUC recommends 12.00 RVUs for 27826. For further support, the RUC compared 27826 to MPC code 60220 Total thyroid lobectomy, unilateral; with or without isthmusectomy (Work RVU=12.29). The RUC noted that as 27826 has less intra-service time as compared to 60220, 60 minutes and 90 minutes, the recommended work RVU of 12.00 appropriately places this code in comparison to 60220 as well as the key reference code, 25609. The RUC recommends 12.00 RVU for 27826.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
27827	Open treatment of fracture of weight bearing articular surface/portion of distal tibia (eg, pilon or tibial plafond), with internal fixation, when performed; of tibia only	090	16.00	The RUC reviewed CPT code 27827 Open treatment of fracture of weight bearing articular surface/portion of distal tibia (eg, pilon or tibial plafond), with internal fixation, when performed; of tibia only and compared it with its reference code 27447 Arthroplasty, knee, condyle and plateau; medial AND lateral compartments with or without patella resurfacing (total knee arthroplasty) (Work RVU=23.04). The RUC agreed that the specialty society recommended 99214 office visit should be removed and replaced with a 99213 office visit as this is more typical of the post-operative care for this procedure. This change in the post-operative visits results in four 99213 office visits and one 99212 office visits being associated with this procedure. However, after comparing 27827 with 27447, the RUC determined that this reference code was not a suitable comparison after the determination was made that 28445 Open treatment of talus fracture, with or without internal or external fixation (Work RVU=17.07), originally part of this internal/external fixation review had no compelling evidence to be reviewed and the RUC recommended that its value be maintained, could now be used as an alternative reference code. The RUC compared the total service times for both procedures and determined at 28445 had a longer total service time in comparison to the surveyed code 485 minutes and 458 minutes. In addition, the RUC agreed that the intensity and complexity of performing 28445 would be greater than performing 27827. Therefore, the RUC agrees that the 25th percentile of the survey data accurately places this code in comparison to the reference code 28445. The RUC recommends 16.00 RVUs for 27827.
27828	Open treatment of fracture of weight bearing articular surface/portion of distal tibia (eg, pilon or tibial plafond), with internal fixation, when performed; of both tibia and fibula	090	20.00	The RUC reviewed CPT code 27828 Open treatment of fracture of weight bearing articular surface/portion of distal tibia (eg, pilon or tibial plafond), with internal fixation, when performed; of both tibia and fibula and compared it with its reference code 27447 Arthroplasty, knee, condyle and plateau; medial AND lateral compartments with or without patella resurfacing (total knee arthroplasty) (Work RVU=23.04). The RUC agreed that the specialty society recommended 99214 office visit should be removed and replaced with a 99213 office visit as this is more typical of the post-operative care for this procedure. This change in the post-operative visits results in four 99213 office visits and one 99212 office visits being associated with this procedure. However, after comparing 27828 with 27447, the RUC determined that this reference code was not a suitable comparison after the determination was made that 28445 Open treatment of talus fracture, with or without internal or external fixation (Work RVU=17.07), originally part of this internal/external fixation review had no compelling evidence to be reviewed, could now be used as an alternative reference code. The RUC compared the intra-service times for both procedures and determined at 27828 had a longer intra-service time in comparison to the reference code, 150 minutes and 125 minutes. In addition, the RUC agreed that the intensity and complexity of performing 27828 would be greater than performing 28445. Therefore, the RUC agrees that the 25th percentile of the survey data accurately places this code in comparison to the reference code 28445. The RUC recommends 20.00 RVUs for 27828.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
27829	Open treatment of distal tibiofibular joint (syndesmosis) disruption, includes internal fixation, when performed	090	9.50	The RUC reviewed CPT code 27829 Open treatment of distal tibiofibular joint (syndesmosis) disruption, includes internal fixation, when performed and compared it to its reference code 25607 Open treatment of distal radial extra-articular fracture or epiphyseal separation, with internal fixation. The RUC noted that although the reference code has more intra-service time compared with it than the reference code, 60 minutes and 45 minutes, respectively, that the surveyed code has more pre-service time associated with it as more time is required in 27829 to evaluate the fracture. The intensity and risk for complication involved in treating the distal tibia fracture is much greater than the intensity and risk for complication involved with 25607. This is demonstrated in the intensity/comlexity measures which demonstrates that 27829 requires more mental effort and judgement, more technical skill and physical effort and is an overall more intense code to perform than 25607. In addition, the surveyed code has more post-operative work in comparison to 25607, because 27829 requires hospitialization to avoid skin issues, swelling and to assess neurocirculatory status. Because of the greater amount of intensity as well as the hospitalization associated with this service, the RUC agreed the 25th percentile of the survey, 9.50 RVUs accurately places this procedure in comparison to the reference code. The RUC recommends 9.50 RVUs for 27829.
27832	Open treatment of proximal tibiofibular joint dislocation, includes internal fixation, when performed, or with excision of proximal fibula	090	11.00	The RUC reviewed CPT code 27832 Open treatment of proximal tiblofibular joint dislocation, includes internal fixation, when performed, or with excision of proximal fibula and compared it to its reference code 25608 Open treatment of distal radial intra-articular fracture or epiphyseal separation; with internal fixation of 2 fragments (Work RVU=10.86). The RUC reviewed the total-service times for both codes and found them to be comparable, 301 minutes and 305 minutes. However, the RUC noted that the intensity/complexity measures for 27832 were significantly higher in comparison to 25608 as the complexity and risk for complication involved in open treatment of the trimalleolar ankle fracture is much greater than 25608. Therefore the RUC agreed that the median value of 11.00 RVU appropriately places this code in comparison to the reference code. For further support the RUC compared this procedure to MPC code 28299 Correction, hallux valgus (bunion), with or without sesamoidectomy; by double osteotomy (Work RVU=11.39) and determined that 11.00 work RVUs was appropriate for 27832 as 28299 has more intra- service time associated with it in comparison to 27832, 90 minutes and 75 minutes respectively. The RUC recommends 11.00 RVUs for 27832.
28415	Open treatment of calcaneal fracture, includes internal fixation, when performed;	090	17.54	The RUC reviewed CPT code 28415 Open treatment of calcaneal fracture, includes internal fixation and recommended that a 99214 office visit should be removed and substituted with a 99213 office visit as this is more typical of the post-operative care for this procedure. This change in the post-operative visits results in four 99213 office visits and one 99212 office visits being associated with this procedure. The RUC agreed that the new survey time data for this procedure further validated the existing work RVUs for this procedure and recommend maintaing the value for this code. The RUC recommends that the new surveyed times be applied to this code and maintaining the current work of 17.54 RVUs for 28415.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
28420	Open treatment of calcaneal fracture, includes internal fixation, when performed; with primary iliac or other autogenous bone graft (includes obtaining graft)	090	19.00	The RUC reviewed CPT code 28420 Open treatment of calcaneal fracture, includes internal fixation, when performed; with primary iliac or other autogenous bone graft (includes obtaining graft) and compared it with its reference code 27487 Revision of total knee arthroplasty, with or without allograft; femoral and entire tibial component (Work RVU=26.91). The RUC agreed that the specialty society recommended 99214 office visit should be removed and replaced with a 99213 office visit as this is more typical of the post-operative care for this procedure. This change in the post-operative visits results in four 99213 office visits and one 99212 office visits being associated with this procedure. However, after comparing 28420 with 27847, the RUC determined that this reference code was not a suitable comparison after the determination was made that 28445 Open treatment of talus fracture, with or without internal or external fixation (Work RVU=17.07), originally part of this internal/external fixation review had no compelling evidence to be reviewed, could now be used as an alternative reference code as the RUC recommended that the value for this service be maintained at its existing value. The RUC compared the intra-service times for both procedures and determined at 28420 had a longer intra-service time in comparison to the reference code, 150 minutes and 125 minutes. In addition, the RUC agreed that the intensity and complexity of performing 28420 would be greater than performing 28445. Therefore, the RUC agrees that the 25th percentile of the survey data accurately places this code in comparison to the reference code 28445. The RUC recommends 19.00 RVUs for 28420.
28445	Open treatment of talus fracture, includes internal fixation, when performed	090	17.07	The RUC reviewed CPT code 28445 Open treatment of talus fracture, includes internal fixation, when performed and agreed that there was not compelling evidence to review it because the nature of the work involved in providing this service has not substantially changed. The RUC recommends that the new surveyed times be applied to this code and that the work RVUs for 28445 be maintained at its current value, 17.07 RVUs.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
28465	Open treatment of tarsal bone fracture (except talus and calcaneus), includes internal fixation, when performed, each	090	9.50	The RUC reviewed CPT code 28465 Open treatment of tarsal bone fracture (except talus and calcaneus), includes internal fixation, when performed, each and compared it with its reference code 25608 Open treatment of distal radial intra-articular fracture or epiphyseal separation; with internal fixation of 2 fragments (Work RVU=10.86). The RUC noted that the intra-service time for the surveyed code is less than the intra-service time for the reference code (60 minutes and 90 minutes, respectively). In addition, the number of post-operative visits is not the same as the surveyed code includes two 99213 and two 99212 office visits compared to the reference code with three 99213 office visits and two 99212, which suggests the surveyed code involves less complex post operative care as compared to the reference code. However, the RUC also compared this procedure to 24685 Open treatment of ulnar fracture proximal end (olecranon process), includes internal fixation, when performed (RUC recommended work RVU=9.50) and 27829 Open treatment of distal tibiofibular joint (syndesmosis) disruption, includes internal fixation, when performed (RUC Recommended work RVU=9.50). The RUC agreed that all of these procedures had similar complexity and should have similar work RVUs. With the lower amount of intra-service time and the differences in the post-operative visits as compared to 25608, the RUC agreed that 9.50 work RVU appropriately places 28465 in comparison to 25608, 24685 and 27829. The RUC recommends 9.50 work RVUs for 28465.
28485	Open treatment of metatarsal fracture, includes internal fixation, when performed, each	090	8.00	The RUC reviewed CPT code 28485 Open treatment of metatarsal fracture, includes internal fixation, when performed, each and compared it with its reference code 28299 Correction, hallux valgus (bunion), with or without sesamoidectomy; by double osteotomy (Work RVU=11.39). The RUC noted that the intra-service time for the surveyed code is less than the intra-service time for the reference code (60 minutes and 90 minutes, respectively). The number of post-operative visits is the same but the surveyed code includes two 99213 and two 99212 office visits compared to the reference code with three 99213 office visits and one 99212 office visit, which suggests the surveyed code involves less complex post operative care as compared to the reference code. The RUC noted that the reference code required more mental effort and judgement, more technical kill and physical effort and greater psychological stress to perform than the surveyed code. Also, the RUC also compared this procedure to 26615 Open treatment of carpometacarpal dislocation, other than thumb; includes internal fixation, when performed, each joint (RUC recommended work RVU=8.00), 28645 Open treatment of metatarsophalangeal joint dislocation, includes internal fixation, when performed (RUC Recommended work RVU=8.00) and 26615 Open treatment of metacarpal fracture, single, includes internal fixation, when performed, each bone (RUC recommended work RVU=8.00). The RUC agreed that all of these procedures had similar complexity and should have similar work RVUs. With the lower amount of intra-service time and the differences in the post-operative visits as well as the lower intensity and complexity measures as compared to 28299, the RUC agreed that 8.00 work RVU appropriately places 28485 in comparison to 28299, 26685, 28645 and 26615. The RUC recommends 8.00 work RVUs for 28485.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
28505	Open treatment of fracture great toe, phalanx or phalanges, includes internal fixation, when performed	090	8.00	The RUC reviewed CPT code 28505 Open treatment of fracture great toe, phalanx or phalanges, includes internal fixation, when performed and compared it with its reference code 28750 Arthrodesis, great toe; metatarsophalangeal joint (Work RVU=8.37). The RUC noted that the intra-service time for the surveyed code is less than the intra-service time for the reference code (45 minutes and 75 minutes, respectively). Additional pre-service time is associated with the surveyed code because this procedure involves the evaluation of a fracture which requires additional positioning and prep time as compared to the reference code. The number of post-operative visits is the same but the surveyed code includes two 99213 and two 99212 office visits compared to the reference code with four 99213 office visits, which suggests the surveyed code involves less complex post operative care as compared to the reference code. However, the RUC also compared this procedure to 26685 Open treatment of carpometacarpal dislocation, other than thumb; includes internal fixation, when performed, each joint (RUC recommended work RVU=8.00), 28645 Open treatment of metatarsophalangeal joint dislocation, includes internal fixation, when performed (RUC Recommended work RVU=8.00) and 26615 Open treatment of metacarpal fracture, single, includes internal fixation, when performed, each bone (RUC recommended work RVU=8.00). The RUC agreed that all of these procedures had similar complexity and should have similar work RVUs. With the lower amount of intra-service time and the differences in the post-operative visits as compared to 28750, the RUC agreed that 8.00 work RVU appropriately places 28525 in comparison to 28750, 26685, 28645 and 26615. The RUC recommends 8.00 work RVUs for 28505.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
28525	Open treatment of fracture, phalanx or phalanges, other than great toe, includes internal fixation, when performed, each	090	6.00	The RUC reviewed CPT code 28525 Open treatment of fracture, phalanx or phalanges, other than great toe, includes internal fixation, when performed, each and compared it with its reference code 28289 Hallux rigidus correction with cheilectomy, debridement and capsular release of the first metatarsophalangeal joint (Work RVU=8.11). The RUC noted that the intra-service time for the surveyed code is less than the intra-service time for the reference code (30 minutes and 45 minutes, respectively). Additional pre-service time is associated with the surveyed code because this procedure involves a fracture with fixation, which requires more positioning and prep time as compared to the reference code. The number of post-operative visits is the same but the surveyed code includes two 99213 and two 99212 office visits compared to the reference code with four 99213 office visits, which suggests the surveyed code involves a less complex post operative care as compared to the reference code. The RUC also compared the intensity/complexity measures of the surveyed code and the reference code and determined that the reference code required more technical and physical skill, more psychological stress and had increased intensity to perform as compared to the surveyed code. With the lower amount of intra-service time and lower intensity/complexity measures as compared to 28289, the RUC agreed that the 25th percentile of survey, 6.00 work RVU appropriately places 28525 in comparison to the reference code. Furthermore, the RUC compared the surveyed code with MPC code 11646 Excision, malignant lesion including margins, face, ears, eyelids, nose, lips; excised diameter over 4.0 cm (Work RVU=6.21) and agreed that 6.00 RVU was an approriate value for the surveyed code because the surveyed code had significantly less intra-service time than this procedure, 30 minutes and 60 minutes, respectively. The RUC recommends 6.00 work RVUs for 28525.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
28555	Open treatment of tarsal bone dislocation, includes internal fixation, when performed	090	10.43	The RUC reviewed CPT code 28555 Open treatment of tarsal bone dislocation, includes internal fixation, when performed and compared it with its reference code 28261 Capsulotomy, midfoot; with tendon lengthening (Work RVU=12.91). The RUC noted that the intra-service time of 28555 is significantly less than the intra-service time of the reference code, 60 minutes and 103 minutes, respectively. The RUC reviewed the post-operative visits for this service and determined that to make this service comparable to other codes within the family, 27784 Open treatment of proximal fibula or shaft fracture, includes internal fixation, when performed (RUC recommended work RVU=10.45) and 27792 Open treatment of distal fibular fracture (lateral malleolus), includes internal fixation, when performed (RUC recommended work RVU=10.50), that the specialty societies' recommendation of including a 99214 office visit should be removed from the post-operative visits associated with this code as only two 99213 and two 99212 office visits is more typical of the post-operative care for the typical patient. With the lower amount of intra-service time of the surveyed code in comparison to the reference code and the same post-operative visits as 27784 and 27792, the RUC agreed that the 25th percentile of the survey, 10.43 RVUs appropriately places this code in comparison to the reference codes. For further support, the RUC compared this code to MPC code 66984 Extracapsular cataract removal with insertion of intraocular lens prosthesis (one stage procedure), manual or mechanical technique (eg, irrigation and aspiration or phacoemulsification) (Work RVU=10.36) and agreed that the recommended value of 10.43 RVU for 28555 was appropriate as the intra-service time for 28555 is significantly more than the 66984, 60 minutes and 30 minutes, respectively. The RUC recommends 10.43 RVUs for 28555.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
28585	Open treatment of talotarsal joint dislocation, includes internal fixation, when performed	090	12.00	The RUC reviewed CPT code 28585 Open treatment of talotarsal joint dislocation, includes internal fixation, when performed and compared it with its reference code 28299 Correction, hallux valgus (bunion), with or without sesamoidectomy; by double osteotomy (work RVU=11.39). The RUC agreed that the specialty society recommended 99214 office visit should be lowered to a 99213 office visit as this is more typical of the post-operative care for this procedure. This change in the post-operative visits results in three 99213 office visits and two 99212 office visits being associated with this procedure. With this change, the RUC noted that the total service times for 28585 is greater than the reference code, 324 minutes and 299 minutes. Additionally, the RUC noted that the surveyed code required greater mental effort and judgement and physicial effort to perform in comparison to the reference code. This intensity of this service is much in part due to the joint that is operated on as it is more proximal and involves larger bones as compared to the tarsometatarsal dislocation procedure. Two bones are involved in this type of dislocation and the risk for post-operative complications is high. Therefore, due more total service time and greater intensity/complexity measures as compared to the reference code, the RUC recommends the 25th percentile of the survey, 12.00 RVUs for this procedure. For further support, the RUC compared 28585 to MPC code 60220 Total thyroid lobectomy, unilateral; with or without isthmusectomy (Work RVU=12.29). The RUC noted that as 28585 has less intra-service time as compared to 60220, 75 minutes and 90 minutes, the recommended work RVU of 12.00 appropriately places this code in comparison to 60220 as well as the reference code, 28299. The RUC recommends 12.00 RVUs for 28585.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
28615	Open treatment of tarsometatarsal joint dislocation, includes internal fixation, when performed	090	11.50	The RUC reviewed CPT code 28615 Open treatment of tarsometatarsal joint dislocation, includes internal fixation, when performed and compared it to its reference code 28299 Correction, hallux valgus (bunion), with or without sesamoidectomy; by double osteotomy (Work RVU=11.39). After hearing the specialty societies' presentation for this code agreed that an additional 10 minutes of pre-service evaluation time and an additional 5 minutes of pre-service scrub, dress and wait time was needed to account for the fact that this procedure involves two bones which increases the complexity and risk associated with this procedure and consequently increases the evaluation and scrub, dress and wait time. Furthermore, the RUC agreed that the specialty society recommended 99214 office visit should be lowered to a 99213 office visit as this is more typical of the post-operative care for this procedure. This change in the post-operative visits results in three 99213 office visits and two 99212 office visits being associated with this procedure. With these changes, the RUC noted that 28615 had more total service time than the reference code, 323 minutes and and 299 minutes respectively. Further, the surveyed code requires greater technical skill, physicial effort and psychgological stress to perform in comparison to the reference code. Therefore the RUC agreed that the approriate value for this procedure is the 25th percentile of the survey data, 11.50 RVUs as this value appropriately places this code in comparison to the reference code. For further support the RUC compared this procedure to 28555 Open treatment of tarsal bone dislocation, includes internal fixation, when performed (RUC recommended RVU=10.43). As treating the type of dislocation involved in 28615 is more difficult than treating a dislocation involving a single bone as in 28555, the proposed value of 11.50 RVU appropriately place this procedure in comparison to 28555. The RUC recommends 11.50 RVUs for 28615
28645	Open treatment of metatarsophalangeal joint dislocation, includes internal fixation, when performed	090	8.00	The RUC reviewed CPT code 28645 Open treatment of metatarsophalangeal joint dislocation, includes internal fixation, when performed and compared it with its reference code 28292 Correction, hallux valgus (bunion), with or without sesamoidectomy; Keller, McBride, or Mayo type procedure (work RVU=8.72). The RUC noted that the intra-service time for the surveyed code is less than the intra-service time for the reference code (45 minutes and 60 minutes, respectively). The number of post-operative visits is the same but the surveyed code includes two 99213 and two 99212 office visits compared to the reference code with four 99213 office visits, which suggests the surveyed code has a less complex post operative care as compared to the reference code. The RUC also compared the intensity/complexity measures of the surveyed code to the reference code and determined that the reference code required more technical skill and more psychological stress. With the lower amount of intra-service time and lower intensity/complexity measures as compared to 28292, the RUC agreed that the 25th percentile of survey, 8.00 work RVU appropriately places 28645 in comparison to the reference code. The RUC recommends 8.00 work RVUs for 28645.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
28675	Open treatment of interphalangeal joint dislocation, includes internal fixation, when performed	090	6.00	The RUC reviewed CPT code 28675 Open treatment of interphalangeal joint dislocation, includes internal fixation, when performed and compared it with 28288 Ostectomy, partial, exostectomy or condylectomy, metatarsal head, each metatarsal head (work RVU=5.81). The RUC compared the service times of both procedures and noted that although the intra-service times are the same (30 minutes), 28675 had considerable more pre-service time associated with it than 28288 (55 minutes and 20 minutes, respectively). The surveyed code has more pre-service time associated with it because in involves a dislocation requiring fixation, which requires additional positioning and prep time. The reference code does not require fixation. Furthermore, the RUC noted that when comparing the intensity/complexity measures of the surveyed code to the reference code that the surveyed code requires greater mental effort and judgement and more overall intensity to perform than the reference code. Therefore, the RUC agreed that because of the greater amount of time and the greater mental effort and judgement associated with the surveyed code in comparison to the reference code, the RUC recommends survey median RVU, 6.00 RVUs for 28675. The RUC recommends 6.00 RVUs for 28675.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
2005 FIVE YEAR REVIEW - SUMMARY OF RECOMMENDATION

CPT Code:23515 Tracking Number F3 Specialty Society Recommended RVU: **11.00**
Global Period: 090 RUC Recommended RVU: **11.00**

CPT Descriptor: Open treatment of clavicular fracture, includes internal fixation, when performed

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 17-year-old male falls and lands on his right shoulder and suffers a displaced clavicle fracture requiring open reduction and internal fixation.

Percentage of Survey Respondents who found Vignette to be Typical: 70%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work:
- Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
- Verify that all required instruments and supplies are available – with special attention to plates and screws

Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulation drapes
- Assess position of the extremities and head, adjust as needed
- The patient's shoulder is placed on the surgery table. A bolster is placed under the scapula to position the shoulder/clavicle.
- Indicate areas of skin to be prepped and mark surgical incisions.
- The arm and shoulder are prepped and draped.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work:
An incision is made over the clavicular shaft. Hemostasis is meticulously controlled with electrocautery. The periosteum, with the trapezial and deltoid fascia, is elevated and the fracture site and configuration is confirmed. Options are reviewed and the fracture reduction is performed. Because of the proximity of the neurovascular structures underneath the clavicle, extreme caution is exercised to protect these structures. Often an interfragmentary screw is required to maintain a reduction while plates or screws are placed to stabilize the fracture. Multiple plating and screw configurations are possible. Rarely four screws are adequate and more often six, eight or ten screws are required to plate and screw the fracture. Once the fracture is reduced and secured with plate and screws the wound is copiously irrigated with antibiotic saline. The periosteum is repaired and the wound is closed in layers.

Description of Post-Service Work:
Post-service work: in facility

Application of bulky dressing and a sling.

Monitor patient stabilization in the recovery room.
- Consultation with the family and patient regarding the surgery and postoperative regimen.
- Communication with health care professionals including written and oral reports and orders.
- Postoperative care is coordinated with recovery room nursing staff.
- The patient's vital signs are checked.

- The circulation, sensation and motor function of the operated extremity are assessed.
- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Write prescriptions for medications needed post-discharge.
- Dictation of an operative report
- Procedure note is written in the patient chart
- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of sling/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order occupational therapy
- Supervision of rehabilitation
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions
- Dictate progress notes for medical record

COMPELLING EVIDENCE RATIONALE (Required to be Completed)

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

- ***Evidence that technology has changed physician work.***

Surgical treatment using open anatomical reduction and internal fixation has been made more complex with the introduction of new imaging methods such as CT which allow better detection of the fracture pathology and provided the basis for new surgical strategies. There are also new internal fixation devices which require more work. Beginning in the 1990s (after the Harvard study), new plates were developed for fracture repair, with most becoming available in the late 1990s and early 2000s. As an example of the complexity of the decision process in current practice, the 1990's have given the surgeon numerous options for bone fixation. The options for a bone fixation device currently include Kirschner wires, wire, staples, screws, as well as newer alternatives such as headless bone screws, T-screws, absorbable pins, cannulated screws, and a myriad of plates. The goal of all these devices remains constant: that is, to achieve stable approximation of bone fragments to facilitate healing. The various devices afford rigid fixation along with compression of the osseous fragments. This allows early range of motion and preservation of surrounding joint function, as well as primary bone healing. Selection of the most advantageous form of fixation is dependent on many factors and takes considerable time in the pre-evaluation of a patient. These include the type of fracture or osteotomy created, bone density, type of bone, and the desire for interfragmental compression. All of this has resulted in more work. The standards of care (fracture reduction, limb alignment, etc.) have also been elevated by literature that shows fracture displacements and poor alignments lead to poorer results. Additionally, women over 50 is a fast growing segment of our population. A huge percentage of these patients are osteoporotic - making fracture fixation and maintenance of fixation far more difficult than it used to be. The new plates are more complex to insert when the underlying bone is of much poorer quality.

Given this information, we believe there is compelling evidence that ORIF is more complex than 5 years ago and this is even more true in comparison to practice in the late 1980s (or more than 25 years ago).

- ***Evidence that incorrect assumptions were made in the previous valuation of the service; a misleading vignette and/or survey in a previous evaluation***

During the period of 1989-1991 (after the Harvard study), a major effort was undertaken by the AAOS and the OTA to rewrite every fracture and dislocation treatment code in the musculoskeletal Section of CPT. In 1991, 395 code changes were accepted by the AMA CPT Editorial Panel under the leadership of Dr. William Felts. At the time of the original proposal, some of the code descriptors were changed from those submitted (presumably by the CPT staff), and published in the 1992 and subsequent editions. Some of the changes in the descriptors published in CPT 1992 didn't make sense, but in those years, the CPT process was closed-door. Additionally, in 1992 and 1993 the AMA staff were deluged by the implementation of the RBRVS process and though AAOS and OTA requested that these problems be addressed then, AMA CPT staff asked that i be deferred as their "plate was full." After that time, more important issues and other opportunities consumed the resources of the AAOS and inertia (or the lack thereof) took over. This third five year review, after completion of the practice expense review, allowed AAOS a window of time to again try to correct the nomenclature for these codes, and review their work using the standard RUC survey method.

We also note, that at the time of the original CPT proposal, external fixation was considered an adjunctive procedure. CPT instructed that the codes for external fixation (20690 and 20692) be "listed in addition to the code for the treatment ...of the fracture." This concept still applies today. External fixation can be used as an adjunctive stabilization modality when treating fractures by almost any method. However, external fixation can also be used in reconstructive orthopaedics (for example, the treatment of joint contractures) and for non-musculoskeletal system treatments (for example, as a suspension device in the treatment of lower extremity burns). In 1991, there was no Modifier -51 exempt code category. Today, these same codes, 20690 and 20692 for external fixator application are modifier -51 exempt, recognizing that they can stand alone or be used adjunctively. Because of the modifier -51 exemption, the RVUs have been reduced, so payers are not paying double when either of these codes are reported with another treatment code.

In the 2005 comment letter to CMS, the AAOS recommended examining the physician work for the ORIF codes because the code descriptors lacked clarity. In particular, because the CPT descriptors include the phrase "with or without internal or external fixation," it is difficult to imagine what the Harvard survey data actually represents (ie, no typical patient was described for the survey respondents to focus on). Further, after the descriptors for these codes were changed for CPT 1993, an Abt study was performed in 1992 for RUC consideration. This study produced *percentage* relationships to key reference codes, but not surveyed time and visit data. Some of these recommendations were accepted by the RUC and CMS and others were adjusted up or down, but no changes were made to the Harvard time and visit data, if available. Therefore, we believe that there is little, if any, relationship between the Harvard database time and visit information (from the old CPT codes) and the current work RVUs.

Given this information, we believe there is compelling evidence that the current work values and/or time and visit data may be incorrect and outdated and should be reviewed.

- *Evidence that incorrect assumptions were made in the previous valuation of the service, as documented; a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data*

Harvard utilized the AMA Physician Masterfile to draw names for their surveys. While general orthopaedic surgeons can perform open reduction fracture care, it is more typical for patients to be referred to orthopaedic surgeons who specialize in orthopaedic trauma or in a given anatomical area (eg, shoulder, hand, knee, etc.). We do not believe that all specialty surgeons were surveyed for these codes, since the AMA Masterfile did not delineate orthopaedic specialties. Additionally, podiatrists were not surveyed for any of the lower extremity codes.

Given this information, we believe there is compelling evidence that not all involved specialties were involved in the review of these codes.

A consensus committee of physicians representing the American Academy of Orthopaedic Surgeons, American Shoulder and Elbow Surgeons, Society for Surgery of the Hand, Arthroscopy Association of North America, Orthopaedic Trauma Association, American Podiatric Medical Association, and American Orthopaedic Foot and Ankle Society met by conference call to discuss the survey data for the revised orthopaedic codes and data for the key reference codes and other codes on the survey reference service lists.

For revised code 23515, we recommend 11.00 work RVUs. After considering differences in time and visits, along with differences in intra-operative work, we believe this value correctly ranks code 23515 relative to other ORIF codes, relative to the key reference code, and relative to orthopaedic codes from the survey reference service list.

›y reference code 29827 requires more total work than 23515, although the fracture reduction and fixation can be ›omplex because of the common occurrence of significant comminution, the procedure is straightforward and not as intense/complex as 29827. Additionally, the neurovascular structures, most notably the subclavian vein, run directly under the clavicle and are at risk during the procedure. The consensus panel believes that 25th percentile work RVU correctly reflects the relationship to 29827.

Neurovascular injury may occur with this type of fracture and multiple post-operative visits are necessary. The first office visit would include removal of the sling and dressing, redressing, discussion of restrictions and operative findings, reapplication of sling and instruction on ROM. X-rays would be reviewed. The second visit would be for sling and dressing removal, suture removal and X-rays would be taken and reviewed. The sling would be reapplied and restrictions discussed. The third visit would include assessment of wound healing and ROM. X-rays would be taken and reviewed assess bone alignment and healing. Motion exercises would be prescribed. The final visit would assess ROM and X-r would be taken and reviewed to assess bone healing.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No
   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FIVE YEAR REVIEW SPECIFIC QUESTIONS:

Please indicate the number of survey respondent percentages responding to each of the following questions (for example 0.05 = 5%):
Has the work of performing this service changed in the past 5 years? Yes 50% No 50%
(Use the subset of the people who responded "Yes" to answer the following questions)

A. This service represents new technology that has become more familiar (i.e., less work):
   I agree 0% I do not agree 100%
B. Patients requiring this service are now:
   more complex (more work) 100% less complex (less work) 0% no change 0%
C. The usual site-of-service has changed:
   from outpatient to inpatient 0% from inpatient to outpatient 20% no change 80%

Attestation Statement

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
2005 FIVE YEAR REVIEW - SUMMARY OF RECOMMENDATION

CPT Code:23585 Tracking Number F4 Specialty Society Recommended RVU: **16.25**
Global Period: 090 RUC Recommended RVU: **16.25**

CPT Descriptor: Open treatment of scapular fracture (body, glenoid or acromion) includes internal fixation

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 25-year-old male falls and suffers a displaced scapular fracture requiring open reduction and internal fixation.

Percentage of Survey Respondents who found Vignette to be Typical: 70%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work:
- Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
- Verify that all required instruments and supplies are available – with special attention to plates and screws
- Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulation drapes
- Assess position of the extremities and head, adjust as needed
- The patient's shoulder is placed on the surgery table. The patient is placed in the lateral decubitus or prone position. The arm and shoulder are prepped and draped.
- Indicate areas of skin to be prepped and mark surgical incisions.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work:
An incision is made over the scapula. Because of the scapular anatomy, the approach to the fracture maybe extremely variable and multiple. Hemostasis is meticulously controlled with electrocautery. The periosteum, with the trapezial, deltoid, supra or infraspinatus fascia, is elevated and the fracture site and configuration is confirmed. Options are reviewed and the fracture reduction is performed. Because of the proximity of the neurovascular structures and the chest wall, extreme caution is exercised to protect these structures. Often an interfragmentary screw is required to maintain a reduction while plates or screws are placed to stabilize the fracture. Multiple plating and screw configurations are possible and frequently necessary. Because of the anatomy, often two plates are required. Once the fracture is reduced and secured with plate and screws the wound is copiously irrigated with antibiotic saline. The periosteum is repaired and the wound is closed in layers.

Description of Post-Service Work:
Post-service work: in facility
- Application of bulky dressing and a sling.
- Monitor patient stabilization in the recovery room.
- Consultation with the family and patient regarding the surgery and postoperative regimen.
- Communication with health care professionals including written and oral reports and orders.
- Postoperative care is coordinated with recovery room nursing staff.
- The patient's vital signs are checked.

- The circulation, sensation and motor function of the operated extremity are assessed.
- The patient is discharged to the orthopaedic floor for monitoring of compartment syndrome. This requires removing and reapplying the dressings.

Discharge day:

- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Write prescriptions for medications needed post-discharge.
- Dictation of an operative report
- Procedure note is written in the patient chart
- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of sling/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order occupational therapy
- Supervision of rehabilitation
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions
- Dictate progress notes for medical record

Post-Service intensity/complexity	3.25	2.33

COMPELLING EVIDENCE RATIONALE (Required to be Completed)

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

- ***Evidence that technology has changed physician work.***

Surgical treatment using open anatomical reduction and internal fixation has been made more complex with the introduction of new imaging methods such as CT which allow better detection of the fracture pathology and provided the basis for new surgical strategies. There are also new internal fixation devices which require more work. Beginning in the 1990s (after the Harvard study), new plates were developed for fracture repair, with most becoming available in the late 1990s and early 2000s. As an example of the complexity of the decision process in current practice, the 1990's have given the surgeon numerous options for bone fixation. The options for a bone fixation device currently include Kirschner wires, wire, staples, screws, as well as newer alternatives such as headless bone screws, T-screws, absorbable pins, cannulated screws, and a myriad of plates. The goal of all these devices remains constant: that is, to achieve stable approximation of bone fragments to facilitate healing. The various devices afford rigid fixation along with compression of the osseous fragments. This allows early range of motion and preservation of surrounding joint function, as well as primary bone healing. Selection of the most advantageous form of fixation is dependent on many factors and takes considerable time in the pre-evaluation of a patient. These include the type of fracture or osteotomy created, bone density, type of bone, and the desire for interfragmental compression. All of this has resulted in more work. The standards of care (fracture reduction, limb alignment, etc.) have also been elevated by literature that shows fracture displacements and poor alignments lead to poorer results. Additionally, women over 50 is a fast growing segment of our population. A huge percentage of these patients are osteoporotic - making fracture fixation and maintenance of fixation far more difficult than it used to be. The new plates are more complex to insert when the underlying bone is of much poorer quality.

Given this information, we believe there is compelling evidence that ORIF is more complex than 5 years ago and this is even more true in comparison to practice in the late 1980s (or more than 25 years ago).

- ***Evidence that incorrect assumptions were made in the previous valuation of the service; a misleading vignette and/or survey in a previous evaluation***

During the period of 1989-1991 (after the Harvard study), a major effort was undertaken by the AAOS and the OTA to rewrite every fracture and dislocation treatment code in the musculoskeletal Section of CPT. In 1991, 395 code changes were accepted by the AMA CPT Editorial Panel under the leadership of Dr. William Felts. At the time of the original proposal, some of the code descriptors were changed from those submitted (presumably by the CPT staff), and published in the 1992 and subsequent editions. Some of the changes in the descriptors published in CPT 1992 didn't make sense, but in those years, the CPT process was closed-door. Additionally, in 1992 and 1993 the AMA staff were deluged by the implementation of the RBRVS process and though AAOS and OTA requested that these problems be addressed then, AMA CPT staff asked that be deferred as their "plate was full." After that time, more important issues and other opportunities consumed the resources of the AAOS and inertia (or the lack thereof) took over. This third five year review, after completion of the practice expense review, allowed AAOS a window of time to again try to correct the nomenclature for these codes, and review their work using the standard RUC survey method.

We also note, that at the time of the original CPT proposal, external fixation was considered an adjunctive procedure. CPT instructed that the codes for external fixation (20690 and 20692) be "listed in addition to the code for the treatment ...of the fracture." This concept still applies today. External fixation can be used as an adjunctive stabilization modality when treating fractures by almost any method. However, external fixation can also be used in reconstructive orthopaedics (for example, the treatment of joint contractures) and for non-musculoskeletal system treatments (for example, as a suspension device in the treatment of lower extremity burns). In 1991, there was no Modifier -51 exempt code category. Today, these same codes, 20690 and 20692 for external fixator application are modifier -51 exempt, recognizing that they can stand alone or be used adjunctively. Because of the modifier -51 exemption, the RVUs have been reduced, so payers are not paying double when either of these codes are reported with another treatment code.

In the 2005 comment letter to CMS, the AAOS recommended examining the physician work for the ORIF codes because the code descriptors lacked clarity. In particular, because the CPT descriptors include the phrase "with or without internal or external fixation," it is difficult to imagine what the Harvard survey data actually represents (ie, no typical patient was described for the survey respondents to focus on). Further, after the descriptors for these codes were changed for CPT 1993, an Abt study was performed in 1992 for RUC consideration. This study produced *percentage* relationships to key reference codes, but not surveyed time and visit data. Some of these recommendations were accepted by the RUC and CMS and others were adjusted up or down, but no changes were made to the Harvard time and visit data, if available. Therefore, we believe that there is little, if any, relationship between the Harvard database time and visit information (from the old CPT codes) and the current work RVUs.

Given this information, we believe there is compelling evidence that the current work values and/or time and visit data may be incorrect and outdated and should be reviewed.

- *Evidence that incorrect assumptions were made in the previous valuation of the service, as documented; a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data*

Harvard utilized the AMA Physician Masterfile to draw names for their surveys. While general orthopaedic surgeons can perform open reduction fracture care, it is more typical for patients to be referred to orthopaedic surgeons who specialize in orthopaedic trauma or in a given anatomical area (eg, shoulder, hand, knee, etc.). We do not believe that all specialty surgeons were surveyed for these codes, since the AMA Masterfile did not delineate orthopaedic specialties. Additionally, podiatrists were not surveyed for any of the lower extremity codes.

Given this information, we believe there is compelling evidence that not all involved specialties were involved in the review of these codes.

A consensus committee of physicians representing the American Academy of Orthopaedic Surgeons, American Shoulder and Elbow Surgeons, Society for Surgery of the Hand, Arthroscopy Association of North America, Orthopaedic Trauma Association, American Podiatric Medical Association, and American Orthopaedic Foot and Ankle Society met by conference call to discuss the survey data for the revised orthopaedic codes and data for the key reference codes and other codes on the survey reference service lists.

For revised code 23585, we recommend 16.25 work RVUs. After considering differences in time and visits, along with differences in intra-operative work, we believe this value correctly ranks code 23585 relative to other ORIF codes, relative to the key reference code, and relative to orthopaedic codes from the survey reference service list.

This is one of the most complex of the procedures performed for reduction and internal fixation of shoulder fractures. This typically requires an extensive exposure of the scapula, with significant muscle dissection, and identification and protection of the suprascapular nerve and artery. Fixation typically requires multiple plates and screws.
23585 requires less postoperative work than the key reference code 27447. the consensus panel felt that the 25th percentile correctly reflected the difference in time and work. This value of 16.25 also correctly places 23585 greater than 23680 and less than 23616.

Postoperative close monitoring is required for assessment of the circulation, sensation and motor function of the involved extremity, as well as evaluation and management of pain control. Hospital work involves removal of the immobilization device, as well as a dressing changes, with each wound inspection. Physical therapy would be started and a discussion with the patient and therapist regarding the protocol and limitations is necessary. Multiple post-discharge office visits a necessary for assessment of the wound, suture removal, ROM and review of x-rays. Progress with rehabilitation thera is evaluated and instructions regarding immobilization, activity, physical therapy, and restrictions would be provided.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No
   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FIVE YEAR REVIEW SPECIFIC QUESTIONS:

Please indicate the number of survey respondent percentages responding to each of the following questions (for example 0.05 = 5%):
Has the work of performing this service changed in the past 5 years? Yes 50% No 50%
(Use the subset of the people who responded "Yes" to answer the following questions)

A. This service represents new technology that has become more familiar (i.e., less work):
   I agree 100% I do not agree
B. Patients requiring this service are now:
   more complex (more work) 100% less complex (less work) no change
C. The usual site-of-service has changed:
   from outpatient to inpatient 0% from inpatient to outpatient 0% no change 100%

Attestation Statement

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
2005 FIVE YEAR REVIEW - SUMMARY OF RECOMMENDATION

CPT Code:23615 Tracking Number F5 Specialty Society Recommended RVU: **15.00**
Global Period: 090 RUC Recommended RVU: **14.00**

CPT Descriptor: Open treatment of proximal humeral (surgical or anatomical neck) fracture, includes internal fixation, when performed, includes repair of tuberosity(s), when performed;

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 70-year-old female falls and suffers a two part proximal humerus fracture requiring open reduction and internal fixation.

Percentage of Survey Respondents who found Vignette to be Typical: 80%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 2%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work:

- Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient

Verify that all required instruments and supplies are available – with special attention to plates and screws

- Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulation drapes
- Assess position of the extremities and head, adjust as needed
- The patient's shoulder is placed on the surgery table. A bolster is placed under the scapula to position the shoulder/clavicle or the patient is placed in the beach chair position.
- Indicate areas of skin to be prepped and mark surgical incisions.
- The arm and shoulder are prepped and draped.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work:
An incision is made over the proximal humerus in the deltopectoral interval. Hemostasis is meticulously controlled with electrocautery. The cephalic vein is retracted with either the deltoid or the pectoralis and protected throughout the case. The fracture fragments (parts) are evaluated and reduced. The reduction, including the tuberosities is often complex requiring reduction of fragments one to another and then reduction of the larger fragments. Because of the proximity of the neurovascular structures extreme caution is exercised to protect these structures. Often an interfragmentary screw or reduction K wires are required to maintain the reduction while plates or screws are placed to stabilize the fracture. Multiple plating and screw configurations are possible. Once the fracture is reduced and secured with plate and screws the wound is copiously irrigated with antibiotic saline. The periosteum is repaired and the wound is closed in layers.

Description of Post-Service Work:
Post-service work: in facility

Application of bulky dressing and a sling.

- Monitor patient stabilization in the recovery room.
- Consultation with the family and patient regarding the surgery and postoperative regimen.
- Communication with health care professionals including written and oral reports and orders.
- Postoperative care is coordinated with recovery room nursing staff.

- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- The patient is discharged to the orthopaedic floor for monitoring of compartment syndrome. This requires removing and reapplying the dressings.

Discharge day:

- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Write prescriptions for medications needed post-discharge.
- Dictation of an operative report
- Procedure note is written in the patient chart
- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of sling/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order occupational therapy
- Supervision of rehabilitation
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions
- Dictate progress notes for medical record

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

- ***Evidence that technology has changed physician work.***

Surgical treatment using open anatomical reduction and internal fixation has been made more complex with the introduction of new imaging methods such as CT which allow better detection of the fracture pathology and provided the basis for new surgical strategies. There are also new internal fixation devices which require more work. Beginning in the 1990s (after the Harvard study), new plates were developed for fracture repair, with most becoming available in the late 1990s and early 2000s. As an example of the complexity of the decision process in current practice, the 1990's have given the surgeon numerous options for bone fixation. The options for a bone fixation device currently include Kirschner wires, wire, staples, screws, as well as newer alternatives such as headless bone screws, T-screws, absorbable pins, cannulated screws, and a myriad of plates. The goal of all these devices remains constant: that is, to achieve stable approximation of bone fragments to facilitate healing. The various devices afford rigid fixation along with compression of the osseous fragments. This allows early range of motion and preservation of surrounding joint function, as well as primary bone healing. Selection of the most advantageous form of fixation is dependent on many factors and takes considerable time in the pre-evaluation of a patient. These include the type of fracture or osteotomy created, bone density, type of bone, and the desire for interfragmental compression. All of this has resulted in more work. The standards of care (fracture reduction, limb alignment, etc.) have also been elevated by literature that shows fracture displacements and poor alignments lead to poorer results. Additionally, women over 50 is a fast growing segment of our population. A huge percentage of these patients are osteoporotic - making fracture fixation and maintenance of fixation far more difficult than it used to be. The new plates are more complex to insert when the underlying bone is of much poorer quality.

Given this information, we believe there is compelling evidence that ORIF is more complex than 5 years ago and this is even more true in comparison to practice in the late 1980s (or more than 25 years ago).

- ***Evidence that incorrect assumptions were made in the previous valuation of the service; a misleading vignette and/or survey in a previous evaluation***

During the period of 1989-1991 (after the Harvard study), a major effort was undertaken by the AAOS and the OTA to rewrite every fracture and dislocation treatment code in the musculoskeletal Section of CPT. In 1991, 395 code changes were accepted by the AMA CPT Editorial Panel under the leadership of Dr. William Felts. At the time of the original proposal, some of the code descriptors were changed from those submitted (presumably by the CPT staff), and published in the 1992 and subsequent editions. Some of the changes in the descriptors published in CPT 1992 didn't make sense, but in those years, the CPT process was closed-door. Additionally, in 1992 and 1993 the AMA staff were deluged by the implementation of the RBRVS process and though AAOS and OTA requested that these problems be addressed then, AMA CPT staff asked that i be deferred as their "plate was full." After that time, more important issues and other opportunities consumed the resources of the AAOS and inertia (or the lack thereof) took over. This third five year review, after completion of the practice expense review, allowed AAOS a window of time to again try to correct the nomenclature for these codes, and review their work using the standard RUC survey method.

We also note, that at the time of the original CPT proposal, external fixation was considered an adjunctive procedure. CPT instructed that the codes for external fixation (20690 and 20692) be "listed in addition to the code for the treatment ...of the fracture." This concept still applies today. External fixation can be used as an adjunctive stabilization modality when treating fractures by almost any method. However, external fixation can also be used in reconstructive orthopaedics (for example, the treatment of joint contractures) and for non-musculoskeletal system treatments (for example, as a suspension device in the treatment of lower extremity burns). In 1991, there was no Modifier -51 exempt code category. Today, these same codes, 20690 and 20692 for external fixator application are modifier -51 exempt, recognizing that they can stand alone or be used adjunctively. Because of the modifier -51 exemption, the RVUs have been reduced, so payers are not paying double when either of these codes are reported with another treatment code.

In the 2005 comment letter to CMS, the AAOS recommended examining the physician work for the ORIF codes because the code descriptors lacked clarity. In particular, because the CPT descriptors include the phrase "with or without internal or external fixation," it is difficult to imagine what the Harvard survey data actually represents (ie, no typical patient was described for the survey respondents to focus on). Further, after the descriptors for these codes were changed for CPT 1993, an Abt study was performed in 1992 for RUC consideration. This study produced *percentage* relationships to key reference codes, but not surveyed time and visit data. Some of these recommendations were accepted by the RUC and CMS and others were adjusted up or down, but no changes were made to the Harvard time and visit data, if available. Therefore, we believe that there is little, if any, relationship between the Harvard database time and visit information (from the old CPT codes) and the current work RVUs.

Given this information, we believe there is compelling evidence that the current work values and/or time and visit data may be incorrect and outdated and should be reviewed.

- *Evidence that incorrect assumptions were made in the previous valuation of the service, as documented; a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data*

Harvard utilized the AMA Physician Masterfile to draw names for their surveys. While general orthopaedic surgeons can perform open reduction fracture care, it is more typical for patients to be referred to orthopaedic surgeons who specialize in orthopaedic trauma or in a given anatomical area (eg, shoulder, hand, knee, etc.). We do not believe that all specialty surgeons were surveyed for these codes, since the AMA Masterfile did not delineate orthopaedic specialties. Additionally, podiatrists were not surveyed for any of the lower extremity codes.

Given this information, we believe there is compelling evidence that not all involved specialties were involved in the review of these codes.

A consensus committee of physicians representing the American Academy of Orthopaedic Surgeons, American Shoulder and Elbow Surgeons, Society for Surgery of the Hand, Arthroscopy Association of North America, Orthopaedic Trauma Association, American Podiatric Medical Association, and American Orthopaedic Foot and Ankle Society met by conference call to discuss the survey data for the revised orthopaedic codes and data for the key reference codes and other codes on the survey reference service lists.

For revised code 23615, we recommend 15.00 work RVUs. After considering differences in time and visits, along with differences in intra-operative work, we believe this value correctly ranks code 23615 relative to other ORIF codes, relative to the key reference code, and relative to orthopaedic codes from the survey reference service list.

he consensus panel compared the work of 23615 to the key reference code 29827 which has greater intra-op work, but .ess post-op work because 23615 requires hospitalization. The panel believes that total work for both procedures is very similar. We are recommending a value of 15.00 which is between the 25th percentile and the median. This value is slightly less than the reference code, but correctly equal to 24545 and greater than 23670 and 27826. Post-operatively, hospital work is required to evaluate the neurovascular status, change the operative dressing, remove the Hemovac if inserted, adjust the sling and abduction pillow and review the post-operative motion and care instructions. Multiple office

visits are required to evaluate the wound and neurovascular status, remove the sutures, review the post-operative instructions including range of motion and active motion limitations, obtain an X-ray and review the findings. Any medications prescriptions are renewed and physical therapy is discussed. Maintenance of the joint reduction while attempting to restore early motion is critical during the entire post-operative/global period. The second visit is to assure proper wound healing, re-evaluate the neurovascular status, and assess ROM. The third and fourth visits are to chec the wound, neurovascular status, a X-ray is obtained and reviewed, increases in the active motions and gentle resistan exercises and increase the activities of daily living/recreation.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No
   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FIVE YEAR REVIEW SPECIFIC QUESTIONS:

Please indicate the number of survey respondent percentages responding to each of the following questions (for example 0.05 = 5%):
Has the work of performing this service changed in the past 5 years? Yes 50% No 50%
(Use the subset of the people who responded "Yes" to answer the following questions)

A. This service represents new technology that has become more familiar (i.e., less work):
   I agree 0% I do not agree 100%
B. Patients requiring this service are now:
   more complex (more work) 100% less complex (less work) no change
C. The usual site-of-service has changed:
   from outpatient to inpatient from inpatient to outpatient no change 100%

Attestation Statement

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
2005 FIVE YEAR REVIEW - SUMMARY OF RECOMMENDATION

CPT Code:23616 Tracking Number F6 Specialty Society Recommended RVU: **21.00**
Global Period: 090 RUC Recommended RVU: **21.00**

CPT Descriptor: Open treatment of proximal humeral (surgical or anatomical neck) fracture, includes internal fixation, when performed, includes repair of tuberosity(s) , when performed; with proximal humeral prosthetic replacement

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 70-year-old female falls and suffers a comminuted four part proximal humerus fracture requiring hemiarthroplasty.

Percentage of Survey Respondents who found Vignette to be Typical: 89%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work:
- Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
- Verify that all required instruments and supplies are available – with special attention to plates and screws
- Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulation drapes
- Assess position of the extremities and head, adjust as needed
- The patient's shoulder is placed on the surgery table. A bolster is placed under the scapula to position the shoulder/clavicle. The patient is then very carefully placed in the beach chair position.
- Indicate areas of skin to be prepped and mark surgical incisions.
- The arm and shoulder are prepped and draped.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work:
An incision is made over the proximal humerus in the deltopectoral interval. Hemostasis is meticulously controlled with electrocautery. The cephalic vein is retracted with either the deltoid or the pectoralis and protected throughout the case. The clavipectoral fascia is released and the conjoined tendon is retracted. The subscapularis is identified and the lesser tuberosity is accessed. If it is attached to the humeral head, the tendon capsular attachment is incised. The fracture fragments (parts) are evaluated and reduced. The complexity of the fracture fragments and especially the articular surface are evaluated. The articular surface is removed and the prothesis is trailed and all loose fragments are removed or reduced to the fins of the prosthesis. The reduction, including the tuberosities is often complex, requiring reduction of fragments one to another, and then reduction of the larger fragments to the prosthesis. Depending on the stability of the prosthesis cementing of the prosthesis is often required. Before the cement is inserted and/or before the prosthesis is placed, drill holes are often required in the humeral shaft to stabilize the fracture as well. Because of the proximity of the neurovascular structures extreme caution is exercised to protect these structures. Once the fracture(s) are reduced and secured and the prosthesis is secured the wound is copiously irrigated with antibiotic saline. The subscapularis and capsule are repaired and the wound is closed in multiple layers.

Description of Post-Service Work:
Post-service work: in facility

- Application of bulky dressing and a sling.
- Monitor patient stabilization in the recovery room.
- Consultation with the family and patient regarding the surgery and postoperative regimen.
- Communication with health care professionals including written and oral reports and orders.
- Postoperative care is coordinated with recovery room nursing staff.
- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- The patient is discharged to the orthopaedic floor for monitoring of compartment syndrome. This requires removing and reapplying the dressings.

Discharge day:

- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Write prescriptions for medications needed post-discharge.
- Dictation of an operative report
- Procedure note is written in the patient chart
- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of sling/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order occupational therapy
- Supervision of rehabilitation
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions

COMPELLING EVIDENCE RATIONALE (Required to be Completed)

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

- ***Evidence that technology has changed physician work.***

Surgical treatment using open anatomical reduction and internal fixation has been made more complex with the introduction of new imaging methods such as CT which allow better detection of the fracture pathology and provided the basis for new surgical strategies. There are also new internal fixation devices which require more work. Beginning in the 1990s (after the Harvard study), new plates were developed for fracture repair, with most becoming available in the late 1990s and early 2000s. As an example of the complexity of the decision process in current practice, the 1990's have given the surgeon numerous options for bone fixation. The options for a bone fixation device currently include Kirschner wires, wire, staples, screws, as well as newer alternatives such as headless bone screws, T-screws, absorbable pins, cannulated screws, and a myriad of plates. The goal of all these devices remains constant: that is, to achieve stable approximation of bone fragments to facilitate healing. The various devices afford rigid fixation along with compression of the osseous fragments. This allows early range of motion and preservation of surrounding joint function, as well as primary bone healing. Selection of the most advantageous form of fixation is dependent on many factors and takes considerable time in the pre-evaluation of a patient. These include the type of fracture or osteotomy created, bone density, type of bone, and the desire for interfragmental compression. All of this has resulted in more work. The standards of care (fracture reduction, limb alignment, etc.) have also been elevated by literature that shows fracture displacements and poor alignments lead to poorer results. Additionally, women over 50 is a fast growing segment of our population. A huge percentage of these patients are osteoporotic - making fracture fixation and maintenance of fixation far more difficult than it used to be. The new plates are more complex to insert when the underlying bone is of much poorer quality.

Given this information, we believe there is compelling evidence that ORIF is more complex than 5 years ago and this is even more true in comparison to practice in the late 1980s (or more than 25 years ago).

- ***Evidence that incorrect assumptions were made in the previous valuation of the service; a misleading vignette and/or survey in a previous evaluation***

During the period of 1989-1991 (after the Harvard study), a major effort was undertaken by the AAOS and the OTA to rewrite every fracture and dislocation treatment code in the musculoskeletal Section of CPT. In 1991, 395 code changes were accepted by the AMA CPT Editorial Panel under the leadership of Dr. William Felts. At the time of the original proposal, some of the code descriptors were changed from those submitted (presumably by the CPT staff), and published in the 1992 and subsequent editions. Some of the changes in the descriptors published in CPT 1992 didn't make sense, but in those years, the CPT process was closed-door. Additionally, in 1992 and 1993 the AMA staff were deluged by the implementation of the RBRVS process and though AAOS and OTA requested that these problems be addressed then, AMA CPT staff asked that i be deferred as their "plate was full." After that time, more important issues and other opportunities consumed the resources of the AAOS and inertia (or the lack thereof) took over. This third five year review, after completion of the practice expense review, allowed AAOS a window of time to again try to correct the nomenclature for these codes, and review their work using the standard RUC survey method.

We also note, that at the time of the original CPT proposal, external fixation was considered an adjunctive procedure. CPT instructed that the codes for external fixation (20690 and 20692) be "listed in addition to the code for the treatment ...of the fracture." This concept still applies today. External fixation can be used as an adjunctive stabilization modality when treating fractures by almost any method. However, external fixation can also be used in reconstructive orthopaedics (for example, the treatment of joint contractures) and for non-musculoskeletal system treatments (for example, as a suspension device in the treatment of lower extremity burns). In 1991, there was no Modifier -51 exempt code category. Today, these same codes, 20690 and 20692 for external fixator application are modifier -51 exempt, recognizing that they can stand alone or be used adjunctively. Because of the modifier -51 exemption, the RVUs have been reduced, so payers are not paying double when either of these codes are reported with another treatment code.

In the 2005 comment letter to CMS, the AAOS recommended examining the physician work for the ORIF codes because the code descriptors lacked clarity. In particular, because the CPT descriptors include the phrase "with or without internal or external fixation," it is difficult to imagine what the Harvard survey data actually represents (ie, no typical patient was described for the survey respondents to focus on). Further, after the descriptors for these codes were changed for CPT 1993, an Abt study was performed in 1992 for RUC consideration. This study produced *percentage* relationships to key reference codes, but not surveyed time and visit data. Some of these recommendations were accepted by the RUC and CMS and others were adjusted up or down, but no changes were made to the Harvard time and visit data, if available. Therefore, we believe that there is little, if any, relationship between the Harvard database time and visit information (from the old CPT codes) and the current work RVUs.

Given this information, we believe there is compelling evidence that the current work values and/or time and visit data may be incorrect and outdated and should be reviewed.

- *Evidence that incorrect assumptions were made in the previous valuation of the service, as documented; a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data*

Harvard utilized the AMA Physician Masterfile to draw names for their surveys. While general orthopaedic surgeons can perform open reduction fracture care, it is more typical for patients to be referred to orthopaedic surgeons who specialize in orthopaedic trauma or in a given anatomical area (eg, shoulder, hand, knee, etc.). We do not believe that all specialty surgeons were surveyed for these codes, since the AMA Masterfile did not delineate orthopaedic specialties. Additionally, podiatrists were not surveyed for any of the lower extremity codes.

Given this information, we believe there is compelling evidence that not all involved specialties were involved in the review of these codes.

A consensus committee of physicians representing the American Academy of Orthopaedic Surgeons, American Shoulder and Elbow Surgeons, Society for Surgery of the Hand, Arthroscopy Association of North America, Orthopaedic Trauma Association, American Podiatric Medical Association, and American Orthopaedic Foot and Ankle Society met by conference call to discuss the survey data for the revised orthopaedic codes and data for the key reference codes and other codes on the survey reference service lists.

For revised code 23616, we recommend 21.00 work RVUs. After considering differences in time and visits, along with differences in intra-operative work, we believe this value correctly ranks code 23616 relative to other ORIF codes, relative to the key reference code, and relative to orthopaedic codes from the survey reference service list.

ode 23472 is a good reference for this code. Both procedures typically occur in elderly patients with osteopenic bone. /ith respect to 23616, comminution is frequently present which makes correct positioning of the prosthesis and stable repair of the tuberosity fragments difficult; these are both critical technical aspects directly related to functional outcome, representing additional complexity compared with 23472. The survey median work RVU correctly accounts for less intra-op time, but greater intra-op complexity. Post-op visits vary in location and level, but basically are similar in total.

Postoperative close monitoring is required for assessment of the circulation, sensation and motor function of the involved extremity, as well as evaluation and management of pain control. Hospital work involves removal of the immobilization device, as well as a dressing changes, with each wound inspection. Physical therapy would be started and a discussion with the patient and therapist regarding the protocol and limitations is necessary. Multiple post-discharge office visits are necessary for assessment of the wound, suture removal, ROM and review of x-rays. Progress with rehabilitation ther is evaluated and instructions regarding immobilization, activity, physical therapy, and restrictions would be provided.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No
   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FIVE YEAR REVIEW SPECIFIC QUESTIONS:

Please indicate the number of survey respondent percentages responding to each of the following questions (for example 0.05 = 5%):
Has the work of performing this service changed in the past 5 years? Yes 61% No 39%
(Use the subset of the people who responded "Yes" to answer the following questions)

A. This service represents new technology that has become more familiar (i.e., less work):
   I agree 8% I do not agree 92%
B. Patients requiring this service are now:
   more complex (more work) 100% less complex (less work) no change
C. The usual site-of-service has changed:
   from outpatient to inpatient from inpatient to outpatient no change 100%

Vignette Used in Survey: A 35-year-old female falls on her upper arm and suffers a displaced tuberosity fracture requiring open reduction and internal fixation.

Percentage of Survey Respondents who found Vignette to be Typical: 87%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work:
- Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
- Verify that all required instruments and supplies are available – with special attention to plates and screws
- Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulation drapes
- Assess position of the extremities and head, adjust as needed
- The patient's shoulder is placed on the surgery table. A bolster is placed under the scapula to position the shoulder/clavicle or the patient is placed in the beach chair position.
- Indicate areas of skin to be prepped and mark surgical incisions.
- The arm and shoulder are prepped and draped.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work:
An incision is made over the proximal humerus in the deltopectoral interval. Hemostasis is meticulously controlled with electrocautery. The cephalic vein is retracted with either the deltoid or the pectoralis and protected throughout the case. The fracture fragments (parts) are evaluated and reduced. The reduction is often complex requiring reduction of fragments one to another and then reduction of the larger fragments. Because of the proximity of the neurovascular structures extreme caution is exercised to protect these structures. Often interfragmentary screws and/or reduction K wires are required to maintain the reduction while plates or screws are placed to stabilize the fracture. Multiple plating and screw configurations are possible. Once the fracture is reduced and secured with plate and screws, the wound is copiously irrigated with antibiotic saline. The periosteum, rotator cuff musculature and deltoid muscle/fascia are repaired and the wound is closed in multiple layers.

Description of Post-Service Work:
Post-service work: in facility
- Application of bulky dressing and a sling.
- Monitor patient stabilization in the recovery room.
- Consultation with the family and patient regarding the surgery and postoperative regimen.
- Communication with health care professionals including written and oral reports and orders.
- Postoperative care is coordinated with recovery room nursing staff.

- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- The patient is discharged to the orthopaedic floor for monitoring of compartment syndrome. This requires removing and reapplying the dressings.

Discharge day:

- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Write prescriptions for medications needed post-discharge.
- Dictation of an operative report
- Procedure note is written in the patient chart
- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of sling/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order occupational therapy
- Supervision of rehabilitation
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions

COMPELLING EVIDENCE RATIONALE (Required to be Completed)

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

- ***Evidence that technology has changed physician work.***

Surgical treatment using open anatomical reduction and internal fixation has been made more complex with the introduction of new imaging methods such as CT which allow better detection of the fracture pathology and provided the basis for new surgical strategies. There are also new internal fixation devices which require more work. Beginning in the 1990s (after the Harvard study), new plates were developed for fracture repair, with most becoming available in the late 1990s and early 2000s. As an example of the complexity of the decision process in current practice, the 1990's have given the surgeon numerous options for bone fixation. The options for a bone fixation device currently include Kirschner wires, wire, staples, screws, as well as newer alternatives such as headless bone screws, T-screws, absorbable pins, cannulated screws, and a myriad of plates. The goal of all these devices remains constant: that is, to achieve stable approximation of bone fragments to facilitate healing. The various devices afford rigid fixation along with compression of the osseous fragments. This allows early range of motion and preservation of surrounding joint function, as well as primary bone healing. Selection of the most advantageous form of fixation is dependent on many factors and takes considerable time in the pre-evaluation of a patient. These include the type of fracture or osteotomy created, bone density, type of bone, and the desire for interfragmental compression. All of this has resulted in more work. The standards of care (fracture reduction, limb alignment, etc.) have also been elevated by literature that shows fracture displacements and poor alignments lead to poorer results. Additionally, women over 50 is a fast growing segment of our population. A huge percentage of these patients are osteoporotic - making fracture fixation and maintenance of fixation far more difficult than it used to be. The new plates are more complex to insert when the underlying bone is of much poorer quality.

Given this information, we believe there is compelling evidence that ORIF is more complex than 5 years ago and this is even more true in comparison to practice in the late 1980s (or more than 25 years ago).

- ***Evidence that incorrect assumptions were made in the previous valuation of the service; a misleading vignette and/or survey in a previous evaluation***

During the period of 1989-1991 (after the Harvard study), a major effort was undertaken by the AAOS and the OTA to rewrite every fracture and dislocation treatment code in the musculoskeletal Section of CPT. In 1991, 395 code changes were accepted by the AMA CPT Editorial Panel under the leadership of Dr. William Felts. At the time of the original proposal, some of the code descriptors were changed from those submitted (presumably by the CPT staff), and published in the 1992 and subsequent editions. Some of the changes in the descriptors published in CPT 1992 didn't make sense, but in those years, the CPT process was closed-door. Additionally, in 1992 and 1993 the AMA staff were deluged by the implementation of the RBRVS process and though AAOS and OTA requested that these problems be addressed then, AMA CPT staff asked that be deferred as their "plate was full." After that time, more important issues and other opportunities consumed the resources of the AAOS and inertia (or the lack thereof) took over. This third five year review, after completion of the practice expense review, allowed AAOS a window of time to again try to correct the nomenclature for these codes, and review their work using the standard RUC survey method.

We also note, that at the time of the original CPT proposal, external fixation was considered an adjunctive procedure. CPT instructed that the codes for external fixation (20690 and 20692) be "listed in addition to the code for the treatment ...of the fracture." This concept still applies today. External fixation can be used as an adjunctive stabilization modality when treating fractures by almost any method. However, external fixation can also be used in reconstructive orthopaedics (for example, the treatment of joint contractures) and for non-musculoskeletal system treatments (for example, as a suspension device in the treatment of lower extremity burns). In 1991, there was no Modifier -51 exempt code category. Today, these same codes, 20690 and 20692 for external fixator application are modifier -51 exempt, recognizing that they can stand alone or be used adjunctively. Because of the modifier -51 exemption, the RVUs have been reduced, so payers are not paying double when either of these codes are reported with another treatment code.

In the 2005 comment letter to CMS, the AAOS recommended examining the physician work for the ORIF codes because the code descriptors lacked clarity. In particular, because the CPT descriptors include the phrase "with or without internal or external fixation," it is difficult to imagine what the Harvard survey data actually represents (ie, no typical patient was described for the survey respondents to focus on). Further, after the descriptors for these codes were changed for CPT 1993, an Abt study was performed in 1992 for RUC consideration. This study produced *percentage* relationships to key reference codes, but not surveyed time and visit data. Some of these recommendations were accepted by the RUC and CMS and others were adjusted up or down, but no changes were made to the Harvard time and visit data, if available. Therefore, we believe that there is little, if any, relationship between the Harvard database time and visit information (from the old CPT codes) and the current work RVUs.

Given this information, we believe there is compelling evidence that the current work values and/or time and visit data may be incorrect and outdated and should be reviewed.

- *Evidence that incorrect assumptions were made in the previous valuation of the service, as documented; a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data*

Harvard utilized the AMA Physician Masterfile to draw names for their surveys. While general orthopaedic surgeons can perform open reduction fracture care, it is more typical for patients to be referred to orthopaedic surgeons who specialize in orthopaedic trauma or in a given anatomical area (eg, shoulder, hand, knee, etc.). We do not believe that all specialty surgeons were surveyed for these codes, since the AMA Masterfile did not delineate orthopaedic specialties. Additionally, podiatrists were not surveyed for any of the lower extremity codes.

Given this information, we believe there is compelling evidence that not all involved specialties were involved in the review of these codes.

A consensus committee of physicians representing the American Academy of Orthopaedic Surgeons, American Shoulder and Elbow Surgeons, Society for Surgery of the Hand, Arthroscopy Association of North America, Orthopaedic Trauma Association, American Podiatric Medical Association, and American Orthopaedic Foot and Ankle Society met by conference call to discuss the survey data for the revised orthopaedic codes and data for the key reference codes and other codes on the survey reference service lists.

For revised code 23630, we recommend 12.00 work RVUs. After considering differences in time and visits, along with differences in intra-operative work, we believe this value correctly ranks code 23630 relative to other ORIF codes, relative to the key reference code, and relative to orthopaedic codes from the survey reference service list.

This is a shoulder fracture code that commonly occurs in tandem with poor bone quality making fixation of the fragment difficult and tenuous. Both 23420 and 23630 require hospitalization. The consensus panel recommends the 25th percentile work RVU. This value is correctly lower than the key reference code and takes into account less intra work and less office work. Neurovascular injury may occur with this type of fracture and multiple post-operative visits are necessary. There is a significant danger of loss of fixation because of poor bone quality and stiffness secondary to immobilization. The first office visit would include removal of the sling and dressing, redressing, discussion of restrictions

and operative findings, reapplication of sling and instruction on ROM. X-rays taken to assess fracture reduction would be reviewed. The second visit would be for sling and dressing removal, suture removal and X-rays would be taken and reviewed. The sling would be reapplied and restrictions discussed. The third visit would include assessment of wound healing and ROM. X-rays would be taken and reviewed to assess bone alignment and healing. Motion exercises would be prescribed. The final visit would assess ROM and X-rays would be taken and reviewed to assess bone healing.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No
   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FIVE YEAR REVIEW SPECIFIC QUESTIONS:

Please indicate the number of survey respondent percentages responding to each of the following questions (for example 0.05 = 5%):
Has the work of performing this service changed in the past 5 years? Yes 37% No 63%
(Use the subset of the people who responded "Yes" to answer the following questions)

A. This service represents new technology that has become more familiar (i.e., less work):
   I agree 6% I do not agree 94%
B. Patients requiring this service are now:
   more complex (more work) 71% less complex (less work) 0% no change 29%
C. The usual site-of-service has changed:
   from outpatient to inpatient 0% from inpatient to outpatient 6% no change 94%

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
2005 FIVE YEAR REVIEW - SUMMARY OF RECOMMENDATION

CPT Code:23670 Tracking Number F8 Specialty Society Recommended RVU: **14.00**
Global Period: 090 RUC Recommended RVU: **14.00**

CPT Descriptor: Open treatment of shoulder dislocation, with fracture of greater humeral tuberosity, includes internal fixation, when performed

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 20-year-old male suffers a fracture dislocation of the shoulder requiring open reduction and internal fixation of the displaced tuberosity fracture.

Percentage of Survey Respondents who found Vignette to be Typical: 74%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work:
- Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
  Verify that all required instruments and supplies are available – with special attention to plates and screws
- Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulation drapes
- Assess position of the extremities and head, adjust as needed
- The patient's shoulder is placed on the surgery table. A bolster is placed under the scapula to position the shoulder/clavicle or the patient is placed in the beach chair position.
- Indicate areas of skin to be prepped and mark surgical incisions.
- The arm and shoulder are prepped and draped.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work:
An incision is made over the proximal humerus in the deltopectoral interval. Hemostasis is meticulously controlled with electrocautery. The cephalic vein is retracted with either the deltoid or the pectoralis and protected throughout the case. The humeral head position is noted. The capsuloligamentous structures and the rotator cuff are evaluated and released as needed to carefully reduce the humeral head. Avoidance of further injury to the articular surface is mandatory during the reduction procedure. Any loose fragments are removed from the joint space. Reduction of the tuberosities is often complex requiring reduction of fragments one to another and then reduction of the larger fragment to the humerus. Because of the proximity of the neurovascular structures extreme caution is exercised to protect these structures. Often an interfragmentary screw and/or reduction K wires are required to maintain the reduction, while plates and/or screws are positioned to stabilize the fracture. Multiple plating and screw configurations are possible. Once the fracture is reduced and secured with plate and screws the wound is copiously irrigated with antibiotic saline. The periosteum, capsule and musculotendinous units are repaired and the wound is closed in multiple layers.

Description of Post-Service Work:
Post-service work: in facility
- Application of bulky dressing and a sling.
- Monitor patient stabilization in the recovery room.

- Consultation with the family and patient regarding the surgery and postoperative regimen.
- Communication with health care professionals including written and oral reports and orders.
- Postoperative care is coordinated with recovery room nursing staff.
- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- The patient is discharged to the orthopaedic floor for monitoring of compartment syndrome. This require removing and reapplying the dressings.

Discharge day:

- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Write prescriptions for medications needed post-discharge.
- Dictation of an operative report
- Procedure note is written in the patient chart
- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of sling/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order occupational therapy
- Supervision of rehabilitation
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions

COMPELLING EVIDENCE RATIONALE (Required to be Completed)

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

- ***Evidence that technology has changed physician work.***

Surgical treatment using open anatomical reduction and internal fixation has been made more complex with the introduction of new imaging methods such as CT which allow better detection of the fracture pathology and provided the basis for new surgical strategies. There are also new internal fixation devices which require more work. Beginning in the 1990s (after the Harvard study), new plates were developed for fracture repair, with most becoming available in the late 1990s and early 2000s. As an example of the complexity of the decision process in current practice, the 1990's have given the surgeon numerous options for bone fixation. The options for a bone fixation device currently include Kirschner wires, wire, staples, screws, as well as newer alternatives such as headless bone screws, T-screws, absorbable pins, cannulated screws, and a myriad of plates. The goal of all these devices remains constant: that is, to achieve stable approximation of bone fragments to facilitate healing. The various devices afford rigid fixation along with compression of the osseous fragments. This allows early range of motion and preservation of surrounding joint function, as well as primary bone healing. Selection of the most advantageous form of fixation is dependent on many factors and takes considerable time in the pre-evaluation of a patient. These include the type of fracture or osteotomy created, bone density, type of bone, and the desire for interfragmental compression. All of this has resulted in more work. The standards of care (fracture reduction, limb alignment, etc.) have also been elevated by literature that shows fracture displacements and poor alignments lead to poorer results. Additionally, women over 50 is a fast growing segment of our population. A huge percentage of these patients are osteoporotic - making fracture fixation and maintenance of fixation far more difficult than it used to be. The new plates are more complex to insert when the underlying bone is of much poorer quality.

Given this information, we believe there is compelling evidence that ORIF is more complex than 5 years ago and this is even more true in comparison to practice in the late 1980s (or more than 25 years ago).

- ***Evidence that incorrect assumptions were made in the previous valuation of the service; a misleading vignette and/or survey in a previous evaluation***

During the period of 1989-1991 (after the Harvard study), a major effort was undertaken by the AAOS and the OTA to rewrite every fracture and dislocation treatment code in the musculoskeletal Section of CPT. In 1991, 395 code changes were accepted by the AMA CPT Editorial Panel under the leadership of Dr. William Felts. At the time of the original proposal, some of the code descriptors were changed from those submitted (presumably by the CPT staff), and published in the 1992 and subsequent editions. Some of the changes in the descriptors published in CPT 1992 didn't make sense, but in those years, the CPT process was closed-door. Additionally, in 1992 and 1993 the AMA staff were deluged by the implementation of the RBRVS process and though AAOS and OTA requested that these problems be addressed then, AMA CPT staff asked that be deferred as their "plate was full." After that time, more important issues and other opportunities consumed the resources of the AAOS and inertia (or the lack thereof) took over. This third five year review, after completion of the practice expense review, allowed AAOS a window of time to again try to correct the nomenclature for these codes, and review their work using the standard RUC survey method.

We also note, that at the time of the original CPT proposal, external fixation was considered an adjunctive procedure. CPT instructed that the codes for external fixation (20690 and 20692) be "listed in addition to the code for the treatment ...of the fracture." This concept still applies today. External fixation can be used as an adjunctive stabilization modality when treating fractures by almost any method. However, external fixation can also be used in reconstructive orthopaedics (for example, the treatment of joint contractures) and for non-musculoskeletal system treatments (for example, as a suspension device in the treatment of lower extremity burns). In 1991, there was no Modifier -51 exempt code category. Today, these same codes, 20690 and 20692 for external fixator application are modifier -51 exempt, recognizing that they can stand alone or be used adjunctively. Because of the modifier -51 exemption, the RVUs have been reduced, so payers are not paying double when either of these codes are reported with another treatment code.

In the 2005 comment letter to CMS, the AAOS recommended examining the physician work for the ORIF codes because the code descriptors lacked clarity. In particular, because the CPT descriptors include the phrase "with or without internal or external fixation," it is difficult to imagine what the Harvard survey data actually represents (ie, no typical patient was described for the survey respondents to focus on). Further, after the descriptors for these codes were changed for CPT 1993, an Abt study was performed in 1992 for RUC consideration. This study produced *percentage* relationships to key reference codes, but not surveyed time and visit data. Some of these recommendations were accepted by the RUC and CMS and others were adjusted up or down, but no changes were made to the Harvard time and visit data, if available. Therefore, we believe that there is little, if any, relationship between the Harvard database time and visit information (from the old CPT codes) and the current work RVUs.

Given this information, we believe there is compelling evidence that the current work values and/or time and visit data may be incorrect and outdated and should be reviewed.

- *Evidence that incorrect assumptions were made in the previous valuation of the service, as documented; a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data*

Harvard utilized the AMA Physician Masterfile to draw names for their surveys. While general orthopaedic surgeons can perform open reduction fracture care, it is more typical for patients to be referred to orthopaedic surgeons who specialize in orthopaedic trauma or in a given anatomical area (eg, shoulder, hand, knee, etc.). We do not believe that all specialty surgeons were surveyed for these codes, since the AMA Masterfile did not delineate orthopaedic specialties. Additionally, podiatrists were not surveyed for any of the lower extremity codes.

Given this information, we believe there is compelling evidence that not all involved specialties were involved in the review of these codes.

A consensus committee of physicians representing the American Academy of Orthopaedic Surgeons, American Shoulder and Elbow Surgeons, Society for Surgery of the Hand, Arthroscopy Association of North America, Orthopaedic Trauma Association, American Podiatric Medical Association, and American Orthopaedic Foot and Ankle Society met by conference call to discuss the survey data for the revised orthopaedic codes and data for the key reference codes and other codes on the survey reference service lists.

For revised code 23670, we recommend 14.00 work RVUs. After considering differences in time and visits, along with differences in intra-operative work, we believe this value correctly ranks code 23670 relative to other ORIF codes, relative to the key reference code, and relative to orthopaedic codes from the survey reference service list.

ɔde 23670 requires an extensive approach to accurately reduce and stabilize the humeral neck fracture. The ‹uberosity(s) are typically also fractured, displaced and require reduction and fixation. Although the intra-time is longer for key reference code 23420, the complexity and intensity of the intra-operative work for 23670 is greater. The consensus panel believes the overall total work for 23670 is only slightly less than 23420 and is similar to 27626 and 25575. It is also less work than 23680. Post-operatively, hospital work is required to evaluate the neurovascular status, change the operative dressing, remove the Hemovac if inserted, adjust the sling and abduction pillow and review the

post-operative motion and care instructions. Multiple office visits are required to evaluate the wound and neurovascular status, remove the sutures, review the post-operative instructions including range of motion and active motion limitations, obtain an X-ray and review the findings. Any medications prescriptions are renewed and physical therapy is discussed. Maintenance of the joint reduction while attempting to restore early motion is critical during the entire post-operative/global period. The second visit is to assure proper wound healing, re-evaluate the neurovascular status, ar assess ROM. The third and fourth visits are to check the wound, neurovascular status, a X-ray is obtained a reviewed, increases in the active motions and gentle resistance exercises and increase the activities of daily living/recreation.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No
   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FIVE YEAR REVIEW SPECIFIC QUESTIONS:

Please indicate the number of survey respondent percentages responding to each of the following questions (for example 0.05 = 5%):
Has the work of performing this service changed in the past 5 years? Yes 55% No 45%
(Use the subset of the people who responded "Yes" to answer the following questions)

A. This service represents new technology that has become more familiar (i.e., less work):
   I agree 8% I do not agree 92%
B. Patients requiring this service are now:
   more complex (more work) 100% less complex (less work) no change 8%
C. The usual site-of-service has changed:
   from outpatient to inpatient from inpatient to outpatient 17% no change 92%

Attestation Statement

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
2005 FIVE YEAR REVIEW - SUMMARY OF RECOMMENDATION

CPT Code:23680 Tracking Number F9 Specialty Society Recommended RVU: **15.00**
Global Period: 090 RUC Recommended RVU: **15.00**

CPT Descriptor: Open treatment of shoulder dislocation, with surgical or anatomical neck fracture, includes internal fixation, when performed

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 20-year-old male suffers a fracture dislocation of the shoulder requiring open reduction and internal fixation of the displaced humeral neck fracture.

Percentage of Survey Respondents who found Vignette to be Typical: 70%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work:

- Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
  Verify that all required instruments and supplies are available – with special attention to plates and screws
- Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulation drapes
- Assess position of the extremities and head, adjust as needed
- The patient's shoulder is placed on the surgery table. A bolster is placed under the scapula to position the shoulder/clavicle or the patient is placed in the beach chair position.
- Indicate areas of skin to be prepped and mark surgical incisions.
- The arm and shoulder are prepped and draped.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work:
An incision is made over the proximal humerus in the deltopectoral interval. Hemostasis is meticulously controlled with electrocautery. The cephalic vein is retracted with either the deltoid or the pectoralis and protected throughout the case. The humeral head position is noted. The capsuloligamentous structures and the rotator cuff are evaluated and released as needed to carefully reduce the humeral head. Avoidance of further injury to the articular surface is mandatory during the reduction procedure. Any loose fragments are removed from the joint space. Attention is then turned to the humeral fracture. Often an interfragmentary screw and/or reduction K wires are required to maintain the reduction while plates and/or screws are placed to stabilize the fracture. Multiple plating and screw configurations are possible. Because of the proximity of the neurovascular structures extreme caution is exercised to protect these structures. Once the fracture is reduced and secured with plate and screws the wound is copiously irrigated with antibiotic saline. The periosteum, capsule and musculotendinous units are repaired and the wound is closed in multiple layers.

escription of Post-Service Work:
Post-service work: in facility

- Application of bulky dressing and a sling.
- Monitor patient stabilization in the recovery room.
- Consultation with the family and patient regarding the surgery and postoperative regimen.

- Communication with health care professionals including written and oral reports and orders.
- Postoperative care is coordinated with recovery room nursing staff.
- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- The patient is discharged to the orthopaedic floor for monitoring of compartment syndrome. This requi removing and reapplying the dressings.

Discharge day:

- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Write prescriptions for medications needed post-discharge.
- Dictation of an operative report
- Procedure note is written in the patient chart
- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of sling/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order occupational therapy
- Supervision of rehabilitation
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions

At the time of the original proposal, some of the code descriptors were changed from those submitted (presumably by the CPT staff), and published in the 1992 and subsequent editions. Some of the changes in the descriptors published in CPT 1992 didn't make sense, but in those years, the CPT process was closed-door. Additionally, in 1992 and 1993 the AMA staff were deluged by the implementation of the RBRVS process and though AAOS and OTA requested that these problems be addressed then, AMA CPT staff asked that i be deferred as their "plate was full." After that time, more important issues and other opportunities consumed the resources of the AAOS and inertia (or the lack thereof) took over. This third five year review, after completion of the practice expense review, allowed AAOS a window of time to again try to correct the nomenclature for these codes, and review their work using the standard RUC survey method.

We also note, that at the time of the original CPT proposal, external fixation was considered an adjunctive procedure. CPT instructed that the codes for external fixation (20690 and 20692) be "listed in addition to the code for the treatment ...of the fracture." This concept still applies today. External fixation can be used as an adjunctive stabilization modality when treating fractures by almost any method. However, external fixation can also be used in reconstructive orthopaedics (for example, the treatment of joint contractures) and for non-musculoskeletal system treatments (for example, as a suspension device in the treatment of lower extremity burns). In 1991, there was no Modifier -51 exempt code category. Today, these same codes, 20690 and 20692 for external fixator application are modifier -51 exempt, recognizing that they can stand alone or be used adjunctively. Because of the modifier -51 exemption, the RVUs have been reduced, so payers are not paying double when either of these codes are reported with another treatment code.

In the 2005 comment letter to CMS, the AAOS recommended examining the physician work for the ORIF codes because the code descriptors lacked clarity. In particular, because the CPT descriptors include the phrase "with or without internal or external fixation," it is difficult to imagine what the Harvard survey data actually represents (ie, no typical patient was described for the survey respondents to focus on). Further, after the descriptors for these codes were changed for CPT 1993, an Abt study was performed in 1992 for RUC consideration. This study produced *percentage* relationships to key reference codes, but not surveyed time and visit data. Some of these recommendations were accepted by the RUC and CMS and others were adjusted up or down, but no changes were made to the Harvard time and visit data, if available. Therefore, we believe that there is little, if any, relationship between the Harvard database time and visit information (from the old CPT codes) and the current work RVUs.

Given this information, we believe there is compelling evidence that the current work values and/or time and visit data may be incorrect and outdated and should be reviewed.

- *Evidence that incorrect assumptions were made in the previous valuation of the service, as documented; a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data*

Harvard utilized the AMA Physician Masterfile to draw names for their surveys. While general orthopaedic surgeons can perform open reduction fracture care, it is more typical for patients to be referred to orthopaedic surgeons who specialize in orthopaedic trauma or in a given anatomical area (eg, shoulder, hand, knee, etc.). We do not believe that all specialty surgeons were surveyed for these codes, since the AMA Masterfile did not delineate orthopaedic specialties. Additionally, podiatrists were not surveyed for any of the lower extremity codes.

Given this information, we believe there is compelling evidence that not all involved specialties were involved in the review of these codes.

A consensus committee of physicians representing the American Academy of Orthopaedic Surgeons, American Shoulder and Elbow Surgeons, Society for Surgery of the Hand, Arthroscopy Association of North America, Orthopaedic Trauma Association, American Podiatric Medical Association, and American Orthopaedic Foot and Ankle Society met by conference call to discuss the survey data for the revised orthopaedic codes and data for the key reference codes and other codes on the survey reference service lists.

For revised code 23680, we recommend 15.00 work RVUs. After considering differences in time and visits, along with differences in intra-operative work, we believe this value correctly ranks code 23680 relative to other ORIF codes, relative to the key reference code, and relative to orthopaedic codes from the survey reference service list.

ıe consensus panel compared the work of 23680 to the key reference code 29827 (same pre and intra-op work, and greater post-op work including hospitalization), but felt that total work for both procedures is very similar. The survey 25th percentile is recommended to reflect this perceived similarity. Post-operatively, hospital work is required to evaluate the neurovascular status, change the operative dressing, remove the Hemovac if inserted, adjust the sling and abduction pillow and review the post-operative motion and care instructions. The first office visit is to re-evaluate the wound and neurovascular status, discuss the operative procedure, remove the wound sutures, review the post-operative instructions

including range of motion and active motion limitations, obtain an X-ray and review the findings. Any medications prescriptions are renewed and physical therapy is discussed. Maintenance of the joint reduction while attempting to restore early motion is critical during the entire post-operative/global period. The second visit is to assure proper wound healing, re-evaluate the neurovascular status, and assess ROM. The third and fourth visits are to check the wound, neurovascular status, obtained and reviewed an X-ray, initiate and increase the active motion and gentle resistan exercises and increase the activities of daily living/recreation.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No
   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FIVE YEAR REVIEW SPECIFIC QUESTIONS:

Please indicate the number of survey respondent percentages responding to each of the following questions (for example 0.05 = 5%):
Has the work of performing this service changed in the past 5 years? Yes 58% No 42%
(Use the subset of the people who responded "Yes" to answer the following questions)

A. This service represents new technology that has become more familiar (i.e., less work):
   I agree 45% I do not agree 55%
B. Patients requiring this service are now:
   more complex (more work) 82% less complex (less work) 0% no change 18%
C. The usual site-of-service has changed:
   from outpatient to inpatient 9% from inpatient to outpatient 0% no change 91%

Attestation Statement

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
2005 FIVE YEAR REVIEW - SUMMARY OF RECOMMENDATION

CPT Code:24545 Tracking Number F10 Specialty Society Recommended RVU: **15.00**
Global Period: 090 RUC Recommended RVU: **15.00**

CPT Descriptor: Open treatment of humeral supracondylar or transcondylar fracture, includes internal fixation, when performed; without intercondylar extension

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 40-year-old male suffers an extra-articular distal humerus fracture requiring open reduction and internal fixation.

Percentage of Survey Respondents who found Vignette to be Typical: 87%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work:
- Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
- Verify that all required instruments and supplies are available – with special attention to plates and screws
- Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulation drapes
- Assess position of the extremities and head, adjust as needed
- The patient's upper extremity is placed on the surgical hand table, on an arm board or in the cross chest position with the patient supine or in the lateral decubitus position.
- Indicate areas of skin to be prepped and mark surgical incisions.
- The arm and shoulder are prepped and draped.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work:
An incision is made over the posterior distal humerus. The triceps is split and the radial nerve is exposed, isolated and protected. The fracture fragments are identified and reduced. The butterfly fragment, which is frequently associated with this fracture, is also identified and reduced. Multiple intra-fragmentary screws and/or cerclage wires are often required as are medial and lateral column plates. Once the fractures are stabilized, the wounds are copiously irrigated with antibiotic saline. The muscle fascia is repaired and the skin is closed in multiple layers.

Description of Post-Service Work:
Post-service work: in facility
- Application of bulky dressing and a splint and sling.
- Monitor patient stabilization in the recovery room.
- Consultation with the family and patient regarding the surgery and postoperative regimen.
- Communication with health care professionals including written and oral reports and orders.
- Postoperative care is coordinated with recovery room nursing staff.
- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.

- The patient is discharged to the orthopaedic floor for monitoring of compartment syndrome. This requires removing and reapplying the dressings.

Discharge day:

- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Write prescriptions for medications needed post-discharge.
- Dictation of an operative report
- Procedure note is written in the patient chart
- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of sling/splint/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order occupational therapy
- Supervision of rehabilitation
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions

COMPELLING EVIDENCE RATIONALE (Required to be Completed)

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

- ***Evidence that technology has changed physician work.***

Surgical treatment using open anatomical reduction and internal fixation has been made more complex with the introduction of new imaging methods such as CT which allow better detection of the fracture pathology and provided the basis for new surgical strategies. There are also new internal fixation devices which require more work. Beginning in the 1990s (after the Harvard study), new plates were developed for fracture repair, with most becoming available in the late 1990s and early 2000s. As an example of the complexity of the decision process in current practice, the 1990's have given the surgeon numerous options for bone fixation. The options for a bone fixation device currently include Kirschner wires, wire, staples, screws, as well as newer alternatives such as headless bone screws, T-screws, absorbable pins, cannulated screws, and a myriad of plates. The goal of all these devices remains constant: that is, to achieve stable approximation of bone fragments to facilitate healing. The various devices afford rigid fixation along with compression of the osseous fragments. This allows early range of motion and preservation of surrounding joint function, as well as primary bone healing. Selection of the most advantageous form of fixation is dependent on many factors and takes considerable time in the pre-evaluation of a patient. These include the type of fracture or osteotomy created, bone density, type of bone, and the desire for interfragmental compression. All of this has resulted in more work. The standards of care (fracture reduction, limb alignment, etc.) have also been elevated by literature that shows fracture displacements and poor alignments lead to poorer results. Additionally, women over 50 is a fast growing segment of our population. A huge percentage of these patients are osteoporotic - making fracture fixation and maintenance of fixation far more difficult than it used to be. The new plates are more complex to insert when the underlying bone is of much poorer quality.

Given this information, we believe there is compelling evidence that ORIF is more complex than 5 years ago and this is even more true in comparison to practice in the late 1980s (or more than 25 years ago).

- ***Evidence that incorrect assumptions were made in the previous valuation of the service; a misleading vignette and/or survey in a previous evaluation***

During the period of 1989-1991 (after the Harvard study), a major effort was undertaken by the AAOS and the OTA to rewrite every fracture and dislocation treatment code in the musculoskeletal Section of CPT. In 1991, 395 code changes were accepted by the AMA CPT Editorial Panel under the leadership of Dr. William Felts. At the time of the original proposal, some of the code descriptors were changed from those submitted (presumably by the CPT staff), and published in the 1992 and subsequent editions. Some of the changes in the descriptors published in CPT 1992 didn't make sense, but in those years, the CPT process was closed-door. Additionally, in 1992 and 1993 the AMA staff were deluged by the implementation of the RBRVS process and though AAOS and OTA requested that these problems be addressed then, AMA CPT staff asked that be deferred as their "plate was full." After that time, more important issues and other opportunities consumed the resources of the AAOS and inertia (or the lack thereof) took over. This third five year review, after completion of the practice expense review, allowed AAOS a window of time to again try to correct the nomenclature for these codes, and review their work using the standard RUC survey method.

We also note, that at the time of the original CPT proposal, external fixation was considered an adjunctive procedure. CPT instructed that the codes for external fixation (20690 and 20692) be "listed in addition to the code for the treatment ...of the fracture." This concept still applies today. External fixation can be used as an adjunctive stabilization modality when treating fractures by almost any method. However, external fixation can also be used in reconstructive orthopaedics (for example, the treatment of joint contractures) and for non-musculoskeletal system treatments (for example, as a suspension device in the treatment of lower extremity burns). In 1991, there was no Modifier -51 exempt code category. Today, these same codes, 20690 and 20692 for external fixator application are modifier -51 exempt, recognizing that they can stand alone or be used adjunctively. Because of the modifier -51 exemption, the RVUs have been reduced, so payers are not paying double when either of these codes are reported with another treatment code.

In the 2005 comment letter to CMS, the AAOS recommended examining the physician work for the ORIF codes because the code descriptors lacked clarity. In particular, because the CPT descriptors include the phrase "with or without internal or external fixation," it is difficult to imagine what the Harvard survey data actually represents (ie, no typical patient was described for the survey respondents to focus on). Further, after the descriptors for these codes were changed for CPT 1993, an Abt study was performed in 1992 for RUC consideration. This study produced *percentage* relationships to key reference codes, but not surveyed time and visit data. Some of these recommendations were accepted by the RUC and CMS and others were adjusted up or down, but no changes were made to the Harvard time and visit data, if available. Therefore, we believe that there is little, if any, relationship between the Harvard database time and visit information (from the old CPT codes) and the current work RVUs.

Given this information, we believe there is compelling evidence that the current work values and/or time and visit data may be incorrect and outdated and should be reviewed.

- *Evidence that incorrect assumptions were made in the previous valuation of the service, as documented; a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data*

Harvard utilized the AMA Physician Masterfile to draw names for their surveys. While general orthopaedic surgeons can perform open reduction fracture care, it is more typical for patients to be referred to orthopaedic surgeons who specialize in orthopaedic trauma or in a given anatomical area (eg, shoulder, hand, knee, etc.). We do not believe that all specialty surgeons were surveyed for these codes, since the AMA Masterfile did not delineate orthopaedic specialties. Additionally, podiatrists were not surveyed for any of the lower extremity codes.

Given this information, we believe there is compelling evidence that not all involved specialties were involved in the review of these codes.

A consensus committee of physicians representing the American Academy of Orthopaedic Surgeons, American Shoulder and Elbow Surgeons, Society for Surgery of the Hand, Arthroscopy Association of North America, Orthopaedic Trauma Association, American Podiatric Medical Association, and American Orthopaedic Foot and Ankle Society met by conference call to discuss the survey data for the revised orthopaedic codes and data for the key reference codes and other codes on the survey reference service lists.

For revised code 24545, we recommend 15.00 work RVUs. After considering differences in time and visits, along with differences in intra-operative work, we believe this value correctly ranks code 24545 relative to other ORIF codes, relative to the key reference code, and relative to orthopaedic codes from the survey reference service list.

This code is similar to the reference code 25609 intensity and complexity with the addition of hospitalization. The consensus panel also believes that 24545 requires the same work as 23615 and requires more work than 23670 and 27826. Post-operatively, hospital work is required to evaluate the neurovascular status, remove the Hemovac if inserted, check the splint, adjust the sling and review the post-operative care instructions. The first office visit is to evaluate the wound and neurovascular status, discuss the operative procedure, remove the wound sutures, review the post-operative instructions including range of motion and active motion limitations, obtain an X-ray and review the findings. Any

medications prescriptions are renewed. Maintenance of the joint reduction while attempting to restore early motion is critical during the entire post-operative/global period. The second visit is to assure proper wound healing, re-evaluate the neurovascular status, and assess ROM. The third and fourth visits are to check the wound, neurovascular status, obtained and reviewed an X-ray, initiate and increase the active motion and gentle resistance exercises and increase the activities of daily living/recreation.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No
   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FIVE YEAR REVIEW SPECIFIC QUESTIONS:

Please indicate the number of survey respondent percentages responding to each of the following questions (for example 0.05 = 5%):
Has the work of performing this service changed in the past 5 years? Yes 43% No 57%
(Use the subset of the people who responded "Yes" to answer the following questions)

A. This service represents new technology that has become more familiar (i.e., less work):
   I agree 30% I do not agree 70%
B. Patients requiring this service are now:
   more complex (more work) 90% less complex (less work) 0% no change 10%
C. The usual site-of-service has changed:
   from outpatient to inpatient 10% from inpatient to outpatient 0% no change 90%

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
2005 FIVE YEAR REVIEW - SUMMARY OF RECOMMENDATION

CPT Code:24546 Tracking Number F11 Specialty Society Recommended RVU: **22.00**
Global Period: 090 RUC Recommended RVU: **17.00**

CPT Descriptor: Open treatment of humeral supracondylar or transcondylar fracture, includes internal fixation, when performed; with intercondylar extension

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 50-year-old male suffers a distal humerus fracture which extends into the joint requiring open reduction and internal fixation.

Percentage of Survey Respondents who found Vignette to be Typical: 67%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work:
- Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
  Verify that all required instruments and supplies are available - with special attention to plates and screws
- Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulation drapes
- Assess position of the extremities and head, adjust as needed
- The patient's upper extremity is placed on the surgical hand table, on an arm board or in the cross chest position with the patient supine or in the lateral decubitus position.
- Indicate areas of skin to be prepped and mark surgical incisions.
- The arm and shoulder are prepped and draped.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work:
An incision is made over the posterior, medial or lateral distal humerus depending on the exact configuration of the fracture. An olecranon osteotomy is often required to exposed and reduce the fracture. The olecranon is cut in a V-shaped fashion after a single or dual screws and a tension band wire are pre-positioned in the olecranon before the osteotomy. The radial nerve is exposed, isolated and protected. The fracture fragments are identified and reduced. The articular surfaces are reduced and carefully placed transcondylar screw(s) are required to maintain the reduction of the articular surface. The multiple fragments, which are frequently associated with this fracture, are also identified and reduced. This fracture is often difficult to maintain a reduction, hold the reduction and stabilize the fracture. Multiple intra-fragmentary screws are required as are medial and lateral column plates. The olecranon osteotomy is repaired with the pre-positioned tension band wire and intra-medullary screw(s). Once the fracture is stabilized the wounds are copiously irrigated with antibiotic saline. The muscle fascia is repaired and the skin is closed in multiple layers.

escription of Post-Service Work:
Post-service work: in facility
- Application of bulky dressing and a splint and sling.
- Monitor patient stabilization in the recovery room.
- Consultation with the family and patient regarding the surgery and postoperative regimen.

- Communication with health care professionals including written and oral reports and orders.
- Postoperative care is coordinated with recovery room nursing staff.
- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- The patient is discharged to the orthopaedic floor for monitoring of compartment syndrome. This requi removing and reapplying the dressings.

Discharge day:

- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Write prescriptions for medications needed post-discharge.
- Dictation of an operative report
- Procedure note is written in the patient chart
- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of sling/splint/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order occupational therapy
- Supervision of rehabilitation
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions

COMPELLING EVIDENCE RATIONALE (Required to be Completed)

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

- ***Evidence that technology has changed physician work.***

Surgical treatment using open anatomical reduction and internal fixation has been made more complex with the introduction of new imaging methods such as CT which allow better detection of the fracture pathology and provided the basis for new surgical strategies. There are also new internal fixation devices which require more work. Beginning in the 1990s (after the Harvard study), new plates were developed for fracture repair, with most becoming available in the late 1990s and early 2000s. As an example of the complexity of the decision process in current practice, the 1990's have given the surgeon numerous options for bone fixation. The options for a bone fixation device currently include Kirschner wires, wire, staples, screws, as well as newer alternatives such as headless bone screws, T-screws, absorbable pins, cannulated screws, and a myriad of plates. The goal of all these devices remains constant: that is, to achieve stable approximation of bone fragments to facilitate healing. The various devices afford rigid fixation along with compression of the osseous fragments. This allows early range of motion and preservation of surrounding joint function, as well as primary bone healing. Selection of the most advantageous form of fixation is dependent on many factors and takes considerable time in the pre-evaluation of a patient. These include the type of fracture or osteotomy created, bone density, type of bone, and the desire for interfragmental compression. All of this has resulted in more work. The standards of care (fracture reduction, limb alignment, etc.) have also been elevated by literature that shows fracture displacements and poor alignments lead to poorer results. Additionally, women over 50 is a fast growing segment of our population. A huge percentage of these patients are osteoporotic - making fracture fixation and maintenance of fixation far more difficult than it used to be. The new plates are more complex to insert when the underlying bone is of much poorer quality.

Given this information, we believe there is compelling evidence that ORIF is more complex than 5 years ago and this is even more true in comparison to practice in the late 1980s (or more than 25 years ago).

- ***Evidence that incorrect assumptions were made in the previous valuation of the service; a misleading vignette and/or survey in a previous evaluation***

During the period of 1989-1991 (after the Harvard study), a major effort was undertaken by the AAOS and the OTA to rewrite every fracture and dislocation treatment code in the musculoskeletal Section of CPT. In 1991, 395 code changes were accepted by the AMA CPT Editorial Panel under the leadership of Dr. William Felts. At the time of the original proposal, some of the code descriptors were changed from those submitted (presumably by the CPT staff), and published in the 1992 and subsequent editions. Some of the changes in the descriptors published in CPT 1992 didn't make sense, but in those years, the CPT process was closed-door. Additionally, in 1992 and 1993 the AMA staff were deluged by the implementation of the RBRVS process and though AAOS and OTA requested that these problems be addressed then, AMA CPT staff asked that i be deferred as their "plate was full." After that time, more important issues and other opportunities consumed the resources of the AAOS and inertia (or the lack thereof) took over. This third five year review, after completion of the practice expense review, allowed AAOS a window of time to again try to correct the nomenclature for these codes, and review their work using the standard RUC survey method.

We also note, that at the time of the original CPT proposal, external fixation was considered an adjunctive procedure. CPT instructed that the codes for external fixation (20690 and 20692) be "listed in addition to the code for the treatment ...of the fracture." This concept still applies today. External fixation can be used as an adjunctive stabilization modality when treating fractures by almost any method. However, external fixation can also be used in reconstructive orthopaedics (for example, the treatment of joint contractures) and for non-musculoskeletal system treatments (for example, as a suspension device in the treatment of lower extremity burns). In 1991, there was no Modifier -51 exempt code category. Today, these same codes, 20690 and 20692 for external fixator application are modifier -51 exempt, recognizing that they can stand alone or be used adjunctively. Because of the modifier -51 exemption, the RVUs have been reduced, so payers are not paying double when either of these codes are reported with another treatment code.

In the 2005 comment letter to CMS, the AAOS recommended examining the physician work for the ORIF codes because the code descriptors lacked clarity. In particular, because the CPT descriptors include the phrase "with or without internal or external fixation," it is difficult to imagine what the Harvard survey data actually represents (ie, no typical patient was described for the survey respondents to focus on). Further, after the descriptors for these codes were changed for CPT 1993, an Abt study was performed in 1992 for RUC consideration. This study produced *percentage* relationships to key reference codes, but not surveyed time and visit data. Some of these recommendations were accepted by the RUC and CMS and others were adjusted up or down, but no changes were made to the Harvard time and visit data, if available. Therefore, we believe that there is little, if any, relationship between the Harvard database time and visit information (from the old CPT codes) and the current work RVUs.

Given this information, we believe there is compelling evidence that the current work values and/or time and visit data may be incorrect and outdated and should be reviewed.

- *Evidence that incorrect assumptions were made in the previous valuation of the service, as documented; a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data*

Harvard utilized the AMA Physician Masterfile to draw names for their surveys. While general orthopaedic surgeons can perform open reduction fracture care, it is more typical for patients to be referred to orthopaedic surgeons who specialize in orthopaedic trauma or in a given anatomical area (eg, shoulder, hand, knee, etc.). We do not believe that all specialty surgeons were surveyed for these codes, since the AMA Masterfile did not delineate orthopaedic specialties. Additionally, podiatrists were not surveyed for any of the lower extremity codes.

Given this information, we believe there is compelling evidence that not all involved specialties were involved in the review of these codes.

A consensus committee of physicians representing the American Academy of Orthopaedic Surgeons, American Shoulder and Elbow Surgeons, Society for Surgery of the Hand, Arthroscopy Association of North America, Orthopaedic Trauma Association, American Podiatric Medical Association, and American Orthopaedic Foot and Ankle Society met by conference call to discuss the survey data for the revised orthopaedic codes and data for the key reference codes and other codes on the survey reference service lists.

For revised code 24546, we recommend 22.00 work RVUs. After considering differences in time and visits, along with differences in intra-operative work, we believe this value correctly ranks code 24546 relative to other ORIF codes, relative to the key reference code, and relative to orthopaedic codes from the survey reference service list.

This is an intra-articular fracture and an extensive exposure of the joint is required. This typically includes osteotomy of the olecranon and later fixation of the osteotomy. Identification, protection, and transposition of the ulnar nerve is usually performed as part of the procedure. Fixation with at least 2 plates and multiple screws is standard. New fixation devices such as locked plates are typically utilized, especially in older patients. Anatomic reduction of the fracture, especially the joint surface, and stable fixation are technically demanding. These are key factors directly related to functional outcome and the prevention of post-traumatic arthritis. Total time for 24546 is similar to key reference code 27447. Intra-time is

greater for 24546, and although more complex, is less intensive. Code 27447 requires more post-operative hospital work. The consensus panel recommends the survey median as an relative reflection of the these differences.

Postoperative close monitoring is required for assessment of the circulation, sensation and motor function of the involved extremity, as well as evaluation and management of pain control. Hospital work involves removal of the immobilizatic device, as well as a dressing changes, with each wound inspection. Physical therapy would be started and a discussi with the patient and therapist regarding the protocol and limitations is necessary. Multiple post-discharge office visits ar necessary for assessment of the wound, suture removal, ROM and review of x-rays. Progress with rehabilitation therapy is evaluated and instructions regarding immobilization, activity, physical therapy, and restrictions would be provided.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No
   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure include:
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FIVE YEAR REVIEW SPECIFIC QUESTIONS:

Please indicate the number of survey respondent percentages responding to each of the following questions (for example 0.05 = 5%):
Has the work of performing this service changed in the past 5 years? Yes 46% No 54%
(Use the subset of the people who responded "Yes" to answer the following questions)

A. This service represents new technology that has become more familiar (i.e., less work):
   I agree 33% I do not agree 67%
B. Patients requiring this service are now:
   more complex (more work) 100% less complex (less work) no change
C. The usual site-of-service has changed:
   from outpatient to inpatient 0% from inpatient to outpatient 8% no change 92%

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
2005 FIVE YEAR REVIEW - SUMMARY OF RECOMMENDATION

CPT Code:24575 Tracking Number F12 Specialty Society Recommended RVU: **11.00**
Global Period: 090 RUC Recommended RVU: **11.00**

CPT Descriptor: Open treatment of humeral epicondylar fracture, medial or lateral, includes internal fixation, when performed

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 17-year-old male suffers a displaced avulsion fracture of the humeral epicondyle requiring open reduction and internal fixation.

Percentage of Survey Respondents who found Vignette to be Typical: 81%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work:
- Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
  Verify that all required instruments and supplies are available – with special attention to plates and screws
- Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulation drapes
- Assess position of the extremities and head, adjust as needed
- The patient's upper extremity is placed on the surgical hand table, on an arm board or in the cross chest position with the patient supine or in the lateral decubitus position.
- Indicate areas of skin to be prepped and mark surgical incisions.
- The arm and shoulder are prepped and draped.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work:
A medial or lateral incision is made to protect the cutaneous nerves of the elbow. The subcutaneous tissue is dissected with sharp and blunt dissection. The epicondyle and any bony fragments are identified and great care is taken to protect the ligamentous and muscular attachments on the bone. Once the rotation of the fragment(s) is/are solved and the reduction is attained, fixation of the fragment(s) is/are secured. The fixation is extremely variable from plate and screws to K wires or sutures or any combination thereof. Repair of the muscle fascia is completed. The wounds are copiously irrigated with antibiotic saline. The subcutaneous tissue and skin are closed in multiple levels.

Description of Post-Service Work:
Post-service work: in facility
- Application of bulky dressing and a splint and sling.
- Monitor patient stabilization in the recovery room.
  Consultation with the family and patient regarding the surgery and postoperative regimen.
- Communication with health care professionals including written and oral reports and orders.
- Postoperative care is coordinated with recovery room nursing staff.
- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.

- The patient is discharged to the orthopaedic floor for monitoring of compartment syndrome. This requires removing and reapplying the dressings.

Discharge day:

- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Write prescriptions for medications needed post-discharge.
- Dictation of an operative report
- Procedure note is written in the patient chart
- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of sling/splint/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order occupational therapy
- Supervision of rehabilitation
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions

COMPELLING EVIDENCE RATIONALE (Required to be Completed)

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

- ***Evidence that technology has changed physician work.***

Surgical treatment using open anatomical reduction and internal fixation has been made more complex with the introduction of new imaging methods such as CT which allow better detection of the fracture pathology and provided the basis for new surgical strategies. There are also new internal fixation devices which require more work. Beginning in the 1990s (after the Harvard study), new plates were developed for fracture repair, with most becoming available in the late 1990s and early 2000s. As an example of the complexity of the decision process in current practice, the 1990's have given the surgeon numerous options for bone fixation. The options for a bone fixation device currently include Kirschner wires, wire, staples, screws, as well as newer alternatives such as headless bone screws, T-screws, absorbable pins, cannulated screws, and a myriad of plates. The goal of all these devices remains constant: that is, to achieve stable approximation of bone fragments to facilitate healing. The various devices afford rigid fixation along with compression of the osseous fragments. This allows early range of motion and preservation of surrounding joint function, as well as primary bone healing. Selection of the most advantageous form of fixation is dependent on many factors and takes considerable time in the pre-evaluation of a patient. These include the type of fracture or osteotomy created, bone density, type of bone, and the desire for interfragmental compression. All of this has resulted in more work. The standards of care (fracture reduction, limb alignment, etc.) have also been elevated by literature that shows fracture displacements and poor alignments lead to poorer results. Additionally, women over 50 is a fast growing segment of our population. A huge percentage of these patients are osteoporotic - making fracture fixation and maintenance of fixation far more difficult than it used to be. The new plates are more complex to insert when the underlying bone is of much poorer quality.

Given this information, we believe there is compelling evidence that ORIF is more complex than 5 years ago and this is even more true in comparison to practice in the late 1980s (or more than 25 years ago).

- ***Evidence that incorrect assumptions were made in the previous valuation of the service; a misleading vignette and/or survey in a previous evaluation***

During the period of 1989-1991 (after the Harvard study), a major effort was undertaken by the AAOS and the OTA to rewrite every fracture and dislocation treatment code in the musculoskeletal Section of CPT. In 1991, 395 code changes were accepted by the AMA CPT Editorial Panel under the leadership of Dr. William Felts. At the time of the original proposal, some of the code descriptors were changed from those submitted (presumably by the CPT staff), and published in the 1992 and subsequent editions. Some of the changes in the descriptors published in CPT 1992 didn't make sense, but in those years, the CPT process was closed-door. Additionally, in 1992 and 1993 the AMA staff were deluged by the implementation of the RBRVS process and though AAOS and OTA requested that these problems be addressed then, AMA CPT staff asked that i be deferred as their "plate was full." After that time, more important issues and other opportunities consumed the resources of the AAOS and inertia (or the lack thereof) took over. This third five year review, after completion of the practice expense review, allowed AAOS a window of time to again try to correct the nomenclature for these codes, and review their work using the standard RUC survey method.

We also note, that at the time of the original CPT proposal, external fixation was considered an adjunctive procedure. CPT instructed that the codes for external fixation (20690 and 20692) be "listed in addition to the code for the treatment ...of the fracture." This concept still applies today. External fixation can be used as an adjunctive stabilization modality when treating fractures by almost any method. However, external fixation can also be used in reconstructive orthopaedics (for example, the treatment of joint contractures) and for non-musculoskeletal system treatments (for example, as a suspension device in the treatment of lower extremity burns). In 1991, there was no Modifier -51 exempt code category. Today, these same codes, 20690 and 20692 for external fixator application are modifier -51 exempt, recognizing that they can stand alone or be used adjunctively. Because of the modifier -51 exemption, the RVUs have been reduced, so payers are not paying double when either of these codes are reported with another treatment code.

In the 2005 comment letter to CMS, the AAOS recommended examining the physician work for the ORIF codes because the code descriptors lacked clarity. In particular, because the CPT descriptors include the phrase "with or without internal or external fixation," it is difficult to imagine what the Harvard survey data actually represents (ie, no typical patient was described for the survey respondents to focus on). Further, after the descriptors for these codes were changed for CPT 1993, an Abt study was performed in 1992 for RUC consideration. This study produced *percentage* relationships to key reference codes, but not surveyed time and visit data. Some of these recommendations were accepted by the RUC and CMS and others were adjusted up or down, but no changes were made to the Harvard time and visit data, if available. Therefore, we believe that there is little, if any, relationship between the Harvard database time and visit information (from the old CPT codes) and the current work RVUs.

Given this information, we believe there is compelling evidence that the current work values and/or time and visit data may be incorrect and outdated and should be reviewed.

- *Evidence that incorrect assumptions were made in the previous valuation of the service, as documented; a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data*

Harvard utilized the AMA Physician Masterfile to draw names for their surveys. While general orthopaedic surgeons can perform open reduction fracture care, it is more typical for patients to be referred to orthopaedic surgeons who specialize in orthopaedic trauma or in a given anatomical area (eg, shoulder, hand, knee, etc.). We do not believe that all specialty surgeons were surveyed for these codes, since the AMA Masterfile did not delineate orthopaedic specialties. Additionally, podiatrists were not surveyed for any of the lower extremity codes.

Given this information, we believe there is compelling evidence that not all involved specialties were involved in the review of these codes.

A consensus committee of physicians representing the American Academy of Orthopaedic Surgeons, American Shoulder and Elbow Surgeons, Society for Surgery of the Hand, Arthroscopy Association of North America, Orthopaedic Trauma Association, American Podiatric Medical Association, and American Orthopaedic Foot and Ankle Society met by conference call to discuss the survey data for the revised orthopaedic codes and data for the key reference codes and other codes on the survey reference service lists.

For revised code 24575, we recommend 11.00 work RVUs. After considering differences in time and visits, along with differences in intra-operative work, we believe this value correctly ranks code 24575 relative to other ORIF codes, relative to the key reference code, and relative to orthopaedic codes from the survey reference service list.

This is an elbow fracture code that puts the radial, posterior interosseous, ulnar and cutaneous nerves at risk. Although intra-time for the reference code 25608 is greater, the post-operative work is less because 24575 requires hospitalization to avoid skin issues, swelling and assess neurocirculatory status. Total time is similar for both codes. Close monitoring of neurovascular status is necessary and the first night is spent in the hospital. Post operative hospital visit would include neurovascular check and review of procedure as well as discussion of limitations and care of splint. The first post operative visit would involve splint and stitch removal with reapplication of immobilization. Wound healing would be

assessed as well as fracture reduction with X-rays. The second visit would entail splint removal, assessment of ROM and initiation of motion exercises. The third visit would assess wound healing, ROM, stability and strength with counseling on activities. X-rays would be taken to assess bone healing. The final visit would assess ROM, stability and strength.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No
   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FIVE YEAR REVIEW SPECIFIC QUESTIONS:

Please indicate the number of survey respondent percentages responding to each of the following questions (for examp 0.05 = 5%):
Has the work of performing this service changed in the past 5 years? Yes 37% No 63%
(Use the subset of the people who responded "Yes" to answer the following questions)

A. This service represents new technology that has become more familiar (i.e., less work):
   I agree 29% I do not agree 71%
B. Patients requiring this service are now:
   more complex (more work) 100% less complex (less work) no change
C. The usual site-of-service has changed:
   from outpatient to inpatient 0% from inpatient to outpatient 29% no change 71%

Attestation Statement

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
2005 FIVE YEAR REVIEW - SUMMARY OF RECOMMENDATION

CPT Code:24579 Tracking Number F13 Specialty Society Recommended RVU: **13.00**
Global Period: 090 RUC Recommended RVU: **13.00**

CPT Descriptor: Open treatment of humeral condylar fracture, medial or lateral, includes internal fixation, when performed

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 22-year-old suffers a displaced humeral condyle fracture requiring open reduction and internal fixation.

Percentage of Survey Respondents who found Vignette to be Typical: 85%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: • Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
- Verify that all required instruments and supplies are available – with special attention to plates and screws

Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulation drapes
- Assess position of the extremities and head, adjust as needed
- The patient's upper extremity is placed on the surgical hand table, on an arm board or in the cross chest position with the patient supine or in the lateral decubitus position.
- Indicate areas of skin to be prepped and mark surgical incisions.
- The arm and shoulder are prepped and draped.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work: A medial or lateral incision is made to protect the cutaneous nerves of the elbow. The subcutaneous tissue is dissected with sharp and blunt dissection. The condyle and any bony fragments are identified and great care is taken to protect the ligamentous and muscular attachments on the bone. Once the rotation of the fragment(s) is/are solved careful reduction of the articular surface is mandatory. The reduction is maintained often while cartilaginous fragments are positioned and stabilized. Trans-condylar screws or pins are often required as are cartilage fragment resorbable fixation. The fixation is extremely variable from plate and screws to K wires or sutures or any combination thereof but stability of the medial or lateral column is mandatory. Repair of the muscle fascia is completed. The wounds are copiously irrigated with antibiotic saline. The subcutaneous tissue and skin are closed in multiple levels.

Description of Post-Service Work:
Post-service work: in facility
Application of bulky dressing and a splint and sling.
Monitor patient stabilization in the recovery room.
- Consultation with the family and patient regarding the surgery and postoperative regimen.
- Communication with health care professionals including written and oral reports and orders.
- Postoperative care is coordinated with recovery room nursing staff.
- The patient's vital signs are checked.

- The circulation, sensation and motor function of the operated extremity are assessed.
- The patient is discharged to the orthopaedic floor for monitoring of compartment syndrome. This requires removing and reapplying the dressings.

Discharge day:

- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Write prescriptions for medications needed post-discharge.
- Dictation of an operative report
- Procedure note is written in the patient chart
- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of sling/splint/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order occupational therapy
- Supervision of rehabilitation
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions

Surgical treatment using open anatomical reduction and internal fixation has been made more complex with the introduction of new imaging methods such as CT which allow better detection of the fracture pathology and provided the basis for new surgical strategies. There are also new internal fixation devices which require more work. Beginning in the 1990s (after the Harvard study), new plates were developed for fracture repair, with most becoming available in the late 1990s and early 2000s. As an example of the complexity of the decision process in current practice, the 1990's have given the surgeon numerous options for bone fixation. The options for a bone fixation device currently include Kirschner wires, wire, staples, screws, as well as newer alternatives such as headless bone screws, T-screws, absorbable pins, cannulated screws, and a myriad of plates. The goal of all these devices remains constant: that is, to achieve stable approximation of bone fragments to facilitate healing. The various devices afford rigid fixation along with compression of the osseous fragments. This allows early range of motion and preservation of surrounding joint function, as well as primary bone healing. Selection of the most advantageous form of fixation is dependent on many factors and takes considerable time in the pre-evaluation of a patient. These include the type of fracture or osteotomy created, bone density, type of bone, and the desire for interfragmental compression. All of this has resulted in more work. The standards of care (fracture reduction, limb alignment, etc.) have also been elevated by literature that shows fracture displacements and poor alignments lead to poorer results. Additionally, women over 50 is a fast growing segment of our population. A huge percentage of these patients are osteoporotic - making fracture fixation and maintenance of fixation far more difficult than it used to be. The new plates are more complex to insert when the underlying bone is of much poorer quality.

Given this information, we believe there is compelling evidence that ORIF is more complex than 5 years ago and this is even more true in comparison to practice in the late 1980s (or more than 25 years ago).

- ***Evidence that incorrect assumptions were made in the previous valuation of the service; a misleading vignette and/or survey in a previous evaluation***

During the period of 1989-1991 (after the Harvard study), a major effort was undertaken by the AAOS and the OTA to rewrite every fracture and dislocation treatment code in the musculoskeletal Section of CPT. In 1991, 395 code changes were accepted by the AMA CPT Editorial Panel under the leadership of Dr. William Felts. At the time of the original proposal, some of the code descriptors were changed from those submitted (presumably by the CPT staff), and published in the 1992 and subsequent editions. Some of the changes in the descriptors published in CPT 1992 didn't make sense, but in those years, the CPT process was closed-door. Additionally, in 1992 and 1993 the AMA staff were deluged by the implementation of the RBRVS process and though AAOS and OTA requested that these problems be addressed then, AMA CPT staff asked that i be deferred as their "plate was full." After that time, more important issues and other opportunities consumed the resources of the AAOS and inertia (or the lack thereof) took over. This third five year review, after completion of the practice expense review, allowed AAOS a window of time to again try to correct the nomenclature for these codes, and review their work using the standard RUC survey method.

We also note, that at the time of the original CPT proposal, external fixation was considered an adjunctive procedure. CPT instructed that the codes for external fixation (20690 and 20692) be "listed in addition to the code for the treatment ...of the fracture." This concept still applies today. External fixation can be used as an adjunctive stabilization modality when treating fractures by almost any method. However, external fixation can also be used in reconstructive orthopaedics (for example, the treatment of joint contractures) and for non-musculoskeletal system treatments (for example, as a suspension device in the treatment of lower extremity burns). In 1991, there was no Modifier -51 exempt code category. Today, these same codes, 20690 and 20692 for external fixator application are modifier -51 exempt, recognizing that they can stand alone or be used adjunctively. Because of the modifier -51 exemption, the RVUs have been reduced, so payers are not paying double when either of these codes are reported with another treatment code.

In the 2005 comment letter to CMS, the AAOS recommended examining the physician work for the ORIF codes because the code descriptors lacked clarity. In particular, because the CPT descriptors include the phrase "with or without internal or external fixation," it is difficult to imagine what the Harvard survey data actually represents (ie, no typical patient was described for the survey respondents to focus on). Further, after the descriptors for these codes were changed for CPT 1993, an Abt study was performed in 1992 for RUC consideration. This study produced *percentage* relationships to key reference codes, but not surveyed time and visit data. Some of these recommendations were accepted by the RUC and CMS and others were adjusted up or down, but no changes were made to the Harvard time and visit data, if available. Therefore, we believe that there is little, if any, relationship between the Harvard database time and visit information (from the old CPT codes) and the current work RVUs.

Given this information, we believe there is compelling evidence that the current work values and/or time and visit data may be incorrect and outdated and should be reviewed.

- *Evidence that incorrect assumptions were made in the previous valuation of the service, as documented; a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data*

Harvard utilized the AMA Physician Masterfile to draw names for their surveys. While general orthopaedic surgeons can perform open reduction fracture care, it is more typical for patients to be referred to orthopaedic surgeons who specialize in orthopaedic trauma or in a given anatomical area (eg, shoulder, hand, knee, etc.). We do not believe that all specialty surgeons were surveyed for these codes, since the AMA Masterfile did not delineate orthopaedic specialties. Additionally, podiatrists were not surveyed for any of the lower extremity codes.

Given this information, we believe there is compelling evidence that not all involved specialties were involved in the review of these codes.

A consensus committee of physicians representing the American Academy of Orthopaedic Surgeons, American Shoulder and Elbow Surgeons, Society for Surgery of the Hand, Arthroscopy Association of North America, Orthopaedic Trauma Association, American Podiatric Medical Association, and American Orthopaedic Foot and Ankle Society met by conference call to discuss the survey data for the revised orthopaedic codes and data for the key reference codes and other codes on the survey reference service lists.

For revised code 24579, we recommend 13.00 work RVUs. After considering differences in time and visits, along with differences in intra-operative work, we believe this value correctly ranks code 24579 relative to other ORIF codes, relative to the key reference code, and relative to orthopaedic codes from the survey reference service list.

ɔde 24579 is similar to 24575 with the addition of an intraarticular extension involving the entire condylar structure. The ɹame neurovascular structures are at risk with the added complexity of obtaining and holding the articular surface reduced anatomically to maintain joint congruity. The key reference code 25608 has similar in operative time but less total time because it is typically performed as an outpatient. The survey median work RVU correctly accounts for the additional work of 24579 relative to 24575 and 25608. Close monitoring of neurovascular status is necessary and the first night is spent in the hospital. Post operative hospital visits would include neurovascular check and review of

procedure as well as discussion of limitations and care of splint. The first post operative visit would involve splint and stitch removal with reapplication of immobilization. Wound healing would be assessed as well as fracture reduction with X-rays. The second visit would entail splint removal, assessment of ROM and initiation of motion exercises. The third visit would assess wound healing, ROM, stability and strength with counseling on activities. X-rays would be taken to assess bone healing. The final visit would assess ROM, stability and strength.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No
   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FIVE YEAR REVIEW SPECIFIC QUESTIONS:

Please indicate the number of survey respondent percentages responding to each of the following questions (for exam 0.05 = 5%):
Has the work of performing this service changed in the past 5 years? Yes 31% No 69%
(Use the subset of the people who responded "Yes" to answer the following questions)

A. This service represents new technology that has become more familiar (i.e., less work):
   I agree 38% I do not agree 63%
B. Patients requiring this service are now:
   more complex (more work) 75% less complex (less work) 0% no change 25%
C. The usual site-of-service has changed:
   from outpatient to inpatient 0% from inpatient to outpatient 25% no change 75%

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

April 2007

Epicondylitis Procedures

The CPT Editorial Panel, in February 2007, replaced the existing five epicondylitis procedure codes with three clearer descriptions of the services. The Panel agreed that the five descriptions are confusing, difficult to specify varied situations, and, in some cases, clinically irrelevant. The three new codes, which describe the same work, were developed to clearly describe the work involved in the epicondylitis procedures as well as additional work that may or may not be required in such procedures.

24357

The RUC discussed the specialty societies' survey results and presentation for 24357, *Tenotomy, elbow, lateral or medial (eg, epicondylitis, tennis elbow, golfer's elbow); percutaneous*. The new code was compared to reference service 25651, *Percutaneous skeletal fixation of ulnar styloid fracture*, (work RVU = 5.68). The two services have identical intra-service time (20 minutes), while the surveyed code requires slightly less intensity and complexity. As such, the specialty society and the RUC agreed that the survey median of 5.68 RVUs was too high. The RUC also compared the service to the code with which it was previously billed, 24350, *Fasciotomy, lateral or medial (eg, tennis elbow or epicondylitis)*, (work RVU = 5.32). Because the service does not represent new work, the RUC agreed that a work RVU of 5.32 was appropriate. Further, 5.32 falls midway between the 25th percentile and the median of the survey results, providing greater rationale for the recommended work RVU. The RUC determined that the single 99213 office visit overstated the work involved in the visit; however, a total of four office visits was appropriate. The RUC, therefore, reduced the single 99213 office visit to a 99212 office visit accounting for a total of four level two office visits within the service's global period. The RUC discussed the pre-service time and noted that the 15 minutes allotted for scrub, dress and wait time was excessive. Subsequently, the RUC recommended a reduction in this pre-service time category to the standard of 10 minutes, reducing total pre-service time to 50 minutes. The RUC recommends a pre-service time of 50 minutes, intra-service time of 20 minutes, and immediate post-service time of 15 minutes as well as one-half 99238 discharge day management and four 99212 office visits for code 24357

283

The RUC recommends a work RVU of 5.32 for code 24357.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

24358

The RUC discussed the specialty societies' survey results and presentation for 24358, *Tenotomy, elbow, lateral or medial (eg, epicondylitis, tennis elbow, golfer's elbow); percutaneous; open, debridement, soft tissue and/or bone.* The new code was compared to reference service 25109, *Excision of tendon, forearm and/or wrist, flexor or extensor, each*, (work RVU = 6.81). The two services have identical intra-service and post-service times (intra = 40 and post = 20 minutes), and the surveyed code requires similar intensity and complexity as compared to the reference code. As such, the specialty society and the RUC agreed that the survey median of 6.81 RVUs was too high, while the 25th percentile was too low. The RUC also compared the service to codes with which it was previously billed, 24351, *Fasciotomy, lateral or medial (eg, tennis elbow or epicondylitis); with extensor origin detachment*, (work RVU = 5.97), 24352, *Fasciotomy, lateral or medial (eg, tennis elbow or epicondylitis); with annular ligament resection*, (work RVU = 6.49); 24354, *Fasciotomy, lateral or medial (eg, tennis elbow or epicondylitis); with stripping*, (work RVU = 6.54); and 24356, *Fasciotomy, lateral or medial (eg, tennis elbow or epicondylitis); with partial ostectomy* (work RVU = 6.74). Because the service does not represent new work, the RUC agreed that a weighted average for the previously billed services would assist in the recommendation of an appropriate work RVU (calculation shown below). The resulting work RVU is 6.54. Further, 6.54 falls midway between the 25th percentile and the median of the survey results, providing greater rationale for the recommended work RVU. The RUC determined that the single 99213 office visit overstated the work involved in the visit; however, a total of four office visits was appropriate. The RUC, therefore, reduced the single level three office visit to a 99212 office visit accounting for a total of four 99212 office visits within the service's global period. The RUC discussed the pre-service time and noted that the 15 minutes allotted for scrub, dress and wait time was excessive. Subsequently, the RUC recommended a reduction in this pre-service time category to the standard of 10 minutes, reducing total pre-service time to 50 minutes. The RUC recommends a pre-service time of 50 minutes, intra-service time of 40 minutes, and immediate post-service time of 20 minutes for code 24358.

284

The RUC recommends a work RVU of 6.54 for code 24358.

Surveyed Service	Previously Billed Service	2007 work RVU	2005 Medicare Frequency	Total work RVUs	Work RVU x Freq. %	Weighted Average
~~243X2~~ 24358	24351	5.97	326 (24%)	1946	1.43	6.54
	24352	6.49	35 (3%)	227	0.20	
	24354	6.54	68 (5%)	445	0.33	
	24356	6.74	925 (68%)	6235	4.58	
			1,354 (Total)	8,853 (Total)		

CPT digit codes, two-digit modifiers, and descriptions only are copyright 1 American Medical Association.

24359

The RUC discussed the specialty societies' survey results and presentation for 24359, *Tenotomy, elbow, lateral or medial (eg, epicondylitis, tennis elbow, golfer's elbow); open, debridement, soft tissue and/or bone, with tendon repair or reattachment.* The new code was compared to reference service 24343, *Repair lateral collateral ligament, elbow, with local tissue* (work RVU = 8.99). The reference service has a greater amount of intra-service and post-service time as compared to the surveyed code (intra = 90 and 30 minutes and post = 60 and 20 minutes). However, the surveyed code requires greater physical effort, urgency of decision making, and more intense pre-service work. As such, the RUC agreed that the surveyed code should be valued slightly lower than the reference service and agreed with the specialty society recommendation of the 25th percentile of the survey data work RVU of 8.86. The RUC also noted that previously, 24359 would have been billed in one of three ways, 1) using both 24341, *Repair, tendon or muscle, upper arm or elbow, each tendon or muscle, primary or secondary (excludes rotator cuff)* (work RVU = 9.24) and 24356, *Fasciotomy, lateral or medial (eg, tennis elbow or epicondylitis); with partial ostectomy,* (work RVU = 6.74) resulting in a total work RVU of 12.61 accounting for the multiple procedure reduction; or 2) using both 24341, *Repair, tendon or muscle, upper arm or elbow, each tendon or muscle, primary or secondary (excludes rotator cuff)* (work RVU = 9.24) and 24351, *Fasciotomy, lateral or medial (eg, tennis elbow or epicondylitis); with extensor origin detachment* (work RVU = 5.97), resulting in a total work RVU of 12.23 accounting for the multiple procedure reduction. The recommended value also retains neutrality of work within the family of services. The RUC determined that the single 99213 office visit overstated the work involved in the visit; however, a total of four office visits was appropriate. The RUC, therefore, reduced the single 99213 office visit to a 99212 office visit accounting for a total of four 99212 office visits within the service's global period. The RUC discussed the pre-service time and noted that the 15 minutes allotted for scrub, dress and wait time was excessive. Subsequently, the RUC recommended a reduction in this pre-service time category to the standard of 10 minutes, reducing total pre-service time to 50 minutes. The RUC recommends a pre-service time of 50 minutes, intra-service time of 60 minutes, and immediate post-service time of 20 minutes for code 24359

285

The RUC recommends a work RVU of 8.86 for code 24359.

Practice Expense

The RUC recommends the specialty societies' recommended inputs for these facility only procedures as they are standard 090 day global inputs.

Work Neutrality

The work described in 24357-24359 does not constitute new physician work and is subject to work neutrality constraints. The RUC calculated and determined that the new work RVUs will maintain neutrality of work within the family

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:24357 Tracking Number V1 Specialty Society Recommended RVU: **5.32**
Global Period: 090 RUC Recommended RVU: **5.32**

CPT Descriptor: Tenotomy, elbow, lateral or medial (eg, epicondylitis, tennis elbow, golfer's elbow); percutaneous

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 45-year-old man with lateral epicondylitis undergoes a percutaneous tenotomy of the proximal extensor carpi radialis at its lateral epicondylar insertion.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: • Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
- Verify that all required instruments and supplies are available – with special attention to plates and screws
- Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulation ,rapes
- Assess position of the extremities and head, adjust as needed
- The patient's arm is placed on the hand surgery table.
- Indicate areas of skin to be prepped and mark surgical incisions
- A tourniquet is applied to the proximal arm.
- The arm and hand are prepped and draped.
- The arm is elevated and exsanguinated.
- The pneumatic tourniquet is inflated.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work: Under anesthesia, an incision is made over the lateral epicondyle. The scalpel blade is advanced to the proximal tendon of the extensor carpi radialis brevis. The blade is then swept across the tendon sectioning the tendon. The fingers and wrist are flexed with the forearm held in pronation to separate the tendon from the lateral epicondyle. The skin is closed.

Description of Post-Service Work: Post-service work: in facility
- Application of bulky dressing, reinforced with long arm splint
- Monitor patient stabilization in the recovery room.
- Consultation with the family and patient regarding the surgery and postoperative regimen.
- Communication with health care professionals including written and oral reports and orders.
- Postoperative care is coordinated with recovery room nursing staff.
- The patient's vital signs are checked.
  The circulation, sensation and motor function of the operated extremity are assessed.
- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Write prescriptions for medications needed post-discharge.
- Dictation of an operative report
- Procedure note is written in the patient chart

- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of splint/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order occupational therapy
- Supervision of rehabilitation
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions
- Dictate progress notes for medical record

Post-Service intensity/complexity	2.10	2.22

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

CPT recently deleted five CPT codes and approve three new CPT codes to better describe surgical procedures in the elbow. The three new codes required RUC surveys to develop physician work RVUs.

A survey for 24357 was sent to orthopaedic surgeons representing general orthopaedics, shoulder & elbow surgery, and hand surgery. A consensus panel of experts representing orthopaedic subspecialty societies (general orthopaedics, arthroscopy, trauma, shoulder and elbow, hand, hip & knee, foot & ankle, total joint, sports medicine) reviewed the survey data compared with the reference code and other orthopaedic services.

New code 24357 would have previously been billed as deleted code 24350. The current value for 24350 is 5.32 and should be maintained because this is not a 5YR issue and budget neutrality applies. The key reference code 25651 reflects comparable work.

				2007 RVW	2005 Freq
24357	reported as	**24350**	Fasciotomy, lateral or medial (eg, tennis elbow or epicondylitis);	5.32	419

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed)
24350 Fasciotomy, lateral or medial (eg, tennis elbow or epicondylitis);

Do many physicians perform this service across the United States?

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:24358 Tracking Number V2 Specialty Society Recommended RVU: **6.54**
Global Period: 090 RUC Recommended RVU: **6.54**

CPT Descriptor: Tenotomy, elbow, lateral or medial (eg, epicondylitis, tennis elbow, golfer's elbow); open, with debridement of soft tissue and/or bone

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 45-year-old man with lateral epicondylitis undergoes debridement of the degenerated proximal extensor carpi radialis brevis tendon.

Percentage of Survey Respondents who found Vignette to be Typical: 98%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: • Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
- Verify that all required instruments and supplies are available – with special attention to plates and screws
- Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulation drapes
- Assess position of the extremities and head, adjust as needed
- The patient's arm is placed on the hand surgery table.
- Indicate areas of skin to be prepped and mark surgical incisions
- A tourniquet is applied to the proximal arm.
- The arm and hand are prepped and draped.
- The arm is elevated and exsanguinated.
- The pneumatic tourniquet is inflated.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work: Under anesthesia, an incision is made over the lateral epicondyle. The fascia is incised. The proximal tendon of the extensor carpi radialis brevis is identified. Care is taken to avoid injuring the radial nerve. The degenerative myxoid tissue is completely excised. The soft tissues are removed from the insertion of the extensor carpi radialis brevis on the lateral condyle. Multiple drill holes are made in the exposed surface of the lateral epicondyle. The wound is irrigated. The fascia is then repaired. The skin is closed in layers.

Description of Post-Service Work: Post-service work: in facility
- Application of bulky dressing, reinforced with long arm splint
- Monitor patient stabilization in the recovery room.
- Consultation with the family and patient regarding the surgery and postoperative regimen.
- Communication with health care professionals including written and oral reports and orders. Postoperative care is coordinated with recovery room nursing staff.
- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Write prescriptions for medications needed post-discharge.

- Dictation of an operative report
- Procedure note is written in the patient chart
- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of splint/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order occupational therapy
- Supervision of rehabilitation
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions
- Dictate progress notes for medical record

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

CPT recently deleted five CPT codes and approve three new CPT codes to better describe surgical procedures in the elbow. The three new codes required RUC surveys to develop physician work RVUs.

A survey for 24358 was sent to orthopaedic surgeons representing general orthopaedics, shoulder & elbow surgery, and hand surgery. A consensus panel of experts representing orthopaedic subspecialty societies (general orthopaedics, arthroscopy, trauma, shoulder and elbow, hand, hip & knee, foot & ankle, total joint, sports medicine) reviewed the survey data compared with the reference code and other orthopaedic services.

New code 24358 would have previously been billed as any one of the deleted codes 24351-24356. The current values for these codes range from 5.97 to 6.74. However, because this is not a 5YR issue and budget neutrality applies, a weight average of all four codes, using current values and Medicare frequency was calculated. An RVW of 6.54 is recommended.

				A 2007 RVW	B 2005 Freq	A x B RVWs	REC Avg RVW
24358	reported as any one of these codes	24351	Fasciotomy, lateral or medial (eg, tennis elbow or epicondylitis); with extensor origin detachment	5.97	326	1,946	
		24352	Fasciotomy, lateral or medial (eg, tennis elbow or epicondylitis); with annular ligament resection	6.49	35	227	
		24354	Fasciotomy, lateral or medial (eg, tennis elbow or epicondylitis); with stripping	6.54	68	445	
		24356	Fasciotomy, lateral or medial (eg, tennis elbow or epicondylitis); with partial ostectomy	6.74	925	6,235	
					1,354	8,853	6.54

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 26 **% of respondents:** 59.0 %

TIME ESTIMATES (Median)	**CPT Code: 24359**	**Key Reference CPT Code: 24343**	**Source of Time RUC Time**
Median Pre-Service Time	50.00	55.00	
Median Intra-Service Time	60.00	90.00	
Median Immediate Post-service Time	20.00	30.00	
Median Critical Care Time	0.0	0.00	
Median Other Hospital Visit Time	0.0	0.00	
Median Discharge Day Management Time	19.0	19.00	
Median Office Visit Time	64.0	87.00	
Prolonged Services Time	0.0	0.00	
Median Total Time	**213.00**	**281.00**	
Other time if appropriate			

INTENSITY/COMPLEXITY MEASURES (Mean)

Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	2.96	3.11
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	2.81	3.06
Urgency of medical decision making	2.08	0.50
Technical Skill/Physical Effort (Mean)		
Technical skill required	3.35	3.53
Physical effort required	2.92	2.88
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	3.08	3.12
Outcome depends on the skill and judgment of physician	3.54	3.47
Estimated risk of malpractice suit with poor outcome	2.73	2.82

INTENSITY/COMPLEXITY MEASURES	CPT Code	Reference Service 1
Time Segments (Mean)		
Pre-Service intensity/complexity	3.16	3.06
Intra-Service intensity/complexity	3.20	3.31
Post-Service intensity/complexity	2.76	2.81

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

CPT recently deleted five CPT codes and approve three new CPT codes to better describe surgical procedures in the elbow. The three new codes required RUC surveys to develop physician work RVUs.

A survey for 24359 was sent to orthopaedic surgeons representing general orthopaedics, shoulder & elbow surgery, and hand surgery. A consensus panel of experts representing orthopaedic subspecialty societies (general orthopaedics, arthroscopy, trauma, shoulder and elbow, hand, hip & knee, foot & ankle, total joint, sports medicine reviewed the survey data compared with the reference code and other orthopaedic services.

New code 24359 would have previously been billed using multiple procedures (24341+24356 or 24341+24351) - note that each of these procedures has allowed claims that use the -51 modifier, or alternatively, 24999 Unlisted humerus or elbow. The RVWs for the multiple procedure combinations are 12.23 and 12.61.

A	24359	reported as		**BONE DEBRIDEMENT AND TENDON REPAIR/REATTACHMENT**	**12.61**
		and	24341	Repair, tendon or muscle, upper arm or elbow, each tendon or muscle, primary or secondary (excludes rotator cuff)	9.24
			24356	Fasciotomy, lateral or medial (eg, tennis elbow or epicondylitis); with partial ostectomy	6.74
OR					
B	24359	reported as		**SOFT TISSUE DEBRIDEMENT AND TENDON REPAIR/REATTACHMENT**	**12.23**
		and	24341	Repair, tendon or muscle, upper arm or elbow, each tendon or muscle, primary or secondary (excludes rotator cuff)	9.24
			24351	Fasciotomy, lateral or medial (eg, tennis elbow or epicondylitis); with extensor origin detachment	5.97
OR					
C	24359	reported as	24999	Unlisted, humerus or elbow.	carrier

However, the survey 25th pctl of 8.86 is recommended to set the new code relative to the key reference code 24343. This value will always be less than previously reported, and therefore meets budget neutrality criteria outside of a 5YR.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed)

BONE DEBRIDEMENT AND TENDON REPAIR/REATTACHMENT

24341-51 Repair, tendon or muscle, upper arm or elbow, each tendon or muscle, primary or secondary (excludes rotator cuff)

?4356-51 Fasciotomy, lateral or medial (eg, tennis elbow or epicondylitis); with partial ostectomy

or

SOFT TISSUE DEBRIDEMENT AND TENDON REPAIR/REATTACHMENT

24341-51 Repair, tendon or muscle, upper arm or elbow, each tendon or muscle, primary or secondary (excludes rotator cuff)

24354-51 Fasciotomy, lateral or medial (eg, tennis elbow or epicondylitis); with stripping

or

unlisted, by report

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

PERC Summary of Recommendation
010 or 090 Day Global Periods
Facility Direct Inputs

CPT Long Descriptor:

24357 Tenotomy, elbow, lateral or medial (eg, epicondylitis, tennis elbow, golfer's elbow); percutaneous

24358 Tenotomy, elbow, lateral or medial (eg, epicondylitis, tennis elbow, golfer's elbow); open, with debridement of soft tissue and/or bone

24359 Tenotomy, elbow, lateral or medial (eg, epicondylitis, tennis elbow, golfer's elbow); open, with debridement of soft tissue and/or bone, with tendon repair or reattachment

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

A consensus panel of experts representing orthopaedic subspecialty societies (general orthopaedics, arthroscopy, trauma, shoulder and elbow, hand, hip & knee, foot & ankle, total joint, sports medicine) reviewed the practice expense details for the survey codes relative to other facility-only 90-day global orthopaedic services.

Please describe the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

No changes were made to the standard pre-service times. A total of 60 minutes has been applied for the pre-service clinical labor activities. During the pre-service period, clinical staff conducts the standard pre-service activities: An RN/LPN/MA completes pre-service diagnostic and referral forms, coordinates pre-surgery services, schedules space and equipment in facility, provides pre-service education/obtains consent, and conducts follow-up phone calls.

Intra-Service Clinical Labor Activities:

The standard 6 minutes has been applied for these outpatient procedures for discharge day management services.

Post-Service Clinical Labor Activities:

The procedures each have 3 x 99212 and 1 x 99213 visit. The standard times have been applied for post-service clinical labor time.

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

February 2007

Internal or External Fixation-Elbow/Hand

As part of the 2005 Five Year Review Process, the American Academy of Orthopaedic Surgery (AAOS) commented that the compelling evidence rationale for examining the work RVU for the fracture treatment codes is that there is evidence that incorrect assumptions were made in the valuation of these codes due to lack of clarity of the CPT descriptor. In particular, the CPT descriptor states "with or without internal or external fixation." However, it is unclear whether the previous valuation for the code included the situation when internal and external fixation is applied to a fracture site. Therefore, the RUC recommended that these codes be referred to the CPT Editorial Panel for further clarification.

At the October 2007 CPT Editorial Panel Meeting, the AAOS recommended to the CPT Editorial Panel that the identified fracture treatment codes in the musculoskeletal section of CPT that include the nomenclature "internal or external" fixation should be clarified to state that external fixation should be an adjunctive procedure to these procedures. The CPT Editorial Panel agreed with the specialty that these codes needed to be clarified and removed reference to external fixation from 64 CPT codes. These 64 codes were divided into four categories based on location: Shoulder/Elbow, Elbow/Hand, Hip/Knee and Foot/Ankle. At the February 2007 RUC Meeting, three of these categories were discussed: Shoulder/Elbow, Elbow/Hand and Foot/Ankle. The Hip/Knee codes will be discussed at the April 2007 RUC Meeting.

Between 225 and 450 orthopaedic providers participated in each of the surveys. These respondents included physicians from general orthopaedic surgery, shoulder and elbow surgery, orthopaedic trauma surgery and general hand surgery. After the results from all of these groups were tabulated, a consensus committee of physicians representing the American Academy of Orthopaedic Surgeons, American Shoulder and Elbow Surgeons, Society for Surgery of the Hand, Arthroscopy Association of North America and Orthopaedic Trauama Association met to discuss the survey data for the revised orthopaedic codes. During this review, the specialties determined that they would recommend the 25th percentile for codes in situations where all of the fracture codes, when they were arrayed in order of complexity, it was rational to recommend the 25th percentile RVU value as a means to maintain rank order. Furthermore, the specialty

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

societies reviewed the resulting IWPUTs associated with the revised codes and determined that these IWPUT values validated the recommended work RVUs.

The RUC reviewed the compelling evidence for these procedures. The specialty societies claimed that because the CPT descriptors originally contained the phrase "with or without internal or external fixation," it is difficult to imagine what the original Harvard survey data actually represented. Furthermore, an Abt study was performed in 1992 for RUC consideration. This study produced percentage relationships to key reference codes, but not surveyed time and visit data. Some of these recommendations were accepted by the RUC and CMS and others were adjusted up or down but no changes were made to the Harvard time and visit data, if available. Therefore, the specialty society believes that there is little, if any, relationship between the Harvard database time and visit information and the current work RVUs.

Furthermore, the specialty societies stated that there was a significant change in the technology for how these procedures are performed. The surgical treatments use open anatomical reduction and internal fixation has been made more complex with the introduction of new imaging methods such as computed tomography which allows better detection of the fracture pathology and provides the basis for new surgical strategies. There are also new internal fixation devices which require more work. Further, the patient population has changed, as women over 50 are a fast growing segment of the population. A huge percentage of these patients are osteoporatic – making fracture fixation and maintenance of fixation far more difficult. Also, for several of the identified procedures, the provider of the services have changed and were not a part of the original Harvard studies such as the American Society for Surgery of the Hand. The specialty societies conducted a full RUC survey of all codes, and for almost all of the codes, recommended the 25th percentile or the median RVU of the specialty survey data. It should also be noted that the RUC is recommending reductions in work RVUs for three codes of the codes in this family, 24635, 25545 and 25525.

The RUC thoroughly reviewed these codes, and as part of this review, the specialties explained that they felt strongly that a 99214 office visit was appropriate for two of the codes within this family and however, based on discussions at the RUC meeting the specialty agreed to lower the intensity of this visit to a 99213 office visit. The RUC also reviewed CPT code 20690 *Application of a uniplane (pins or wires in one plane), unilateral, external fixation system* and 20692 *Application of a multiplane (pins or wires in more than one plane), unilateral, external fixation system (eg, Ilizarov, Monticelli type).* It is the RUC's understanding that the utilization for these two procedures will not change with this coding change made by the CPT Editorial Panel. Therefore, the RUC believes that there will be no budget neutrality impact for these recommendations. However, the RUC welcomes a retrospective review of this issue in the future.

AMA/Specialty Society RVS Update Committee
RUC Recommendations - Internal or External Fixation
CPT Code Order

CPT Code	*Descriptor*	*Global*	*RUC Rec Work RVU*	*RUC Rationale*
23515	Open treatment of clavicular fracture, includes internal fixation, when performed	090	11.00	The RUC reviewed CPT code 23515 Open treatment of clavicular fracture, includes internal fixation, when performed and compared it to its reference code 29827 Arthroscopy, shoulder, surgical; with rotator cuff repair (Work RVU=15.44). The RUC compared the intra-service times for these procedures and noted that 23515 had less intra-service time associated with it as compared to 29827, 90 and 120 minutes, respectively. The RUC compared the intensity complexity measures of 23515 amd 29827 and noted that the reference code required more technical skill to perform and had a more intense intra-service period as compared to 23515. Therefore, the RUC agreed that the median of the survey data, 11.00 RVUs, appropriately places this code in comparison to the reference code. For further support the RUC compared this procedure to MPC code 28299 Correction, hallux valgus (bunion), with or without sesamoidectomy; by double osteotomy (Work RVU=11.39) and determined that 11.00 work RVUs was appropriate for 23515 as 28299 has slightly more total service time associated with it in comparison to 23515, 299 minutes and 287 minutes respectively. The RUC recommends 11.00 RVUs for 23515.
23585	Open treatment of scapular fracture (body, glenoid or acromion) includes internal fixation	090	16.25	The RUC reviewed CPTcode 23585 Open treatment of scapular fracture (body, glenoid or acromion) includes internal fixation and compared it to its reference code 27447 Arthroplasty, knee, condyle and plateau; medial AND lateral compartments with or without patella resurfacing (total knee arthroplasty) (Work RVU=23.04). The RUC noted that the total service time for the surveyed code was lower than the reference code, 407 minutes and 469 minutes respectively. Furthermore, the RUC compared the intensities of these procedures and determined that because, 23585 is one of the most complex of the procedures performed for reduction and internal fixation of shoulder fractures and typically requires an extensive exposure of the scapula with significant muscle disection and identification and protection of the suprascapular nerve and artery, it was deemed a more intensive procedure than the reference code 27447. However, the RUC agreed that to keep this code in proper rank order with other codes in the family, such as 23680 Open treatment of shoulder dislocation, with surgical or anatomical neck fracture, includes internal fixation, when performed (RUC recommended value of 15.00 RVUs) and 23616 Open treatment of proximal humeral (surgical or anatomical neck) fracture, includes internal fixation, when performed, includes repair of tuberosity(s) , when performed; with proximal humeral prosthetic replacement (RUC recommended value of 21.00 RVUs), the value associated with this procedure should be the 25th percentile of the survey, 16.25 RVUs. The RUC recommends 16.25 RVUs for 23585.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
23615	Open treatment of proximal humeral (surgical or anatomical neck) fracture, includes internal fixation, when performed, includes repair of tuberosity(s), when performed;	090	14.00	The RUC reviewed CPT code 23615 Open treatment of proximal humeral (surgical or anatomical neck) fracture, includes internal fixation, when performed, includes repair of tuberosity(s), when performed; and compared it with its reference code 29827 Arthroscopy, shoulder, surgical; with rotator cuff repair (Work RVU=15.44). The RUC noted that the surveyed code has significantly less intra-service time associated with it as compared to the reference code, 90 minutes and 130 minutes, respectively. Further, the RUC noted that the reference service required more physical effort to perform and has a more complex intra-service period as compared to 23615. The RUC reviewed several other codes under review in this family, such as 23670 Open treatment of shoulder dislocation, with fracture of greater humeral tuberosity, includes internal fixation, when performed (RUC Recommended value=14.00 RVUs) 25575 Open treatment of radial AND ulnar shaft fractures, with internal fixation, when performed; of radius AND ulna (RUC recommended value=14.00). The RUC determined that because all of these services had the same intra-servce time, 90 minutes and because they all involve similar complexity and intensity to perform the service, the RUC agreed that the 25th percentile of the survey, 14.00 RVU appropriately places this service in comparison to 23670, 25575 and the key reference service 29827. The RUC recommends 14.00 RVU for 23615.
23616	Open treatment of proximal humeral (surgical or anatomical neck) fracture, includes internal fixation, when performed, includes repair of tuberosity(s) , when performed; with proximal humeral prosthetic replacement	090	21.00	The RUC reviewed CPT code 23616 Open treatment of proximal humeral (surgical or anatomical neck) fracture, includes internal fixation, when performed, includes repair of tuberosity(s) , when performed; with proximal humeral prosthetic replacement and compared it with its reference code 23472 Arthroplasty, glenohumeral joint; total shoulder (glenoid and proximal humeral replacement (eg, total shoulder)) (Work RVU=22.47). The RUC agreed that the specialty society recommended 99214 office visit should be removed and replaced with a 99213 office visit as this is more typical of the post-operative care for this procedure. This change in the post-operative visits results in three 99213 office visits and one 99212 office visits being associated with this procedure. The RUC noted that 23616 has less intra-service time associated with it as compared to the reference code, 120 minutes and 165 minutes, respectively. Although 23472 has longer intra-service times than the surveyed code, with 23616 comminution is frequently present which makes correct positioning of the prosthesis and stable repair of the tuberosity fragments difficult this makes 23616 a very intensive procedure to perform. For further support the RUC reviewed MPC code 50546 Laparoscopy, surgical; nephrectomy, including partial ureterectomy (Work RVU=21.69). The RUC noted that 50546 had a longer intra-service time in comparison to 23616, 205 minutes and 120 minutes, respectively. Therefore, the RUC agreed that the median value of 21.00 RVUs is appropriate and correctly places this code in comparison to the reference code, 23472 and 50546. The RUC noted that the proposed value for this procedure, 21.00 RVUs, is less than the existing value, 21.68 RVUs. The RUC recommends 21.00 RVUs for 23616.

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
23630	Open treatment of greater humeral tuberosity fracture, includes internal fixation, when performed	090	12.00	The RUC reviewed CPT code 23630 Open treatment of greater humeral tuberosity fracture, includes internal fixation, when performed and compared it to its reference code 23420 Reconstruction of complete shoulder (rotator) cuff avulsion, chronic (includes acromioplasty) (Work RVU=14.75). The RUC noted that the intra-service time of the surveyed code was far less than the intra-service time of the reference code, 70 minutes and 120 minutes. The RUC also noted that although 23630 is a shoulder fracture that commonly occurs in tandem with poor bone quality, making fixation of the fragment difficult and tenuous, the reference code is a more intensive procedure to perform. This comparison of intensity is demonstrated in the intensity measure of the intra-service time associated with the surveyed code, as it is less than the intensity associated with the reference code. Therefore, the RUC recommends the 25th percentile of the survey for this procedure, 12.00 RVUs. For further support, the RUC compared 23630 to MPC code 60220 Total thyroid lobectomy, unilateral; with or without isthmusectomy (Work RVU=12.29). The RUC noted that as 23630 has less intra-service time as compared to 60220, 70 minutes and 90 minutes, the recommended work RVU of 12.00 appropriately places this code in comparison to 60220 as well as the reference code, 23420. The RUC recommends 12.00 RVU for 23630.
23670	Open treatment of shoulder dislocation, with fracture of greater humeral tuberosity, includes internal fixation, when performed	090	14.00	The RUC reviewed CPT code 23670 Open treatment of shoulder dislocation, with fracture of greater humeral tuberosity, includes internal fixation, when performed and compared it with its reference code 23420 Reconstruction of complete shoulder (rotator) cuff avulsion, chronic (includes acromioplasty) (Work RVU=14.75). The RUC noted that the surveyed code has significantly less intra-service time associated with it as compared to the reference code, 90 minutes and 120 minutes, respectively. However, all of the intensity and complexity measures demonstrated that the surveyed code was significanly more difficult to perform than the reference code. The RUC reviewed several other codes under review in this family, such as 23615 Open treatment of proximal humeral (surgical or anatomical neck) fracture, includes internal fixation, when performed, includes repair of tuberosity(s), when performed; (RUC recommended value of 14.00 RVUs) and 25575 Open treatment of radial AND ulnar shaft fractures, with internal fixation, when performed; of radius AND ulna (RUC recommended value of 14.00 RVUs). The RUC determined that because all of these services had the same intra-servce time, 90 minutes and because they all involve similar complexity and intensity to perform the service, the RUC agreed that the 25th percentile of the survey, 14.00 RVU appropriately places this service in comparison to 23615, 25575 and the key reference service 23420. The RUC recommends 14.00 RVU for 23670.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
23680	Open treatment of shoulder dislocation, with surgical or anatomical neck fracture, includes internal fixation, when performed	090	15.00	The RUC reviewed CPT code 23680 Open treatment of shoulder dislocation, with surgical or anatomical neck fracture, includes internal fixation, when performed and compared it to its reference code 29827 Arthroscopy, shoulder, surgical; with rotator cuff repair (Work RVU=15.44). The RUC noted that 23680 and 29827 have the same pre-service time (75 minutes) and intra-service time (120 minutes). The RUC agreed that that in addition to the times for these two procedures being the same that the complexity and work associated with them is similar as well. Therefore the RUC recommends the 25th percentile of the survey 15.00 RVUs to reflect this similarity in service times and work. The RUC recommends 15.00 RVUs for 23680.
24545	Open treatment of humeral supracondylar or transcondylar fracture, includes internal fixation, when performed; without intercondylar extension	090	15.00	The RUC reviewed CPT code 24545 Open treatment of humeral supracondylar or transcondylar fracture, includes internal fixation, when performed; without intercondylar extension and compared it to its reference code 25609 Open treatment of distal radial intra-articular fracture or epiphyseal separation; with internal fixation of 3 or more fragments (Work RVU=14.12). The RUC reviewed the total-service times for both codes and found them to be comparable, 361 minutes and 358 minutes. However, the RUC noted that the intensity/complexity measures for 24545 were significantly higher in comparison to 25609 as the complexity and risk for complication involved in 24545 is much greater than 25609. Therefore the RUC agreed that the median value of 15.00 RVU appropriately places this code in comparison to the reference code. The RUC recommends a work RVU of 15.00 for code 24545.
24546	Open treatment of humeral supracondylar or transcondylar fracture, includes internal fixation, when performed; with intercondylar extension	090	17.01	The RUC reviewed CPT code 24546 Open treatment of humeral supracondylar or transcondylar fracture, includes internal fixation, when performed; with intercondylar extension and compared it with its reference code 23472 Arthroplasty, glenohumeral joint; total shoulder (glenoid and proximal humeral replacement (eg, total shoulder)) (Work RVU=22.47). The RUC agreed that the specialty society recommended 99214 office visit should be removed and replaced with a 99213 office visit as this is more typical of the post-operative care for this procedure. This change in the post-operative visits results in three 99213 office visits and a 99212 office visit being associated with this procedure. However, after comparing 24546 with 23472, the RUC determined that this reference code was not a suitable comparison. The RUC agreed that the better reference code would be 24545 Open treatment of humeral supracondylar or transcondylar fracture, includes internal fixation, when performed; without intercondylar extension (RUC recommended RVU=15.00 RVUs). The RUC compared the total service times for both procedures and determined at 24546 had a longer intra service time in comparison to 24545, 150 minutes and 120 minutes. The RUC also agreed that the intensity/complexity of performing 24546 is significantly higher that performing 24545 as 24545 is an extra-articular fracture and 24546 is an intra-articular fracture requiring extensive exposure of the joint. Therefore, to calculate the recommended RVUs for this procedure, the RUC started with the 25th percentile of the survey data, 16.34 RVUs and added a work RVU increment of 2.01, the difference in intra-service times between 24546 and 24545 (30 minutes) multiplied by the IWPUT of 24545 (0.067). This calculation results in a value of 17.01 RVUs. The RUC recommends 17.01 RVUs for 24546.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
24575	Open treatment of humeral epicondylar fracture, medial or lateral, includes internal fixation, when performed	090	11.00	The RUC reviewed CPT code 24575 Open treatment of humeral epicondylar fracture, medial or lateral, includes internal fixation, when performed and compared it to its reference code 25608 Open treatment of distal radial intra-articular fracture or epiphyseal separation; with internal fixation of 2 fragments (Work RVU=10.86). The RUC reviewed the total-service times for both codes and found them to be comparable, 305 minutes and 308 minutes. Therefore the RUC agreed that the median value of 11.00 RVU appropriately places this code in comparison to the reference code. For further support the RUC compared this procedure to MPC code 28299 Correction, hallux valgus (bunion), with or without sesamoidectomy; by double osteotomy (Work RVU=11.39) and determined that 11.00 work RVUs was appropriate for 24575 as 28299 has more intra- service time associated with it in comparison to 24575, 90 minutes and 60 minutes, respectively. The RUC noted that the proposed value for this procedure, 11.00 RVUs, is slightly less than the existing value, 11.02 RVUs. The RUC recommends 11.00 RVUs for 24575.
24579	Open treatment of humeral condylar fracture, medial or lateral, includes internal fixation, when performed	090	13.00	The RUC reviewed CPT code 24579 Open treatment of humeral condylar fracture, medial or lateral, includes internal fixation, when performed and compared it to 25609 Open treatment of humeral condylar fracture, medial or lateral, includes internal fixation, when performed (Work RVU=14.12). The RUC noted that the intra-service time for the surveyed code is significantly less than the reference code, 90 minutes and 120 minutes. Furthermore, the RUC noted that the reference code requires more mental effort and judgement and technical skill to perform in comparison to 24579. Because of a lower intra-service time and lower intensity and complexity measures of the surveyed code in comparison to the reference code, the RUC recommends the survey median work RVU, 13.00 RVUs for 24579 as it appropriately places this code in comparison to the reference code. For further support the RUC compared 24579 to 24575 Open treatment of humeral epicondylar fracture, medial or lateral, includes internal fixation, when performed (RUC recommended value=11.00 RVU). The RUC noted that these procedures are similar except 24579 has the addition of an intraarticular extension involving the entire condylar structure. The same neurovascular structures are at risk in 24579 and 24575 except 24579 has the added complexity of obtaining and holding the articular surface reduced anatomically to maintain joint congruity. Because of these comparisons to a reference code and another code within the family, the RUC recommends 13.00 RVUs for 24579.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
24635	Open treatment of Monteggia type of fracture dislocation at elbow (fracture proximal end of ulna with dislocation of radial head), includes internal fixation, when performed	090	10.00	The RUC reviewed CPT code 24635 Open treatment of Monteggia type of fracture dislocation at elbow (fracture proximal end of ulna with dislocation of radial head), includes internal fixation, when performed and compared it to its reference code 25607 Open treatment of distal radial extra-articular fracture or epiphyseal separation, with internal fixation (Work RVU=9.35). The RUC noted that the total service time for 24635 is higher than the total service time for 25607, 291 minutes and 275 minutes, respectively. Furthermore, the work for 24635 is greater than 25607 because the dislocated radial head must be treated in addition to the ulna fracture and post-operatively there is a danger of neurovascular injury and compartment syndrome. Close monitoring is required. This is demonstrated in the intensity/complexity measures which indicate that the surveyed code requies greater mental effort and judgement, greater technical skill and greater physical effort to perform in comparison to the reference code. Furthermore, the RUC noted that this service requires a hospital stay as there is significant monitoring of circulation, sensation and motor function of the involved extremity. Therefore, the RUC agreed that the 25th percentile of the survey data, 10.00 work RVUs accurately places this code in comparison to the reference code. The RUC noted that the proposed value for this procedure, 10.00 RVUs, is less than the existing value, 13.56 RVUs. The RUC recommends 10.00 work RVUs for 24635.
24685	Open treatment of ulnar fracture proximal end (olecranon process), includes internal fixation, when performed	090	9.50	The RUC reviewed CPT code 24685 Open treatment of ulnar fracture proximal end (olecranon process), includes internal fixation, when performed and compared it to its reference code 25607 Open treatment of distal radial extra-articular fracture or epiphyseal separation, with internal fixation (Work RVU=9.35). The RUC noted that while both services have an intra-service time of 60 minutes, the surveyed procedure is more complex than the reference code as 24685 is intraarticular and 25607 is extraarticular. This complexity of the intra-service is also noted in the intra-service intensity complexity measure which shows that the surveyed code's intra-service period is more intense than the intra-service time associated with the reference code. Furthermore, the intensity/complexity measures indicate that the surveyed code requires greater mental effort and judgment, greater technical skill and greater physical effort to perform in comparison to the reference code. Therefore, the RUC agreed that the 25th percentile of the survey data, 9.50 work RVUs, accurately places this code in comparsion to the reference code. The RUC recommends 9.50 work RVUs for 24685.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
25515	Open treatment of radial shaft fracture, includes internal fixation, when performed	090	10.00	The RUC reviewed CPT code 25515 Open treatment of radial shaft fracture, includes internal fixation, when performed and compared it with its reference code 25608 Open treatment of distal radial intra-articular fracture or epiphyseal separation; with internal fixation of 2 fragments (work RVU=10.86). The RUC noted that the intra-service time for the surveyed code is less than the intra-service time for the reference code (60 minutes and 90 minutes, respectively). The RUC also compared the intensity/complexity measures of the surveyed code and the reference code and determined that the reference code required more technical skill, physical effort, mental effort and judgment to perform than the reference code. With the lower amount of intra-service time and lower intensity/complexity measures as compared to 25608, the RUC agreed that the 25th percentile of survey, 10.00 work RVU appropriately places 25515 in comparison to the reference code. The RUC recommends 10.00 work RVUs for 25515.
25525	Open treatment of radial shaft fracture, with internal fixation, when performed, and closed treatment of dislocation of distal radioulnar joint (Galeazzi fracture/dislocation), with percutaneous skeletal fixation, when performed	090	12.00	The RUC reviewed CPT code 25525 Open treatment of radial shaft fracture, with internal fixation, when performed, and closed treatment of dislocation of distal radioulnar joint (Galeazzi fracture/dislocation), with percutaneous skeletal fixation, when performed and compared it with its reference code 25608 Open treatment of distal radial intra-articular fracture or epiphyseal separation; with internal fixation of 2 fragments (work RVU=10.86). The RUC agreed that the specialty society recommended 99214 office visit should be lowered to a 99213 office visit as this is more typical of the post-operative care for this procedure. This change in the post-operative visits results in three 99213 office visits and one 99212 office visits being associated with this procedure. With this change, the RUC noted that the total service times for both of these codes are comparable, 303 minutes and 305 minutes. However, the RUC noted that the surveyed code required greater mental effort and judgment and physicial effort to perform in comparison to the reference code. Therefore, due to comparable total service times but greater intensity/complexity measures, the RUC recommends the survey median, 12.00 RVU for this procedure. For further support, the RUC compared 25525 to MPC code 60220 Total thyroid lobectomy, unilateral; with or without isthmusectomy (Work RVU=12.29). The RUC noted that as 25525 has less intra-service time as compared to 60220, 70 minutes and 90 minutes, the recommended work RVU of 12.00 appropriately places this code in comparison to 60220 as well as the reference code, 25608. The RUC noted that the proposed value for this procedure, 12.00 RVUs, is less than the existing value, 12.69 RVUs. The RUC recommends 12.00 RVU for 22525.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
25526	Open treatment of radial shaft fracture, with internal fixation, when performed, and open treatment of distal radioulnar joint, with internal fixation, when performed (Galeazzi fracture/dislocation), includes repair of triangular fibrocartilage complex	090	15.00	The RUC reviewed CPT code 25526 Open treatment of radial shaft fracture, with internal fixation, when performed, and open treatment of distal radioulnar joint, with internal fixation, when performed (Galeazzi fracture/dislocation), includes repair of triangular fibrocartilage complex and compared it to its reference code 25609 Open treatment of distal radial intra-articular fracture or epiphyseal separation; with internal fixation of 3 or more fragments. The RUC agreed that the specialty society recommended 99214 office visit should be removed and two 99212 office visit should be added as this is more typical of the post-operative care for this procedure. This change in the post-operative visits results in two 99213 office visits and three 99212 office visits being associated with this procedure. With these changes, the RUC noted that the surveyed code has more total service time associated with it in comparison to the reference code, 398 minutes and 358 minutes, respectively. Further, the RUC noted that the surveyed code required more mental effort and judgement and more physical effort to perform and has a more complex intra-service period as compared to 25609. The difficulty of this procedure can be explained as this is the most complex of the hand procedures reviewed because this procedure consists of two separate procedures, an open reduction internal fixation of the radius which places the radial nerve in danger as well as the radial artery and a separate arthrotomy of the ulnocarpal joint and repair of the triangular fibrocartilage complex. Because of the increased total service time as well as the higher intensity/complexity measures associated with 25526 in comparison to its reference code, the RUC recommends the survey median of 15.00 work RVU for 25526. The RUC recommends 15.00 RVUs for 25526.
25545	Open treatment of ulnar shaft fracture, includes internal fixation, when performed	090	9.00	The RUC reviewed CPT code 25545 Open treatment of ulnar shaft fracture, includes internal fixation, when performed in compairison to 25607 Open treatment of distal radial extra-articular fracture or epiphyseal separation, with internal fixation (Work RVU=9.35). The RUC noted that the surveyed code and the reference code had the same intra-service time, 60 minutes. The RUC noted that 25545 requires a 99231 hospital visit as there is a danger of neurovascular injury and compartment syndrome and close monitoring is needed. The RUC also noted that the reference code requires greater endurance of psychological stress to perform as compared to the surveyed code. The RUC compared this procedure to 26665 Open treatment of carpometacarpal fracture dislocation, thumb (Bennett fracture), includes internal fixation, when performed (RUC recommended value of 9.00 RVUs) and MPC code 14060 Adjacent tissue transfer or rearrangement, eyelids, nose, ears and/or lips; defect 10 sq cm or less (Work RVU=9.07 and noted that because all of these procedures had similar work and the same intra-service time, 60 minutes, that they should all be valued the similarly. Therefore, because of all of these comparisons, the RUC recommends the median survey RVU, 9.00 work RVUs. The RUC noted that the proposed value for this procedure, 9.00 RVUs, is less than the existing value, 9.09 RVUs. The RUC recommends 9.00 Work RVUs for 25545.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
25574	Open treatment of radial AND ulnar shaft fractures, with internal fixation, when performed; of radius OR ulna	090	10.00	The RUC reviewed CPT code 25574 Open treatment of radial AND ulnar shaft fractures, with internal fixation, when performed; of radius OR ulna and compared it with its reference code 25608 Open treatment of distal radial intra-articular fracture or epiphyseal separation; with internal fixation of 2 fragments (work RVU=10.86). The RUC noted that the intra-service time for the surveyed code is less than the intra-service time for the reference code (60 minutes and 90 minutes, respectively). The RUC also compared the intensity/complexity measures of the surveyed code and the reference code and determined that the reference code required more technical skill, mental effort and judgement to perform than the reference code. With the lower amount of intra-service time and lower intensity/complexity measures as compared to 25608, the RUC agreed that the 25th percentile of survey, 10.00 work RVU appropriately places 25574 in comparison to the reference code. The RUC recommends 10.00 work RVUs for 25574.
25575	Open treatment of radial AND ulnar shaft fractures, with internal fixation, when performed; of radius AND ulna	090	14.00	The RUC reviewed CPT code 25575 Open treatment of radial AND ulnar shaft fractures, with internal fixation, when performed; of radius AND ulna and compared it with its reference code 25609 Open treatment of distal radial intra-articular fracture or epiphyseal separation; with internal fixation of 3 or more fragments (Work RVU=14.12). The RUC agreed that the specialty society recommended 99214 office visit should be removed and two 99212 office visit should be added as this is more typical of the post-operative care for this procedure. This change in the post-operative visits results in two 99213 office visits and three 99212 office visits being associated with this procedure. With these changes, the RUC noted that the surveyed code has less total service time associated with it in comparison to the reference code, 342 minutes and 358 minutes, respectively. Further, the RUC noted that the reference service required more technical skill, physical effort and more psychological stress to perform and has a more complex intra-service period as compared to 25609. The RUC reviewed several other codes under review in this family, such as 23670 Open treatment of shoulder dislocation, with fracture of greater humeral tuberosity, includes internal fixation, when performed (RUC Recommended wRVU=14.00 RVUs) 23615 Open treatment of proximal humeral (surgical or anatomical neck) fracture, includes internal fixation, when performed, includes repair of tuberosity(s), when performed; (RUC recommended wRVU=14.00). The RUC determined that because all of these services had the same intra-servce time, 90 minutes and because they all involve similar complexity and intensity to perform the service, the RUC agreed that the median of the survey, 14.00 RVUs appropriately places this service in comparison to 23670, 23615 and the key reference service 25609. The RUC recommends 14.00 RVUs for 25575.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
25628	Open treatment of carpal scaphoid (navicular) fracture, includes internal fixation, when performed	090	11.00	The RUC reviewed CPT code 25628 Open treatment of carpal scaphoid (navicular) fracture, includes internal fixation, when performed and compared it with its reference code 25394 Osteoplasty, carpal bone, shortening (work RVU=10.71). The RUC noted that the total service time for the surveyed code is more than the total service time for the reference code (277 minutes and 250 minutes, respectively). The RUC also compared the intensity/complexity measures of the surveyed code to the reference code and determined that the surveyed code required more technical skill, physical and mental effort and judgement to perform than the reference code. With the higher amount of total service time and higher intensity/complexity measures as compared to 25394, the RUC agreed that the 25th percentile of survey, 11.00 work RVU appropriately places 25628 in comparison to the reference code. The RUC recommends 11.00 work RVUs for 25628.
26615	Open treatment of metacarpal fracture, single, includes internal fixation, when performed, each bone	090	8.00	The RUC reviewed CPT code 26615 Open treatment of metacarpal fracture, single, includes internal fixation, when performed, each bone and compared it with its reference code 25607 Open treatment of distal radial extra-articular fracture or epiphyseal separation, with internal fixation (work RVU=9.35). The RUC noted that the intra-service time for the surveyed code is less than the intra-service time for the reference code (45 minutes and 60 minutes, respectively). The RUC also compared the intensity/complexity measures of the surveyed code to the reference code and determined that the reference code required more mental effort and judgement and more psychological stress. With the lower amount of intra-service time and lower intensity/complexity measures as compared to 25607, the RUC agreed that the 25th percentile of survey, 8.00 work RVU appropriately places 26615 in comparison to the reference code. The RUC recommends 8.00 work RVUs for 26615.
26650	Percutaneous skeletal fixation of carpometacarpal fracture dislocation, thumb (Bennett fracture), with manipulation, with external fixation	090	6.00	The RUC reviewed CPT code 26650 Percutaneous skeletal fixation of carpometacarpal fracture dislocation, thumb (Bennett fracture), with manipulation, with external fixation and compared it to its reference code 25651 Percutaneous skeletal fixation of ulnar styloid fracture (work RVU=5.68). The RUC compared the total service times for these procedures and noted that the surveyed code (197 minutes of total service time) had more total service time associated with it than the 25651 (190 minutes of total service time). The RUC also compared the office visits associated with this procedure and noted that although they both have four post-operative office visits associated with them, the surveyed code has two 99213 and two 99212 visits associated with it while 25651 has one 99213 and three 99212 associated with it, which suggests the surveyed code involves more complex post operative care as compared to the reference code. This difference in the intensity of the post-operative care is also demonstrated in the post-operative intensity/complexity measures which show that the post service time segment of the surveyed code has a greater intensity associated with it as compared to the reference code. Therefore, because of the greater total service time and the more intense post-operative visits, the RUC agreed that the median RVU of the survey data appropriately places 26650 in comparison to 25651. The RUC recommends 6.00 RVUs for 26650.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
26665	Open treatment of carpometacarpal fracture dislocation, thumb (Bennett fracture), includes internal fixation, when performed	090	9.00	The RUC reviewed CPT code 26665 Open treatment of carpometacarpal fracture dislocation, thumb (Bennett fracture), includes internal fixation, when performed in comparison to 25652 Open treatment of ulnar styloid fracture (Work RVU=7.92). The RUC noted that the surveyed code had a greater total service time associated with it in comparison to the reference code, 237 minutes and 225 minutes, respectively. The RUC also noted that the surveyed procedure requires greater physicial effort and an endurance of greater psychological stress to perform as compared to the reference code. Furthermore, the surveyed code is a more complex procedure to perform than the reference code given the increased intensity of dealing with an intraarticular fracture as demonstrated in the intensity/complexity time measures which shows that surveyed code is a much more intense procedure to perform than the reference code. The RUC agreed that because of the larger total service time and the greater amount of intensity and complexity associated with the surveyed code as compared to the reference code, the RUC recommends the median survey RVU, 9.00 work RVUs. In addition, the RUC agreed this value is appropriate because it has similar work and the same intra-service time as MPC code 14060 Adjacent tissue transfer or rearrangement, eyelids, nose, ears and/or lips; defect 10 sq cm or less (Work RVU=9.07). The RUC recommends 9.00 Work RVUs for 26665.
26685	Open treatment of carpometacarpal dislocation, other than thumb; includes internal fixation, when performed, each joint	090	8.00	The RUC reviewed CPT code 26685 Open treatment of carpometacarpal dislocation, other than thumb; includes internal fixation, when performed, each joint and compared it with its reference code 25652 Open treatment of ulnar styloid fracture (work RVU=7.92). The RUC noted that the intra-service times for both procedures are 60 minutes. The RUC also compared the office visits associated with this procedure and noted that although they both have four post-operative office visits associated with them, the surveyed code has two 99213 and two 99212 visits associated with it while 25652 has one 99213 and three 99212 associated with it which suggests the surveyed code has a more complex post operative care as compared to the reference code. This difference in the intensity of the post-operative care is also demonstrated in the post-operative intensity/ complexity measure which shows that the post service time segment of the surveyed code has a greater intensity associated with it as compared to the reference code. With the same amount of intra-service time and slightly different office visits as compared to 25652, the RUC agreed that the median of the survey, 8.00 work RVUs appropriately places 26685 in comparison to the reference code, 26615 Open treatment of metacarpal fracture, single, includes internal fixation, when performed, each bone and 28645 Open treatment of metatarsophalangeal joint dislocation, includes internal fixation, when performed which all have the same complexity and proposed work RVU. The RUC recommends 8.00 work RVUs for 26685.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
26715	Open treatment of metacarpophalangeal dislocation, single, includes internal fixation, when performed	090	7.95	The RUC reviewed CPT code 26715 Open treatment of metacarpophalangeal dislocation, single, includes internal fixation, when performed and compared it to its reference code, 25671 Percutaneous skeletal fixation of distal radioulnar dislocation (Work RVU=6.32). The RUC compared the total service times for these procedures and noted that the surveyed code (220 minutes of total service time) had more total service time associated with it than the 25671 (210 minutes of total service time). The RUC also compared the office visits associated with this procedure and noted that although they both have four post-operative office visits associated with them, the surveyed code has two 99213 and two 99212 visits associated with it while 25651 has one 99213 and three 99212 associated with it which suggests the surveyed code involves more complex post operative care as compared to the reference code. This difference in the intensity of the post-operative care is also demonstrated in the post-operative intensity/ complexity measure which shows that the post service time segment of the surveyed code has a greater intensity associated with it as compared to the reference code. Therefore, because of the greater total service time and the more intense post-operative visits, the RUC agreed that the median RVU of the survey data 7.95 work RVUs, appropriately places 26715 in comparison to 25671. Furthermore, the RUC agreed that this value correctly places this procedure in terms of complexity in comparison to other orthopaedic codes such that it is more complex than 26785 Open treatment of interphalangeal joint dislocation, includes internal fixation, when performed, single (RUC recommended work RVU =7.45 work RVU) and has similar complexity to 28645 Open treatment of metatarsophalangeal joint dislocation, includes internal fixation, when performed (RUC recommended work RVU=8.00). The RUC recommends 7.95 RVUs for 26715.
26735	Open treatment of phalangeal shaft fracture, proximal or middle phalanx, finger or thumb, includes internal fixation, when performed, each	090	8.40	The RUC reviewed CPT code 26735 Open treatment of phalangeal shaft fracture, proximal or middle phalanx, finger or thumb, includes internal fixation, when performed, each and compared it with its reference code 25608 Open treatment of distal radial intra-articular fracture or epiphyseal separation; with internal fixation of 2 fragments (work RVU=10.86). The RUC noted that the intra-service time for the surveyed code is less than the intra-service time for the reference code (60 minutes and 90 minutes, respectively). The RUC also compared the intensity/complexity measures of the surveyed code to the reference code and determined that the reference code required more physical effort and more psychological stress to perform than the surveyed code. With the lower amount of intra-service time and lower intensity/complexity measures as compared to 25608, the RUC agreed that the 25th percentile of survey, 8.40 work RVUs appropriately places 26735 in comparison to the reference code. Furthermore, the RUC compared the surveyed code with MPC code 14040 Adjacent tissue transfer or rearrangement, forehead, cheeks, chin, mouth, neck, axillae, genitalia, hands and/or feet; defect 10 sq cm or less (Work RVU=8.44) and agreed that 8.40 RVU was an approriate value for the surveyed code because the surveyed code had similar total-service time as compared to this procedure, 237 minutes and 223 minutes, respectively. The RUC recommends 8.40 work RVUs for 26735.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
26746	Open treatment of articular fracture, involving metacarpophalangeal or interphalangeal joint, includes internal fixation, when performed, each	090	11.10	The RUC reviewed CPT code 26746 Open treatment of articular fracture, involving metacarpophalangeal or interphalangeal joint, includes internal fixation, when performed, each and compared it to its reference code 25608 Open treatment of distal radial intra-articular fracture or epiphyseal separation; with internal fixation of 2 fragments (Work RVU=10.86). The RUC reviewed the total-service times for both codes and found them to be comparable, 303 minutes and 305 minutes. However, the RUC noted that the intensity/complexity measures for 26746 were significantly higher in comparison to 25608 as the complexity and risk for complication involved in 26746 is much greater than 25608. Therefore the RUC agreed that the median value of 11.10 RVU appropriately places this code in comparison to the reference code. For further support the RUC compared this procedure to MPC code 28299 Correction, hallux valgus (bunion), with or without sesamoidectomy; by double osteotomy (Work RVU=11.39) and determined that 11.10 work RVUs was appropriate for 26746 as 28299 has more intra- service time associated with it in comparison to 27832, 90 minutes and 83 minutes respectively. The RUC recommends 11.10 RVUs for 26746.
26765	Open treatment of distal phalangeal fracture, finger or thumb, includes internal fixation, when performed, each	090	6.60	The RUC reviewed CPT code 26765 Open treatment of distal phalangeal fracture, finger or thumb, includes internal fixation, when performed, each and compared it with its reference code 25652 Open treatment of ulnar styloid fracture (work RVU=7.92). The RUC noted that the intra-service time for the surveyed code is less than the intra-service time for the reference code (45 minutes and 60 minutes, respectively). The RUC also compared the intensity/complexity measures of the surveyed code and the reference code and determined that the reference code required more technical and physical effort, more psychological stress and had increased intensity to perform as compared to the surveyed code. With the lower amount of intra-service time and lower intensity/complexity measures as compared to 25652, the RUC agreed that the 25th percentile of survey, 6.60 work RVU appropriately places 26765 in comparison to the reference code. The RUC recommends 6.60 work RVUs for 26765.
26785	Open treatment of interphalangeal joint dislocation, includes internal fixation, when performed, single	090	7.45	The RUC reviewed CPT code 26785 Open treatment of interphalangeal joint dislocation, includes internal fixation, when performed, single and compared it with its reference code 25652 Open treatment of ulnar styloid fracture (work RVU=7.92). The RUC noted that the intra-service time for the surveyed code is less than the intra-service time for the reference code (45 minutes and 60 minutes, respectively). The RUC also compared the intensity/complexity measures of the surveyed code and the reference code and determined that the reference code required more technical and physical effort, more psychological stress and had increased intensity to perform as compared to the surveyed code. With the lower amount of intra-service time and lower intensity/complexity measures as compared to 25652, the RUC agreed that the 25th percentile of survey, 7.45 work RVU appropriately places 26785 in comparison to the reference code. The RUC recommends 7.45 work RVUs for 26785.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
27766	Open treatment of medial malleolus fracture, includes internal fixation, when performed	090	8.50	The RUC reviewed CPT code 27766 Open treatment of medial malleolus fracture, includes internal fixation, when performed and compared it with its reference code 25607 Open treatment of distal radial extra-articular fracture or epiphyseal separation, with internal fixation (work RVU=9.35). The RUC noted that the intra-service time for the surveyed code is less than the intra-service time for the reference code (45 minutes and 60 minutes, respectively). The RUC noted that this procedure requires a 99231 hospital stay because of the risk of post-operative complications. The RUC also compared the intensity/complexity measures of the surveyed code and the reference code and determined that the reference code required more technical skill, physical effort and more psychological stress to perform than the reference code. With the lower amount of intra-service time and lower intensity/complexity measures as compared to 25607, the RUC agreed that the 25th percentile of survey, 8.50 work RVU appropriately places 27766 in comparison to the reference code. The RUC noted that the proposed value for this procedure, 8.50 RVUs, is less than the existing value, 8.73 RVUs. The RUC recommends 8.50 work RVUs for 27766.
27784	Open treatment of proximal fibula or shaft fracture, includes internal fixation, when performed	090	10.45	The RUC reviewed CPT code 27784 Open treatment of proximal fibula or shaft fracture, includes internal fixation, when performed and compared it with its reference code 25607 Open treatment of distal radial extra-articular fracture or epiphyseal separation, with internal fixation (Work RVU=9.35). The RUC noted that the total service time of 27784 is higher than the total service time of the reference code, 281 minutes and 275 minutes, respectively. The RUC reviewed the intensity complexity measures associated with 27784 and 25607. The RUC noted that 27784 requires more technical skill, physical effort and psychological stress to perform than the reference code. With the higher amount of total service time of the surveyed code in comparison to the reference code and the higher intensity/complexity measures of the surveyed code in comparison to the reference code, the RUC agreed that the median of the survey, 10.45 RVUs appropriately places this code in comparison to the reference codes. For further support, the RUC compared this code to MPC code 66984 Extracapsular cataract removal with insertion of intraocular lens prosthesis (one stage procedure), manual or mechanical technique (eg, irrigation and aspiration or phacoemulsification) (Work RVU=10.36) and agreed that the recommended value of 10.45 RVU for 27784 was appropriate as the intra-service time for 27784 is significantly more than the 66984, 60 minutes and 30 minutes, respectively. The RUC recommends 10.45 RVUs for 27784.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
27792	Open treatment of distal fibular fracture (lateral malleolus), includes internal fixation, when performed	090	10.50	The RUC reviewed CPT code 27792 Open treatment of distal fibular fracture (lateral malleolus), includes internal fixation, when performed and compared it with its reference code 28299 Correction, hallux valgus (bunion), with or without sesamoidectomy; by double osteotomy (Work RVU=11.39). The RUC noted that the intra-service time of 27792 is significantly less than the intra-service time of the reference code, 60 minutes and 90 minutes, respectively. The RUC also noted that the care for this type of fracture is slightly more complex than 27784 Open treatment of proximal fibula or shaft fracture, includes internal fixation, when performed (RUC Recommended Value=10.45). With the lower amount of intra-service time of the surveyed code in comparison to the reference code and maintaining the proper rank order between the surveyed code and 27784, the RUC agreed that the median of the survey, 10.50 RVUs appropriately places this code in comparison to the reference codes. For further support, the RUC compared this code to MPC code 66984 Extracapsular cataract removal with insertion of intraocular lens prosthesis (one stage procedure), manual or mechanical technique (eg, irrigation and aspiration or phacoemulsification) (Work RVU=10.36) and agreed that the recommended value of 10.50 RVU for 27792 was appropriate as the intra-service time for 27792 is significantly more than the 66984, 60 minutes and 30 minutes, respectively. The RUC recommends 10.50 RVUs for 27792.
27814	Open treatment of bimalleolar ankle fracture, includes internal fixation, when performed	090	11.50	The RUC reviewed CPT code 27814 Open treatment of bimalleolar ankle fracture, includes internal fixation, when performed and compared it to its reference code 25609 Open treatment of distal radial intra-articular fracture or epiphyseal separation; with internal fixation of 3 or more fragments (Work RVU=14.12). The RUC compared the intra-service times for these procedures and noted that 27814 had less intra-service time associated with it as compared to 25609, 90 and 120 minutes, respectively. The RUC compared the intensity complexity measures of 27814 amd 25609 and noted that the reference code required more physical effort, mental effort and judgement to perform as compared to 23515. Therefore, the RUC agreed that the 25th percentile of the survey data, 11.50 RVUs, appropriately places this code in comparison to the reference code. For further support the RUC compared this procedure to MPC code 28299 Correction, hallux valgus (bunion), with or without sesamoidectomy; by double osteotomy (Work RVU=11.39) and determined that 11.50 work RVUs was appropriate for 27814 as 28299 has the less total service time than the 27814, 299 minutes and 346 minutes respectively. The RUC recommends 11.50 RVUs for 27814.
27822	Open treatment of trimalleolar ankle fracture, with internal fixation, when performed, medial and/or lateral malleolus; without fixation of posterior lip	090	12.12	The RUC reviewed CPT code 27822 Open treatment of trimalleolar ankle fracture, with internal fixation, when performed, medial and/or lateral malleolus; without fixation of posterior lip and agreed that there was not compelling evidence to review it because the nature of the work involved in providing this service has not substantially changed since the RUC last reviewed it in 2000. The RUC recommends that the new surveyed times be applied to this code and that the work RVUs for 27822 be maintained at its current value, 12.12.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
27823	Open treatment of trimalleolar ankle fracture, with internal fixation, when performed, medial and/or lateral malleolus; with fixation of posterior lip	090	14.26	The RUC reviewed CPT code 27823 Open treatment of trimalleolar ankle fracture, with internal fixation, when performed, medial and/or lateral malleolus; with fixation of posterior lip and agreed that there was not compelling evidence to review it because the nature of the work involved in providing this service has not substantially changed since the RUC last reviewed it in 2000. The RUC recommends that the new surveyed times be applied to this code and that the work RVUs for 27823 be maintained at its current value, 14.26 RVUs.
27826	Open treatment of fracture of weight bearing articular surface/portion of distal tibia (eg, pilon or tibial plafond), with internal fixation, when performed; of fibula only	090	12.00	The RUC reviewed CPT code 27826 Open treatment of fracture of weight bearing articular surface/portion of distal tibia (eg, pilon or tibial plafond), with internal fixation, when performed; of fibula only and compared it to its reference code 25609 Open treatment of distal radial intra-articular fracture or epiphyseal separation; with internal fixation of 3 or more fragments (Work RVU=14.12). The RUC agreed that the specialty society recommended 99214 office visit should be lowered to a 99213 office visit as this is more typical of the post-operative care for this procedure. This change in the post-operative visits results in three 99213 office visits and one 99212 office visits being associated with this procedure. The RUC noted that the intra-service time of the surveyed code was far less than the intra-service time of the reference code, 60 minutes and 120 minutes. The RUC compared the intensity/complexity mesaures for these procedures and noted that they were comparable. The RUC after revieweing these times and complexity measures associated with the key reference code and the surveyed code agreed that this surveyed code has the same amount of complexity and work as 25525 Open treatment of radial shaft fracture, with internal fixation, when performed, and closed treatment of dislocation of distal radioulnar joint (Galeazzi fracture/dislocation), with percutaneous skeletal fixation, when performed, 23630 Open treatment of greater humeral tuberosity fracture, includes internal fixation, when performed and 25585 Open treatment of talotarsal joint dislocation, includes internal fixation, when performed and therefore recommends that this procedure be valued the same as these other reference codes (all three codes RUC recommended RVU=12.00). The RUC recommends 12.00 RVUs for 27826. For further support, the RUC compared 27826 to MPC code 60220 Total thyroid lobectomy, unilateral; with or without isthmusectomy (Work RVU=12.29). The RUC noted that as 27826 has less intra-service time as compared to 60220, 60 minutes and 90 minutes, the recommended work RVU of 12.00 appropriately places this code in comparison to 60220 as well as the key reference code, 25609. The RUC recommends 12.00 RVU for 27826.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
27827	Open treatment of fracture of weight bearing articular surface/portion of distal tibia (eg, pilon or tibial plafond), with internal fixation, when performed; of tibia only	090	16.00	The RUC reviewed CPT code 27827 Open treatment of fracture of weight bearing articular surface/portion of distal tibia (eg, pilon or tibial plafond), with internal fixation, when performed; of tibia only and compared it with its reference code 27447 Arthroplasty, knee, condyle and plateau; medial AND lateral compartments with or without patella resurfacing (total knee arthroplasty) (Work RVU=23.04). The RUC agreed that the specialty society recommended 99214 office visit should be removed and replaced with a 99213 office visit as this is more typical of the post-operative care for this procedure. This change in the post-operative visits results in four 99213 office visits and one 99212 office visits being associated with this procedure. However, after comparing 27827 with 27447, the RUC determined that this reference code was not a suitable comparison after the determination was made that 28445 Open treatment of talus fracture, with or without internal or external fixation (Work RVU=17.07), originally part of this internal/external fixation review had no compelling evidence to be reviewed and the RUC recommended that its value be maintained, could now be used as an alternative reference code. The RUC compared the total service times for both procedures and determined at 28445 had a longer total service time in comparison to the surveyed code 485 minutes and 458 minutes. In addition, the RUC agreed that the intensity and complexity of performing 28445 would be greater than performing 27827. Therefore, the RUC agrees that the 25th percentile of the survey data accurately places this code in comparison to the reference code 28445. The RUC recommends 16.00 RVUs for 27827.
27828	Open treatment of fracture of weight bearing articular surface/portion of distal tibia (eg, pilon or tibial plafond), with internal fixation, when performed; of both tibia and fibula	090	20.00	The RUC reviewed CPT code 27828 Open treatment of fracture of weight bearing articular surface/portion of distal tibia (eg, pilon or tibial plafond), with internal fixation, when performed; of both tibia and fibula and compared it with its reference code 27447 Arthroplasty, knee, condyle and plateau; medial AND lateral compartments with or without patella resurfacing (total knee arthroplasty) (Work RVU=23.04). The RUC agreed that the specialty society recommended 99214 office visit should be removed and replaced with a 99213 office visit as this is more typical of the post-operative care for this procedure. This change in the post-operative visits results in four 99213 office visits and one 99212 office visits being associated with this procedure. However, after comparing 27828 with 27447, the RUC determined that this reference code was not a suitable comparison after the determination was made that 28445 Open treatment of talus fracture, with or without internal or external fixation (Work RVU=17.07), originally part of this internal/external fixation review had no compelling evidence to be reviewed, could now be used as an alternative reference code. The RUC compared the intra-service times for both procedures and determined at 27828 had a longer intra-service time in comparison to the reference code, 150 minutes and 125 minutes. In addition, the RUC agreed that the intensity and complexity of performing 27828 would be greater than performing 28445. Therefore, the RUC agrees that the 25th percentile of the survey data accurately places this code in comparison to the reference code 28445. The RUC recommends 20.00 RVUs for 27828.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
27829	Open treatment of distal tibiofibular joint (syndesmosis) disruption, includes internal fixation, when performed	090	9.50	The RUC reviewed CPT code 27829 Open treatment of distal tibiofibular joint (syndesmosis) disruption, includes internal fixation, when performed and compared it to its reference code 25607 Open treatment of distal radial extra-articular fracture or epiphyseal separation, with internal fixation. The RUC noted that although the reference code has more intra-service time compared with it than the reference code, 60 minutes and 45 minutes, respectively, that the surveyed code has more pre-service time associated with it as more time is required in 27829 to evaluate the fracture. The intensity and risk for complication involved in treating the distal tibia fracture is much greater than the intensity and risk for complication involved with 25607. This is demonstrated in the intensity/comlexity measures which demonstrates that 27829 requires more mental effort and judgement, more technical skill and physical effort and is an overall more intense code to perform than 25607. In addition, the surveyed code has more post-operative work in comparison to 25607, because 27829 requires hospitialization to avoid skin issues, swelling and to assess neurocirculatory status. Because of the greater amount of intensity as well as the hospitalization associated with this service, the RUC agreed the 25th percentile of the survey, 9.50 RVUs accurately places this procedure in comparison to the reference code. The RUC recommends 9.50 RVUs for 27829.
27832	Open treatment of proximal tibiofibular joint dislocation, includes internal fixation, when performed, or with excision of proximal fibula	090	11.00	The RUC reviewed CPT code 27832 Open treatment of proximal tibiofibular joint dislocation, includes internal fixation, when performed, or with excision of proximal fibula and compared it to its reference code 25608 Open treatment of distal radial intra-articular fracture or epiphyseal separation; with internal fixation of 2 fragments (Work RVU=10.86). The RUC reviewed the total-service times for both codes and found them to be comparable, 301 minutes and 305 minutes. However, the RUC noted that the intensity/complexity measures for 27832 were significantly higher in comparison to 25608 as the complexity and risk for complication involved in open treatment of the trimalleolar ankle fracture is much greater than 25608. Therefore the RUC agreed that the median value of 11.00 RVU appropriately places this code in comparison to the reference code. For further support the RUC compared this procedure to MPC code 28299 Correction, hallux valgus (bunion), with or without sesamoidectomy; by double osteotomy (Work RVU=11.39) and determined that 11.00 work RVUs was appropriate for 27832 as 28299 has more intra- service time associated with it in comparison to 27832, 90 minutes and 75 minutes respectively. The RUC recommends 11.00 RVUs for 27832.
28415	Open treatment of calcaneal fracture, includes internal fixation, when performed;	090	17.54	The RUC reviewed CPT code 28415 Open treatment of calcaneal fracture, includes internal fixation and recommended that a 99214 office visit should be removed and substituted with a 99213 office visit as this is more typical of the post-operative care for this procedure. This change in the post-operative visits results in four 99213 office visits and one 99212 office visits being associated with this procedure. The RUC agreed that the new survey time data for this procedure further validated the existing work RVUs for this procedure and recommend maintaing the value for this code. The RUC recommends that the new surveyed times be applied to this code and maintaining the current work of 17.54 RVUs for 28415.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
28420	Open treatment of calcaneal fracture, includes internal fixation, when performed; with primary iliac or other autogenous bone graft (includes obtaining graft)	090	19.00	The RUC reviewed CPT code 28420 Open treatment of calcaneal fracture, includes internal fixation, when performed; with primary iliac or other autogenous bone graft (includes obtaining graft) and compared it with its reference code 27487 Revision of total knee arthroplasty, with or without allograft; femoral and entire tibial component (Work RVU=26.91). The RUC agreed that the specialty society recommended 99214 office visit should be removed and replaced with a 99213 office visit as this is more typical of the post-operative care for this procedure. This change in the post-operative visits results in four 99213 office visits and one 99212 office visits being associated with this procedure. However, after comparing 28420 with 27847, the RUC determined that this reference code was not a suitable comparison after the determination was made that 28445 Open treatment of talus fracture, with or without internal or external fixation (Work RVU=17.07), originally part of this internal/external fixation review had no compelling evidence to be reviewed, could now be used as an alternative reference code as the RUC recommended that the value for this service be maintained at its existing value. The RUC compared the intra-service times for both procedures and determined at 28420 had a longer intra-service time in comparison to the reference code, 150 minutes and 125 minutes. In addition, the RUC agreed that the intensity and complexity of performing 28420 would be greater than performing 28445. Therefore, the RUC agrees that the 25th percentile of the survey data accurately places this code in comparison to the reference code 28445. The RUC recommends 19.00 RVUs for 28420.
28445	Open treatment of talus fracture, includes internal fixation, when performed	090	17.07	The RUC reviewed CPT code 28445 Open treatment of talus fracture, includes internal fixation, when performed and agreed that there was not compelling evidence to review it because the nature of the work involved in providing this service has not substantially changed. The RUC recommends that the new surveyed times be applied to this code and that the work RVUs for 28445 be maintained at its current value, 17.07 RVUs.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
28465	Open treatment of tarsal bone fracture (except talus and calcaneus), includes internal fixation, when performed, each	090	9.50	The RUC reviewed CPT code 28465 Open treatment of tarsal bone fracture (except talus and calcaneus), includes internal fixation, when performed, each and compared it with its reference code 25608 Open treatment of distal radial intra-articular fracture or epiphyseal separation; with internal fixation of 2 fragments (Work RVU=10.86). The RUC noted that the intra-service time for the surveyed code is less than the intra-service time for the reference code (60 minutes and 90 minutes, respectively). In addition, the number of post-operative visits is not the same as the surveyed code includes two 99213 and two 99212 office visits compared to the reference code with three 99213 office visits and two 99212, which suggests the surveyed code involves less complex post operative care as compared to the reference code. However, the RUC also compared this procedure to 24685 Open treatment of ulnar fracture proximal end (olecranon process), includes internal fixation, when performed (RUC recommended work RVU=9.50) and 27829 Open treatment of distal tibiofibular joint (syndesmosis) disruption, includes internal fixation, when performed (RUC Recommended work RVU=9.50). The RUC agreed that all of these procedures had similar complexity and should have similar work RVUs. With the lower amount of intra-service time and the differences in the post-operative visits as compared to 25608, the RUC agreed that 9.50 work RVU appropriately places 28465 in comparison to 25608, 24685 and 27829. The RUC recommends 9.50 work RVUs for 28465.
28485	Open treatment of metatarsal fracture, includes internal fixation, when performed, each	090	8.00	The RUC reviewed CPT code 28485 Open treatment of metatarsal fracture, includes internal fixation, when performed, each and compared it with its reference code 28299 Correction, hallux valgus (bunion), with or without sesamoidectomy; by double osteotomy (Work RVU=11.39). The RUC noted that the intra-service time for the surveyed code is less than the intra-service time for the reference code (60 minutes and 90 minutes, respectively). The number of post-operative visits is the same but the surveyed code includes two 99213 and two 99212 office visits compared to the reference code with three 99213 office visits and one 99212 office visit, which suggests the surveyed code involves less complex post operative care as compared to the reference code. The RUC noted that the reference code required more mental effort and judgement, more technical kill and physical effort and greater psychological stress to perform than the surveyed code. Also, the RUC also compared this procedure to 26615 Open treatment of carpometacarpal dislocation, other than thumb; includes internal fixation, when performed, each joint (RUC recommended work RVU=8.00), 28645 Open treatment of metatarsophalangeal joint dislocation, includes internal fixation, when performed (RUC Recommended work RVU=8.00) and 26615 Open treatment of metacarpal fracture, single, includes internal fixation, when performed, each bone (RUC recommended work RVU=8.00). The RUC agreed that all of these procedures had similar complexity and should have similar work RVUs. With the lower amount of intra-service time and the differences in the post-operative visits as well as the lower intensity and complexity measures as compared to 28299, the RUC agreed that 8.00 work RVU appropriately places 28485 in comparison to 28299, 26685, 28645 and 26615. The RUC recommends 8.00 work RVUs for 28485.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
28505	Open treatment of fracture great toe, phalanx or phalanges, includes internal fixation, when performed	090	8.00	The RUC reviewed CPT code 28505 Open treatment of fracture great toe, phalanx or phalanges, includes internal fixation, when performed and compared it with its reference code 28750 Arthrodesis, great toe; metatarsophalangeal joint (Work RVU=8.37). The RUC noted that the intra-service time for the surveyed code is less than the intra-service time for the reference code (45 minutes and 75 minutes, respectively). Additional pre-service time is associated with the surveyed code because this procedure involves the evaluation of a fracture which requires additional positioning and prep time as compared to the reference code. The number of post-operative visits is the same but the surveyed code includes two 99213 and two 99212 office visits compared to the reference code with four 99213 office visits, which suggests the surveyed code involves less complex post operative care as compared to the reference code. However, the RUC also compared this procedure to 26685 Open treatment of carpometacarpal dislocation, other than thumb; includes internal fixation, when performed, each joint (RUC recommended work RVU=8.00), 28645 Open treatment of metatarsophalangeal joint dislocation, includes internal fixation, when performed (RUC Recommended work RVU=8.00) and 26615 Open treatment of metacarpal fracture, single, includes internal fixation, when performed, each bone (RUC recommended work RVU=8.00). The RUC agreed that all of these procedures had similar complexity and should have similar work RVUs. With the lower amount of intra-service time and the differences in the post-operative visits as compared to 28750, the RUC agreed that 8.00 work RVU appropriately places 28525 in comparison to 28750, 26685, 28645 and 26615. The RUC recommends 8.00 work RVUs for 28505.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
28525	Open treatment of fracture, phalanx or phalanges, other than great toe, includes internal fixation, when performed, each	090	6.00	The RUC reviewed CPT code 28525 Open treatment of fracture, phalanx or phalanges, other than great toe, includes internal fixation, when performed, each and compared it with its reference code 28289 Hallux rigidus correction with cheilectomy, debridement and capsular release of the first metatarsophalangeal joint (Work RVU=8.11). The RUC noted that the intra-service time for the surveyed code is less than the intra-service time for the reference code (30 minutes and 45 minutes, respectively). Additional pre-service time is associated with the surveyed code because this procedure involves a fracture with fixation, which requires more positioning and prep time as compared to the reference code. The number of post-operative visits is the same but the surveyed code includes two 99213 and two 99212 office visits compared to the reference code with four 99213 office visits, which suggests the surveyed code involves a less complex post operative care as compared to the reference code. The RUC also compared the intensity/complexity measures of the surveyed code and the reference code and determined that the reference code required more technical and physical skill, more psychological stress and had increased intensity to perform as compared to the surveyed code. With the lower amount of intra-service time and lower intensity/complexity measures as compared to 28289, the RUC agreed that the 25th percentile of survey, 6.00 work RVU appropriately places 28525 in comparison to the reference code. Furthermore, the RUC compared the surveyed code with MPC code 11646 Excision, malignant lesion including margins, face, ears, eyelids, nose, lips; excised diameter over 4.0 cm (Work RVU=6.21) and agreed that 6.00 RVU was an approriate value for the surveyed code because the surveyed code had significantly less intra-service time than this procedure, 30 minutes and 60 minutes, respectively. The RUC recommends 6.00 work RVUs for 28525.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
28555	Open treatment of tarsal bone dislocation, includes internal fixation, when performed	090	10.43	The RUC reviewed CPT code 28555 Open treatment of tarsal bone dislocation, includes internal fixation, when performed and compared it with its reference code 28261 Capsulotomy, midfoot; with tendon lengthening (Work RVU=12.91). The RUC noted that the intra-service time of 28555 is significantly less than the intra-service time of the reference code, 60 minutes and 103 minutes, respectively. The RUC reviewed the post-operative visits for this service and determined that to make this service comparable to other codes within the family, 27784 Open treatment of proximal fibula or shaft fracture, includes internal fixation, when performed (RUC recommended work RVU=10.45) and 27792 Open treatment of distal fibular fracture (lateral malleolus), includes internal fixation, when performed (RUC recommended work RVU=10.50), that the specialty societies' recommendation of including a 99214 office visit should be removed from the post-operative visits associated with this code as only two 99213 and two 99212 office visits is more typical of the post-operative care for the typical patient. With the lower amount of intra-service time of the surveyed code in comparison to the reference code and the same post-operative visits as 27784 and 27792, the RUC agreed that the 25th percentile of the survey, 10.43 RVUs appropriately places this code in comparison to the reference codes. For further support, the RUC compared this code to MPC code 66984 Extracapsular cataract removal with insertion of intraocular lens prosthesis (one stage procedure), manual or mechanical technique (eg, irrigation and aspiration or phacoemulsification) (Work RVU=10.36) and agreed that the recommended value of 10.43 RVU for 28555 was appropriate as the intra-service time for 28555 is significantly more than the 66984, 60 minutes and 30 minutes, respectively. The RUC recommends 10.43 RVUs for 28555.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
28585	Open treatment of talotarsal joint dislocation, includes internal fixation, when performed	090	12.00	The RUC reviewed CPT code 28585 Open treatment of talotarsal joint dislocation, includes internal fixation, when performed and compared it with its reference code 28299 Correction, hallux valgus (bunion), with or without sesamoidectomy; by double osteotomy (work RVU=11.39). The RUC agreed that the specialty society recommended 99214 office visit should be lowered to a 99213 office visit as this is more typical of the post-operative care for this procedure. This change in the post-operative visits results in three 99213 office visits and two 99212 office visits being associated with this procedure. With this change, the RUC noted that the total service times for 28585 is greater than the reference code, 324 minutes and 299 minutes. Additionally, the RUC noted that the surveyed code required greater mental effort and judgement and physicial effort to perform in comparison to the reference code. This intensity of this service is much in part due to the joint that is operated on as it is more proximal and involves larger bones as compared to the tarsometatarsal dislocation procedure. Two bones are involved in this type of dislocation and the risk for post-operative complications is high. Therefore, due more total service time and greater intensity/complexity measures as compared to the reference code, the RUC recommends the 25th percentile of the survey, 12.00 RVUs for this procedure. For further support, the RUC compared 28585 to MPC code 60220 Total thyroid lobectomy, unilateral; with or without isthmusectomy (Work RVU=12.29). The RUC noted that as 28585 has less intra-service time as compared to 60220, 75 minutes and 90 minutes, the recommended work RVU of 12.00 appropriately places this code in comparison to 60220 as well as the reference code, 28299. The RUC recommends 12.00 RVUs for 28585.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
28615	Open treatment of tarsometatarsal joint dislocation, includes internal fixation, when performed	090	11.50	The RUC reviewed CPT code 28615 Open treatment of tarsometatarsal joint dislocation, includes internal fixation, when performed and compared it to its reference code 28299 Correction, hallux valgus (bunion), with or without sesamoidectomy; by double osteotomy (Work RVU=11.39). After hearing the specialty societies' presentation for this code agreed that an additional 10 minutes of pre-service evaluation time and an additional 5 minutes of pre-service scrub, dress and wait time was needed to account for the fact that this procedure involves two bones which increases the complexity and risk associated with this procedure and consequently increases the evaluation and scrub, dress and wait time. Furthermore, the RUC agreed that the specialty society recommended 99214 office visit should be lowered to a 99213 office visit as this is more typical of the post-operative care for this procedure. This change in the post-operative visits results in three 99213 office visits and two 99212 office visits being associated with this procedure. With these changes, the RUC noted that 28615 had more total service time than the reference code, 323 minutes and and 299 minutes respectively. Further, the surveyed code requires greater technical skill, physicial effort and psychgological stress to perform in comparison to the reference code. Therefore the RUC agreed that the approriate value for this procedure is the 25th percentile of the survey data, 11.50 RVUs as this value appropriately places this code in comparison to the reference code. For further support the RUC compared this procedure to 28555 Open treatment of tarsal bone dislocation, includes internal fixation, when performed (RUC recommended RVU=10.43). As treating the type of dislocation involved in 28615 is more difficult than treating a dislocation involving a single bone as in 28555, the proposed value of 11.50 RVU appropriately place this procedure in comparison to 28555. The RUC recommends 11.50 RVUs for 28615
28645	Open treatment of metatarsophalangeal joint dislocation, includes internal fixation, when performed	090	8.00	The RUC reviewed CPT code 28645 Open treatment of metatarsophalangeal joint dislocation, includes internal fixation, when performed and compared it with its reference code 28292 Correction, hallux valgus (bunion), with or without sesamoidectomy; Keller, McBride, or Mayo type procedure (work RVU=8.72). The RUC noted that the intra-service time for the surveyed code is less than the intra-service time for the reference code (45 minutes and 60 minutes, respectively). The number of post-operative visits is the same but the surveyed code includes two 99213 and two 99212 office visits compared to the reference code with four 99213 office visits, which suggests the surveyed code has a less complex post operative care as compared to the reference code. The RUC also compared the intensity/complexity measures of the surveyed code to the reference code and determined that the reference code required more technical skill and more psychological stress. With the lower amount of intra-service time and lower intensity/complexity measures as compared to 28292, the RUC agreed that the 25th percentile of survey, 8.00 work RVU appropriately places 28645 in comparison to the reference code. The RUC recommends 8.00 work RVUs for 28645.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
28675	Open treatment of interphalangeal joint dislocation, includes internal fixation, when performed	090	6.00	The RUC reviewed CPT code 28675 Open treatment of interphalangeal joint dislocation, includes internal fixation, when performed and compared it with 28288 Ostectomy, partial, exostectomy or condylectomy, metatarsal head, each metatarsal head (work RVU=5.81). The RUC compared the service times of both procedures and noted that although the intra-service times are the same (30 minutes), 28675 had considerable more pre-service time associated with it than 28288 (55 minutes and 20 minutes, respectively). The surveyed code has more pre-service time associated with it because in involves a dislocation requiring fixation, which requires additional positioning and prep time. The reference code does not require fixation. Furthermore, the RUC noted that when comparing the intensity/complexity measures of the surveyed code to the reference code that the surveyed code requires greater mental effort and judgement and more overall intensity to perform than the reference code. Therefore, the RUC agreed that because of the greater amount of time and the greater mental effort and judgement associated with the surveyed code in comparison to the reference code, the RUC recommends survey median RVU, 6.00 RVUs for 28675. The RUC recommends 6.00 RVUs for 28675.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
2005 FIVE YEAR REVIEW - SUMMARY OF RECOMMENDATION

CPT Code:24635 Tracking Number F14 Specialty Society Recommended RVU: **10.00**
Global Period: 090 RUC Recommended RVU: **10.00**

CPT Descriptor: Open treatment of Monteggia type of fracture dislocation at elbow (fracture proximal end of ulna with dislocation of radial head), includes internal fixation, when performed

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 25-year-old male falls and suffers a displaced fracture of the proximal ulnar shaft and a dislocation of the radial head requiring an open reduction and internal fixation of the ulna and closed reduction of the radial head.

Percentage of Survey Respondents who found Vignette to be Typical: 92%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: • Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
- Verify that all required instruments and supplies are available - with special attention to plates and screws
- Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulation drapes
- Assess position of the extremities and head, adjust as needed
- The patient's arm is placed on the hand surgery table.
- Indicate areas of skin to be prepped and mark surgical incisions
- A tourniquet is applied to the proximal arm.
- The arm and hand are prepped and draped.
- The arm is elevated and exsanguinated.
- The pneumatic tourniquet is inflated.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work: An incision is made along the subcutaneous border of the ulna. Careful dissection is carried down to the fascia. The fascia between the extensor carpi ulnaris and flexor carpi ulnaris is incised. The periosteum in the region of the ulnar fracture is incised and elevated. The fracture site is cleared of clot and fibrinous material. The fracture is reduced. A plate is put into position and the reduction held with plate holding clamps. The screw holes are then drilled and the screws are inserted. The fascia is then repaired and the wound closed in layers.

Description of Post-Service Work: Post-service work: in facility
- Application of bulky dressing, reinforced with long arm splint
- Monitor patient stabilization in the recovery room.
- Consultation with the family and patient regarding the surgery and postoperative regimen.
- Communication with health care professionals including written and oral reports and orders.
- Postoperative care is coordinated with recovery room nursing staff.
- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.

- The patient is discharged to the orthopaedic floor for monitoring of compartment syndrome. This requires removing and reapplying the dressings.

Discharge day:

- The patient's vital signs are checked.

The circulation, sensation and motor function of the operated extremity are assessed.

- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Write prescriptions for medications needed post-discharge.
- Dictation of an operative report
- Procedure note is written in the patient chart
- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of splint/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order occupational therapy
- Supervision of rehabilitation
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions
- Dictate progress notes for medical record

COMPELLING EVIDENCE RATIONALE (Required to be Completed)

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

- ***Evidence that technology has changed physician work.***

Surgical treatment using open anatomical reduction and internal fixation has been made more complex with the introduction of new imaging methods such as CT which allow better detection of the fracture pathology and provided the basis for new surgical strategies. There are also new internal fixation devices which require more work. Beginning in the 1990s (after the Harvard study), new plates were developed for fracture repair, with most becoming available in the late 1990s and early 2000s. As an example of the complexity of the decision process in current practice, the 1990's have given the surgeon numerous options for bone fixation. The options for a bone fixation device currently include Kirschner wires, wire, staples, screws, as well as newer alternatives such as headless bone screws, T-screws, absorbable pins, cannulated screws, and a myriad of plates. The goal of all these devices remains constant: that is, to achieve stable approximation of bone fragments to facilitate healing. The various devices afford rigid fixation along with compression of the osseous fragments. This allows early range of motion and preservation of surrounding joint function, as well as primary bone healing. Selection of the most advantageous form of fixation is dependent on many factors and takes considerable time in the pre-evaluation of a patient. These include the type of fracture or osteotomy created, bone density, type of bone, and the desire for interfragmental compression. All of this has resulted in more work. The standards of care (fracture reduction, limb alignment, etc.) have also been elevated by literature that shows fracture displacements and poor alignments lead to poorer results. Additionally, women over 50 is a fast growing segment of our population. A huge percentage of these patients are osteoporotic - making fracture fixation and maintenance of fixation far more difficult than it used to be. The new plates are more complex to insert when the underlying bone is of much poorer quality.

Given this information, we believe there is compelling evidence that ORIF is more complex than 5 years ago and this is even more true in comparison to practice in the late 1980s (or more than 25 years ago).

- ***Evidence that incorrect assumptions were made in the previous valuation of the service; a misleading vignette and/or survey in a previous evaluation***

During the period of 1989-1991 (after the Harvard study), a major effort was undertaken by the AAOS and the OTA to rewrite every fracture and dislocation treatment code in the musculoskeletal Section of CPT. In 1991, 395 code changes were accepted by the AMA CPT Editorial Panel under the leadership of Dr. William Felts. At the time of the original proposal, some of the code descriptors were changed from those submitted (presumably by the CPT staff), and published in the 1992 and subsequent editions. Some of the changes in the descriptors published in CPT 1992 didn't make sense, but in those years, the CPT process was closed-door. Additionally, in 1992 and 1993 the AMA staff were deluged by the implementation of the RBRVS process and though AAOS and OTA requested that these problems be addressed then, AMA CPT staff asked that it be deferred as their "plate was full." After that time, more important issues and other opportunities consumed the resources of the AAOS and inertia (or the lack thereof) took over. This third five year review, after completion of the practice expense review, allowed AAOS a window of time to again try to correct the nomenclature for these codes, and review their work using the standard RUC survey method.

We also note, that at the time of the original CPT proposal, external fixation was considered an adjunctive procedure. CPT instructed that the codes for external fixation (20690 and 20692) be "listed in addition to the code for the treatment ...of the fracture." This concept still applies today. External fixation can be used as an adjunctive stabilization modality when treating fractures by almost any method. However, external fixation can also be used in reconstructive orthopaedics (for example, the treatment of joint contractures) and for non-musculoskeletal system treatments (for example, as a suspension device in the treatment of lower extremity burns). In 1991, there was no Modifier -51 exempt code category. Today, these same codes, 20690 and 20692 for external fixator application are modifier -51 exempt, recognizing that they can stand alone or be used adjunctively. Because of the modifier -51 exemption, the RVUs have been reduced, so payers are not paying double when either of these codes are reported with another treatment code.

In the 2005 comment letter to CMS, the AAOS recommended examining the physician work for the ORIF codes because the code descriptors lacked clarity. In particular, because the CPT descriptors include the phrase "with or without internal or external fixation," it is difficult to imagine what the Harvard survey data actually represents (ie, no typical patient was described for the survey respondents to focus on). Further, after the descriptors for these codes were changed for CPT 1993, an Abt study was performed in 1992 for RUC consideration. This study produced *percentage* relationships to key reference codes, but not surveyed time and visit data. Some of these recommendations were accepted by the RUC and CMS and others were adjusted up or down, but no changes were made to the Harvard time and visit data, if available. Therefore, we believe that there is little, if any, relationship between the Harvard database time and visit information (from the old CPT codes) and the current work RVUs.

Given this information, we believe there is compelling evidence that the current work values and/or time and visit data may be incorrect and outdated and should be reviewed.

- *Evidence that incorrect assumptions were made in the previous valuation of the service, as documented; a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data*

Harvard utilized the AMA Physician Masterfile to draw names for their surveys. While general orthopaedic surgeons can perform open reduction fracture care, it is more typical for patients to be referred to orthopaedic surgeons who specialize in orthopaedic trauma or in a given anatomical area (eg, shoulder, hand, knee, etc.). We do not believe that all specialty surgeons were surveyed for these codes, since the AMA Masterfile did not delineate orthopaedic specialties. Additionally, podiatrists were not surveyed for any of the lower extremity codes.

Given this information, we believe there is compelling evidence that not all involved specialties were involved in the review of these codes.

A consensus committee of physicians representing the American Academy of Orthopaedic Surgeons, American Shoulder and Elbow Surgeons, Society for Surgery of the Hand, Arthroscopy Association of North America, Orthopaedic Trauma Association, American Podiatric Medical Association, and American Orthopaedic Foot and Ankle Society met by conference call to discuss the survey data for the revised orthopaedic codes and data for the key reference codes and other codes on the survey reference service lists.

For revised code 24635, we recommend 10.00 work RVUs. After considering differences in time and visits, along with differences in intra-operative work, we believe this value correctly ranks code 24635 relative to other ORIF codes, relative to the key reference code, and relative to orthopaedic codes from the survey reference service list.

The work for 24635 is slightly greater than the key reference code 25607 because the dislocated radial head must b treated in addition to the ulna fracture and post-operatively there is a danger of neurovascular injury and compartmen syndrome. Close monitoring is needed. The first night is spent in the hospital monitoring the circulation, sensation and motor function of the involved extremity. The first office visit would include removing the long arm splint, inspecting the wounds, evaluation of the circulation, motor and sensory function, discussion of restrictions and operative findings, X-ray, application of a new dressing and cast, instruction in ROM. The second visit would include taking the cast off, removing

the dressing, removing the sutures, inspecting the wounds, evaluation of the circulation, motor and sensory function, X-ray, application of a new dressing and cast, instruction in ROM. The third visit would include removal of the cast, evaluation of the circulation, motor and sensory function, X-ray, and instruction in ROM and referral to OT. The last visit would evaluate the progress in therapy, modify therapy Rx, review X-ray, and discuss limitations.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No
   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FIVE YEAR REVIEW SPECIFIC QUESTIONS:

Please indicate the number of survey respondent percentages responding to each of the following questions (for example .05 = 5%):
Has the work of performing this service changed in the past 5 years? Yes 59% No 41%
(Use the subset of the people who responded "Yes" to answer the following questions)

A. This service represents new technology that has become more familiar (i.e., less work):
   I agree 18% I do not agree 82%
B. Patients requiring this service are now:
   more complex (more work) 91% less complex (less work) 0% no change 9%
C. The usual site-of-service has changed:
   from outpatient to inpatient 0% from inpatient to outpatient 27% no change 73%

Attestation Statement

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
2005 FIVE YEAR REVIEW - SUMMARY OF RECOMMENDATION

CPT Code:24685 Tracking Number F17 Specialty Society Recommended RVU: **9.50**
Global Period: 090 RUC Recommended RVU: **9.50**

CPT Descriptor: Open treatment of ulnar fracture proximal end (olecranon process), includes internal fixation, when performed

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 50-year-old male suffers a displaced fracture of the olecranon requiring open reduction and internal fixation of the olecranon.

Percentage of Survey Respondents who found Vignette to be Typical: 74%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: • Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
- Verify that all required instruments and supplies are available – with special attention to plates and screws
- Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulat drapes
- Assess position of the extremities and head, adjust as needed
- The patient's arm is placed on the hand surgery table.
- Indicate areas of skin to be prepped and mark surgical incisions
- A tourniquet is applied to the proximal arm.
- The arm and hand are prepped and draped.
- The arm is elevated and exsanguinated.
- The pneumatic tourniquet is inflated.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work: An incision is made over the olecranon taking care to avoid the ulnar nerve. The dissection is carried down to the subcutaneous boarder of the ulna. The fracture site is identified. The fibrinous material and clot are removed. The fracture is reduced. Two heavy Kirschner wires a driven across the fractures from proximal to distal passing through the triceps tendon taking care to engage the anterior cortex of the radius. A transverse hole is drilled in the distal fragment along its posterior border. Surgical wire is then passed through this hole and figure of 8 tension band is fabricated. This is tightened down. The Kirschner wires are bent and driven into the proximal ulna taking care to engage the wire. The wound is irrigated and then closed in layers.

Description of Post-Service Work: Post-service work: in facility
- Application of bulky dressing, reinforced with long arm splint
- Monitor patient stabilization in the recovery room.
- Consultation with the family and patient regarding the surgery and postoperative regimen.
- Communication with health care professionals including written and oral reports and orders.
- Postoperative care is coordinated with recovery room nursing staff.
- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.

- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Write prescriptions for medications needed post-discharge.
- Dictation of an operative report
- Procedure note is written in the patient chart

All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of splint/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order occupational therapy
- Supervision of rehabilitation
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions
- Dictate progress notes for medical record

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

- ***Evidence that technology has changed physician work.***

Surgical treatment using open anatomical reduction and internal fixation has been made more complex with the introduction of new imaging methods such as CT which allow better detection of the fracture pathology and provided the basis for new surgical strategies. There are also new internal fixation devices which require more work. Beginning in the 1990s (after the Harvard study), new plates were developed for fracture repair, with most becoming available in the late 1990s and early 2000s. As an example of the complexity of the decision process in current practice, the 1990's have given the surgeon numerous options for bone fixation. The options for a bone fixation device currently include Kirschner wires, wire, staples, screws, as well as newer alternatives such as headless bone screws, T-screws, absorbable pins, cannulated screws, and a myriad of plates. The goal of all these devices remains constant: that is, to achieve stable approximation of bone fragments to facilitate healing. The various devices afford rigid fixation along with compression of the osseous fragments. This allows early range of motion and preservation of surrounding joint function, as well as primary bone healing. Selection of the most advantageous form of fixation is dependent on many factors and takes considerable time in the pre-evaluation of a patient. These include the type of fracture or osteotomy created, bone density, type of bone, and the desire for interfragmental compression. All of this has resulted in more work. The standards of care (fracture reduction, limb alignment, etc.) have also been elevated by literature that shows fracture displacements and poor alignments lead to poorer results. Additionally, women over 50 is a fast growing segment of our population. A huge percentage of these patients are osteoporotic - making fracture fixation and maintenance of fixation far more difficult than it used to be. The new plates are more complex to insert when the underlying bone is of much poorer quality.

Given this information, we believe there is compelling evidence that ORIF is more complex than 5 years ago and this is even more true in comparison to practice in the late 1980s (or more than 25 years ago).

- ***Evidence that incorrect assumptions were made in the previous valuation of the service; a misleading vignette and/or survey in a previous evaluation***

During the period of 1989-1991 (after the Harvard study), a major effort was undertaken by the AAOS and the OTA to rewrite every fracture and dislocation treatment code in the musculoskeletal Section of CPT. In 1991, 395 code changes were accepted by the AMA CPT Editorial Panel under the leadership of Dr. William Felts. At the time of the original proposal, some of the code descriptors were changed from those submitted (presumably by the CPT staff), and published in the 1992 and subsequent editions. Some of the changes in the descriptors published in CPT 1992 didn't make sense, but in those years the CPT process was closed-door. Additionally, in 1992 and 1993 the AMA staff were deluged by the implementation of the RBRVS process and though AAOS and OTA requested that these problems be addressed then, AMA CPT staff asked that it be deferred as their "plate was full." After that time, more important issues and other opportunities consumed the resources of the AAOS and inertia (or the lack thereof) took over. This third five year review, after completion of the practice expense review, allowed AAOS a window of time to again try to correct the nomenclature for these codes, and review their work using the standard RUC survey method.

We also note, that at the time of the original CPT proposal, external fixation was considered an adjunctive procedure. CPT instructed that the codes for external fixation (20690 and 20692) be "listed in addition to the code for the treatment ...of the fracture." This concept still applies today. External fixation can be used as an adjunctive stabilization modality when treating fractures by almost any method. However, external fixation can also be used in reconstructive orthopaedics (for example, the treatment of joint contractures) and for non-musculoskeletal system treatments (for example, as a suspension device in the treatment of lower extremity burns). In 1991, there was no Modifier -51 exempt code category. Today, these same codes, 20690 and 20692 for external fixator application are modifier -51 exempt, recognizing that they can stand alone or be used adjunctively. Because of the modifier -51 exemption, the RVUs have been reduced, so payers are not paying double when either of these codes are reported with another treatment code.

In the 2005 comment letter to CMS, the AAOS recommended examining the physician work for the ORIF codes because the code descriptors lacked clarity. In particular, because the CPT descriptors include the phrase "with or without internal or external fixation," it is difficult to imagine what the Harvard survey data actually represents (ie, no typical patient was described for the survey respondents to focus on). Further, after the descriptors for these codes were changed for CPT 1993, an Abt study was performed in 1992 for RUC consideration. This study produced *percentage* relationships to key reference codes, but not surveyed time and visit data. Some of these recommendations were accepted by the RUC and CMS and others were adjusted up or down, but no changes were made to the Harvard time and visit data, if available. Therefore, we believe that there is little, if any, relationship between the Harvard database time and visit information (from the old CPT codes) and the current work RVUs.

Given this information, we believe there is compelling evidence that the current work values and/or time and visit data may be incorrect and outdated and should be reviewed.

- *Evidence that incorrect assumptions were made in the previous valuation of the service, as documented; a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data*

Harvard utilized the AMA Physician Masterfile to draw names for their surveys. While general orthopaedic surgeons can perform open reduction fracture care, it is more typical for patients to be referred to orthopaedic surgeons who specialize in orthopaedic trauma or in a given anatomical area (eg, shoulder, hand, knee, etc.). We do not believe that all specialty surgeons were surveyed for these codes, since the AMA Masterfile did not delineate orthopaedic specialties. Additionally, podiatrists were not surveyed for any of the lower extremity codes.

Given this information, we believe there is compelling evidence that not all involved specialties were involved in the review of these codes.

A consensus committee of physicians representing the American Academy of Orthopaedic Surgeons, American Shoulder and Elbow Surgeons, Society for Surgery of the Hand, Arthroscopy Association of North America, Orthopaedic Trauma Association, American Podiatric Medical Association, and American Orthopaedic Foot and Ankle Society met by conference call to discuss the survey data for the revised orthopaedic codes and data for the key reference codes and other codes on the survey reference service lists.

For revised code 24685, we recommend 9.50 work RVUs. After considering differences in time and visits, along with differences in intra-operative work, we believe this value correctly ranks code 24685 relative to other ORIF codes, relative to the key reference code, and relative to orthopaedic codes from the survey reference service list.

Total work is similar to key reference code 25607, however, intra-operatively, 24685 is more complex because it is intraarticular compared with 25607, which is extraarticular. The first postoperative visit would include a dressing change, CMS check; wound check, application of a new splint, X-rays, OT Rx, discussion of restrictions and operative findings. Early ROM is essential and must be monitored closely. The second visit would be similar to the first but the sutures would be removed and there would be less discussion regarding the procedure. The third visit would include liberation

from the splint, new OT Rx, X-rays would be reviewed, new restrictions discussed. The fourth visit would include a check on the ROM and strength progress, X-rays would be reviewed, new restrictions discussed.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No
   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FIVE YEAR REVIEW SPECIFIC QUESTIONS:

Please indicate the number of survey respondent percentages responding to each of the following questions (for example 0.05 = 5%):
Has the work of performing this service changed in the past 5 years? Yes 54% No 46%
(Use the subset of the people who responded "Yes" to answer the following questions)

A. This service represents new technology that has become more familiar (i.e., less work):
   I agree 9% I do not agree 91%
B. Patients requiring this service are now:
   more complex (more work) 95% less complex (less work) 5% no change 0%
C. The usual site-of-service has changed:
   from outpatient to inpatient 5% from inpatient to outpatient 23% no change 73%

Description of Pre-Service Work: • Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
- Verify that all required instruments and supplies are available – with special attention to plates and screws
- Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulation Drapes
- Assess position of the extremities and head, adjust as needed
- The patient's arm is placed on the hand surgery table.
- Indicate areas of skin to be prepped and mark surgical incisions
- A tourniquet is applied to the proximal arm.
- The arm and hand are prepped and draped.
- The arm is elevated and exsanguinated.
- The pneumatic tourniquet is inflated.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work: An anterior incision is made over the radius. The brachioradialis fascia is identified and incised. The lateral antebrachial cutaneous nerve is protected as is the superficial branch of the radial nerve. The branches of the radial artery are identified and cauterized. While the arm is held in supination, the attachment of the supinator is released. The arm is then pronated and the insertion of the pronator tear is identified and released and the periosteum along the radius is elevated. The fracture is identified. The fracture is cleared of any fibrinous material or clot. The fracture is then reduced. A plate is applied and the plate is held in position using plate holding clamps. The drill holes are then drilled and the screws placed. The periosteum is then repaired are the supinator and pronator teres. The wound is then closed in layers.

Description of Post-Service Work: Post-service work: in facility
- Application of bulky dressing, reinforced with long arm splint
- Monitor patient stabilization in the recovery room.
- Consultation with the family and patient regarding the surgery and postoperative regimen.
- Communication with health care professionals including written and oral reports and orders.
- Postoperative care is coordinated with recovery room nursing staff.
- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.

- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Write prescriptions for medications needed post-discharge.
- Dictation of an operative report
- Procedure note is written in the patient chart
- All appropriate medical records are completed, including discharge summary and discharge instructions, insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of splint/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order occupational therapy
- Supervision of rehabilitation
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions
- Dictate progress notes for medical record

COMPELLING EVIDENCE RATIONALE (Required to be Completed)

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

- ***Evidence that technology has changed physician work.***

Surgical treatment using open anatomical reduction and internal fixation has been made more complex with the introduction of new imaging methods such as CT which allow better detection of the fracture pathology and provided the basis for new surgical strategies. There are also new internal fixation devices which require more work. Beginning in the 1990s (after the Harvard study), new plates were developed for fracture repair, with most becoming available in the late 1990s and early 2000s. As an example of the complexity of the decision process in current practice, the 1990's have given the surgeon numerous options for bone fixation. The options for a bone fixation device currently include Kirschner wires, wire, staples, screws, as well as newer alternatives such as headless bone screws, T-screws, absorbable pins, cannulated screws, and a myriad of plates. The goal of all these devices remains constant: that is, to achieve stable approximation of bone fragments to facilitate healing. The various devices afford rigid fixation along with compression of the osseous fragments. This allows early range of motion and preservation of surrounding joint function, as well as primary bone healing. Selection of the most advantageous form of fixation is dependent on many factors and takes considerable time in the pre-evaluation of a patient. These include the type of fracture or osteotomy created, bone density, type of bone, and the desire for interfragmental compression. All of this has resulted in more work. The standards of care (fracture reduction, limb alignment, etc.) have also been elevated by literature that shows fracture displacements and poor alignments lead to poorer results. Additionally, women over 50 is a fast growing segment of our population. A huge percentage of these patients are osteoporotic - making fracture fixation and maintenance of fixation far more difficult than it used to be. The new plates are more complex to insert when the underlying bone is of much poorer quality.

Given this information, we believe there is compelling evidence that ORIF is more complex than 5 years ago and this is even more true in comparison to practice in the late 1980s (or more than 25 years ago).

- ***Evidence that incorrect assumptions were made in the previous valuation of the service; a misleading vignette and/or survey in a previous evaluation***

During the period of 1989-1991 (after the Harvard study), a major effort was undertaken by the AAOS and the OTA to rewrite every fracture and dislocation treatment code in the musculoskeletal Section of CPT. In 1991, 395 code changes were accepted by the AMA CPT Editorial Panel under the leadership of Dr. William Felts. At the time of the original proposal, some of the code descriptors were changed from those submitted (presumably by the CPT staff), and published in the 1992 and subsequent editions. Some of the changes in the descriptors published in CPT 1992 didn't make sense, but in those years, the CPT process was closed-door. Additionally, in 1992 and 1993 the AMA staff were deluged by the implementation of the RBRVS process and though AAOS and OTA requested that these problems be addressed then, AMA CPT staff asked that it be deferred as their "plate was full." After that time, more important issues and other opportunities consumed the resources of the AAOS and inertia (or the lack thereof) took over. This third five year review, after completion of the practice expense review, allowed AAOS a window of time to again try to correct the nomenclature for these codes, and review their work using the standard RUC survey method.

We also note, that at the time of the original CPT proposal, external fixation was considered an adjunctive procedure. CPT instructed that the codes for external fixation (20690 and 20692) be "listed in addition to the code for the treatment ...of the fracture." This concept still applies today. External fixation can be used as an adjunctive stabilization modality when treating fractures by almost any method. However, external fixation can also be used in reconstructive orthopaedics (for example, th treatment of joint contractures) and for non-musculoskeletal system treatments (for example, as a suspension device in the treatment of lower extremity burns). In 1991, there was no Modifier -51 exempt code category. Today, these same codes, 20690 and 20692 for external fixator application are modifier -51 exempt, recognizing that they can stand alone or be used adjunctively. Because of the modifier -51 exemption, the RVUs have been reduced, so payers are not paying double when either of these codes are reported with another treatment code.

In the 2005 comment letter to CMS, the AAOS recommended examining the physician work for the ORIF codes because the code descriptors lacked clarity. In particular, because the CPT descriptors include the phrase "with or without internal or external fixation," it is difficult to imagine what the Harvard survey data actually represents (ie, no typical patient was described for the survey respondents to focus on). Further, after the descriptors for these codes were changed for CPT 1993, an Abt study was performed in 1992 for RUC consideration. This study produced *percentage* relationships to key reference codes, but not surveyed time and visit data. Some of these recommendations were accepted by the RUC and CMS and others were adjusted up or down, but no changes were made to the Harvard time and visit data, if available. Therefore, we believe that there is little, if any, relationship between the Harvard database time and visit information (from the old CPT codes) and the current work RVUs.

Given this information, we believe there is compelling evidence that the current work values and/or time and visit data may be incorrect and outdated and should be reviewed.

- *Evidence that incorrect assumptions were made in the previous valuation of the service, as documented; a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data*

Harvard utilized the AMA Physician Masterfile to draw names for their surveys. While general orthopaedic surgeons can perform open reduction fracture care, it is more typical for patients to be referred to orthopaedic surgeons who specialize in orthopaedic trauma or in a given anatomical area (eg, shoulder, hand, knee, etc.). We do not believe that all specialty surgeons were surveyed for these codes, since the AMA Masterfile did not delineate orthopaedic specialties. Additionally, podiatrists were not surveyed for any of the lower extremity codes.

Given this information, we believe there is compelling evidence that not all involved specialties were involved in the review of these codes.

A consensus committee of physicians representing the American Academy of Orthopaedic Surgeons, American Shoulder and Elbow Surgeons, Society for Surgery of the Hand, Arthroscopy Association of North America, Orthopaedic Trauma Association, American Podiatric Medical Association, and American Orthopaedic Foot and Ankle Society met by conference call to discuss the survey data for the revised orthopaedic codes and data for the key reference codes and other codes on the survey reference service lists.

For revised code 25515, we recommend 10.00 work RVUs. After considering differences in time and visits, along with differences in intra-operative work, we believe this value correctly ranks code 25515 relative to other ORIF codes, relative to the key reference code, and relative to orthopaedic codes from the survey reference service list.

Total work is slightly less than an ORIF of a two part distal radius fracture, 25608.
The first postoperative visit would include a dressing change, CMS check, wound check, application of a new splint, X-rays, OT Rx, discussion of restrictions and operative findings. The second visit would be similar to the first but the sutures would be removed and there would be less discussion regarding the procedure. The third visit would include

liberation from the splint, new OT Rx, X-rays would be reviewed, new restrictions discussed. The fourth visit would include a check on the ROM and strength progress, X-rays would be reviewed, new restrictions discussed.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No
   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FIVE YEAR REVIEW SPECIFIC QUESTIONS:

Please indicate the number of survey respondent percentages responding to each of the following questions (for example 0.05 = 5%):

Has the work of performing this service changed in the past 5 years? Yes 56% No 44%

(Use the subset of the people who responded "Yes" to answer the following questions)

A. This service represents new technology that has become more familiar (i.e., less work):
   I agree 10% I do not agree 90%
B. Patients requiring this service are now:
   more complex (more work) 90% less complex (less work) 0% no change 10%
C. The usual site-of-service has changed:
   from outpatient to inpatient 0% from inpatient to outpatient 35% no change 65%

Attestation Statement

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
2005 FIVE YEAR REVIEW - SUMMARY OF RECOMMENDATION

CPT Code:25525 Tracking Number F19 Specialty Society Recommended RVU: **12.00**
Global Period: 090 RUC Recommended RVU: **12.00**

CPT Descriptor: Open treatment of radial shaft fracture, with internal fixation, when performed and closed treatment of dislocation of distal radioulnar joint (Galeazzi fracture/dislocation), with or without percutaneous skeletal fixation

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: An 18-year-old female suffers a fracture of the radial shaft and dislocation of the distal radioulnar joint requiring an open reduction and internal fixation of the radius and a closed reduction and percutaneous fixation of the distal radioulnar joint.

Percentage of Survey Respondents who found Vignette to be Typical: 86%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work:
- Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
- Verify that all required instruments and supplies are available – with special attention to plates and screws
- Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulation drapes
- Assess position of the extremities and head, adjust as needed
- The patient's arm is placed on the hand surgery table.
- Indicate areas of skin to be prepped and mark surgical incisions
- A tourniquet is applied to the proximal arm.
- The arm and hand are prepped and draped.
- The arm is elevated and exsanguinated.
- The pneumatic tourniquet is inflated.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work: An anterior incision is made over the radius. The brachioradialis fascia is identified and incised. The lateral antebrachial cutaneous nerve is protected as is the superficial branch of the radial nerve. The branches of the radial artery are identified and cauterized. While the arm is held in supination, the attachment of the supinator is released. The arm is then pronated and the insertion of the pronator tear is identified and released and the periosteum along the radius is elevated. The fracture is identified. The fracture is cleared of any fibrinous material or clot. The radial fracture and distal radioulnar joint dislocation are reduced. A plate is applied to the radius and held in position using plate holding clamps. The drill holes are then drilled and the screws placed. Kirschner wires are driven across the distal radioulnar joint holding the reduction. Care is taken to avoid the dorsal branch of the ulnar nerve. Pin caps are applied to the pins. The radial periosteum is then repaired as are the insertion of the supinator and pronator teres. The wound is then closed in layers.

Description of Post-Service Work: Post-service work: in facility
- Application of bulky dressing, reinforced with long arm splint
- Monitor patient stabilization in the recovery room.
- Consultation with the family and patient regarding the surgery and postoperative regimen.

- Communication with health care professionals including written and oral reports and orders.
- Postoperative care is coordinated with recovery room nursing staff.
- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.

The patient is discharged to the orthopaedic floor for monitoring of compartment syndrome. This requires removing and reapplying the dressings.

Discharge day:

- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Write prescriptions for medications needed post-discharge.
- Dictation of an operative report
- Procedure note is written in the patient chart
- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of splint/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order occupational therapy
- Supervision of rehabilitation
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions
- Dictate progress notes for medical record

COMPELLING EVIDENCE RATIONALE (Required to be Completed)

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

- ***Evidence that technology has changed physician work.***

Surgical treatment using open anatomical reduction and internal fixation has been made more complex with the introduction of new imaging methods such as CT which allow better detection of the fracture pathology and provided the basis for new surgical strategies. There are also new internal fixation devices which require more work. Beginning in the 1990s (after the Harvard study), new plates were developed for fracture repair, with most becoming available in the late 1990s and early 2000s. As an example of the complexity of the decision process in current practice, the 1990's have given the surgeon numerous options for bone fixation. The options for a bone fixation device currently include Kirschner wires, wire, staples, screws, as well as newer alternatives such as headless bone screws, T-screws, absorbable pins, cannulated screws, and a myriad of plates. The goal of all these devices remains constant: that is, to achieve stable approximation of bone fragments to facilitate healing. The various devices afford rigid fixation along with compression of the osseous fragments. This allows early range of motion and preservation of surrounding joint function, as well as primary bone healing. Selection of the most advantageous form of fixation is dependent on many factors and takes considerable time in the pre-evaluation of a patient. These include the type of fracture or osteotomy created, bone density, type of bone, and the desire for interfragmental compression. All of this has resulted in more work. The standards of care (fracture reduction, limb alignment, etc.) have also been elevated by literature that shows fracture displacements and poor alignments lead to poorer results. Additionally, women over 50 is a fast growing segment of our population. A huge percentage of these patients are osteoporotic - making fracture fixation and maintenance of fixation far more difficult than it used to be. The new plates are more complex to insert when the underlying bone is of much poorer quality.

Given this information, we believe there is compelling evidence that ORIF is more complex than 5 years ago and this is even more true in comparison to practice in the late 1980s (or more than 25 years ago).

- ***Evidence that incorrect assumptions were made in the previous valuation of the service; a misleading vignette and/or survey in a previous evaluation***

During the period of 1989-1991 (after the Harvard study), a major effort was undertaken by the AAOS and the OTA to rewrite every fracture and dislocation treatment code in the musculoskeletal Section of CPT. In 1991, 395 code changes were accepted by the AMA CPT Editorial Panel under the leadership of Dr. William Felts. At the time of the original proposal, some of the code descriptors were changed from those submitted (presumably by the CPT staff), and published in the 1992 and subsequent editions. Some of the changes in the descriptors published in CPT 1992 didn't make sense, but in those years, the CPT process was closed-door. Additionally, in 1992 and 1993 the AMA staff were deluged by the implementation of the RBRVS process and though AAOS and OTA requested that these problems be addressed then, AMA CPT staff asked that it be deferred as their "plate was full." After that time, more important issues and other opportunities consumed the resources of the AAOS and inertia (or the lack thereof) took over. This third five year review, after completion of the practice expense review, allowed AAOS a window of time to again try to correct the nomenclature for these codes, and review their work using the standard RUC survey method.

We also note, that at the time of the original CPT proposal, external fixation was considered an adjunctive procedure. CPT instructed that the codes for external fixation (20690 and 20692) be "listed in addition to the code for the treatment ...of the fracture." This concept still applies today. External fixation can be used as an adjunctive stabilization modality when treating fractures by almost any method. However, external fixation can also be used in reconstructive orthopaedics (for example, the treatment of joint contractures) and for non-musculoskeletal system treatments (for example, as a suspension device in the treatment of lower extremity burns). In 1991, there was no Modifier -51 exempt code category. Today, these same codes, 20690 and 20692 for external fixator application are modifier -51 exempt, recognizing that they can stand alone or be used adjunctively. Because of the modifier -51 exemption, the RVUs have been reduced, so payers are not paying double when either of these codes are reported with another treatment code.

In the 2005 comment letter to CMS, the AAOS recommended examining the physician work for the ORIF codes because the code descriptors lacked clarity. In particular, because the CPT descriptors include the phrase "with or without internal or external fixation," it is difficult to imagine what the Harvard survey data actually represents (ie, no typical patient was described for the survey respondents to focus on). Further, after the descriptors for these codes were changed for CPT 1993, an Abt study was performed in 1992 for RUC consideration. This study produced *percentage* relationships to key reference codes, but not surveyed time and visit data. Some of these recommendations were accepted by the RUC and CMS and others were adjusted up or down, but no changes were made to the Harvard time and visit data, if available. Therefore, we believe that there is little, if any, relationship between the Harvard database time and visit information (from the old CPT codes) and the current work RVUs.

Given this information, we believe there is compelling evidence that the current work values and/or time and visit data may be incorrect and outdated and should be reviewed.

- *Evidence that incorrect assumptions were made in the previous valuation of the service, as documented; a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data*

Harvard utilized the AMA Physician Masterfile to draw names for their surveys. While general orthopaedic surgeons can perform open reduction fracture care, it is more typical for patients to be referred to orthopaedic surgeons who specialize in orthopaedic trauma or in a given anatomical area (eg, shoulder, hand, knee, etc.). We do not believe that all specialty surgeons were surveyed for these codes, since the AMA Masterfile did not delineate orthopaedic specialties. Additionally, podiatrists were not surveyed for any of the lower extremity codes.

Given this information, we believe there is compelling evidence that not all involved specialties were involved in the review of these codes.

A consensus committee of physicians representing the American Academy of Orthopaedic Surgeons, American Shoulder and Elbow Surgeons, Society for Surgery of the Hand, Arthroscopy Association of North America, Orthopaedic Trauma Association, American Podiatric Medical Association, and American Orthopaedic Foot and Ankle Society met by conference call to discuss the survey data for the revised orthopaedic codes and data for the key reference codes and other codes on the survey reference service lists.

For revised code 25525, we recommend 12.00 work RVUs. After considering differences in time and visits, along with differences in intra-operative work, we believe this value correctly ranks code 25525 relative to other ORIF codes, relative to the key reference code, and relative to orthopaedic codes from the survey reference service list.

Code 25525 is less work than the 25526 since the distal radioulnar joint is treated closed with percutaneous pinning. This is less work than a both bone fracture as well. Additional pre-time is needed to consider the radius and the distal radioulnar joint rather than the single region as noted as in the key reference code. Post-operatively there is a significant danger of neurovascular injury and compartment syndrome. Close monitoring is needed. The first night is spent in the hospital monitoring the circulation, sensation and motor function of the involved extremity. The first office visit would include removal of the splint and dressing, redressing, discussion of restrictions and operative findings, splinting or

casting and instruction on range of motion. X-rays would be reviewed. The second visit would be for splint and dressing removal, suture removal, new cast applications, ROM exercises. The third visit would be for cast removal and range of motion exercises, review restrictions. X-rays would be reviewed. The fourth visit would be to check X-rays, wound healing and ROM.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No
   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FIVE YEAR REVIEW SPECIFIC QUESTIONS:

Please indicate the number of survey respondent percentages responding to each of the following questions (for example 0.05 = 5%):
Has the work of performing this service changed in the past 5 years? Yes 51% No 49%
(Use the subset of the people who responded "Yes" to answer the following questions)

A. This service represents new technology that has become more familiar (i.e., less work):
   I agree 22% I do not agree 78%
B. Patients requiring this service are now:
   more complex (more work) 88% less complex (less work) 0% no change 13%
C. The usual site-of-service has changed:
   from outpatient to inpatient 0% from inpatient to outpatient 34% no change 66%

Attestation Statement

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
2005 FIVE YEAR REVIEW - SUMMARY OF RECOMMENDATION

CPT Code:25526 Tracking Number F20 Specialty Society Recommended RVU: **15.00**
Global Period: 090 RUC Recommended RVU: **15.00**

CPT Descriptor: Open treatment of radial shaft fracture, with internal fixation, when performed and open treatment of distal radioulnar joint, with internal fixation, when performed (Galeazzi fracture/dislocation), includes repair of triangular fibrocartilage complex

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: An 18-year-old female suffers a fracture of the radial shaft and dislocation of the distal radioulnar joint requiring an open reduction and internal fixation of the radius and an open reduction of the distal radioulnar joint and open repair of the triangular fibrocartilage.

Percentage of Survey Respondents who found Vignette to be Typical: 89%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: • Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
- Verify that all required instruments and supplies are available – with special attention to plates and screws
- Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulation drapes
- Assess position of the extremities and head, adjust as needed
- The patient's arm is placed on the hand surgery table.
- Indicate areas of skin to be prepped and mark surgical incisions
- A tourniquet is applied to the proximal arm.
- The arm and hand are prepped and draped.
- The arm is elevated and exsanguinated.
- The pneumatic tourniquet is inflated.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work: An anterior incision is made over the radius. The brachioradialis fascia is identified and incised. The lateral antebrachial cutaneous nerve is protected as is the superficial branch of the radial nerve. The branches of the radial artery are identified and cauterized. While the arm is held in supination, the attachment of the supinator is released. The arm is then pronated and the insertion of the pronator tear is identified and released and the periosteum along the radius is elevated. The fracture is identified. The fracture is cleared of any fibrinous material or clot. A curvilinear incision is made over the dorsal aspect of the distal radioulnar joint. Care is taken to protect the dorsal branch of the ulnar nerve. The fifth dorsal compartment is opened and the extensor digiti quinti is retraced out of the field. The capsule of the distal radioulnar joint and ulnocarpal joint is incised and reflected. The radius and distal radioulnar joint are reduced. A plate is applied to the radius and held in position using plate holding clamps. The dri holes are then drilled and the screws placed. The peripheral triangular fibrocartilage tear is identified. Drill holes ar made in the fovea at the base of the ulnar styloid. Sutures pass through the peripheral edge of the triangular fibrocartilage and then out through the holes at the base of the fovea. The sutures are then secured to the ulnar aspect of the distal ulna. The stability of the distal radioulnar joint is assessed. The capsule is then repaired taking care to adjust for any capsular redundancy. The wounds are then closed in layers.

Description of Post-Service Work: Post-service work: in facility

- Application of bulky dressing, reinforced with long arm splint
- Monitor patient stabilization in the recovery room.

Consultation with the family and patient regarding the surgery and postoperative regimen.

- Communication with health care professionals including written and oral reports and orders.
- Postoperative care is coordinated with recovery room nursing staff.
- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- The patient is discharged to the orthopaedic floor for monitoring of compartment syndrome. This requires removing and reapplying the dressings.

Discharge day:

- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Write prescriptions for medications needed post-discharge.
- Dictation of an operative report
- Procedure note is written in the patient chart
- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of splint/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order occupational therapy
- Supervision of rehabilitation
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions
- Dictate progress notes for medical record

COMPELLING EVIDENCE RATIONALE (Required to be Completed)

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

- ***Evidence that technology has changed physician work.***

Surgical treatment using open anatomical reduction and internal fixation has been made more complex with the introduction of new imaging methods such as CT which allow better detection of the fracture pathology and provided the basis for new surgical strategies. There are also new internal fixation devices which require more work. Beginning in the 1990s (after the Harvard study), new plates were developed for fracture repair, with most becoming available in the late 1990s and early 2000s. As an example of the complexity of the decision process in current practice, the 1990's have given the surgeon numerous options for bone fixation. The options for a bone fixation device currently include Kirschner wires, wire, staples, screws, as well as newer alternatives such as headless bone screws, T-screws, absorbable pins, cannulated screws, and a myriad of plates. The goal of all these devices remains constant: that is, to achieve stable approximation of bone fragments to facilitate healing. The various devices afford rigid fixation along with compression of the osseous fragments. This allows early range of motion and preservation of surrounding joint function, as well as primary bone healing. Selection of the most advantageous form of fixation is dependent on many factors and takes considerable time in the pre-evaluation of a patient. These include the type of fracture or osteotomy created, bone density, type of bone, and the desire for interfragmental compression. All of this has resulted in more work. The standards of care (fracture reduction, limb alignment, etc.) have also been elevated by literature that shows fracture displacements and poor alignments lead to poorer results. Additionally, women over 50 is a fast growing segment of our population. A huge percentage of these patients are osteoporotic - making fracture fixation and maintenance of fixation far more difficult than it used to be. The new plates are more complex to insert when the underlying bone is of much poorer quality.

Given this information, we believe there is compelling evidence that ORIF is more complex than 5 years ago and this is even more true in comparison to practice in the late 1980s (or more than 25 years ago).

- ***Evidence that incorrect assumptions were made in the previous valuation of the service; a misleading vignette and/or survey in a previous evaluation***

During the period of 1989-1991 (after the Harvard study), a major effort was undertaken by the AAOS and the OTA to rewrite every fracture and dislocation treatment code in the musculoskeletal Section of CPT. In 1991, 395 code changes were accepted by the AMA CPT Editorial Panel under the leadership of Dr. William Felts. At the time of the original proposal, some of the code descriptors were changed from those submitted (presumably by the CPT staff), and published in the 1992 and subsequent editions. Some of the changes in the descriptors published in CPT 1992 didn't make sense, but in those years, the CPT process was closed-door. Additionally, in 1992 and 1993 the AMA staff were deluged by the implementation of the RBRVS process and though AAOS and OTA requested that these problems be addressed then, AMA CPT staff asked that it be deferred as their "plate was full." After that time, more important issues and other opportunities consumed the resources of the AAOS and inertia (or the lack thereof) took over. This third five year review, after completion of the practice expense review, allowed AAOS a window of time to again try to correct the nomenclature for these codes, and review their work using the standard RUC survey method.

We also note, that at the time of the original CPT proposal, external fixation was considered an adjunctive procedure. CPT instructed that the codes for external fixation (20690 and 20692) be "listed in addition to the code for the treatment ...of the fracture." This concept still applies today. External fixation can be used as an adjunctive stabilization modality when treating fractures by almost any method. However, external fixation can also be used in reconstructive orthopaedics (for example, the treatment of joint contractures) and for non-musculoskeletal system treatments (for example, as a suspension device in the treatment of lower extremity burns). In 1991, there was no Modifier -51 exempt code category. Today, these same codes, 20690 and 20692 for external fixator application are modifier -51 exempt, recognizing that they can stand alone or be used adjunctively. Because of the modifier -51 exemption, the RVUs have been reduced, so payers are not paying double when either of these codes are reported with another treatment code.

In the 2005 comment letter to CMS, the AAOS recommended examining the physician work for the ORIF codes because the code descriptors lacked clarity. In particular, because the CPT descriptors include the phrase "with or without internal or external fixation," it is difficult to imagine what the Harvard survey data actually represents (ie, no typical patient was described for the survey respondents to focus on). Further, after the descriptors for these codes were changed for CPT 1993, an Abt study was performed in 1992 for RUC consideration. This study produced *percentage* relationships to key reference codes, but not surveyed time and visit data. Some of these recommendations were accepted by the RUC and CMS and others were adjusted up or down, but no changes were made to the Harvard time and visit data, if available. Therefore, we believe that there is little, if any, relationship between the Harvard database time and visit information (from the old CPT codes) and the current work RVUs.

Given this information, we believe there is compelling evidence that the current work values and/or time and visit data may be incorrect and outdated and should be reviewed.

- *Evidence that incorrect assumptions were made in the previous valuation of the service, as documented; a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data*

Harvard utilized the AMA Physician Masterfile to draw names for their surveys. While general orthopaedic surgeons can perform open reduction fracture care, it is more typical for patients to be referred to orthopaedic surgeons who specialize in orthopaedic trauma or in a given anatomical area (eg, shoulder, hand, knee, etc.). We do not believe that all specialty surgeons were surveyed for these codes, since the AMA Masterfile did not delineate orthopaedic specialties. Additionally, podiatrists were not surveyed for any of the lower extremity codes.

Given this information, we believe there is compelling evidence that not all involved specialties were involved in the review of these codes.

A consensus committee of physicians representing the American Academy of Orthopaedic Surgeons, American Shoulder and Elbow Surgeons, Society for Surgery of the Hand, Arthroscopy Association of North America, Orthopaedic Trauma Association, American Podiatric Medical Association, and American Orthopaedic Foot and Ankle Society met by conference call to discuss the survey data for the revised orthopaedic codes and data for the key reference codes and other codes on the survey reference service lists.

For revised code 25526, we recommend 15.00 work RVUs. After considering differences in time and visits, along with differences in intra-operative work, we believe this value correctly ranks code 25526 relative to other ORIF codes, relative to the key reference code, and relative to orthopaedic codes from the survey reference service list.

This is the most complex of the hand procedures reviewed and consists of two separate procedures, an ORIF of th radius which places the radial nerve in danger as well as the radial artery, and a separate arthrotomy of the ulnocarpa joint and repair of the TFCC. Compared with the key reference code, the intra-times are similar. Additional pre-time is needed to consider the radius and the distal radioulnar joint, rather than a single region. Post-operatively there is a significant danger of neurovascular injury and compartment syndrome. Close monitoring is needed. The first night is spent in the hospital monitoring the circulation, sensation and motor function of the involved extremity. The first office

visit would include removal of the splint and dressing, redressing, discussion of restrictions and operative findings, splinting or casting and instruction on range of motion. X-rays would be reviewed,. The second visit would be for splint and dressing removal, suture removal, new cast applications, ROM exercises. The third visit would be for cast removal and range of motion exercises, review restrictions. X-rays would be reviewed. The fourth and fifth visits would be to check X-rays, wound healing and ROM.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No
   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FIVE YEAR REVIEW SPECIFIC QUESTIONS:

Please indicate the number of survey respondent percentages responding to each of the following questions (for example 0.05 = 5%):
Has the work of performing this service changed in the past 5 years? Yes 51% No 49%
(Use the subset of the people who responded "Yes" to answer the following questions)

A. This service represents new technology that has become more familiar (i.e., less work):
   I agree 26% I do not agree 74%
B. Patients requiring this service are now:
   more complex (more work) 91% less complex (less work) 0% no change 9%
C. The usual site-of-service has changed:
   from outpatient to inpatient 0% from inpatient to outpatient 37% no change 63%

Attestation Statement

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
2005 FIVE YEAR REVIEW - SUMMARY OF RECOMMENDATION

CPT Code:25545 Tracking Number F21 Specialty Society Recommended RVU: **9.00**
Global Period: 090 RUC Recommended RVU: **9.00**

CPT Descriptor: Open treatment of ulnar shaft fracture, includes internal fixation, when performed

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 25-year-old male falls on his outstretched upper extremity and suffers a fracture of the ulnar shaft requiring an open reduction and internal fixation of the ulna.

Percentage of Survey Respondents who found Vignette to be Typical: 79%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: • Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
- Verify that all required instruments and supplies are available – with special attention to plates and screws
- Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulatio drapes
- Assess position of the extremities and head, adjust as needed
- The patient's arm is placed on the hand surgery table.
- Indicate areas of skin to be prepped and mark surgical incisions
- A tourniquet is applied to the proximal arm.
- The arm and hand are prepped and draped.
- The arm is elevated and exsanguinated.
- The pneumatic tourniquet is inflated.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work: An incision is made along the subcutaneous border of the ulna. Careful dissection is carried down to the fascia. The fascia between the extensor carpi ulnaris and flexor carpi ulnaris is incised. The periosteum in the region of the ulnar fracture is incised and elevated. The fracture site is cleared of clot and fibrinous material. The fracture is reduced. A plate is put into position and the reduction held with plate holding clamps. The screw holes are then drilled and the screws are inserted. The fascia is then repaired and the wound closed in layers.

Description of Post-Service Work: Post-service work: in facility
- Application of bulky dressing, reinforced with long arm splint
- Monitor patient stabilization in the recovery room.
- Consultation with the family and patient regarding the surgery and postoperative regimen.
- Communication with health care professionals including written and oral reports and orders.
- Postoperative care is coordinated with recovery room nursing staff.
- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- The patient is discharged to the orthopaedic floor for monitoring of compartment syndrome. This requires removing and reapplying the dressings.

Discharge day:

- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Write prescriptions for medications needed post-discharge.

Dictation of an operative report

- Procedure note is written in the patient chart
- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of splint/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order occupational therapy
- Supervision of rehabilitation
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions
- Dictate progress notes for medical record

COMPELLING EVIDENCE RATIONALE (Required to be Completed)

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

- ***Evidence that technology has changed physician work.***

Surgical treatment using open anatomical reduction and internal fixation has been made more complex with the introduction of new imaging methods such as CT which allow better detection of the fracture pathology and provided the basis for new surgical strategies. There are also new internal fixation devices which require more work. Beginning in the 1990s (after the Harvard study), new plates were developed for fracture repair, with most becoming available in the late 1990s and early 2000s. As an example of the complexity of the decision process in current practice, the 1990's have given the surgeon numerous options for bone fixation. The options for a bone fixation device currently include Kirschner wires, wire, staples, screws, as well as newer alternatives such as headless bone screws, T-screws, absorbable pins, cannulated screws, and a myriad of plates. The goal of all these devices remains constant: that is, to achieve stable approximation of bone fragments to facilitate healing. The various devices afford rigid fixation along with compression of the osseous fragments. This allows early range of motion and preservation of surrounding joint function, as well as primary bone healing. Selection of the most advantageous form of fixation is dependent on many factors and takes considerable time in the pre-evaluation of a patient. These include the type of fracture or osteotomy created, bone density, type of bone, and the desire for interfragmental compression. All of this has resulted in more work. The standards of care (fracture reduction, limb alignment, etc.) have also been elevated by literature that shows fracture displacements and poor alignments lead to poorer results. Additionally, women over 50 is a fast growing segment of our population. A huge percentage of these patients are osteoporotic - making fracture fixation and maintenance of fixation far more difficult than it used to be. The new plates are more complex to insert when the underlying bone is of much poorer quality.

Given this information, we believe there is compelling evidence that ORIF is more complex than 5 years ago and this is even more true in comparison to practice in the late 1980s (or more than 25 years ago).

- ***Evidence that incorrect assumptions were made in the previous valuation of the service; a misleading vignette and/or survey in a previous evaluation***

During the period of 1989-1991 (after the Harvard study), a major effort was undertaken by the AAOS and the OTA to rewrite every fracture and dislocation treatment code in the musculoskeletal Section of CPT. In 1991, 395 code changes were accepted by the AMA CPT Editorial Panel under the leadership of Dr. William Felts. At the time of the original proposal, some of the code descriptors were changed from those submitted (presumably by the CPT staff), and published in the 1992 and subsequent editions. Some of the changes in the descriptors published in CPT 1992 didn't make sense, but in those years, the CPT process was closed-door. Additionally, in 1992 and 1993 the AMA staff were deluged by the implementation of the RBRVS process and though AAOS and OTA requested that these problems be addressed then, AMA CPT staff asked that it be deferred as their "plate was full." After that time, more important issues and other opportunities consumed the resources of the AAOS and inertia (or the lack thereof) took over. This third five year review, after completion of the practice expense review, allowed AAOS a window of time to again try to correct the nomenclature for these codes, and review their work using the standard RUC survey method.

We also note, that at the time of the original CPT proposal, external fixation was considered an adjunctive procedure. CPT instructed that the codes for external fixation (20690 and 20692) be "listed in addition to the code for the treatment ...of the fracture." This concept still applies today. External fixation can be used as an adjunctive stabilization modality when treating fractures by almost any method. However, external fixation can also be used in reconstructive orthopaedics (for example, the treatment of joint contractures) and for non-musculoskeletal system treatments (for example, as a suspension device in the treatment of lower extremity burns). In 1991, there was no Modifier -51 exempt code category. Today, these same codes, 20690 and 20692 for external fixator application are modifier -51 exempt, recognizing that they can stand alone or be used adjunctively. Because of the modifier -51 exemption, the RVUs have been reduced, so payers are not paying double when either of these codes are reported with another treatment code.

In the 2005 comment letter to CMS, the AAOS recommended examining the physician work for the ORIF codes because the code descriptors lacked clarity. In particular, because the CPT descriptors include the phrase "with or without internal or external fixation," it is difficult to imagine what the Harvard survey data actually represents (ie, no typical patient was described for the survey respondents to focus on). Further, after the descriptors for these codes were changed for CPT 1993, an Abt study was performed in 1992 for RUC consideration. This study produced *percentage* relationships to key reference codes, but not surveyed time and visit data. Some of these recommendations were accepted by the RUC and CMS and others were adjusted up or down, but no changes were made to the Harvard time and visit data, if available. Therefore, we believe that there is little, if any, relationship between the Harvard database time and visit information (from the old CPT codes) and the current work RVUs.

Given this information, we believe there is compelling evidence that the current work values and/or time and visit data may be incorrect and outdated and should be reviewed.

- *Evidence that incorrect assumptions were made in the previous valuation of the service, as documented; a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data*

Harvard utilized the AMA Physician Masterfile to draw names for their surveys. While general orthopaedic surgeons can perform open reduction fracture care, it is more typical for patients to be referred to orthopaedic surgeons who specialize in orthopaedic trauma or in a given anatomical area (eg, shoulder, hand, knee, etc.). We do not believe that all specialty surgeons were surveyed for these codes, since the AMA Masterfile did not delineate orthopaedic specialties. Additionally, podiatrists were not surveyed for any of the lower extremity codes.

Given this information, we believe there is compelling evidence that not all involved specialties were involved in the review of these codes.

A consensus committee of physicians representing the American Academy of Orthopaedic Surgeons, American Shoulder and Elbow Surgeons, Society for Surgery of the Hand, Arthroscopy Association of North America, Orthopaedic Trauma Association, American Podiatric Medical Association, and American Orthopaedic Foot and Ankle Society met by conference call to discuss the survey data for the revised orthopaedic codes and data for the key reference codes and other codes on the survey reference service lists.

For revised code 25545, we recommend 9.00 work RVUs. After considering differences in time and visits, along with differences in intra-operative work, we believe this value correctly ranks code 25545 relative to other ORIF codes, relative to the key reference code, and relative to orthopaedic codes from the survey reference service list.

Total work is slightly less than key reference code 25607, however, post-operatively there is a danger of neurovascul injury and compartment syndrome and close monitoring is needed. The first night is spent in the hospital monitoring the circulation, sensation and motor function of the involved extremity. The post operative care is similar to that for a radial shaft fracture. The first postoperative visit would include a dressing change, CMS check, wound check, application of a new splint, X-rays, OT Rx, discussion of restrictions and operative findings. The second visit would be similar to the first but the sutures would be removed and there would be less discussion regarding the procedure. The third visit would

include liberation from the splint, new OT Rx, X-rays would be reviewed, new restrictions discussed. The fourth visit would include a check on the ROM and strength progress, X-rays would be reviewed, new restrictions discussed.

SERVICES REPORTED WITH MULTIPLE CPT CODES

. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No
Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FIVE YEAR REVIEW SPECIFIC QUESTIONS:

Please indicate the number of survey respondent percentages responding to each of the following questions (for example 0.05 = 5%):
Has the work of performing this service changed in the past 5 years? Yes 34% No 66%
(Use the subset of the people who responded "Yes" to answer the following questions)

A. This service represents new technology that has become more familiar (i.e., less work):
I agree 8% I do not agree 92%
B. Patients requiring this service are now:
more complex (more work) 85% less complex (less work) 0% no change 23%
C. The usual site-of-service has changed:
from outpatient to inpatient 0% from inpatient to outpatient 38% no change 69%

CPT Descriptor: Open treatment of radial AND ulnar shaft fractures, with internal fixation, when performed; of radius OR ulna

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 22-year-old male suffers a both-bone-fracture of the forearm requiring an open reduction and internal fixation of the radius and a closed reduction of the ulna.

Percentage of Survey Respondents who found Vignette to be Typical: 74%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: • Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
- Verify that all required instruments and supplies are available – with special attention to plates and screws
- Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulati drapes
- Assess position of the extremities and head, adjust as needed
- The patient's arm is placed on the hand surgery table.
- Indicate areas of skin to be prepped and mark surgical incisions
- A tourniquet is applied to the proximal arm.
- The arm and hand are prepped and draped.
- The arm is elevated and exsanguinated.
- The pneumatic tourniquet is inflated.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work: An anterior incision is made over the radius. The brachioradialis fascia is identified and incised. The lateral antebrachial cutaneous nerve is protected as is the superficial branch of the radial nerve. The branches of the radial artery are identified and cauterized. While the arm is held in supination, the attachment of the supinator is released. The arm is then pronated and the insertion of the pronator tear is identified and released and the periosteum along the radius is elevated. The fracture is identified. The fracture is cleared of any fibrinous material or clot. The fracture is then reduced. A plate is applied and the plate is held in position using plate holding clamps. The drill holes are then drilled and the screws placed. The periosteum is then repaired as are the supinator and pronator teres. The wound is then closed in layers.
OR
An incision is made along the subcutaneous border of the ulna. Careful dissection is carried out down to the fascia. The fascia between the extensor carpi ulnaris and flexor carpi ulnaris is incised. The periosteum in the region of the ulna fracture is incised and elevated. The fracture site is cleared of any clot and fibrinous material. The fracture is reduced. A plate is put into position and the reduction held with plate holding clamps. The holes are then drilled for the screws and the screws are applied. The fascia is then repaired and the wound approximated in layers.

Description of Post-Service Work: Post-service work: in facility

- Application of bulky dressing, reinforced with long arm splint
- Monitor patient stabilization in the recovery room.
- Consultation with the family and patient regarding the surgery and postoperative regimen.
- Communication with health care professionals including written and oral reports and orders.
- Postoperative care is coordinated with recovery room nursing staff.
- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- The patient is discharged to the orthopaedic floor for monitoring of compartment syndrome. This requires removing and reapplying the dressings.

Discharge day:

- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Write prescriptions for medications needed post-discharge.
- Dictation of an operative report
- Procedure note is written in the patient chart
- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of splint/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order occupational therapy
- Supervision of rehabilitation
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions
- Dictate progress notes for medical record

COMPELLING EVIDENCE RATIONALE (Required to be Completed)

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

- ***Evidence that technology has changed physician work.***

Surgical treatment using open anatomical reduction and internal fixation has been made more complex with the introduction of new imaging methods such as CT which allow better detection of the fracture pathology and provided the basis for new surgical strategies. There are also new internal fixation devices which require more work. Beginning in the 1990s (after the Harvard study), new plates were developed for fracture repair, with most becoming available in the late 1990s and early 2000s. As an example of the complexity of the decision process in current practice, the 1990's have given the surgeon numerous options for bone fixation. The options for a bone fixation device currently include Kirschner wires, wire, staples, screws, as well as newer alternatives such as headless bone screws, T-screws, absorbable pins, cannulated screws, and a myriad of plates. The goal of all these devices remains constant: that is, to achieve stable approximation of bone fragments to facilitate healing. The various devices afford rigid fixation along with compression of the osseous fragments. This allows early range of motion and preservation of surrounding joint function, as well as primary bone healing. Selection of the most advantageous form of fixation is dependent on many factors and takes considerable time in the pre-evaluation of a patient. These include the type of fracture or osteotomy created, bone density, type of bone, and the desire for interfragmental compression. All of this has resulted in more work. The standards of care (fracture reduction, limb alignment, etc.) have also been elevated by literature that shows fracture displacements and poor alignments lead to poorer results. Additionally, women over 50 is a fast growing segment of our population. A huge percentage of these patients are osteoporotic - making fracture fixation and maintenance of fixation far more difficult than it used to be. The new plates are more complex to insert when the underlying bone is of much poorer quality.

Given this information, we believe there is compelling evidence that ORIF is more complex than 5 years ago and this is even more true in comparison to practice in the late 1980s (or more than 25 years ago).

- ***Evidence that incorrect assumptions were made in the previous valuation of the service; a misleading vignette and/or survey in a previous evaluation***

During the period of 1989-1991 (after the Harvard study), a major effort was undertaken by the AAOS and the OTA to rewrite every fracture and dislocation treatment code in the musculoskeletal Section of CPT. In 1991, 395 code changes were accepted by the AMA CPT Editorial Panel under the leadership of Dr. William Felts. At the time of the original proposal, some of the code descriptors were changed from those submitted (presumably by the CPT staff), and published in the 1992 and subsequent editions. Some of the changes in the descriptors published in CPT 1992 didn't make sense, but in those years, the CPT process was closed-door. Additionally, in 1992 and 1993 the AMA staff were deluged by the implementation of the RBRVS process and though AAOS and OTA requested that these problems be addressed then, AMA CPT staff asked that it be deferred as their "plate was full." After that time, more important issues and other opportunities consumed the resources of the AAOS and inertia (or the lack thereof) took over. This third five year review, after completion of the practice expense review, allowed AAOS a window of time to again try to correct the nomenclature for these codes, and review their work using the standard RUC survey method.

We also note, that at the time of the original CPT proposal, external fixation was considered an adjunctive procedure. CPT instructed that the codes for external fixation (20690 and 20692) be "listed in addition to the code for the treatment ...of the fracture." This concept still applies today. External fixation can be used as an adjunctive stabilization modality when treating fractures by almost any method. However, external fixation can also be used in reconstructive orthopaedics (for example, t' treatment of joint contractures) and for non-musculoskeletal system treatments (for example, as a suspension device in the treatment of lower extremity burns). In 1991, there was no Modifier -51 exempt code category. Today, these same codes, 20690 and 20692 for external fixator application are modifier -51 exempt, recognizing that they can stand alone or be used adjunctively. Because of the modifier -51 exemption, the RVUs have been reduced, so payers are not paying double when either of these codes are reported with another treatment code.

In the 2005 comment letter to CMS, the AAOS recommended examining the physician work for the ORIF codes because the code descriptors lacked clarity. In particular, because the CPT descriptors include the phrase "with or without internal or external fixation," it is difficult to imagine what the Harvard survey data actually represents (ie, no typical patient was described for the survey respondents to focus on). Further, after the descriptors for these codes were changed for CPT 1993, an Abt study was performed in 1992 for RUC consideration. This study produced *percentage* relationships to key reference codes, but not surveyed time and visit data. Some of these recommendations were accepted by the RUC and CMS and others were adjusted up or down, but no changes were made to the Harvard time and visit data, if available. Therefore, we believe that there is little, if any, relationship between the Harvard database time and visit information (from the old CPT codes) and the current work RVUs.

Given this information, we believe there is compelling evidence that the current work values and/or time and visit data may be incorrect and outdated and should be reviewed.

- *Evidence that incorrect assumptions were made in the previous valuation of the service, as documented; a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data*

Harvard utilized the AMA Physician Masterfile to draw names for their surveys. While general orthopaedic surgeons can perform open reduction fracture care, it is more typical for patients to be referred to orthopaedic surgeons who specialize in orthopaedic trauma or in a given anatomical area (eg, shoulder, hand, knee, etc.). We do not believe that all specialty surgeons were surveyed for these codes, since the AMA Masterfile did not delineate orthopaedic specialties. Additionally, podiatrists were not surveyed for any of the lower extremity codes.

Given this information, we believe there is compelling evidence that not all involved specialties were involved in the review of these codes.

A consensus committee of physicians representing the American Academy of Orthopaedic Surgeons, American Shoulder and Elbow Surgeons, Society for Surgery of the Hand, Arthroscopy Association of North America, Orthopaedic Trauma Association, American Podiatric Medical Association, and American Orthopaedic Foot and Ankle Society met by conference call to discuss the survey data for the revised orthopaedic codes and data for the key reference codes and other codes on the survey reference service lists.

For revised code 25574, we recommend 10.00 work RVUs. After considering differences in time and visits, along with differences in intra-operative work, we believe this value correctly ranks code 25574 relative to other ORIF codes, relative to the key reference code, and relative to orthopaedic codes from the survey reference service list.

Total work is slightly less than an ORIF of a two part distal radius fracture, 25608, however, post-operatively there is a danger of neurovascular injury and compartment syndrome and close monitoring is needed. The first night is spent in the hospital monitoring the circulation, sensation and motor function of the involved extremity. The first postoperative office visit would include a dressing change, CMS check, wound check, application of a new splint, X-rays, OT Rx, discussion of restrictions and operative findings. The second visit would be similar to the first but the sutures would be removed and

there would be less discussion regarding the procedure. The third visit would include liberation from the splint, new OT Rx, X-rays would be reviewed, new restrictions discussed. The fourth visit would include a check on the ROM and strength progress, X-rays would be reviewed, new restrictions discussed.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No
   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FIVE YEAR REVIEW SPECIFIC QUESTIONS:

Please indicate the number of survey respondent percentages responding to each of the following questions (for example 0.05 = 5%):
Has the work of performing this service changed in the past 5 years? Yes 73% No 27%
(Use the subset of the people who responded "Yes" to answer the following questions)

A. This service represents new technology that has become more familiar (i.e., less work):
   I agree 10% I do not agree 90%
B. Patients requiring this service are now:
   more complex (more work) 93% less complex (less work) 3% no change 3%
C. The usual site-of-service has changed:
   from outpatient to inpatient 3% from inpatient to outpatient 40% no change 53%

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

- ***Evidence that technology has changed physician work.***

Surgical treatment using open anatomical reduction and internal fixation has been made more complex with the introduction of new imaging methods such as CT which allow better detection of the fracture pathology and provided the basis for new surgical strategies. There are also new internal fixation devices which require more work. Beginning in the 1990s (after the Harvard study), new plates were developed for fracture repair, with most becoming available in the late 1990s and early 2000s. As an example of the complexity of the decision process in current practice, the 1990's have given the surgeon numerous options for bone fixation. The options for a bone fixation device currently include Kirschner wires, wire, staples, screws, as well as newer alternatives such as headless bone screws, T-screws, absorbable pins, cannulated screws, and a myriad of plates. The goal of all these devices remains constant: that is, to achieve stable approximation of bone fragments to facilitate healing. The various devices afford rigid fixation along with compression of the osseous fragments. This allows early range of motion and preservation of surrounding joint function, as well as primary bone healing. Selection of the most advantageous form of fixation is dependent on many factors and takes considerable time in the pre-evaluation of a patient. These include the type of fracture or osteotomy created, bone density, type of bone, and the desire for interfragmental compression. All of this has resulted in more work. The standards of care (fracture reduction, limb alignment, etc.) have also been elevated by literature that shows fracture displacements and poor alignments lead to poorer results. Additionally, women over 50 is a fast growing segment of our population. A huge percentage of these patients are osteoporotic - making fracture fixation and maintenance of fixation far more difficult than it used to be. The new plates are more complex to insert when the underlying bone is of much poorer quality.

Given this information, we believe there is compelling evidence that ORIF is more complex than 5 years ago and this is even more true in comparison to practice in the late 1980s (or more than 25 years ago).

- ***Evidence that incorrect assumptions were made in the previous valuation of the service; a misleading vignette and/or survey in a previous evaluation***

During the period of 1989-1991 (after the Harvard study), a major effort was undertaken by the AAOS and the OTA to rewrite every fracture and dislocation treatment code in the musculoskeletal Section of CPT. In 1991, 395 code changes were accepted by the AMA CPT Editorial Panel under the leadership of Dr. William Felts. At the time of the original proposal, some of the code descriptors were changed from those submitted (presumably by the CPT staff), and published in the 1992 and subsequent editions. Some of the changes in the descriptors published in CPT 1992 didn't make sense, but in those years, the CPT process was closed-door. Additionally, in 1992 and 1993 the AMA staff were deluged by the implementation of the RBRVS process and though AAOS and OTA requested that these problems be addressed then, AMA CPT staff asked that it be deferred as their "plate was full." After that time, more important issues and other opportunities consumed the resources of the AAOS and inertia (or the lack thereof) took over. This third five year review, after completion of the practice expense review, allowed AAOS a window of time to again try to correct the nomenclature for these codes, and review their work using the standard RUC survey method.

We also note, that at the time of the original CPT proposal, external fixation was considered an adjunctive procedure. CPT instructed that the codes for external fixation (20690 and 20692) be "listed in addition to the code for the treatment ...of the fracture." This concept still applies today. External fixation can be used as an adjunctive stabilization modality when treating fractures by almost any method. However, external fixation can also be used in reconstructive orthopaedics (for example, th treatment of joint contractures) and for non-musculoskeletal system treatments (for example, as a suspension device in the treatment of lower extremity burns). In 1991, there was no Modifier -51 exempt code category. Today, these same codes, 20690 and 20692 for external fixator application are modifier -51 exempt, recognizing that they can stand alone or be used adjunctively. Because of the modifier -51 exemption, the RVUs have been reduced, so payers are not paying double when either of these codes are reported with another treatment code.

In the 2005 comment letter to CMS, the AAOS recommended examining the physician work for the ORIF codes because the code descriptors lacked clarity. In particular, because the CPT descriptors include the phrase "with or without internal or external fixation," it is difficult to imagine what the Harvard survey data actually represents (ie, no typical patient was described for the survey respondents to focus on). Further, after the descriptors for these codes were changed for CPT 1993, an Abt study was performed in 1992 for RUC consideration. This study produced *percentage* relationships to key reference codes, but not surveyed time and visit data. Some of these recommendations were accepted by the RUC and CMS and others were adjusted up or down, but no changes were made to the Harvard time and visit data, if available. Therefore, we believe that there is little, if any, relationship between the Harvard database time and visit information (from the old CPT codes) and the current work RVUs.

Given this information, we believe there is compelling evidence that the current work values and/or time and visit data may be incorrect and outdated and should be reviewed.

- *Evidence that incorrect assumptions were made in the previous valuation of the service, as documented; a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data*

  Harvard utilized the AMA Physician Masterfile to draw names for their surveys. While general orthopaedic surgeons can perform open reduction fracture care, it is more typical for patients to be referred to orthopaedic surgeons who specialize in orthopaedic trauma or in a given anatomical area (eg, shoulder, hand, knee, etc.). We do not believe that all specialty surgeons were surveyed for these codes, since the AMA Masterfile did not delineate orthopaedic specialties. Additionally, podiatrists were not surveyed for any of the lower extremity codes.

  Given this information, we believe there is compelling evidence that not all involved specialties were involved in the review of these codes.

A consensus committee of physicians representing the American Academy of Orthopaedic Surgeons, American Shoulder and Elbow Surgeons, Society for Surgery of the Hand, Arthroscopy Association of North America, Orthopaedic Trauma Association, American Podiatric Medical Association, and American Orthopaedic Foot and Ankle Society met by conference call to discuss the survey data for the revised orthopaedic codes and data for the key reference codes and other codes on the survey reference service lists.

For revised code 25575, we recommend 14.00 work RVUs. After considering differences in time and visits, along with differences in intra-operative work, we believe this value correctly ranks code 25575 relative to other ORIF codes, relative to the key reference code, and relative to orthopaedic codes from the survey reference service list.

This is the second most complex hand procedure of the hand code family group. It includes two ORIFs through two separate incisions. There is a significant danger of neurovascular injury and compartment syndrome. Compared with the key reference code, total work is similar - the intra-time is less, but the total time is greater with one day in the hospital. Post-operatively there is a significant danger of neurovascular injury and compartment syndrome. Close monitoring is needed. The first night is spent in the hospital monitoring the circulation, sensation and motor function of

the involved extremity. The first office visit would include removal of the splint and dressing, redressing, discussion of restrictions and operative findings, splinting or casting and instruction on range of motion. X-rays would be reviewed. The next visit would be for splint and dressing removal, suture removal, new cast applications, ROM exercises. The third visit would be for cast removal and range of motion exercises, review restrictions. X-rays would be reviewed. The fourth and fifth visits would be to check X-rays, wound healing and ROM.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No
   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FIVE YEAR REVIEW SPECIFIC QUESTIONS:

Please indicate the number of survey respondent percentages responding to each of the following questions (for example 0.05 = 5%):
Has the work of performing this service changed in the past 5 years? Yes 53% No 47%
(Use the subset of the people who responded "Yes" to answer the following questions)

A. This service represents new technology that has become more familiar (i.e., less work):
   I agree 13% I do not agree 87%
B. Patients requiring this service are now:
   more complex (more work) 100% less complex (less work) 4% no change 0%
C. The usual site-of-service has changed:
   from outpatient to inpatient 4% from inpatient to outpatient 30% no change 65%

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
2005 FIVE YEAR REVIEW - SUMMARY OF RECOMMENDATION

CPT Code:25628 Tracking Number F24 Specialty Society Recommended RVU: **11.00**
Global Period: 090 RUC Recommended RVU: **11.00**

CPT Descriptor: Open treatment of radial AND ulnar shaft fractures, with internal fixation, when performed; of radius AND ulna

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 30-year-old male suffers an acute scaphoid fracture requiring an open reduction and internal fixation of the scaphoid..

Percentage of Survey Respondents who found Vignette to be Typical: 0%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: • Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
- Verify that all required instruments and supplies are available – with special attention to plates and screws
- Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulatic drapes
- Assess position of the extremities and head, adjust as needed
- The patient's arm is placed on the hand surgery table.
- Indicate areas of skin to be prepped and mark surgical incisions
- A tourniquet is applied to the proximal arm.
- The arm and hand are prepped and draped.
- The arm is elevated and exsanguinated.
- The pneumatic tourniquet is inflated.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work: A curvilinear incision is made over the palmar aspect of the scaphoid passing just radial to the flexor carpi radialis. The palmar branch of the radial artery is identified and ligated. The sheath of the flexor carpi radialis is opened. The dissection is carried down to the radiocarpal capsule which is incised. The scaphoid fracture is identified. It is reduced and held in position using a guide wire. A supplemental stabilization Kirschner wire is placed parallel to this wire. The screw hold is drilled. A screw of the appropriate length is then placed. The two Kirschner wires are removed. The stability is assessed. The capsule is repaired. The subcutaneous suture and skin are closed in layers

Description of Post-Service Work: Post-service work: in facility
- Application of bulky dressing, reinforced with long arm splint
- Monitor patient stabilization in the recovery room.
- Consultation with the family and patient regarding the surgery and postoperative regimen.
- Communication with health care professionals including written and oral reports and orders.
- Postoperative care is coordinated with recovery room nursing staff.
- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.

- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Write prescriptions for medications needed post-discharge.
- Dictation of an operative report
- Procedure note is written in the patient chart

All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of splint/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order occupational therapy
- Supervision of rehabilitation
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions
- Dictate progress notes for medical record

External fixation can be used as an adjunctive stabilization modality when treating fractures by almost any method. However, external fixation can also be used in reconstructive orthopaedics (for example, the treatment of joint contractures) and for non-musculoskeletal system treatments (for example, as a suspension device in the treatment of lower extremity burns). In 1991, there was no Modifier -51 exempt code category. Today, these same codes, 20690 and 20692 for external fixator application are modifier -51 exempt, recognizing that they can stand alone or be used adjunctively. Because of the modifier -51 exemption, the RVUs have been reduced, so payers are not paying double when either of these codes are reported with another treatment code.

In the 2005 comment letter to CMS, the AAOS recommended examining the physician work for the ORIF codes because the code descriptors lacked clarity. In particular, because the CPT descriptors include the phrase "with or without internal or external fixation," it is difficult to imagine what the Harvard survey data actually represents (ie, no typical patient was described for the survey respondents to focus on). Further, after the descriptors for these codes were changed for CPT 1993, an Abt study was performed in 1992 for RUC consideration. This study produced *percentage* relationships to key reference codes, but not surveyed time and visit data. Some of these recommendations were accepted by the RUC and CMS and others were adjusted up or down, but no changes were made to the Harvard time and visit data, if available. Therefore, we believe that there is little, if any, relationship between the Harvard database time and visit information (from the old CPT codes) and the current work RVUs.

Given this information, we believe there is compelling evidence that the current work values and/or time and visit data may be incorrect and outdated and should be reviewed.

- *Evidence that incorrect assumptions were made in the previous valuation of the service, as documented; a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data*

Harvard utilized the AMA Physician Masterfile to draw names for their surveys. While general orthopaedic surgeons can perform open reduction fracture care, it is more typical for patients to be referred to orthopaedic surgeons who specialize in orthopaedic trauma or in a given anatomical area (eg, shoulder, hand, knee, etc.). We do not believe that all specialty surgeons were surveyed for these codes, since the AMA Masterfile did not delineate orthopaedic specialties. Additionally, podiatrists were not surveyed for any of the lower extremity codes.

Given this information, we believe there is compelling evidence that not all involved specialties were involved in the review of these codes.

A consensus committee of physicians representing the American Academy of Orthopaedic Surgeons, American Shoulder and Elbow Surgeons, Society for Surgery of the Hand, Arthroscopy Association of North America, Orthopaedic Trauma Association, American Podiatric Medical Association, and American Orthopaedic Foot and Ankle Society met by conference call to discuss the survey data for the revised orthopaedic codes and data for the key reference codes and other codes on the survey reference service lists.

For revised code 25628, we recommend 11.00 work RVUs. After considering differences in time and visits, along with differences in intra-operative work, we believe this value correctly ranks code 25628 relative to other ORIF codes, relative to the key reference code, and relative to orthopaedic codes from the survey reference service list.

Total work is similar to the key reference code. The first postoperative visit would include a dressing change, wound check, CMS check, application of a long arm cast, X-rays, OT Rx for finger and shoulder ROM, discussion of restrictions and operative findings. The second visit would include CMS check, wound check, suture removal, and application of a new long arm cast. The third visit would include cast removal and application of a new short arm cast, OT Rx for elbow

ROM, discussion of restrictions. The fourth visit would include removal of the short arm case, OT Rx for ROM and strengthening, discussion of restrictions.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No
   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FIVE YEAR REVIEW SPECIFIC QUESTIONS:

Please indicate the number of survey respondent percentages responding to each of the following questions (for example 0.05 = 5%):
Has the work of performing this service changed in the past 5 years? Yes 60% No 40%
(Use the subset of the people who responded "Yes" to answer the following questions)

A. This service represents new technology that has become more familiar (i.e., less work):
   I agree 17% I do not agree 83%
B. Patients requiring this service are now:
   more complex (more work) 96% less complex (less work) 0% no change 8%
C. The usual site-of-service has changed:
   from outpatient to inpatient 0% from inpatient to outpatient 33% no change 71%

Attestation Statement

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
2005 FIVE YEAR REVIEW - SUMMARY OF RECOMMENDATION

CPT Code:26615 Tracking Number F25 Specialty Society Recommended RVU: **8.00**
Global Period: 090 RUC Recommended RVU: **8.00**

CPT Descriptor: Open treatment of metacarpal fracture, single, includes internal fixation, when performed, each bone

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 21-year-old male suffers a fracture of his fifth metacarpal requiring an open reduction and internal fixation of a fracture the fifth metacarpal.

Percentage of Survey Respondents who found Vignette to be Typical: 0%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work:
- Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
- Verify that all required instruments and supplies are available – with special attention to plates and screws
- Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulation drapes
- Assess position of the extremities and head, adjust as needed
- The patient's arm is placed on the hand surgery table.
- Indicate areas of skin to be prepped and mark surgical incisions
- A tourniquet is applied to the proximal arm.
- The arm and hand are prepped and draped.
- The arm is elevated and exsanguinated.
- The pneumatic tourniquet is inflated.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work: An incision is made over the dorsal aspect of the metacarpal. The periosteum of the dorsal aspect of the metacarpal is incised and reflected. The fracture is identified and cleared of any fibrous material and clot. A plate is applied taking care to maintain the proper alignment of the metacarpal. The plate is held in position using plate holding clamps. The screw holes are then drilled and the screws placed. The periosteum is repaired and the skin is repaired in layers.

Description of Post-Service Work: Post-service work: in facility
- Application of bulky dressing, reinforced with long arm splint
- Monitor patient stabilization in the recovery room.
- Consultation with the family and patient regarding the surgery and postoperative regimen.
- Communication with health care professionals including written and oral reports and orders.
- Postoperative care is coordinated with recovery room nursing staff.
- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Write prescriptions for medications needed post-discharge.

- Dictation of an operative report
- Procedure note is written in the patient chart
- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of splint/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order occupational therapy
- Supervision of rehabilitation
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions
- Dictate progress notes for medical record

COMPELLING EVIDENCE RATIONALE (Required to be Completed)

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

- ***Evidence that technology has changed physician work.***

Surgical treatment using open anatomical reduction and internal fixation has been made more complex with the introduction of new imaging methods such as CT which allow better detection of the fracture pathology and provided the basis for new surgical strategies. There are also new internal fixation devices which require more work. Beginning in the 1990s (after the Harvard study), new plates were developed for fracture repair, with most becoming available in the late 1990s and early 2000s. As an example of the complexity of the decision process in current practice, the 1990's have given the surgeon numerous options for bone fixation. The options for a bone fixation device currently include Kirschner wires, wire, staples, screws, as well as newer alternatives such as headless bone screws, T-screws, absorbable pins, cannulated screws, and a myriad of plates. The goal of all these devices remains constant: that is, to achieve stable approximation of bone fragments to facilitate healing. The various devices afford rigid fixation along with compression of the osseous fragments. This allows early range of motion and preservation of surrounding joint function, as well as primary bone healing. Selection of the most advantageous form of fixation is dependent on many factors and takes considerable time in the pre-evaluation of a patient. These include the type of fracture or osteotomy created, bone density, type of bone, and the desire for interfragmental compression. All of this has resulted in more work. The standards of care (fracture reduction, limb alignment, etc.) have also been elevated by literature that shows fracture displacements and poor alignments lead to poorer results. Additionally, women over 50 is a fast growing segment of our population. A huge percentage of these patients are osteoporotic - making fracture fixation and maintenance of fixation far more difficult than it used to be. The new plates are more complex to insert when the underlying bone is of much poorer quality.

Given this information, we believe there is compelling evidence that ORIF is more complex than 5 years ago and this is even more true in comparison to practice in the late 1980s (or more than 25 years ago).

- ***Evidence that incorrect assumptions were made in the previous valuation of the service; a misleading vignette and/or survey in a previous evaluation***

During the period of 1989-1991 (after the Harvard study), a major effort was undertaken by the AAOS and the OTA to rewrite every fracture and dislocation treatment code in the musculoskeletal Section of CPT. In 1991, 395 code changes were accepted by the AMA CPT Editorial Panel under the leadership of Dr. William Felts. At the time of the original proposal, some of the code descriptors were changed from those submitted (presumably by the CPT staff), and published in the 1992 and subsequent editions. Some of the changes in the descriptors published in CPT 1992 didn't make sense, but in those years, the CPT process was closed-door. Additionally, in 1992 and 1993 the AMA staff were deluged by the implementation of the RBRVS process and though AAOS and OTA requested that these problems be addressed then, AMA CPT staff asked that it be deferred as their "plate was full." After that time, more important issues and other opportunities consumed the resources of the AAOS and inertia (or the lack thereof) took over. This third five year review, after completion of the practice expense review, allowed AAOS a window of time to again try to correct the nomenclature for these codes, and review their work using the standard RUC survey method.

We also note, that at the time of the original CPT proposal, external fixation was considered an adjunctive procedure. CPT instructed that the codes for external fixation (20690 and 20692) be "listed in addition to the code for the treatment ...of the fracture." This concept still applies today. External fixation can be used as an adjunctive stabilization modality when treating fractures by almost any method. However, external fixation can also be used in reconstructive orthopaedics (for example, the treatment of joint contractures) and for non-musculoskeletal system treatments (for example, as a suspension device in the treatment of lower extremity burns). In 1991, there was no Modifier -51 exempt code category. Today, these same codes, 20690 and 20692 for external fixator application are modifier -51 exempt, recognizing that they can stand alone or be used adjunctively. Because of the modifier -51 exemption, the RVUs have been reduced, so payers are not paying double when either of these codes are reported with another treatment code.

In the 2005 comment letter to CMS, the AAOS recommended examining the physician work for the ORIF codes because the code descriptors lacked clarity. In particular, because the CPT descriptors include the phrase "with or without internal or external fixation," it is difficult to imagine what the Harvard survey data actually represents (ie, no typical patient was described for the survey respondents to focus on). Further, after the descriptors for these codes were changed for CPT 1993, an Abt study was performed in 1992 for RUC consideration. This study produced *percentage* relationships to key reference codes, but not surveyed time and visit data. Some of these recommendations were accepted by the RUC and CMS and others were adjusted up or down, but no changes were made to the Harvard time and visit data, if available. Therefore, we believe that there is little, if any, relationship between the Harvard database time and visit information (from the old CPT codes) and the current work RVUs.

Given this information, we believe there is compelling evidence that the current work values and/or time and visit data may be incorrect and outdated and should be reviewed.

- *Evidence that incorrect assumptions were made in the previous valuation of the service, as documented; a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data*

  Harvard utilized the AMA Physician Masterfile to draw names for their surveys. While general orthopaedic surgeons can perform open reduction fracture care, it is more typical for patients to be referred to orthopaedic surgeons who specialize in orthopaedic trauma or in a given anatomical area (eg, shoulder, hand, knee, etc.). We do not believe that all specialty surgeons were surveyed for these codes, since the AMA Masterfile did not delineate orthopaedic specialties. Additionally, podiatrists were not surveyed for any of the lower extremity codes.

  Given this information, we believe there is compelling evidence that not all involved specialties were involved in the review of these codes.

A consensus committee of physicians representing the American Academy of Orthopaedic Surgeons, American Shoulder and Elbow Surgeons, Society for Surgery of the Hand, Arthroscopy Association of North America, Orthopaedic Trauma Association, American Podiatric Medical Association, and American Orthopaedic Foot and Ankle Society met by conference call to discuss the survey data for the revised orthopaedic codes and data for the key reference codes and other codes on the survey reference service lists.

For revised code 26615, we recommend 8.00 work RVUs. After considering differences in time and visits, along with differences in intra-operative work, we believe this value correctly ranks code 26615 relative to other ORIF codes, relative to the key reference code, and relative to orthopaedic codes from the survey reference service list.

Total work for 26615 is less than key reference code 25607. Intuitively it would seem less difficult to fix a metacarpal than a phalanx and the 25th percentile work RVU would keep this rank order. The first postoperative visit would include a dressing change, wound check, CMS check, application of a splint, X-rays, OT Rx for finger and wrist ROM, discussion of restrictions and operative findings. The second visit would include removal of the splint, wound check, CMS check, suture removal, reapplication of a new splint and X-rays. The third visit would include X-rays, OT Rx for range of motion

exercises, and discussion of limitations. The fourth visit would include X-rays, assessment of ROM, OT Rx for ROM and strengthening and discussion of limitations.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No
   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FIVE YEAR REVIEW SPECIFIC QUESTIONS:

Please indicate the number of survey respondent percentages responding to each of the following questions (for example 0.05 = 5%):

Has the work of performing this service changed in the past 5 years? Yes 66% No 33%

(Use the subset of the people who responded "Yes" to answer the following questions)

A. This service represents new technology that has become more familiar (i.e., less work):
   I agree 10% I do not agree 90%

B. Patients requiring this service are now:
   more complex (more work) 100% less complex (less work) no change

C. The usual site-of-service has changed:
   from outpatient to inpatient 0% from inpatient to outpatient 14% no change 86%

- Verify that all required instruments and supplies are available – with special attention to plates and screws
- Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulati drapes
- Assess position of the extremities and head, adjust as needed
- The patient's arm is placed on the hand surgery table.
- Indicate areas of skin to be prepped and mark surgical incisions
- A tourniquet is applied to the proximal arm.
- The arm and hand are prepped and draped.
- The arm is elevated and exsanguinated.
- The pneumatic tourniquet is inflated.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work: The fracture dislocation of the base of the first metacarpal is reduced under fluoroscopic control. Kirschner wires are then passed through the fracture fragments holding the reduction. Pin caps are applied to the Kirschner wires.

Description of Post-Service Work: Post-service work: in facility
- Application of bulky dressing, reinforced with long arm splint
- Monitor patient stabilization in the recovery room.
- Consultation with the family and patient regarding the surgery and postoperative regimen.
- Communication with health care professionals including written and oral reports and orders.
- Postoperative care is coordinated with recovery room nursing staff.
- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Write prescriptions for medications needed post-discharge.
- Dictation of an operative report
- Procedure note is written in the patient chart

- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

Examine and talk with patient

- Answer patient/family questions
- Removal of splint/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order occupational therapy
- Supervision of rehabilitation
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions
- Dictate progress notes for medical record

COMPELLING EVIDENCE RATIONALE (Required to be Completed)

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

- ***Evidence that technology has changed physician work.***

Surgical treatment using open anatomical reduction and internal fixation has been made more complex with the introduction of new imaging methods such as CT which allow better detection of the fracture pathology and provided the basis for new surgical strategies. There are also new internal fixation devices which require more work. Beginning in the 1990s (after the Harvard study), new plates were developed for fracture repair, with most becoming available in the late 1990s and early 2000s. As an example of the complexity of the decision process in current practice, the 1990's have given the surgeon numerous options for bone fixation. The options for a bone fixation device currently include Kirschner wires, wire, staples screws, as well as newer alternatives such as headless bone screws, T-screws, absorbable pins, cannulated screws, and a myriad of plates. The goal of all these devices remains constant: that is, to achieve stable approximation of bone fragments to facilitate healing. The various devices afford rigid fixation along with compression of the osseous fragments. This allows early range of motion and preservation of surrounding joint function, as well as primary bone healing. Selection of the most advantageous form of fixation is dependent on many factors and takes considerable time in the pre-evaluation of a patient. These include the type of fracture or osteotomy created, bone density, type of bone, and the desire for interfragmental compression. All of this has resulted in more work. The standards of care (fracture reduction, limb alignment, etc.) have also been elevated by literature that shows fracture displacements and poor alignments lead to poorer results. Additionally, women over 50 is a fast growing segment of our population. A huge percentage of these patients are osteoporotic - making fracture fixation and maintenance of fixation far more difficult than it used to be. The new plates are more complex to insert when the underlying bone is of much poorer quality.

Given this information, we believe there is compelling evidence that ORIF is more complex than 5 years ago and this is even more true in comparison to practice in the late 1980s (or more than 25 years ago).

- ***Evidence that incorrect assumptions were made in the previous valuation of the service; a misleading vignette and/or survey in a previous evaluation***

During the period of 1989-1991 (after the Harvard study), a major effort was undertaken by the AAOS and the OTA to rewrite every fracture and dislocation treatment code in the musculoskeletal Section of CPT. In 1991, 395 code changes were accepted by the AMA CPT Editorial Panel under the leadership of Dr. William Felts. At the time of the original proposal, some of the code descriptors were changed from those submitted (presumably by the CPT staff), and published in the 1992 and subsequent editions. Some of the changes in the descriptors published in CPT 1992 didn't make sense, but in those years, the CPT process was closed-door. Additionally, in 1992 and 1993 the AMA staff were deluged by the implementation of th RBRVS process and though AAOS and OTA requested that these problems be addressed then, AMA CPT staff asked that be deferred as their "plate was full." After that time, more important issues and other opportunities consumed the resources of the AAOS and inertia (or the lack thereof) took over. This third five year review, after completion of the practice expense review, allowed AAOS a window of time to again try to correct the nomenclature for these codes, and review their work using the standard RUC survey method.

We also note, that at the time of the original CPT proposal, external fixation was considered an adjunctive procedure. CPT instructed that the codes for external fixation (20690 and 20692) be "listed in addition to the code for the treatment ...of the fracture." This concept still applies today. External fixation can be used as an adjunctive stabilization modality when treating fractures by almost any method. However, external fixation can also be used in reconstructive orthopaedics (for example, the treatment of joint contractures) and for non-musculoskeletal system treatments (for example, as a suspension device in the treatment of lower extremity burns). In 1991, there was no Modifier -51 exempt code category. Today, these same codes, 20690 and 20692 for external fixator application are modifier -51 exempt, recognizing that they can stand alone or be used adjunctively. Because of the modifier -51 exemption, the RVUs have been reduced, so payers are not paying double when either of these codes are reported with another treatment code.

In the 2005 comment letter to CMS, the AAOS recommended examining the physician work for the ORIF codes because the code descriptors lacked clarity. In particular, because the CPT descriptors include the phrase "with or without internal or external fixation," it is difficult to imagine what the Harvard survey data actually represents (ie, no typical patient was described for the survey respondents to focus on). Further, after the descriptors for these codes were changed for CPT 1993, an Abt study was performed in 1992 for RUC consideration. This study produced *percentage* relationships to key reference codes, but not surveyed time and visit data. Some of these recommendations were accepted by the RUC and CMS and others were adjusted up or down, but no changes were made to the Harvard time and visit data, if available. Therefore, we believe that there is little, if any, relationship between the Harvard database time and visit information (from the old CPT codes) and the current work RVUs.

Given this information, we believe there is compelling evidence that the current work values and/or time and visit data may be incorrect and outdated and should be reviewed.

- *Evidence that incorrect assumptions were made in the previous valuation of the service, as documented; a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data*

Harvard utilized the AMA Physician Masterfile to draw names for their surveys. While general orthopaedic surgeons can perform open reduction fracture care, it is more typical for patients to be referred to orthopaedic surgeons who specialize in orthopaedic trauma or in a given anatomical area (eg, shoulder, hand, knee, etc.). We do not believe that all specialty surgeons were surveyed for these codes, since the AMA Masterfile did not delineate orthopaedic specialties. Additionally, podiatrists were not surveyed for any of the lower extremity codes.

Given this information, we believe there is compelling evidence that not all involved specialties were involved in the review of these codes.

A consensus committee of physicians representing the American Academy of Orthopaedic Surgeons, American Shoulder and Elbow Surgeons, Society for Surgery of the Hand, Arthroscopy Association of North America, Orthopaedic Trauma Association, American Podiatric Medical Association, and American Orthopaedic Foot and Ankle Society met by conference call to discuss the survey data for the revised orthopaedic codes and data for the key reference codes and other codes on the survey reference service lists.

For revised code 26650, we recommend 6.00 work RVUs. After considering differences in time and visits, along with differences in intra-operative work, we believe this value correctly ranks code 26650 relative to other ORIF codes, relative to the key reference code, and relative to orthopaedic codes from the survey reference service list.

)tal work for 26650 is slightly greater than key reference code 25651. The first postoperative visit would include a ɹessing change, wound check, CMS check, application of a splint, X-rays, OT Rx for finger and wrist ROM, discussion of restrictions and operative findings. The second visit would include removal of the splint, wound check, CMS check, suture removal, reapplication of a new splint and X-rays. The third visit would include X-rays, removal of pin(s), OT Rx for range of motion exercises, and discussion of limitations. The fourth visit would include X-rays, assessment of ROM, OT Rx for ROM and strengthening and discussion of limitations.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No
   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FIVE YEAR REVIEW SPECIFIC QUESTIONS:

Please indicate the number of survey respondent percentages responding to each of the following questions (for example 0.05 = 5%):
Has the work of performing this service changed in the past 5 years? Yes 57% No 43%
(Use the subset of the people who responded "Yes" to answer the following questions)

A. This service represents new technology that has become more familiar (i.e., less work):
   I agree 0% I do not agree 100%
B. Patients requiring this service are now:
   more complex (more work) 100% less complex (less work) no change
C. The usual site-of-service has changed:
   from outpatient to inpatient 0% from inpatient to outpatient 14% no change 81%

Attestation Statement

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
2005 FIVE YEAR REVIEW - SUMMARY OF RECOMMENDATION

CPT Code:26665 Tracking Number F27 Specialty Society Recommended RVU: **9.00**
Global Period: 090 RUC Recommended RVU: **9.00**

CPT Descriptor: Open treatment of carpometacarpal fracture dislocation, thumb (Bennett fracture), includes internal fixation, when performed

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 30-year-old female who suffered a carpometacarpal fracture dislocation of the thumb requires an open reduction and internal fixation of a first CMC dislocation.

Percentage of Survey Respondents who found Vignette to be Typical: 92%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: • Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
- Verify that all required instruments and supplies are available – with special attention to plates and screws

Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulation drapes
- Assess position of the extremities and head, adjust as needed
- The patient's arm is placed on the hand surgery table.
- Indicate areas of skin to be prepped and mark surgical incisions
- A tourniquet is applied to the proximal arm.
- The arm and hand are prepped and draped.
- The arm is elevated and exsanguinated.
- The pneumatic tourniquet is inflated.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work: An incision is made over the radial volar aspect of first CMC joint. The branches of the superficial branch of the radial nerve are carefully protected. The extensor tendons are carefully retracted. The fracture is identified and cleared of any fibrinous material or clot. The fracture is reduced and provisionally held with small Kirschner wires. The fracture is then definitively fixed using small screws using a lag technique. The thenar musculature and fascia are then repaired. The subcutaneous and skin are closed in layers.

Description of Post-Service Work: Post-service work: in facility
- Application of bulky dressing, reinforced with long arm splint
- Monitor patient stabilization in the recovery room.
- Consultation with the family and patient regarding the surgery and postoperative regimen.
- Communication with health care professionals including written and oral reports and orders.

Postoperative care is coordinated with recovery room nursing staff.
- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Write prescriptions for medications needed post-discharge.

- Dictation of an operative report
- Procedure note is written in the patient chart
- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office
- Examine and talk with patient
- Answer patient/family questions
- Removal of splint/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order occupational therapy
- Supervision of rehabilitation
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions
- Dictate progress notes for medical record

Intra-Service intensity/complexity	2.85	2.80
Post-Service intensity/complexity	3.31	3.20

COMPELLING EVIDENCE RATIONALE (Required to be Completed)

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

- ***Evidence that technology has changed physician work.***

Surgical treatment using open anatomical reduction and internal fixation has been made more complex with the introduction of new imaging methods such as CT which allow better detection of the fracture pathology and provided the basis for new surgical strategies. There are also new internal fixation devices which require more work. Beginning in the 1990s (after the Harvard study), new plates were developed for fracture repair, with most becoming available in the late 1990s and early 2000s. As an example of the complexity of the decision process in current practice, the 1990's have given the surgeon numerous options for bone fixation. The options for a bone fixation device currently include Kirschner wires, wire, staples, screws, as well as newer alternatives such as headless bone screws, T-screws, absorbable pins, cannulated screws, and a myriad of plates. The goal of all these devices remains constant: that is, to achieve stable approximation of bone fragments to facilitate healing. The various devices afford rigid fixation along with compression of the osseous fragments. This allows early range of motion and preservation of surrounding joint function, as well as primary bone healing. Selection of the most advantageous form of fixation is dependent on many factors and takes considerable time in the pre-evaluation of a patient. These include the type of fracture or osteotomy created, bone density, type of bone, and the desire for interfragmental compression. All of this has resulted in more work. The standards of care (fracture reduction, limb alignment, etc.) have also been elevated by literature that shows fracture displacements and poor alignments lead to poorer results. Additionally, women over 50 is a fast growing segment of our population. A huge percentage of these patients are osteoporotic - making fracture fixation and maintenance of fixation far more difficult than it used to be. The new plates are more complex to insert when the underlying bone is of much poorer quality.

Given this information, we believe there is compelling evidence that ORIF is more complex than 5 years ago and this is even more true in comparison to practice in the late 1980s (or more than 25 years ago).

- ***Evidence that incorrect assumptions were made in the previous valuation of the service; a misleading vignette and/or survey in a previous evaluation***

During the period of 1989-1991 (after the Harvard study), a major effort was undertaken by the AAOS and the OTA to rewrite every fracture and dislocation treatment code in the musculoskeletal Section of CPT. In 1991, 395 code changes were accepted by the AMA CPT Editorial Panel under the leadership of Dr. William Felts. At the time of the original proposal, some of the code descriptors were changed from those submitted (presumably by the CPT staff), and published in the 1992 and subsequent editions. Some of the changes in the descriptors published in CPT 1992 didn't make sense, but in those years, the CPT process was closed-door. Additionally, in 1992 and 1993 the AMA staff were deluged by the implementation of the RBRVS process and though AAOS and OTA requested that these problems be addressed then, AMA CPT staff asked that it be deferred as their "plate was full." After that time, more important issues and other opportunities consumed the resources of the AAOS and inertia (or the lack thereof) took over. This third five year review, after completion of the practice expense review, allowed AAOS a window of time to again try to correct the nomenclature for these codes, and review their work using the standard RUC survey method.

We also note, that at the time of the original CPT proposal, external fixation was considered an adjunctive procedure. CPT instructed that the codes for external fixation (20690 and 20692) be "listed in addition to the code for the treatment ...of the fracture." This concept still applies today. External fixation can be used as an adjunctive stabilization modality when treating fractures by almost any method. However, external fixation can also be used in reconstructive orthopaedics (for example, th treatment of joint contractures) and for non-musculoskeletal system treatments (for example, as a suspension device in the treatment of lower extremity burns). In 1991, there was no Modifier -51 exempt code category. Today, these same codes, 20690 and 20692 for external fixator application are modifier -51 exempt, recognizing that they can stand alone or be used adjunctively. Because of the modifier -51 exemption, the RVUs have been reduced, so payers are not paying double when either of these codes are reported with another treatment code.

In the 2005 comment letter to CMS, the AAOS recommended examining the physician work for the ORIF codes because the code descriptors lacked clarity. In particular, because the CPT descriptors include the phrase "with or without internal or external fixation," it is difficult to imagine what the Harvard survey data actually represents (ie, no typical patient was described for the survey respondents to focus on). Further, after the descriptors for these codes were changed for CPT 1993, an Abt study was performed in 1992 for RUC consideration. This study produced *percentage* relationships to key reference codes, but not surveyed time and visit data. Some of these recommendations were accepted by the RUC and CMS and others were adjusted up or down, but no changes were made to the Harvard time and visit data, if available. Therefore, we believe that there is little, if any, relationship between the Harvard database time and visit information (from the old CPT codes) and the current work RVUs.

Given this information, we believe there is compelling evidence that the current work values and/or time and visit data may be incorrect and outdated and should be reviewed.

- *Evidence that incorrect assumptions were made in the previous valuation of the service, as documented; a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data*

  Harvard utilized the AMA Physician Masterfile to draw names for their surveys. While general orthopaedic surgeons can perform open reduction fracture care, it is more typical for patients to be referred to orthopaedic surgeons who specialize in orthopaedic trauma or in a given anatomical area (eg, shoulder, hand, knee, etc.). We do not believe that all specialty surgeons were surveyed for these codes, since the AMA Masterfile did not delineate orthopaedic specialties. Additionally, podiatrists were not surveyed for any of the lower extremity codes.

  Given this information, we believe there is compelling evidence that not all involved specialties were involved in the review of these codes.

A consensus committee of physicians representing the American Academy of Orthopaedic Surgeons, American Shoulder and Elbow Surgeons, Society for Surgery of the Hand, Arthroscopy Association of North America, Orthopaedic Trauma Association, American Podiatric Medical Association, and American Orthopaedic Foot and Ankle Society met by conference call to discuss the survey data for the revised orthopaedic codes and data for the key reference codes and other codes on the survey reference service lists.

For revised code 26665, we recommend 9.00 work RVUs. After considering differences in time and visits, along with differences in intra-operative work, we believe this value correctly ranks code 26665 relative to other ORIF codes, relative to the key reference code, and relative to orthopaedic codes from the survey reference service list.

The total work for 26665 is greater than the work for 25652 given the increased intensity of dealing with an intraarticular fracture. The first postoperative visit would include a dressing change, wound check, CMS check, application of a thumb spica splint or cast, X-rays, OT Rx for finger and wrist ROM, discussion of restrictions and operative findings. The second visit would include removal of the splint, wound check, CMS check, suture removal, reapplication of a new splint

and X-rays. The third visit would include X-rays, range of motion exercises, and discussion of limitations. The fourth visit would include X-rays, assessment of ROM, OT Rx for ROM and strengthening and discussion of limitations.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No
   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FIVE YEAR REVIEW SPECIFIC QUESTIONS:

Please indicate the number of survey respondent percentages responding to each of the following questions (for example 0.05 = 5%):

Has the work of performing this service changed in the past 5 years? Yes No

(Use the subset of the people who responded "Yes" to answer the following questions)

A. This service represents new technology that has become more familiar (i.e., less work):
   I agree I do not agree

B. Patients requiring this service are now:
   more complex (more work) less complex (less work) no change

C. The usual site-of-service has changed:
   from outpatient to inpatient from inpatient to outpatient no change

Attestation Statement

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
2005 FIVE YEAR REVIEW - SUMMARY OF RECOMMENDATION

CPT Code:26685 Tracking Number F28 Specialty Society Recommended RVU: **8.00**
Global Period: 090 RUC Recommended RVU: **8.00**

CPT Descriptor: Open treatment of carpometacarpal dislocation, other than thumb; includes internal fixation, when performed, each joint

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 20-year-old male suffers a fifth carpometacarpal joint dislocation requiring an open reduction and internal fixation.

Percentage of Survey Respondents who found Vignette to be Typical: 92%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: • Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
- Verify that all required instruments and supplies are available – with special attention to plates and screws
- Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulati drapes
- Assess position of the extremities and head, adjust as needed
- The patient's arm is placed on the hand surgery table.
- Indicate areas of skin to be prepped and mark surgical incisions
- A tourniquet is applied to the proximal arm.
- The arm and hand are prepped and draped.
- The arm is elevated and exsanguinated.
- The pneumatic tourniquet is inflated.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work: An incision is made over the dorsal aspect of the fifth carpometacarpal joint. Dissection is carried down to the joint taking care to protect any branches of the dorsal branch of the ulnar nerve. The extensor tendons are gently retracted out of the field and the fifth carpometacarpal joint capsule opened. Any intervening soft tissue is removed and the joint is reduced. The joint is held in a reduced position and held with a Kirschner wire. The capsule is then repaired. The wound is then closed in layers.

Description of Post-Service Work: Post-service work: in facility
- Application of bulky dressing, reinforced with long arm splint
- Monitor patient stabilization in the recovery room.
- Consultation with the family and patient regarding the surgery and postoperative regimen.
- Communication with health care professionals including written and oral reports and orders.
- Postoperative care is coordinated with recovery room nursing staff.
- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Write prescriptions for medications needed post-discharge.

- Dictation of an operative report
- Procedure note is written in the patient chart
- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of splint/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order occupational therapy
- Supervision of rehabilitation
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions
- Dictate progress notes for medical record

COMPELLING EVIDENCE RATIONALE (Required to be Completed)

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

- ***Evidence that technology has changed physician work.***

Surgical treatment using open anatomical reduction and internal fixation has been made more complex with the introduction of new imaging methods such as CT which allow better detection of the fracture pathology and provided the basis for new surgical strategies. There are also new internal fixation devices which require more work. Beginning in the 1990s (after the Harvard study), new plates were developed for fracture repair, with most becoming available in the late 1990s and early 2000s. As an example of the complexity of the decision process in current practice, the 1990's have given the surgeon numerous options for bone fixation. The options for a bone fixation device currently include Kirschner wires, wire, staples, screws, as well as newer alternatives such as headless bone screws, T-screws, absorbable pins, cannulated screws, and a myriad of plates. The goal of all these devices remains constant: that is, to achieve stable approximation of bone fragments to facilitate healing. The various devices afford rigid fixation along with compression of the osseous fragments. This allows early range of motion and preservation of surrounding joint function, as well as primary bone healing. Selection of the most advantageous form of fixation is dependent on many factors and takes considerable time in the pre-evaluation of a patient. These include the type of fracture or osteotomy created, bone density, type of bone, and the desire for interfragmental compression. All of this has resulted in more work. The standards of care (fracture reduction, limb alignment, etc.) have also been elevated by literature that shows fracture displacements and poor alignments lead to poorer results. Additionally, women over 50 is a fast growing segment of our population. A huge percentage of these patients are osteoporotic - making fracture fixation and maintenance of fixation far more difficult than it used to be. The new plates are more complex to insert when the underlying bone is of much poorer quality.

Given this information, we believe there is compelling evidence that ORIF is more complex than 5 years ago and this is even more true in comparison to practice in the late 1980s (or more than 25 years ago).

- ***Evidence that incorrect assumptions were made in the previous valuation of the service; a misleading vignette and/or survey in a previous evaluation***

During the period of 1989-1991 (after the Harvard study), a major effort was undertaken by the AAOS and the OTA to rewrite every fracture and dislocation treatment code in the musculoskeletal Section of CPT. In 1991, 395 code changes were accepted by the AMA CPT Editorial Panel under the leadership of Dr. William Felts. At the time of the original proposal, some of the code descriptors were changed from those submitted (presumably by the CPT staff), and published in the 1992 and subsequent editions. Some of the changes in the descriptors published in CPT 1992 didn't make sense, but in those years the CPT process was closed-door. Additionally, in 1992 and 1993 the AMA staff were deluged by the implementation of the RBRVS process and though AAOS and OTA requested that these problems be addressed then, AMA CPT staff asked that it be deferred as their "plate was full." After that time, more important issues and other opportunities consumed the resources of the AAOS and inertia (or the lack thereof) took over. This third five year review, after completion of the practice expense review, allowed AAOS a window of time to again try to correct the nomenclature for these codes, and review their work using the standard RUC survey method.

We also note, that at the time of the original CPT proposal, external fixation was considered an adjunctive procedure. CPT instructed that the codes for external fixation (20690 and 20692) be "listed in addition to the code for the treatment ...of the fracture." This concept still applies today. External fixation can be used as an adjunctive stabilization modality when treating fractures by almost any method. However, external fixation can also be used in reconstructive orthopaedics (for example, the treatment of joint contractures) and for non-musculoskeletal system treatments (for example, as a suspension device in the treatment of lower extremity burns). In 1991, there was no Modifier -51 exempt code category. Today, these same codes, 20690 and 20692 for external fixator application are modifier -51 exempt, recognizing that they can stand alone or be used adjunctively. Because of the modifier -51 exemption, the RVUs have been reduced, so payers are not paying double when either of these codes are reported with another treatment code.

In the 2005 comment letter to CMS, the AAOS recommended examining the physician work for the ORIF codes because the code descriptors lacked clarity. In particular, because the CPT descriptors include the phrase "with or without internal or external fixation," it is difficult to imagine what the Harvard survey data actually represents (ie, no typical patient was described for the survey respondents to focus on). Further, after the descriptors for these codes were changed for CPT 1993, an Abt study was performed in 1992 for RUC consideration. This study produced *percentage* relationships to key reference codes, but not surveyed time and visit data. Some of these recommendations were accepted by the RUC and CMS and others were adjusted up or down, but no changes were made to the Harvard time and visit data, if available. Therefore, we believe that there is little, if any, relationship between the Harvard database time and visit information (from the old CPT codes) and the current work RVUs.

Given this information, we believe there is compelling evidence that the current work values and/or time and visit data may be incorrect and outdated and should be reviewed.

- *Evidence that incorrect assumptions were made in the previous valuation of the service, as documented; a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data*

Harvard utilized the AMA Physician Masterfile to draw names for their surveys. While general orthopaedic surgeons can perform open reduction fracture care, it is more typical for patients to be referred to orthopaedic surgeons who specialize in orthopaedic trauma or in a given anatomical area (eg, shoulder, hand, knee, etc.). We do not believe that all specialty surgeons were surveyed for these codes, since the AMA Masterfile did not delineate orthopaedic specialties. Additionally, podiatrists were not surveyed for any of the lower extremity codes.

Given this information, we believe there is compelling evidence that not all involved specialties were involved in the review of these codes.

A consensus committee of physicians representing the American Academy of Orthopaedic Surgeons, American Shoulder and Elbow Surgeons, Society for Surgery of the Hand, Arthroscopy Association of North America, Orthopaedic Trauma Association, American Podiatric Medical Association, and American Orthopaedic Foot and Ankle Society met by conference call to discuss the survey data for the revised orthopaedic codes and data for the key reference codes and other codes on the survey reference service lists.

For revised code 26685, we recommend 8.00 work RVUs. After considering differences in time and visits, along with differences in intra-operative work, we believe this value correctly ranks code 26685 relative to other ORIF codes, relative to the key reference code, and relative to orthopaedic codes from the survey reference service list.

The total work for 26685 is very similar to key reference code 25652. The first postoperative visit would include a dressing change, wound check, CMS check, application of a splint, X-rays, OT Rx for finger and wrist ROM, discussion of restrictions and operative findings are discussed. The second visit would include removal of the splint, wound check, CMS check, suture removal, reapplication of a new splint and X-rays. The third visit would include X-rays, removal of

pin(s), OT Rx for range of motion exercises, and discussion of limitations. The fourth visit would include X-rays, assessment of ROM, OT Rx for ROM and strengthening and discussion of limitations.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No
   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FIVE YEAR REVIEW SPECIFIC QUESTIONS:

Please indicate the number of survey respondent percentages responding to each of the following questions (for example 0.05 = 5%):
Has the work of performing this service changed in the past 5 years? Yes 51% No 49%
(Use the subset of the people who responded "Yes" to answer the following questions)

A. This service represents new technology that has become more familiar (i.e., less work):
   I agree 11% I do not agree 89%
B. Patients requiring this service are now:
   more complex (more work) 100% less complex (less work) no change
C. The usual site-of-service has changed:
   from outpatient to inpatient from inpatient to outpatient no change 100%

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
2005 FIVE YEAR REVIEW - SUMMARY OF RECOMMENDATION

CPT Code:26715 Tracking Number F29 Specialty Society Recommended RVU: **7.95**
Global Period: 090 RUC Recommended RVU: **7.95**

CPT Descriptor: Open treatment of metacarpophalangeal dislocation, single, includes internal fixation, when performed

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 20-year-old female suffers a second metacarpophalangeal joint dislocation requiring an open reduction and internal fixation

Percentage of Survey Respondents who found Vignette to be Typical: 84%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: • Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
- Verify that all required instruments and supplies are available – with special attention to plates and screws

Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulation drapes
- Assess position of the extremities and head, adjust as needed
- The patient's arm is placed on the hand surgery table.
- Indicate areas of skin to be prepped and mark surgical incisions
- A tourniquet is applied to the proximal arm.
- The arm and hand are prepped and draped.
- The arm is elevated and exsanguinated.
- The pneumatic tourniquet is inflated.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work: An oblique palmar incision is made over the metacarpal head. Careful dissection is carried out taking care to avoid the neurovascular structures. The A-1 pulley is released. The flexor tendon and lumbrical are gentle retracted and the volar plate is gently teased out of the joint. The joint is then reduced. The stability of the joint is verified. The skin is then approximated.

Description of Post-Service Work: Post-service work: in facility
- Application of bulky dressing, reinforced with long arm splint
- Monitor patient stabilization in the recovery room.
- Consultation with the family and patient regarding the surgery and postoperative regimen.
- Communication with health care professionals including written and oral reports and orders.

Postoperative care is coordinated with recovery room nursing staff.
The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Write prescriptions for medications needed post-discharge.
- Dictation of an operative report

- Procedure note is written in the patient chart
- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of splint/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order occupational therapy
- Supervision of rehabilitation
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions
- Dictate progress notes for medical record

COMPELLING EVIDENCE RATIONALE (Required to be Completed)

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

- ***Evidence that technology has changed physician work.***

Surgical treatment using open anatomical reduction and internal fixation has been made more complex with the introduction of new imaging methods such as CT which allow better detection of the fracture pathology and provided the basis for new surgical strategies. There are also new internal fixation devices which require more work. Beginning in the 1990s (after the Harvard study), new plates were developed for fracture repair, with most becoming available in the late 1990s and early 2000s. As an example of the complexity of the decision process in current practice, the 1990's have given the surgeon numerous options for bone fixation. The options for a bone fixation device currently include Kirschner wires, wire, staples, screws, as well as newer alternatives such as headless bone screws, T-screws, absorbable pins, cannulated screws, and a myriad of plates. The goal of all these devices remains constant: that is, to achieve stable approximation of bone fragments to facilitate healing. The various devices afford rigid fixation along with compression of the osseous fragments. This allows early range of motion and preservation of surrounding joint function, as well as primary bone healing. Selection of the most advantageous form of fixation is dependent on many factors and takes considerable time in the pre-evaluation of a patient. These include the type of fracture or osteotomy created, bone density, type of bone, and the desire for interfragmental compression. All of this has resulted in more work. The standards of care (fracture reduction, limb alignment, etc.) have also been elevated by literature that shows fracture displacements and poor alignments lead to poorer results. Additionally, women over 50 is a fast growing segment of our population. A huge percentage of these patients are osteoporotic - making fracture fixation and maintenance of fixation far more difficult than it used to be. The new plates are more complex to insert when the underlying bone is of much poorer quality.

Given this information, we believe there is compelling evidence that ORIF is more complex than 5 years ago and this is even more true in comparison to practice in the late 1980s (or more than 25 years ago).

- ***Evidence that incorrect assumptions were made in the previous valuation of the service; a misleading vignette and/or survey in a previous evaluation***

During the period of 1989-1991 (after the Harvard study), a major effort was undertaken by the AAOS and the OTA to rewrite every fracture and dislocation treatment code in the musculoskeletal Section of CPT. In 1991, 395 code changes were accepted by the AMA CPT Editorial Panel under the leadership of Dr. William Felts. At the time of the original proposal, some of the code descriptors were changed from those submitted (presumably by the CPT staff), and published in the 1992 and subsequent editions. Some of the changes in the descriptors published in CPT 1992 didn't make sense, but in those years, the CPT process was closed-door. Additionally, in 1992 and 1993 the AMA staff were deluged by the implementation of the RBRVS process and though AAOS and OTA requested that these problems be addressed then, AMA CPT staff asked that it be deferred as their "plate was full." After that time, more important issues and other opportunities consumed the resources of the AAOS and inertia (or the lack thereof) took over. This third five year review, after completion of the practice expense review, allowed AAOS a window of time to again try to correct the nomenclature for these codes, and review their work using the standard RUC survey method.

We also note, that at the time of the original CPT proposal, external fixation was considered an adjunctive procedure. CPT instructed that the codes for external fixation (20690 and 20692) be "listed in addition to the code for the treatment ...of the fracture." This concept still applies today. External fixation can be used as an adjunctive stabilization modality when treating fractures by almost any method. However, external fixation can also be used in reconstructive orthopaedics (for example, treatment of joint contractures) and for non-musculoskeletal system treatments (for example, as a suspension device in the treatment of lower extremity burns). In 1991, there was no Modifier -51 exempt code category. Today, these same codes, 20690 and 20692 for external fixator application are modifier -51 exempt, recognizing that they can stand alone or be used adjunctively. Because of the modifier -51 exemption, the RVUs have been reduced, so payers are not paying double when either of these codes are reported with another treatment code.

In the 2005 comment letter to CMS, the AAOS recommended examining the physician work for the ORIF codes because the code descriptors lacked clarity. In particular, because the CPT descriptors include the phrase "with or without internal or external fixation," it is difficult to imagine what the Harvard survey data actually represents (ie, no typical patient was described for the survey respondents to focus on). Further, after the descriptors for these codes were changed for CPT 1993, an Abt study was performed in 1992 for RUC consideration. This study produced *percentage* relationships to key reference codes, but not surveyed time and visit data. Some of these recommendations were accepted by the RUC and CMS and others were adjusted up or down, but no changes were made to the Harvard time and visit data, if available. Therefore, we believe that there is little, if any, relationship between the Harvard database time and visit information (from the old CPT codes) and the current work RVUs.

Given this information, we believe there is compelling evidence that the current work values and/or time and visit data may be incorrect and outdated and should be reviewed.

- *Evidence that incorrect assumptions were made in the previous valuation of the service, as documented; a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data*

Harvard utilized the AMA Physician Masterfile to draw names for their surveys. While general orthopaedic surgeons can perform open reduction fracture care, it is more typical for patients to be referred to orthopaedic surgeons who specialize in orthopaedic trauma or in a given anatomical area (eg, shoulder, hand, knee, etc.). We do not believe that all specialty surgeons were surveyed for these codes, since the AMA Masterfile did not delineate orthopaedic specialties. Additionally, podiatrists were not surveyed for any of the lower extremity codes.

Given this information, we believe there is compelling evidence that not all involved specialties were involved in the review of these codes.

A consensus committee of physicians representing the American Academy of Orthopaedic Surgeons, American Shoulder and Elbow Surgeons, Society for Surgery of the Hand, Arthroscopy Association of North America, Orthopaedic Trauma Association, American Podiatric Medical Association, and American Orthopaedic Foot and Ankle Society met by conference call to discuss the survey data for the revised orthopaedic codes and data for the key reference codes and other codes on the survey reference service lists.

For revised code 26715, we recommend 7.95 work RVUs. After considering differences in time and visits, along with differences in intra-operative work, we believe this value correctly ranks code 26715 relative to other ORIF codes, relative to the key reference code, and relative to orthopaedic codes from the survey reference service list.

Code 26715 is more complex than 26785 Open treatment of interphalangeal joint dislocation, includes internal fixatio.., when performed, single and similar to 28645 Open treatment of metatarsophalangeal joint dislocation, includes internal fixation, when performed. The survey median correctly ranks this service relative to these similar procedures. The first postoperative visit would include a dressing change, wound check, CMS check, application of a splint, X-rays, OT Rx for finger and wrist ROM, discussion of restrictions and operative findings are discussed. The second visit would include

removal of the splint, wound check, CMS check, suture removal, reapplication of a new splint and X-rays. The third visit would include X-rays, removal of pin(s), OT Rx for range of motion exercises, and discussion of limitations. The fourth visit would include X-rays, assessment of ROM, OT Rx for ROM and strengthening and discussion of limitations.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No
   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FIVE YEAR REVIEW SPECIFIC QUESTIONS:

Please indicate the number of survey respondent percentages responding to each of the following questions (for example 0.05 = 5%):

Has the work of performing this service changed in the past 5 years? Yes 59% No 41%

(Use the subset of the people who responded "Yes" to answer the following questions)

A. This service represents new technology that has become more familiar (i.e., less work):
   I agree 5% I do not agree 95%
B. Patients requiring this service are now:
   more complex (more work) 95% less complex (less work) 0% no change 5%
C. The usual site-of-service has changed:
   from outpatient to inpatient 0% from inpatient to outpatient 11% no change 89%

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
2005 FIVE YEAR REVIEW - SUMMARY OF RECOMMENDATION

CPT Code:26735 Tracking Number F30 Specialty Society Recommended RVU: **8.40**
Global Period: 090 RUC Recommended RVU: **8.40**

CPT Descriptor: Open treatment of phalangeal shaft fracture, proximal or middle phalanx, finger or thumb, includes internal fixation, when performed, each

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 45-year-old male who suffered a fracture of the middle phalanx of the long finger requires open reduction and internal fixation of the middle phalanx.

Percentage of Survey Respondents who found Vignette to be Typical: 91%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: • Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
- Verify that all required instruments and supplies are available – with special attention to plates and screws
- Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulati drapes
- Assess position of the extremities and head, adjust as needed
- The patient's arm is placed on the hand surgery table.
- Indicate areas of skin to be prepped and mark surgical incisions
- A tourniquet is applied to the proximal arm.
- The arm and hand are prepped and draped.
- The arm is elevated and exsanguinated.
- The pneumatic tourniquet is inflated.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work: An incision is made over the middle phalanx of the long finger. The extensor mechanism is incised and gently retracted. The periosteum is elevated. The fracture is identified and cleared of any fibrinous material and clot. The fracture is then reduced. A plate is put into position holding the fracture in the reduced position. It is held using plate holding clamps. The screw holes are drilled and the screws applied taking care to choose the appropriate length of screws so as to not impinge on the underlying flexor tendons. The periosteum is carefully repaired as is the extensor mechanism. The skin is closed

Description of Post-Service Work: Post-service work: in facility
- Application of bulky dressing, reinforced with long arm splint
- Monitor patient stabilization in the recovery room.
- Consultation with the family and patient regarding the surgery and postoperative regimen.
- Communication with health care professionals including written and oral reports and orders.
- Postoperative care is coordinated with recovery room nursing staff.

COMPELLING EVIDENCE RATIONALE (Required to be Completed)

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

- ***Evidence that technology has changed physician work.***

Surgical treatment using open anatomical reduction and internal fixation has been made more complex with the introduction of new imaging methods such as CT which allow better detection of the fracture pathology and provided the basis for new surgical strategies. There are also new internal fixation devices which require more work. Beginning in the 1990s (after the Harvard study), new plates were developed for fracture repair, with most becoming available in the late 1990s and early 2000s. As an example of the complexity of the decision process in current practice, the 1990's have given the surgeon numerous options for bone fixation. The options for a bone fixation device currently include Kirschner wires, wire, staples, screws, as well as newer alternatives such as headless bone screws, T-screws, absorbable pins, cannulated screws, and a myriad of plates. The goal of all these devices remains constant: that is, to achieve stable approximation of bone fragments to facilitate healing. The various devices afford rigid fixation along with compression of the osseous fragments. This allows early range of motion and preservation of surrounding joint function, as well as primary bone healing. Selection of the most advantageous form of fixation is dependent on many factors and takes considerable time in the pre-evaluation of a patient. These include the type of fracture or osteotomy created, bone density, type of bone, and the desire for interfragmental compression. All of this has resulted in more work. The standards of care (fracture reduction, limb alignment, etc.) have also been elevated by literature that shows fracture displacements and poor alignments lead to poorer results. Additionally, women over 50 is a fast growing segment of our population. A huge percentage of these patients are osteoporotic - making fracture fixation and maintenance of fixation far more difficult than it used to be. The new plates are more complex to insert when the underlying bone is of much poorer quality.

Given this information, we believe there is compelling evidence that ORIF is more complex than 5 years ago and this is even more true in comparison to practice in the late 1980s (or more than 25 years ago).

- ***Evidence that incorrect assumptions were made in the previous valuation of the service; a misleading vignette and/or survey in a previous evaluation***

During the period of 1989-1991 (after the Harvard study), a major effort was undertaken by the AAOS and the OTA to rewrite every fracture and dislocation treatment code in the musculoskeletal Section of CPT. In 1991, 395 code changes were accepted by the AMA CPT Editorial Panel under the leadership of Dr. William Felts. At the time of the original proposal, some of the code descriptors were changed from those submitted (presumably by the CPT staff), and published in the 1992 and subsequent editions. Some of the changes in the descriptors published in CPT 1992 didn't make sense, but in those years the CPT process was closed-door. Additionally, in 1992 and 1993 the AMA staff were deluged by the implementation of the RBRVS process and though AAOS and OTA requested that these problems be addressed then, AMA CPT staff asked that it be deferred as their "plate was full." After that time, more important issues and other opportunities consumed the resources of the AAOS and inertia (or the lack thereof) took over. This third five year review, after completion of the practice expense review, allowed AAOS a window of time to again try to correct the nomenclature for these codes, and review their work using the standard RUC survey method.

We also note, that at the time of the original CPT proposal, external fixation was considered an adjunctive procedure. CPT instructed that the codes for external fixation (20690 and 20692) be "listed in addition to the code for the treatment ...of the fracture." This concept still applies today. External fixation can be used as an adjunctive stabilization modality when treating fractures by almost any method. However, external fixation can also be used in reconstructive orthopaedics (for example, the treatment of joint contractures) and for non-musculoskeletal system treatments (for example, as a suspension device in the treatment of lower extremity burns). In 1991, there was no Modifier -51 exempt code category. Today, these same codes, 20690 and 20692 for external fixator application are modifier -51 exempt, recognizing that they can stand alone or be used adjunctively. Because of the modifier -51 exemption, the RVUs have been reduced, so payers are not paying double when either of these codes are reported with another treatment code.

In the 2005 comment letter to CMS, the AAOS recommended examining the physician work for the ORIF codes because the code descriptors lacked clarity. In particular, because the CPT descriptors include the phrase "with or without internal or external fixation," it is difficult to imagine what the Harvard survey data actually represents (ie, no typical patient was described for the survey respondents to focus on). Further, after the descriptors for these codes were changed for CPT 1993, an Abt study was performed in 1992 for RUC consideration. This study produced *percentage* relationships to key reference codes, but not surveyed time and visit data. Some of these recommendations were accepted by the RUC and CMS and others were adjusted up or down, but no changes were made to the Harvard time and visit data, if available. Therefore, we believe that there is little, if any, relationship between the Harvard database time and visit information (from the old CPT codes) and the current work RVUs.

Given this information, we believe there is compelling evidence that the current work values and/or time and visit data may be incorrect and outdated and should be reviewed.

- *Evidence that incorrect assumptions were made in the previous valuation of the service, as documented; a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data*

Harvard utilized the AMA Physician Masterfile to draw names for their surveys. While general orthopaedic surgeons can perform open reduction fracture care, it is more typical for patients to be referred to orthopaedic surgeons who specialize in orthopaedic trauma or in a given anatomical area (eg, shoulder, hand, knee, etc.). We do not believe that all specialty surgeons were surveyed for these codes, since the AMA Masterfile did not delineate orthopaedic specialties. Additionally, podiatrists were not surveyed for any of the lower extremity codes.

Given this information, we believe there is compelling evidence that not all involved specialties were involved in the review of these codes.

A consensus committee of physicians representing the American Academy of Orthopaedic Surgeons, American Shoulder and Elbow Surgeons, Society for Surgery of the Hand, Arthroscopy Association of North America, Orthopaedic Trauma Association, American Podiatric Medical Association, and American Orthopaedic Foot and Ankle Society met by conference call to discuss the survey data for the revised orthopaedic codes and data for the key reference codes and other codes on the survey reference service lists.

For revised code 26735, we recommend 8.40 work RVUs. After considering differences in time and visits, along with differences in intra-operative work, we believe this value correctly ranks code 26735 relative to other ORIF codes, relative to the key reference code, and relative to orthopaedic codes from the survey reference service list.

Total work for 26735 is less than key reference code 25608 (RVW=10.86) and another reference code 25607 (RVW=9.35). The survey 25th percentile is less than both of these codes and relates correctly to RSL code 28750 Arthrodesis, great toe; metatarsophalangeal joint (RVW=8.37) and 14040 Adjacent tissue transfer or rearrangement, forehead, cheeks, chin, mouth, neck, axillae, genitalia, hands and/or feet; defect 10 sq cm or less (RVW=8.44). The first postoperative visit would include a dressing change, wound check, CMS check, application of a splint, X-rays, OT Rx for

finger and wrist ROM, discussion of restrictions and operative findings . The second visit would include removal of the splint, wound check, CMS check, suture removal, reapplication of a new splint and X-rays. The third visit would include X-rays, OT Rx for range of motion exercises, and discussion of limitations. The fourth visit would include X-rays, assessment of ROM, OT Rx for ROM and strengthening and discussion of limitations.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No
   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FIVE YEAR REVIEW SPECIFIC QUESTIONS:

Please indicate the number of survey respondent percentages responding to each of the following questions (for exam 0.05 = 5%):
Has the work of performing this service changed in the past 5 years? Yes 52% No 48%
(Use the subset of the people who responded "Yes" to answer the following questions)

A. This service represents new technology that has become more familiar (i.e., less work):
   I agree 17% I do not agree 83%
B. Patients requiring this service are now:
   more complex (more work) 100% less complex (less work) no change
C. The usual site-of-service has changed:
   from outpatient to inpatient 0% from inpatient to outpatient 17% no change 78%

Attestation Statement

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
2005 FIVE YEAR REVIEW - SUMMARY OF RECOMMENDATION

CPT Code:26746 Tracking Number F31 Specialty Society Recommended RVU: **11.10**
Global Period: 090 RUC Recommended RVU: **11.10**

CPT Descriptor: Open treatment of articular fracture, involving metacarpophalangeal or interphalangeal joint, includes internal fixation, when performed, each

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 26-year-old male suffers an intraarticular fracture of the base of the middle phalanx requiring an open reduction and internal fixation of the intraarticular fracture of the base of the middle phalanx.

Percentage of Survey Respondents who found Vignette to be Typical: 81%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: • Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
- Verify that all required instruments and supplies are available – with special attention to plates and screws
- Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulation drapes
- Assess position of the extremities and head, adjust as needed
- The patient's arm is placed on the hand surgery table.
- Indicate areas of skin to be prepped and mark surgical incisions
- A tourniquet is applied to the proximal arm.
- The arm and hand are prepped and draped.
- The arm is elevated and exsanguinated.
- The pneumatic tourniquet is inflated.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work: A curvilinear incision is made over the dorsal aspect of the proximal interphalangeal joint. The incision is carried down to the extensor mechanism. The interval between the lateral bands and the central slip is identified and incised. Care is taken not to detach the central slip from the base of the middle phalanx. The articular surface is examined. The fracture fragments are then reduced and held with a small bone holding tenaculum. Provisional fixation is achieved using small Kirschner wires. Small screws are then placed to hold the reduction using lag technique. The extensor mechanism is then repaired. The skin is closed.

Description of Post-Service Work: Post-service work: in facility
- Application of bulky dressing, reinforced with long arm splint
- Monitor patient stabilization in the recovery room.
- Consultation with the family and patient regarding the surgery and postoperative regimen.
- Communication with health care professionals including written and oral reports and orders.
- Postoperative care is coordinated with recovery room nursing staff.
- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- Home restrictions (ie, activity, bathing) are discussed with the patient and family members

- Write prescriptions for medications needed post-discharge.
- Dictation of an operative report
- Procedure note is written in the patient chart
- All appropriate medical records are completed, including discharge summary and discharge instructions, a[illegible] insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of splint/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order occupational therapy
- Supervision of rehabilitation
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions
- Dictate progress notes for medical record

Surgical treatment using open anatomical reduction and internal fixation has been made more complex with the introduction of new imaging methods such as CT which allow better detection of the fracture pathology and provided the basis for new surgical strategies. There are also new internal fixation devices which require more work. Beginning in the 1990s (after the Harvard study), new plates were developed for fracture repair, with most becoming available in the late 1990s and early 2000s. As an example of the complexity of the decision process in current practice, the 1990's have given the surgeon numerous options for bone fixation. The options for a bone fixation device currently include Kirschner wires, wire, staples, screws, as well as newer alternatives such as headless bone screws, T-screws, absorbable pins, cannulated screws, and a myriad of plates. The goal of all these devices remains constant: that is, to achieve stable approximation of bone fragments to facilitate healing. The various devices afford rigid fixation along with compression of the osseous fragments. This allows early range of motion and preservation of surrounding joint function, as well as primary bone healing. Selection of the most advantageous form of fixation is dependent on many factors and takes considerable time in the pre-evaluation of a patient. These include the type of fracture or osteotomy created, bone density, type of bone, and the desire for interfragmental compression. All of this has resulted in more work. The standards of care (fracture reduction, limb alignment, etc.) have also been elevated by literature that shows fracture displacements and poor alignments lead to poorer results. Additionally, women over 50 is a fast growing segment of our population. A huge percentage of these patients are osteoporotic - making fracture fixation and maintenance of fixation far more difficult than it used to be. The new plates are more complex to insert when the underlying bone is of much poorer quality.

Given this information, we believe there is compelling evidence that ORIF is more complex than 5 years ago and this is even more true in comparison to practice in the late 1980s (or more than 25 years ago).

- ***Evidence that incorrect assumptions were made in the previous valuation of the service; a misleading vignette and/or survey in a previous evaluation***

During the period of 1989-1991 (after the Harvard study), a major effort was undertaken by the AAOS and the OTA to rewrite every fracture and dislocation treatment code in the musculoskeletal Section of CPT. In 1991, 395 code changes were accepted by the AMA CPT Editorial Panel under the leadership of Dr. William Felts. At the time of the original proposal, some of the code descriptors were changed from those submitted (presumably by the CPT staff), and published in the 1992 and subsequent editions. Some of the changes in the descriptors published in CPT 1992 didn't make sense, but in those years, the CPT process was closed-door. Additionally, in 1992 and 1993 the AMA staff were deluged by the implementation of the RBRVS process and though AAOS and OTA requested that these problems be addressed then, AMA CPT staff asked that it be deferred as their "plate was full." After that time, more important issues and other opportunities consumed the resources of the AAOS and inertia (or the lack thereof) took over. This third five year review, after completion of the practice expense review, allowed AAOS a window of time to again try to correct the nomenclature for these codes, and review their work using the standard RUC survey method.

We also note, that at the time of the original CPT proposal, external fixation was considered an adjunctive procedure. CPT instructed that the codes for external fixation (20690 and 20692) be "listed in addition to the code for the treatment ...of the fracture." This concept still applies today. External fixation can be used as an adjunctive stabilization modality when treating fractures by almost any method. However, external fixation can also be used in reconstructive orthopaedics (for example, the treatment of joint contractures) and for non-musculoskeletal system treatments (for example, as a suspension device in the treatment of lower extremity burns). In 1991, there was no Modifier -51 exempt code category. Today, these same codes, 20690 and 20692 for external fixator application are modifier -51 exempt, recognizing that they can stand alone or be used adjunctively. Because of the modifier -51 exemption, the RVUs have been reduced, so payers are not paying double when either of these codes are reported with another treatment code.

In the 2005 comment letter to CMS, the AAOS recommended examining the physician work for the ORIF codes because the code descriptors lacked clarity. In particular, because the CPT descriptors include the phrase "with or without internal or external fixation," it is difficult to imagine what the Harvard survey data actually represents (ie, no typical patient was described for the survey respondents to focus on). Further, after the descriptors for these codes were changed for CPT 1993, an Abt study was performed in 1992 for RUC consideration. This study produced *percentage* relationships to key reference codes, but not surveyed time and visit data. Some of these recommendations were accepted by the RUC and CMS and others were adjusted up or down, but no changes were made to the Harvard time and visit data, if available. Therefore, we believe that there is little, if any, relationship between the Harvard database time and visit information (from the old CPT codes) and the current work RVUs.

Given this information, we believe there is compelling evidence that the current work values and/or time and visit data may be incorrect and outdated and should be reviewed.

- *Evidence that incorrect assumptions were made in the previous valuation of the service, as documented; a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data*

Harvard utilized the AMA Physician Masterfile to draw names for their surveys. While general orthopaedic surgeons can perform open reduction fracture care, it is more typical for patients to be referred to orthopaedic surgeons who specialize in orthopaedic trauma or in a given anatomical area (eg, shoulder, hand, knee, etc.). We do not believe that all specialty surgeons were surveyed for these codes, since the AMA Masterfile did not delineate orthopaedic specialties. Additionally, podiatrists were not surveyed for any of the lower extremity codes.

Given this information, we believe there is compelling evidence that not all involved specialties were involved in the review of these codes.

A consensus committee of physicians representing the American Academy of Orthopaedic Surgeons, American Shoulder and Elbow Surgeons, Society for Surgery of the Hand, Arthroscopy Association of North America, Orthopaedic Trauma Association, American Podiatric Medical Association, and American Orthopaedic Foot and Ankle Society met by conference call to discuss the survey data for the revised orthopaedic codes and data for the key reference codes and other codes on the survey reference service lists.

For revised code 26746, we recommend 11.10 work RVUs. After considering differences in time and visits, along with differences in intra-operative work, we believe this value correctly ranks code 26746 relative to other ORIF codes, relative to the key reference code, and relative to orthopaedic codes from the survey reference service list.

These fractures can be every bit as difficult treat as the key reference code – total work is very similar. At the first pc op visit the dressing and splint are removed, the wound is checked, the circulation, sensation and motor function ar checked, the wound is redressed, X-rays are reviewed, and referral to OT is completed. The second visit includes dressing removal, suture removal, OT progress check, OT prescription, X-ray check. The third and fourth visits include wound check, ROM check, X-ray, OT prescription and a discussion of limitations.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No
   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FIVE YEAR REVIEW SPECIFIC QUESTIONS:

Please indicate the number of survey respondent percentages responding to each of the following questions (for example 0.05 = 5%):
Has the work of performing this service changed in the past 5 years? Yes 82% No 18%
(Use the subset of the people who responded "Yes" to answer the following questions)

A. This service represents new technology that has become more familiar (i.e., less work):
   I agree 4% I do not agree 96%
B. Patients requiring this service are now:
   more complex (more work) 96% less complex (less work) 4% no change 0%
C. The usual site-of-service has changed:
   from outpatient to inpatient 4% from inpatient to outpatient 17% no change 74%

Attestation Statement

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
2005 FIVE YEAR REVIEW - SUMMARY OF RECOMMENDATION

CPT Code:26765 Tracking Number F32 Specialty Society Recommended RVU: **6.60**
Global Period: 090 RUC Recommended RVU: **6.60**

CPT Descriptor: Open treatment of distal phalangeal fracture, finger or thumb, includes internal fixation, when performed, each

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 45-year-old male who suffered a fracture of the distal phalanx of the long finger requires an open reduction and internal fixation of the distal phalanx.

Percentage of Survey Respondents who found Vignette to be Typical: 88%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work:
- Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
- Verify that all required instruments and supplies are available – with special attention to plates and screws
- Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulatic drapes
- Assess position of the extremities and head, adjust as needed
- The patient's arm is placed on the hand surgery table.
- Indicate areas of skin to be prepped and mark surgical incisions
- A tourniquet is applied to the proximal arm.
- The arm and hand are prepped and draped.
- The arm is elevated and exsanguinated.
- The pneumatic tourniquet is inflated.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work: A curvilinear incision is made over the distal interphalangeal joint and distal phalanx. Care is taken to protect the underlying extensor mechanism and nail organ. The periosteum is elevated. The fracture is identified and cleared of any fibrinous material and clot. The fracture is reduced. Two Kirschner wires are then drilled across the fracture site maintaining the alignment of the fracture. Care is taken to maintain the appropriate alignment of the fracture fragments. The periosteum is repaired as is the skin.

Description of Post-Service Work: Post-service work: in facility
- Application of bulky dressing, reinforced with long arm splint
- Monitor patient stabilization in the recovery room.
- Consultation with the family and patient regarding the surgery and postoperative regimen.
- Communication with health care professionals including written and oral reports and orders.
- Postoperative care is coordinated with recovery room nursing staff.
- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Write prescriptions for medications needed post-discharge.

- Dictation of an operative report
- Procedure note is written in the patient chart
- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of splint/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order occupational therapy
- Supervision of rehabilitation
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions
- Dictate progress notes for medical record

COMPELLING EVIDENCE RATIONALE (Required to be Completed)

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

- ***Evidence that technology has changed physician work.***

Surgical treatment using open anatomical reduction and internal fixation has been made more complex with the introduction of new imaging methods such as CT which allow better detection of the fracture pathology and provided the basis for new surgical strategies. There are also new internal fixation devices which require more work. Beginning in the 1990s (after the Harvard study), new plates were developed for fracture repair, with most becoming available in the late 1990s and early 2000s. As an example of the complexity of the decision process in current practice, the 1990's have given the surgeon numerous options for bone fixation. The options for a bone fixation device currently include Kirschner wires, wire, staples, screws, as well as newer alternatives such as headless bone screws, T-screws, absorbable pins, cannulated screws, and a myriad of plates. The goal of all these devices remains constant: that is, to achieve stable approximation of bone fragments to facilitate healing. The various devices afford rigid fixation along with compression of the osseous fragments. This allows early range of motion and preservation of surrounding joint function, as well as primary bone healing. Selection of the most advantageous form of fixation is dependent on many factors and takes considerable time in the pre-evaluation of a patient. These include the type of fracture or osteotomy created, bone density, type of bone, and the desire for interfragmental compression. All of this has resulted in more work. The standards of care (fracture reduction, limb alignment, etc.) have also been elevated by literature that shows fracture displacements and poor alignments lead to poorer results. Additionally, women over 50 is a fast growing segment of our population. A huge percentage of these patients are osteoporotic - making fracture fixation and maintenance of fixation far more difficult than it used to be. The new plates are more complex to insert when the underlying bone is of much poorer quality.

Given this information, we believe there is compelling evidence that ORIF is more complex than 5 years ago and this is even more true in comparison to practice in the late 1980s (or more than 25 years ago).

- ***Evidence that incorrect assumptions were made in the previous valuation of the service; a misleading vignette and/or survey in a previous evaluation***

During the period of 1989-1991 (after the Harvard study), a major effort was undertaken by the AAOS and the OTA to rewrite every fracture and dislocation treatment code in the musculoskeletal Section of CPT. In 1991, 395 code changes were accepted by the AMA CPT Editorial Panel under the leadership of Dr. William Felts. At the time of the original proposal, some of the code descriptors were changed from those submitted (presumably by the CPT staff), and published in the 1992 and subsequent editions. Some of the changes in the descriptors published in CPT 1992 didn't make sense, but in those years the CPT process was closed-door. Additionally, in 1992 and 1993 the AMA staff were deluged by the implementation of tl RBRVS process and though AAOS and OTA requested that these problems be addressed then, AMA CPT staff asked that it be deferred as their "plate was full." After that time, more important issues and other opportunities consumed the resources of the AAOS and inertia (or the lack thereof) took over. This third five year review, after completion of the practice expense review, allowed AAOS a window of time to again try to correct the nomenclature for these codes, and review their work using the standard RUC survey method.

We also note, that at the time of the original CPT proposal, external fixation was considered an adjunctive procedure. CPT instructed that the codes for external fixation (20690 and 20692) be "listed in addition to the code for the treatment ...of the fracture." This concept still applies today. External fixation can be used as an adjunctive stabilization modality when treating fractures by almost any method. However, external fixation can also be used in reconstructive orthopaedics (for example, the treatment of joint contractures) and for non-musculoskeletal system treatments (for example, as a suspension device in the treatment of lower extremity burns). In 1991, there was no Modifier -51 exempt code category. Today, these same codes, 20690 and 20692 for external fixator application are modifier -51 exempt, recognizing that they can stand alone or be used adjunctively. Because of the modifier -51 exemption, the RVUs have been reduced, so payers are not paying double when either of these codes are reported with another treatment code.

In the 2005 comment letter to CMS, the AAOS recommended examining the physician work for the ORIF codes because the code descriptors lacked clarity. In particular, because the CPT descriptors include the phrase "with or without internal or external fixation," it is difficult to imagine what the Harvard survey data actually represents (ie, no typical patient was described for the survey respondents to focus on). Further, after the descriptors for these codes were changed for CPT 1993, an Abt study was performed in 1992 for RUC consideration. This study produced *percentage* relationships to key reference codes, but not surveyed time and visit data. Some of these recommendations were accepted by the RUC and CMS and others were adjusted up or down, but no changes were made to the Harvard time and visit data, if available. Therefore, we believe that there is little, if any, relationship between the Harvard database time and visit information (from the old CPT codes) and the current work RVUs.

Given this information, we believe there is compelling evidence that the current work values and/or time and visit data may be incorrect and outdated and should be reviewed.

- *Evidence that incorrect assumptions were made in the previous valuation of the service, as documented; a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data*

Harvard utilized the AMA Physician Masterfile to draw names for their surveys. While general orthopaedic surgeons can perform open reduction fracture care, it is more typical for patients to be referred to orthopaedic surgeons who specialize in orthopaedic trauma or in a given anatomical area (eg, shoulder, hand, knee, etc.). We do not believe that all specialty surgeons were surveyed for these codes, since the AMA Masterfile did not delineate orthopaedic specialties. Additionally, podiatrists were not surveyed for any of the lower extremity codes.

Given this information, we believe there is compelling evidence that not all involved specialties were involved in the review of these codes.

A consensus committee of physicians representing the American Academy of Orthopaedic Surgeons, American Shoulder and Elbow Surgeons, Society for Surgery of the Hand, Arthroscopy Association of North America, Orthopaedic Trauma Association, American Podiatric Medical Association, and American Orthopaedic Foot and Ankle Society met by conference call to discuss the survey data for the revised orthopaedic codes and data for the key reference codes and other codes on the survey reference service lists.

For revised code 26765, we recommend 6.60 work RVUs. After considering differences in time and visits, along with differences in intra-operative work, we believe this value correctly ranks code 26765 relative to other ORIF codes, relative to the key reference code, and relative to orthopaedic codes from the survey reference service list.

Code 26765 requires less total work and is less complex than key reference code 25652. The 25th percentile work RVU reflects this difference better than the survey median. The first postoperative visit would include a dressing change, wound check, CMS check, application of a splint, X-rays, OT Rx for finger and wrist ROM, discussion of restrictions and operative findings. The second visit would include removal of the splint, wound check, CMS check, suture removal, reapplication of a new splint and X-rays. The third visit would include X-rays, OT Rx for range of motion exercises, and

discussion of limitations. The fourth visit would include X-rays, assessment of ROM, OT Rx for ROM and strengthening and discussion of limitations.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No
   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FIVE YEAR REVIEW SPECIFIC QUESTIONS:

Please indicate the number of survey respondent percentages responding to each of the following questions (for example 0.05 = 5%):
Has the work of performing this service changed in the past 5 years? Yes 55% No 45%
(Use the subset of the people who responded "Yes" to answer the following questions)

A. This service represents new technology that has become more familiar (i.e., less work):
   I agree 17% I do not agree 83%
B. Patients requiring this service are now:
   more complex (more work) 89% less complex (less work) 0% no change 11%
C. The usual site-of-service has changed:
   from outpatient to inpatient 0% from inpatient to outpatient 17% no change 83%

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
2005 FIVE YEAR REVIEW - SUMMARY OF RECOMMENDATION

CPT Code:26785 Tracking Number F33 Specialty Society Recommended RVU: **7.45**
Global Period: 090 RUC Recommended RVU: **7.45**

CPT Descriptor: Open treatment of interphalangeal joint dislocation, includes internal fixation, when performed, single

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 30-year-old male suffers a dislocation of the PIP joint requiring an open reduction and internal fixation of the PIP dislocation.

Percentage of Survey Respondents who found Vignette to be Typical: 84%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: • Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
- Verify that all required instruments and supplies are available – with special attention to plates and screws
- Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulation drapes
- Assess position of the extremities and head, adjust as needed
- The patient's arm is placed on the hand surgery table.
- Indicate areas of skin to be prepped and mark surgical incisions
- A tourniquet is applied to the proximal arm.
- The arm and hand are prepped and draped.
- The arm is elevated and exsanguinated.
- The pneumatic tourniquet is inflated.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work: A curvilinear dorsal incision is made over the proximal interphalangeal joint. Dissection is carried down to the extensor mechanism. The interval between the lateral bands and the central slip is identified and incised. Any interposed soft tissue within the joint is removed. The joint is then reduced. A small Kirschner wire is passed across the joint to maintain the reduction. The extensor mechanism is repaired. The skin is closed.

Description of Post-Service Work: Post-service work: in facility
- Application of bulky dressing, reinforced with long arm splint
- Monitor patient stabilization in the recovery room.
- Consultation with the family and patient regarding the surgery and postoperative regimen.
- Communication with health care professionals including written and oral reports and orders.
- Postoperative care is coordinated with recovery room nursing staff.
- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Write prescriptions for medications needed post-discharge.

- Dictation of an operative report
- Procedure note is written in the patient chart
- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of splint/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order occupational therapy
- Supervision of rehabilitation
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions
- Dictate progress notes for medical record

COMPELLING EVIDENCE RATIONALE (Required to be Completed)

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

- ***Evidence that technology has changed physician work.***

Surgical treatment using open anatomical reduction and internal fixation has been made more complex with the introduction of new imaging methods such as CT which allow better detection of the fracture pathology and provided the basis for new surgical strategies. There are also new internal fixation devices which require more work. Beginning in the 1990s (after the Harvard study), new plates were developed for fracture repair, with most becoming available in the late 1990s and early 2000s. As an example of the complexity of the decision process in current practice, the 1990's have given the surgeon numerous options for bone fixation. The options for a bone fixation device currently include Kirschner wires, wire, staples, screws, as well as newer alternatives such as headless bone screws, T-screws, absorbable pins, cannulated screws, and a myriad of plates. The goal of all these devices remains constant: that is, to achieve stable approximation of bone fragments to facilitate healing. The various devices afford rigid fixation along with compression of the osseous fragments. This allows early range of motion and preservation of surrounding joint function, as well as primary bone healing. Selection of the most advantageous form of fixation is dependent on many factors and takes considerable time in the pre-evaluation of a patient. These include the type of fracture or osteotomy created, bone density, type of bone, and the desire for interfragmental compression. All of this has resulted in more work. The standards of care (fracture reduction, limb alignment, etc.) have also been elevated by literature that shows fracture displacements and poor alignments lead to poorer results. Additionally, women over 50 is a fast growing segment of our population. A huge percentage of these patients are osteoporotic - making fracture fixation and maintenance of fixation far more difficult than it used to be. The new plates are more complex to insert when the underlying bone is of much poorer quality.

Given this information, we believe there is compelling evidence that ORIF is more complex than 5 years ago and this is even more true in comparison to practice in the late 1980s (or more than 25 years ago).

- ***Evidence that incorrect assumptions were made in the previous valuation of the service; a misleading vignette and/or survey in a previous evaluation***

During the period of 1989-1991 (after the Harvard study), a major effort was undertaken by the AAOS and the OTA to rewrite every fracture and dislocation treatment code in the musculoskeletal Section of CPT. In 1991, 395 code changes were accepted by the AMA CPT Editorial Panel under the leadership of Dr. William Felts. At the time of the original proposal, some of the code descriptors were changed from those submitted (presumably by the CPT staff), and published in the 1992 and subsequent editions. Some of the changes in the descriptors published in CPT 1992 didn't make sense, but in those years, the CPT process was closed-door. Additionally, in 1992 and 1993 the AMA staff were deluged by the implementation of the RBRVS process and though AAOS and OTA requested that these problems be addressed then, AMA CPT staff asked that it be deferred as their "plate was full." After that time, more important issues and other opportunities consumed the resources of the AAOS and inertia (or the lack thereof) took over. This third five year review, after completion of the practice expense review, allowed AAOS a window of time to again try to correct the nomenclature for these codes, and review their work using the standard RUC survey method.

We also note, that at the time of the original CPT proposal, external fixation was considered an adjunctive procedure. CPT instructed that the codes for external fixation (20690 and 20692) be "listed in addition to the code for the treatment ...of the fracture." This concept still applies today. External fixation can be used as an adjunctive stabilization modality when treating fractures by almost any method. However, external fixation can also be used in reconstructive orthopaedics (for example, t' treatment of joint contractures) and for non-musculoskeletal system treatments (for example, as a suspension device in the treatment of lower extremity burns). In 1991, there was no Modifier -51 exempt code category. Today, these same codes, 20690 and 20692 for external fixator application are modifier -51 exempt, recognizing that they can stand alone or be used adjunctively. Because of the modifier -51 exemption, the RVUs have been reduced, so payers are not paying double when either of these codes are reported with another treatment code.

In the 2005 comment letter to CMS, the AAOS recommended examining the physician work for the ORIF codes because the code descriptors lacked clarity. In particular, because the CPT descriptors include the phrase "with or without internal or external fixation," it is difficult to imagine what the Harvard survey data actually represents (ie, no typical patient was described for the survey respondents to focus on). Further, after the descriptors for these codes were changed for CPT 1993, an Abt study was performed in 1992 for RUC consideration. This study produced *percentage* relationships to key reference codes, but not surveyed time and visit data. Some of these recommendations were accepted by the RUC and CMS and others were adjusted up or down, but no changes were made to the Harvard time and visit data, if available. Therefore, we believe that there is little, if any, relationship between the Harvard database time and visit information (from the old CPT codes) and the current work RVUs.

Given this information, we believe there is compelling evidence that the current work values and/or time and visit data may be incorrect and outdated and should be reviewed.

- *Evidence that incorrect assumptions were made in the previous valuation of the service, as documented; a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data*

Harvard utilized the AMA Physician Masterfile to draw names for their surveys. While general orthopaedic surgeons can perform open reduction fracture care, it is more typical for patients to be referred to orthopaedic surgeons who specialize in orthopaedic trauma or in a given anatomical area (eg, shoulder, hand, knee, etc.). We do not believe that all specialty surgeons were surveyed for these codes, since the AMA Masterfile did not delineate orthopaedic specialties. Additionally, podiatrists were not surveyed for any of the lower extremity codes.

Given this information, we believe there is compelling evidence that not all involved specialties were involved in the review of these codes.

A consensus committee of physicians representing the American Academy of Orthopaedic Surgeons, American Shoulder and Elbow Surgeons, Society for Surgery of the Hand, Arthroscopy Association of North America, Orthopaedic Trauma Association, American Podiatric Medical Association, and American Orthopaedic Foot and Ankle Society met by conference call to discuss the survey data for the revised orthopaedic codes and data for the key reference codes and other codes on the survey reference service lists.

For revised code 26785, we recommend 7.45 work RVUs. After considering differences in time and visits, along with differences in intra-operative work, we believe this value correctly ranks code 26785 relative to other ORIF codes, relative to the key reference code, and relative to orthopaedic codes from the survey reference service list.

Total work for 26785 is similar to key reference code 25652. The first postoperative visit would include a dressing change, wound check, CMS check, application of a splint, X-rays, OT Rx for finger and wrist ROM, discussion of restrictions and operative findings . The second visit would include removal of the splint, wound check, CMS check, suture removal, reapplication of a new splint and X-rays. The third visit would include X-rays, removal of pin(s), OT Rx for

range of motion exercises, and discussion of limitations. The fourth visit would include X-rays, assessment of ROM, OT Rx for ROM and strengthening and discussion of limitations.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No
   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FIVE YEAR REVIEW SPECIFIC QUESTIONS:

Please indicate the number of survey respondent percentages responding to each of the following questions (for example 0.05 = 5%):

as the work of performing this service changed in the past 5 years? Yes 52% No 48%

Use the subset of the people who responded "Yes" to answer the following questions)

A. This service represents new technology that has become more familiar (i.e., less work):
   I agree I do not agree 100%

B. Patients requiring this service are now:
   more complex (more work) 100% less complex (less work) no change

C. The usual site-of-service has changed:
   from outpatient to inpatient 0% from inpatient to outpatient 19% no change 81%

Femoral Head Fracture Treatment

The CPT Editorial Panel created three new Category I CPT codes to describe services performed by orthopedists that are distinctly different from the treatment of other proximal femoral fractures, involving the femoral neck, intertrochanteric or subtrochanteric regions. Whereas these other fractures do not involve the femoral head (i.e. the cartilage covered "ball" of the hip joint's "ball joint articulation") fractures of the femoral head are both intraarticular and intracapsular by definition. These injuries may involve any part of the femoral head. Displaced fractures, especially those involving the superior head, place the hip joint at grave risk for developing osteoarthritis (degeneration of the joint) as the weight bearing portion is affected directly. New codes are necessary to reflect the management of these patients and the varied injury patterns that have been described. An open treatment code is required as the procedure is distinctly different from the treatment of other proximal femoral fractures as fractures of the head usually require a hip arthrotomy with a surgical dislocation of the hip to affect a repair and place internal fixation.

517

The specialty societies surveying CPT codes 27267, *Closed treatment of femoral fracture, proximal end, head; without manipulation*; 27268, *Closed treatment of femoral fracture, proximal end, head; with manipulation*; and 27269, *Open treatment of femoral fracture, proximal end, head, includes internal fixation, when performed,* commented and the RUC agreed that the vignettes were confusing and required further refinement by the CPT Editorial Panel. The survey respondents indicated they were unable to determine what if any work was involved in the procedure and the survey results were problematic in that most respondents were unable to identify any time in the pre-, intra- or post-service procedures because they agreed, that the vignette was potentially flawed. The RUC decided to refer the codes to the Editorial Panel for refinement of the vignettes and request that once the revised vignettes are finalized that the specialty societies re-survey the services for review by the RUC at the September 2007 RUC meeting. **In the interim, the RUC agreed that it was appropriate for the services to be carrier priced.**

Summary of Recommendations

April 2007

Internal or External Fixation-Hip and Knee

As part of the 2005 Five-Year Review Process, the American Academy of Orthopaedic Surgery (AAOS) commented that the compelling evidence rationale for examining the work RVU for the fracture treatment codes is that there is evidence that incorrect assumptions were made in the valuation of these codes due to lack of clarity of the CPT descriptor. In particular, the CPT descriptor states "with or without internal or external fixation." However, it is unclear whether the previous valuation for the code included the situation when internal and external fixation is applied to a fracture site. Therefore, the RUC recommended that these codes be referred to the CPT Editorial Panel for further clarification.

At the October 2006 CPT Editorial Panel Meeting, the AAOS recommended to the CPT Editorial Panel that the identified fracture treatment codes in the musculoskeletal section of CPT that include the nomenclature "internal or external" fixation should be clarified to state that external fixation should be an adjunctive procedure to these procedures. The CPT Editorial Panel agreed with the specialty society that these codes needed to be clarified and reference to external fixation should be removed from 64 CPT codes. These 64 codes were divided into four categories based on location: Shoulder/Elbow, Elbow/Hand, Hip/Knee and Foot/Ankle. At the February 2007 RUC Meeting, three of these categories were discussed: Shoulder/Elbow, Elbow/Hand and Foot/Ankle. These recommendations specifically detail the RUC's recommendations for the Hip/Knee codes as discussed at the April 2007 RUC Meeting.

Approximately 150 orthopaedic providers participated in each of the surveys. These respondents included physicians from general orthopaedic surgery, orthopaedic trauma surgery and hip and knee surgery. After the results from all of these groups were tabulated, a consensus committee of physicians representing the American Academy of Orthopaedic Surgeons, American Association of Hip and Knee Surgeons and Orthopaedic Trauma Association met to discuss the survey data for the revised orthopaedic codes.

The RUC reviewed the compelling evidence for these procedures. The specialty societies claimed that because the CPT descriptors originally contained the phrase "with or without internal or external fixation," it is difficult to imagine what the original Harvard survey data actually represented. Furthermore, an Abt study was performed in 1992 for RUC consideration. This study produced percentage relationships to key reference codes, but not surveyed time and visit data. Some of these recommendations were accepted by the RUC

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

and CMS and others were adjusted up or down but no changes were made to the Harvard time and visit data, if available. Therefore, the specialty society believes that there is little, if any, relationship between the Harvard database time and visit information and the current work RVUs.

Furthermore, the specialty societies stated that there was a significant change in the technology for how these procedures are performed. The surgical treatments use open anatomical reduction and internal fixation has been made more complex with the introduction of new imaging methods such as computed tomography which allows better detection of the fracture pathology and provides the basis for new surgical strategies. Further, the patient population has changed, as women over 50 are a fast growing segment of the population. A huge percentage of these patients are osteoporatic – making fracture fixation and maintenance of fixation far more difficult. The specialty societies conducted a full RUC survey of all codes, and for over half of the codes, recommended the 25th percentile or the median RVU of the specialty survey data. It should also be noted that the RUC is recommending the current work RVUs for two codes of the codes in this family, 27519 and 27540.

The RUC thoroughly reviewed these codes, and as part of this review, the specialty societies explained that they felt strongly that a 99233 hospital visit was appropriate for all of the codes within this family however, based on discussions at the RUC meeting the specialty agreed to lower the intensity of this visit to a 99232 hospital visit. Additionally, the specialty societies explained that they felt strongly that three 99213 office visits were appropriate for all of the codes within this family and however, based on discussions at the RUC meeting the specialty agreed to lower the intensity of two of these visits to two 99212 office visits. The RUC also reviewed CPT code 20690 *Application of a uniplane (pins or wires in one plane), unilateral, external fixation system* and 20692 *Application of a multiplane (pins or wires in more than one plane), unilateral, external fixation system (eg, Ilizarov, Monticelli type)*. It is the RUC's understanding that the utilization for these two procedures will not change with this coding change made by the CPT Editorial Panel. Therefore, the RUC determined that there will be no work neutrality impact for these recommendations. However, the RUC welcomes a retrospective review of this issue in the future.

27248 *Open treatment of greater trochanteric fracture, includes internal fixation, when performed*

The RUC reviewed CPT code 27248 and compared it with 27236 *Open treatment of femoral fracture, proximal end, neck, internal fixation or prosthetic replacement* (work RVU=17.43). The RUC reviewed the proposed post-operative visits associated with the surveyed procedure and although the specialties explained that they felt strongly that a 99233 hospital visit was appropriate for this procedure, based on discussions at the RUC meeting, the specialty agreed to lower the intensity of this visit to a 99232 hospital visit. Additionally, the specialties explained that they felt strongly that three 99213 office visits were appropriate for this procedure however,

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

based on discussions at the RUC meeting the specialty agreed to lower the intensity of two of these visits to two 99212 office visits. The RUC compared the service times of both procedures and noted that the intra-service time for the reference code is significantly greater than the surveyed code, 90 minutes and 60 minutes respectively. Furthermore, the RUC noted that when comparing the intensity/complexity measures of the surveyed code to the reference code that the reference code requires greater mental effort and judgment and more overall intensity to perform than the surveyed code. Therefore, the RUC agreed that because of the greater amount of time and the greater mental effort and judgment associated with the reference code in comparison to the surveyed code, the RUC recommends the 25th percentile of the survey data minus the work RVU associated with the amended post-operative visits, 12.83 RVUs for 27248. **The RUC recommends 12.83 work RVUs for 27248.**

27511 *Open treatment of femoral supracondylar or transcondylar fracture without intercondylar extension, includes internal fixation, when performed*

The RUC reviewed CPT code 27511 and compared it with 27477 *Arrest, epiphyseal, any method (eg, epiphysiodesis); tibia and fibula, proximal* (work RVU=23.04). The RUC reviewed the proposed post-operative visits associated with the surveyed procedure and although the specialties explained that they felt strongly that a 99233 hospital visit was appropriate for this procedure, based on discussions at the RUC meeting, the specialty agreed to lower the intensity of this visit to a 99232 hospital visit. Additionally, the specialties explained that they felt strongly that three 99213 office visits were appropriate for this procedure however, based on discussions at the RUC meeting the specialty agreed to lower the intensity of two of these visits to two 99212 office visits. The RUC compared the service times of both procedures and noted that the intra-service time for the reference code is slightly greater than the surveyed code, 124 minutes and 120 minutes respectively. Furthermore, the RUC noted that when comparing the intensity/complexity measures of the surveyed code to the reference code that the reference code requires greater physical effort and judgment and more overall intensity to perform than the surveyed code. Therefore, the RUC agreed that because of the greater amount of time and the greater physical effort and overall higher intensity to perform associated with the reference code in comparison to the surveyed code, the RUC recommends the 25th percentile of the survey data, 18.05 RVUs for 27511. **The RUC recommends 18.05 work RVUs for 27511.**

27513 *Open treatment of femoral supracondylar or transcondylar fracture with intercondylar extension, includes internal fixation, when performed*

The RUC reviewed CPT code 27513 and compared it with 27477 *Arrest, epiphyseal, any method (eg, epiphysiodesis); tibia and fibula, proximal* (work RVU=23.04). The RUC reviewed the proposed post-operative visits associated with the surveyed procedure and although the specialties explained that they felt strongly that a 99233 hospital visit was appropriate for this procedure, based on

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

discussions at the RUC meeting, the specialty agreed to lower the intensity of this visit to a 99232 hospital visit. Additionally, the specialties explained that they felt strongly that three 99213 office visits were appropriate for this procedure however, based on discussions at the RUC meeting the specialty agreed to lower the intensity of two of these visits to two 99212 office visits. The RUC compared the service times of both procedures and noted that the total service time for the reference code and the surveyed code is very similar, 469 minutes and 464 minutes respectively. Furthermore, the RUC agreed with the specialty that although when comparing the intensity/complexity measures of the surveyed code to the reference code that the surveyed code requires greater physical effort and judgment and more overall intensity to perform than the reference code that both procedures have similar intensity. Therefore, the RUC agreed that because of the similar amount of total service time and similar intensities between the reference code and the surveyed code, that these two codes should be valued the same, 23.04 RVUs. **The RUC recommends the median of the survey data, 23.04 work RVUs for 27513.**

27514 *Open treatment of femoral fracture, distal end, medial or lateral condyle, includes internal fixation, when performed*

The RUC reviewed CPT code 27514 and compared it with 27236 *Open treatment of femoral fracture, proximal end, neck, internal fixation or prosthetic replacement* (work RVU=17.43). The RUC reviewed the proposed post-operative visits associated with the surveyed procedure and although the specialties explained that they felt strongly that a 99233 hospital visit was appropriate for this procedure, based on discussions at the RUC meeting, the specialty agreed to lower the intensity of this visit to a 99232 hospital visit. Additionally, the specialties explained that they felt strongly that three 99213 office visits were appropriate for this procedure however, based on discussions at the RUC meeting the specialty agreed to lower the intensity of two of these visits to two 99212 office visits. The RUC compared the service times of both procedures and noted that the intra-service time for the reference code and the surveyed code were the same, 90 minutes. Furthermore, the RUC noted that when comparing the intensity/complexity measures of the surveyed code to the reference code that the reference code requires similar overall intensity to perform as compared to the surveyed code. Therefore, the RUC agreed that because of the same amount of intra-service time and overall similar intensity to perform the surveyed code should be valued the same as the reference code, 17.43 RVUs. **The RUC recommends the 25th percentile of the survey data, 17.43 work RVUs for 27514.**

27519 *Open treatment of distal femoral epiphyseal separation, includes internal fixation, when performed*

The RUC reviewed CPT code 27519 and compared it with 27236 *Open treatment of femoral fracture, proximal end, neck, internal fixation or prosthetic replacement* (work RVU=17.43). The RUC reviewed the proposed post-operative visits associated with the surveyed procedure and although the specialties explained that they felt strongly that a 99233 hospital visit was appropriate for this

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

procedure, based on discussions at the RUC meeting, the specialty agreed to lower the intensity of this visit to a 99232 hospital visit. Additionally, the specialties explained that they felt strongly that three 99213 office visits were appropriate for this procedure however, based on discussions at the RUC meeting the specialty agreed to lower the intensity of two of these visits to two 99212 office visits. The RUC compared the service times of both procedures and noted that the total-service time for the reference code is significantly greater than the surveyed code, 473 minutes and 359 minutes respectively. However, the RUC noted that when comparing the intensity/complexity measures of the surveyed code to the reference code that the surveyed code requires greater physical effort and judgment and more overall intensity to perform than the reference code. Therefore, the specialty society recommended that the current value be maintained for this code as the current value maintains an appropriate relativity with the other knee and hip fracture codes as well as with the key reference code 27236. The RUC agreed with the specialty society and recommends that the surveyed times and visits be applied to this code and its current value should be maintained. **The RUC recommends maintaining the current value of 15.80 work RVUs for 27519.**

27535 *Open treatment of tibial fracture, proximal (plateau); unicondylar, includes internal fixation, when performed*

The RUC reviewed CPT code 27535 and compared it with 27236 *Open treatment of femoral fracture, proximal end, neck, internal fixation or prosthetic replacement* (work RVU=17.43). The RUC reviewed the proposed post-operative visits associated with the surveyed procedure and although the specialties explained that they felt strongly that a 99233 hospital visit was appropriate for this procedure, based on discussions at the RUC meeting, the specialty agreed to lower the intensity of this visit to a 99232 hospital visit. Additionally, the specialties explained that they felt strongly that three 99213 office visits were appropriate for this procedure however, based on discussions at the RUC meeting the specialty agreed to lower the intensity of two of these visits to two 99212 office visits. The RUC compared the service times of both procedures and noted that the total service time for the reference code is significantly greater than the surveyed code, 473 minutes and 389 minutes. Furthermore, the RUC noted that when comparing the intensity/complexity measures of the surveyed code to the reference code that the reference code requires greater overall intensity to perform as compared to the surveyed code. Therefore, the RUC agreed that because of the greater amount of total service time and the higher amount of overall intensity to perform of the reference code as compared to the surveyed code, the surveyed code should be valued at the surveyed 25th percentile, 16.00 RVUs. **The RUC recommends 16.00 work RVUs for 27535.**

27540 *Open treatment of intercondylar spine(s) and/or tuberosity fracture(s) of the knee, includes internal fixation, when performed*

The RUC reviewed CPT code 27540 and compared it with 29833 *Arthroscopy, knee, surgical; with meniscus repair (medial AND lateral)* (work RVU=11.61). The RUC reviewed the proposed post-operative visits associated with the surveyed procedure and although

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

the specialties explained that they felt strongly that a 99233 hospital visit was appropriate for this procedure, based on discussions at the RUC meeting, the specialty agreed to lower the intensity of this visit to a 99232 hospital visit. Additionally, the specialties explained that they felt strongly that three 99213 office visits were appropriate for this procedure however, based on discussions at the RUC meeting the specialty agreed to lower the intensity of two of these visits to two 99212 office visits. The RUC compared the service times of both procedures and noted that the total-service time for the surveyed code is significantly greater than the reference code, 334 minutes and 311 minutes respectively. Further, the RUC noted that when comparing the intensity/complexity measures of the surveyed code to the reference code that the surveyed code requires greater physical effort and judgment and more overall intensity to perform than the reference code. The specialty society recommended that the surveyed code should be valued higher than the reference code based on these survey results but believed that the 25th percentile and median RVU value of the survey data both over-estimated the value of this procedure and would create rank-order anomalies with the other knee and hip fracture codes. The RUC agreed with the specialty society and recommends that the surveyed times and visits be applied to this code and its current value should be maintained. **The RUC recommends maintaining the current value of 13.45 work RVUs for 27540.**

27556 *Open treatment of knee dislocation, includes internal fixation, when performed; without primary ligamentous repair or augmentation/reconstruction*

The RUC reviewed CPT code 27556 and compared it with 27415 *Osteochondral allograft, knee, open* (work RVU=19.79). The RUC reviewed the proposed post-operative visits associated with the surveyed procedure and although the specialties explained that they felt strongly that a 99233 hospital visit was appropriate for this procedure, based on discussions at the RUC meeting, the specialty agreed to lower the intensity of this visit to a 99232 hospital visit. Additionally, the specialties explained that they felt strongly that three 99213 office visits were appropriate for this procedure however, based on discussions at the RUC meeting the specialty agreed to lower the intensity of two of these visits to two 99212 office visits. The RUC compared the service times of both procedures and noted that the intra-service time for the reference code is significantly greater than the surveyed code, 120 minutes and 90 minutes respectively. Further, the RUC noted that when comparing the intensity/complexity measures of the surveyed code to the reference code that the reference code requires greater mental effort and judgment and more overall intensity to perform than the surveyed code. Therefore, the RUC recommends the 25th percentile of the RVU value of the survey data or 15.50 RVU for 27556. This value maintains an appropriate relativity with the other knee and hip fracture codes as well as with the key reference code 27415. **The RUC recommends 15.50 work RVUs for 27556.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

27557 *Open treatment of knee dislocation, includes internal fixation, when performed; with primary ligamentous repair*

The RUC reviewed CPT code 27557 and compared it with 27415 *Osteochondral allograft, knee, open* (work RVU=19.79). The RUC reviewed the proposed post-operative visits associated with the surveyed procedure and although the specialties explained that they felt strongly that a 99233 hospital visit was appropriate for this procedure, based on discussions at the RUC meeting, the specialty agreed to lower the intensity of this visit to a 99232 hospital visit. Additionally, the specialties explained that they felt strongly that three 99213 office visits were appropriate for this procedure however, based on discussions at the RUC meeting the specialty agreed to lower the intensity of two of these visits to two 99212 office visits. The RUC compared the service times of both procedures and noted that the total-service time for the reference code is significantly greater than the surveyed code, 424 minutes and 399 minutes respectively. However, the RUC noted that when comparing the intensity/complexity measures of the surveyed code to the reference code that the surveyed code requires greater physical effort and psychological judgment and more overall intensity to perform than the reference code. Therefore, the specialty society recommended that the 25th percentile of the work RVU of the survey data for this code, 19.00 RVUs. This value maintains an appropriate relativity with the other knee and hip fracture codes as well as with the key reference code 27415. The RUC agreed with the specialty society and recommends that the surveyed times and visits be applied to this code and the current value should be 19.00 RVUs. **The RUC recommends 19.00 work RVUs for 27557.**

27558 *Open treatment of knee dislocation, includes internal fixation, when performed; with primary ligamentous repair, with augmentation/reconstruction*

The RUC reviewed CPT code 27558 and compared it with 27134 *Revision of total hip arthroplasty; both components, with or without autograft or allograft* (work RVU=30.13). The RUC reviewed the proposed post-operative visits associated with the surveyed procedure and although the specialties explained that they felt strongly that a 99233 hospital visit was appropriate for this procedure, based on discussions at the RUC meeting, the specialty agreed to lower the intensity of this visit to a 99232 hospital visit. Additionally, the specialties explained that they felt strongly that three 99213 office visits were appropriate for this procedure however, based on discussions at the RUC meeting the specialty agreed to lower the intensity of two of these visits to two 99212 office visits. The RUC compared the service times of both procedures and noted that the intra-service time for the reference code is significantly greater than the surveyed code, 240 minutes and 150 minutes respectively. Further, the RUC noted that when comparing the intensity/complexity measures of the surveyed code to the reference code that the reference code requires greater mental effort and judgment and more overall intensity to perform than the surveyed code. Therefore, the RUC recommends the 25th percentile of the RVU value of the survey data or 22.00 RVU for 27558. This value maintains an appropriate relativity with the other knee and hip fracture codes as well as with the key reference code 27134. **The RUC recommends 22.00 work RVUs for 27558.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Practice Expense:
The RUC recommends the standard 090 day global practice expense packages. The only exceptions to the standard 090 day global practice expense packages was where the procedure was considered to be emergent and the pre-service time allocated in the facility setting was removed.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
2005 FIVE YEAR REVIEW - SUMMARY OF RECOMMENDATION

CPT Code:27248 Tracking Number F34 Specialty Society Recommended RVU: **12.83**
Global Period: 090 RUC Recommended RVU: **12.83**

CPT Descriptor: Open treatment of greater trochanteric fracture, includes internal fixation, when performed

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 70-year-old female falls two years after successful total hip arthroplasty sustaining a displaced fracture of the greater trochanter of the hip requiring open reduction and internal fixation.

Percentage of Survey Respondents who found Vignette to be Typical: 86%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: • Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
- Verify that all required instruments and supplies are available
- Monitor/assist with patient positioning in a lateral position, held by a lateral positioning device; padding of bor prominences, with care taken to protect the axillary region as well as the downside peroneal nerve; and application thermal regulation drapes
- Assess position of the extremities and head, adjust as needed

Confirm ability to visualize operative area with fluoroscopy
- Indicate areas of skin to be prepped and mark surgical incisions
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work: Under anesthesia, a lateral incision is made over the greater trochanter. A dissection is carried down to the fascia lata which is split longitudinally. The fracture fragments are identified. A portion of the vastus lateralis is elevated in order to anatomically reduce the fracture site. A combination of wires or cables are passed around the medial side of the femoral shaft. The wires or cables require a careful dissection along the posterior aspect of the femur in order to pass them safely - positioning is checked under fluoroscopy. A combination of wires or cables, screws and potentially a trochanteric grip are placed about the greater trochanter and used to reduce the fracture of the greater trochanter. The position of the fixation and the reduction is checked either with a fluoroscopy or plain film. The wound is closed in layers over drains, closing the fascia lata, subcutaneous tissues and then reapproximating the skin edges..

Description of Post-Service Work: Post-service work: in facility
- Application of dressing and abduction splint
- Monitor patient stabilization in the recovery room.
- Consultation with the family and patient regarding the surgery and postoperative regimen.
- Communication with health care professionals including written and oral reports and orders.
- Postoperative care is coordinated with recovery room nursing staff.
- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- The patient is discharged to the orthopaedic floor – followed by daily monitoring of the wound, drains, anticoagulation, and physical therapy.

- Orders are written for evaluation of periodic imaging and laboratory reports; review of anticoagulation laboratory values and appropriate medication adjustment, and antibiotic and pain medication adjustments
- Dictation of an operative report
- Procedure note is written in the patient chart

Discharge day:

- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Physical therapy for the uses of crutches or walker is ordered
- Write prescriptions for medications needed post-discharge.
- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of dressings
- Assessment of surgical wound
- Remove sutures and drains
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order occupational therapy
- Supervision of rehabilitation
- Monitor physical therapy
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions
- Dictate progress notes for medical record

Median Total Time	**384.00**	**473.00**	
Other time if appropriate			

INTENSITY/COMPLEXITY MEASURES (Mean)

Mental Effort and Judgment (Mean)

The number of possible diagnosis and/or the number of management options that must be considered	2.48	2.84
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	2.90	2.95
Urgency of medical decision making	2.90	3.21

Technical Skill/Physical Effort (Mean)

Technical skill required	3.38	3.11
Physical effort required	3.42	3.42

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	3.48	3.58
Outcome depends on the skill and judgment of physician	3.81	3.68
Estimated risk of malpractice suit with poor outcome	2.90	2.84

INTENSITY/COMPLEXITY MEASURES	CPT Code	Reference Service 1
Time Segments (Mean)		
Pre-Service intensity/complexity	2.90	3.00
Intra-Service intensity/complexity	3.14	3.17
Post-Service intensity/complexity	2.90	2.94

COMPELLING EVIDENCE RATIONALE (Required to be Completed)

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

- ***Evidence that incorrect assumptions were made in the previous valuation of the service, as documented; a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data***

Harvard utilized the AMA Physician Masterfile to draw names for their surveys. While general orthopaedic surgeons can perform open reduction fracture care, it is more typical for patients to be referred to orthopaedic surgeons who specialize in orthopaedic trauma or in a given anatomical area (eg, shoulder, hand, knee, etc.). We do not believe that all specialty surgeons were surveyed for these codes, especially with respect to the primary provider subspecialty - trauma, since the AMA Masterfile did not delineate orthopaedic subspecialties. This may have led to an underestimation of post-service work in the Harvard survey.

Given this information, we believe there is compelling evidence that not all involved specialties were involved in the review of these codes.

- ***Evidence that technology has changed physician work.***

Surgical treatment using open anatomical reduction and internal fixation has been made more complex with the introduction of new imaging methods such as CT which allow better detection of the fracture pathology and provided the basis for new surgical strategies. There are also new internal fixation devices which require more work. Beginning in the 1990s (after the Harvard study), new plates were developed for fracture repair, with most becoming available in the late 1990s and early 2000s. As an example of the complexity of the decision process in current practice, the 1990's have given the surgeon numerous options for bone fixation. The options for a bone fixation device currently include Kirschner wires, wire, staples, screws, as well as newer alternatives such as headless bone screws, T-screws, absorbable pins, cannulated screws, and a myriad of plates. The goal of all these devices remains constant: that is, to achieve stable approximation of bone fragments to facilitate healing. The various devices afford rigid fixation along with compression of the osseous fragments. This allows early range of motion and preservation of surrounding joint function, as well as primary bone healing. Selection of the most advantageous form of fixation is dependent on many factors and takes considerable time in the pre-evaluation of a patient. These include the type of fracture or osteotomy created, bone density, type of bone, and the desire for interfragmental compression. All of this has resulted in more work. The standards of care (fracture reduction, limb alignment, etc.) have also been elevated by literature that shows fracture displacements and poor alignments lead to poorer results. Additionally, women over 50 is a fast growing segment of our population. A huge percentage of these patients are osteoporotic - making fracture fixation and maintenance of fixation far more difficult than it used to be. The new plates are more complex to insert when the underlying bone is of much poorer quality.

Given this information, we believe there is compelling evidence that ORIF is more complex than 5 years ago and this is even more true in comparison to practice in the late 1980s (or more than 25 years ago).

- ***Evidence that incorrect assumptions were made in the previous valuation of the service; a misleading vignette and/or survey in a previous evaluation***

During the period of 1989-1991 (after the Harvard study), a major effort was undertaken by the AAOS and the OTA to rewrite every fracture and dislocation treatment code in the musculoskeletal Section of CPT. In 1991, 395 code changes were accepted by the AMA CPT Editorial Panel under the leadership of Dr. William Felts. At the time of the original proposal, some of the code descriptors were changed from those submitted (presumably by the CPT staff), and published in the 1992 and subsequent editions. Some of the changes in the descriptors published in CPT 1992 didn't make sense, but in those years, the CPT process was closed-door. Additionally, in 1992 and 1993 the AMA staff were deluged by the implementation of the RBRVS process and though AAOS and OTA requested that these problems be addressed then, AMA CPT staff asked that it be deferred as their "plate was full." After that time, more important issues and other opportunities consumed the resources of the AAOS and inertia (or the lack thereof) took over. This third five year review, after completion of the practice expense review, allowed AAOS a window of time to again try to correct the nomenclature for these codes, and review their work using the standard RUC survey method.

We also note, that at the time of the original CPT proposal, external fixation was considered an adjunctive procedure. CPT instructed that the codes for external fixation (20690 and 20692) be "listed in addition to the code for the treatment ...of the fracture." This concept still applies today. External fixation can be used as an adjunctive stabilization modality when treating fractures by almost any method. However, external fixation can also be used in reconstructive orthopaedics (for example, the treatment of joint contractures) and for non-musculoskeletal system treatments (for example, as a suspension device in the treatment of lower extremity burns). In 1991, there was no Modifier -51 exempt code category. Today, these same codes, 20690 and 20692 for external fixator application are modifier -51 exempt, recognizing that they can stand alone or be used adjunctively. Because of the modifier -51 exemption, the RVUs have been reduced, so payers are not paying double when either of these codes are reported with another treatment code.

In the 2005 comment letter to CMS, the AAOS recommended examining the physician work for the ORIF codes because the code descriptors lacked clarity. In particular, because the CPT descriptors include the phrase "with or without internal or external fixation," it is difficult to imagine what the Harvard survey data actually represents (ie, no typical patient was described for the survey respondents to focus on). Further, after the descriptors for these codes were changed for CPT 1993, an Abt study was performed in 1992 for RUC consideration. This study produced *percentage* relationships to key reference codes, but not surveyed time and visit data. Some of these recommendations were accepted by the RUC and CMS and others were adjusted up or down, but no changes were made to the Harvard time and visit data, if available. Therefore, we believe that there is little, if any, relationship between the Harvard database time and visit information (from the old CPT codes) and the current work RVUs.

Given this information, we believe there is compelling evidence that the current work values and/or time and visit data may be incorrect and outdated and should be reviewed.

A survey was sent to orthopaedic surgeons representing orthopaedic trauma, general orthopaedics, and hip & knee surgery. A consensus panel of experts representing orthopaedic subspecialty societies (general orthopaedics, arthroscopy, trauma, hip & knee, foot & ankle, total joint, sports medicine) reviewed the survey data compared with tl reference code and other orthopaedic services.

We are recommending a work RVU of 14.38 which is the 25% survey result with a IWPUT of .060 which is the same as the IWPUT for 27236, our key reference service. Our key comparison service was 27236, with a work RVU of 17.36, intra-service time of 90 minutes, four total post-operative hospital visit days plus one discharge day, and four

total post-operative office visit days with 3 99213's and 1 99212. The total time for our comparison code 27236 is 473. We felt the survey median RVU for 27248 of 16.00 was slightly higher than the procedure warrants. The 14.38 value maintains an appropriate relativity with the other knee and hip fracture codes as well as with the key reference service, 27236, which has a RUC validated work RVU of 17.43 but has more intra-service time (appropriate because 27248 does not take quite as long) and 27236 also has more post operative hospital visits than the surveyed code, 27248. The pre-service time for 27248 is 20 minutes for evaluation time, 20 minutes positioning and 15 minutes scrub, dress and wait time. The median intra-service (skin-to-skin) time for 27248 is 60 minutes, which we believe is appropriate. The survey immediate post service time was 30 minutes, which again we believe to be appropriate. We are recommending three total hospital visits, 1-99233, 1-99232 and 1-99231 plus one discharge day, 99238. We are recommending 4 post-operative office visits, 2-99213 and 2-99212, which is consistent with the recommended post-operative office visits for many of the other Hip and Knee Fracture codes, as well as being the same office visit package as the comparison code 23236.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No
   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FIVE YEAR REVIEW SPECIFIC QUESTIONS:

Please indicate the number of survey respondent percentages responding to each of the following questions (for example 0.05 = 5%):
Has the work of performing this service changed in the past 5 years? Yes 28% No 72%
(Use the subset of the people who responded "Yes" to answer the following questions)

A. This service represents new technology that has become more familiar (i.e., less work):
   I agree 25% I do not agree 75%
B. Patients requiring this service are now:
   more complex (more work) 100% less complex (less work) 0% no change 0%
C. The usual site-of-service has changed:
   from outpatient to inpatient 0% from inpatient to outpatient 8% no change 92%

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
2005 FIVE YEAR REVIEW - SUMMARY OF RECOMMENDATION

CPT Code:27511 Tracking Number F35 Specialty Society Recommended RVU: **18.05**
Global Period: 090 RUC Recommended RVU: **18.05**

CPT Descriptor: Open treatment of femoral supracondylar or transcondylar fracture without intercondylar extension, includes internal fixation, when performed

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 35-year-old male sustains a supracondylar femur fracture requiring open reduction and internal fixation.

Percentage of Survey Respondents who found Vignette to be Typical: 67%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: • Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
- Verify that all required instruments and supplies are available
- Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulati drapes
- Assess position of the extremities and head, adjust as needed
- The patient's leg is placed properly on the table and positioned with proper bolstering to aid surgical exposure.
- Indicate areas of skin to be prepped and mark surgical incisions
- A tourniquet is placed on the proximal thigh
- The leg is prepped and draped.
-
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work: The leg is elevated and exsanguinated; the pneumatic tourniquet is inflated. An incision is made over the lateral side of the leg extending from the articular surface approximately 15 cm proximal to the knee. The dissection is carried down to the fascia lata which is split. Subsequently, the vastus lateralis posterior edge is identified. Careful dissection is performed along the posterior aspect of this as the femoral shaft is approached. All of the perforating branches from the profunda femoris artery are identified and electrocauterized or ligated. The fracture site is identified. The fracture hematoma is cleaned out. A provisional reduction is achieved by longitudinal traction of the leg. This may require use of a femoral distractor. A locking type plate is applied to the lateral cortex. Screws are placed into the femoral condyle with their length checked and confirmed fluoroscopically. Then screws are placed into the proximal portion of the femur in a similar manner. The quality of the reduction in the AP and lateral radiographs is checked either with a fluoroscopic unit or with permanent radiographs. Subsequently, all of the screws are checked and tensioned again, and additional screws are added. The wounds are irrigated, the tourniquet is deflated, hemostasis is achieved, and the layers are closed sequentially beginning with the vastus lateralis, then the fascia lata, the subcutaneo tissues and then the skin. .

Description of Post-Service Work: Post-service work: in facility
- Application of dressing and brace.
- Monitor patient stabilization in the recovery room.

- Consultation with the family and patient regarding the surgery and postoperative regimen.
- Communication with health care professionals including written and oral reports and orders.
- Postoperative care is coordinated with recovery room nursing staff.
- The patient's vital signs are checked.

he limb is positioned in a CPM device.

- The circulation, sensation and motor function of the operated extremity are assessed.
- The patient is discharged to the orthopaedic floor for monitoring of compartment syndrome. This requires removing and reapplying the dressings.

Dictation of an operative report

- Procedure note is written in the patient chart

Discharge day:

- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Physical therapy for the uses of crutches or walker is ordered
- Write prescriptions for medications needed post-discharge.
- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of splint/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound

Order occupational therapy

Supervision of rehabilitation

- Monitor physical therapy
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions
- Dictate progress notes for medical record

COMPELLING EVIDENCE RATIONALE (Required to be Completed)
Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

- ***Evidence that incorrect assumptions were made in the previous valuation of the service, as documented; a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data***

  This code was never surveyed by Harvard. The current RVW is based on an Abt study that did not collect time and visit information, but "relative" RVW based on an algorithm.

  Given this information, we believe there is compelling evidence that the current value may be flawed and without evidence.

- ***Evidence that technology has changed physician work.***

  Surgical treatment using open anatomical reduction and internal fixation has been made more complex with the introduction of new imaging methods such as CT which allow better detection of the fracture pathology and provided the basis for new surgical strategies. There are also new internal fixation devices which require more work. Beginning in the 1990s (after the Harvard study), new plates were developed for fracture repair, with most becoming available in the late 1990s and early 2000s. As an example of the complexity of the decision process in current practice, the 1990's have given the surgeon numerous options for bone fixation. The options for a bone fixation device currently include Kirschner wires, wire, staples, screws, as well as newer alternatives such as headless bone screws, T-screws, absorbable pins, cannulated screws, and a myriad of plates. The goal of all these devices remains constant: that is, to achieve stable approximation of bone fragments to facilitate healing. The various devices afford rigid fixation along with compression of the osseous fragments. This allows early range of motion and preservation of surrounding joint function, as well as primary bone healing. Selection of the most advantageous form of fixation is dependent on many factors and takes considerable time in the pre-evaluation of a patient. These include the type of fracture or osteotomy created, bone density, type of bone, and the desire for interfragmental compression. All of this has resulted in more work. The standards of care (fracture reduction, limb alignment, etc.) have also been elevated by literature that shows fracture displacements and poor alignments lead to poorer results. Additionally, women over 50 is a fast growing segment of our population. A huge percentage of these patients are osteoporotic - making fracture fixation and maintenance of fixation far more difficult than it used to be. The new plates are more complex to insert when the underlying bone is of much poorer quality.

  Given this information, we believe there is compelling evidence that ORIF is more complex than 5 years ago and this is even more true in comparison to practice in the late 1980s (or more than 25 years ago).

- ***Evidence that incorrect assumptions were made in the previous valuation of the service; a misleading vignette and/or survey in a previous evaluation***

  During the period of 1989-1991 (after the Harvard study), a major effort was undertaken by the AAOS and the OTA to rewrite every fracture and dislocation treatment code in the musculoskeletal Section of CPT. In 1991, 395 code changes were accepted by the AMA CPT Editorial Panel under the leadership of Dr. William Felts. At the time of the original proposal, some of the code descriptors were changed from those submitted (presumably by the CPT staff), and published in the 1992 and subsequent editions. Some of the changes in the descriptors published in CPT 1992 didn't make sense, but in those years, the CPT process was closed-door. Additionally, in 1992 and 1993 the AMA staff were deluged by the implementation of the RBRVS process and though AAOS and OTA requested that these problems be addressed then, AMA CPT staff asked that it be deferred as their "plate was full." After that time, more important issues and other opportunities consumed the resources of the AAOS and inertia (or the lack thereof) took over. This third five year review, after completion of the practice expense review, allowed AAOS a window of time to again try to correct the nomenclature for these codes, and review their work using the standard RUC survey method.

  We also note, that at the time of the original CPT proposal, external fixation was considered an adjunctive procedure. CPT instructed that the codes for external fixation (20690 and 20692) be "listed in addition to the code for the treatment ...of the fracture." This concept still applies today. External fixation can be used as an adjunctive stabilization modality when treating fractures by almost any method. However, external fixation can also be used in reconstructive orthopaedics (for example, the treatment of joint contractures) and for non-musculoskeletal system treatments (for example, as a suspension device in the treatment of lower extremity burns). In 1991, there was no Modifier -51 exempt code category. Today, these same codes, 20690 and 20692 for external fixator application are modifier -51 exempt, recognizing that they can stand alone or be used adjunctively. Because of the modifier -51 exemption, the RVUs have been reduced, so payers are not paying double when either of these codes are reported with another treatment code.

  In the 2005 comment letter to CMS, the AAOS recommended examining the physician work for the ORIF codes because the code descriptors lacked clarity. In particular, because the CPT descriptors include the phrase "with or without internal or external fixation," it is difficult to imagine what the Harvard survey data actually represents (ie, no typical patient was described for the survey respondents to focus on). Further, after the descriptors for these codes were changed for CPT 1993, an Abt study was performed in 1992 for RUC consideration. This study produced *percentage* relationships to key reference codes, but not surveyed time and visit data. Some of these recommendations were accepted by the RUC and CMS and others were adjusted up or down, but no changes were made to the Harvard time and visit data, if available. Therefore, we believe that there is little, if any, relationship between the Harvard database time and visit information (from the old CPT codes) and the current work RVUs.

  Given this information, we believe there is compelling evidence that the current work values and/or time and visit data may be incorrect and outdated and should be reviewed.

A survey was sent to orthopaedic surgeons representing orthopaedic trauma, general orthopaedics, and hip & knee surgery. A consensus panel of experts representing orthopaedic subspecialty societies (general orthopaedics. arthroscopy, trauma, hip & knee, foot & ankle, total joint, sports medicine) reviewed the survey data compared with the reference code and other orthopaedic services.

We are recommending a work RVU of 20.96 which is the median survey result. Our key comparison service was 27447, with a work RVU of 23.04, intra-service time of 124 minutes, four total post-operative hospital visit days plus one discharge day, and four total post-operative office visit days with 1-99214, 2-99213 and 1- 99212. The total time for our comparison code 27447 is 469. We felt the survey median RVU for 27511 of 20.96 is appropriate for the service and maintains an appropriate relativity with the other knee and hip fracture codes as well as with the key reference service, 27447, which has a RUC validated work RVU of 23.04 but has more intra-service time and more post operative hospital and office visits than the surveyed code, 27511. The pre-service time for 27511 is 15 minutes for evaluation

time, 15 minutes positioning and 15 minutes scrub, dress and wait time. The median intra-service (skin-to-skin) time for 27511 is 120 minutes, which we believe is appropriate. The survey immediate post service time was 20 minutes, which again we believe to be appropriate. We are recommending three total hospital visits, 1-99233, 1-99232 and 1-99231 plus one discharge day, 99238 which is consistent with the other Hip and Knee Fracture codes in this family. We are recommending 4 post-operative office visits, 2-99213 and 2-99212, which is consistent with the recommended post-operative office visits for those Hip and Knee Fracture codes that are similar in work, and maintains relativity with the reference code, 27447 which has one more post-operative office visit at a higher level. The IWPUT for 27511 is .088 which we believe is appropriate for a service of this complexity.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No
   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FIVE YEAR REVIEW SPECIFIC QUESTIONS:

Please indicate the number of survey respondent percentages responding to each of the following questions (for example 0.05 = 5%):
Has the work of performing this service changed in the past 5 years? Yes 40% No 60%
(Use the subset of the people who responded "Yes" to answer the following questions)

A. This service represents new technology that has become more familiar (i.e., less work):
   I agree 24% I do not agree 76%
B. Patients requiring this service are now:
   more complex (more work) 100% less complex (less work) 0% no change 0%
C. The usual site-of-service has changed:
   from outpatient to inpatient 0% from inpatient to outpatient 8% no change 92%

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
2005 FIVE YEAR REVIEW - SUMMARY OF RECOMMENDATION

CPT Code:27513 Tracking Number F36 Specialty Society Recommended RVU: **23.04**
Global Period: 090 RUC Recommended RVU: **23.04**

CPT Descriptor: Open treatment of femoral supracondylar or transcondylar fracture with intercondylar extension, includes internal fixation, when performed

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 35-year-old male sustains a supracondylar femur fracture requiring open reduction and internal fixation.

Percentage of Survey Respondents who found Vignette to be Typical: 67%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: • Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
- Verify that all required instruments and supplies are available
- Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulati drapes
- Assess position of the extremities and head, adjust as needed
- The patient's leg is placed properly on the table and positioned with proper bolstering to aid surgical exposure.
- Indicate areas of skin to be prepped and mark surgical incisions
- A tourniquet is placed on the proximal thigh
- The leg is prepped and draped.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work: The leg is elevated and exsanguinated; the pneumatic tourniquet is inflated. A midline or lateral incision is made and an arthrotomy is performed. A careful dissection occurs into the knee joint. The articular fragments will be carefully preserved. The fracture fragments are all identified and an attempt is made to achieve an anatomic reduction of the articular surface. This may require several attempts at reduction and passage of K-wires for provisional fixation and then placement of lag compression screws. These are carefully placed either very anteriorly or very posteriorly in order to allow fixation of the distal femur to the more proximal femur. The quality of this reduction is checked under fluoroscopic or radiographic guidance. Further fixation of the condyles of the femur to the femoral shaft is performed either with an intramedullary rod which is passed through the intercondylar notch up into the proximal aspect of the femur with locking screws being placed through the femoral condyles and through the more proximal femur or a lateral plate is used, requiring additional screws placed through a separate incision. The lag screws distally are checked for position fluoroscopically. The quality of the reduction and the position of the implants is confirmed with radiographs or fluoroscopy. The wounds are irrigated, the tourniquet is deflated, hemostasis is achieved, and the wound is closed in layers.

Description of Post-Service Work: Post-service work: in facility
- Range of motion is checked at the end of the reduction to insure that it has been well restored and a dry sterile dressing including compression and a knee brace are applied.

The limb is positioned in a knee CPM machine.

- Monitor patient stabilization in the recovery room.
- Consultation with the family and patient regarding the surgery and postoperative regimen.
- Communication with health care professionals including written and oral reports and orders.

Dictation of an operative report

- Procedure note is written in the patient chart
- Postoperative care is coordinated with recovery room nursing staff.
- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- The patient is discharged to the orthopaedic floor for monitoring of compartment syndrome. This requires removing and reapplying the dressings.

Discharge day:

- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Physical therapy for the uses of crutches or walker is ordered
- Write prescriptions for medications needed post-discharge.
- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of splint/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order occupational therapy

Supervision of rehabilitation

- Monitor physical therapy
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions
- Dictate progress notes for medical record

Post-Service intensity/complexity	3.45	3.40

COMPELLING EVIDENCE RATIONALE (Required to be Completed)

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

- ***Evidence that incorrect assumptions were made in the previous valuation of the service, as documented; a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data***

  This code was never surveyed by Harvard. The current RVW is based on an Abt study that did not collect time and visit information, but "relative" RVW based on an algorithm.

  Given this information, we believe there is compelling evidence that the current value may be flawed and without evidence.

- ***Evidence that technology has changed physician work.***

  Surgical treatment using open anatomical reduction and internal fixation has been made more complex with the introduction of new imaging methods such as CT which allow better detection of the fracture pathology and provided the basis for new surgical strategies. There are also new internal fixation devices which require more work. Beginning in the 1990s (after the Harvard study), new plates were developed for fracture repair, with most becoming available in the late 1990s and early 2000s. As an example of the complexity of the decision process in current practice, the 1990's have given the surgeon numerous options for bone fixation. The options for a bone fixation device currently include Kirschner wires, wire, staples, screws, as well as newer alternatives such as headless bone screws, T-screws, absorbable pins, cannulated screws, and a myriad of plates. The goal of all these devices remains constant: that is, to achieve stable approximation of bone fragments to facilitate healing. The various devices afford rigid fixation along with compression of the osseous fragments. This allows early range of motion and preservation of surrounding joint function, as well as primary bone healing. Selection of the most advantageous form of fixation is dependent on many factors and takes considerable time in the pre-evaluation of a patient. These include the type of fracture or osteotomy created, bone density, type of bone, and the desire for interfragmental compression. All of this has resulted in more work. The standards of care (fracture reduction, limb alignment, etc.) have also been elevated by literature that shows fracture displacements and poor alignments lead to poorer results. Additionally, women over 50 is a fast growing segment of our population. A huge percentage of these patients are osteoporotic - making fracture fixation and maintenance of fixation far more difficult than it used to be. The new plates are more complex to insert when the underlying bone is of much poorer quality.

  Given this information, we believe there is compelling evidence that ORIF is more complex than 5 years ago and this is even more true in comparison to practice in the late 1980s (or more than 25 years ago).

- ***Evidence that incorrect assumptions were made in the previous valuation of the service; a misleading vignette and/or survey in a previous evaluation***

During the period of 1989-1991 (after the Harvard study), a major effort was undertaken by the AAOS and the OTA to rewrite every fracture and dislocation treatment code in the musculoskeletal Section of CPT. In 1991, 395 code changes were accepted by the AMA CPT Editorial Panel under the leadership of Dr. William Felts. At the time of the original proposal, some of the code descriptors were changed from those submitted (presumably by the CPT staff), and published in the 1992 and subsequent editions. Some of the changes in the descriptors published in CPT 1992 didn't make sense, but in those years, the CPT process was closed-door. Additionally, in 1992 and 1993 the AMA staff were deluged by the implementation of the RBRVS process and though AAOS and OTA requested that these problems be addressed then, AMA CPT staff asked that it be deferred as their "plate was full." After that time, more important issues and other opportunities consumed the resources of the AAOS and inertia (or the lack thereof) took over. This third five year review, after completion of the practice expense review, allowed AAOS a window of time to again try to correct the nomenclature for these codes, and review their work using the standard RUC survey method.

We also note, that at the time of the original CPT proposal, external fixation was considered an adjunctive procedure. CPT instructed that the codes for external fixation (20690 and 20692) be "listed in addition to the code for the treatment ...of the fracture." This concept still applies today. External fixation can be used as an adjunctive stabilization modality when treating fractures by almost any method. However, external fixation can also be used in reconstructive orthopaedics (for example, the treatment of joint contractures) and for non-musculoskeletal system treatments (for example, as a suspension device in the treatment of lower extremity burns). In 1991, there was no Modifier -51 exempt code category. Today, these same codes, 20690 and 20692 for external fixator application are modifier -51 exempt, recognizing that they can stand alone or be used adjunctively. Because of the modifier -51 exemption, the RVUs have been reduced, so payers are not paying double when either of these codes are reported with another treatment code

In the 2005 comment letter to CMS, the AAOS recommended examining the physician work for the ORIF codes because the code descriptors lacked clarity. In particular, because the CPT descriptors include the phrase "with or without internal or external fixation," it is difficult to imagine what the Harvard survey data actually represents (ie, no typical patient was described for the survey respondents to focus on). Further, after the descriptors for these codes were changed for CPT 1993, an Abt study was performed in 1992 for RUC consideration. This study produced *percentage* relationships to key reference codes, but not surveyed time and visit data. Some of these recommendations were accepted by the RUC and CMS and others were adjusted up or down, but no changes were made to the Harvard time and visit data, if available. Therefore, we believe that there is little, if any, relationship between the Harvard database time and visit information (from the old CPT codes) and the current work RVUs.

Given this information, we believe there is compelling evidence that the current work values and/or time and visit data may be incorrect and outdated and should be reviewed.

A survey was sent to orthopaedic surgeons representing orthopaedic trauma, general orthopaedics, and hip & knee surgery. A consensus panel of experts representing orthopaedic subspecialty societies (general orthopaedics, arthroscopy, trauma, hip & knee, foot & ankle, total joint, sports medicine) reviewed the survey data compared with the reference code and other orthopaedic services.
We are recommending a work RVU of 23.04 which is the median survey result. Our key comparison service was 27447, with a work RVU of 23.04, intra-service time of 124 minutes, four total post-operative hospital visit days plus one discharge day, and four total post-operative office visit days with 1-99214, 2-99213 and 1- 99212. The total time for our comparison code 27447 is 469. We felt the survey median RVU for 27513 of 23.04 is appropriate for the servi and maintains an appropriate relativity with the other knee and hip fracture codes as well as with the key referenc service, 27447, which has the same work RVU as we are recommending and we believe these two codes, while slightly different in terms of times, are collectively similar. 27447 has a RVU of 23.04 with less intra-service time and more post operative hospital and office visits than the surveyed code, 27513. The IWPUT for 27513 (.083) is lower than the IWPUT for 27447 which we believe is appropriate when comparing the levels of intensity. The pre-service time for

27513 is 15 minutes for evaluation time, 15 minutes positioning and 15 minutes scrub, dress and wait time. The median intra-service (skin-to-skin) time for 27513 is 145 minutes, which we believe is appropriate. The survey immediate post service time was 20 minutes, which again we believe to be appropriate. We are recommending three total hospital visits, 1-99233, 1-99232 and 1-99231 plus one discharge day, 99238 which is consistent with the hospital visits recommended or other Hip and Knee fracture codes. We are recommending 4 post-operative office visits, 2-99213 and 2-99212, which is consistent with the recommended post-operative office visits for those Hip and Knee Fracture codes that are similar in work, and maintains relativity with the reference code, 27447 which has one more post-operative office visit at a higher level.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No
   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FIVE YEAR REVIEW SPECIFIC QUESTIONS:

Please indicate the number of survey respondent percentages responding to each of the following questions (for example 0.05 = 5%):
Has the work of performing this service changed in the past 5 years? Yes 51% No 49%
(Use the subset of the people who responded "Yes" to answer the following questions)

A. This service represents new technology that has become more familiar (i.e., less work):
   I agree 36% I do not agree 64%
B. Patients requiring this service are now:
   more complex (more work) 82% less complex (less work) 0% no change 18%
C. The usual site-of-service has changed:
   from outpatient to inpatient 0% from inpatient to outpatient 5% no change 95%

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
2005 FIVE YEAR REVIEW - SUMMARY OF RECOMMENDATION

CPT Code:27514 Tracking Number F37 Specialty Society Recommended RVU: **17.43**
Global Period: 090 RUC Recommended RVU: **17.43**

CPT Descriptor: Open treatment of femoral supracondylar or transcondylar fracture with intercondylar extension, includes internal fixation, when performed

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 55-year-old female trips and sustains a displaced fracture of the lateral femoral condyle requiring open reduction and internal fixation..

Percentage of Survey Respondents who found Vignette to be Typical: 79%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: • Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
- Verify that all required instruments and supplies are available
- Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulat. drapes
- Assess position of the extremities and head, adjust as needed
- The patient's leg is placed properly on the table and positioned with proper bolstering to aid surgical exposure.
- Indicate areas of skin to be prepped and mark surgical incisions
- A tourniquet is placed on the proximal thigh
- The leg is prepped and draped.
-
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work: The leg is elevated and exsanguinated; the pneumatic tourniquet is inflated. An incision is made over the lateral side of the limb extending from the articular surface approximately 15 cm from the knee. The dissection is carried down to the fascia lata which is split. Subsequently, the vastus lateralis posterior edge is identified. Careful dissection is performed along the posterior aspect of this as the femoral shaft is approached. All of the perforating vessels from the profunda femoris artery are identified and electrocauterized or ligated. The fracture site is identified. The knee joint will need to be exposed via an arthtotomy. The articular surface identified by direct visualization. This requires extending the incision more distally. Anatomic reduction will be required. This will be achieved by manipulation of the fracture fragments and then placement of provisional K-wires and then lag screws to hold them into place, and then an additional buttress plate will be applied to the lateral cortex in order to provide additional stability. The reduction will be checked in AP and lateral views to insure that both the articular surface has been congruently replaced and that the fracture reduction sits in an anatomic position. The wounds are irrigated, the tourniquet is deflated, hemostasis is achieved, and the fascia lata is reapproximated using interrupted suture and then r' subcutaneous tissue and skin are reapproximated .

Description of Post-Service Work: Post-service work: in facility
- Range of motion is checked at the end of the reduction to insure that it has been well restored and a dry sterile dressing including compression and a knee brace are applied.

The limb is positioned in a CPM machine.

- Monitor patient stabilization in the recovery room.
- Consultation with the family and patient regarding the surgery and postoperative regimen.
- Communication with health care professionals including written and oral reports and orders.
- Postoperative care is coordinated with recovery room nursing staff.

Dictation of an operative report

- Procedure note is written in the patient chart
- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- The patient is discharged to the orthopaedic floor for monitoring of compartment syndrome. This requires removing and reapplying the dressings.

Discharge day:

- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Physical therapy for the uses of crutches or walker is ordered
- Write prescriptions for medications needed post-discharge.
- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of splint/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity

Redress wound

Order occupational therapy

- Supervision of rehabilitation
- Monitor physical therapy
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions
- Dictate progress notes for medical record

COMPELLING EVIDENCE RATIONALE (Required to be Completed)

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

- ***Evidence that incorrect assumptions were made in the previous valuation of the service, as documented; a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data***

Harvard utilized the AMA Physician Masterfile to draw names for their surveys. While general orthopaedic surgeons can perform open reduction fracture care, it is more typical for patients to be referred to orthopaedic surgeons who specialize in orthopaedic trauma or in a given anatomical area (eg, shoulder, hand, knee, etc.). We do not believe that all specialty surgeons were surveyed for these codes, especially with respect to the primary provider subspecialty - trauma, since the AMA Masterfile did not delineate orthopaedic subspecialties. This may have led to an underestimation of post-service work in the Harvard survey.

Given this information, we believe there is compelling evidence that not all involved specialties were involved in the review of these codes.

- ***Evidence that technology has changed physician work.***

Surgical treatment using open anatomical reduction and internal fixation has been made more complex with the introduction of new imaging methods such as CT which allow better detection of the fracture pathology and provided the basis for new surgical strategies. There are also new internal fixation devices which require more work. Beginning in the 1990s (after the Harvard study), new plates were developed for fracture repair, with most becoming available in the late 1990s and early 2000s. As an example of the complexity of the decision process in current practice, the 1990's have given the surgeon numerous options for bone fixation. The options for a bone fixation device currently include Kirschner wires, wire, staples, screws, as well as newer alternatives such as headless bone screws, T-screws, absorbable pins, cannulated screws, and a myriad of plates. The goal of all these devices remains constant: that is, to achieve stable approximation of bone fragments to facilitate healing. The various devices afford rigid fixation along with compression of the osseous fragments. This allows early range of motion and preservation of surrounding joint function, as well as primary bone healing. Selection of the most advantageous form of fixation is dependent on many factors and takes considerable time in the pre-evaluation of a patient. These include the type of fracture or osteotomy created, bone density, type of bone, and the desire for interfragmental compression. All of this has resulted in more work. The standards of care (fracture reduction, limb alignment, etc.) have also been elevated by literature that shows fracture displacements and poor alignments lead to poorer results. Additionally, women over 50 is a fast growing segment of our population. A huge percentage of these patients are osteoporotic - making fracture fixation and maintenance of fixation far more difficult than it used to be. The new plates are more complex to insert when the underlying bone is of much poorer quality.

Given this information, we believe there is compelling evidence that ORIF is more complex than 5 years ago and this is even more true in comparison to practice in the late 1980s (or more than 25 years ago).

- ***Evidence that incorrect assumptions were made in the previous valuation of the service; a misleading vignette and/or survey in a previous evaluation***

During the period of 1989-1991 (after the Harvard study), a major effort was undertaken by the AAOS and the OTA to rewrite every fracture and dislocation treatment code in the musculoskeletal Section of CPT. In 1991, 395 code changes were accepted by the AMA CPT Editorial Panel under the leadership of Dr. William Felts. At the time of the original proposal, some of the code descriptors were changed from those submitted (presumably by the CPT staff), and published in the 1992 and subsequent editions. Some of the changes in the descriptors published in CPT 1992 didn't make sense, but in those years, the CPT process was closed-door. Additionally, in 1992 and 1993 the AMA staff were deluged by the implementation of the RBRVS process and though AAOS and OTA requested that these problems be addressed then, AMA CPT staff asked that it be deferred as their "plate was full." After that time, more important issues and other opportunities consumed the resources of the AAOS and inertia (or the lack thereof) took over. This third five year review, after completion of the practice expense review, allowed AAOS a window of time to again try to correct the nomenclature for these codes, and review their work using the standard RUC survey method.

We also note, that at the time of the original CPT proposal, external fixation was considered an adjunctive procedure. CPT instructed that the codes for external fixation (20690 and 20692) be "listed in addition to the code for the treatment ...of the fracture." This concept still applies today. External fixation can be used as an adjunctive stabilization modality when treating fractures by almost any method. However, external fixation can also be used in reconstructive orthopaedics (for example, the treatment of joint contractures) and for non-musculoskeletal system treatments (for example, as a suspension device in the treatment of lower extremity burns). In 1991, there was no Modifier -51 exempt code category. Today, these same codes, 20690 and 20692 for external fixator application are modifier -51 exempt, recognizing that they can stand alone or be used adjunctively. Because of the modifier -51 exemption, the RVUs have been reduced, so payers are not paying double when either of these codes are reported with another treatment code.

In the 2005 comment letter to CMS, the AAOS recommended examining the physician work for the ORIF codes because the code descriptors lacked clarity. In particular, because the CPT descriptors include the phrase "with or without internal or external fixation," it is difficult to imagine what the Harvard survey data actually represents (ie, no typical patient was described for the survey respondents to focus on). Further, after the descriptors for these codes were changed for CPT 1993, an Abt study was performed in 1992 for RUC consideration. This study produced *percentage* relationships to key reference codes, but not surveyed time and visit data. Some of these recommendations were accepted by the RUC and CMS and others were adjusted up or down, but no changes were made to the Harvard time and visit data, if available. Therefore, we believe that there is little, if any, relationship between the Harvard database time and visit information (from the old CPT codes) and the current work RVUs.

Given this information, we believe there is compelling evidence that the current work values and/or time and visit data may be incorrect and outdated and should be reviewed.

A survey was sent to orthopaedic surgeons representing orthopaedic trauma, general orthopaedics, and hip & knee surgery. A consensus panel of experts representing orthopaedic subspecialty societies (general orthopaedics, arthroscopy, trauma, hip & knee, foot & ankle, total joint, sports medicine) reviewed the survey data compared wit' the reference code and other orthopaedic services.

We are recommending a work RVU of 17.43 which is the 25% survey result with a IWPUT of .078 which is an (appropriately higher) IWPUT than the IWPUT of .060 for 27236, our key reference service. Our key comparison service was 27236, with a work RVU of 17.36, intra-service time of 90 minutes, four total post-operative hospital visit

days plus one discharge day, and four total post-operative office visit days with 3 99213's and 1 99212. The total time for our comparison code 27236 is 473. We felt the survey median RVU for 27248 of 19.79 was slightly higher than the procedure warrants. Our recommended valued of 17.43 is also lower than the current value for 27514 19.09 but we believe it is appropriate to lower the work RVU for this procedure. The 17.43 value maintains an appropriate relativity with the other knee and hip fracture codes as well as with the key reference service, 27236, which has a RUC validated work RVU of 17.43 but has more post operative hospital visits than the surveyed code, 27514. The pre-service time for 27248 is 15 minutes for evaluation time, 15 minutes positioning and 15 minutes scrub, dress and wait time. The median intra-service (skin-to-skin) time for 27514 is 90 minutes, which we believe is appropriate. The survey immediate post service time was 20 minutes, which again we believe to be appropriate. We are recommending three total hospital visits, 1-99233, 1-99232 and 1-99231 plus one discharge day, 99238 which is consistent with the post-operative hospital visit package for other surveyed Hip and Knee Fracture codes. Finally, we are recommending 4 post-operative office visits, 2-99213 and 2-99212, which is consistent with the recommended post-operative office visits for many of the other Hip and Knee Fracture codes.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No
   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FIVE YEAR REVIEW SPECIFIC QUESTIONS:

Please indicate the number of survey respondent percentages responding to each of the following questions (for example 0.05 = 5%):
Has the work of performing this service changed in the past 5 years? Yes 31% No 69%
(Use the subset of the people who responded "Yes" to answer the following questions)

A. This service represents new technology that has become more familiar (i.e., less work):
   I agree 0% I do not agree 100%
B. Patients requiring this service are now:
   more complex (more work) 100% less complex (less work) 0% no change 0%
C. The usual site-of-service has changed:
   from outpatient to inpatient 0% from inpatient to outpatient 0% no change 100%

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
2005 FIVE YEAR REVIEW - SUMMARY OF RECOMMENDATION

CPT Code:27519 Tracking Number F38 Specialty Society Recommended RVU: **15.80**
Global Period: 090 RUC Recommended RVU: **15.80**

CPT Descriptor: Open treatment of distal femoral epiphyseal separation, includes internal fixation, when performed

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 10-year-old boy falls and sustains a distal femoral epiphyseal separation with a large metaphyseal fragment requiring open reduction and internal fixation.

Percentage of Survey Respondents who found Vignette to be Typical: 93%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: • Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
- Verify that all required instruments and supplies are available
- Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulati drapes
- Assess position of the extremities and head, adjust as needed
- The patient's leg is placed properly on the table and positioned with proper bolstering to aid surgical exposure.
- Indicate areas of skin to be prepped and mark surgical incisions
- A tourniquet is placed on the proximal thigh
- The leg is prepped and draped.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work: The leg is elevated and exsanguinated; the pneumatic tourniquet is inflated. An incision is made over the lateral side of the limb to the distal femur. The dissection is carried down to the fascia lata which is split in the line of direction of its fibers. The vastus lateralis is carefully elevated anteriorly with care being taken to identify the perforating vessels from the profunda femoris artery. Dissection is extremely cautious near the growth plate of the femur to minimize damage. The metaphyseal fragment is carefully identified. The fracture fragments are identified and then careful manipulation of the fracture fragments is performed in order to restore anatomic alignment of the fracture. Provisional fixation is done with K-wires. Subsequently, several cannulated screws may be applied to the metaphyseal fragment. In addition, smooth Steinmann pins are carefully placed from the medial and possibly the lateral femoral condyle in order to control rotation of the distal fragment to minimize damage of the growth plate. These may be left protruding out through the skin. The quality of the reduction is checked in AP and lateral radiographs. The wounds are irrigated, the tourniquet is deflated, hemostasis is achieved, and subcutaneous tissue and the skin are reapproximated in the standard manner.

Description of Post-Service Work: Post-service work: in facility
- Range of motion is checked at the end of the reduction to insure that it has been well restored and a dry ste dressing including compression and a knee brace are applied.
- Monitor patient stabilization in the recovery room.
- Consultation with the family and patient regarding the surgery and postoperative regimen.
- Communication with health care professionals including written and oral reports and orders.

- Postoperative care is coordinated with recovery room nursing staff.

Dictation of an operative report

- Procedure note is written in the patient chart
- The patient's vital signs are checked.

The circulation, sensation and motor function of the operated extremity are assessed.

- The patient is discharged to the orthopaedic floor for monitoring of compartment syndrome. This requires removing and reapplying the dressings.

Discharge day:

- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Physical therapy for the uses of crutches or walker is ordered
- Write prescriptions for medications needed post-discharge.
- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of splint/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order occupational therapy
- Supervision of rehabilitation
- Monitor physical therapy

Discuss progress with PCP (verbal and written)

Write medication prescriptions

- Dictate progress notes for medical record

COMPELLING EVIDENCE RATIONALE (Required to be Completed)
Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

- ***Evidence that incorrect assumptions were made in the previous valuation of the service, as documented; a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data***

Harvard utilized the AMA Physician Masterfile to draw names for their surveys. While general orthopaedic surgeons can perform open reduction fracture care, it is more typical for patients to be referred to orthopaedic surgeons who specialize in orthopaedic trauma or in a given anatomical area (eg, shoulder, hand, knee, etc.). We do not believe that all specialty surgeons were surveyed for these codes, especially with respect to the primary provider subspecialty - trauma, since the AMA Masterfile did not delineate orthopaedic subspecialties. This may have led to an underestimation of post-service work in the Harvard survey.

Given this information, we believe there is compelling evidence that not all involved specialties were involved in the review of these codes.

- ***Evidence that technology has changed physician work.***

Surgical treatment using open anatomical reduction and internal fixation has been made more complex with the introduction of new imaging methods such as CT which allow better detection of the fracture pathology and provided the basis for new surgical strategies. There are also new internal fixation devices which require more work. Beginning in the 1990s (after the Harvard study), new plates were developed for fracture repair, with most becoming available in the late 1990s and early 2000s. As an example of the complexity of the decision process in current practice, the 1990's have given the surgeon numerous options for bone fixation. The options for a bone fixation device currently include Kirschner wires, wire, staples, screws, as well as newer alternatives such as headless bone screws, T-screws, absorbable pins, cannulated screws, and a myriad of plates. The goal of all these devices remains constant: that is, to achieve stable approximation of bone fragments to facilitate healing. The various devices afford rigid fixation along with compression of the osseous fragments. This allows early range of motion and preservation of surrounding joint function, as well as primary bone healing. Selection of the most advantageous form of fixation is dependent on many factors and takes considerable time in the pre-evaluation of a patient. These include the type of fracture or osteotomy created, bone density, type of bone, and the desire for interfragmental compression. All of this has resulted in more work. The standards of care (fracture reduction, limb alignment, etc.) have also been elevated by literature that shows fracture displacements and poor alignments lead to poorer results. Additionally, women over 50 is a fast growing segment of our population. A huge percentage of these patients are osteoporotic - making fracture fixation and maintenance of fixation far more

difficult than it used to be. The new plates are more complex to insert when the underlying bone is of much poorer quality.

Given this information, we believe there is compelling evidence that ORIF is more complex than 5 years ago and this is even more true in comparison to practice in the late 1980s (or more than 25 years ago).

- ***Evidence that incorrect assumptions were made in the previous valuation of the service; a misleading vignette and/or survey in a previous evaluation***

During the period of 1989-1991 (after the Harvard study), a major effort was undertaken by the AAOS and the OTA to rewrite every fracture and dislocation treatment code in the musculoskeletal Section of CPT. In 1991, 395 code changes were accepted by the AMA CPT Editorial Panel under the leadership of Dr. William Felts. At the time of the original proposal, some of the code descriptors were changed from those submitted (presumably by the CPT staff), and published in the 1992 and subsequent editions. Some of the changes in the descriptors published in CPT 1992 didn't make sense, but in those years, the CPT process was closed-door. Additionally, in 1992 and 1993 the AMA staff were deluged by the implementation of the RBRVS process and though AAOS and OTA requested that these problems be addressed then, AMA CPT staff asked that it be deferred as their "plate was full." After that time, more important issues and other opportunities consumed the resources of the AAOS and inertia (or the lack thereof) took over. This third five year review, after completion of the practice expense review, allowed AAOS a window of time to again try to correct the nomenclature for these codes, and review their work using the standard RUC survey method.

We also note, that at the time of the original CPT proposal, external fixation was considered an adjunctive procedure. CPT instructed that the codes for external fixation (20690 and 20692) be "listed in addition to the code for the treatment ...of the fracture." This concept still applies today. External fixation can be used as an adjunctive stabilization modality when treating fractures by almost any method. However, external fixation can also be used in reconstructive orthopaedics (for example, the treatment of joint contractures) and for non-musculoskeletal system treatments (for example, as a suspension device in the treatment of lower extremity burns). In 1991, there was no Modifier -51 exempt code category. Today, these same codes, 20690 and 20692 for external fixator application are modifier -51 exempt, recognizing that they can stand alone or be used adjunctively. Because of the modifier -51 exemption, the RVUs have been reduced, so payers are not paying double when either of these codes are reported with another treatment code.

In the 2005 comment letter to CMS, the AAOS recommended examining the physician work for the ORIF codes because the code descriptors lacked clarity. In particular, because the CPT descriptors include the phrase "with or without internal or external fixation," it is difficult to imagine what the Harvard survey data actually represents (ie, no typical patient was described for the survey respondents to focus on). Further, after the descriptors for these codes were changed for CPT 1993, an Abt study was performed in 1992 for RUC consideration. This study produced *percentage* relationships to key reference codes, but not surveyed time and visit data. Some of these recommendations were accepted by the RUC and CMS and others were adjusted up or down, but no changes were made to the Harvard time and visit data, if available. Therefore, we believe that there is little, if any, relationship between the Harvard database time and visit information (from the old CPT codes) and the current work RVUs.

Given this information, we believe there is compelling evidence that the current work values and/or time and visit data may be incorrect and outdated and should be reviewed.

A survey was sent to orthopaedic surgeons representing orthopaedic trauma, general orthopaedics, and hip & knee surgery. A consensus panel of experts representing orthopaedic subspecialty societies (general orthopaedics, arthroscopy, trauma, hip & knee, foot & ankle, total joint, sports medicine) reviewed the survey data compared with the reference code and other orthopaedic services.

We are recommending a work RVU of 15.80 which is the current value for 27519 and is very near the 25th percentile survey RVU of 16.00. This yields a IWPUT of .085 which is an (appropriately higher) IWPUT than the IWPUT of .060 for 27236, our key reference service. Our key comparison service was 27236, with a work RVU of 17.36, intra-service time of 90 minutes, four total post-operative hospital visit days plus one discharge day, and four total post-operative office visit days with 3 99213's and 1 99212. The total time for our comparison code 27236 is 473. We felt the survey median RVU for 27519 of 18.00 was higher than the procedure warrants and that the 25th percentile value of 16.00 was closer to the appropriate value but still slightly high. The 15.80 value maintains an appropriate relativity with the other knee and hip fracture codes as well as with the key reference service, 27236, which has a RUC validated work RVU of 17.43 but has more post operative hospital visits than the surveyed code, 27519. The pre-service time for 27519 is 15 minutes for evaluation time, 15 minutes positioning and 15 minutes scrub, dress and wait time. The median intra-service (skin-to-skin) time for 27248 is 80 minutes, which we believe is appropriate. The survey immediate post service time was 20 minutes, which again we believe to be appropriate. We are recommending two total hospital visits, 1-99233 (the first day visit which is typically a longer and more intense patient visit than the subsequent day's hospital visit) and 1-99231 plus one discharge day, 99238 which is slightly different than the post-operative hospital visit package for other surveyed Hip and Knee Fracture codes but is warranted in this procedure as the typical patient is discharged after two days in the hospital. Finally, we are recommending 4 post-operative office visits, 2-99213 and 2-99212, which is consistent with the recommended post-operative office visits for many of the other Hip and Knee Fracture codes.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No
   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FIVE YEAR REVIEW SPECIFIC QUESTIONS:

Please indicate the number of survey respondent percentages responding to each of the following questions (for example 0.05 = 5%):
Has the work of performing this service changed in the past 5 years? Yes 21% No 79%
(Use the subset of the people who responded "Yes" to answer the following questions)

A. This service represents new technology that has become more familiar (i.e., less work):
   I agree 0% I do not agree 100%
B. Patients requiring this service are now:
   more complex (more work) 100% less complex (less work) 0% no change 0%
C. The usual site-of-service has changed:
   from outpatient to inpatient 0% from inpatient to outpatient 0% no change 100%

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
2005 FIVE YEAR REVIEW - SUMMARY OF RECOMMENDATION

CPT Code:27535 Tracking Number F39 Specialty Society Recommended RVU: **16.00**
Global Period: 090 RUC Recommended RVU: **16.00**

CPT Descriptor: Open treatment of tibial fracture, proximal (plateau); unicondylar, includes internal fixation, when performed

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 30-year-old female falls and sustains a medial tibial plateau fracture requiring open reduction and internal fixation.

Percentage of Survey Respondents who found Vignette to be Typical: 91%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: • Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
- Verify that all required instruments and supplies are available
- Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulati drapes
- Assess position of the extremities and head, adjust as needed
- The patient's leg is placed properly on the table and positioned with proper bolstering to aid surgical exposure.
- Indicate areas of skin to be prepped and mark surgical incisions
- A tourniquet is placed on the proximal thigh
- The leg is prepped and draped.
- The leg is elevated and exsanguinated.
- The pneumatic tourniquet is inflated.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work: Under anesthesia, an anterior midline incision is made. The dissection is carried down to the medial portion of the proximal tibia taking care to identify the patellar tendon and the pes anserine tendons and the tibial collateral ligament. The fracture site is identified. The portions of the tibial collateral ligament and the pes anserine tendons are carefully reflected off of the medial surface of the tibia. An arthrotomy is performed to look at the articular surface of the knee. Subsequently, a provisional reduction of the medial tibial plateau is performed with K-wires and is confirmed fluoroscopically. A proper plate is identified and bent using bending irons in order to conform to the medial portion of the tibia. Screws are placed in standard compression fashion across the fracture at the proximal tibia and extending down the shaft of the tibia. The overall length of the incision is approximately 15 cm. The quality of the reduction is checked with radiographs of the knee. An AP and lateral radiograph of the knee are obtained which are tangential to the articular surface and then the quality of the fracture reduction is separately checked with AP and lateral images of the tibia. The length of the screws is checked as well. The wounds are irrigated, the tourniquet deflated, hemostasis is achieved, and the wound is closed in layers, primarily with the subcutaneous tissue and the si being reapproximated.

Description of Post-Service Work: Post-service work: in facility

- Range of motion is checked at the end of the reduction to insure that it has been well restored and a dry sterile dressing including compression and a knee immobilizer are applied.
- Monitor patient stabilization in the recovery room.
- Consultation with the family and patient regarding the surgery and postoperative regimen.
- Communication with health care professionals including written and oral reports and orders.
- Postoperative care is coordinated with recovery room nursing staff.

Dictation of an operative report

- Procedure note is written in the patient chart
- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- The patient is discharged to the orthopaedic floor for monitoring of compartment syndrome. This requires removing and reapplying the dressings.

Discharge day:

- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Physical therapy for the uses of crutches or walker is ordered
- Write prescriptions for medications needed post-discharge.
- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of splint/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity

Redress wound

- Order occupational therapy
- Supervision of rehabilitation
- Monitor physical therapy
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions
- Dictate progress notes for medical record

COMPELLING EVIDENCE RATIONALE (Required to be Completed)

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

- ***Evidence that incorrect assumptions were made in the previous valuation of the service, as documented; a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data***

This code was never surveyed by Harvard. The current RVW is based on an Abt study that did not collect time and visit information, but "relative" RVW based on an algorithm.

Given this information, we believe there is compelling evidence that the current value may be flawed and without evidence.

- ***Evidence that technology has changed physician work.***

Surgical treatment using open anatomical reduction and internal fixation has been made more complex with the introduction of new imaging methods such as CT which allow better detection of the fracture pathology and provided the basis for new surgical strategies. There are also new internal fixation devices which require more work. Beginning in the 1990s (after the Harvard study), new plates were developed for fracture repair, with most becoming available in the late 1990s and early 2000s. As an example of the complexity of the decision process in current practice, the 1990's have given the surgeon numerous options for bone fixation. The options for a bone fixation device currently include Kirschner wires, wire, staples, screws, as well as newer alternatives such as headless bone screws, T-screws, absorbable pins, cannulated screws, and a myriad of plates. The goal of all these devices remains constant: that is, to achieve stable approximation of bone fragments to facilitate healing. The various devices afford rigid fixation along with compression of the osseous fragments. This allows early range of motion and preservation of surrounding joint function, as well as primary bone healing. Selection of the most advantageous form of fixation is dependent on many factors and takes considerable time in the pre-evaluation of a patient. These include the type of fracture or osteotomy created, bone density, type of bone, and the desire for interfragmental compression. All of this has resulted in more work. The standards of care (fracture reduction, limb alignment, etc.) have also been elevated by literature that shows fracture displacements and poor alignments lead to poorer results. Additionally, women over 50 is a fast growing segment of our population. A huge percentage of these patients are osteoporotic - making fracture fixation and maintenance of fixation far more difficult than it used to be. The new plates are more complex to insert when the underlying bone is of much poorer quality.

Given this information, we believe there is compelling evidence that ORIF is more complex than 5 years ago and this is even more true in comparison to practice in the late 1980s (or more than 25 years ago).

- ***Evidence that incorrect assumptions were made in the previous valuation of the service; a misleading vignette and/or survey in a previous evaluation***

During the period of 1989-1991 (after the Harvard study), a major effort was undertaken by the AAOS and the OTA to rewrite every fracture and dislocation treatment code in the musculoskeletal Section of CPT. In 1991, 395 code changes were accepted by the AMA CPT Editorial Panel under the leadership of Dr. William Felts. At the time of the original proposal, some of the code descriptors were changed from those submitted (presumably by the CPT staff), and published in the 1992 and subsequent editions. Some of the changes in the descriptors published in CPT 1992 didn't make sense, but in those years, the CPT process was closed-door. Additionally, in 1992 and 1993 the AMA staff were deluged by the implementation of the RBRVS process and though AAOS and OTA requested that these problems be addressed then, AMA CPT staff asked that it be deferred as their "plate was full." After that time, more important issues and other opportunities consumed the resources of the AAOS and inertia (or the lack thereof) took over. This third five year review, after completion of the practice expense review, allowed AAOS a window of time to again try to correct the nomenclature for these codes, and review their work using the standard RUC survey method.

We also note, that at the time of the original CPT proposal, external fixation was considered an adjunctive procedure. CPT instructed that the codes for external fixation (20690 and 20692) be "listed in addition to the code for the treatment ...of the fracture." This concept still applies today. External fixation can be used as an adjunctive stabilization modality when treating fractures by almost any method. However, external fixation can also be used in reconstructive orthopaedics (for example, the treatment of joint contractures) and for non-musculoskeletal system treatments (for example, as a suspension device in the treatment of lower extremity burns). In 1991, there was no Modifier -51 exempt code category. Today, these same codes, 20690 and 20692 for external fixator application are modifier -51 exempt, recognizing that they can stand alone or be used adjunctively. Because of the modifier -51 exemption, the RVUs have been reduced, so payers are not paying double when either of these codes are reported with another treatment code.

In the 2005 comment letter to CMS, the AAOS recommended examining the physician work for the ORIF code because the code descriptors lacked clarity. In particular, because the CPT descriptors include the phrase "with or without internal or external fixation," it is difficult to imagine what the Harvard survey data actually represents (ie, no typical patient was described for the survey respondents to focus on). Further, after the descriptors for these codes were changed for CPT 1993, an Abt study was performed in 1992 for RUC consideration. This study produced *percentage* relationships to key reference codes, but not surveyed time and visit data. Some of these recommendations were accepted by the RUC and CMS and others were adjusted up or down, but no changes were made to the Harvard time and visit data, if available. Therefore, we believe that there is little, if any, relationship between the Harvard database time and visit information (from the old CPT codes) and the current work RVUs.

Given this information, we believe there is compelling evidence that the current work values and/or time and visit data may be incorrect and outdated and should be reviewed.

A survey was sent to orthopaedic surgeons representing orthopaedic trauma, general orthopaedics, and hip & knee surgery. A consensus panel of experts representing orthopaedic subspecialty societies (general orthopaedics, arthroscopy, trauma, hip & knee, foot & ankle, total joint, sports medicine) reviewed the survey data compared with the reference code and other orthopaedic services.

We are recommending a work RVU of 16.00 25th percentile survey RVU. This yields a IWPUT of .074 which is an (appropriately higher) IWPUT than the IWPUT of .060 for 27236, our key reference service. Our key comparison service was 27236, with a work RVU of 17.36, intra-service time of 90 minutes, four total post-operative hospital vi days plus one discharge day, and four total post-operative office visit days with 3 99213's and 1 99212. The total tim for our comparison code 27236 is 473. We felt the survey median RVU for 27248 of 18.00 was higher than the procedure warrants and that the 25th percentile value of 16.00 represents the appropriate value. The 16.00 value maintains an appropriate relativity with the other knee and hip fracture codes as well as with the key reference service, 27236, which has a RUC validated work RVU of 17.43 but has more post operative hospital visits than the surveyed

code. The pre-service time for 27519 is 15 minutes for evaluation time, 15 minutes positioning and 15 minutes scrub, dress and wait time. The median intra-service (skin-to-skin) time for 27248 is 90 minutes, which we believe is appropriate. The survey immediate post service time was 20 minutes, which again we believe to be appropriate. We are recommending three total hospital visits plus one discharge day with values of 1-99233 (the first day visit which is ypically a longer and more intense patient visit than the subsequent day's hospital visit) and 1-99232 plus one discharge day, 99238 which is slightly different than the post-operative hospital visit package for other surveyed Hip and Knee Fracture codes but is warranted in this procedure as the typical patient is discharged after two days in the hospital. Finally, we are recommending 4 post-operative office visits, 2-99213 and 2-99212, which is consistent with the recommended post-operative office visits for many of the other Hip and Knee Fracture codes.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No
   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FIVE YEAR REVIEW SPECIFIC QUESTIONS:

Please indicate the number of survey respondent percentages responding to each of the following questions (for example 0.05 = 5%):
Has the work of performing this service changed in the past 5 years? Yes 31% No 69%
(Use the subset of the people who responded "Yes" to answer the following questions)

A. This service represents new technology that has become more familiar (i.e., less work):
   I agree 0% I do not agree 100%
B. Patients requiring this service are now:
   more complex (more work) 100% less complex (less work) 0% no change 0%
C. The usual site-of-service has changed:
   from outpatient to inpatient 0% from inpatient to outpatient 9% no change 91%

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
2005 FIVE YEAR REVIEW - SUMMARY OF RECOMMENDATION

CPT Code:27540 Tracking Number F40 Specialty Society Recommended RVU: **13.45**
Global Period: 090 RUC Recommended RVU: **13.45**

CPT Descriptor: Open treatment of intercondylar spine(s) and/or tuberosity fracture(s) of the knee, includes internal fixation, when performed

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 13-year-old boy sustains an intercondylar spine fracture when a heavy object falls on his outstretched leg requiring open reduction and internal fixation..

Percentage of Survey Respondents who found Vignette to be Typical: 84%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: • Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
- Verify that all required instruments and supplies are available
- Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regula drapes
- Assess position of the extremities and head, adjust as needed
- The patient's leg is placed properly on the table and positioned with proper bolstering to aid surgical exposure.
- Indicate areas of skin to be prepped and mark surgical incisions
- A tourniquet is placed on the proximal thigh
- The leg is prepped and draped.
- The leg is elevated and exsanguinated.
- The pneumatic tourniquet is inflated.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work: Under anesthesia, an anterior midline incision is made. An anterior medial arthrotomy is made into the knee. The hematoma is carefully evacuated and washed out. The fracture fragments are identified. The knee is inspected for damage to the lateral medial menisci and the cruciate ligaments. The fracture fragments are carefully identified and the intercondylar spine fracture is anatomically reduced provisionally with a K-wire. Subsequently, wires are passed from the proximal tibia into the intercondylar eminence fragment which allow passage of heavy sutures in order to compress to anchor this, and then additional screws are placed from the intercondylar fragment into the proximal metaphysis of the tibia. These are cannulated screws requiring placement of a K-wire, then confirmation of anatomic reduction of the fragment, and then placement of the screw into the fragment compressing the fragment into place. After the entire fixation has been done, the knee is carefully washed out. The quality of the reduction is checked with radiographs. The range of motion of the knee is examined. The stability of the knee is examined. The wounds are irrigated, the tourniquet is deflated, hemostasis is achieved, and the me parapatellar arthrotomy is reapproximated using a stout suture. The subcutaneous tissue and skin are reapproxima

Description of Post-Service Work: Post-service work: in facility

- Range of motion is checked at the end of the reduction to insure that it has been well restored and a dry sterile dressing including compression and a knee immobilizer are applied.
- Monitor patient stabilization in the recovery room.
- Consultation with the family and patient regarding the surgery and postoperative regimen.
- Communication with health care professionals including written and oral reports and orders.
- Postoperative care is coordinated with recovery room nursing staff.

Dictation of an operative report

- Procedure note is written in the patient chart
- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- The patient is discharged to the orthopaedic floor for monitoring of compartment syndrome. This requires removing and reapplying the dressings.

Discharge day:

- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Physical therapy for the uses of crutches or walker is ordered
- Write prescriptions for medications needed post-discharge.
- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of splint/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order occupational therapy
- Supervision of rehabilitation
- Monitor physical therapy
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions
- Dictate progress notes for medical record

Post-Service intensity/complexity	2.89	3.11

COMPELLING EVIDENCE RATIONALE (Required to be Completed)

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

- ***Evidence that incorrect assumptions were made in the previous valuation of the service, as documented; a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data***

Harvard utilized the AMA Physician Masterfile to draw names for their surveys. While general orthopaedic surgeons can perform open reduction fracture care, it is more typical for patients to be referred to orthopaedic surgeons who specialize in orthopaedic trauma or in a given anatomical area (eg, shoulder, hand, knee, etc.). We do not believe that all specialty surgeons were surveyed for these codes, especially with respect to the primary provider subspecialty - trauma, since the AMA Masterfile did not delineate orthopaedic subspecialties. This may have led to an underestimation of post-service work in the Harvard survey.

Given this information, we believe there is compelling evidence that not all involved specialties were involved in the review of these codes.

- ***Evidence that technology has changed physician work.***

Surgical treatment using open anatomical reduction and internal fixation has been made more complex with the introduction of new imaging methods such as CT which allow better detection of the fracture pathology and provided the basis for new surgical strategies. There are also new internal fixation devices which require more work. Beginning in the 1990s (after the Harvard study), new plates were developed for fracture repair, with most becoming available in the late 1990s and early 2000s. As an example of the complexity of the decision process in current practice, the 1990's have given the surgeon numerous options for bone fixation. The options for a bone fixation device currently include Kirschner wires, wire, staples, screws, as well as newer alternatives such as headless bone screws, T-screws, absorbable pins, cannulated screws, and a myriad of plates. The goal of all these devices remains constant: that is, to achieve stable approximation of bone fragments to facilitate healing. The various devices afford rigid fixation along with compression of the osseous fragments. This allows early range of motion and preservation of surrounding joint function, as well as primary bone healing. Selection of the most advantageous form of fixation is dependent on many factors and takes considerable time in the pre-evaluation of a patient. These include the type of fracture or osteotomy created, bone density, type of bone, and the desire for interfragmental compression. All of this has resulted in more work. The standards of care (fracture reduction, limb alignment, etc.) have also been elevated by literature that shows fracture displacements and poor alignments lead to poorer results. Additionally, women over 50 is a fast growing segment of our population. A huge percentage of these patients are osteoporotic - making fracture fixation and maintenance of fixation far more difficult than it used to be. The new plates are more complex to insert when the underlying bone is of much poorer quality.

Given this information, we believe there is compelling evidence that ORIF is more complex than 5 years ago and this is even more true in comparison to practice in the late 1980s (or more than 25 years ago).

- ***Evidence that incorrect assumptions were made in the previous valuation of the service; a misleading vignette and/or survey in a previous evaluation***

During the period of 1989-1991 (after the Harvard study), a major effort was undertaken by the AAOS and the OTA to rewrite every fracture and dislocation treatment code in the musculoskeletal Section of CPT. In 1991, 395 code changes were accepted by the AMA CPT Editorial Panel under the leadership of Dr. William Felts. At the time of the original proposal, some of the code descriptors were changed from those submitted (presumably by the CPT staff), and published in the 1992 and subsequent editions. Some of the changes in the descriptors published in CPT 1992 didn't make sense, but in those years, the CPT process was closed-door. Additionally, in 1992 and 1993 the AMA staff were deluged by the implementation of the RBRVS process and though AAOS and OTA requested that these problems be addressed then, AMA CPT staff asked that it be deferred as their "plate was full." After that time, more important issues and other opportunities consumed the resources of the AAOS and inertia (or the lack thereof) took over. This third five year review, after completion of the practice expense review, allowed AAOS a window of time to again try to correct the nomenclature for these codes, and review their work using the standard RUC survey method.

We also note, that at the time of the original CPT proposal, external fixation was considered an adjunctive procedure. CPT instructed that the codes for external fixation (20690 and 20692) be "listed in addition to the code for the treatment ...of the fracture." This concept still applies today. External fixation can be used as an adjunctive stabilization modality when treating fractures by almost any method. However, external fixation can also be used in reconstructive orthopaedics (for example, the treatment of joint contractures) and for non-musculoskeletal system treatments (for example, as a suspension device in the treatment of lower extremity burns). In 1991, there was no Modifier -51 exempt code category. Today, these same codes, 20690 and 20692 for external fixator application are modifier -51 exempt, recognizing that they can stand alone or be used adjunctively. Because of the modifier -51 exemption, the RVUs have been reduced, so payers are not paying double when either of these codes are reported with another treatment code.

In the 2005 comment letter to CMS, the AAOS recommended examining the physician work for the ORIF codes because the code descriptors lacked clarity. In particular, because the CPT descriptors include the phrase "with or without internal or external fixation," it is difficult to imagine what the Harvard survey data actually represents (ie, no typical patient was described for the survey respondents to focus on). Further, after the descriptors for these codes were changed for CPT 1993, an Abt study was performed in 1992 for RUC consideration. This study produced *percentage* relationships to key reference codes, but not surveyed time and visit data. Some of these recommendations were accepted by the RUC and CMS and others were adjusted up or down, but no changes were made to the Harvard time and visit data, if available. Therefore, we believe that there is little, if any, relationship between the Harvard database time and visit information (from the old CPT codes) and the current work RVUs.

Given this information, we believe there is compelling evidence that the current work values and/or time and visit data may be incorrect and outdated and should be reviewed.

A survey was sent to orthopaedic surgeons representing orthopaedic trauma, general orthopaedics, and hip & knee surgery. A consensus panel of experts representing orthopaedic subspecialty societies (general orthopaedics, arthroscopy, trauma, hip & knee, foot & ankle, total joint, sports medicine) reviewed the survey data compared wi the reference code and other orthopaedic services.
We are recommending a work RVU of 14.00 which is the 25% survey result. Our key comparison service was 29883, with a work RVU of 11.61, intra-service time of 90 minutes, one full hospital discharge day, and four total post-operative office visit days with 2 99213's and 2 99212. We felt the survey median RVU for 27540 of 16.00 was higher than the procedure warrants and would not have maintained a rank order relativity with other Hip and Knee Fracture

codes. The 14.00 value maintains an appropriate relativity with the other knee and hip fracture codes as well as with the key reference service, 29883, which has a RUC validated work RVU of 11.61 but has more intra-service time (appropriate because 27540 does not take quite as long) and an appropriately lower IWPUT of .058 compared to the IWPUT for our recommended values, which is .075 which we believe is correct for 27540. The pre-service time for 7540 is 15 minutes for evaluation time, 15 minutes positioning and 15 minutes scrub, dress and wait time. The median intra-service (skin-to-skin) time for 27540 is 75 minutes, which we believe is appropriate. The survey immediate post service time was 20 minutes, which again we believe to be appropriate. We are recommending one hospital visits plus one discharge day, 99238. We are recommending 4 post-operative office visits, 2-99213 and 2-99212, which is consistent with the recommended post-operative office visits for many of the other Hip and Knee Fracture codes.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No
   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FIVE YEAR REVIEW SPECIFIC QUESTIONS:

Please indicate the number of survey respondent percentages responding to each of the following questions (for example 0.05 = 5%):
Has the work of performing this service changed in the past 5 years? Yes 30% No 70%
(Use the subset of the people who responded "Yes" to answer the following questions)

A. This service represents new technology that has become more familiar (i.e., less work):
   I agree 31% I do not agree 69%
B. Patients requiring this service are now:
   more complex (more work) 62% less complex (less work) 0% no change 38%
C. The usual site-of-service has changed:
   from outpatient to inpatient 0% from inpatient to outpatient 8% no change 92%

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
2005 FIVE YEAR REVIEW - SUMMARY OF RECOMMENDATION

CPT Code:27556 Tracking Number F41 Specialty Society Recommended RVU: **15.50**
Global Period: 090 RUC Recommended RVU: **15.50**

CPT Descriptor: Open treatment of knee dislocation, with internal fixation, when performed; without primary ligamentous repair or augmentation/reconstruction

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 25-year-old male falls and dislocates his knee requiring open reduction. [Note: Internal fixation, when performed, is included in the work of this procedure. External fixation, when performed, would be reported separately.].

Percentage of Survey Respondents who found Vignette to be Typical: 73%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work:
- Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
- Verify that all required instruments and supplies are available
- Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulation drapes
- Assess position of the extremities and head, adjust as needed
- The patient's leg is placed properly on the table and positioned with proper bolstering to aid surgical exposure.
- Indicate areas of skin to be prepped and mark surgical incisions
- A tourniquet is placed on the proximal thigh
- The leg is prepped and draped.
- The leg is elevated and exsanguinated.
- The pneumatic tourniquet is inflated.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work: Under anesthesia, attempts at closed reduction are made, with reduction not possible because the femoral condyle is buttonholed through the fascia lata. An anterior midline incision is made which allows exposure of these structures. A cautious release of some of the fascia lata is performed. This allows reduction of the knee. The arthrotomy also permits inspection of the inside of the knee and allows removal of loose osteochondral fragments. The knee is carefully irrigated. Hemostasis is again achieved. The stability of the limb is gently tested in order to assess stable positions for the knee. The range of motion of the knee is checked. The quality of the reduction is checked either with a fluoroscopy or with a plain film. The stability of the newly reduced knee can be held acceptably. No further fixation is applied. The wounds are irrigated, the tourniquet is deflated, hemostasis is achieved, and the incision is closed with the ligamentous portion of the knee being reapproximated, subcutaneous tissue and skin being reapproximated.

Description of Post-Service Work: Post-service work: in facility
- Range of motion is gently checked at the end of the reduction to insure that it has been well restored and a dry sterile dressing including compression and a knee immobilizer are applied.
- Monitor patient stabilization in the recovery room.

- Consultation with the family and patient regarding the surgery and postoperative regimen.
- Communication with health care professionals including written and oral reports and orders.
- Postoperative care is coordinated with recovery room nursing staff.

Dictation of an operative report

Procedure note is written in the patient chart

- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- The patient is discharged to the orthopaedic floor for monitoring of compartment syndrome. This may require removing and reapplying the dressings.

Discharge day:

- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Physical therapy for the uses of crutches or walker is ordered
- Write prescriptions for medications needed post-discharge.
- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of splint/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order occupational therapy

Supervision of rehabilitation

Monitor physical therapy

- Discuss progress with PCP (verbal and written)
- Write medication prescriptions
- Dictate progress notes for medical record

COMPELLING EVIDENCE RATIONALE (Required to be Completed)

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

- ***Evidence that incorrect assumptions were made in the previous valuation of the service, as documented; a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data***

Harvard utilized the AMA Physician Masterfile to draw names for their surveys. While general orthopaedic surgeons can perform open reduction fracture care, it is more typical for patients to be referred to orthopaedic surgeons who specialize in orthopaedic trauma or in a given anatomical area (eg, shoulder, hand, knee, etc.). We do not believe that all specialty surgeons were surveyed for these codes, especially with respect to the primary provider subspecialty - trauma, since the AMA Masterfile did not delineate orthopaedic subspecialties. This may have led to an underestimation of post-service work in the Harvard survey.

Given this information, we believe there is compelling evidence that not all involved specialties were involved in the review of these codes.

- ***Evidence that technology has changed physician work.***

Surgical treatment using open anatomical reduction and internal fixation has been made more complex with the introduction of new imaging methods such as CT which allow better detection of the fracture pathology and provided the basis for new surgical strategies. There are also new internal fixation devices which require more work. Beginning in the 1990s (after the Harvard study), new plates were developed for fracture repair, with most becoming available in the late 1990s and early 2000s. As an example of the complexity of the decision process in current practice, the 1990's have given the surgeon numerous options for bone fixation. The options for a bone fixation device currently include Kirschner wires, wire, staples, screws, as well as newer alternatives such as headless bone screws, T-screws, absorbable pins, cannulated screws, and a myriad of plates. The goal of all these devices remains constant: that is, to achieve stable approximation of bone fragments to facilitate healing. The various devices afford rigid fixation along with compression of the osseous fragments. This allows early range of motion and preservation of surrounding joint function, as well as primary bone healing. Selection of the most advantageous form of fixation is dependent on many factors and takes considerable time in the pre-evaluation of a patient. These include the type of fracture or osteotomy created, bone density, type of bone, and the desire for interfragmental compression. All of this has resulted in more work. The standards of care (fracture reduction, limb alignment, etc.) have also been elevated by literature that shows fracture displacements and poor alignments lead to poorer results. Additionally, women over 50 is a fast growing segment of our population. A huge percentage of these patients are osteoporotic - making fracture fixation and maintenance of fixation far more difficult than it used to be. The new plates are more complex to insert when the underlying bone is of much poorer quality.

Given this information, we believe there is compelling evidence that ORIF is more complex than 5 years ago and this is even more true in comparison to practice in the late 1980s (or more than 25 years ago).

- ***Evidence that incorrect assumptions were made in the previous valuation of the service; a misleading vignette and/or survey in a previous evaluation***

During the period of 1989-1991 (after the Harvard study), a major effort was undertaken by the AAOS and the OTA to rewrite every fracture and dislocation treatment code in the musculoskeletal Section of CPT. In 1991, 395 code changes were accepted by the AMA CPT Editorial Panel under the leadership of Dr. William Felts. At the time of the original proposal, some of the code descriptors were changed from those submitted (presumably by the CPT staff), and published in the 1992 and subsequent editions. Some of the changes in the descriptors published in CPT 1992 didn't make sense, but in those years, the CPT process was closed-door. Additionally, in 1992 and 1993 the AMA staff were deluged by the implementation of the RBRVS process and though AAOS and OTA requested that these problems be addressed then, AMA CPT staff asked that it be deferred as their "plate was full." After that time, more important issues and other opportunities consumed the resources of the AAOS and inertia (or the lack thereof) took over. This third five year review, after completion of the practice expense review, allowed AAOS a window of time to again try to correct the nomenclature for these codes, and review their work using the standard RUC survey method.

We also note, that at the time of the original CPT proposal, external fixation was considered an adjunctive procedure. CPT instructed that the codes for external fixation (20690 and 20692) be "listed in addition to the code for the treatment ...of the fracture." This concept still applies today. External fixation can be used as an adjunctive stabilization modality when treating fractures by almost any method. However, external fixation can also be used in reconstructive orthopaedics (for example, the treatment of joint contractures) and for non-musculoskeletal system treatments (for example, as a suspension device in the treatment of lower extremity burns). In 1991, there was no Modifier -51 exempt code category. Today, these same codes, 20690 and 20692 for external fixator application are modifier -51 exempt, recognizing that they can stand alone or be used adjunctively. Because of the modifier -51 exemption, the RVUs have been reduced, so payers are not paying double when either of these codes are reported with another treatment code.

In the 2005 comment letter to CMS, the AAOS recommended examining the physician work for the ORIF codes because the code descriptors lacked clarity. In particular, because the CPT descriptors include the phrase "with or without internal or external fixation," it is difficult to imagine what the Harvard survey data actually represents (ie, no typical patient was described for the survey respondents to focus on). Further, after the descriptors for these codes were changed for CPT 1993, an Abt study was performed in 1992 for RUC consideration. This study produced *percentage* relationships to key reference codes, but not surveyed time and visit data. Some of these recommendations were accepted by the RUC and CMS and others were adjusted up or down, but no changes were made to the Harvard time and visit data, if available. Therefore, we believe that there is little, if any, relationship between the Harvard database time and visit information (from the old CPT codes) and the current work RVUs.

Given this information, we believe there is compelling evidence that the current work values and/or time and visit data may be incorrect and outdated and should be reviewed.

A survey was sent to orthopaedic surgeons representing orthopaedic trauma, general orthopaedics, and hip & knee surgery. A consensus panel of experts representing orthopaedic subspecialty societies (general orthopaedics, arthroscopy, trauma, hip & knee, foot & ankle, total joint, sports medicine) reviewed the survey data compared with the reference code and other orthopaedic services.

We are recommending a work RVU of 15.50 which is the 25% survey result. Our key comparison service was 27415, with a work RVU of 19.79, intra-service time of 120 minutes, two post-operative hospital visits plus one full hospital discharge day, and five total post-operative office visit days with 2 99213's and 2 99212. We felt the survey median

RVU for 27540 of 18.00 was higher than the procedure warrants and would not have maintained a rank order relativity with other Hip and Knee Fracture codes. The 15.50 value maintains an appropriate relativity with the other knee and hip fracture codes as well as with the key reference service, 27415, which has a RUC validated work RVU of 19.79 with more intra-service time, and more post-operative hospital visits (appropriate because 27556 does not take quite as ng) and an appropriately higher IWPUT of .088 compared to the IWPUT for our recommended values, which is .083 which we believe is correct for 27556. The pre-service time for 27557 is 15 minutes for evaluation time, 15 minutes positioning and 15 minutes scrub, dress and wait time. The median intra-service (skin-to-skin) time for 27556 is 90 minutes, which we believe is appropriate. The survey immediate post service time was 20 minutes, which again we believe to be appropriate. We are recommending two total hospital visits, 1-99233 (the first day visit which is typically a longer and more intense patient visit than the subsequent day's hospital visit) and 1-99231 plus one discharge day, 99238 which is the same post-operative hospital visit package for the other surveyed Hip and Knee Fracture codes that are most similar to this procedure. We are recommending 4 post-operative office visits, 2-99213 and 2-99212, which is consistent with the recommended post-operative office visits for many of the other Hip and Knee Fracture codes.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No
   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

   Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FIVE YEAR REVIEW SPECIFIC QUESTIONS:

Please indicate the number of survey respondent percentages responding to each of the following questions (for example 0.05 = 5%):
Has the work of performing this service changed in the past 5 years? Yes 19% No 81%
(Use the subset of the people who responded "Yes" to answer the following questions)

A. This service represents new technology that has become more familiar (i.e., less work):
   I agree 14% I do not agree 86%
B. Patients requiring this service are now:
   more complex (more work) 86% less complex (less work) 0% no change 14%
C. The usual site-of-service has changed:
   from outpatient to inpatient 0% from inpatient to outpatient 0% no change 100%

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
2005 FIVE YEAR REVIEW - SUMMARY OF RECOMMENDATION

CPT Code:27557 Tracking Number F42 Specialty Society Recommended RVU: **19.00**
Global Period: 090 RUC Recommended RVU: **19.00**

CPT Descriptor: Open treatment of knee dislocation, with internal fixation, when performed; with primary ligamentous repair

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 18-year-old male falls and dislocates his knee. The anterior cruciate ligament is avulsed with a fragment of bone. Open reduction with primary ligamentous repair is performed. [Note: Internal fixation, when performed, is included in the work of this procedure. External fixation, when performed, would be reported separately.]

Percentage of Survey Respondents who found Vignette to be Typical: 78%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: • Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
- Verify that all required instruments and supplies are available
- Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulation drapes
- Assess position of the extremities and head, adjust as needed
- The patient's leg is placed properly on the table and positioned with proper bolstering to aid surgical exposure.
- Indicate areas of skin to be prepped and mark surgical incisions
- A tourniquet is placed on the proximal thigh
- The leg is prepped and draped.
- The leg is elevated and exsanguinated.
- The pneumatic tourniquet is inflated.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work: Under anesthesia, attempts at closed reduction are made, with reduction not possible because the femoral condyle is buttonholed through the fascia lata. An anterior midline incision is made which allows exposure of these structures. A cautious release of some of the fascia lata is performed. This allows reduction of the knee. The arthrotomy also permits inspection of the inside of the knee and allows removal of loose osteochondral fragments. During the arthrotomy, the anterior cruciate ligament is noted to be avulsed with a bony fragment. These fracture fragments are large enough that they warrant an attempt at internal fixation. The fragment is too small to allow placement of large screws. Subsequently, the fractured fragment is held anatomically reduced and a K-wire is carefully directed to allow placement of two sutures into the fractured fragment, thus a suture is passed from the proximal medial tibia into the knee joint itself. It is then sutured to anchor the anterior cruciate ligament and the bony fragment, and th brought back through a separate tunnel and then tightly tied around a screw and a washer. This is used to hold ruptured anterior cruciate ligament and bony fragment in anatomic position. The knee is then checked fluoroscopically fo quality of the reduction and gentle ligamentous stability testing is performed. The wounds are irrigated, the to.. iquet is deflated, hemostasis is achieved, and the medial parapatellar arthrotomy is then reapproximated. Subcutaneous tissue and skin are reapproximated.

Description of Post-Service Work: Post-service work: in facility

- Range of motion is checked at the end of the reduction to insure that it has been well restored and a dry sterile dressing including compression and a knee immobilizer are applied.

Monitor patient stabilization in the recovery room.

- Consultation with the family and patient regarding the surgery and postoperative regimen.
- Communication with health care professionals including written and oral reports and orders.
- Postoperative care is coordinated with recovery room nursing staff.

Dictation of an operative report

- Procedure note is written in the patient chart
- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- The patient is discharged to the orthopaedic floor for monitoring of compartment syndrome. This requires removing and reapplying the dressings.

Discharge day:

- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Physical therapy for the uses of crutches or walker is ordered
- Write prescriptions for medications needed post-discharge.
- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of splint/dressings

Assessment of surgical wound

Remove sutures

- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order occupational therapy
- Supervision of rehabilitation
- Monitor physical therapy
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions
- Dictate progress notes for medical record

COMPELLING EVIDENCE RATIONALE (Required to be Completed)

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

- ***Evidence that incorrect assumptions were made in the previous valuation of the service, as documented; a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data***

Harvard utilized the AMA Physician Masterfile to draw names for their surveys. While general orthopaedic surgeons can perform open reduction fracture care, it is more typical for patients to be referred to orthopaedic surgeons who specialize in orthopaedic trauma or in a given anatomical area (eg, shoulder, hand, knee, etc.). We do not believe that all specialty surgeons were surveyed for these codes, especially with respect to the primary provider subspecialty - trauma, since the AMA Masterfile did not delineate orthopaedic subspecialties. This may have led to an underestimation of post-service work in the Harvard survey.

Given this information, we believe there is compelling evidence that not all involved specialties were involved in the review of these codes.

- ***Evidence that technology has changed physician work.***

Surgical treatment using open anatomical reduction and internal fixation has been made more complex with the introduction of new imaging methods such as CT which allow better detection of the fracture pathology and provided the basis for new surgical strategies. There are also new internal fixation devices which require more work. Beginning in the 1990s (after the Harvard study), new plates were developed for fracture repair, with most becoming available in the late 1990s and early 2000s. As an example of the complexity of the decision process in current practice, the 1990's have given the surgeon numerous options for bone fixation. The options for a bone fixation device currently include Kirschner wires, wire, staples, screws, as well as newer alternatives such as headless bone screws, T-screws, absorbable pins, cannulated screws, and a myriad of plates. The goal of all these devices remains constant: that is, to achieve stable approximation of bone fragments to facilitate healing. The various devices afford rigid fixation along with compression of the osseous fragments. This allows early range of motion and preservation of surrounding joint function, as well as primary bone healing. Selection of the most advantageous form of fixation is dependent on many factors and takes considerable time in the pre-evaluation of a patient. These include the type of fracture or osteotomy created, bone density, type of bone, and the desire for interfragmental compression. All of this has resulted in more work. The standards of care (fracture reduction, limb alignment, etc.) have also been elevated by literature that shows fracture displacements and poor alignments lead to poorer results. Additionally, women over 50 is a fast growing segment of our population. A huge percentage of these patients are osteoporotic - making fracture fixation and maintenance of fixation far more difficult than it used to be. The new plates are more complex to insert when the underlying bone is of much poorer quality.

Given this information, we believe there is compelling evidence that ORIF is more complex than 5 years ago and this is even more true in comparison to practice in the late 1980s (or more than 25 years ago).

- ***Evidence that incorrect assumptions were made in the previous valuation of the service; a misleading vignette and/or survey in a previous evaluation***

During the period of 1989-1991 (after the Harvard study), a major effort was undertaken by the AAOS and the OTA to rewrite every fracture and dislocation treatment code in the musculoskeletal Section of CPT. In 1991, 395 code changes were accepted by the AMA CPT Editorial Panel under the leadership of Dr. William Felts. At the time of the original proposal, some of the code descriptors were changed from those submitted (presumably by the CPT staff), and published in the 1992 and subsequent editions. Some of the changes in the descriptors published in CPT 1992 didn't make sense, but in those years, the CPT process was closed-door. Additionally, in 1992 and 1993 the AMA staff were deluged by the implementation of the RBRVS process and though AAOS and OTA requested that these problems be addressed then, AMA CPT staff asked that it be deferred as their "plate was full." After that time, more important issues and other opportunities consumed the resources of the AAOS and inertia (or the lack thereof) took over. This third five year review, after completion of the practice expense review, allowed AAOS a window of time to again try to correct the nomenclature for these codes, and review their work using the standard RUC survey method.

We also note, that at the time of the original CPT proposal, external fixation was considered an adjunctive procedure. CPT instructed that the codes for external fixation (20690 and 20692) be "listed in addition to the code for the treatment ...of the fracture." This concept still applies today. External fixation can be used as an adjunctive stabilization modality when treating fractures by almost any method. However, external fixation can also be used in reconstructive orthopaedics (for example, the treatment of joint contractures) and for non-musculoskeletal system treatments (for example, as a suspension device in the treatment of lower extremity burns). In 1991, there was no Modifier -51 exempt code category. Today, these same codes, 20690 and 20692 for external fixator application are modifier -51 exempt, recognizing that they can stand alone or be used adjunctively. Because of the modifier -51 exemption, the RVUs have been reduced, so payers are not paying double when either of these codes are reported with another treatment code.

In the 2005 comment letter to CMS, the AAOS recommended examining the physician work for the ORIF codes because the code descriptors lacked clarity. In particular, because the CPT descriptors include the phrase "with or without internal or external fixation," it is difficult to imagine what the Harvard survey data actually represents (ie, no typical patient was described for the survey respondents to focus on). Further, after the descriptors for these codes were changed for CPT 1993, an Abt study was performed in 1992 for RUC consideration. This study produced *percentage* relationships to key reference codes, but not surveyed time and visit data. Some of these recommendations were accepted by the RUC and CMS and others were adjusted up or down, but no changes were made to the Harvard time and visit data, if available. Therefore, we believe that there is little, if any, relationship between the Harvard database time and visit information (from the old CPT codes) and the current work RVUs.

Given this information, we believe there is compelling evidence that the current work values and/or time and visit data may be incorrect and outdated and should be reviewed.

A survey was sent to orthopaedic surgeons representing orthopaedic trauma, general orthopaedics, and hip & knee surgery. A consensus panel of experts representing orthopaedic subspecialty societies (general orthopaedics, arthroscopy, trauma, hip & knee, foot & ankle, total joint, sports medicine) reviewed the survey data compared wit the reference code and other orthopaedic services.
We are recommending a work RVU of 19.00 which is the 25% survey result. Our key comparison service was 27415, with a work RVU of 19.79, intra-service time of 120 minutes, two post-operative hospital visits plus one full hospital discharge day, and five total post-operative office visit days with 2 99213's and 2 99212. We felt the survey median RVU for 27540 of 21.61 was higher than the procedure warrants and would not have maintained a rank order relativity

with other Hip and Knee Fracture codes. The 19.00 value maintains an appropriate relativity with the other knee and hip fracture codes as well as with the key reference service, 27415, which is very similar in value to the RUC validated work RVU of 19.79. Our recommended value yields a IWPUT of .091 which is very similar our comparison code, 27415, IWPUT of .088. The pre-service time for 27248 is 15 minutes for evaluation time, 15 minutes positioning and 5 minutes scrub, dress and wait time. The median intra-service (skin-to-skin) time for 27557 is 120 minutes, which we believe is appropriate and maintains relatively within the Hip and Knee Fracture family. The survey immediate post service time was 20 minutes, which again we believe to be appropriate. We are recommending two total hospital visits, 1-99233 (the first day visit which is typically a longer and more intense patient visit than the subsequent day's hospital visit) and 1-99231 plus one discharge day, 99238 which is the same post-operative hospital visit package for the other surveyed Hip and Knee Fracture codes that are most similar to this procedure. We are recommending 4 post-operative office visits, 2-99213 and 2-99212, which is consistent with the recommended post-operative office visits for many of the other Hip and Knee Fracture codes.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No
   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

   Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FIVE YEAR REVIEW SPECIFIC QUESTIONS:

Please indicate the number of survey respondent percentages responding to each of the following questions (for example 0.05 = 5%):
Has the work of performing this service changed in the past 5 years? Yes 30% No 70%
(Use the subset of the people who responded "Yes" to answer the following questions)

A. This service represents new technology that has become more familiar (i.e., less work):
   I agree 36% I do not agree 64%

CPT Descriptor: Open treatment of knee dislocation, with internal fixation, when performed; with primary ligamentous repair, with augmentation/reconstruction

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 25-year-old female sustains a right knee dislocation requiring open reduction and primary repair of the lateral collateral ligament and hamstring reconstruction of her anterior cruciate ligament. [Note: Internal fixation, when performed, is included in the work of this procedure. External fixation, when performed, would be reported separately.]

Percentage of Survey Respondents who found Vignette to be Typical: 78%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: • Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
- Verify that all required instruments and supplies are available
- Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulation drapes
- Assess position of the extremities and head, adjust as needed
- The patient's leg is placed properly on the table and positioned with proper bolstering to aid surgical exposure.
- Indicate areas of skin to be prepped and mark surgical incisions
- A tourniquet is placed on the proximal thigh
- The leg is prepped and draped.
- The leg is elevated and exsanguinated.
- The pneumatic tourniquet is inflated.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work: Under anesthesia, attempts at closed reduction are made, with reduction not possible because the femoral condyle is buttonholed through the fascia lata. An anterior midline incision is made which allows exposure of these structures. A cautious release of some of the fascia lata is performed. This allows reduction of the knee. The arthrotomy also permits inspection of the inside of the knee and allows removal of loose osteochondral fragments. During the arthrotomy, the anterior cruciate ligament is noted to be avulsed with a bony fragment. These fracture fragments are large enough that they warrant an attempt at internal fixation. The fragment is too small to allow placement of large screws. Subsequently, the fractured fragment is held anatomically reduced and a K-wire is carefully directed to allow placement of two sutures into the fractured fragment, thus a suture is passed from the proximal medial tibia into the knee joint itself. It is then sutured to anchor the anterior cruciate ligament and the bony fragment, and th brought back through a separate tunnel and then tightly tied around a screw and a washer. This is used to hold . ruptured anterior cruciate ligament and bony fragment in anatomic position. For harvesting of the medial hamstring tendons for reconstruction, the anterior midline incision is extended distally. The semitendinosus tendon is identified and is dissected posteriorly towards the popliteal space of the knee. A tendon stripper is then placed over the tendon and is advanced deep into the thigh in order to harvest the greatest length of semitendinosus tendon possible. This graft is then

carefully prepared for reconstruction of the posterior cruciate ligament in the posterior aspect of the knee. This semitendinosus tendon is used to reconstruct the anterior cruciate ligament with a quadruple stranded tendon repair. The bony fragment of the posterior cruciate ligament is carefully identified and is repaired by passing sutures into it from the anterior portion of the tibia passing the suture into the fractured fragment, and this proves to be exceptionally difficult because of the limited ability to dissect posteriorly, and this is anchored with a single #5 Ethibond suture posteriorly. The quality of the reduction is checked fluoroscopically. The ligamentous stability is gently tested. The wounds are irrigated, the tourniquet is deflated, hemostasis is achieved, and the anterior midline incision and arthrotomy are reapproximated, and the skin is closed.

Description of Post-Service Work: Post-service work: in facility

- Range of motion is gently checked at the end of the reduction to insure that it has been well restored and a dry sterile dressing including compression and a knee immobilizer are applied.
- Monitor patient stabilization in the recovery room.
- Consultation with the family and patient regarding the surgery and postoperative regimen.
- Communication with health care professionals including written and oral reports and orders.
- Postoperative care is coordinated with recovery room nursing staff.

Dictation of an operative report

- Procedure note is written in the patient chart
- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- The patient is discharged to the orthopaedic floor for monitoring of compartment syndrome. This requires removing and reapplying the dressings.

Discharge day:

- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Physical therapy for the uses of crutches or walker is ordered

Write prescriptions for medications needed post-discharge.

All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of splint/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order occupational therapy
- Supervision of rehabilitation
- Monitor physical therapy
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions
- Dictate progress notes for medical record

Intra-Service intensity/complexity	4.50	4.83
Post-Service intensity/complexity	3.83	4.17

COMPELLING EVIDENCE RATIONALE (Required to be Completed)
Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

- ***Evidence that incorrect assumptions were made in the previous valuation of the service, as documented; a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data***

  This code was never surveyed by Harvard. The current RVW is based on an Abt study that did not collect time and visit information, but "relative" RVW based on an algorithm.

  Given this information, we believe there is compelling evidence that the current value may be flawed and without evidence.

- ***Evidence that technology has changed physician work.***

  Surgical treatment using open anatomical reduction and internal fixation has been made more complex with the introduction of new imaging methods such as CT which allow better detection of the fracture pathology and provided the basis for new surgical strategies. There are also new internal fixation devices which require more work. Beginning in the 1990s (after the Harvard study), new plates were developed for fracture repair, with most becoming available in the late 1990s and early 2000s. As an example of the complexity of the decision process in current practice, the 1990's have given the surgeon numerous options for bone fixation. The options for a bone fixation device currently include Kirschner wires, wire, staples, screws, as well as newer alternatives such as headless bone screws, T-screws, absorbable pins, cannulated screws, and a myriad of plates. The goal of all these devices remains constant: that is, to achieve stable approximation of bone fragments to facilitate healing. The various devices afford rigid fixation along with compression of the osseous fragments. This allows early range of motion and preservation of surrounding joint function, as well as primary bone healing. Selection of the most advantageous form of fixation is dependent on many factors and takes considerable time in the pre-evaluation of a patient. These include the type of fracture or osteotomy created, bone density, type of bone, and the desire for interfragmental compression. All of this has resulted in more work. The standards of care (fracture reduction, limb alignment, etc.) have also been elevated by literature that shows fracture displacements and poor alignments lead to poorer results. Additionally, women over 50 is a fast growing segment of our population. A huge percentage of these patients are osteoporotic - making fracture fixation and maintenance of fixation far more difficult than it used to be. The new plates are more complex to insert when the underlying bone is of much poorer quality.

  Given this information, we believe there is compelling evidence that ORIF is more complex than 5 years ago and this is even more true in comparison to practice in the late 1980s (or more than 25 years ago).

- ***Evidence that incorrect assumptions were made in the previous valuation of the service; a misleading vignette and/or survey in a previous evaluation***

  During the period of 1989-1991 (after the Harvard study), a major effort was undertaken by the AAOS and the OTA to rewrite every fracture and dislocation treatment code in the musculoskeletal Section of CPT. In 1991, 395 code changes were accepted by the AMA CPT Editorial Panel under the leadership of Dr. William Felts. At the time of the original proposal, some of the code descriptors were changed from those submitted (presumably by the CPT staff), and published in the 1992 and subsequent editions. Some of the changes in the descriptors published in CPT 1992 didn't make sense, but in those years, the CPT process was closed-door. Additionally, in 1992 and 1993 the AMA staff were deluged by the implementation of the RBRVS process and though AAOS and OTA requested that these problems be addressed then, AMA CPT staff asked that it be deferred as their "plate was full." After that time, more important issues and other opportunities consumed the resources of the AAOS and inertia (or the lack thereof) took over. This third five year review, after completion of the practice expense review, allowed AAOS a window of time to again try to correct the nomenclature for these codes, and review their work using the standard RUC survey method.

  We also note, that at the time of the original CPT proposal, external fixation was considered an adjunctive procedure. CPT instructed that the codes for external fixation (20690 and 20692) be "listed in addition to the code for the treatment ...of the fracture." This concept still applies today. External fixation can be used as an adjunctive stabilization modality when treating fractures by almost any method. However, external fixation can also be used in reconstructive orthopaedics (for example, the treatment of joint contractures) and for non-musculoskeletal system treatments (for example, as a suspension device in the treatment of lower extremity burns). In 1991, there was no Modifier -51 exempt code category. Today, these same codes, 20690 and 20692 for external fixator application are modifier -51 exempt, recognizing that they can stand alone or be used adjunctively. Because of the modifier -51 exemption, the RVUs have been reduced, so payers are not paying double when either of these codes are reported with another treatment code.

  In the 2005 comment letter to CMS, the AAOS recommended examining the physician work for the ORIF codes because the code descriptors lacked clarity. In particular, because the CPT descriptors include the phrase "with or without internal or external fixation," it is difficult to imagine what the Harvard survey data actually represents (ie, no typical patient was described for the survey respondents to focus on). Further, after the descriptors for these codes were changed for CPT 1993, an Abt study was performed in 1992 for RUC consideration. This study produced *percentage* relationships to key reference codes, but not surveyed time and visit data. Some of these recommendations were accepted by the RUC and CMS and others were adjusted up or down, but no changes were made to the Harvard time and visit data, if available. Therefore, we believe that there is little, if any, relationship between the Harvard database time and visit information (from the old CPT codes) and the current work RVUs.

  Given this information, we believe there is compelling evidence that the current work values and/or time and visit data may be incorrect and outdated and should be reviewed.

A survey was sent to orthopaedic surgeons representing orthopaedic trauma, general orthopaedics, and hip & knee surgery. A consensus panel of experts representing orthopaedic subspecialty societies (general orthopaedics, arthroscopy, trauma, hip & knee, foot & ankle, total joint, sports medicine) reviewed the survey data compared with the reference code and other orthopaedic services.

We are recommending a work RVU of 22.00 which is the 25% survey result. Our key comparison service was 271 with a work RVU of 30.13, intra-service time of 240 minutes, seven post-operative hospital visits plus one full hospi. discharge day, and three 99213 post-operative office visit days. We felt the survey median RVU for 27540 of 25.00 was higher than the procedure warrants and would not have maintained a rank order relativity with other Hip and Knee Fracture codes. The 22.00 value maintains an appropriate relativity with the other knee and hip fracture codes as well as with the key reference service, 27134 with a higher work RVU of 30.13 but with significantly more intra-service time

at 240 and a much longer hospital visit time of 7 days plus one discharge day. Our recommended value yields a IWPUT of .092 which maintains relativity with the IWPUTs for the other Hip and Knee Fracture codes. The pre-service time for 27248 is 15 minutes for evaluation time, 15 minutes positioning and 15 minutes scrub, dress and wait time. The median intra-service (skin-to-skin) time for 27557 is 150 minutes, which we believe is appropriate and maintains relatively within the Hip and Knee Fracture family. The survey immediate post service time was 20 minutes, which again we believe to be appropriate. We are recommending two total hospital visits, 1-99233 (the first day visit which is typically a longer and more intense patient visit than the subsequent day's hospital visit) and 1-99231 plus one discharge day, 99238 which is the same post-operative hospital visit package for the other surveyed Hip and Knee Fracture codes that are most similar to this procedure. We are recommending 4 post-operative office visits, 2-99213 and 2-99212, which is consistent with the recommended post-operative office visits for many of the other Hip and Knee Fracture codes.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No
   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FIVE YEAR REVIEW SPECIFIC QUESTIONS:

Please indicate the number of survey respondent percentages responding to each of the following questions (for example 0.05 = 5%):
Has the work of performing this service changed in the past 5 years? Yes 36% No 64%
(Use the subset of the people who responded "Yes" to answer the following questions)

A. This service represents new technology that has become more familiar (i.e., less work):
   I agree 33% I do not agree 67%
B. Patients requiring this service are now:
   more complex (more work) 92% less complex (less work) 0% no change 8%
C. The usual site-of-service has changed:
   from outpatient to inpatient 0% from inpatient to outpatient 8% no change 92%

CPT Code: 27248,27511,27513,27514,27519,27535,27540,27556,27557,27558

AMA/Specialty Society Update Process
PERC Summary of Recommendation
010 or 090 Day Global Periods
Facility Direct Inputs

CPT Long Descriptor:

27248 Open treatment of greater trochanteric fracture, includes internal fixation, when performed
27511 Open treatment of femoral supracondylar or transcondylar fracture without intercondylar extension, includes internal fixation, when performed
27513 Open treatment of femoral supracondylar or transcondylar fracture with intercondylar extension, includes internal fixation, when performed
27514 Open treatment of femoral fracture, distal end, medial or lateral condyle, includes internal fixation, when performed
27519 Open treatment of distal femoral epiphyseal separation, includes internal fixation, when performed
27535 Open treatment of tibial fracture, proximal (plateau); unicondylar, includes internal fixation, when performed
27540 Open treatment of intercondylar spine(s) and/or tuberosity fracture(s) of the knee, includes internal fixation, when performed
27556 Open treatment of knee dislocation, with internal fixation, when performed; without primary ligamentous repair or augmentation/reconstruction
27557 Open treatment of knee dislocation, with internal fixation, when performed; with primary ligamentous repair
27558 Open treatment of knee dislocation, with internal fixation, when performed; with primary ligamentous repair, with augmentation/reconstruction

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

A consensus panel of experts representing orthopaedic subspecialty societies (general orthopaedics, arthroscopy, trauma, shoulder and elbow, hand, hip & knee, foot & ankle, total joint, sports medicine) reviewed the practice expense details the survey codes relative to other facility-only 90-day global orthopaedic services.

Please describe the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

No changes were made to the standard pre-service times. A total of 60 minutes has been applied for the pre-service clinical labor activities. During the pre-service period, clinical staff conducts the standard pre-service activities: An RN/LPN/MA completes pre-service diagnostic and referral forms, coordinates pre-surgery services, schedules space and equipment in facility, provides pre-service education/obtains consent, and conducts follow-up phone calls.

Intra-Service Clinical Labor Activities:

The standard 12 minutes has been applied for these inpatient procedures for discharge day management services.

Post-Service Clinical Labor Activities:

The standard times have been applied for post-service clinical labor time.

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

April 2007

Open Knee Osteochondral Autograft

In February 2007, the CPT Editorial Panel created one new Category I CPT code to describe procedures not previously described in the family of osteochondral implantation CPT codes created in February 2004. These existing codes describe closed autograft, closed allograft, and open allograft techniques, but failed to describe open autograft technique. This new service describes the final combination of techniques.

The RUC reviewed the specialty society's survey results and recommendations for CPT code 27416, *Osteochondral autograft(s), knee, open (eg, mosaicplasty) (includes harvesting of autograft[s])*. The RUC considered the surveyed code in comparison to the key reference service, 29866, *Arthroscopy, knee, surgical; osteochondral autograft(s) (eg, mosaicplasty) (includes harvesting of the autograft)* (work RVU = 14.48). The RUC noted that the reference service has very similar pre-, intra- and post-service times. The reference service has slightly less pre-service time (75 versus 80 minutes) and slightly more intra-service time (100 versus 90 minutes), accounting for a difference in total time between the reference service and the surveyed service of only 5 minutes (292 versus 287 minutes). The survey results indicated a median of 19.00 work RVUs, which the specialty and RUC agreed was too high, given the similarity of the surveyed procedure with the reference service. The RUC concurred that the 25th percentile work RVU of 14.00 was appropriate for the work involved in the service and this value was below the reference service, maintaining proper rank order. Following some discussion, the RUC agreed that number and intensity of post-operative visits were appropriate (two 99213, two 99212, and 0.5 99238).

The RUC recommends the specialty society survey 25th percentile work RVU of 14.00 for code 27416.

Practice Expense
The RUC recommends the specialty societies' recommended inputs for these facility only procedures as they are standard 090 day global inputs.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
27415		Osteochondral allograft, knee, open (For arthroscopic implant of osteochondral allograft, use 29867) (Do not report 27415 in conjunction with 27416)	090	19.79 (No Change)
●27416	X1	Osteochondral autograft(s), knee, open (eg, mosaicplasty) (includes harvesting of autograft[s]) (Do not report 27416 in conjunction with 27415, 29870, 29871, 29874, 29875, 29884 when performed at the same session and/or 29877, 29879, 29885-29887 when performed in the same compartment) (For arthroscopic osteochondral autograft of knee, use 29866)	090	14.00
Endoscopy/Arthroscopy				
29866		Arthroscopy, knee, surgical; osteochondral autografts (eg, mosaicplasty) (includes harvesting of autograft[s]) (Do not report 29866 in conjunction with 29870, 29871, 29875, 29884 when performed at the same session and/or 29874, 29877, 29879, 29885-29887 when performed in the same compartment) (For open osteochondral autograft of knee, use 27416)	090	14.48 (No Change)

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:27416 Tracking Number X1 Specialty Society Recommended RVU: **14.00**
Global Period: 090 RUC Recommended RVU: **14.00**

CPT Descriptor: Osteochondral autograft(s), knee, open (eg, mosaicplasty) (includes harvesting of autograft[s])

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: The patient is a 38-year-old woman with medial right knee pain of 4 months duration. She has been treated with anti-inflammatory medicines and physical therapy without improvement. Physical exam demonstrates normal alignment, a small joint effusion, medial joint line tenderness and no knee instability. Imaging studies reveal an isolated osteochondral defect of medial femoral condyle. Because of failure to respond to non-operative measures, an open osteochondral autograft is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 94%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work:
- Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
  Review informed consent with patient
- Sign the operative site
- Verify that all required instruments and supplies are available
- Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulation drapes
- Assess position of the extremities and head, adjust as needed
- Position the extremity, padding any bony prominence and bolstering as necessary
- Indicate areas of skin to be prepped and mark surgical incisions
- Apply a protective wrap and then the tourniquet
- Prep and drape the extremity
- Exsanguinate the leg if desired and inflate the tourniquet
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work: Under anesthesia, an arthrotomy is made to access the compartment in question. The osteochondral defect is debrided and prepared for transplantation. The donor site is visualized and the harvest device is carefully directed into the donor site tissue. Exact perpendicularity of the harvest device to the articular surface is mandatory. Once the tissue is harvested the recipient site is prepared with an appropriate sized drill to match the harvested tissue. The harvested osteochondral graft is then inserted into the articular surface defect which was "standardized" with the drill. Great care is taken to correctly orient the osteochondral autograft as it is forced into the original osteochondral defect. Once correctly placed, the procedure is repeated until the defect is filled or the available donor tissue is exhausted. The wounds are irrigated, the tourniquet is deflated, hemostasis is achieved, and the incision closed

Description of Post-Service Work: Post-service work: in facility
- Apply a sterile lightly compressive dressing and knee immobilizer or hinged brace
- Monitor patient stabilization in the recovery room.
- Consultation with the family and patient regarding the surgery and postoperative regimen.

- Communication with health care professionals including written and oral reports and orders.
- Postoperative care is coordinated with recovery room nursing staff.
- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Physical therapy for the use of crutches or walker is ordered
- Write prescriptions for medications needed post-discharge.
- Dictation of an operative report
- Procedure note is written in the patient chart
- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of splint/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order occupational therapy
- Supervision of rehabilitation
- Monitor physical therapy
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions
- Dictate progress notes for medical record

Intra-Service intensity/complexity	3.79	4.22
Post-Service intensity/complexity	3.14	3.22

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

A survey was sent to orthopaedic surgeons representing general orthopaedics, arthroscopy, and hip & knee surgery. A consensus panel of experts representing orthopaedic subspecialty societies (general orthopaedics, arthroscopy, trauma, shoulder and elbow, hand, hip & knee, foot & ankle, total joint, sports medicine) reviewed the survey data compared with the reference code and other orthopaedic services. The panel agreed that the arthroscopic procedure may require slightly more intra time (100 vs 90 minutes). The panel also agreed that that the total work for both the survey code and reference code are very comparable. Based on this discussion, the survey 25th percentile RVW of 14.00 is recommended. This value correctly sets this new code slightly less than the reference code.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlist code is reviewed) 27599

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty AAOS How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 200
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. Estimate of requestor

Specialty Orthopaedic Surgery Frequency 200 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 100
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimate of requestor

Specialty Orthopaedic Surgery Frequency 100 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? No

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/Specialty Society Update Process
PERC Summary of Recommendation
010 or 090 Day Global Periods
Facility Direct Inputs

CPT Long Descriptor:

27416 Osteochondral autograft(s), knee, open (eg, mosaicplasty) (includes harvesting of autograft[s])

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

A consensus panel of experts representing orthopaedic subspecialty societies (general orthopaedics, arthroscopy, trauma, shoulder and elbow, hand, hip & knee, foot & ankle, total joint, sports medicine) reviewed the practice expense details for the survey code relative to other facility-only 90-day global orthopaedic services.

Please describe the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

No changes were made to the standard pre-service times. A total of 60 minutes has been applied for the pre-service clinical labor activities. During the pre-service period, clinical staff conducts the standard pre-service activities: An RN/LPN/MA completes pre-service diagnostic and referral forms, coordinates pre-surgery services, schedules space and equipment in facility, provides pre-service education/obtains consent, and conducts follow-up phone calls.

Intra-Service Clinical Labor Activities:

The standard 6 minutes has been applied for this outpatient procedure for discharge day management services.

Post-Service Clinical Labor Activities:

The procedures each have 2 x 99212 and 2 x 99213 visit. The standard times have been applied for post-service clinical labor time.

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

April 2007

Posterior Malleolar Fracture Treatment

In February 2007, the CPT Editorial Panel created three new Category I CPT codes to describe treatment of isolated, posterior malleolar fractures. Such treatments are recognized as being important in maintaining ankle joint stability and preventing or delaying the onset of degenerative arthritis. Prior to the creation of these codes, there were no codes describing closed or percutaneous treatment of these fractures, though codes exist for the treatment of a posterior malleolar fracture only when this fracture occurs with another malleolar injury (i.e., a lateral malleolus fracture or a medial malleolus fracture ("bimalleolar" fracture) or both together ("trimalleolar" pattern)). This fracture is now recognized to occur in isolation (i.e. without involvement of either the lateral or medial malleolus). These three new codes were established to describe treatment for these isolated injuries.

625

27767

The RUC reviewed the specialty societies' survey results and presentation for CPT code 27767, *Closed treatment of posterior malleolus fracture; without manipulation.* The RUC compared the surveyed code to the reference service code, 27808, *Closed treatment of bimalleolar ankle fracture, (including Potts); without manipulation*, (work RVU = 2.91) and noted that the reference service had significantly more intra-service time than the surveyed code (15 minutes versus 37 minutes). The specialty societies commented that the physician time for code 27808 was not reviewed by the RUC and stated that the work described was similar and the intensity and complexity of both services were comparable. The RUC found that 26600, *Closed treatment of metacarpal fracture, single; without manipulation, each bone* (work RVU = 2.48) was a more suitable reference code (included on the survey's reference service list). Code 26600 has been reviewed by the RUC and describes similar work. Additionally, the RUC reviewed intra-service time is identical to the surveyed code and each contains four office visits within their global periods. The total time for the surveyed code is slightly higher (96 minutes) than code 26600 (93 minutes). In tandem with this appropriate reference code, the survey's 25th percentile work RVU was 2.50, which the RUC agreed was the appropriate work RVU for 27767.

The RUC recommends the survey 25th percentile work RVU of 2.50 for code 27767.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

27768

The RUC reviewed the specialty societies' survey results and presentation for CPT code 27768, *Closed treatment of posterior malleolus fracture; with manipulation*. The RUC compared the surveyed code to the reference service code, 27810, *Closed treatment of bimalleolar ankle fracture, (including Potts); with manipulation* (work RVU = 5.20) and noted that the reference service had significantly more intra-service time than the surveyed code (25 minutes versus 52 minutes). The specialty societies commented that the physician service times for 27810 were not previously reviewed by the RUC, however, the work described was similar. Further, the surveyed code requires greater intensity and complexity than the reference service, particularly in mental effort and judgment, technical skill and physical effort, and psychological stress. The reference service and surveyed service require comparable pre- and post-service times (45 minutes versus 34 minutes) and nearly identical post-service time (10 minutes versus 11 minutes). Comparable to the reference service, the RUC agreed that the survey median of 5.00 work RVUs was appropriate for 27768.

The RUC recommends the survey median work RVU of 5.00 for code 27768.

27769

626

The RUC reviewed the specialty societies' survey results and presentation for CPT code 27769, *Open treatment of posterior malleolus fracture; includes internal fixation, when performed.* The RUC compared the surveyed code to the reference service code, 25607, *Open treatment of distal radial extra-articular fracture or epiphyseal separation, with internal fixation* (work RVU = 9.35). The RUC noted the similarity in pre-, intra-, and post-service times between the surveyed code and the reference code, 75, 60, and 15 minutes, versus 65, 60, and 30 minutes, respectively. The surveyed code also requires greater technical skill and physical effort as well as greater intra- and post- service time intensity/complexity. Given, the similarities, the RUC agreed that the reference service code was appropriate. The RUC also considered in-depth, the specialties' survey, noting that the survey was randomized with a relatively high number of responses (n = 48) and a sound response rate (24%). The RUC agreed that the tight distribution of work RVUs between the 25th and 75th percentiles gave credence to the survey median work RVU of 10.00. The RUC did, however, concur that the intensity of the office visits within the service's global period were overstated in the survey results. The RUC and the specialty societies agreed that the four visits were appropriate, but the visits should consist of three 99212 and only one 99213 office visits. The RUC recommends a pre-service time of 75 minutes, intra-service time of 60 minutes, and immediate post-service time of 15 minutes for code 27769.

The RUC recommends the survey median work RVU of 10.00 for code 27769.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Practice Expense

The RUC recommends the practice expense inputs as amended in the non-facility setting for 27767, removing duplicative clinical staff time as well as the specialty societies' recommended inputs for 27768 and 27769, facility-only procedures, as they are standard 090 day global inputs.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
●27767	Y1	Closed treatment of posterior malleolus fracture; without manipulation	090	2.50
●27768	Y2	with manipulation	090	5.00
●27769	Y3	Open treatment of posterior malleolus fracture, includes internal fixation, when performed (Do not report 27767-27769 in conjunction with 27808-27823)	090	10.00

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:27767 Tracking Number Y1 Specialty Society Recommended RVU: **2.50**
Global Period: 090 RUC Recommended RVU: **2.50**

CPT Descriptor: Closed treatment of posterior malleolus fracture; without manipulation

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 60 year old woman presents with ankle pain after a fall. Physical examination and imaging studies demonstrate a [non]displaced fracture of the posterior malleolus. The fracture is treated without manipulation.

Percentage of Survey Respondents who found Vignette to be Typical: 85%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: • Monitor/assist with patient positioning and padding of bony prominences to allow access of fluoroscopy equipment

Description of Intra-Service Work: After careful positioning by the physician, the physician confirms the stability & position of the fracture, then holds the foot and a cast is applied from calf to the toes, including applying the padding. While the casting material is setting, the cast is molded to maintain anatomic position of the fracture without compromising the skin or neurovascular structures.

Description of Post-Service Work: • Assess circulation, sensation and motor function of the extremity
- Examine and talk with patient
- Answer patient/family questions
- Removal of splint/dressings
- Order periodic x-rays
- Order occupational therapy
- Supervision of rehabilitation
- Monitor physical therapy
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions
- Dictate progress notes for medical record

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The AAOS, OTA and AOFAS convened an expert panel to review the survey results for 27767. We are recommending a work RVU of 2.91 which is the median survey work RVU and we believe appropriately values this service. Our survey respondents choose 27808 as the key reference service and 27808 has a 2.91 work RVU. We believe these two procedures to be very similar in terms of work and intensity and the surveys results confirm that. Our survey respondents indicated a total time for this procedure of 96 minutes distributed as follows: 5 minutes of positioning time, 15 minutes intra-service time, 5 immediate post service time and four post-service office visits, 1-99213 and 3-99212. We believe these time inputs to be appropriate as the survey results were tightly packed with a high N of 48 and the value is appropriately rank ordered with other codes in this fam Our IWPUT is .028 which we believe is appropriate.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 27299

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty AAOS How often? Rarely

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 100
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimate of Requestor

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The AAOS, OTA and AOFAS convened an expert panel to review the survey results for 27768. We are recommending a work RVU of 5.00 which is the median survey work RVU and we believe appropriately values this service. Our survey respondents choose 27810 as the key reference service and 27810 has a very similar work RVU of 5.20. We believe these two procedures to be very similar in terms of work and intensity; this is confirmed by the surveys results. Our survey respondents indicated a total time for this procedure of 170 minutes distributed as follows: 30 minutes of pre-service evaluation time, 10 minutes of positioning time, 5 minutes of scrub, dress and wait time; 25 intra-service minutes, 10 immediate post service minutes and four post-service office visits, 1-99213 and 3-99212. We believe these time inputs to be appropriate as the survey results were tightly packed v a high N of 48 and the value is appropriately rank ordered with other codes in this family. Our IWPUT is .037 which we beli is appropriate and maintains relativity with the other codes in this family.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

Global Period: 090 RUC Recommended RVU: **10.00**

CPT Descriptor: Open treatment of posterior malleolus fracture, includes internal fixation, when performed

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 60 year old woman presents with ankle pain after a fall. Physical examination and imaging studies demonstrate a [non]displaced fracture of the posterior malleolus. An open reduction and internal fixation is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 65%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work:
- Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
- Verify that all required instruments and supplies are available
- Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulati drapes
- Assess position of the extremities and head, adjust as needed
- The patient's leg is placed properly on the table and positioned with proper bolstering to aid surgical exposure.
- Indicate areas of skin to be prepped and mark surgical incisions
- A tourniquet is placed on the proximal thigh
- The leg is prepped and draped.
- The leg is elevated and exsanguinated.
- The pneumatic tourniquet is inflated.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work: Under anesthesia, a posterolateral incision is made. The sural nerve is identified and protected. The interval between the peroneal tendons and the Achilles tendon is developed, retracting these structures. The fracture is identified, cleansed of clot and debris. The fracture is reduced and held with provisional K-wire fixation. Internal fixation is used to buttress the fracture. Position is confirmed with intraoperative radiographs. The wound is irrigated and closed in layers.

Description of Post-Service Work: Post-service work: in facility
- Application of bulky dressing and short leg splint
- Monitor patient stabilization in the recovery room.
- Consultation with the family and patient regarding the surgery and postoperative regimen.
- Communication with health care professionals including written and oral reports and orders.
- Postoperative care is coordinated with recovery room nursing staff.
- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- The patient is discharged to the orthopaedic floor for monitoring of compartment syndrome. Discharge day:

- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Physical therapy for the uses of crutches or walker is ordered
  Write prescriptions for medications needed post-discharge.
- Dictation of an operative report
- Procedure note is written in the patient chart
- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of splint/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order occupational therapy
- Supervision of rehabilitation
- Monitor physical therapy
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions
- Dictate progress notes for medical record

Pre-Service intensity/complexity	3.00	3.00
Intra-Service intensity/complexity	3.42	3.24
Post-Service intensity/complexity	2.89	2.73

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The AAOS, OTA and AOFAS convened an expert panel to review the survey results for 27769. We are recommending a work RVU of 10.00 which is the median survey work RVU and we believe appropriately values this service. Our survey respondents choose 25607 as the key reference service and 25607 has a very similar work RVU of 9.35 with similar pre, intra and post-service times as well. We believe these two procedures to be very similar in terms of work and intensity and the surveys results confirm that. Our survey respondents indicated a total time for this procedure of 286 minutes distributed as follows: 45 minutes of pre-service evaluation time, 15 minutes of positioning time, 15 minutes of scrub, dress and wait time; 60 intra-service minutes. 15 immediate post service minutes and four post-service office visits, 2-99213 and 2-99212. We believe these time inputs to appropriate as the survey results were tightly packed with a high N of 48 and the value is appropriately rank ordered with oth codes in this family. Our IWPUT is .057 which believe is appropriate and maintains relativity with the other codes in this family.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 27899

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty AAOS How often? Rarely

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 50
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. Estimate of Requestor

Specialty Orthopaedic Surgery Frequency 47 Percentage 94.00 %

Specialty Podiatry Frequency 3 Percentage 6.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 25
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimate of Reqestor

Specialty Orthopaedic Surgery Frequency 24 Percentage 96.00 %

Specialty Podiatry Frequency 1 Percentage 4.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? No

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/Specialty Society Update Process
PERC Summary of Recommendation
010 or 090 Day Global Periods
Nonfacility and Facility Direct Inputs

CPT Long Descriptor:

27767 Closed treatment of posterior malleolus fracture; without manipulation
27768 Closed treatment of posterior malleolus fracture; with manipulation
27769 Open treatment of posterior malleolus fracture, includes internal fixation, when performed

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

A consensus panel of experts representing orthopaedic subspecialty societies (general orthopaedics, arthroscopy, trauma, shoulder and elbow, hand, hip & knee, foot & ankle, total joint, sports medicine) reviewed the practice expense details for the survey codes relative to other facility-only 90-day global orthopaedic services.

Please describe the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

No changes were made to the standard pre-service times. A total of 35 (office) and 60 (facility) minutes has been applied for the pre-service clinical labor activities. During the pre-service period, clinical staff conducts the standard pre-service activities: An RN/LPN/MA completes pre-service diagnostic and referral forms, coordinates pre-surgery services, schedules space and equipment in facility, provides pre-service education/obtains consent, and conducts follow-up phone calls.

Intra-Service Clinical Labor Activities:

27767 can be performed in both the office and facility setting. Standard times for the activities necessary in the office and 100% of physician time were applied.

For 27767 and 27768, the standard 6 minutes has been applied for the outpatient procedures for discharge day management services from the facility.

For 27769, the standard 12 minutes has been applied for the inpatient procedure for discharge day management services from the facility.

Post-Service Clinical Labor Activities:

The standard times have been applied for post-service clinical labor time.

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

April 2007

Fibula Malunion

At its February 2007 meeting, the CPT Editorial Panel created one new Category I CPT code to describe a service not currently included in CPT for repair of fibula with internal fixation. Current coding fails to address such a procedure when it is not performed with an osteotomy of the fibula or only when the fibula is repaired without open treatment of lateral malleolus.

The RUC reviewed the specialty societies' survey results describing the physician work for CPT code 27726, *Repair of fibula nonunion and/or malunion with internal fixation.* The RUC also reviewed the surveyed service in comparison to the key reference service, CPT code 27709, *Osteotomy; tibia and fibula* (work RVU = 17.32). While the survey data were reliable, the specialty societies and the RUC agreed that the survey median work RVU was too high, as the surveyed service requires less time and is less intense than the reference service. In comparison to the key reference service, the surveyed service contains slightly less intra-service time, 100 minutes versus 108 minutes, respectively. Additionally, the surveyed code requires significantly less complexity and intensity, as survey respondents indicated a lower level of mental effort and judgment, technical skill and physical effort, and psychological stress required to perform the surveyed procedure. The RUC agreed that the number of post-operative hospital visits was appropriate; however, given the differences in intensity to the reference code, reasoned that the intensity of the visits should be lower. The specialty societies agreed and reduced one 99213 visit to one 99212, accounting for a total of three 99212 and one 99213 post-operative office visits. Based on this review, the RUC agreed with the specialty society recommendation of the surveyed 25th percentile work RVU of 14.20 for code 27726.

The RUC recommends the specialty societies' survey 25th percentile work RVU of 14.20 for code 27726.

Practice Expense

The RUC recommends the specialty societies' recommended inputs for these facility only procedures as they are standard 090 day global inputs.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:27726 Tracking Number Z1 Specialty Society Recommended RVU: **14.20**
Global Period: 090 RUC Recommended RVU: **14.20**

CPT Descriptor: Repair of fibula nonunion and/or malunion with internal fixation

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 50-year-old female twisted her ankle last winter sustaining sustained a fracture dislocation of her ankle. The patient was treated in a closed manner, without manipulation and with cast immobilization. She presents with ankle pain and a healed fracture which is misaligned. The fibula has healed with shortening and external rotation. An open repair of the fibular malunion is planned using internal fixation.

Percentage of Survey Respondents who found Vignette to be Typical: 68%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: • Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
  Review informed consent with patient
  Verify that all required instruments and supplies are available
- Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulation drapes
- Assess position of the extremities and head, adjust as needed
- The patient's leg is placed properly on the table and positioned with proper bolstering to aid surgical exposure.
- Indicate areas of skin to be prepped and mark surgical incisions
- A tourniquet is placed on the proximal thigh
- The leg is prepped and draped.
-
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work: The leg is elevated and exsanguinated; the pneumatic tourniquet is inflated. An incision is made along the lateral border of the fibula. Dissection is performed, identifying the superficial peroneal nerve and each of the united bone ends. An oblique osteotomy is performed using the micro-oscillating saw, based on preoperative planning. The shape, location and plane of this osteotomy are performed so that restoration of length, rotation and alignment may be achieved. Provisional fixation is performed. Satisfactory restoration of osseous anatomy is confirmed. A neutralization, bridge and/or compression plating is/are performed using anatomically contoured implants while avoiding both the ankle joint and the distal tibial-fibula syndesmosis. The osseous correction and the position of the implants are monitored throughout the procedure with fluoroscopy. The wound is irrigated and closed in layers. Permanent radiographs are obtained and reviewed.

escription of Post-Service Work: Post-service work: in facility
  Application of bulky dressing and short leg splint
- Monitor patient stabilization in the recovery room.
- Consultation with the family and patient regarding the surgery and postoperative regimen.
- Communication with health care professionals including written and oral reports and orders.
- Postoperative care is coordinated with recovery room nursing staff.

- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Physical therapy for the uses of crutches or walker is ordered
- Write prescriptions for medications needed post-discharge.
- Dictation of an operative report
- Procedure note is written in the patient chart
- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of splint/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order occupational therapy
- Supervision of rehabilitation
- Monitor physical therapy
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions
- Dictate progress notes for medical record

Intra-Service intensity/complexity	3.63	4.00
Post-Service intensity/complexity	2.25	2.86

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The AAOS and AAHKS, along with OTA convened an expert panel to review the survey results for 27726. We are recommending a work RVU of 14.20 which is the 25% survey result. Our key comparison service was 27709, with a work RVU of 17.32, intra-service time of 108 minutes, two post-operative hospital visit days plus one discharge day, and four total post-operative office visit days with 2-99213 and 2-99212. The total time for our comparison code 27236 is 347. Our total time for our survey code is very similar at 326 minutes, distributed as follows: 40 minutes evaluation time, 15 minutes for positioning and 15 minutes for scrub, dress and wait time; 100 minutes for intra-service time; 20 minutes for immediate post-service time; one 99231 hospital visit, one 99238 discharge day; and four total post-operative office visits, 2-99213 and 2-99212. We felt the survey median RVU for 27726 of 15.50 was slightly higher than we believed was appropriate and we believe the 25th percentile work RVU of 14.20 is the more appropriate and correct value. A RVU of 14.20 produces an IWPUT of .076 which we believe is an appropriate approximation of the intensity for this procedure.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) (27792 + 27707) or 27899

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty AAOS How often? Rarely

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 100
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. Estimate of Requestor

Specialty Orthopaedic Frequency 100 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 50
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimate of Requestor

Specialty Orthopaedic Frequency 50 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? No

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/Specialty Society Update Process
PERC Summary of Recommendation
010 or 090 Day Global Periods
Facility Direct Inputs

CPT Long Descriptor:

27726: Repair of fibula nonunion and/or malunion with internal fixation

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

A consensus panel of experts representing orthopaedic subspecialty societies (general orthopaedics, arthroscopy, trauma, shoulder and elbow, hand, hip & knee, foot & ankle, total joint, sports medicine) reviewed the practice expense details for the survey codes relative to other facility-only 90-day global orthopaedic services.

Please describe the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

No changes were made to the standard pre-service times. A total of 35 (office) and 60 (facility) minutes has been applied for the pre-service clinical labor activities. During the pre-service period, clinical staff conducts the standard pre-service activities: An RN/LPN/MA completes pre-service diagnostic and referral forms, coordinates pre-surgery services, schedules space and equipment in facility, provides pre-service education/obtains consent, and conducts follow-up phone calls.

Intra-Service Clinical Labor Activities:

Standard times for the activities necessary in the office and 100% of physician time were applied.

The standard 6 minutes has been applied for the outpatient procedures for discharge day management services from the facility.

The standard 12 minutes has been applied for the inpatient procedure for discharge day management services from the facility.

Post-Service Clinical Labor Activities:

The standard times have been applied for post-service clinical labor time.

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

February 2007

Internal or External Fixation-Foot/Ankle

As part of the 2005 Five Year Review Process, the American Academy of Orthopaedic Surgery (AAOS) commented that the compelling evidence rationale for examining the work RVU for the fracture treatment codes is that there is evidence that incorrect assumptions were made in the valuation of these codes due to lack of clarity of the CPT descriptor. In particular, the CPT descriptor states "with or without internal or external fixation." However, it is unclear whether the previous valuation for the code included the situation when internal and external fixation is applied to a fracture site. Therefore, the RUC recommended that these codes be referred to the CPT Editorial Panel for further clarification.

At the October 2007 CPT Editorial Panel Meeting, the AAOS recommended to the CPT Editorial Panel that the identified fracture treatment codes in the musculoskeletal section of CPT that include the nomenclature "internal or external" fixation should be clarified to state that external fixation should be an adjunctive procedure to these procedures. The CPT Editorial Panel agreed with the specialty that these codes needed to be clarified and removed reference to external fixation from 64 CPT codes. These 64 codes were divided into four categories based on location: Shoulder/Elbow, Elbow/Hand, Hip/Knee and Foot/Ankle. At the February 2007 RUC Meeting, three of these categories were discussed: Shoulder/Elbow, Elbow/Hand and Foot/Ankle. The Hip/Knee codes will be discussed at the April 2007 RUC Meeting.

Between 225 and 450 orthopaedic providers participated in each of the surveys. These respondents included physicians from general orthopaedic surgery, foot and ankle surgery, orthopaedic trauma surgery and podiatry. After the results from all of these groups were tablulated, a concensus committee of physicians representing the American Academy of Orthopaedic Surgeons, Arthroscopy Association of North America, Orthopaedic Trauama Association, American Podiatic Medical Association and the American Orthopaedic Foot and Ankle Society met to discuss the survey data for the revised orthopaedic codes. During this review, the specialties determined that they would recommend the 25th percentile for codes in situations where all of the fracture codes, when they were arrayed in order of complexity, it was rational to recommend the 25th percentile RVU value as a means to maintain rank order. Furthermore, the specialty

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

societies reviewed the resulting IWPUTs associated with the revised codes and determined that these IWPUT values validated the recommended work RVUs.

The RUC reviewed the compelling evidence for these procedures. The specialty societies claimed that because the CPT descriptors originally contained the phrase "with or without internal or external fixation," it is difficult to imagine what the original Harvard survey data actually represented. Furthermore, an Abt study was performed in 1992 for RUC consideration. This study produced percentage relationships to key reference codes, but not surveyed time and visit data. Some of these recommendations were accepted by the RUC and CMS and others were adjusted up or down but no changes were made to the Harvard time and visit data, if available. Therefore, the specialty society believes that there is little, if any, relationship between the Harvard database time and visit information and the current work RVUs.

Furthermore, the specialty societies stated that there was a significant change in the technology for how these procedures are performed. The surgical treatments use open anatomical reduction and internal fixation has been made more complex with the introduction of new imaging methods such as computed tomography which allows better detection of the fracture pathology and provides the basis for new surgical strategies. There are also new internal fixation devices which require more work. Further, the patient population has changed, as women over 50 are a fast growing segment of the population. A huge percentage of these patients are osteoporatic – making fracture fixation and maintenance of fixation far more difficult. Also, for several of the identified procedures, the provider of the services have changed and were not a part of the original Harvard studies such as the American Podiatric Medical Association. The RUC agreed that there was an abundant amount of compelling evidence to review these codes with the exception of CPT codes 27822 *Open treatment of trimalleolar ankle fracture, with internal fixation, when performed, medial and/or lateral malleolus; without fixation of posterior lip* (Work RVU=12.12), 27823 *Open treatment of trimalleolar ankle fracture, with internal fixation, when performed, medial and/or lateral malleolus; with fixation of posterior lip* (Work RVU=14.26) and 28445 *Open treatment of talus fracture, includes internal fixation, when performed* (Work RVU=17.07). These three identified codes were not reviewed by the RUC because the RUC agreed that the nature of the work involved in providing these services has not substantially changed since the RUC last reviewed them in 2000. The specialty societies conducted a full RUC survey of all codes, and for almost all of the codes, recommended the 25th percentile or the median RVU of the specialty survey data. It should also be noted that the RUC is recommending a slight reduction in work RVUs for one code in this family, 27766 and maintaing the work RVUs for four codes, 27822, 27823, 28445 and 28415.

The RUC thoroughly reviewed these codes, and as part of this review, the specialties explained that they felt strongly that a 99214 office visit was appropriate for two of the codes within this family and however, based on discussions at the RUC meeting the specialty agreed to lower the intensity of this visit to a 99213 office visit. The RUC reviewed CPT code 20690 *Application of a uniplane (pins or wires in*

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

one plane), unilateral, external fixation system and 20692 *Application of a multiplane (pins or wires in more than one plane), unilateral, external fixation system (eg, Ilizarov, Monticelli type)*. It is the RUC's understanding that the utilization for these two procedures will not change with this coding change made by the CPT Editorial Panel. Therefore, the RUC believes that there will be no budget neutrality impact for these recommendations. However, the RUC welcomes a retrospective review of this issue in the future.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
▲27766	F44	Open treatment of medial malleolus fracture, ~~with or without~~ includes internal ~~or external~~ fixation, when performed	090	8.50
▲27784	F45	Open treatment of proximal fibula or shaft fracture, ~~with or without~~ includes internal ~~or external~~ fixation, when performed	090	10.45
▲27792	F46	Open treatment of distal fibular fracture (lateral malleolus), ~~with or without~~ includes internal ~~or external~~ fixation, when performed	090	10.50

AMA/Specialty Society RVS Update Committee
RUC Recommendations - Internal or External Fixation
CPT Code Order

CPT Code	*Descriptor*	*Global*	*RUC Rec Work RVU*	*RUC Rationale*
23515	Open treatment of clavicular fracture, includes internal fixation, when performed	090	11.00	The RUC reviewed CPT code 23515 Open treatment of clavicular fracture, includes internal fixation, when performed and compared it to its reference code 29827 Arthroscopy, shoulder, surgical; with rotator cuff repair (Work RVU=15.44). The RUC compared the intra-service times for these procedures and noted that 23515 had less intra-service time associated with it as compared to 29827, 90 and 120 minutes, respectively. The RUC compared the intensity complexity measures of 23515 amd 29827 and noted that the reference code required more technical skill to perform and had a more intense intra-service period as compared to 23515. Therefore, the RUC agreed that the median of the survey data, 11.00 RVUs, appropriately places this code in comparison to the reference code. For further support the RUC compared this procedure to MPC code 28299 Correction, hallux valgus (bunion), with or without sesamoidectomy; by double osteotomy (Work RVU=11.39) and determined that 11.00 work RVUs was appropriate for 23515 as 28299 has slightly more total service time associated with it in comparison to 23515, 299 minutes and 287 minutes respectively. The RUC recommends 11.00 RVUs for 23515.
23585	Open treatment of scapular fracture (body, glenoid or acromion) includes internal fixation	090	16.25	The RUC reviewed CPTcode 23585 Open treatment of scapular fracture (body, glenoid or acromion) includes internal fixation and compared it to its reference code 27447 Arthroplasty, knee, condyle and plateau; medial AND lateral compartments with or without patella resurfacing (total knee arthroplasty) (Work RVU=23.04). The RUC noted that the total service time for the surveyed code was lower than the reference code, 407 minutes and 469 minutes respectively. Furthermore, the RUC compared the intensities of these procedures and determined that because, 23585 is one of the most complex of the procedures performed for reduction and internal fixation of shoulder fractures and typically requires an extensive exposure of the scapula with significant muscle disection and identification and protection of the suprascapular nerve and artery, it was deemed a more intensive procedure than the reference code 27447. However, the RUC agreed that to keep this code in proper rank order with other codes in the family, such as 23680 Open treatment of shoulder dislocation, with surgical or anatomical neck fracture, includes internal fixation, when performed (RUC recommended value of 15.00 RVUs) and 23616 Open treatment of proximal humeral (surgical or anatomical neck) fracture, includes internal fixation, when performed, includes repair of tuberosity(s) , when performed; with proximal humeral prosthetic replacement (RUC recommended value of 21.00 RVUs), the value associated with this procedure should be the 25th percentile of the survey, 16.25 RVUs. The RUC recommends 16.25 RVUs for 23585.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
23615	Open treatment of proximal humeral (surgical or anatomical neck) fracture, includes internal fixation, when performed, includes repair of tuberosity(s), when performed;	090	14.00	The RUC reviewed CPT code 23615 Open treatment of proximal humeral (surgical or anatomical neck) fracture, includes internal fixation, when performed, includes repair of tuberosity(s), when performed; and compared it with its reference code 29827 Arthroscopy, shoulder, surgical; with rotator cuff repair (Work RVU=15.44). The RUC noted that the surveyed code has significantly less intra-service time associated with it as compared to the reference code, 90 minutes and 130 minutes, respectively. Further, the RUC noted that the reference service required more physical effort to perform and has a more complex intra-service period as compared to 23615. The RUC reviewed several other codes under review in this family, such as 23670 Open treatment of shoulder dislocation, with fracture of greater humeral tuberosity, includes internal fixation, when performed (RUC Recommended value=14.00 RVUs) 25575 Open treatment of radial AND ulnar shaft fractures, with internal fixation, when performed; of radius AND ulna (RUC recommended value=14.00). The RUC determined that because all of these services had the same intra-servce time, 90 minutes and because they all involve similar complexity and intensity to perform the service, the RUC agreed that the 25th percentile of the survey, 14.00 RVU appropriately places this service in comparison to 23670, 25575 and the key reference service 29827. The RUC recommends 14.00 RVU for 23615.
23616	Open treatment of proximal humeral (surgical or anatomical neck) fracture, includes internal fixation, when performed, includes repair of tuberosity(s) , when performed; with proximal humeral prosthetic replacement	090	21.00	The RUC reviewed CPT code 23616 Open treatment of proximal humeral (surgical or anatomical neck) fracture, includes internal fixation, when performed, includes repair of tuberosity(s) , when performed; with proximal humeral prosthetic replacement and compared it with its reference code 23472 Arthroplasty, glenohumeral joint; total shoulder (glenoid and proximal humeral replacement (eg, total shoulder)) (Work RVU=22.47). The RUC agreed that the specialty society recommended 99214 office visit should be removed and replaced with a 99213 office visit as this is more typical of the post-operative care for this procedure. This change in the post-operative visits results in three 99213 office visits and one 99212 office visits being associated with this procedure. The RUC noted that 23616 has less intra-service time associated with it as compared to the reference code, 120 minutes and 165 minutes, respectively. Although 23472 has longer intra-service times than the surveyed code, with 23616 comminution is frequently present which makes correct positioning of the prosthesis and stable repair of the tuberosity fragments difficult this makes 23616 a very intensive procedure to perform. For further support the RUC reviewed MPC code 50546 Laparoscopy, surgical; nephrectomy, including partial ureterectomy (Work RVU=21.69). The RUC noted that 50546 had a longer intra-service time in comparison to 23616, 205 minutes and 120 minutes, respectively. Therefore, the RUC agreed that the median value of 21.00 RVUs is appropriate and correctly places this code in comparison to the reference code, 23472 and 50546. The RUC noted that the proposed value for this procedure, 21.00 RVUs, is less than the existing value, 21.68 RVUs. The RUC recommends 21.00 RVUs for 23616.

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
23630	Open treatment of greater humeral tuberosity fracture, includes internal fixation, when performed	090	12.00	The RUC reviewed CPT code 23630 Open treatment of greater humeral tuberosity fracture, includes internal fixation, when performed and compared it to its reference code 23420 Reconstruction of complete shoulder (rotator) cuff avulsion, chronic (includes acromioplasty) (Work RVU=14.75). The RUC noted that the intra-service time of the surveyed code was far less than the intra-service time of the reference code, 70 minutes and 120 minutes. The RUC also noted that although 23630 is a shoulder fracture that commonly occurs in tandem with poor bone quality, making fixation of the fragment difficult and tenuous, the reference code is a more intensive procedure to perform. This comparison of intensity is demonstrated in the intensity measure of the intra-service time associated with the surveyed code, as it is less than the intensity associated with the reference code. Therefore, the RUC recommends the 25th percentile of the survey for this procedure, 12.00 RVUs. For further support, the RUC compared 23630 to MPC code 60220 Total thyroid lobectomy, unilateral; with or without isthmusectomy (Work RVU=12.29). The RUC noted that as 23630 has less intra-service time as compared to 60220, 70 minutes and 90 minutes, the recommended work RVU of 12.00 appropriately places this code in comparison to 60220 as well as the reference code, 23420. The RUC recommends 12.00 RVU for 23630.
23670	Open treatment of shoulder dislocation, with fracture of greater humeral tuberosity, includes internal fixation, when performed	090	14.00	The RUC reviewed CPT code 23670 Open treatment of shoulder dislocation, with fracture of greater humeral tuberosity, includes internal fixation, when performed and compared it with its reference code 23420 Reconstruction of complete shoulder (rotator) cuff avulsion, chronic (includes acromioplasty) (Work RVU=14.75). The RUC noted that the surveyed code has significantly less intra-service time associated with it as compared to the reference code, 90 minutes and 120 minutes, respectively. However, all of the intensity and complexity measures demonstrated that the surveyed code was significanly more difficult to perform than the reference code. The RUC reviewed several other codes under review in this family, such as 23615 Open treatment of proximal humeral (surgical or anatomical neck) fracture, includes internal fixation, when performed, includes repair of tuberosity(s), when performed; (RUC recommended value of 14.00 RVUs) and 25575 Open treatment of radial AND ulnar shaft fractures, with internal fixation, when performed; of radius AND ulna (RUC recommended value of 14.00 RVUs). The RUC determined that because all of these services had the same intra-servce time, 90 minutes and because they all involve similar complexity and intensity to perform the service, the RUC agreed that the 25th percentile of the survey, 14.00 RVU appropriately places this service in comparison to 23615, 25575 and the key reference service 23420. The RUC recommends 14.00 RVU for 23670.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
23680	Open treatment of shoulder dislocation, with surgical or anatomical neck fracture, includes internal fixation, when performed	090	15.00	The RUC reviewed CPT code 23680 Open treatment of shoulder dislocation, with surgical or anatomical neck fracture, includes internal fixation, when performed and compared it to its reference code 29827 Arthroscopy, shoulder, surgical; with rotator cuff repair (Work RVU=15.44). The RUC noted that 23680 and 29827 have the same pre-service time (75 minutes) and intra-service time (120 minutes). The RUC agreed that that in addition to the times for these two procedures being the same that the complexity and work associated with them is similar as well. Therefore the RUC recommends the 25th percentile of the survey 15.00 RVUs to reflect this similarity in service times and work. The RUC recommends 15.00 RVUs for 23680.
24545	Open treatment of humeral supracondylar or transcondylar fracture, includes internal fixation, when performed; without intercondylar extension	090	15.00	The RUC reviewed CPT code 24545 Open treatment of humeral supracondylar or transcondylar fracture, includes internal fixation, when performed; without intercondylar extension and compared it to its reference code 25609 Open treatment of distal radial intra-articular fracture or epiphyseal separation; with internal fixation of 3 or more fragments (Work RVU=14.12). The RUC reviewed the total-service times for both codes and found them to be comparable, 361 minutes and 358 minutes. However, the RUC noted that the intensity/complexity measures for 24545 were significantly higher in comparison to 25609 as the complexity and risk for complication involved in 24545 is much greater than 25609. Therefore the RUC agreed that the median value of 15.00 RVU appropriately places this code in comparison to the reference code. The RUC recommends a work RVU of 15.00 for code 24545.
24546	Open treatment of humeral supracondylar or transcondylar fracture, includes internal fixation, when performed; with intercondylar extension	090	17.01	The RUC reviewed CPT code 24546 Open treatment of humeral supracondylar or transcondylar fracture, includes internal fixation, when performed; with intercondylar extension and compared it with its reference code 23472 Arthroplasty, glenohumeral joint; total shoulder (glenoid and proximal humeral replacement (eg, total shoulder)) (Work RVU=22.47). The RUC agreed that the specialty society recommended 99214 office visit should be removed and replaced with a 99213 office visit as this is more typical of the post-operative care for this procedure. This change in the post-operative visits results in three 99213 office visits and a 99212 office visit being associated with this procedure. However, after comparing 24546 with 23472, the RUC determined that this reference code was not a suitable comparison. The RUC agreed that the better reference code would be 24545 Open treatment of humeral supracondylar or transcondylar fracture, includes internal fixation, when performed; without intercondylar extension (RUC recommended RVU=15.00 RVUs). The RUC compared the total service times for both procedures and determined at 24546 had a longer intra service time in comparison to 24545, 150 minutes and 120 minutes. The RUC also agreed that the intensity/complexity of performing 24546 is significantly higher that performing 24545 as 24545 is an extra-articular fracture and 24546 is an intra-articular fracture requiring extensive exposure of the joint. Therefore, to calculate the recommended RVUs for this procedure, the RUC started with the 25th percentile of the survey data, 16.34 RVUs and added a work RVU increment of 2.01, the difference in intra-service times between 24546 and 24545 (30 minutes) multiplied by the IWPUT of 24545 (0.067). This calculation results in a value of 17.01 RVUs. The RUC recommends 17.01 RVUs for 24546.

699

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
24575	Open treatment of humeral epicondylar fracture, medial or lateral, includes internal fixation, when performed	090	11.00	The RUC reviewed CPT code 24575 Open treatment of humeral epicondylar fracture, medial or lateral, includes internal fixation, when performed and compared it to its reference code 25608 Open treatment of distal radial intra-articular fracture or epiphyseal separation; with internal fixation of 2 fragments (Work RVU=10.86). The RUC reviewed the total-service times for both codes and found them to be comparable, 305 minutes and 308 minutes. Therefore the RUC agreed that the median value of 11.00 RVU appropriately places this code in comparison to the reference code. For further support the RUC compared this procedure to MPC code 28299 Correction, hallux valgus (bunion), with or without sesamoidectomy; by double osteotomy (Work RVU=11.39) and determined that 11.00 work RVUs was appropriate for 24575 as 28299 has more intra- service time associated with it in comparison to 24575, 90 minutes and 60 minutes, respectively. The RUC noted that the proposed value for this procedure, 11.00 RVUs, is slightly less than the existing value, 11.02 RVUs. The RUC recommends 11.00 RVUs for 24575.
24579	Open treatment of humeral condylar fracture, medial or lateral, includes internal fixation, when performed	090	13.00	The RUC reviewed CPT code 24579 Open treatment of humeral condylar fracture, medial or lateral, includes internal fixation, when performed and compared it to 25609 Open treatment of humeral condylar fracture, medial or lateral, includes internal fixation, when performed (Work RVU=14.12). The RUC noted that the intra-service time for the surveyed code is significantly less than the reference code, 90 minutes and 120 minutes. Furthermore, the RUC noted that the reference code requires more mental effort and judgement and technical skill to perform in comparison to 24579. Because of a lower intra-service time and lower intensity and complexity measures of the surveyed code in comparison to the reference code, the RUC recommends the survey median work RVU, 13.00 RVUs for 24579 as it appropriately places this code in comparison to the reference code. For further support the RUC compared 24579 to 24575 Open treatment of humeral epicondylar fracture, medial or lateral, includes internal fixation, when performed (RUC recommended value=11.00 RVU). The RUC noted that these procedures are similar except 24579 has the addition of an intraarticular extension involving the entire condylar structure. The same neurovascular structures are at risk in 24579 and 24575 except 24579 has the added complexity of obtaining and holding the articular surface reduced anatomically to maintain joint congruity. Because of these comparisons to a reference code and another code within the family, the RUC recommends 13.00 RVUs for 24579.

670

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
24635	Open treatment of Monteggia type of fracture dislocation at elbow (fracture proximal end of ulna with dislocation of radial head), includes internal fixation, when performed	090	10.00	The RUC reviewed CPT code 24635 Open treatment of Monteggia type of fracture dislocation at elbow (fracture proximal end of ulna with dislocation of radial head), includes internal fixation, when performed and compared it to its reference code 25607 Open treatment of distal radial extra-articular fracture or epiphyseal separation, with internal fixation (Work RVU=9.35). The RUC noted that the total service time for 24635 is higher than the total service time for 25607, 291 minutes and 275 minutes, respectively. Furthermore, the work for 24635 is greater than 25607 because the dislocated radial head must be treated in addition to the ulna fracture and post-operatively there is a danger of neurovascular injury and compartment syndrome. Close monitoring is required. This is demonstrated in the intensity/complexity measures which indicate that the surveyed code requies greater mental effort and judgement, greater technical skill and greater physical effort to perform in comparison to the reference code. Furthermore, the RUC noted that this service requires a hospital stay as there is significant monitoring of circulation, sensation and motor function of the involved extremity. Therefore, the RUC agreed that the 25th percentile of the survey data, 10.00 work RVUs accurately places this code in comparison to the reference code. The RUC noted that the proposed value for this procedure, 10.00 RVUs, is less than the existing value, 13.56 RVUs. The RUC recommends 10.00 work RVUs for 24635.
24685	Open treatment of ulnar fracture proximal end (olecranon process), includes internal fixation, when performed	090	9.50	The RUC reviewed CPT code 24685 Open treatment of ulnar fracture proximal end (olecranon process), includes internal fixation, when performed and compared it to its reference code 25607 Open treatment of distal radial extra-articular fracture or epiphyseal separation, with internal fixation (Work RVU=9.35). The RUC noted that while both services have an intra-service time of 60 minutes, the surveyed procedure is more complex than the reference code as 24685 is intraarticular and 25607 is extraarticular. This complexity of the intra-service is also noted in the intra-service intensity complexity measure which shows that the surveyed code's intra-service period is more intense than the intra-service time associated with the reference code. Furthermore, the intensity/complexity measures indicate that the surveyed code requires greater mental effort and judgment, greater technical skill and greater physical effort to perform in comparison to the reference code. Therefore, the RUC agreed that the 25th percentile of the survey data, 9.50 work RVUs, accurately places this code in comparsion to the reference code. The RUC recommends 9.50 work RVUs for 24685.

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
25515	Open treatment of radial shaft fracture, includes internal fixation, when performed	090	10.00	The RUC reviewed CPT code 25515 Open treatment of radial shaft fracture, includes internal fixation, when performed and compared it with its reference code 25608 Open treatment of distal radial intra-articular fracture or epiphyseal separation; with internal fixation of 2 fragments (work RVU=10.86). The RUC noted that the intra-service time for the surveyed code is less than the intra-service time for the reference code (60 minutes and 90 minutes, respectively). The RUC also compared the intensity/complexity measures of the surveyed code and the reference code and determined that the reference code required more technical skill, physical effort, mental effort and judgment to perform than the reference code. With the lower amount of intra-service time and lower intensity/complexity measures as compared to 25608, the RUC agreed that the 25th percentile of survey, 10.00 work RVU appropriately places 25515 in comparison to the reference code. The RUC recommends 10.00 work RVUs for 25515.
25525	Open treatment of radial shaft fracture, with internal fixation, when performed, and closed treatment of dislocation of distal radioulnar joint (Galeazzi fracture/dislocation), with percutaneous skeletal fixation, when performed	090	12.00	The RUC reviewed CPT code 25525 Open treatment of radial shaft fracture, with internal fixation, when performed, and closed treatment of dislocation of distal radioulnar joint (Galeazzi fracture/dislocation), with percutaneous skeletal fixation, when performed and compared it with its reference code 25608 Open treatment of distal radial intra-articular fracture or epiphyseal separation; with internal fixation of 2 fragments (work RVU=10.86). The RUC agreed that the specialty society recommended 99214 office visit should be lowered to a 99213 office visit as this is more typical of the post-operative care for this procedure. This change in the post-operative visits results in three 99213 office visits and one 99212 office visits being associated with this procedure. With this change, the RUC noted that the total service times for both of these codes are comparable, 303 minutes and 305 minutes. However, the RUC noted that the surveyed code required greater mental effort and judgment and physicial effort to perform in comparison to the reference code. Therefore, due to comparable total service times but greater intensity/complexity measures, the RUC recommends the survey median, 12.00 RVU for this procedure. For further support, the RUC compared 25525 to MPC code 60220 Total thyroid lobectomy, unilateral; with or without isthmusectomy (Work RVU=12.29). The RUC noted that as 25525 has less intra-service time as compared to 60220, 70 minutes and 90 minutes, the recommended work RVU of 12.00 appropriately places this code in comparison to 60220 as well as the reference code, 25608. The RUC noted that the proposed value for this procedure, 12.00 RVUs, is less than the existing value, 12.69 RVUs. The RUC recommends 12.00 RVU for 22525.

672

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
25526	Open treatment of radial shaft fracture, with internal fixation, when performed, and open treatment of distal radioulnar joint, with internal fixation, when performed (Galeazzi fracture/dislocation), includes repair of triangular fibrocartilage complex	090	15.00	The RUC reviewed CPT code 25526 Open treatment of radial shaft fracture, with internal fixation, when performed, and open treatment of distal radioulnar joint, with internal fixation, when performed (Galeazzi fracture/dislocation), includes repair of triangular fibrocartilage complex and compared it to its reference code 25609 Open treatment of distal radial intra-articular fracture or epiphyseal separation; with internal fixation of 3 or more fragments. The RUC agreed that the specialty society recommended 99214 office visit should be removed and two 99212 office visit should be added as this is more typical of the post-operative care for this procedure. This change in the post-operative visits results in two 99213 office visits and three 99212 office visits being associated with this procedure. With these changes, the RUC noted that the surveyed code has more total service time associated with it in comparison to the reference code, 398 minutes and 358 minutes, respectively. Further, the RUC noted that the surveyed code required more mental effort and judgement and more physical effort to perform and has a more complex intra-service period as compared to 25609. The difficulty of this procedure can be explained as this is the most complex of the hand procedures reviewed because this procedure consists of two separate procedures, an open reduction internal fixation of the radius which places the radial nerve in danger as well as the radial artery and a separate arthrotomy of the ulnocarpal joint and repair of the triangular fibrocartilage complex. Because of the increased total service time as well as the higher intensity/complexity measures associated with 25526 in comparison to its reference code, the RUC recommends the survey median of 15.00 work RVU for 25526. The RUC recommends 15.00 RVUs for 25526.
25545	Open treatment of ulnar shaft fracture, includes internal fixation, when performed	090	9.00	The RUC reviewed CPT code 25545 Open treatment of ulnar shaft fracture, includes internal fixation, when performed in compairison to 25607 Open treatment of distal radial extra-articular fracture or epiphyseal separation, with internal fixation (Work RVU=9.35). The RUC noted that the surveyed code and the reference code had the same intra-service time, 60 minutes. The RUC noted that 25545 requires a 99231 hospital visit as there is a danger of neurovascular injury and compartment syndrome and close monitoring is needed. The RUC also noted that the reference code requires greater endurance of psychological stress to perform as compared to the surveyed code. The RUC compared this procedure to 26665 Open treatment of carpometacarpal fracture dislocation, thumb (Bennett fracture), includes internal fixation, when performed (RUC recommended value of 9.00 RVUs) and MPC code 14060 Adjacent tissue transfer or rearrangement, eyelids, nose, ears and/or lips; defect 10 sq cm or less (Work RVU=9.07 and noted that because all of these procedures had similar work and the same intra-service time, 60 minutes, that they should all be valued the similarly. Therefore, because of all of these comparisons, the RUC recommends the median survey RVU, 9.00 work RVUs. The RUC noted that the proposed value for this procedure, 9.00 RVUs, is less than the existing value, 9.09 RVUs. The RUC recommends 9.00 Work RVUs for 25545.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
25574	Open treatment of radial AND ulnar shaft fractures, with internal fixation, when performed; of radius OR ulna	090	10.00	The RUC reviewed CPT code 25574 Open treatment of radial AND ulnar shaft fractures, with internal fixation, when performed; of radius OR ulna and compared it with its reference code 25608 Open treatment of distal radial intra-articular fracture or epiphyseal separation; with internal fixation of 2 fragments (work RVU=10.86). The RUC noted that the intra-service time for the surveyed code is less than the intra-service time for the reference code (60 minutes and 90 minutes, respectively). The RUC also compared the intensity/complexity measures of the surveyed code and the reference code and determined that the reference code required more technical skill, mental effort and judgement to perform than the reference code. With the lower amount of intra-service time and lower intensity/complexity measures as compared to 25608, the RUC agreed that the 25th percentile of survey, 10.00 work RVU appropriately places 25574 in comparison to the reference code. The RUC recommends 10.00 work RVUs for 25574.
25575	Open treatment of radial AND ulnar shaft fractures, with internal fixation, when performed; of radius AND ulna	090	14.00	The RUC reviewed CPT code 25575 Open treatment of radial AND ulnar shaft fractures, with internal fixation, when performed; of radius AND ulna and compared it with its reference code 25609 Open treatment of distal radial intra-articular fracture or epiphyseal separation; with internal fixation of 3 or more fragments (Work RVU=14.12). The RUC agreed that the specialty society recommended 99214 office visit should be removed and two 99212 office visit should be added as this is more typical of the post-operative care for this procedure. This change in the post-operative visits results in two 99213 office visits and three 99212 office visits being associated with this procedure. With these changes, the RUC noted that the surveyed code has less total service time associated with it in comparison to the reference code, 342 minutes and 358 minutes, respectively. Further, the RUC noted that the reference service required more technical skill, physical effort and more psychological stress to perform and has a more complex intra-service period as compared to 25609. The RUC reviewed several other codes under review in this family, such as 23670 Open treatment of shoulder dislocation, with fracture of greater humeral tuberosity, includes internal fixation, when performed (RUC Recommended wRVU=14.00 RVUs) 23615 Open treatment of proximal humeral (surgical or anatomical neck) fracture, includes internal fixation, when performed, includes repair of tuberosity(s), when performed; (RUC recommended wRVU=14.00). The RUC determined that because all of these services had the same intra-servce time, 90 minutes and because they all involve similar complexity and intensity to perform the service, the RUC agreed that the median of the survey, 14.00 RVUs appropriately places this service in comparison to 23670, 23615 and the key reference service 25609. The RUC recommends 14.00 RVUs for 25575.

674

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
25628	Open treatment of carpal scaphoid (navicular) fracture, includes internal fixation, when performed	090	11.00	The RUC reviewed CPT code 25628 Open treatment of carpal scaphoid (navicular) fracture, includes internal fixation, when performed and compared it with its reference code 25394 Osteoplasty, carpal bone, shortening (work RVU=10.71). The RUC noted that the total service time for the surveyed code is more than the total service time for the reference code (277 minutes and 250 minutes, respectively). The RUC also compared the intensity/complexity measures of the surveyed code to the reference code and determined that the surveyed code required more technical skill, physical and mental effort and judgement to perform than the reference code. With the higher amount of total service time and higher intensity/complexity measures as compared to 25394, the RUC agreed that the 25th percentile of survey, 11.00 work RVU appropriately places 25628 in comparison to the reference code. The RUC recommends 11.00 work RVUs for 25628.
26615	Open treatment of metacarpal fracture, single, includes internal fixation, when performed, each bone	090	8.00	The RUC reviewed CPT code 26615 Open treatment of metacarpal fracture, single, includes internal fixation, when performed, each bone and compared it with its reference code 25607 Open treatment of distal radial extra-articular fracture or epiphyseal separation, with internal fixation (work RVU=9.35). The RUC noted that the intra-service time for the surveyed code is less than the intra-service time for the reference code (45 minutes and 60 minutes, respectively). The RUC also compared the intensity/complexity measures of the surveyed code to the reference code and determined that the reference code required more mental effort and judgement and more psychological stress. With the lower amount of intra-service time and lower intensity/complexity measures as compared to 25607, the RUC agreed that the 25th percentile of survey, 8.00 work RVU appropriately places 26615 in comparison to the reference code. The RUC recommends 8.00 work RVUs for 26615.
26650	Percutaneous skeletal fixation of carpometacarpal fracture dislocation, thumb (Bennett fracture), with manipulation, with external fixation	090	6.00	The RUC reviewed CPT code 26650 Percutaneous skeletal fixation of carpometacarpal fracture dislocation, thumb (Bennett fracture), with manipulation, with external fixation and compared it to its reference code 25651 Percutaneous skeletal fixation of ulnar styloid fracture (work RVU=5.68). The RUC compared the total service times for these procedures and noted that the surveyed code (197 minutes of total service time) had more total service time associated with it than the 25651 (190 minutes of total service time). The RUC also compared the office visits associated with this procedure and noted that although they both have four post-operative office visits associated with them, the surveyed code has two 99213 and two 99212 visits associated with it while 25651 has one 99213 and three 99212 associated with it, which suggests the surveyed code involves more complex post operative care as compared to the reference code. This difference in the intensity of the post-operative care is also demonstrated in the post-operative intensity/complexity measures which show that the post service time segment of the surveyed code has a greater intensity associated with it as compared to the reference code. Therefore, because of the greater total service time and the more intense post-operative visits, the RUC agreed that the median RVU of the survey data appropriately places 26650 in comparison to 25651. The RUC recommends 6.00 RVUs for 26650.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
26665	Open treatment of carpometacarpal fracture dislocation, thumb (Bennett fracture), includes internal fixation, when performed	090	9.00	The RUC reviewed CPT code 26665 Open treatment of carpometacarpal fracture dislocation, thumb (Bennett fracture), includes internal fixation, when performed in comparison to 25652 Open treatment of ulnar styloid fracture (Work RVU=7.92). The RUC noted that the surveyed code had a greater total service time associated with it in comparison to the reference code, 237 minutes and 225 minutes, respectively. The RUC also noted that the surveyed procedure requires greater physicial effort and an endurance of greater psychological stress to perform as compared to the reference code. Furthermore, the surveyed code is a more complex procedure to perform than the reference code given the increased intensity of dealing with an intraarticular fracture as demonstrated in the intensity/complexity time measures which shows that surveyed code is a much more intense procedure to perform than the reference code. The RUC agreed that because of the larger total service time and the greater amount of intensity and complexity associated with the surveyed code as compared to the reference code, the RUC recommends the median survey RVU, 9.00 work RVUs. In addition, the RUC agreed this value is appropriate because it has similar work and the same intra-service time as MPC code 14060 Adjacent tissue transfer or rearrangement, eyelids, nose, ears and/or lips; defect 10 sq cm or less (Work RVU=9.07). The RUC recommends 9.00 Work RVUs for 26665.
26685	Open treatment of carpometacarpal dislocation, other than thumb; includes internal fixation, when performed, each joint	090	8.00	The RUC reviewed CPT code 26685 Open treatment of carpometacarpal dislocation, other than thumb; includes internal fixation, when performed, each joint and compared it with its reference code 25652 Open treatment of ulnar styloid fracture (work RVU=7.92). The RUC noted that the intra-service times for both procedures are 60 minutes. The RUC also compared the office visits associated with this procedure and noted that although they both have four post-operative office visits associated with them, the surveyed code has two 99213 and two 99212 visits associated with it while 25652 has one 99213 and three 99212 associated with it which suggests the surveyed code has a more complex post operative care as compared to the reference code. This difference in the intensity of the post-operative care is also demonstrated in the post-operative intensity/ complexity measure which shows that the post service time segment of the surveyed code has a greater intensity associated with it as compared to the reference code. With the same amount of intra-service time and slightly different office visits as compared to 25652, the RUC agreed that the median of the survey, 8.00 work RVUs appropriately places 26685 in comparison to the reference code, 26615 Open treatment of metacarpal fracture, single, includes internal fixation, when performed, each bone and 28645 Open treatment of metatarsophalangeal joint dislocation, includes internal fixation, when performed which all have the same complexity and proposed work RVU. The RUC recommends 8.00 work RVUs for 26685.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
26715	Open treatment of metacarpophalangeal dislocation, single, includes internal fixation, when performed	090	7.95	The RUC reviewed CPT code 26715 Open treatment of metacarpophalangeal dislocation, single, includes internal fixation, when performed and compared it to its reference code, 25671 Percutaneous skeletal fixation of distal radioulnar dislocation (Work RVU=6.32). The RUC compared the total service times for these procedures and noted that the surveyed code (220 minutes of total service time) had more total service time associated with it than the 25671 (210 minutes of total service time). The RUC also compared the office visits associated with this procedure and noted that although they both have four post-operative office visits associated with them, the surveyed code has two 99213 and two 99212 visits associated with it while 25651 has one 99213 and three 99212 associated with it which suggests the surveyed code involves more complex post operative care as compared to the reference code. This difference in the intensity of the post-operative care is also demonstrated in the post-operative intensity/ complexity measure which shows that the post service time segment of the surveyed code has a greater intensity associated with it as compared to the reference code. Therefore, because of the greater total service time and the more intense post-operative visits, the RUC agreed that the median RVU of the survey data 7.95 work RVUs, appropriately places 26715 in comparison to 25671. Furthermore, the RUC agreed that this value correctly places this procedure in terms of complexity in comparison to other orthopaedic codes such that it is more complex than 26785 Open treatment of interphalangeal joint dislocation, includes internal fixation, when performed, single (RUC recommended work RVU =7.45 work RVU) and has similar complexity to 28645 Open treatment of metatarsophalangeal joint dislocation, includes internal fixation, when performed (RUC recommended work RVU=8.00). The RUC recommends 7.95 RVUs for 26715.
26735	Open treatment of phalangeal shaft fracture, proximal or middle phalanx, finger or thumb, includes internal fixation, when performed, each	090	8.40	The RUC reviewed CPT code 26735 Open treatment of phalangeal shaft fracture, proximal or middle phalanx, finger or thumb, includes internal fixation, when performed, each and compared it with its reference code 25608 Open treatment of distal radial intra-articular fracture or epiphyseal separation; with internal fixation of 2 fragments (work RVU=10.86). The RUC noted that the intra-service time for the surveyed code is less than the intra-service time for the reference code (60 minutes and 90 minutes, respectively). The RUC also compared the intensity/complexity measures of the surveyed code to the reference code and determined that the reference code required more physical effort and more psychological stress to perform than the surveyed code. With the lower amount of intra-service time and lower intensity/complexity measures as compared to 25608, the RUC agreed that the 25th percentile of survey, 8.40 work RVUs appropriately places 26735 in comparison to the reference code. Furthermore, the RUC compared the surveyed code with MPC code 14040 Adjacent tissue transfer or rearrangement, forehead, cheeks, chin, mouth, neck, axillae, genitalia, hands and/or feet; defect 10 sq cm or less (Work RVU=8.44) and agreed that 8.40 RVU was an approriate value for the surveyed code because the surveyed code had similar total-service time as compared to this procedure, 237 minutes and 223 minutes, respectively. The RUC recommends 8.40 work RVUs for 26735.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
26746	Open treatment of articular fracture, involving metacarpophalangeal or interphalangeal joint, includes internal fixation, when performed, each	090	11.10	The RUC reviewed CPT code 26746 Open treatment of articular fracture, involving metacarpophalangeal or interphalangeal joint, includes internal fixation, when performed, each and compared it to its reference code 25608 Open treatment of distal radial intra-articular fracture or epiphyseal separation; with internal fixation of 2 fragments (Work RVU=10.86). The RUC reviewed the total-service times for both codes and found them to be comparable, 303 minutes and 305 minutes. However, the RUC noted that the intensity/complexity measures for 26746 were significantly higher in comparison to 25608 as the complexity and risk for complication involved in 26746 is much greater than 25608. Therefore the RUC agreed that the median value of 11.10 RVU appropriately places this code in comparison to the reference code. For further support the RUC compared this procedure to MPC code 28299 Correction, hallux valgus (bunion), with or without sesamoidectomy; by double osteotomy (Work RVU=11.39) and determined that 11.10 work RVUs was appropriate for 26746 as 28299 has more intra- service time associated with it in comparison to 27832, 90 minutes and 83 minutes respectively. The RUC recommends 11.10 RVUs for 26746.
26765	Open treatment of distal phalangeal fracture, finger or thumb, includes internal fixation, when performed, each	090	6.60	The RUC reviewed CPT code 26765 Open treatment of distal phalangeal fracture, finger or thumb, includes internal fixation, when performed, each and compared it with its reference code 25652 Open treatment of ulnar styloid fracture (work RVU=7.92). The RUC noted that the intra-service time for the surveyed code is less than the intra-service time for the reference code (45 minutes and 60 minutes, respectively). The RUC also compared the intensity/complexity measures of the surveyed code and the reference code and determined that the reference code required more technical and physical effort, more psychological stress and had increased intensity to perform as compared to the surveyed code. With the lower amount of intra-service time and lower intensity/complexity measures as compared to 25652, the RUC agreed that the 25th percentile of survey, 6.60 work RVU appropriately places 26765 in comparison to the reference code. The RUC recommends 6.60 work RVUs for 26765.
26785	Open treatment of interphalangeal joint dislocation, includes internal fixation, when performed, single	090	7.45	The RUC reviewed CPT code 26785 Open treatment of interphalangeal joint dislocation, includes internal fixation, when performed, single and compared it with its reference code 25652 Open treatment of ulnar styloid fracture (work RVU=7.92). The RUC noted that the intra-service time for the surveyed code is less than the intra-service time for the reference code (45 minutes and 60 minutes, respectively). The RUC also compared the intensity/complexity measures of the surveyed code and the reference code and determined that the reference code required more technical and physical effort, more psychological stress and had increased intensity to perform as compared to the surveyed code. With the lower amount of intra-service time and lower intensity/complexity measures as compared to 25652, the RUC agreed that the 25th percentile of survey, 7.45 work RVU appropriately places 26785 in comparison to the reference code. The RUC recommends 7.45 work RVUs for 26785.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
27766	Open treatment of medial malleolus fracture, includes internal fixation, when performed	090	8.50	The RUC reviewed CPT code 27766 Open treatment of medial malleolus fracture, includes internal fixation, when performed and compared it with its reference code 25607 Open treatment of distal radial extra-articular fracture or epiphyseal separation, with internal fixation (work RVU=9.35). The RUC noted that the intra-service time for the surveyed code is less than the intra-service time for the reference code (45 minutes and 60 minutes, respectively). The RUC noted that this procedure requires a 99231 hospital stay because of the risk of post-operative complications. The RUC also compared the intensity/complexity measures of the surveyed code and the reference code and determined that the reference code required more technical skill, physical effort and more psychological stress to perform than the reference code. With the lower amount of intra-service time and lower intensity/complexity measures as compared to 25607, the RUC agreed that the 25th percentile of survey, 8.50 work RVU appropriately places 27766 in comparison to the reference code. The RUC noted that the proposed value for this procedure, 8.50 RVUs, is less than the existing value, 8.73 RVUs. The RUC recommends 8.50 work RVUs for 27766.
27784	Open treatment of proximal fibula or shaft fracture, includes internal fixation, when performed	090	10.45	The RUC reviewed CPT code 27784 Open treatment of proximal fibula or shaft fracture, includes internal fixation, when performed and compared it with its reference code 25607 Open treatment of distal radial extra-articular fracture or epiphyseal separation, with internal fixation (Work RVU=9.35). The RUC noted that the total service time of 27784 is higher than the total service time of the reference code, 281 minutes and 275 minutes, respectively. The RUC reviewed the intensity complexity measures associated with 27784 and 25607. The RUC noted that 27784 requires more technical skill, physical effort and psychological stress to perform than the reference code. With the higher amount of total service time of the surveyed code in comparison to the reference code and the higher intensity/complexity measures of the surveyed code in comparison to the reference code, the RUC agreed that the median of the survey, 10.45 RVUs appropriately places this code in comparison to the reference codes. For further support, the RUC compared this code to MPC code 66984 Extracapsular cataract removal with insertion of intraocular lens prosthesis (one stage procedure), manual or mechanical technique (eg, irrigation and aspiration or phacoemulsification) (Work RVU=10.36) and agreed that the recommended value of 10.45 RVU for 27784 was appropriate as the intra-service time for 27784 is significantly more than the 66984, 60 minutes and 30 minutes, respectively. The RUC recommends 10.45 RVUs for 27784.

679

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
27792	Open treatment of distal fibular fracture (lateral malleolus), includes internal fixation, when performed	090	10.50	The RUC reviewed CPT code 27792 Open treatment of distal fibular fracture (lateral malleolus), includes internal fixation, when performed and compared it with its reference code 28299 Correction, hallux valgus (bunion), with or without sesamoidectomy; by double osteotomy (Work RVU=11.39). The RUC noted that the intra-service time of 27792 is significantly less than the intra-service time of the reference code, 60 minutes and 90 minutes, respectively. The RUC also noted that the care for this type of fracture is slightly more complex than 27784 Open treatment of proximal fibula or shaft fracture, includes internal fixation, when performed (RUC Recommended Value=10.45). With the lower amount of intra-service time of the surveyed code in comparison to the reference code and maintaining the proper rank order between the surveyed code and 27784, the RUC agreed that the median of the survey, 10.50 RVUs appropriately places this code in comparison to the reference codes. For further support, the RUC compared this code to MPC code 66984 Extracapsular cataract removal with insertion of intraocular lens prosthesis (one stage procedure), manual or mechanical technique (eg, irrigation and aspiration or phacoemulsification) (Work RVU=10.36) and agreed that the recommended value of 10.50 RVU for 27792 was appropriate as the intra-service time for 27792 is significantly more than the 66984, 60 minutes and 30 minutes, respectively. The RUC recommends 10.50 RVUs for 27792.
27814	Open treatment of bimalleolar ankle fracture, includes internal fixation, when performed	090	11.50	The RUC reviewed CPT code 27814 Open treatment of bimalleolar ankle fracture, includes internal fixation, when performed and compared it to its reference code 25609 Open treatment of distal radial intra-articular fracture or epiphyseal separation; with internal fixation of 3 or more fragments (Work RVU=14.12). The RUC compared the intra-service times for these procedures and noted that 27814 had less intra-service time associated with it as compared to 25609, 90 and 120 minutes, respectively. The RUC compared the intensity complexity measures of 27814 amd 25609 and noted that the reference code required more physical effort, mental effort and judgement to perform as compared to 23515. Therefore, the RUC agreed that the 25th percentile of the survey data, 11.50 RVUs, appropriately places this code in comparison to the reference code. For further support the RUC compared this procedure to MPC code 28299 Correction, hallux valgus (bunion), with or without sesamoidectomy; by double osteotomy (Work RVU=11.39) and determined that 11.50 work RVUs was appropriate for 27814 as 28299 has the less total service time than the 27814, 299 minutes and 346 minutes respectively. The RUC recommends 11.50 RVUs for 27814.
27822	Open treatment of trimalleolar ankle fracture, with internal fixation, when performed, medial and/or lateral malleolus; without fixation of posterior lip	090	12.12	The RUC reviewed CPT code 27822 Open treatment of trimalleolar ankle fracture, with internal fixation, when performed, medial and/or lateral malleolus; without fixation of posterior lip and agreed that there was not compelling evidence to review it because the nature of the work involved in providing this service has not substantially changed since the RUC last reviewed it in 2000. The RUC recommends that the new surveyed times be applied to this code and that the work RVUs for 27822 be maintained at its current value, 12.12.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
27823	Open treatment of trimalleolar ankle fracture, with internal fixation, when performed, medial and/or lateral malleolus; with fixation of posterior lip	090	14.26	The RUC reviewed CPT code 27823 Open treatment of trimalleolar ankle fracture, with internal fixation, when performed, medial and/or lateral malleolus; with fixation of posterior lip and agreed that there was not compelling evidence to review it because the nature of the work involved in providing this service has not substantially changed since the RUC last reviewed it in 2000. The RUC recommends that the new surveyed times be applied to this code and that the work RVUs for 27823 be maintained at its current value, 14.26 RVUs.
27826	Open treatment of fracture of weight bearing articular surface/portion of distal tibia (eg, pilon or tibial plafond), with internal fixation, when performed; of fibula only	090	12.00	The RUC reviewed CPT code 27826 Open treatment of fracture of weight bearing articular surface/portion of distal tibia (eg, pilon or tibial plafond), with internal fixation, when performed; of fibula only and compared it to its reference code 25609 Open treatment of distal radial intra-articular fracture or epiphyseal separation; with internal fixation of 3 or more fragments (Work RVU=14.12). The RUC agreed that the specialty society recommended 99214 office visit should be lowered to a 99213 office visit as this is more typical of the post-operative care for this procedure. This change in the post-operative visits results in three 99213 office visits and one 99212 office visits being associated with this procedure. The RUC noted that the intra-service time of the surveyed code was far less than the intra-service time of the reference code, 60 minutes and 120 minutes. The RUC compared the intensity/complexity mesaures for these procedures and noted that they were comparable. The RUC after revieweing these times and complexity measures associated with the key reference code and the surveyed code agreed that this surveyed code has the same amount of complexity and work as 25525 Open treatment of radial shaft fracture, with internal fixation, when performed, and closed treatment of dislocation of distal radioulnar joint (Galeazzi fracture/dislocation), with percutaneous skeletal fixation, when performed, 23630 Open treatment of greater humeral tuberosity fracture, includes internal fixation, when performed and 25585 Open treatment of talotarsal joint dislocation, includes internal fixation, when performed and therefore recommends that this procedure be valued the same as these other reference codes (all three codes RUC recommended RVU=12.00). The RUC recommends 12.00 RVUs for 27826. For further support, the RUC compared 27826 to MPC code 60220 Total thyroid lobectomy, unilateral; with or without isthmusectomy (Work RVU=12.29). The RUC noted that as 27826 has less intra-service time as compared to 60220, 60 minutes and 90 minutes, the recommended work RVU of 12.00 appropriately places this code in comparison to 60220 as well as the key reference code, 25609. The RUC recommends 12.00 RVU for 27826.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
27827	Open treatment of fracture of weight bearing articular surface/portion of distal tibia (eg, pilon or tibial plafond), with internal fixation, when performed; of tibia only	090	16.00	The RUC reviewed CPT code 27827 Open treatment of fracture of weight bearing articular surface/portion of distal tibia (eg, pilon or tibial plafond), with internal fixation, when performed; of tibia only and compared it with its reference code 27447 Arthroplasty, knee, condyle and plateau; medial AND lateral compartments with or without patella resurfacing (total knee arthroplasty) (Work RVU=23.04). The RUC agreed that the specialty society recommended 99214 office visit should be removed and replaced with a 99213 office visit as this is more typical of the post-operative care for this procedure. This change in the post-operative visits results in four 99213 office visits and one 99212 office visits being associated with this procedure. However, after comparing 27827 with 27447, the RUC determined that this reference code was not a suitable comparison after the determination was made that 28445 Open treatment of talus fracture, with or without internal or external fixation (Work RVU=17.07), originally part of this internal/external fixation review had no compelling evidence to be reviewed and the RUC recommended that its value be maintained, could now be used as an alternative reference code. The RUC compared the total service times for both procedures and determined at 28445 had a longer total service time in comparison to the surveyed code 485 minutes and 458 minutes. In addition, the RUC agreed that the intensity and complexity of performing 28445 would be greater than performing 27827. Therefore, the RUC agrees that the 25th percentile of the survey data accurately places this code in comparison to the reference code 28445. The RUC recommends 16.00 RVUs for 27827.
27828	Open treatment of fracture of weight bearing articular surface/portion of distal tibia (eg, pilon or tibial plafond), with internal fixation, when performed; of both tibia and fibula	090	20.00	The RUC reviewed CPT code 27828 Open treatment of fracture of weight bearing articular surface/portion of distal tibia (eg, pilon or tibial plafond), with internal fixation, when performed; of both tibia and fibula and compared it with its reference code 27447 Arthroplasty, knee, condyle and plateau; medial AND lateral compartments with or without patella resurfacing (total knee arthroplasty) (Work RVU=23.04). The RUC agreed that the specialty society recommended 99214 office visit should be removed and replaced with a 99213 office visit as this is more typical of the post-operative care for this procedure. This change in the post-operative visits results in four 99213 office visits and one 99212 office visits being associated with this procedure. However, after comparing 27828 with 27447, the RUC determined that this reference code was not a suitable comparison after the determination was made that 28445 Open treatment of talus fracture, with or without internal or external fixation (Work RVU=17.07), originally part of this internal/external fixation review had no compelling evidence to be reviewed, could now be used as an alternative reference code. The RUC compared the intra-service times for both procedures and determined at 27828 had a longer intra-service time in comparison to the reference code, 150 minutes and 125 minutes. In addition, the RUC agreed that the intensity and complexity of performing 27828 would be greater than performing 28445. Therefore, the RUC agrees that the 25th percentile of the survey data accurately places this code in comparison to the reference code 28445. The RUC recommends 20.00 RVUs for 27828.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
27829	Open treatment of distal tibiofibular joint (syndesmosis) disruption, includes internal fixation, when performed	090	9.50	The RUC reviewed CPT code 27829 Open treatment of distal tibiofibular joint (syndesmosis) disruption, includes internal fixation, when performed and compared it to its reference code 25607 Open treatment of distal radial extra-articular fracture or epiphyseal separation, with internal fixation. The RUC noted that although the reference code has more intra-service time compared with it than the reference code, 60 minutes and 45 minutes, respectively, that the surveyed code has more pre-service time associated with it as more time is required in 27829 to evaluate the fracture. The intensity and risk for complication involved in treating the distal tibia fracture is much greater than the intensity and risk for complication involved with 25607. This is demonstrated in the intensity/comlexity measures which demonstrates that 27829 requires more mental effort and judgement, more technical skill and physical effort and is an overall more intense code to perform than 25607. In addition, the surveyed code has more post-operative work in comparison to 25607, because 27829 requires hospitialization to avoid skin issues, swelling and to assess neurocirculatory status. Because of the greater amount of intensity as well as the hospitalization associated with this service, the RUC agreed the 25th percentile of the survey, 9.50 RVUs accurately places this procedure in comparison to the reference code. The RUC recommends 9.50 RVUs for 27829.
27832	Open treatment of proximal tibiofibular joint dislocation, includes internal fixation, when performed, or with excision of proximal fibula	090	11.00	The RUC reviewed CPT code 27832 Open treatment of proximal tibiofibular joint dislocation, includes internal fixation, when performed, or with excision of proximal fibula and compared it to its reference code 25608 Open treatment of distal radial intra-articular fracture or epiphyseal separation; with internal fixation of 2 fragments (Work RVU=10.86). The RUC reviewed the total-service times for both codes and found them to be comparable, 301 minutes and 305 minutes. However, the RUC noted that the intensity/complexity measures for 27832 were significantly higher in comparison to 25608 as the complexity and risk for complication involved in open treatment of the trimalleolar ankle fracture is much greater than 25608. Therefore the RUC agreed that the median value of 11.00 RVU appropriately places this code in comparison to the reference code. For further support the RUC compared this procedure to MPC code 28299 Correction, hallux valgus (bunion), with or without sesamoidectomy; by double osteotomy (Work RVU=11.39) and determined that 11.00 work RVUs was appropriate for 27832 as 28299 has more intra- service time associated with it in comparison to 27832, 90 minutes and 75 minutes respectively. The RUC recommends 11.00 RVUs for 27832.
28415	Open treatment of calcaneal fracture, includes internal fixation, when performed;	090	17.54	The RUC reviewed CPT code 28415 Open treatment of calcaneal fracture, includes internal fixation and recommended that a 99214 office visit should be removed and substituted with a 99213 office visit as this is more typical of the post-operative care for this procedure. This change in the post-operative visits results in four 99213 office visits and one 99212 office visits being associated with this procedure. The RUC agreed that the new survey time data for this procedure further validated the existing work RVUs for this procedure and recommend maintaing the value for this code. The RUC recommends that the new surveyed times be applied to this code and maintaining the current work of 17.54 RVUs for 28415.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
28420	Open treatment of calcaneal fracture, includes internal fixation, when performed; with primary iliac or other autogenous bone graft (includes obtaining graft)	090	19.00	The RUC reviewed CPT code 28420 Open treatment of calcaneal fracture, includes internal fixation, when performed; with primary iliac or other autogenous bone graft (includes obtaining graft) and compared it with its reference code 27487 Revision of total knee arthroplasty, with or without allograft; femoral and entire tibial component (Work RVU=26.91). The RUC agreed that the specialty society recommended 99214 office visit should be removed and replaced with a 99213 office visit as this is more typical of the post-operative care for this procedure. This change in the post-operative visits results in four 99213 office visits and one 99212 office visits being associated with this procedure. However, after comparing 28420 with 27847, the RUC determined that this reference code was not a suitable comparison after the determination was made that 28445 Open treatment of talus fracture, with or without internal or external fixation (Work RVU=17.07), originally part of this internal/external fixation review had no compelling evidence to be reviewed, could now be used as an alternative reference code as the RUC recommended that the value for this service be maintained at its existing value. The RUC compared the intra-service times for both procedures and determined at 28420 had a longer intra-service time in comparison to the reference code, 150 minutes and 125 minutes. In addition, the RUC agreed that the intensity and complexity of performing 28420 would be greater than performing 28445. Therefore, the RUC agrees that the 25th percentile of the survey data accurately places this code in comparison to the reference code 28445. The RUC recommends 19.00 RVUs for 28420.
28445	Open treatment of talus fracture, includes internal fixation, when performed	090	17.07	The RUC reviewed CPT code 28445 Open treatment of talus fracture, includes internal fixation, when performed and agreed that there was not compelling evidence to review it because the nature of the work involved in providing this service has not substantially changed. The RUC recommends that the new surveyed times be applied to this code and that the work RVUs for 28445 be maintained at its current value, 17.07 RVUs.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
28465	Open treatment of tarsal bone fracture (except talus and calcaneus), includes internal fixation, when performed, each	090	9.50	The RUC reviewed CPT code 28465 Open treatment of tarsal bone fracture (except talus and calcaneus), includes internal fixation, when performed, each and compared it with its reference code 25608 Open treatment of distal radial intra-articular fracture or epiphyseal separation; with internal fixation of 2 fragments (Work RVU=10.86). The RUC noted that the intra-service time for the surveyed code is less than the intra-service time for the reference code (60 minutes and 90 minutes, respectively). In addition, the number of post-operative visits is not the same as the surveyed code includes two 99213 and two 99212 office visits compared to the reference code with three 99213 office visits and two 99212, which suggests the surveyed code involves less complex post operative care as compared to the reference code. However, the RUC also compared this procedure to 24685 Open treatment of ulnar fracture proximal end (olecranon process), includes internal fixation, when performed (RUC recommended work RVU=9.50) and 27829 Open treatment of distal tibiofibular joint (syndesmosis) disruption, includes internal fixation, when performed (RUC Recommended work RVU=9.50). The RUC agreed that all of these procedures had similar complexity and should have similar work RVUs. With the lower amount of intra-service time and the differences in the post-operative visits as compared to 25608, the RUC agreed that 9.50 work RVU appropriately places 28465 in comparison to 25608, 24685 and 27829. The RUC recommends 9.50 work RVUs for 28465.
28485	Open treatment of metatarsal fracture, includes internal fixation, when performed, each	090	8.00	The RUC reviewed CPT code 28485 Open treatment of metatarsal fracture, includes internal fixation, when performed, each and compared it with its reference code 28299 Correction, hallux valgus (bunion), with or without sesamoidectomy; by double osteotomy (Work RVU=11.39). The RUC noted that the intra-service time for the surveyed code is less than the intra-service time for the reference code (60 minutes and 90 minutes, respectively). The number of post-operative visits is the same but the surveyed code includes two 99213 and two 99212 office visits compared to the reference code with three 99213 office visits and one 99212 office visit, which suggests the surveyed code involves less complex post operative care as compared to the reference code. The RUC noted that the reference code required more mental effort and judgement, more technical kill and physical effort and greater psychological stress to perform than the surveyed code. Also, the RUC also compared this procedure to 26615 Open treatment of carpometacarpal dislocation, other than thumb; includes internal fixation, when performed, each joint (RUC recommended work RVU=8.00), 28645 Open treatment of metatarsophalangeal joint dislocation, includes internal fixation, when performed (RUC Recommended work RVU=8.00) and 26615 Open treatment of metacarpal fracture, single, includes internal fixation, when performed, each bone (RUC recommended work RVU=8.00). The RUC agreed that all of these procedures had similar complexity and should have similar work RVUs. With the lower amount of intra-service time and the differences in the post-operative visits as well as the lower intensity and complexity measures as compared to 28299, the RUC agreed that 8.00 work RVU appropriately places 28485 in comparison to 28299, 26685, 28645 and 26615. The RUC recommends 8.00 work RVUs for 28485.

685

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
28505	Open treatment of fracture great toe, phalanx or phalanges, includes internal fixation, when performed	090	8.00	The RUC reviewed CPT code 28505 Open treatment of fracture great toe, phalanx or phalanges, includes internal fixation, when performed and compared it with its reference code 28750 Arthrodesis, great toe; metatarsophalangeal joint (Work RVU=8.37). The RUC noted that the intra-service time for the surveyed code is less than the intra-service time for the reference code (45 minutes and 75 minutes, respectively). Additional pre-service time is associated with the surveyed code because this procedure involves the evaluation of a fracture which requires additional positioning and prep time as compared to the reference code. The number of post-operative visits is the same but the surveyed code includes two 99213 and two 99212 office visits compared to the reference code with four 99213 office visits, which suggests the surveyed code involves less complex post operative care as compared to the reference code. However, the RUC also compared this procedure to 26685 Open treatment of carpometacarpal dislocation, other than thumb; includes internal fixation, when performed, each joint (RUC recommended work RVU=8.00), 28645 Open treatment of metatarsophalangeal joint dislocation, includes internal fixation, when performed (RUC recommended work RVU=8.00) and 26615 Open treatment of metacarpal fracture, single, includes internal fixation, when performed, each bone (RUC recommended work RVU=8.00). The RUC agreed that all of these procedures had similar complexity and should have similar work RVUs. With the lower amount of intra-service time and the differences in the post-operative visits as compared to 28750, the RUC agreed that 8.00 work RVU appropriately places 28525 in comparison to 28750, 26685, 28645 and 26615. The RUC recommends 8.00 work RVUs for 28505.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
28525	Open treatment of fracture, phalanx or phalanges, other than great toe, includes internal fixation, when performed, each	090	6.00	The RUC reviewed CPT code 28525 Open treatment of fracture, phalanx or phalanges, other than great toe, includes internal fixation, when performed, each and compared it with its reference code 28289 Hallux rigidus correction with cheilectomy, debridement and capsular release of the first metatarsophalangeal joint (Work RVU=8.11). The RUC noted that the intra-service time for the surveyed code is less than the intra-service time for the reference code (30 minutes and 45 minutes, respectively). Additional pre-service time is associated with the surveyed code because this procedure involves a fracture with fixation, which requires more positioning and prep time as compared to the reference code. The number of post-operative visits is the same but the surveyed code includes two 99213 and two 99212 office visits compared to the reference code with four 99213 office visits, which suggests the surveyed code involves a less complex post operative care as compared to the reference code. The RUC also compared the intensity/complexity measures of the surveyed code and the reference code and determined that the reference code required more technical and physical skill, more psychological stress and had increased intensity to perform as compared to the surveyed code. With the lower amount of intra-service time and lower intensity/complexity measures as compared to 28289, the RUC agreed that the 25th percentile of survey, 6.00 work RVU appropriately places 28525 in comparison to the reference code. Furthermore, the RUC compared the surveyed code with MPC code 11646 Excision, malignant lesion including margins, face, ears, eyelids, nose, lips; excised diameter over 4.0 cm (Work RVU=6.21) and agreed that 6.00 RVU was an approriate value for the surveyed code because the surveyed code had significantly less intra-service time than this procedure, 30 minutes and 60 minutes, respectively. The RUC recommends 6.00 work RVUs for 28525.

687

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
28555	Open treatment of tarsal bone dislocation, includes internal fixation, when performed	090	10.43	The RUC reviewed CPT code 28555 Open treatment of tarsal bone dislocation, includes internal fixation, when performed and compared it with its reference code 28261 Capsulotomy, midfoot; with tendon lengthening (Work RVU=12.91). The RUC noted that the intra-service time of 28555 is significantly less than the intra-service time of the reference code, 60 minutes and 103 minutes, respectively. The RUC reviewed the post-operative visits for this service and determined that to make this service comparable to other codes within the family, 27784 Open treatment of proximal fibula or shaft fracture, includes internal fixation, when performed (RUC recommended work RVU=10.45) and 27792 Open treatment of distal fibular fracture (lateral malleolus), includes internal fixation, when performed (RUC recommended work RVU=10.50), that the specialty societies' recommendation of including a 99214 office visit should be removed from the post-operative visits associated with this code as only two 99213 and two 99212 office visits is more typical of the post-operative care for the typical patient. With the lower amount of intra-service time of the surveyed code in comparison to the reference code and the same post-operative visits as 27784 and 27792, the RUC agreed that the 25th percentile of the survey, 10.43 RVUs appropriately places this code in comparison to the reference codes. For further support, the RUC compared this code to MPC code 66984 Extracapsular cataract removal with insertion of intraocular lens prosthesis (one stage procedure), manual or mechanical technique (eg, irrigation and aspiration or phacoemulsification) (Work RVU=10.36) and agreed that the recommended value of 10.43 RVU for 28555 was appropriate as the intra-service time for 28555 is significantly more than the 66984, 60 minutes and 30 minutes, respectively. The RUC recommends 10.43 RVUs for 28555.

688

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
28585	Open treatment of talotarsal joint dislocation, includes internal fixation, when performed	090	12.00	The RUC reviewed CPT code 28585 Open treatment of talotarsal joint dislocation, includes internal fixation, when performed and compared it with its reference code 28299 Correction, hallux valgus (bunion), with or without sesamoidectomy; by double osteotomy (work RVU=11.39). The RUC agreed that the specialty society recommended 99214 office visit should be lowered to a 99213 office visit as this is more typical of the post-operative care for this procedure. This change in the post-operative visits results in three 99213 office visits and two 99212 office visits being associated with this procedure. With this change, the RUC noted that the total service times for 28585 is greater than the reference code, 324 minutes and 299 minutes. Additionally, the RUC noted that the surveyed code required greater mental effort and judgement and physicial effort to perform in comparison to the reference code. This intensity of this service is much in part due to the joint that is operated on as it is more proximal and involves larger bones as compared to the tarsometatarsal dislocation procedure. Two bones are involved in this type of dislocation and the risk for post-operative complications is high. Therefore, due more total service time and greater intensity/complexity measures as compared to the reference code, the RUC recommends the 25th percentile of the survey, 12.00 RVUs for this procedure. For further support, the RUC compared 28585 to MPC code 60220 Total thyroid lobectomy, unilateral; with or without isthmusectomy (Work RVU=12.29). The RUC noted that as 28585 has less intra-service time as compared to 60220, 75 minutes and 90 minutes, the recommended work RVU of 12.00 appropriately places this code in comparison to 60220 as well as the reference code, 28299. The RUC recommends 12.00 RVUs for 28585.

689

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
28615	Open treatment of tarsometatarsal joint dislocation, includes internal fixation, when performed	090	11.50	The RUC reviewed CPT code 28615 Open treatment of tarsometatarsal joint dislocation, includes internal fixation, when performed and compared it to its reference code 28299 Correction, hallux valgus (bunion), with or without sesamoidectomy; by double osteotomy (Work RVU=11.39). After hearing the specialty societies' presentation for this code agreed that an additional 10 minutes of pre-service evaluation time and an additional 5 minutes of pre-service scrub, dress and wait time was needed to account for the fact that this procedure involves two bones which increases the complexity and risk associated with this procedure and consequently increases the evaluation and scrub, dress and wait time. Furthermore, the RUC agreed that the specialty society recommended 99214 office visit should be lowered to a 99213 office visit as this is more typical of the post-operative care for this procedure. This change in the post-operative visits results in three 99213 office visits and two 99212 office visits being associated with this procedure. With these changes, the RUC noted that 28615 had more total service time than the reference code, 323 minutes and and 299 minutes respectively. Further, the surveyed code requires greater technical skill, physicial effort and psychgological stress to perform in comparison to the reference code. Therefore the RUC agreed that the approriate value for this procedure is the 25th percentile of the survey data, 11.50 RVUs as this value appropriately places this code in comparison to the reference code. For further support the RUC compared this procedure to 28555 Open treatment of tarsal bone dislocation, includes internal fixation, when performed (RUC recommended RVU=10.43). As treating the type of dislocation involved in 28615 is more difficult than treating a dislocation involving a single bone as in 28555, the proposed value of 11.50 RVU appropriately place this procedure in comparison to 28555. The RUC recommends 11.50 RVUs for 28615
28645	Open treatment of metatarsophalangeal joint dislocation, includes internal fixation, when performed	090	8.00	The RUC reviewed CPT code 28645 Open treatment of metatarsophalangeal joint dislocation, includes internal fixation, when performed and compared it with its reference code 28292 Correction, hallux valgus (bunion), with or without sesamoidectomy; Keller, McBride, or Mayo type procedure (work RVU=8.72). The RUC noted that the intra-service time for the surveyed code is less than the intra-service time for the reference code (45 minutes and 60 minutes, respectively). The number of post-operative visits is the same but the surveyed code includes two 99213 and two 99212 office visits compared to the reference code with four 99213 office visits, which suggests the surveyed code has a less complex post operative care as compared to the reference code. The RUC also compared the intensity/complexity measures of the surveyed code to the reference code and determined that the reference code required more technical skill and more psychological stress. With the lower amount of intra-service time and lower intensity/complexity measures as compared to 28292, the RUC agreed that the 25th percentile of survey, 8.00 work RVU appropriately places 28645 in comparison to the reference code. The RUC recommends 8.00 work RVUs for 28645.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Descriptor	Global	RUC Rec Work RVU	RUC Rationale
28675	Open treatment of interphalangeal joint dislocation, includes internal fixation, when performed	090	6.00	The RUC reviewed CPT code 28675 Open treatment of interphalangeal joint dislocation, includes internal fixation, when performed and compared it with 28288 Ostectomy, partial, exostectomy or condylectomy, metatarsal head, each metatarsal head (work RVU=5.81). The RUC compared the service times of both procedures and noted that although the intra-service times are the same (30 minutes), 28675 had considerable more pre-service time associated with it than 28288 (55 minutes and 20 minutes, respectively). The surveyed code has more pre-service time associated with it because in involves a dislocation requiring fixation, which requires additional positioning and prep time. The reference code does not require fixation. Furthermore, the RUC noted that when comparing the intensity/complexity measures of the surveyed code to the reference code that the surveyed code requires greater mental effort and judgement and more overall intensity to perform than the reference code. Therefore, the RUC agreed that because of the greater amount of time and the greater mental effort and judgement associated with the surveyed code in comparison to the reference code, the RUC recommends survey median RVU, 6.00 RVUs for 28675. The RUC recommends 6.00 RVUs for 28675.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
2005 FIVE YEAR REVIEW - SUMMARY OF RECOMMENDATION

CPT Code:27766 Tracking Number F44 Specialty Society Recommended RVU: **8.50**
Global Period: 090 RUC Recommended RVU: **8.50**

CPT Descriptor: Open treatment of medial malleolus fracture, includes internal fixation, when performed

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 23-year-old male falls and sustains a displaced medial malleolar fracture requiring open reduction and internal fixation.

Percentage of Survey Respondents who found Vignette to be Typical: 81%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: • Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
- Verify that all required instruments and supplies are available
- Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulatio drapes
- Assess position of the extremities and head, adjust as needed
- The patient's leg is placed properly on the table and positioned with proper bolstering to aid surgical exposure.
- Indicate areas of skin to be prepped and mark surgical incisions
- A tourniquet is placed on the proximal thigh
- The leg is prepped and draped.
- The leg is elevated and exsanguinated.
- The pneumatic tourniquet is inflated.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work: A midline longitudinal incision is made with care to protect the branches of the medial saphenous nerve and vein. Sub-periosteal exposure of the fracture line is carried out. The fracture is pulled apart and the joint is inspected and irrigated for loose fragments. The fracture is then held in a reduced position and fixed with two parallel guide wires. Properly sized screws are place to achieve reduction and compression. The wound is irrigated and closed in layers.

Description of Post-Service Work: Post-service work: in facility
- Application of bulky dressing and short leg splint
- Monitor patient stabilization in the recovery room.
- Consultation with the family and patient regarding the surgery and postoperative regimen.
- Communication with health care professionals including written and oral reports and orders.
- Postoperative care is coordinated with recovery room nursing staff.
- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- The patient is discharged to the orthopaedic floor for monitoring of compartment syndrome. This requires removing and reapplying the dressings.

Discharge day:

- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Physical therapy for the uses of crutches or walker is ordered
  Write prescriptions for medications needed post-discharge.
- Dictation of an operative report
- Procedure note is written in the patient chart
- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of splint/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order occupational therapy
- Supervision of rehabilitation
- Monitor physical therapy
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions
- Dictate progress notes for medical record

COMPELLING EVIDENCE RATIONALE (Required to be Completed)

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

- ***Evidence that technology has changed physician work.***

Surgical treatment using open anatomical reduction and internal fixation has been made more complex with the introduction of new imaging methods such as CT which allow better detection of the fracture pathology and provided the basis for new surgical strategies. There are also new internal fixation devices which require more work. Beginning in the 1990s (after the Harvard study), new plates were developed for fracture repair, with most becoming available in the late 1990s and early 2000s. As an example of the complexity of the decision process in current practice, the 1990's have given the surgeon numerous options for bone fixation. The options for a bone fixation device currently include Kirschner wires, wire, staples, screws, as well as newer alternatives such as headless bone screws, T-screws, absorbable pins, cannulated screws, and a myriad of plates. The goal of all these devices remains constant: that is, to achieve stable approximation of bone fragments to facilitate healing. The various devices afford rigid fixation along with compression of the osseous fragments. This allows early range of motion and preservation of surrounding joint function, as well as primary bone healing. Selection of the most advantageous form of fixation is dependent on many factors and takes considerable time in the pre-evaluation of a patient. These include the type of fracture or osteotomy created, bone density, type of bone, and the desire for interfragmental compression. All of this has resulted in more work. The standards of care (fracture reduction, limb alignment, etc.) have also been elevated by literature that shows fracture displacements and poor alignments lead to poorer results. Additionally, women over 50 is a fast growing segment of our population. A huge percentage of these patients are osteoporotic - making fracture fixation and maintenance of fixation far more difficult than it used to be. The new plates are more complex to insert when the underlying bone is of much poorer quality.

Given this information, we believe there is compelling evidence that ORIF is more complex than 5 years ago and this is even more true in comparison to practice in the late 1980s (or more than 25 years ago).

- ***Evidence that incorrect assumptions were made in the previous valuation of the service; a misleading vignette and/or survey in a previous evaluation***

During the period of 1989-1991 (after the Harvard study), a major effort was undertaken by the AAOS and the OTA to rewrite every fracture and dislocation treatment code in the musculoskeletal Section of CPT. In 1991, 395 code changes were accepted by the AMA CPT Editorial Panel under the leadership of Dr. William Felts. At the time of the original proposal, some of the code descriptors were changed from those submitted (presumably by the CPT staff), and published in the 1992 and subsequent editions. Some of the changes in the descriptors published in CPT 1992 didn't make sense, but in those years, the CPT process was closed-door. Additionally, in 1992 and 1993 the AMA staff were deluged by the implementation of the RBRVS process and though AAOS and OTA requested that these problems be addressed then, AMA CPT staff asked that it be deferred as their "plate was full." After that time, more important issues and other opportunities consumed the resources of the AAOS and inertia (or the lack thereof) took over. This third five year review, after completion of the practice expense review, allowed AAOS a window of time to again try to correct the nomenclature for these codes, and review their work using the standard RUC survey method.

We also note, that at the time of the original CPT proposal, external fixation was considered an adjunctive procedure. CPT instructed that the codes for external fixation (20690 and 20692) be "listed in addition to the code for the treatment ...of the fracture." This concept still applies today. External fixation can be used as an adjunctive stabilization modality when treating fractures by almost any method. However, external fixation can also be used in reconstructive orthopaedics (for example, the treatment of joint contractures) and for non-musculoskeletal system treatments (for example, as a suspension device in the treatment of lower extremity burns). In 1991, there was no Modifier -51 exempt code category. Today, these same codes, 20690 and 20692 for external fixator application are modifier -51 exempt, recognizing that they can stand alone or be used adjunctively. Because of the modifier -51 exemption, the RVUs have been reduced, so payers are not paying double when either of these codes are reported with another treatment code.

In the 2005 comment letter to CMS, the AAOS recommended examining the physician work for the ORIF codes because the code descriptors lacked clarity. In particular, because the CPT descriptors include the phrase "with or without internal or external fixation," it is difficult to imagine what the Harvard survey data actually represents (ie, no typical patient was described for the survey respondents to focus on). Further, after the descriptors for these codes were changed for CPT 1993, an Abt study was performed in 1992 for RUC consideration. This study produced *percentage* relationships to key reference codes, but not surveyed time and visit data. Some of these recommendations were accepted by the RUC and CMS and others were adjusted up or down, but no changes were made to the Harvard time and visit data, if available. Therefore, we believe that there is little, if any, relationship between the Harvard database time and visit information (from the old CPT codes) and the current work RVUs.

Given this information, we believe there is compelling evidence that the current work values and/or time and visit data may be incorrect and outdated and should be reviewed.

- *Evidence that incorrect assumptions were made in the previous valuation of the service, as documented; a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data*

Harvard utilized the AMA Physician Masterfile to draw names for their surveys. While general orthopaedic surgeons can perform open reduction fracture care, it is more typical for patients to be referred to orthopaedic surgeons who specialize in orthopaedic trauma or in a given anatomical area (eg, shoulder, hand, knee, etc.). We do not believe that all specialty surgeons were surveyed for these codes, since the AMA Masterfile did not delineate orthopaedic specialties. Additionally, podiatrists were not surveyed for any of the lower extremity codes.

Given this information, we believe there is compelling evidence that not all involved specialties were involved in the review of these codes.

A consensus committee of physicians representing the American Academy of Orthopaedic Surgeons, American Shoulder and Elbow Surgeons, Society for Surgery of the Hand, Arthroscopy Association of North America, Orthopaedic Trauma Association, American Podiatric Medical Association, and American Orthopaedic Foot and Ankle Society met by conference call to discuss the survey data for the revised orthopaedic codes and data for the key reference codes and other codes on the survey reference service lists.

For revised code 27766, we recommend 8.50 work RVUs. After considering differences in time and visits, along with differences in intra-operative work, we believe this value correctly ranks code 27766 relative to other ORIF codes, relative to the key reference code, and relative to orthopaedic codes from the survey reference service list.

The intra-service time for the key reference code (25607) is greater than the survey code, but 27766 requires one ni in the hospital because of the risk for post-operative complications. Total work for 27766 is only slightly less than 256 and this is reflected in the survey 25th percentile work RVU. Neurovascular injury may occur with this type of fracture and multiple post-operative visits are necessary. Assessment of the circulation, sensation and motor function of the involved digit and extremity is ongoing. The first office visit would include removal of the splint and dressing, wound evaluation, redressing, discussion of restrictions and operative findings, splinting and instruction on weight bearing activities. X-rays

would be reviewed. The second visit would be for splint and dressing removal, wound evaluation, suture removal, new splint application, and instruction on range of motion (ROM) exercises. The third visit would be for range of motion exercises and review of restrictions and review of radiographs. X-rays would be reviewed. The fourth visit would be to check X-rays, final assessment of range of motion and review activities.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No
   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FIVE YEAR REVIEW SPECIFIC QUESTIONS:

Please indicate the number of survey respondent percentages responding to each of the following questions (for example .05 = 5%):

Has the work of performing this service changed in the past 5 years? Yes 55% No 45%

(Use the subset of the people who responded "Yes" to answer the following questions)

A. This service represents new technology that has become more familiar (i.e., less work):
   I agree 17% I do not agree 83%
B. Patients requiring this service are now:
   more complex (more work) 89% less complex (less work) 0% no change 11%
C. The usual site-of-service has changed:
   from outpatient to inpatient 0% from inpatient to outpatient 17% no change 83%

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
2005 FIVE YEAR REVIEW - SUMMARY OF RECOMMENDATION

CPT Code:27784 Tracking Number F45 Specialty Society Recommended RVU: **10.45**
Global Period: 090 RUC Recommended RVU: **10.45**

CPT Descriptor: Open treatment of proximal fibula or shaft fracture, includes internal fixation, when performed

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 20-year-old male is struck by a blunt object and suffers a fracture of the proximal fibula requiring open reduction and internal fixation.

Percentage of Survey Respondents who found Vignette to be Typical: 86%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: • Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
- Verify that all required instruments and supplies are available
- Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulati drapes
- Assess position of the extremities and head, adjust as needed
- The patient's leg is placed properly on the table and positioned with proper bolstering to aid surgical exposure.
- Indicate areas of skin to be prepped and mark surgical incisions
- A tourniquet is placed on the proximal thigh
- The leg is prepped and draped.
- The leg is elevated and exsanguinated.
- The pneumatic tourniquet is inflated.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work: A longitudinal incision is made along the course of the proximal fibula with care to protect the peroneal nerve, which, if necessary, is retracted out of harms way. The bone fragments are reduced with a bone holding forceps and the appropriate size plate is chosen. The fracture is reduced. A plate is put into position The screw holes are then drilled and the screws are inserted. The wound is irrigated and closed in layers.

Description of Post-Service Work: Post-service work: in facility
- Application of bulky dressing and short leg splint
- Monitor patient stabilization in the recovery room.
- Consultation with the family and patient regarding the surgery and postoperative regimen.
- Communication with health care professionals including written and oral reports and orders.
- Postoperative care is coordinated with recovery room nursing staff.
- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- The patient is discharged to the orthopaedic floor for monitoring of compartment syndrome. This requires removing and reapplying the dressings.

Discharge day:
- The patient's vital signs are checked.

- The circulation, sensation and motor function of the operated extremity are assessed.
- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Physical therapy for the uses of crutches or walker is ordered
- Write prescriptions for medications needed post-discharge.

Dictation of an operative report

- Procedure note is written in the patient chart
- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of splint/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order occupational therapy
- Supervision of rehabilitation
- Monitor physical therapy
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions
- Dictate progress notes for medical record

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

- ***Evidence that technology has changed physician work.***

Surgical treatment using open anatomical reduction and internal fixation has been made more complex with the introduction of new imaging methods such as CT which allow better detection of the fracture pathology and provided the basis for new surgical strategies. There are also new internal fixation devices which require more work. Beginning in the 1990s (after the Harvard study), new plates were developed for fracture repair, with most becoming available in the late 1990s and early 2000s. As an example of the complexity of the decision process in current practice, the 1990's have given the surgeon numerous options for bone fixation. The options for a bone fixation device currently include Kirschner wires, wire, staples, screws, as well as newer alternatives such as headless bone screws, T-screws, absorbable pins, cannulated screws, and a myriad of plates. The goal of all these devices remains constant: that is, to achieve stable approximation of bone fragments to facilitate healing. The various devices afford rigid fixation along with compression of the osseous fragments. This allows early range of motion and preservation of surrounding joint function, as well as primary bone healing. Selection of the most advantageous form of fixation is dependent on many factors and takes considerable time in the pre-evaluation of a patient. These include the type of fracture or osteotomy created, bone density, type of bone, and the desire for interfragmental compression. All of this has resulted in more work. The standards of care (fracture reduction, limb alignment, etc.) have also been elevated by literature that shows fracture displacements and poor alignments lead to poorer results. Additionally, women over 50 is a fast growing segment of our population. A huge percentage of these patients are osteoporotic - making fracture fixation and maintenance of fixation far more difficult than it used to be. The new plates are more complex to insert when the underlying bone is of much poorer quality.

Given this information, we believe there is compelling evidence that ORIF is more complex than 5 years ago and this is even more true in comparison to practice in the late 1980s (or more than 25 years ago).

- ***Evidence that incorrect assumptions were made in the previous valuation of the service; a misleading vignette and/or survey in a previous evaluation***

During the period of 1989-1991 (after the Harvard study), a major effort was undertaken by the AAOS and the OTA to rewrite every fracture and dislocation treatment code in the musculoskeletal Section of CPT. In 1991, 395 code changes were accepted by the AMA CPT Editorial Panel under the leadership of Dr. William Felts. At the time of the original proposal, some of the code descriptors were changed from those submitted (presumably by the CPT staff), and published in the 1992 and subsequent editions. Some of the changes in the descriptors published in CPT 1992 didn't make sense, but in those years, the CPT process was closed-door. Additionally, in 1992 and 1993 the AMA staff were deluged by the implementation of the RBRVS process and though AAOS and OTA requested that these problems be addressed then, AMA CPT staff asked that it be deferred as their "plate was full." After that time, more important issues and other opportunities consumed the resources of the AAOS and inertia (or the lack thereof) took over. This third five year review, after completion of the practice expense review, allowed AAOS a window of time to again try to correct the nomenclature for these codes, and review their work using the standard RUC survey method.

We also note, that at the time of the original CPT proposal, external fixation was considered an adjunctive procedure. CPT instructed that the codes for external fixation (20690 and 20692) be "listed in addition to the code for the treatment ...of the fracture." This concept still applies today. External fixation can be used as an adjunctive stabilization modality when treating fractures by almost any method. However, external fixation can also be used in reconstructive orthopaedics (for example, th treatment of joint contractures) and for non-musculoskeletal system treatments (for example, as a suspension device in the treatment of lower extremity burns). In 1991, there was no Modifier -51 exempt code category. Today, these same codes, 20690 and 20692 for external fixator application are modifier -51 exempt, recognizing that they can stand alone or be used adjunctively. Because of the modifier -51 exemption, the RVUs have been reduced, so payers are not paying double when either of these codes are reported with another treatment code.

In the 2005 comment letter to CMS, the AAOS recommended examining the physician work for the ORIF codes because the code descriptors lacked clarity. In particular, because the CPT descriptors include the phrase "with or without internal or external fixation," it is difficult to imagine what the Harvard survey data actually represents (ie, no typical patient was described for the survey respondents to focus on). Further, after the descriptors for these codes were changed for CPT 1993, an Abt study was performed in 1992 for RUC consideration. This study produced *percentage* relationships to key reference codes, but not surveyed time and visit data. Some of these recommendations were accepted by the RUC and CMS and others were adjusted up or down, but no changes were made to the Harvard time and visit data, if available. Therefore, we believe that there is little, if any, relationship between the Harvard database time and visit information (from the old CPT codes) and the current work RVUs.

Given this information, we believe there is compelling evidence that the current work values and/or time and visit data may be incorrect and outdated and should be reviewed.

- *Evidence that incorrect assumptions were made in the previous valuation of the service, as documented; a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data*

  Harvard utilized the AMA Physician Masterfile to draw names for their surveys. While general orthopaedic surgeons can perform open reduction fracture care, it is more typical for patients to be referred to orthopaedic surgeons who specialize in orthopaedic trauma or in a given anatomical area (eg, shoulder, hand, knee, etc.). We do not believe that all specialty surgeons were surveyed for these codes, since the AMA Masterfile did not delineate orthopaedic specialties. Additionally, podiatrists were not surveyed for any of the lower extremity codes.

  Given this information, we believe there is compelling evidence that not all involved specialties were involved in the review of these codes.

A consensus committee of physicians representing the American Academy of Orthopaedic Surgeons, American Shoulder and Elbow Surgeons, Society for Surgery of the Hand, Arthroscopy Association of North America, Orthopaedic Trauma Association, American Podiatric Medical Association, and American Orthopaedic Foot and Ankle Society met by conference call to discuss the survey data for the revised orthopaedic codes and data for the key reference codes and other codes on the survey reference service lists.

For revised code 27784, we recommend 10.45 work RVUs. After considering differences in time and visits, along with differences in intra-operative work, we believe this value correctly ranks code 27784 relative to other ORIF codes, relative to the key reference code, and relative to orthopaedic codes from the survey reference service list.

Compared to the reference service code 25607, pre-service and intra-service work and times are similar The survey code has more post-operative work, because 27784 requires hospitalization to avoid skin issues, swelling and assess neurocirculatory status. Neurovascular injury may occur with this type of dislocation and multiple post-operative visits are necessary. Assessment of the circulation, sensation and motor function of the involved extremity is ongoing, specifically the paranetal nerve is removed. The first office visit would include removal of the splint and dressing, wound evaluation,

redressing, discussion of restrictions and operative findings, splinting and instruction on weight bearing activities. X-rays would be reviewed. The second visit would be for splint and dressing removal, wound evaluation, suture removal, new splint application, and instruction on range of motion (ROM) exercises. The third visit would be for splint removal, removal of hardware, range of motion exercises and review of restrictions. X-rays would be reviewed. The fourth visit would be to check X-rays, wound healing and ROM.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No
   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FIVE YEAR REVIEW SPECIFIC QUESTIONS:

Please indicate the number of survey respondent percentages responding to each of the following questions (for example 0.05 = 5%):
Has the work of performing this service changed in the past 5 years? Yes 28% No 82%
(Use the subset of the people who responded "Yes" to answer the following questions)

A. This service represents new technology that has become more familiar (i.e., less work):
   I agree 10% I do not agree 90%
B. Patients requiring this service are now:
   more complex (more work) 100% less complex (less work) 0% no change 10%
C. The usual site-of-service has changed:
   from outpatient to inpatient 0% from inpatient to outpatient 20% no change 90%

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
2005 FIVE YEAR REVIEW - SUMMARY OF RECOMMENDATION

CPT Code:27792 Tracking Number F46 Specialty Society Recommended RVU: **10.50**
Global Period: 090 RUC Recommended RVU: **10.50**

CPT Descriptor: Open treatment of distal fibular fracture (lateral malleolus), includes internal fixation, when performed

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 50-year-old male misses the last step and falls, sustaining a displaced fracture of the lateral malleolus requiring open reduction and internal fixation.

Percentage of Survey Respondents who found Vignette to be Typical: 85%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work:
- Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
- Verify that all required instruments and supplies are available
- Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulati drapes
- Assess position of the extremities and head, adjust as needed
- The patient's leg is placed properly on the table and positioned with proper bolstering to aid surgical exposure.
- Indicate areas of skin to be prepped and mark surgical incisions
- A tourniquet is placed on the proximal thigh
- The leg is prepped and draped.
- The leg is elevated and exsanguinated.
- The pneumatic tourniquet is inflated.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work: A lateral incision is made over the distal fibula with care to protect branches of the superficial peroneal and sural nerve. The fracture hematoma is irrigated and the joint inspected from the lateral side for loose debris. The fracture is reduced and held with a bone holding forceps. An interfragmentary screw is inserted. An appropriate sized plate is chosen and fixed with screws. Stability of the syndesmosis is confirmed by trying to disrupt the distal tibio - fibular junction. The wound is irrigated and closed in layers.

Description of Post-Service Work: Post-service work: in facility
- Application of bulky dressing and short leg splint
- Monitor patient stabilization in the recovery room.
- Consultation with the family and patient regarding the surgery and postoperative regimen.
- Communication with health care professionals including written and oral reports and orders.
- Postoperative care is coordinated with recovery room nursing staff.
- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- The patient is discharged to the orthopaedic floor for monitoring of compartment syndrome. This requires removing and reapplying the dressings.

Discharge day:

- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Physical therapy for the uses of crutches or walker is ordered
- Write prescriptions for medications needed post-discharge.
- Dictation of an operative report
- Procedure note is written in the patient chart
- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of splint/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order occupational therapy
- Supervision of rehabilitation
- Monitor physical therapy
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions
- Dictate progress notes for medical record

COMPELLING EVIDENCE RATIONALE (Required to be Completed)

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

- ***Evidence that technology has changed physician work.***

Surgical treatment using open anatomical reduction and internal fixation has been made more complex with the introduction of new imaging methods such as CT which allow better detection of the fracture pathology and provided the basis for new surgical strategies. There are also new internal fixation devices which require more work. Beginning in the 1990s (after the Harvard study), new plates were developed for fracture repair, with most becoming available in the late 1990s and early 2000s. As an example of the complexity of the decision process in current practice, the 1990's have given the surgeon numerous options for bone fixation. The options for a bone fixation device currently include Kirschner wires, wire, staples, screws, as well as newer alternatives such as headless bone screws, T-screws, absorbable pins, cannulated screws, and a myriad of plates. The goal of all these devices remains constant: that is, to achieve stable approximation of bone fragments to facilitate healing. The various devices afford rigid fixation along with compression of the osseous fragments. This allows early range of motion and preservation of surrounding joint function, as well as primary bone healing. Selection of the most advantageous form of fixation is dependent on many factors and takes considerable time in the pre-evaluation of a patient. These include the type of fracture or osteotomy created, bone density, type of bone, and the desire for interfragmental compression. All of this has resulted in more work. The standards of care (fracture reduction, limb alignment, etc.) have also been elevated by literature that shows fracture displacements and poor alignments lead to poorer results. Additionally, women over 50 is a fast growing segment of our population. A huge percentage of these patients are osteoporotic - making fracture fixation and maintenance of fixation far more difficult than it used to be. The new plates are more complex to insert when the underlying bone is of much poorer quality.

Given this information, we believe there is compelling evidence that ORIF is more complex than 5 years ago and this is even more true in comparison to practice in the late 1980s (or more than 25 years ago).

- ***Evidence that incorrect assumptions were made in the previous valuation of the service; a misleading vignette and/or survey in a previous evaluation***

During the period of 1989-1991 (after the Harvard study), a major effort was undertaken by the AAOS and the OTA to rewrite every fracture and dislocation treatment code in the musculoskeletal Section of CPT. In 1991, 395 code changes were accepted by the AMA CPT Editorial Panel under the leadership of Dr. William Felts. At the time of the original proposal, some of the code descriptors were changed from those submitted (presumably by the CPT staff), and published in the 1992 and subsequent editions. Some of the changes in the descriptors published in CPT 1992 didn't make sense, but in those years, the CPT process was closed-door. Additionally, in 1992 and 1993 the AMA staff were deluged by the implementation of the RBRVS process and though AAOS and OTA requested that these problems be addressed then, AMA CPT staff asked that it be deferred as their "plate was full." After that time, more important issues and other opportunities consumed the resources of the AAOS and inertia (or the lack thereof) took over. This third five year review, after completion of the practice expense review, allowed AAOS a window of time to again try to correct the nomenclature for these codes, and review their work using the standard RUC survey method.

We also note, that at the time of the original CPT proposal, external fixation was considered an adjunctive procedure. CPT instructed that the codes for external fixation (20690 and 20692) be "listed in addition to the code for the treatment ...of the fracture." This concept still applies today. External fixation can be used as an adjunctive stabilization modality when treating fractures by almost any method. However, external fixation can also be used in reconstructive orthopaedics (for example, treatment of joint contractures) and for non-musculoskeletal system treatments (for example, as a suspension device in the treatment of lower extremity burns). In 1991, there was no Modifier -51 exempt code category. Today, these same codes, 20690 and 20692 for external fixator application are modifier -51 exempt, recognizing that they can stand alone or be used adjunctively. Because of the modifier -51 exemption, the RVUs have been reduced, so payers are not paying double when either of these codes are reported with another treatment code.

In the 2005 comment letter to CMS, the AAOS recommended examining the physician work for the ORIF codes because the code descriptors lacked clarity. In particular, because the CPT descriptors include the phrase "with or without internal or external fixation," it is difficult to imagine what the Harvard survey data actually represents (ie, no typical patient was described for the survey respondents to focus on). Further, after the descriptors for these codes were changed for CPT 1993, an Abt study was performed in 1992 for RUC consideration. This study produced *percentage* relationships to key reference codes, but not surveyed time and visit data. Some of these recommendations were accepted by the RUC and CMS and others were adjusted up or down, but no changes were made to the Harvard time and visit data, if available. Therefore, we believe that there is little, if any, relationship between the Harvard database time and visit information (from the old CPT codes) and the current work RVUs.

Given this information, we believe there is compelling evidence that the current work values and/or time and visit data may be incorrect and outdated and should be reviewed.

- *Evidence that incorrect assumptions were made in the previous valuation of the service, as documented; a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data*

Harvard utilized the AMA Physician Masterfile to draw names for their surveys. While general orthopaedic surgeons can perform open reduction fracture care, it is more typical for patients to be referred to orthopaedic surgeons who specialize in orthopaedic trauma or in a given anatomical area (eg, shoulder, hand, knee, etc.). We do not believe that all specialty surgeons were surveyed for these codes, since the AMA Masterfile did not delineate orthopaedic specialties. Additionally, podiatrists were not surveyed for any of the lower extremity codes.

Given this information, we believe there is compelling evidence that not all involved specialties were involved in the review of these codes.

A consensus committee of physicians representing the American Academy of Orthopaedic Surgeons, American Shoulder and Elbow Surgeons, Society for Surgery of the Hand, Arthroscopy Association of North America, Orthopaedic Trauma Association, American Podiatric Medical Association, and American Orthopaedic Foot and Ankle Society met by conference call to discuss the survey data for the revised orthopaedic codes and data for the key reference codes and other codes on the survey reference service lists.

For revised code 27792, we recommend 10.50 work RVUs. After considering differences in time and visits, along with differences in intra-operative work, we believe this value correctly ranks code 27792 relative to other ORIF codes, relative to the key reference code, and relative to orthopaedic codes from the survey reference service list.

This fracture is slightly more complex than 27784 and a RVW of 10.50 maintains the rank order between these two procedures. The survey code involves more pre-service time for evaluating the fracture, the appropriate fixation, and positioning and prepping but the intra-service time for the reference code is greater. Code 27792 requires overnight hospitalization. Neurovascular injury may occur with this type of fracture and proper function must be restored so multiple post-operative visits are necessary. Assessment of the circulation, sensation and motor function of the involved

extremity is ongoing. The first office visit would include removal of the splint and dressing, wound evaluation, redressing, discussion of restrictions and operative findings, splinting or casting and instruction on range of motion (ROM) and weight bearing activities. X-rays would be reviewed. The second visit would be for splint and dressing removal, wound evaluation, suture removal, new cast or splint application, and ROM exercises. The third visit would be for cast or splint removal and removal of hardware, range of motion exercises and review of restrictions. X-rays would be reviewed. The fourth visit would be to check X-rays, wound healing and ROM.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No
   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FIVE YEAR REVIEW SPECIFIC QUESTIONS:

Please indicate the number of survey respondent percentages responding to each of the following questions (for example 0.05 = 5%):
Has the work of performing this service changed in the past 5 years? Yes 56% No 44%
(Use the subset of the people who responded "Yes" to answer the following questions)

A. This service represents new technology that has become more familiar (i.e., less work):
   I agree 5% I do not agree 95%
B. Patients requiring this service are now:
   more complex (more work) 105% less complex (less work) 0% no change 0%
C. The usual site-of-service has changed:
   from outpatient to inpatient 5% from inpatient to outpatient 14% no change 91%

CPT Descriptor: Open treatment of bimalleolar ankle fracture, includes internal fixation, when performed

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 28-year-old male slips sustaining a displaced bimalleolar fracture requiring open reduction and internal fixation.

Percentage of Survey Respondents who found Vignette to be Typical: 70%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: • Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
- Verify that all required instruments and supplies are available
- Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulati drapes
- Assess position of the extremities and head, adjust as needed
- The patient's leg is placed properly on the table and positioned with proper bolstering to aid surgical exposure.
- Indicate areas of skin to be prepped and mark surgical incisions
- A tourniquet is placed on the proximal thigh
- The leg is prepped and draped.
- The leg is elevated and exsanguinated.
- The pneumatic tourniquet is inflated.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work: A lateral incision is made over the distal fibula with care to protect branches of the superficial peroneal and sural nerve. The fracture hematoma is irrigated and the joint inspected from the lateral side for loose debris. The fracture is reduced and held with a bone holding forceps. An interfragmentary screw is inserted. An appropriate sized plate is chosen and fixed with screws. The wound is irrigated and closed in layers. Next, a midline longitudinal incision is made with care to protect the branches of the medial saphenous nerve and vein. Sub-periosteal exposure of the fracture line is carried out. The fracture is pulled apart and the joint is inspected and irrigated for loose fragments. The fracture is then held in a reduced position and fixed with two parallel guide wires. Properly sized screws are place to achieve reduction and compression. Stability of the syndesmosis is confirmed by trying to disrupt the distal tibio – fibular junction The wound is irrigated and closed in layers.

Description of Post-Service Work: Post-service work: in facility
- Application of bulky dressing and short leg splint
- Monitor patient stabilization in the recovery room.
- Consultation with the family and patient regarding the surgery and postoperative regimen.
- Communication with health care professionals including written and oral reports and orders.
- Postoperative care is coordinated with recovery room nursing staff.
- The patient's vital signs are checked.

- The circulation, sensation and motor function of the operated extremity are assessed.
- The patient is discharged to the orthopaedic floor for monitoring of compartment syndrome. This requires removing and reapplying the dressings.

Discharge day:

- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Physical therapy for the uses of crutches or walker is ordered
- Write prescriptions for medications needed post-discharge.
- Dictation of an operative report
- Procedure note is written in the patient chart
- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of splint/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order occupational therapy
- Supervision of rehabilitation
- Monitor physical therapy
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions
- Dictate progress notes for medical record

COMPELLING EVIDENCE RATIONALE (Required to be Completed)

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

- ***Evidence that technology has changed physician work.***

Surgical treatment using open anatomical reduction and internal fixation has been made more complex with the introduction of new imaging methods such as CT which allow better detection of the fracture pathology and provided the basis for new surgical strategies. There are also new internal fixation devices which require more work. Beginning in the 1990s (after the Harvard study), new plates were developed for fracture repair, with most becoming available in the late 1990s and early 2000s. As an example of the complexity of the decision process in current practice, the 1990's have given the surgeon numerous options for bone fixation. The options for a bone fixation device currently include Kirschner wires, wire, staples, screws, as well as newer alternatives such as headless bone screws, T-screws, absorbable pins, cannulated screws, and a myriad of plates. The goal of all these devices remains constant: that is, to achieve stable approximation of bone fragments to facilitate healing. The various devices afford rigid fixation along with compression of the osseous fragments. This allows early range of motion and preservation of surrounding joint function, as well as primary bone healing. Selection of the most advantageous form of fixation is dependent on many factors and takes considerable time in the pre-evaluation of a patient. These include the type of fracture or osteotomy created, bone density, type of bone, and the desire for interfragmental compression. All of this has resulted in more work. The standards of care (fracture reduction, limb alignment, etc.) have also been elevated by literature that shows fracture displacements and poor alignments lead to poorer results. Additionally, women over 50 is a fast growing segment of our population. A huge percentage of these patients are osteoporotic - making fracture fixation and maintenance of fixation far more difficult than it used to be. The new plates are more complex to insert when the underlying bone is of much poorer quality.

Given this information, we believe there is compelling evidence that ORIF is more complex than 5 years ago and this is even more true in comparison to practice in the late 1980s (or more than 25 years ago).

- ***Evidence that incorrect assumptions were made in the previous valuation of the service; a misleading vignette and/or survey in a previous evaluation***

During the period of 1989-1991 (after the Harvard study), a major effort was undertaken by the AAOS and the OTA to rewrite every fracture and dislocation treatment code in the musculoskeletal Section of CPT. In 1991, 395 code changes were accepted by the AMA CPT Editorial Panel under the leadership of Dr. William Felts. At the time of the original proposal, some of the code descriptors were changed from those submitted (presumably by the CPT staff), and published in the 1992 and subsequent editions. Some of the changes in the descriptors published in CPT 1992 didn't make sense, but in those years, the CPT process was closed-door. Additionally, in 1992 and 1993 the AMA staff were deluged by the implementation of the RBRVS process and though AAOS and OTA requested that these problems be addressed then, AMA CPT staff asked that it be deferred as their "plate was full." After that time, more important issues and other opportunities consumed the resources of the AAOS and inertia (or the lack thereof) took over. This third five year review, after completion of the practice expense review, allowed AAOS a window of time to again try to correct the nomenclature for these codes, and review their work using the standard RUC survey method.

We also note, that at the time of the original CPT proposal, external fixation was considered an adjunctive procedure. CPT instructed that the codes for external fixation (20690 and 20692) be "listed in addition to the code for the treatment ...of the fracture." This concept still applies today. External fixation can be used as an adjunctive stabilization modality when treating fractures by almost any method. However, external fixation can also be used in reconstructive orthopaedics (for example, t' treatment of joint contractures) and for non-musculoskeletal system treatments (for example, as a suspension device in the treatment of lower extremity burns). In 1991, there was no Modifier -51 exempt code category. Today, these same codes, 20690 and 20692 for external fixator application are modifier -51 exempt, recognizing that they can stand alone or be used adjunctively. Because of the modifier -51 exemption, the RVUs have been reduced, so payers are not paying double when either of these codes are reported with another treatment code.

In the 2005 comment letter to CMS, the AAOS recommended examining the physician work for the ORIF codes because the code descriptors lacked clarity. In particular, because the CPT descriptors include the phrase "with or without internal or external fixation," it is difficult to imagine what the Harvard survey data actually represents (ie, no typical patient was described for the survey respondents to focus on). Further, after the descriptors for these codes were changed for CPT 1993, an Abt study was performed in 1992 for RUC consideration. This study produced *percentage* relationships to key reference codes, but not surveyed time and visit data. Some of these recommendations were accepted by the RUC and CMS and others were adjusted up or down, but no changes were made to the Harvard time and visit data, if available. Therefore, we believe that there is little, if any, relationship between the Harvard database time and visit information (from the old CPT codes) and the current work RVUs.

Given this information, we believe there is compelling evidence that the current work values and/or time and visit data may be incorrect and outdated and should be reviewed.

- *Evidence that incorrect assumptions were made in the previous valuation of the service, as documented; a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data*

  Harvard utilized the AMA Physician Masterfile to draw names for their surveys. While general orthopaedic surgeons can perform open reduction fracture care, it is more typical for patients to be referred to orthopaedic surgeons who specialize in orthopaedic trauma or in a given anatomical area (eg, shoulder, hand, knee, etc.). We do not believe that all specialty surgeons were surveyed for these codes, since the AMA Masterfile did not delineate orthopaedic specialties. Additionally, podiatrists were not surveyed for any of the lower extremity codes.

  Given this information, we believe there is compelling evidence that not all involved specialties were involved in the review of these codes.

A consensus committee of physicians representing the American Academy of Orthopaedic Surgeons, American Shoulder and Elbow Surgeons, Society for Surgery of the Hand, Arthroscopy Association of North America, Orthopaedic Trauma Association, American Podiatric Medical Association, and American Orthopaedic Foot and Ankle Society met by conference call to discuss the survey data for the revised orthopaedic codes and data for the key reference codes and other codes on the survey reference service lists.

For revised code 27814, we recommend 14.20 work RVUs. After considering differences in time and visits, along with differences in intra-operative work, we believe this value correctly ranks code 27814 relative to other ORIF codes, relative to the key reference code, and relative to orthopaedic codes from the survey reference service list.

The reference code 25609 offers a good comparison and has a similar RVW of 14.12. Although intra-time for t. reference code is greater, the post-operative work is less because 27826 requires hospitalization to avoid skin issues, swelling and assess neurocirculatory status. Total time is similar for both codes. Neurovascular injury may occur with this type of dislocation and proper function of the joint must be restored so multiple post-operative visits are necessary. Assessment of the circulation, sensation and motor function of the involved extremity is ongoing. The first office visit

would include removal of the splint and dressing, wound evaluation, redressing, discussion of restrictions and operative findings, splinting or casting and instruction on range of motion (ROM) and weightbearing activities. X-rays would be reviewed. The second visit would be for splint or cast and dressing removal, wound evaluation, suture removal, new cast or splint application and ROM exercises. The third visit would be for splint or cast and dressing removal, wound evaluation, hardware removal, review of restrictions and ROM exercises. X-rays would be reviewed. The fourth visit would be to check X-rays, wound healing and ROM.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No
   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FIVE YEAR REVIEW SPECIFIC QUESTIONS:

Please indicate the number of survey respondent percentages responding to each of the following questions (for example 0.05 = 5%):
Has the work of performing this service changed in the past 5 years? Yes 64% No 36%
(Use the subset of the people who responded "Yes" to answer the following questions)

A. This service represents new technology that has become more familiar (i.e., less work):
   I agree 4% I do not agree 96%
B. Patients requiring this service are now:
   more complex (more work) 96% less complex (less work) 0% no change 4%
C. The usual site-of-service has changed:
   from outpatient to inpatient 0% from inpatient to outpatient 21% no change 79%

Attestation Statement

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
2005 FIVE YEAR REVIEW - SUMMARY OF RECOMMENDATION

CPT Code:27822 Tracking Number F48 Specialty Society Recommended RVU: **14.75**
Global Period: 090 RUC Recommended RVU: **12.12**

CPT Descriptor: Open treatment of trimalleolar ankle fracture, with internal fixation, when performed, medial and/or lateral malleolus; without fixation of posterior lip

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 27-year-old female falls on an incline and sustains a trimalleolar ankle fracture requiring open reduction and internal fixation of the medial and/or lateral malleolus.

Percentage of Survey Respondents who found Vignette to be Typical: 64%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: • Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
- Verify that all required instruments and supplies are available
- Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulatic drapes
- Assess position of the extremities and head, adjust as needed
- The patient's leg is placed properly on the table and positioned with proper bolstering to aid surgical exposure.
- Indicate areas of skin to be prepped and mark surgical incisions
- A tourniquet is placed on the proximal thigh
- The leg is prepped and draped.
- The leg is elevated and exsanguinated.
- The pneumatic tourniquet is inflated.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work: A lateral incision is made over the distal fibula with care to protect branches of the superficial peroneal and sural nerve. The fracture hematoma is irrigated and the joint inspected from the lateral side for loose debris. The size and position of the posterior lip is confirmed. The fracture is reduced and held with a bone holding forceps. An interfragmentary screw is inserted. An appropriate sized plate is chosen and fixed with screws. The wound is irrigated and closed in layers. Next, a midline longitudinal incision is made with care to protect the branches of the medial saphenous nerve and vein. Sub-periosteal exposure of the fracture line is carried out. The fracture is pulled apart and the joint is inspected and irrigated for loose fragments. The fracture is then held in a reduced position and fixed with two parallel guide wires. Properly sized screws are place to achieve reduction and compression. Stability of the syndesmosis is confirmed by trying to disrupt the distal tibio – fibular junction. The wound is irrigated and closed in layers.

Description of Post-Service Work: Post-service work: in facility
- Application of bulky dressing and short leg splint
- Monitor patient stabilization in the recovery room.
- Consultation with the family and patient regarding the surgery and postoperative regimen.
- Communication with health care professionals including written and oral reports and orders.

- Postoperative care is coordinated with recovery room nursing staff.
- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- The patient is discharged to the orthopaedic floor for monitoring of compartment syndrome. This requires removing and reapplying the dressings.

Discharge day:

- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Physical therapy for the uses of crutches or walker is ordered
- Write prescriptions for medications needed post-discharge.
- Dictation of an operative report
- Procedure note is written in the patient chart
- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of splint/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order occupational therapy
- Supervision of rehabilitation
- Monitor physical therapy
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions
- Dictate progress notes for medical record

Surgical treatment using open anatomical reduction and internal fixation has been made more complex with the introduction of new imaging methods such as CT which allow better detection of the fracture pathology and provided the basis for new surgical strategies. There are also new internal fixation devices which require more work. Beginning in the 1990s (after the Harvard study), new plates were developed for fracture repair, with most becoming available in the late 1990s and early 2000s. As an example of the complexity of the decision process in current practice, the 1990's have given the surgeon numerous options for bone fixation. The options for a bone fixation device currently include Kirschner wires, wire, staples, screws, as well as newer alternatives such as headless bone screws, T-screws, absorbable pins, cannulated screws, and a myriad of plates. The goal of all these devices remains constant: that is, to achieve stable approximation of bone fragments to facilitate healing. The various devices afford rigid fixation along with compression of the osseous fragments. This allows early range of motion and preservation of surrounding joint function, as well as primary bone healing. Selection of the most advantageous form of fixation is dependent on many factors and takes considerable time in the pre-evaluation of a patient. These include the type of fracture or osteotomy created, bone density, type of bone, and the desire for interfragmental compression. All of this has resulted in more work. The standards of care (fracture reduction, limb alignment, etc.) have also been elevated by literature that shows fracture displacements and poor alignments lead to poorer results. Additionally, women over 50 is a fast growing segment of our population. A huge percentage of these patients are osteoporotic - making fracture fixation and maintenance of fixation far more difficult than it used to be. The new plates are more complex to insert when the underlying bone is of much poorer quality.

Given this information, we believe there is compelling evidence that ORIF is more complex than 5 years ago and this is even more true in comparison to practice in the late 1980s (or more than 25 years ago).

- ***Evidence that incorrect assumptions were made in the previous valuation of the service; a misleading vignette and/or survey in a previous evaluation***

During the period of 1989-1991 (after the Harvard study), a major effort was undertaken by the AAOS and the OTA to rewrite every fracture and dislocation treatment code in the musculoskeletal Section of CPT. In 1991, 395 code changes were accepted by the AMA CPT Editorial Panel under the leadership of Dr. William Felts. At the time of the original proposal, some of the code descriptors were changed from those submitted (presumably by the CPT staff), and published in the 1992 and subsequent editions. Some of the changes in the descriptors published in CPT 1992 didn't make sense, but in those years, the CPT process was closed-door. Additionally, in 1992 and 1993 the AMA staff were deluged by the implementation of the RBRVS process and though AAOS and OTA requested that these problems be addressed then, AMA CPT staff asked that it be deferred as their "plate was full." After that time, more important issues and other opportunities consumed the resources of the AAOS and inertia (or the lack thereof) took over. This third five year review, after completion of the practice expense review, allowed AAOS a window of time to again try to correct the nomenclature for these codes, and review their work using the standard RUC survey method.

We also note, that at the time of the original CPT proposal, external fixation was considered an adjunctive procedure. CPT instructed that the codes for external fixation (20690 and 20692) be "listed in addition to the code for the treatment ...of the fracture." This concept still applies today. External fixation can be used as an adjunctive stabilization modality when treating fractures by almost any method. However, external fixation can also be used in reconstructive orthopaedics (for example, th treatment of joint contractures) and for non-musculoskeletal system treatments (for example, as a suspension device in the treatment of lower extremity burns). In 1991, there was no Modifier -51 exempt code category. Today, these same codes, 20690 and 20692 for external fixator application are modifier -51 exempt, recognizing that they can stand alone or be used adjunctively. Because of the modifier -51 exemption, the RVUs have been reduced, so payers are not paying double when either of these codes are reported with another treatment code.

In the 2005 comment letter to CMS, the AAOS recommended examining the physician work for the ORIF codes because the code descriptors lacked clarity. In particular, because the CPT descriptors include the phrase "with or without internal or external fixation," it is difficult to imagine what the Harvard survey data actually represents (ie, no typical patient was described for the survey respondents to focus on). Further, after the descriptors for these codes were changed for CPT 1993, an Abt study was performed in 1992 for RUC consideration. This study produced *percentage* relationships to key reference codes, but not surveyed time and visit data. Some of these recommendations were accepted by the RUC and CMS and others were adjusted up or down, but no changes were made to the Harvard time and visit data, if available. Therefore, we believe that there is little, if any, relationship between the Harvard database time and visit information (from the old CPT codes) and the current work RVUs.

Given this information, we believe there is compelling evidence that the current work values and/or time and visit data may be incorrect and outdated and should be reviewed.

- *Evidence that incorrect assumptions were made in the previous valuation of the service, as documented; a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data*

Harvard utilized the AMA Physician Masterfile to draw names for their surveys. While general orthopaedic surgeons can perform open reduction fracture care, it is more typical for patients to be referred to orthopaedic surgeons who specialize in orthopaedic trauma or in a given anatomical area (eg, shoulder, hand, knee, etc.). We do not believe that all specialty surgeons were surveyed for these codes, since the AMA Masterfile did not delineate orthopaedic specialties. Additionally, podiatrists were not surveyed for any of the lower extremity codes.

Given this information, we believe there is compelling evidence that not all involved specialties were involved in the review of these codes.

A consensus committee of physicians representing the American Academy of Orthopaedic Surgeons, American Shoulder and Elbow Surgeons, Society for Surgery of the Hand, Arthroscopy Association of North America, Orthopaedic Trauma Association, American Podiatric Medical Association, and American Orthopaedic Foot and Ankle Society met by conference call to discuss the survey data for the revised orthopaedic codes and data for the key reference codes and other codes on the survey reference service lists.

For revised code 27822, we recommend 14.75 work RVUs. After considering differences in time and visits, along with differences in intra-operative work, we believe this value correctly ranks code 27822 relative to other ORIF codes, relative to the key reference code, and relative to orthopaedic codes from the survey reference service list.

This fracture is slightly more complex than key reference code 28299 and similar code 27814 and a RVW of 14. maintains the rank order relative to these two procedures. Total time is greater than 28299, including hospitalization wi close monitoring because of the significant risk for complications. Neurovascular injury may occur with this type of fracture and multiple post-operative visits are necessary. Assessment of the circulation, sensation and motor function of the involved extremity is ongoing. The first office visit would include removal of the splint and dressing, wound evaluation, redressing, discussion of restrictions and operative findings, splinting or casting and instruction on range of

motion (ROM) and weightbearing activities. X-rays would be reviewed. The second visit would be for splint or cast and dressing removal, wound evaluation, suture removal, new cast application, ROM exercises. The third visit would be for splint or cast removal and range of motion exercises and review of restrictions. X-rays would be reviewed. The fourth visit would be to check X-rays, wound healing and ROM.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No
   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FIVE YEAR REVIEW SPECIFIC QUESTIONS:

Please indicate the number of survey respondent percentages responding to each of the following questions (for example .05 = 5%):

Has the work of performing this service changed in the past 5 years? Yes 64% No 36%

(Use the subset of the people who responded "Yes" to answer the following questions)

A. This service represents new technology that has become more familiar (i.e., less work):
   I agree 4% I do not agree 96%
B. Patients requiring this service are now:
   more complex (more work) 96% less complex (less work) 0% no change 4%
C. The usual site-of-service has changed:
   from outpatient to inpatient 0% from inpatient to outpatient 21% no change 79%

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
2005 FIVE YEAR REVIEW - SUMMARY OF RECOMMENDATION

CPT Code:27823 Tracking Number F49 Specialty Society Recommended RVU: **15.00**
Global Period: 090 RUC Recommended RVU: **14.26**

CPT Descriptor: Open treatment of trimalleolar ankle fracture, with internal fixation, when performed, medial and/or lateral malleolus; with fixation of posterior lip

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 27-year-old female falls on an incline and sustains a trimalleolar ankle fracture requiring open reduction and internal fixation of the medial and/or lateral malleolus, as well as the posterior lip.

Percentage of Survey Respondents who found Vignette to be Typical: 68%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: • Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
- Verify that all required instruments and supplies are available
- Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulat. drapes
- Assess position of the extremities and head, adjust as needed
- The patient's leg is placed properly on the table and positioned with proper bolstering to aid surgical exposure.
- Indicate areas of skin to be prepped and mark surgical incisions
- A tourniquet is placed on the proximal thigh
- The leg is prepped and draped.
- The leg is elevated and exsanguinated.
- The pneumatic tourniquet is inflated.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work: A lateral incision is made over the distal fibula with care to protect branches of the superficial peroneal and sural nerve. The fracture hematoma is irrigated and the joint inspected from the lateral side for loose debris. The soft tissue attachments of the distal fibula, with the exception of the ankle ligaments, are released and the fibula is turned down to expose the posterior ankle joint from the lateral side. The posterior lip is reduced, held in place with provisional guide wires, and then fixed with two front to back compression screws. The fibular fracture is then reduced and held with a bone holding forceps. An interfragmentary screw is inserted. An appropriate sized plate is chosen and fixed with screws. The wound is irrigated and closed in layers. Next, a midline medial longitudinal incision is made over the medial malleolus with care to protect the branches of the medial saphenous nerve and vein. Sub-periosteal exposure of the fracture line is carried out. The fracture is pulled apart and the joint is inspected and irrigated for loose fragments. The fracture is then held in a reduced position and fixed with two parallel guide wires. Properly sized screws are place to achieve reduction and compression. Stability of the syndesmosis is confirmed by trying disrupt the distal tibio – fibular junction. The wound is irrigated and closed in layers.

Description of Post-Service Work: Post-service work: in facility
- Application of bulky dressing and short leg splint
- Monitor patient stabilization in the recovery room.

- Consultation with the family and patient regarding the surgery and postoperative regimen.
- Communication with health care professionals including written and oral reports and orders.
- Postoperative care is coordinated with recovery room nursing staff.
- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- The patient is discharged to the orthopaedic floor for monitoring of compartment syndrome. This requires removing and reapplying the dressings.

Discharge day:

- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Physical therapy for the uses of crutches or walker is ordered
- Write prescriptions for medications needed post-discharge.
- Dictation of an operative report
- Procedure note is written in the patient chart
- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of splint/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order occupational therapy
- Supervision of rehabilitation
- Monitor physical therapy
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions
- Dictate progress notes for medical record

COMPELLING EVIDENCE RATIONALE (Required to be Completed)

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

- ***Evidence that technology has changed physician work.***

Surgical treatment using open anatomical reduction and internal fixation has been made more complex with the introduction of new imaging methods such as CT which allow better detection of the fracture pathology and provided the basis for new surgical strategies. There are also new internal fixation devices which require more work. Beginning in the 1990s (after the Harvard study), new plates were developed for fracture repair, with most becoming available in the late 1990s and early 2000s. As an example of the complexity of the decision process in current practice, the 1990's have given the surgeon numerous options for bone fixation. The options for a bone fixation device currently include Kirschner wires, wire, staples, screws, as well as newer alternatives such as headless bone screws, T-screws, absorbable pins, cannulated screws, and a myriad of plates. The goal of all these devices remains constant: that is, to achieve stable approximation of bone fragments to facilitate healing. The various devices afford rigid fixation along with compression of the osseous fragments. This allows early range of motion and preservation of surrounding joint function, as well as primary bone healing. Selection of the most advantageous form of fixation is dependent on many factors and takes considerable time in the pre-evaluation of a patient. These include the type of fracture or osteotomy created, bone density, type of bone, and the desire for interfragmental compression. All of this has resulted in more work. The standards of care (fracture reduction, limb alignment, etc.) have also been elevated by literature that shows fracture displacements and poor alignments lead to poorer results. Additionally, women over 50 is a fast growing segment of our population. A huge percentage of these patients are osteoporotic - making fracture fixation and maintenance of fixation far more difficult than it used to be. The new plates are more complex to insert when the underlying bone is of much poorer quality.

Given this information, we believe there is compelling evidence that ORIF is more complex than 5 years ago and this is even more true in comparison to practice in the late 1980s (or more than 25 years ago).

- ***Evidence that incorrect assumptions were made in the previous valuation of the service; a misleading vignette and/or survey in a previous evaluation***

During the period of 1989-1991 (after the Harvard study), a major effort was undertaken by the AAOS and the OTA to rewrite every fracture and dislocation treatment code in the musculoskeletal Section of CPT. In 1991, 395 code changes were accepted by the AMA CPT Editorial Panel under the leadership of Dr. William Felts. At the time of the original proposal, some of the code descriptors were changed from those submitted (presumably by the CPT staff), and published in the 1992 and subsequent editions. Some of the changes in the descriptors published in CPT 1992 didn't make sense, but in those years, the CPT process was closed-door. Additionally, in 1992 and 1993 the AMA staff were deluged by the implementation of the RBRVS process and though AAOS and OTA requested that these problems be addressed then, AMA CPT staff asked that it be deferred as their "plate was full." After that time, more important issues and other opportunities consumed the resources of the AAOS and inertia (or the lack thereof) took over. This third five year review, after completion of the practice expense review, allowed AAOS a window of time to again try to correct the nomenclature for these codes, and review their work using the standard RUC survey method.

We also note, that at the time of the original CPT proposal, external fixation was considered an adjunctive procedure. CPT instructed that the codes for external fixation (20690 and 20692) be "listed in addition to the code for the treatment ...of the fracture." This concept still applies today. External fixation can be used as an adjunctive stabilization modality when treating fractures by almost any method. However, external fixation can also be used in reconstructive orthopaedics (for example, t' treatment of joint contractures) and for non-musculoskeletal system treatments (for example, as a suspension device in the treatment of lower extremity burns). In 1991, there was no Modifier -51 exempt code category. Today, these same codes, 20690 and 20692 for external fixator application are modifier -51 exempt, recognizing that they can stand alone or be used adjunctively. Because of the modifier -51 exemption, the RVUs have been reduced, so payers are not paying double when either of these codes are reported with another treatment code.

In the 2005 comment letter to CMS, the AAOS recommended examining the physician work for the ORIF codes because the code descriptors lacked clarity. In particular, because the CPT descriptors include the phrase "with or without internal or external fixation," it is difficult to imagine what the Harvard survey data actually represents (ie, no typical patient was described for the survey respondents to focus on). Further, after the descriptors for these codes were changed for CPT 1993, an Abt study was performed in 1992 for RUC consideration. This study produced *percentage* relationships to key reference codes, but not surveyed time and visit data. Some of these recommendations were accepted by the RUC and CMS and others were adjusted up or down, but no changes were made to the Harvard time and visit data, if available. Therefore, we believe that there is little, if any, relationship between the Harvard database time and visit information (from the old CPT codes) and the current work RVUs.

Given this information, we believe there is compelling evidence that the current work values and/or time and visit data may be incorrect and outdated and should be reviewed.

- *Evidence that incorrect assumptions were made in the previous valuation of the service, as documented; a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data*

Harvard utilized the AMA Physician Masterfile to draw names for their surveys. While general orthopaedic surgeons can perform open reduction fracture care, it is more typical for patients to be referred to orthopaedic surgeons who specialize in orthopaedic trauma or in a given anatomical area (eg, shoulder, hand, knee, etc.). We do not believe that all specialty surgeons were surveyed for these codes, since the AMA Masterfile did not delineate orthopaedic specialties. Additionally, podiatrists were not surveyed for any of the lower extremity codes.

Given this information, we believe there is compelling evidence that not all involved specialties were involved in the review of these codes.

A consensus committee of physicians representing the American Academy of Orthopaedic Surgeons, American Shoulder and Elbow Surgeons, Society for Surgery of the Hand, Arthroscopy Association of North America, Orthopaedic Trauma Association, American Podiatric Medical Association, and American Orthopaedic Foot and Ankle Society met by conference call to discuss the survey data for the revised orthopaedic codes and data for the key reference codes and other codes on the survey reference service lists.

For revised code 27823, we recommend 15.00 work RVUs. After considering differences in time and visits, along with differences in intra-operative work, we believe this value correctly ranks code 27823 relative to other ORIF codes, relative to the key reference code, and relative to orthopaedic codes from the survey reference service list.

This fracture is slightly more complex than 27822 and a RVW of 15.00 maintains the rank order between these two procedures. The key reference service of 25609 has very similar total time of 358 compared the total recommended time for the survey of 366. However, the intensity and risk for complications involved in treating the trimalleolar ankle fracture is greater than that involved with 25609. 27823 involves hospitalization for close monitoring because of the significant risk for complications. Neurovascular injury may occur with this type of fracture and multiple post-operative

visits are necessary. Assessment of the circulation, sensation and motor function of the involved extremity is ongoing. The first office visit would include removal of the splint and dressing, wound evaluation, redressing, discussion of restrictions and operative findings, splinting or casting and instruction on range of motion (ROM) and weightbearing activities. X-rays would be reviewed. The second visit would be for splint or cast and dressing removal, wound evaluation, suture removal, new cast application, ROM exercises. The third visit would be for splint or cast removal and range of motion exercises and review of restrictions. X-rays would be reviewed. The fourth visit would be to check X-rays, wound healing and ROM.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No
   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FIVE YEAR REVIEW SPECIFIC QUESTIONS:

Please indicate the number of survey respondent percentages responding to each of the following questions (for example 0.05 = 5%):
Has the work of performing this service changed in the past 5 years? Yes 64% No 36%
(Use the subset of the people who responded "Yes" to answer the following questions)

A. This service represents new technology that has become more familiar (i.e., less work):
   I agree 4% I do not agree 96%
B. Patients requiring this service are now:
   more complex (more work) 96% less complex (less work) 0% no change 4%
C. The usual site-of-service has changed:
   from outpatient to inpatient 0% from inpatient to outpatient 13% no change 83%

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
2005 FIVE YEAR REVIEW - SUMMARY OF RECOMMENDATION

CPT Code:27826 Tracking Number F50 Specialty Society Recommended RVU: **14.00**
Global Period: 090 RUC Recommended RVU: **12.00**

CPT Descriptor: Open treatment of fracture of weight bearing articular surface/portion of distal tibia (eg, pilon or tibial plafond), with internal fixation, when performed; of fibula only

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 45-year-old female trips, fracturing the distal tibial articular surface with an adjacent displaced distal fibular fracture. An anatomic open reduction of the distal fibula and internal fixation is performed to restore alignment of the fractured tibia and fibula.

Percentage of Survey Respondents who found Vignette to be Typical: 75%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: • Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
- Verify that all required instruments and supplies are available
- Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulation drapes
- Assess position of the extremities and head, adjust as needed
- The patient's leg is placed properly on the table and positioned with proper bolstering to aid surgical exposure.
- Indicate areas of skin to be prepped and mark surgical incisions
- A tourniquet is placed on the proximal thigh
- The leg is prepped and draped.
- The leg is elevated and exsanguinated.
- The pneumatic tourniquet is inflated.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work: A lateral incision is made over the distal fibula with care to protect branches of the superficial peroneal and sural nerve. The fracture hematoma is irrigated and the joint inspected from the lateral side for loose debris. Stability of the fractured articular surface of the tibia is confirmed. The fibular fracture is reduced and held with a bone holding forceps. An interfragmentary screw is inserted. An appropriate sized plate is chosen and fixed with screws. Stability of the syndesmosis is confirmed by trying to disrupt the distal tibio – fibular junction. The wound is irrigated and closed in layers.

Description of Post-Service Work: Post-service work: in facility
- Application of bulky dressing and short leg splint
- Monitor patient stabilization in the recovery room.
- Consultation with the family and patient regarding the surgery and postoperative regimen.
- Communication with health care professionals including written and oral reports and orders.
- Postoperative care is coordinated with recovery room nursing staff.
- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.

- The patient is discharged to the orthopaedic floor for monitoring of compartment syndrome. This requires removing and reapplying the dressings.

Discharge day:

- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Physical therapy for the uses of crutches or walker is ordered
- Write prescriptions for medications needed post-discharge.
- Dictation of an operative report
- Procedure note is written in the patient chart
- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of splint/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order occupational therapy
- Supervision of rehabilitation
- Monitor physical therapy
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions
- Dictate progress notes for medical record

COMPELLING EVIDENCE RATIONALE (Required to be Completed)

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

- ***Evidence that technology has changed physician work.***

Surgical treatment using open anatomical reduction and internal fixation has been made more complex with the introduction of new imaging methods such as CT which allow better detection of the fracture pathology and provided the basis for new surgical strategies. There are also new internal fixation devices which require more work. Beginning in the 1990s (after the Harvard study), new plates were developed for fracture repair, with most becoming available in the late 1990s and early 2000s. As an example of the complexity of the decision process in current practice, the 1990's have given the surgeon numerous options for bone fixation. The options for a bone fixation device currently include Kirschner wires, wire, staples, screws, as well as newer alternatives such as headless bone screws, T-screws, absorbable pins, cannulated screws, and a myriad of plates. The goal of all these devices remains constant: that is, to achieve stable approximation of bone fragments to facilitate healing. The various devices afford rigid fixation along with compression of the osseous fragments. This allows early range of motion and preservation of surrounding joint function, as well as primary bone healing. Selection of the most advantageous form of fixation is dependent on many factors and takes considerable time in the pre-evaluation of a patient. These include the type of fracture or osteotomy created, bone density, type of bone, and the desire for interfragmental compression. All of this has resulted in more work. The standards of care (fracture reduction, limb alignment, etc.) have also been elevated by literature that shows fracture displacements and poor alignments lead to poorer results. Additionally, women over 50 is a fast growing segment of our population. A huge percentage of these patients are osteoporotic - making fracture fixation and maintenance of fixation far more difficult than it used to be. The new plates are more complex to insert when the underlying bone is of much poorer quality.

Given this information, we believe there is compelling evidence that ORIF is more complex than 5 years ago and this is even more true in comparison to practice in the late 1980s (or more than 25 years ago).

- ***Evidence that incorrect assumptions were made in the previous valuation of the service; a misleading vignette and/or survey in a previous evaluation***

During the period of 1989-1991 (after the Harvard study), a major effort was undertaken by the AAOS and the OTA to rewrite every fracture and dislocation treatment code in the musculoskeletal Section of CPT. In 1991, 395 code changes were accepted by the AMA CPT Editorial Panel under the leadership of Dr. William Felts. At the time of the original proposal, some of the code descriptors were changed from those submitted (presumably by the CPT staff), and published in the 1992 and subsequent editions. Some of the changes in the descriptors published in CPT 1992 didn't make sense, but in those years, the CPT process was closed-door. Additionally, in 1992 and 1993 the AMA staff were deluged by the implementation of the RBRVS process and though AAOS and OTA requested that these problems be addressed then, AMA CPT staff asked that it be deferred as their "plate was full." After that time, more important issues and other opportunities consumed the resources of the AAOS and inertia (or the lack thereof) took over. This third five year review, after completion of the practice expense review, allowed AAOS a window of time to again try to correct the nomenclature for these codes, and review their work using the standard RUC survey method.

We also note, that at the time of the original CPT proposal, external fixation was considered an adjunctive procedure. CPT instructed that the codes for external fixation (20690 and 20692) be "listed in addition to the code for the treatment ...of the fracture." This concept still applies today. External fixation can be used as an adjunctive stabilization modality when treating fractures by almost any method. However, external fixation can also be used in reconstructive orthopaedics (for example, t' treatment of joint contractures) and for non-musculoskeletal system treatments (for example, as a suspension device in the treatment of lower extremity burns). In 1991, there was no Modifier -51 exempt code category. Today, these same codes, 20690 and 20692 for external fixator application are modifier -51 exempt, recognizing that they can stand alone or be used adjunctively. Because of the modifier -51 exemption, the RVUs have been reduced, so payers are not paying double when either of these codes are reported with another treatment code.

In the 2005 comment letter to CMS, the AAOS recommended examining the physician work for the ORIF codes because the code descriptors lacked clarity. In particular, because the CPT descriptors include the phrase "with or without internal or external fixation," it is difficult to imagine what the Harvard survey data actually represents (ie, no typical patient was described for the survey respondents to focus on). Further, after the descriptors for these codes were changed for CPT 1993, an Abt study was performed in 1992 for RUC consideration. This study produced *percentage* relationships to key reference codes, but not surveyed time and visit data. Some of these recommendations were accepted by the RUC and CMS and others were adjusted up or down, but no changes were made to the Harvard time and visit data, if available. Therefore, we believe that there is little, if any, relationship between the Harvard database time and visit information (from the old CPT codes) and the current work RVUs.

Given this information, we believe there is compelling evidence that the current work values and/or time and visit data may be incorrect and outdated and should be reviewed.

- *Evidence that incorrect assumptions were made in the previous valuation of the service, as documented; a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data*

Harvard utilized the AMA Physician Masterfile to draw names for their surveys. While general orthopaedic surgeons can perform open reduction fracture care, it is more typical for patients to be referred to orthopaedic surgeons who specialize in orthopaedic trauma or in a given anatomical area (eg, shoulder, hand, knee, etc.). We do not believe that all specialty surgeons were surveyed for these codes, since the AMA Masterfile did not delineate orthopaedic specialties. Additionally, podiatrists were not surveyed for any of the lower extremity codes.

Given this information, we believe there is compelling evidence that not all involved specialties were involved in the review of these codes.

A consensus committee of physicians representing the American Academy of Orthopaedic Surgeons, American Shoulder and Elbow Surgeons, Society for Surgery of the Hand, Arthroscopy Association of North America, Orthopaedic Trauma Association, American Podiatric Medical Association, and American Orthopaedic Foot and Ankle Society met by conference call to discuss the survey data for the revised orthopaedic codes and data for the key reference codes and other codes on the survey reference service lists.

For revised code 27826, we recommend 14.00 work RVUs. After considering differences in time and visits, along with differences in intra-operative work, we believe this value correctly ranks code 27826 relative to other ORIF codes, relative to the key reference code, and relative to orthopaedic codes from the survey reference service list.

The reference code 25609 offers a good comparison and has a similar RVW of 14.12. Although intra-time for t... reference code is greater, the post-operative work is less because 27826 requires hospitalization to avoid skin issues, swelling and assess neurocirculatory status. Total time is similar for both codes. Neurovascular injury may occur with this type of fracture and multiple post-operative visits are necessary. Assessment of the circulation, sensation and motor function of the involved extremity is ongoing. The first office visit would include removal of the splint and dressing,

wound evaluation, redressing, discussion of restrictions and operative findings, splinting or casting and instruction on range of motion (ROM) and weightbearing activities. X-rays would be reviewed. The second visit would be for splint or cast and dressing removal, wound evaluation, suture removal, new cast application, ROM exercises. The third visit would be for splint or cast removal and range of motion exercises and review of restrictions. X-rays would be reviewed. The fourth visit would be to check X-rays, wound healing and ROM.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No
   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FIVE YEAR REVIEW SPECIFIC QUESTIONS:

Please indicate the number of survey respondent percentages responding to each of the following questions (for example 0.05 = 5%):
Has the work of performing this service changed in the past 5 years? Yes 64% No 36%
(Use the subset of the people who responded "Yes" to answer the following questions)

A. This service represents new technology that has become more familiar (i.e., less work):
   I agree 17% I do not agree 83%
B. Patients requiring this service are now:
   more complex (more work) 100% less complex (less work) 0% no change 0%
C. The usual site-of-service has changed:
   from outpatient to inpatient 0% from inpatient to outpatient 4% no change 91%

CPT Descriptor: Open treatment of fracture of weight bearing articular surface/portion of distal tibia (eg, pilon or tibial plafond), with internal fixation, when performed; of tibia only

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 24-year-old male with a displaced articular (pilon) fracture of the distal tibia undergoes open reduction and internal fixation of the distal tibia and its articular surface.

Percentage of Survey Respondents who found Vignette to be Typical: 78%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: • Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
- Verify that all required instruments and supplies are available
- Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulati drapes
- Assess position of the extremities and head, adjust as needed
- The patient's leg is placed properly on the table and positioned with proper bolstering to aid surgical exposure.
- Indicate areas of skin to be prepped and mark surgical incisions
- A tourniquet is placed on the proximal thigh
- The leg is prepped and draped.
- The leg is elevated and exsanguinated.
- The pneumatic tourniquet is inflated.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work: A medial or anteromedial incision is made, protecting the underlying neurovascular structures, and the fracture fragments are exposed. A Schantz pin or femoral distractor is applied to take advantage of ligamentotaxis. An appropriate sized and shaped plate is chosen. Preliminary fixation is carried out with pins and final fixation is with plate and screws. Most fracture fragments are fixed to the plate, but some are just fixed fragment to fragment. The stability of the distal tibio-fibular syndesmosis is confirmed. The wound is irrigated and closed in layers.

Description of Post-Service Work: Post-service work: in facility
- Application of bulky dressing and short leg splint
- Monitor patient stabilization in the recovery room.
- Consultation with the family and patient regarding the surgery and postoperative regimen.
- Communication with health care professionals including written and oral reports and orders.
- Postoperative care is coordinated with recovery room nursing staff.
- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- The patient is discharged to the orthopaedic floor for monitoring of compartment syndrome. This requires removing and reapplying the dressings.

Discharge day:

- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Physical therapy for the uses of crutches or walker is ordered
- Write prescriptions for medications needed post-discharge.
- Dictation of an operative report
- Procedure note is written in the patient chart
- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of splint/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order occupational therapy
- Supervision of rehabilitation
- Monitor physical therapy
- Discuss progress with PCP (verbal and written)

COMPELLING EVIDENCE RATIONALE (Required to be Completed)

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

- ***Evidence that technology has changed physician work.***

Surgical treatment using open anatomical reduction and internal fixation has been made more complex with the introduction of new imaging methods such as CT which allow better detection of the fracture pathology and provided the basis for new surgical strategies. There are also new internal fixation devices which require more work. Beginning in the 1990s (after the Harvard study), new plates were developed for fracture repair, with most becoming available in the late 1990s and early 2000s. As an example of the complexity of the decision process in current practice, the 1990's have given the surgeon numerous options for bone fixation. The options for a bone fixation device currently include Kirschner wires, wire, staples, screws, as well as newer alternatives such as headless bone screws, T-screws, absorbable pins, cannulated screws, and a myriad of plates. The goal of all these devices remains constant: that is, to achieve stable approximation of bone fragments to facilitate healing. The various devices afford rigid fixation along with compression of the osseous fragments. This allows early range of motion and preservation of surrounding joint function, as well as primary bone healing. Selection of the most advantageous form of fixation is dependent on many factors and takes considerable time in the pre-evaluation of a patient. These include the type of fracture or osteotomy created, bone density, type of bone, and the desire for interfragmental compression. All of this has resulted in more work. The standards of care (fracture reduction, limb alignment, etc.) have also been elevated by literature that shows fracture displacements and poor alignments lead to poorer results. Additionally, women over 50 is a fast growing segment of our population. A huge percentage of these patients are osteoporotic - making fracture fixation and maintenance of fixation far more difficult than it used to be. The new plates are more complex to insert when the underlying bone is of much poorer quality.

Given this information, we believe there is compelling evidence that ORIF is more complex than 5 years ago and this is even more true in comparison to practice in the late 1980s (or more than 25 years ago).

- ***Evidence that incorrect assumptions were made in the previous valuation of the service; a misleading vignette and/or survey in a previous evaluation***

During the period of 1989-1991 (after the Harvard study), a major effort was undertaken by the AAOS and the OTA to rewrite every fracture and dislocation treatment code in the musculoskeletal Section of CPT. In 1991, 395 code changes were accepted by the AMA CPT Editorial Panel under the leadership of Dr. William Felts. At the time of the original proposal, some of the code descriptors were changed from those submitted (presumably by the CPT staff), and published in the 1992 and subsequent editions. Some of the changes in the descriptors published in CPT 1992 didn't make sense, but in those years, the CPT process was closed-door. Additionally, in 1992 and 1993 the AMA staff were deluged by the implementation of the RBRVS process and though AAOS and OTA requested that these problems be addressed then, AMA CPT staff asked that it be deferred as their "plate was full." After that time, more important issues and other opportunities consumed the resources of the AAOS and inertia (or the lack thereof) took over. This third five year review, after completion of the practice expense review, allowed AAOS a window of time to again try to correct the nomenclature for these codes, and review their work using the standard RUC survey method.

We also note, that at the time of the original CPT proposal, external fixation was considered an adjunctive procedure. CPT instructed that the codes for external fixation (20690 and 20692) be "listed in addition to the code for the treatment ...of the fracture." This concept still applies today. External fixation can be used as an adjunctive stabilization modality when treating fractures by almost any method. However, external fixation can also be used in reconstructive orthopaedics (for example, treatment of joint contractures) and for non-musculoskeletal system treatments (for example, as a suspension device in the treatment of lower extremity burns). In 1991, there was no Modifier -51 exempt code category. Today, these same codes, 20690 and 20692 for external fixator application are modifier -51 exempt, recognizing that they can stand alone or be used adjunctively. Because of the modifier -51 exemption, the RVUs have been reduced, so payers are not paying double when either of these codes are reported with another treatment code.

In the 2005 comment letter to CMS, the AAOS recommended examining the physician work for the ORIF codes because the code descriptors lacked clarity. In particular, because the CPT descriptors include the phrase "with or without internal or external fixation," it is difficult to imagine what the Harvard survey data actually represents (ie, no typical patient was described for the survey respondents to focus on). Further, after the descriptors for these codes were changed for CPT 1993, an Abt study was performed in 1992 for RUC consideration. This study produced *percentage* relationships to key reference codes, but not surveyed time and visit data. Some of these recommendations were accepted by the RUC and CMS and others were adjusted up or down, but no changes were made to the Harvard time and visit data, if available. Therefore, we believe that there is little, if any, relationship between the Harvard database time and visit information (from the old CPT codes) and the current work RVUs.

Given this information, we believe there is compelling evidence that the current work values and/or time and visit data may be incorrect and outdated and should be reviewed.

- *Evidence that incorrect assumptions were made in the previous valuation of the service, as documented; a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data*

Harvard utilized the AMA Physician Masterfile to draw names for their surveys. While general orthopaedic surgeons can perform open reduction fracture care, it is more typical for patients to be referred to orthopaedic surgeons who specialize in orthopaedic trauma or in a given anatomical area (eg, shoulder, hand, knee, etc.). We do not believe that all specialty surgeons were surveyed for these codes, since the AMA Masterfile did not delineate orthopaedic specialties. Additionally, podiatrists were not surveyed for any of the lower extremity codes.

Given this information, we believe there is compelling evidence that not all involved specialties were involved in the review of these codes.

A consensus committee of physicians representing the American Academy of Orthopaedic Surgeons, American Shoulder and Elbow Surgeons, Society for Surgery of the Hand, Arthroscopy Association of North America, Orthopaedic Trauma Association, American Podiatric Medical Association, and American Orthopaedic Foot and Ankle Society met by conference call to discuss the survey data for the revised orthopaedic codes and data for the key reference codes and other codes on the survey reference service lists.

For revised code 27827, we recommend 20.00 work RVUs. After considering differences in time and visits, along with differences in intra-operative work, we believe this value correctly ranks code 27827 relative to other ORIF codes, relative to the key reference code, and relative to orthopaedic codes from the survey reference service list.

The reference code 27447 offers a good comparison to 27827. Although both codes have a similar total time, 27447 has a greater intensity and complexity with additional hospital work. In comparing the survey code against the reference code, the median RVW appears appropriate and maintains relativity. Neurovascular injury may occur with this type of fracture and multiple post-operative visits are necessary. Assessment of the circulation, sensation and motor function of the involved extremity is ongoing. The first office visit would include removal of the splint and dressing, wound

evaluation, redressing, discussion of restrictions and operative findings, splinting or casting and instruction on range of motion (ROM) and weightbearing activities. X-rays would be reviewed. The second visit would be for splint or cast and dressing removal, wound evaluation, suture removal, new cast application, ROM exercises. The third visit would be for splint or cast removal and range of motion exercises and review of restrictions. X-rays would be reviewed. The fourth visit would be to check X-rays, wound healing and ROM.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No
   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FIVE YEAR REVIEW SPECIFIC QUESTIONS:

Please indicate the number of survey respondent percentages responding to each of the following questions (for example 0.05 = 5%):
Has the work of performing this service changed in the past 5 years? Yes 68% No 32%
(Use the subset of the people who responded "Yes" to answer the following questions)

A. This service represents new technology that has become more familiar (i.e., less work):
   I agree 22% I do not agree 78%
B. Patients requiring this service are now:
   more complex (more work) 104% less complex (less work) 0% no change 0%
C. The usual site-of-service has changed:
   from outpatient to inpatient 0% from inpatient to outpatient 0% no change 100%

Attestation Statement

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
2005 FIVE YEAR REVIEW - SUMMARY OF RECOMMENDATION

CPT Code:27828 Tracking Number F52 Specialty Society Recommended RVU: **24.00**
Global Period: 090 RUC Recommended RVU: **20.00**

CPT Descriptor: Open treatment of fracture of weight bearing articular surface/portion of distal tibia (eg, pilon or tibial plafond), with internal fixation, when performed; of both tibia and fibula

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 40-year-old male falls sustaining a displaced fracture of the distal tibial articular surface including the tibia and fibula. An open reduction of the fracture and internal fixation is performed to restore the articular surface of the distal tibia and fibula.

Percentage of Survey Respondents who found Vignette to be Typical: 75%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: • Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
- Verify that all required instruments and supplies are available
- Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulation drapes
- Assess position of the extremities and head, adjust as needed
- The patient's leg is placed properly on the table and positioned with proper bolstering to aid surgical exposure.
- Indicate areas of skin to be prepped and mark surgical incisions
- A tourniquet is placed on the proximal thigh
- The leg is prepped and draped.
- The leg is elevated and exsanguinated.
- The pneumatic tourniquet is inflated.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work: A lateral incision is made over the distal fibula with care to protect branches of the superficial peroneal and sural nerve. The fracture hematoma is irrigated and the joint inspected from the lateral side for loose debris. Stability of the fractured articular surface of the tibia is confirmed. The fibular fracture is reduced and held with a bone holding forceps. An interfragmentary screw is inserted. An appropriate sized plate is chosen and fixed with screws. A medial or anteromedial incision is made protecting the underlying neurovascular structures, the fracture fragments are exposed. A Schantz pin or femoral distractor is applied to take advantage of ligamentotaxis. An appropriate sized and shaped plate is chosen. Preliminary fixation is carried out with pins and final fixation is with plate and screws. Most fracture fragments are fixed to the plate, but some are just fixed fragment to fragment. Stability of the syndesmosis is confirmed by trying to disrupt the distal tibio – fibular junction. The wound is irrigated and closed in layers.

Description of Post-Service Work: Post-service work: in facility
- Application of bulky dressing and short leg splint
- Monitor patient stabilization in the recovery room.
- Consultation with the family and patient regarding the surgery and postoperative regimen.

- Communication with health care professionals including written and oral reports and orders.
- Postoperative care is coordinated with recovery room nursing staff.
- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- The patient is discharged to the orthopaedic floor for monitoring of compartment syndrome. This requires removing and reapplying the dressings.

Discharge day:

- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Physical therapy for the uses of crutches or walker is ordered
- Write prescriptions for medications needed post-discharge.
- Dictation of an operative report
- Procedure note is written in the patient chart
- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of splint/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order occupational therapy
- Supervision of rehabilitation
- Monitor physical therapy
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions
- Dictate progress notes for medical record

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

- ***Evidence that technology has changed physician work.***

Surgical treatment using open anatomical reduction and internal fixation has been made more complex with the introduction of new imaging methods such as CT which allow better detection of the fracture pathology and provided the basis for new surgical strategies. There are also new internal fixation devices which require more work. Beginning in the 1990s (after the Harvard study), new plates were developed for fracture repair, with most becoming available in the late 1990s and early 2000s. As an example of the complexity of the decision process in current practice, the 1990's have given the surgeon numerous options for bone fixation. The options for a bone fixation device currently include Kirschner wires, wire, staples, screws, as well as newer alternatives such as headless bone screws, T-screws, absorbable pins, cannulated screws, and a myriad of plates. The goal of all these devices remains constant: that is, to achieve stable approximation of bone fragments to facilitate healing. The various devices afford rigid fixation along with compression of the osseous fragments. This allows early range of motion and preservation of surrounding joint function, as well as primary bone healing. Selection of the most advantageous form of fixation is dependent on many factors and takes considerable time in the pre-evaluation of a patient. These include the type of fracture or osteotomy created, bone density, type of bone, and the desire for interfragmental compression. All of this has resulted in more work. The standards of care (fracture reduction, limb alignment, etc.) have also been elevated by literature that shows fracture displacements and poor alignments lead to poorer results. Additionally, women over 50 is a fast growing segment of our population. A huge percentage of these patients are osteoporotic - making fracture fixation and maintenance of fixation far more difficult than it used to be. The new plates are more complex to insert when the underlying bone is of much poorer quality.

Given this information, we believe there is compelling evidence that ORIF is more complex than 5 years ago and this is even more true in comparison to practice in the late 1980s (or more than 25 years ago).

- ***Evidence that incorrect assumptions were made in the previous valuation of the service; a misleading vignette and/or survey in a previous evaluation***

During the period of 1989-1991 (after the Harvard study), a major effort was undertaken by the AAOS and the OTA to rewrite every fracture and dislocation treatment code in the musculoskeletal Section of CPT. In 1991, 395 code changes were accepted by the AMA CPT Editorial Panel under the leadership of Dr. William Felts. At the time of the original proposal, some of the code descriptors were changed from those submitted (presumably by the CPT staff), and published in the 1992 and subsequent editions. Some of the changes in the descriptors published in CPT 1992 didn't make sense, but in those years, the CPT process was closed-door. Additionally, in 1992 and 1993 the AMA staff were deluged by the implementation of the RBRVS process and though AAOS and OTA requested that these problems be addressed then, AMA CPT staff asked that it be deferred as their "plate was full." After that time, more important issues and other opportunities consumed the resources of the AAOS and inertia (or the lack thereof) took over. This third five year review, after completion of the practice expense review, allowed AAOS a window of time to again try to correct the nomenclature for these codes, and review their work using the standard RUC survey method.

We also note, that at the time of the original CPT proposal, external fixation was considered an adjunctive procedure. CPT instructed that the codes for external fixation (20690 and 20692) be "listed in addition to the code for the treatment ...of the fracture." This concept still applies today. External fixation can be used as an adjunctive stabilization modality when treating fractures by almost any method. However, external fixation can also be used in reconstructive orthopaedics (for example, the treatment of joint contractures) and for non-musculoskeletal system treatments (for example, as a suspension device in the treatment of lower extremity burns). In 1991, there was no Modifier -51 exempt code category. Today, these same codes, 20690 and 20692 for external fixator application are modifier -51 exempt, recognizing that they can stand alone or be used adjunctively. Because of the modifier -51 exemption, the RVUs have been reduced, so payers are not paying double when either of these codes are reported with another treatment code.

In the 2005 comment letter to CMS, the AAOS recommended examining the physician work for the ORIF codes because the code descriptors lacked clarity. In particular, because the CPT descriptors include the phrase "with or without internal or external fixation," it is difficult to imagine what the Harvard survey data actually represents (ie, no typical patient was described for the survey respondents to focus on). Further, after the descriptors for these codes were changed for CPT 1993, an Abt study was performed in 1992 for RUC consideration. This study produced *percentage* relationships to key reference codes, but not surveyed time and visit data. Some of these recommendations were accepted by the RUC and CMS and others were adjusted up or down, but no changes were made to the Harvard time and visit data, if available. Therefore, we believe that there is little, if any, relationship between the Harvard database time and visit information (from the old CPT codes) and the current work RVUs.

Given this information, we believe there is compelling evidence that the current work values and/or time and visit data may be incorrect and outdated and should be reviewed.

- *Evidence that incorrect assumptions were made in the previous valuation of the service, as documented; a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data*

  Harvard utilized the AMA Physician Masterfile to draw names for their surveys. While general orthopaedic surgeons can perform open reduction fracture care, it is more typical for patients to be referred to orthopaedic surgeons who specialize in orthopaedic trauma or in a given anatomical area (eg, shoulder, hand, knee, etc.). We do not believe that all specialty surgeons were surveyed for these codes, since the AMA Masterfile did not delineate orthopaedic specialties. Additionally, podiatrists were not surveyed for any of the lower extremity codes.

  Given this information, we believe there is compelling evidence that not all involved specialties were involved in the review of these codes.

A consensus committee of physicians representing the American Academy of Orthopaedic Surgeons, American Shoulder and Elbow Surgeons, Society for Surgery of the Hand, Arthroscopy Association of North America, Orthopaedic Trauma Association, American Podiatric Medical Association, and American Orthopaedic Foot and Ankle Society met by conference call to discuss the survey data for the revised orthopaedic codes and data for the key reference codes and other codes on the survey reference service lists.

For revised code 27828, we recommend 24.00 work RVUs. After considering differences in time and visits, along with differences in intra-operative work, we believe this value correctly ranks code 27828 relative to other ORIF codes, relative to the key reference code, and relative to orthopaedic codes from the survey reference service list.

The reference code 27447 offers a good comparison to 27827. In comparison to 27447, the survey code total time almost identical with 27447 having more hospital work and 27828 having more intra and office work. The consensus panel believes the difference in work RVUs for these two codes correctly reflect these differences. Neurovascular injury may occur with this type of fracture and multiple post-operative visits are necessary. Assessment of the circulation, sensation and motor function of the involved extremity is ongoing. The first office visit would include removal of the splint and dressing, wound evaluation, redressing, discussion of restrictions and operative findings, splinting or casting and

instruction on range of motion (ROM) and weight bearing activities. X-rays would be reviewed. The second visit would be for splint or cast and dressing removal, wound evaluation, suture removal, new cast application, ROM exercises. The third visit would be for splint or cast removal and range of motion exercises and review of restrictions. X-rays would be reviewed. The fourth visit would be to check X-rays, wound healing and ROM.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No
   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FIVE YEAR REVIEW SPECIFIC QUESTIONS:

Please indicate the number of survey respondent percentages responding to each of the following questions (for example 0.05 = 5%):
Has the work of performing this service changed in the past 5 years? Yes 69% No 31%
(Use the subset of the people who responded "Yes" to answer the following questions)

A. This service represents new technology that has become more familiar (i.e., less work):
   I agree 20% I do not agree 80%
B. Patients requiring this service are now:
   more complex (more work) 92% less complex (less work) 0% no change 8%
C. The usual site-of-service has changed:
   from outpatient to inpatient 0% from inpatient to outpatient 0% no change 96%

Attestation Statement

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
2005 FIVE YEAR REVIEW - SUMMARY OF RECOMMENDATION

CPT Code:27829 Tracking Number F53 Specialty Society Recommended RVU: **9.50**
Global Period: 090 RUC Recommended RVU: **9.50**

CPT Descriptor: Open treatment of distal tibiofibular joint (syndesmosis) disruption, includes internal fixation, when performed

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 22-year-old male trips and sustains a severe torsional injury to his ankle resulting in a syndesmosis disruption requiring open reduction and internal fixation.

Percentage of Survey Respondents who found Vignette to be Typical: 87%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: • Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
- Verify that all required instruments and supplies are available
- Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulatic drapes
- Assess position of the extremities and head, adjust as needed
- The patient's leg is placed properly on the table and positioned with proper bolstering to aid surgical exposure.
- Indicate areas of skin to be prepped and mark surgical incisions
- A tourniquet is placed on the proximal thigh
- The leg is prepped and draped.
- The leg is elevated and exsanguinated.
- The pneumatic tourniquet is inflated.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work: A longitudinal anterior incision is made down the tibiofibular syndesmosis. If this is a fresh injury, the tissues are mobilized for later repair. If this is a late injury. the scar tissue will have to be mobilized to allow for anatomic reduction. A bone holding clamp is used to obtain reduction and with the ankle in neutral mortise. Two screws with washers and/or a small plate are placed to maintain reduction without compression. The wound is irrigated and closed in layers.

Description of Post-Service Work: Post-service work: in facility
- Application of bulky dressing and short leg splint
- Monitor patient stabilization in the recovery room.
- Consultation with the family and patient regarding the surgery and postoperative regimen.
- Communication with health care professionals including written and oral reports and orders.
- Postoperative care is coordinated with recovery room nursing staff.
- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- The patient is discharged to the orthopaedic floor for monitoring of compartment syndrome. This requires removing and reapplying the dressings.

Discharge day:

- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Physical therapy for the uses of crutches or walker is ordered
- Write prescriptions for medications needed post-discharge.
- Dictation of an operative report
- Procedure note is written in the patient chart
- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of splint/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order occupational therapy
- Supervision of rehabilitation
- Monitor physical therapy
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions
- Dictate progress notes for medical record

COMPELLING EVIDENCE RATIONALE (Required to be Completed)

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

- ***Evidence that technology has changed physician work.***

Surgical treatment using open anatomical reduction and internal fixation has been made more complex with the introduction of new imaging methods such as CT which allow better detection of the fracture pathology and provided the basis for new surgical strategies. There are also new internal fixation devices which require more work. Beginning in the 1990s (after the Harvard study), new plates were developed for fracture repair, with most becoming available in the late 1990s and early 2000s. As an example of the complexity of the decision process in current practice, the 1990's have given the surgeon numerous options for bone fixation. The options for a bone fixation device currently include Kirschner wires, wire, staples, screws, as well as newer alternatives such as headless bone screws, T-screws, absorbable pins, cannulated screws, and a myriad of plates. The goal of all these devices remains constant: that is, to achieve stable approximation of bone fragments to facilitate healing. The various devices afford rigid fixation along with compression of the osseous fragments. This allows early range of motion and preservation of surrounding joint function, as well as primary bone healing. Selection of the most advantageous form of fixation is dependent on many factors and takes considerable time in the pre-evaluation of a patient. These include the type of fracture or osteotomy created, bone density, type of bone, and the desire for interfragmental compression. All of this has resulted in more work. The standards of care (fracture reduction, limb alignment, etc.) have also been elevated by literature that shows fracture displacements and poor alignments lead to poorer results. Additionally, women over 50 is a fast growing segment of our population. A huge percentage of these patients are osteoporotic - making fracture fixation and maintenance of fixation far more difficult than it used to be. The new plates are more complex to insert when the underlying bone is of much poorer quality.

Given this information, we believe there is compelling evidence that ORIF is more complex than 5 years ago and this is even more true in comparison to practice in the late 1980s (or more than 25 years ago).

- ***Evidence that incorrect assumptions were made in the previous valuation of the service; a misleading vignette and/or survey in a previous evaluation***

During the period of 1989-1991 (after the Harvard study), a major effort was undertaken by the AAOS and the OTA to rewrite every fracture and dislocation treatment code in the musculoskeletal Section of CPT. In 1991, 395 code changes were accepted by the AMA CPT Editorial Panel under the leadership of Dr. William Felts. At the time of the original proposal, some of the code descriptors were changed from those submitted (presumably by the CPT staff), and published in the 1992 and subsequent editions. Some of the changes in the descriptors published in CPT 1992 didn't make sense, but in those years, the CPT process was closed-door. Additionally, in 1992 and 1993 the AMA staff were deluged by the implementation of the RBRVS process and though AAOS and OTA requested that these problems be addressed then, AMA CPT staff asked that it be deferred as their "plate was full." After that time, more important issues and other opportunities consumed the resources of the AAOS and inertia (or the lack thereof) took over. This third five year review, after completion of the practice expense review, allowed AAOS a window of time to again try to correct the nomenclature for these codes, and review their work using the standard RUC survey method.

We also note, that at the time of the original CPT proposal, external fixation was considered an adjunctive procedure. CPT instructed that the codes for external fixation (20690 and 20692) be "listed in addition to the code for the treatment ...of the fracture." This concept still applies today. External fixation can be used as an adjunctive stabilization modality when treating fractures by almost any method. However, external fixation can also be used in reconstructive orthopaedics (for example, t' treatment of joint contractures) and for non-musculoskeletal system treatments (for example, as a suspension device in the treatment of lower extremity burns). In 1991, there was no Modifier -51 exempt code category. Today, these same codes, 20690 and 20692 for external fixator application are modifier -51 exempt, recognizing that they can stand alone or be used adjunctively. Because of the modifier -51 exemption, the RVUs have been reduced, so payers are not paying double when either of these codes are reported with another treatment code.

In the 2005 comment letter to CMS, the AAOS recommended examining the physician work for the ORIF codes because the code descriptors lacked clarity. In particular, because the CPT descriptors include the phrase "with or without internal or external fixation," it is difficult to imagine what the Harvard survey data actually represents (ie, no typical patient was described for the survey respondents to focus on). Further, after the descriptors for these codes were changed for CPT 1993, an Abt study was performed in 1992 for RUC consideration. This study produced *percentage* relationships to key reference codes, but not surveyed time and visit data. Some of these recommendations were accepted by the RUC and CMS and others were adjusted up or down, but no changes were made to the Harvard time and visit data, if available. Therefore, we believe that there is little, if any, relationship between the Harvard database time and visit information (from the old CPT codes) and the current work RVUs.

Given this information, we believe there is compelling evidence that the current work values and/or time and visit data may be incorrect and outdated and should be reviewed.

- *Evidence that incorrect assumptions were made in the previous valuation of the service, as documented; a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data*

Harvard utilized the AMA Physician Masterfile to draw names for their surveys. While general orthopaedic surgeons can perform open reduction fracture care, it is more typical for patients to be referred to orthopaedic surgeons who specialize in orthopaedic trauma or in a given anatomical area (eg, shoulder, hand, knee, etc.). We do not believe that all specialty surgeons were surveyed for these codes, since the AMA Masterfile did not delineate orthopaedic specialties. Additionally, podiatrists were not surveyed for any of the lower extremity codes.

Given this information, we believe there is compelling evidence that not all involved specialties were involved in the review of these codes.

A consensus committee of physicians representing the American Academy of Orthopaedic Surgeons, American Shoulder and Elbow Surgeons, Society for Surgery of the Hand, Arthroscopy Association of North America, Orthopaedic Trauma Association, American Podiatric Medical Association, and American Orthopaedic Foot and Ankle Society met by conference call to discuss the survey data for the revised orthopaedic codes and data for the key reference codes and other codes on the survey reference service lists.

For revised code 27829, we recommend 9.50 work RVUs. After considering differences in time and visits, along with differences in intra-operative work, we believe this value correctly ranks code 27829 relative to other ORIF codes, relative to the key reference code, and relative to orthopaedic codes from the survey reference service list.

The reference code 25607 offers a good comparison and has a very similar RVW of 9.35. The intra-service time is 1. minutes higher for the reference code compared to the survey code, but the survey code has more pre-service time for evaluation of the fracture. The intensity and risk for complications involved in treating the distal tibia fracture is much greater than that involved with 25607. The survey code has more post-operative work, because 27829 requires hospitalization to avoid skin issues, swelling and assess neurocirculatory status. Neurovascular injury may occur with

this type of fracture and multiple post-operative visits are necessary. Assessment of the circulation, sensation and motor function of the involved extremity is ongoing. The first office visit would include removal of the splint and dressing, wound evaluation, redressing, discussion of restrictions and operative findings, splinting or casting and instruction on range of motion (ROM) and weightbearing activities. X-rays would be reviewed. The second visit would be for splint or cast and dressing removal, wound evaluation, suture removal, new cast application, ROM exercises. The third visit would be for splint or cast removal and range of motion exercises and review of restrictions. X-rays would be reviewed. The fourth visit would be to check X-rays, wound healing and ROM.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No
   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FIVE YEAR REVIEW SPECIFIC QUESTIONS:

Please indicate the number of survey respondent percentages responding to each of the following questions (for example 0.05 = 5%):
Has the work of performing this service changed in the past 5 years? Yes 31% No 69%
(Use the subset of the people who responded "Yes" to answer the following questions)

A. This service represents new technology that has become more familiar (i.e., less work):
   I agree 29% I do not agree 71%
B. Patients requiring this service are now:
   more complex (more work) 86% less complex (less work) 0% no change 14%
C. The usual site-of-service has changed:
   from outpatient to inpatient 0% from inpatient to outpatient 50% no change 50%

Attestation Statement

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
2005 FIVE YEAR REVIEW - SUMMARY OF RECOMMENDATION

CPT Code:27832 Tracking Number F54 Specialty Society Recommended RVU: **11.00**
Global Period: 090 RUC Recommended RVU: **11.00**

CPT Descriptor: Open treatment of proximal tibiofibular joint dislocation, includes internal fixation, when performed, or with excision of proximal fibula

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: An 18-year-old male is hit from the side resulting in a proximal tibiofibular disruption requiring open reduction and internal fixation.

Percentage of Survey Respondents who found Vignette to be Typical: 86%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work:
- Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
- Verify that all required instruments and supplies are available
- Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulati drapes
- Assess position of the extremities and head, adjust as needed
- The patient's leg is placed properly on the table and positioned with proper bolstering to aid surgical exposure.
- Indicate areas of skin to be prepped and mark surgical incisions
- A tourniquet is placed on the proximal thigh
- The leg is prepped and draped.
- The leg is elevated and exsanguinated.
- The pneumatic tourniquet is inflated.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work: A longitudinal lateral incision is made. The lateral collateral ligament, arcuate ligament, fabellofibular ligament, popliteal fibular ligament, popliteus, biceps femoris tendon, and common peroneal tendon and it sheath are identified and dissected. The peroneal nerve is identified, dissected, and protected. Only then is the dissection carried down to the disrupted capsule and the dislocated proximal tibio-fibular joint. If this is a late injury, the scar tissue will have to be mobilized to allow for an anatomical reduction. Bone reduction clamps are used to obtain reduction and then provisional fixation (K-wires) are placed to maintain the reduction. The reduction is confirmed. One or two screws are placed through the fibular head into the proximal tibial metaphysis to maintain reduction, protecting the peroneal nerve which is always in proximity. The attached ligaments are repaired/stabilized as necessary to prevent knee instability. If the joint cannot be congruously reduced or there is fracture comminution, the proximal fibula may be completely or partly excised. The wound is irrigated and closed in layers.

Description of Post-Service Work: Post-service work: in facility
- Application of bulky dressing and short leg splint
- Monitor patient stabilization in the recovery room.
- Consultation with the family and patient regarding the surgery and postoperative regimen.
- Communication with health care professionals including written and oral reports and orders.

- Postoperative care is coordinated with recovery room nursing staff.
- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- The patient is discharged to the orthopaedic floor for monitoring of compartment syndrome. This requires removing and reapplying the dressings.

Discharge day:

- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Physical therapy for the uses of crutches or walker is ordered
- Write prescriptions for medications needed post-discharge.
- Dictation of an operative report
- Procedure note is written in the patient chart
- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of splint/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order occupational therapy
- Supervision of rehabilitation
- Monitor physical therapy
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions
- Dictate progress notes for medical record

COMPELLING EVIDENCE RATIONALE (Required to be Completed)

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

- ***Evidence that technology has changed physician work.***

Surgical treatment using open anatomical reduction and internal fixation has been made more complex with the introduction of new imaging methods such as CT which allow better detection of the fracture pathology and provided the basis for new surgical strategies. There are also new internal fixation devices which require more work. Beginning in the 1990s (after the Harvard study), new plates were developed for fracture repair, with most becoming available in the late 1990s and early 2000s. As an example of the complexity of the decision process in current practice, the 1990's have given the surgeon numerous options for bone fixation. The options for a bone fixation device currently include Kirschner wires, wire, staples, screws, as well as newer alternatives such as headless bone screws, T-screws, absorbable pins, cannulated screws, and a myriad of plates. The goal of all these devices remains constant: that is, to achieve stable approximation of bone fragments to facilitate healing. The various devices afford rigid fixation along with compression of the osseous fragments. This allows early range of motion and preservation of surrounding joint function, as well as primary bone healing. Selection of the most advantageous form of fixation is dependent on many factors and takes considerable time in the pre-evaluation of a patient. These include the type of fracture or osteotomy created, bone density, type of bone, and the desire for interfragmental compression. All of this has resulted in more work. The standards of care (fracture reduction, limb alignment, etc.) have also been elevated by literature that shows fracture displacements and poor alignments lead to poorer results. Additionally, women over 50 is a fast growing segment of our population. A huge percentage of these patients are osteoporotic - making fracture fixation and maintenance of fixation far more difficult than it used to be. The new plates are more complex to insert when the underlying bone is of much poorer quality.

Given this information, we believe there is compelling evidence that ORIF is more complex than 5 years ago and this is even more true in comparison to practice in the late 1980s (or more than 25 years ago).

- ***Evidence that incorrect assumptions were made in the previous valuation of the service; a misleading vignette and/or survey in a previous evaluation***

During the period of 1989-1991 (after the Harvard study), a major effort was undertaken by the AAOS and the OTA to rewrite every fracture and dislocation treatment code in the musculoskeletal Section of CPT. In 1991, 395 code changes were accepted by the AMA CPT Editorial Panel under the leadership of Dr. William Felts. At the time of the original proposal, some of the code descriptors were changed from those submitted (presumably by the CPT staff), and published in the 1992 and subsequent editions. Some of the changes in the descriptors published in CPT 1992 didn't make sense, but in those years, the CPT process was closed-door. Additionally, in 1992 and 1993 the AMA staff were deluged by the implementation of the RBRVS process and though AAOS and OTA requested that these problems be addressed then, AMA CPT staff asked that it be deferred as their "plate was full." After that time, more important issues and other opportunities consumed the resources of the AAOS and inertia (or the lack thereof) took over. This third five year review, after completion of the practice expense review, allowed AAOS a window of time to again try to correct the nomenclature for these codes, and review their work using the standard RUC survey method.

We also note, that at the time of the original CPT proposal, external fixation was considered an adjunctive procedure. CPT instructed that the codes for external fixation (20690 and 20692) be "listed in addition to the code for the treatment ...of the fracture." This concept still applies today. External fixation can be used as an adjunctive stabilization modality when treating fractures by almost any method. However, external fixation can also be used in reconstructive orthopaedics (for example, th/ treatment of joint contractures) and for non-musculoskeletal system treatments (for example, as a suspension device in the treatment of lower extremity burns). In 1991, there was no Modifier -51 exempt code category. Today, these same codes, 20690 and 20692 for external fixator application are modifier -51 exempt, recognizing that they can stand alone or be used adjunctively. Because of the modifier -51 exemption, the RVUs have been reduced, so payers are not paying double when either of these codes are reported with another treatment code.

In the 2005 comment letter to CMS, the AAOS recommended examining the physician work for the ORIF codes because the code descriptors lacked clarity. In particular, because the CPT descriptors include the phrase "with or without internal or external fixation," it is difficult to imagine what the Harvard survey data actually represents (ie, no typical patient was described for the survey respondents to focus on). Further, after the descriptors for these codes were changed for CPT 1993, an Abt study was performed in 1992 for RUC consideration. This study produced *percentage* relationships to key reference codes, but not surveyed time and visit data. Some of these recommendations were accepted by the RUC and CMS and others were adjusted up or down, but no changes were made to the Harvard time and visit data, if available. Therefore, we believe that there is little, if any, relationship between the Harvard database time and visit information (from the old CPT codes) and the current work RVUs.

Given this information, we believe there is compelling evidence that the current work values and/or time and visit data may be incorrect and outdated and should be reviewed.

- *Evidence that incorrect assumptions were made in the previous valuation of the service, as documented; a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data*

Harvard utilized the AMA Physician Masterfile to draw names for their surveys. While general orthopaedic surgeons can perform open reduction fracture care, it is more typical for patients to be referred to orthopaedic surgeons who specialize in orthopaedic trauma or in a given anatomical area (eg, shoulder, hand, knee, etc.). We do not believe that all specialty surgeons were surveyed for these codes, since the AMA Masterfile did not delineate orthopaedic specialties. Additionally, podiatrists were not surveyed for any of the lower extremity codes.

Given this information, we believe there is compelling evidence that not all involved specialties were involved in the review of these codes.

A consensus committee of physicians representing the American Academy of Orthopaedic Surgeons, American Shoulder and Elbow Surgeons, Society for Surgery of the Hand, Arthroscopy Association of North America, Orthopaedic Trauma Association, American Podiatric Medical Association, and American Orthopaedic Foot and Ankle Society met by conference call to discuss the survey data for the revised orthopaedic codes and data for the key reference codes and other codes on the survey reference service lists.

For revised code 27832, we recommend 11.00 work RVUs. After considering differences in time and visits, along with differences in intra-operative work, we believe this value correctly ranks code 27832 relative to other ORIF codes, relative to the key reference code, and relative to orthopaedic codes from the survey reference service list.

The reference code 25608 offers a good comparison and has a very similar RVW of 10.86. Although intra-service tim greater for the reference code, 27832 requires overnight hospitalization to avoid skin issues, swelling and assess neurocirculatory status. The intensity and risk for complications involved in open treatment the trimalleolar ankle fracture is much greater than that involved with 25608. Neurovascular injury may occur with this type of fracture and multiple post-operative visits are necessary. Assessment of the circulation, sensation and motor function of the involved extremity is ongoing. The first office visit would include removal of the splint and dressing, wound evaluation, redressing,

discussion of restrictions and operative findings, splinting or casting and instruction on range of motion (ROM) and weightbearing activities. X-rays would be reviewed. The second visit would be for splint or cast and dressing removal, wound evaluation, suture removal, new cast application, ROM exercises. The third visit would be for splint or cast removal and range of motion exercises and review of restrictions. X-rays would be reviewed. The fourth visit would be to check X-rays, wound healing and ROM.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No
   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FIVE YEAR REVIEW SPECIFIC QUESTIONS:

Please indicate the number of survey respondent percentages responding to each of the following questions (for example 0.05 = 5%):

Has the work of performing this service changed in the past 5 years? Yes 25% No 75%

(Use the subset of the people who responded "Yes" to answer the following questions)

A. This service represents new technology that has become more familiar (i.e., less work):
   I agree 20% I do not agree 80%
B. Patients requiring this service are now:
   more complex (more work) 80% less complex (less work) 0% no change 30%
C. The usual site-of-service has changed:
   from outpatient to inpatient 0% from inpatient to outpatient 40% no change 70%

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
2005 FIVE YEAR REVIEW - SUMMARY OF RECOMMENDATION

CPT Code:28415 Tracking Number F55 Specialty Society Recommended RVU: **20.06**
Global Period: 090 RUC Recommended RVU: **17.54**

CPT Descriptor: Open treatment of calcaneal fracture, includes internal fixation, when performed;

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 55-year-old male falls and sustains a comminuted calcaneal fracture. To reconstruct the fracture and joint surface, an open reduction and internal fixation of the intra-articular fracture of the calcaneus is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 89%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: • Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
- Verify that all required instruments and supplies are available
- Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulati drapes
- Assess position of the extremities and head, adjust as needed
- The patient's leg is placed properly on the table and positioned with proper bolstering to aid surgical exposure.
- Indicate areas of skin to be prepped and mark surgical incisions
- A tourniquet is placed on the proximal thigh
- The leg is prepped and draped.
- The leg is elevated and exsanguinated.
- The pneumatic tourniquet is inflated.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work: An L-shaped lateral incision is made to the hindfoot. The posterior L is along the border of the posterior lateral skin, turns at the heel and proceed: along the border of the plantar lateral skin. The incision is taken down to bone and subperiosteally dissected up to the subtalar joint, with care to protect the sural nerve. With adequate exposure k-wires are inserted into the fibula and talus to gently act as retractors of the skin. The lateral wall of the fracture is mobilized so that the depressed portions of the posterior and middle facet can be visualized. With the aid of a Schantz pin, the fragments are mobilized to anatomic position and a calcaneal plate is contoured to maintain the reduction from the posterior calcaneus to the calcaneocuboid joint. Bohler's angle is restored. Initial reduction is carried out with guide wires and secured with screw fixation. The wound is irrigated and closed in layers.

Description of Post-Service Work: Post-service work: in facility
- Application of bulky dressing and short leg splint
- Monitor patient stabilization in the recovery room.
- Consultation with the family and patient regarding the surgery and postoperative regimen.
- Communication with health care professionals including written and oral reports and orders.
- Postoperative care is coordinated with recovery room nursing staff.
- The patient's vital signs are checked.

- The circulation, sensation and motor function of the operated extremity are assessed.
- The patient is discharged to the orthopaedic floor for monitoring of compartment syndrome. This requires removing and reapplying the dressings.

Discharge day:

- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Physical therapy for the uses of crutches or walker is ordered
- Write prescriptions for medications needed post-discharge.
- Dictation of an operative report
- Procedure note is written in the patient chart
- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of splint/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order occupational therapy
- Supervision of rehabilitation
- Monitor physical therapy
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions

COMPELLING EVIDENCE RATIONALE (Required to be Completed)

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

- ***Evidence that technology has changed physician work.***

Surgical treatment using open anatomical reduction and internal fixation has been made more complex with the introduction of new imaging methods such as CT which allow better detection of the fracture pathology and provided the basis for new surgical strategies. There are also new internal fixation devices which require more work. Beginning in the 1990s (after the Harvard study), new plates were developed for fracture repair, with most becoming available in the late 1990s and early 2000s. As an example of the complexity of the decision process in current practice, the 1990's have given the surgeon numerous options for bone fixation. The options for a bone fixation device currently include Kirschner wires, wire, staples, screws, as well as newer alternatives such as headless bone screws, T-screws, absorbable pins, cannulated screws, and a myriad of plates. The goal of all these devices remains constant: that is, to achieve stable approximation of bone fragments to facilitate healing. The various devices afford rigid fixation along with compression of the osseous fragments. This allows early range of motion and preservation of surrounding joint function, as well as primary bone healing. Selection of the most advantageous form of fixation is dependent on many factors and takes considerable time in the pre-evaluation of a patient. These include the type of fracture or osteotomy created, bone density, type of bone, and the desire for interfragmental compression. All of this has resulted in more work. The standards of care (fracture reduction, limb alignment, etc.) have also been elevated by literature that shows fracture displacements and poor alignments lead to poorer results. Additionally, women over 50 is a fast growing segment of our population. A huge percentage of these patients are osteoporotic - making fracture fixation and maintenance of fixation far more difficult than it used to be. The new plates are more complex to insert when the underlying bone is of much poorer quality.

Given this information, we believe there is compelling evidence that ORIF is more complex than 5 years ago and this is even more true in comparison to practice in the late 1980s (or more than 25 years ago).

- ***Evidence that incorrect assumptions were made in the previous valuation of the service; a misleading vignette and/or survey in a previous evaluation***

During the period of 1989-1991 (after the Harvard study), a major effort was undertaken by the AAOS and the OTA to rewrite every fracture and dislocation treatment code in the musculoskeletal Section of CPT. In 1991, 395 code changes were accepted by the AMA CPT Editorial Panel under the leadership of Dr. William Felts. At the time of the original proposal, some of the code descriptors were changed from those submitted (presumably by the CPT staff), and published in the 1992 and subsequent editions. Some of the changes in the descriptors published in CPT 1992 didn't make sense, but in those years, the CPT process was closed-door. Additionally, in 1992 and 1993 the AMA staff were deluged by the implementation of the RBRVS process and though AAOS and OTA requested that these problems be addressed then, AMA CPT staff asked that it be deferred as their "plate was full." After that time, more important issues and other opportunities consumed the resources of the AAOS and inertia (or the lack thereof) took over. This third five year review, after completion of the practice expense review, allowed AAOS a window of time to again try to correct the nomenclature for these codes, and review their work using the standard RUC survey method.

We also note, that at the time of the original CPT proposal, external fixation was considered an adjunctive procedure. CPT instructed that the codes for external fixation (20690 and 20692) be "listed in addition to the code for the treatment ...of the fracture." This concept still applies today. External fixation can be used as an adjunctive stabilization modality when treating fractures by almost any method. However, external fixation can also be used in reconstructive orthopaedics (for example, th treatment of joint contractures) and for non-musculoskeletal system treatments (for example, as a suspension device in the treatment of lower extremity burns). In 1991, there was no Modifier -51 exempt code category. Today, these same codes, 20690 and 20692 for external fixator application are modifier -51 exempt, recognizing that they can stand alone or be used adjunctively. Because of the modifier -51 exemption, the RVUs have been reduced, so payers are not paying double when either of these codes are reported with another treatment code.

In the 2005 comment letter to CMS, the AAOS recommended examining the physician work for the ORIF codes because the code descriptors lacked clarity. In particular, because the CPT descriptors include the phrase "with or without internal or external fixation," it is difficult to imagine what the Harvard survey data actually represents (ie, no typical patient was described for the survey respondents to focus on). Further, after the descriptors for these codes were changed for CPT 1993, an Abt study was performed in 1992 for RUC consideration. This study produced *percentage* relationships to key reference codes, but not surveyed time and visit data. Some of these recommendations were accepted by the RUC and CMS and others were adjusted up or down, but no changes were made to the Harvard time and visit data, if available. Therefore, we believe that there is little, if any, relationship between the Harvard database time and visit information (from the old CPT codes) and the current work RVUs.

Given this information, we believe there is compelling evidence that the current work values and/or time and visit data may be incorrect and outdated and should be reviewed.

- *Evidence that incorrect assumptions were made in the previous valuation of the service, as documented; a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data*

Harvard utilized the AMA Physician Masterfile to draw names for their surveys. While general orthopaedic surgeons can perform open reduction fracture care, it is more typical for patients to be referred to orthopaedic surgeons who specialize in orthopaedic trauma or in a given anatomical area (eg, shoulder, hand, knee, etc.). We do not believe that all specialty surgeons were surveyed for these codes, since the AMA Masterfile did not delineate orthopaedic specialties. Additionally, podiatrists were not surveyed for any of the lower extremity codes.

Given this information, we believe there is compelling evidence that not all involved specialties were involved in the review of these codes.

A consensus committee of physicians representing the American Academy of Orthopaedic Surgeons, American Shoulder and Elbow Surgeons, Society for Surgery of the Hand, Arthroscopy Association of North America, Orthopaedic Trauma Association, American Podiatric Medical Association, and American Orthopaedic Foot and Ankle Society met by conference call to discuss the survey data for the revised orthopaedic codes and data for the key reference codes and other codes on the survey reference service lists.

For revised code 28415, we recommend 20.06 work RVUs. After considering differences in time and visits, along with differences in intra-operative work, we believe this value correctly ranks code 28415 relative to other ORIF codes, relative to the key reference code, and relative to orthopaedic codes from the survey reference service list.

The reference code 28705 offers a very close comparison to the total work 28415. Although 28705 requires more intra-time, the intensity and risk for complications involved in treating the calcaneal fracture is much greater. In comparing the survey code against the reference code, the median RVW appears appropriate and maintains relativity. Neurovascular injury may occur with this type of fracture and multiple post-operative visits are necessary. Assessment of the circulation, sensation and motor function of the involved extremity is ongoing. The first office visit would include removal

of the splint and dressing, wound evaluation, redressing, discussion of restrictions and operative findings, splinting or casting and instruction on range of motion (ROM) and weightbearing activities. X-rays would be reviewed. The second visit would be for splint or cast and dressing removal, wound evaluation, suture removal, new cast application, ROM exercises. The third visit would be for splint or cast removal and range of motion exercises and review of restrictions. X-rays would be reviewed. The fourth visit would be to check X-rays, wound healing and ROM.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No
   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FIVE YEAR REVIEW SPECIFIC QUESTIONS:

Please indicate the number of survey respondent percentages responding to each of the following questions (for example 0.05 = 5%):

Has the work of performing this service changed in the past 5 years? Yes 60% No 40%

(Use the subset of the people who responded "Yes" to answer the following questions)

A. This service represents new technology that has become more familiar (i.e., less work):
   I agree 15% I do not agree 85%
B. Patients requiring this service are now:
   more complex (more work) 97% less complex (less work) 0% no change 3%
C. The usual site-of-service has changed:
   from outpatient to inpatient 3% from inpatient to outpatient 6% no change 91%

Attestation Statement

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
2005 FIVE YEAR REVIEW - SUMMARY OF RECOMMENDATION

CPT Code:28420 Tracking Number F56 Specialty Society Recommended RVU: **23.50**
Global Period: 090 RUC Recommended RVU: **19.00**

CPT Descriptor: Open treatment of calcaneal fracture, includes internal fixation, when performed; with primary iliac or other autogenous bone graft (includes obtaining graft)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 50-year-old female falls sustaining a calcaneal fracture with severe loss of Bohler's angle requiring open reduction and internal fixation. To make up for crushed bone, a separate incision is made in the iliac crest where a large bone graft is harvested and used for fracture stabilization. [Please note that total physician work for this service includes both ORIF and obtaining bone graft.]

Percentage of Survey Respondents who found Vignette to be Typical: 78%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work: • Write preadmission orders for preoperative medications
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
- Verify that all required instruments and supplies are available
- Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulation drapes
- Assess position of the extremities and head, adjust as needed
- The patient's leg is placed properly on the table and positioned with proper bolstering to aid surgical exposure.
- Indicate areas of skin to be prepped and mark surgical incisions
- A tourniquet is placed on the proximal thigh
- The leg is prepped and draped.
- The leg is elevated and exsanguinated.
- The pneumatic tourniquet is inflated.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work: An L-shaped lateral incision is made to the hindfoot. The posterior L is along the border of the posterior lateral skin, turns at the heel and proceeds along the border of the plantar lateral skin. The incision is taken down to bone and subperiosteally dissected up to the subtalar joint, with care taken to protect the sural nerve. With adequate exposure, k-wires are inserted into the fibula and talus to gently act as retractors of the skin. The lateral wall of the fracture is mobilized so that the depressed portions of the posterior and middle facet can be visualized. With the aid of a Schantz pin the fragments are mobilized to anatomic position and a calcaneal plate is contoured to maintain the reduction from the posterior calcaneus to the calcaneocuboid joint. Because large gaps are seen in bone contact secondary to crushing, a separate incision is made at the iliac crest and a large bone graft is obtained. The iliac crest wound is irrigated and closed in layers. Bohler's angle is restored. Initial reduction is carried out with guide wire and secured with screw fixation. Bone graft is packed in prior to plate application to fill the gaps. The wound is irrigated and closed in layers.

Description of Post-Service Work: Post-service work: in facility
- Application of bulky dressing and short leg splint

- Monitor patient stabilization in the recovery room.
- Consultation with the family and patient regarding the surgery and postoperative regimen.
- Communication with health care professionals including written and oral reports and orders.
- Postoperative care is coordinated with recovery room nursing staff.
- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- The patient is discharged to the orthopaedic floor for monitoring of compartment syndrome. This requires removing and reapplying the dressings.

Discharge day:

- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Physical therapy for the uses of crutches or walker is ordered
- Write prescriptions for medications needed post-discharge.
- Dictation of an operative report
- Procedure note is written in the patient chart
- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of splint/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order occupational therapy
- Supervision of rehabilitation
- Monitor physical therapy
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions
- Dictate progress notes for medical record

Median Critical Care Time	0.0	0.00	
Median Other Hospital Visit Time	60.0	100.00	
Median Discharge Day Management Time	38.0	38.00	
Median Office Visit Time	108.0	92.00	
Prolonged Services Time	0.0	0.00	
Median Total Time	**481.00**	**520.00**	
Other time if appropriate			

INTENSITY/COMPLEXITY MEASURES (Mean)

Mental Effort and Judgment (Mean)

The number of possible diagnosis and/or the number of management options that must be considered	4.91	4.40
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	4.91	4.50
Urgency of medical decision making	4.82	4.40

Technical Skill/Physical Effort (Mean)

Technical skill required	4.91	4.50
Physical effort required	4.73	4.30

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	4.73	4.30
Outcome depends on the skill and judgment of physician	4.91	4.30
Estimated risk of malpractice suit with poor outcome	4.55	4.30

INTENSITY/COMPLEXITY MEASURES	CPT Code	Reference Service 1
Time Segments (Mean)		
Pre-Service intensity/complexity	3.73	3.70
Intra-Service intensity/complexity	4.18	4.00
Post-Service intensity/complexity	4.36	3.10

COMPELLING EVIDENCE RATIONALE (Required to be Completed)

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

- ***Evidence that technology has changed physician work.***

Surgical treatment using open anatomical reduction and internal fixation has been made more complex with the introduction of new imaging methods such as CT which allow better detection of the fracture pathology and provided the basis for new surgical strategies. There are also new internal fixation devices which require more work. Beginning in the 1990s (after the Harvard study), new plates were developed for fracture repair, with most becoming available in the late 1990s and early 2000s. As an example of the complexity of the decision process in current practice, the 1990's have given the surgeon numerous options for bone fixation. The options for a bone fixation device currently include Kirschner wires, wire, staples, screws, as well as newer alternatives such as headless bone screws, T-screws, absorbable pins, cannulated screws, and a myriad of plates. The goal of all these devices remains constant: that is, to achieve stable approximation of bone fragments to facilitate healing. The various devices afford rigid fixation along with compression of the osseous fragments. This allows early range of motion and preservation of surrounding joint function, as well as primary bone healing. Selection of the most advantageous form of fixation is dependent on many factors and takes considerable time in the pre-evaluation of a patient. These include the type of fracture or osteotomy created, bone density, type of bone, and the desire for interfragmental compression. All of this has resulted in more work. The standards of care (fracture reduction, limb alignment, etc.) have also been elevated by literature that shows fracture displacements and poor alignments lead to poorer results. Additionally, women over 50 is a fast growing segment of our population. A huge percentage of these patients are osteoporotic - making fracture fixation and maintenance of fixation far more difficult than it used to be. The new plates are more complex to insert when the underlying bone is of much poorer quality.

Given this information, we believe there is compelling evidence that ORIF is more complex than 5 years ago and this is even more true in comparison to practice in the late 1980s (or more than 25 years ago).

- ***Evidence that incorrect assumptions were made in the previous valuation of the service; a misleading vignette and/or survey in a previous evaluation***

During the period of 1989-1991 (after the Harvard study), a major effort was undertaken by the AAOS and the OTA to rewrite every fracture and dislocation treatment code in the musculoskeletal Section of CPT. In 1991, 395 code changes were accepted by the AMA CPT Editorial Panel under the leadership of Dr. William Felts. At the time of the original proposal, some of the code descriptors were changed from those submitted (presumably by the CPT staff), and published in the 1992 and subsequent editions. Some of the changes in the descriptors published in CPT 1992 didn't make sense, but in those years, the CPT process was closed-door. Additionally, in 1992 and 1993 the AMA staff were deluged by the implementation of the RBRVS process and though AAOS and OTA requested that these problems be addressed then, AMA CPT staff asked that it be deferred as their "plate was full." After that time, more important issues and other opportunities consumed the resources of the AAOS and inertia (or the lack thereof) took over. This third five year review, after completion of the practice expense review, allowed AAOS a window of time to again try to correct the nomenclature for these codes, and review their work using the standard RUC survey method.

We also note, that at the time of the original CPT proposal, external fixation was considered an adjunctive procedure. CPT instructed that the codes for external fixation (20690 and 20692) be "listed in addition to the code for the treatment ...of the fracture." This concept still applies today. External fixation can be used as an adjunctive stabilization modality when treating fractures by almost any method. However, external fixation can also be used in reconstructive orthopaedics (for example, th treatment of joint contractures) and for non-musculoskeletal system treatments (for example, as a suspension device in the treatment of lower extremity burns). In 1991, there was no Modifier -51 exempt code category. Today, these same codes, 20690 and 20692 for external fixator application are modifier -51 exempt, recognizing that they can stand alone or be used adjunctively. Because of the modifier -51 exemption, the RVUs have been reduced, so payers are not paying double when either of these codes are reported with another treatment code.

In the 2005 comment letter to CMS, the AAOS recommended examining the physician work for the ORIF codes because the code descriptors lacked clarity. In particular, because the CPT descriptors include the phrase "with or without internal or external fixation," it is difficult to imagine what the Harvard survey data actually represents (ie, no typical patient was described for the survey respondents to focus on). Further, after the descriptors for these codes were changed for CPT 1993, an Abt study was performed in 1992 for RUC consideration. This study produced *percentage* relationships to key reference codes, but not surveyed time and visit data. Some of these recommendations were accepted by the RUC and CMS and others were adjusted up or down, but no changes were made to the Harvard time and visit data, if available. Therefore, we believe that there is little, if any, relationship between the Harvard database time and visit information (from the old CPT codes) and the current work RVUs.

Given this information, we believe there is compelling evidence that the current work values and/or time and visit data may be incorrect and outdated and should be reviewed.

- *Evidence that incorrect assumptions were made in the previous valuation of the service, as documented; a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data*

Harvard utilized the AMA Physician Masterfile to draw names for their surveys. While general orthopaedic surgeons can perform open reduction fracture care, it is more typical for patients to be referred to orthopaedic surgeons who specialize in orthopaedic trauma or in a given anatomical area (eg, shoulder, hand, knee, etc.). We do not believe that all specialty surgeons were surveyed for these codes, since the AMA Masterfile did not delineate orthopaedic specialties. Additionally, podiatrists were not surveyed for any of the lower extremity codes.

Given this information, we believe there is compelling evidence that not all involved specialties were involved in the review of these codes.

A consensus committee of physicians representing the American Academy of Orthopaedic Surgeons, American Shoulder and Elbow Surgeons, Society for Surgery of the Hand, Arthroscopy Association of North America, Orthopaedic Trauma Association, American Podiatric Medical Association, and American Orthopaedic Foot and Ankle Society met by conference call to discuss the survey data for the revised orthopaedic codes and data for the key reference codes and other codes on the survey reference service lists.

For revised code 28420, we recommend 23.50 work RVUs. After considering differences in time and visits, along with differences in intra-operative work, we believe this value correctly ranks code 28420 relative to other ORIF codes, relative to the key reference code, and relative to orthopaedic codes from the survey reference service list.
